practical self-relation: basic self-confidence, self-respect, and self-esteem.\textsuperscript{14} As Joel Anderson points out, “these three modes of relating practically to oneself can be acquired and maintained only intersubjectively, through relationships of mutual recognition.”\textsuperscript{15} Basic self-confidence is dependent on intact mutual recognition in loving, familial relations; self-respect is rooted in legal recognition; and self-esteem is grounded in the mutual recognition afforded by membership in a community of value. Together, these three forms of practical self-relation are constitutive of the possibility of individual autonomy. Honneth also connects these three forms of recognition and of practical self-relation to forms of disrespect: abuse and rape, which undermine basic self-confidence; denial of rights or legal exclusion, which undermine self-respect; and the denigration of culturally specific ways of life, which undermines self-esteem.\textsuperscript{16}

These forms of disrespect generate subjective feelings of humiliation and injustice that can, under the right sorts of social conditions, generate social struggles for the expansion of recognition and that serve, in Honneth’s theory, as the pretheoretical foothold for critical theory in social praxis.

In the final chapter of \textit{The Struggle for Recognition}, Honneth develops these insights in the direction of a formal conception of the good life that further signals his departure from Habermasian proceduralism.\textsuperscript{17} Unlike Habermas, who attempts to develop his normative perspective independently of an ethical-existential conception of the good life, Honneth maintains that a normatively oriented critical theory must appeal at least hypothetically to a provisional conception of the good life. Indeed, Honneth’s teleological account of the progressive expansion of the three forms of recognition through the vehicle of social struggle necessitates such a move. Unlike communitarians, such as Charles Taylor, however, Honneth does not conceive of the good life “as the expression of substantive values that constitute the \textit{ethos} of a concrete tradition-based community.”\textsuperscript{18} Rather, in an attempt to split the difference between proceduralism and communitarianism, Honneth conceives of the good life formally, in terms of “structural elements of ethical life” or “necessary conditions for individual self-realization.”\textsuperscript{19} These necessary conditions are the three forms of practical relation to self – self-confidence, self-respect and self-esteem – that emerge

\end{itemize}
only as a result of intact mutual recognition in the forms of love, rights, and solidarity. By rooting his normative perspective in a theory of the good life, albeit a formal one, Honneth has placed much greater emphasis on the ethical notion of self-realization than does Habermas, whose Kantianism has compelled him to endorse a razor-sharp distinction between the right and the good.20

II. CRITICAL ENGAGEMENTS WITH HABERMAS: FOUCAULTIAN THEMES

The relationship between third generation critical theory and Foucaultian poststructuralism is complex and multifaceted.21 All three of the thinkers considered here have offered trenchant – although not always fully convincing – critiques of poststructuralism. Nevertheless, Honneth and Fraser have also drawn productively – although sometimes only implicitly – on Foucaultian themes both in their critical engagements with Habermas and in the articulation of their own critical theories. Indeed, in general, the third generation distinguishes itself from Habermas by its degree of openness to the insights generated by Foucaultian poststructuralism, particularly when it comes to his analysis of power. In this section, I will start by briefly laying out the criticisms of Foucault (and the related critique of Judith Butler’s early feminist-Foucaultian work) offered by the third generation. I will then go on to consider how Honneth in particular mobilizes Foucaultian themes in his critical engagements with Habermas and in the articulation of his own critical theory.

In a series of essays originally published in the early 1980s and subsequently reprinted as the first three chapters of her first book, Unruly Practices, Nancy Fraser initiated the third generation’s critical encounter with Foucault.22 Fraser presents two main criticisms of Foucault, the first focusing on his conception of power, the second, on his critique of humanism. First, in her extremely influential essay “Foucault on Modern Power: Empirical Insights and Normative Confusions,” Fraser argues that Foucault offers a rich and useful empirical

22. Indeed, in something of a generational inversion, Fraser’s critique of Foucault was also highly influential for Habermas’s critical engagement with Foucault in The Philosophical Discourse of Modernity. Thus, Fraser’s work shaped both the third and second generation’s encounters with Foucault.
account of micropractices of power but remains “normatively confused” inasmuch as his work lacks “normative criteria for distinguishing acceptable from unacceptable forms of power.”

Second, in her essays “Michel Foucault: A Young Conservative?” and “Foucault’s Body Language: A Posthumanist Political Rhetoric?,” Fraser argues that Foucault’s critique of humanism is unviable both because it commits the genetic fallacy and because Foucault fails to articulate a plausible alternative conception of human freedom.

In her well-known debate with Butler, Benhabib echoes some similar themes, while also bringing a new issue into focus: the problem of the subject. Although Benhabib’s initial critique of what she calls “postmodernism” ranges over a number of issues, including the postmodern critique of grand metanarratives of historical progress and Enlightenment notions of transcendent reason, it is the issue of the so-called “death of man” that takes center stage in the debate. Although Benhabib sees no problem with a weak version of the “death of man” thesis, according to which the subject is always situated in various social and linguistic practices, she rejects the strong version, which dissolves the subject into just another position in language/discourse, on the grounds that this thesis is “not compatible with the goals of feminism.”

Speaking of Butler’s Nietzschean and Foucaultian inspired notion of the gendered self, Benhabib asks:

If we are no more than the sum total of the gendered expressions we perform, is there ever any chance to stop the performance for a while, to pull the curtain down, and let it rise only if one can have a say in the production of the play itself? Isn’t this what the struggle over gender is all about?

In general, Benhabib diagnoses the feminist alliance with postmodernism as symptomatic of a broader “retreat from utopia” in feminist thinking.

---

23. Fraser, *Unruly Practices*, 31, 33. In a more recent essay, Fraser has substantially weakened the empirical insightfulness claim, arguing that Foucault’s account of power is more suited for the Fordist world of the 1970s than it is for the post-Fordist, globalized, flexibilized world of the early twenty-first century. See Nancy Fraser, “From Discipline to Flexibilization: Rereading Foucault in the Shadow of Globalization,” in her *Scales of Justice: Reframing Justice in a Globalizing World* (Cambridge: Polity, 2008).

25. Butler’s work is the focus of an essay by Gayle Salamon in *The History of Continental Philosophy: Volume 8*.

28. Ibid., 21.

29. Ibid., 29–30.
In her response, Butler scoffs at Benhabib’s overly simplistic characterization of postmodernism, but defends a central insight of Foucaultian poststructuralism, namely, that the subject can be both constituted by power relations and still capable of agency and resistance. Indeed, as Butler puts it, “the constituted character of the subject is the very precondition of its agency. For what is it that enables a purposive and significant reconfiguration of cultural and political relations, if not a relation that can be turned against itself, reworked, resisted?” Fraser, in her reply to this exchange, echoes and affirms Butler’s point: pace Benhabib, “nothing in principle precludes that subjects are both culturally constructed and capable of critique.” What feminists need, according to Fraser, is “an alternative conceptualization of the subject, one that integrates Butler’s poststructuralist emphasis on construction with Benhabib’s critical-theoretical stress on critique.”

Although Benhabib has more recently shown a greater appreciation for Butler’s work on the subject, and although she has incorporated some Derridean themes in her recent work on cosmopolitanism, Benhabib has remained more steadfastly critical of poststructuralism than has either Fraser or Honneth. In this respect, Benhabib is perhaps closer to Habermas than her fellow third generation critical theorists. Honneth, by contrast, despite his critique of what he calls Foucault’s “systems-theoretical solution to the Dialectic of Enlightenment,” also relies on Foucaultian themes in his critical engagement with Habermas. In The Critique of Power, Honneth criticizes Habermas’s social-theoretical distinction between system and lifeworld on the grounds that it presents a problematically norm-free system and a problematically power-free lifeworld. In the “Afterword” to the second German edition of The Critique of Power, Honneth claims that a central question for critical social theory is “the question of how the conceptual framework of an analysis has to be laid out so that it is able to comprehend both the structures of social domination and the

36. Fraser develops a similar critique of Habermas in her essay “What’s Critical About Critical Theory: The Case of Habermas and Gender,” although without any explicit reference to Foucault. See Fraser, Unruly Practices, ch. 6.
social resources for its practical overcoming.” Honneth’s central critique of Habermas here is that, as a result of his distinction between system and lifeworld and his insufficient attention to the role that power plays in the latter, he is incapable of fully illuminating both sides of this duality. As Honneth puts it: “the dynamic that arises in the historical development of social orders can be fully explained only by extending the sphere of communicative action to include the negative dimension of struggle.” To be sure, Honneth is likewise critical of Foucault for the inverse reason. He maintains that whereas Foucault helpfully theorizes the negative moment of social domination, he does not give an account – indeed, perhaps even denies the possibility of – the positive moment that enables the practical overcoming of domination. Still, Honneth emphasizes that the systematic aim of including Foucault in his study was “to show that the dimension of social conflict that Foucault makes central can only be invoked at the level of a social theory if it is grasped as the negative moment of a comprehensive process in the formation of social consensus.”

It is Honneth’s interest in bringing out this “negative moment” emphasized in Foucault’s theory of power that leads to his emphasis on social struggles for recognition within the lifeworld. As he puts it in the “Introduction” to The Struggle for Recognition, his account of recognition is motivated by his conclusion in The Critique of Power that “any attempt to integrate the sociatheoretical insights of Foucault’s historical work within the framework of a theory of communicative action has to rely on the concept of morally motivated struggle.” Hence, despite his criticisms of Foucault, Honneth’s critical engagement with Habermasian social theory and his own recognition-theoretical contribution to critical theory draw a great deal of inspiration from Foucault’s analysis of power.

39. On this point, see ibid., xxii–xxviii.
40. Ibid., xxii.
41. Honneth, The Struggle for Recognition, 1.
42. Similarly, Fraser, both in her intervention in the Benhabib–Butler debate and in essays such as “Social Criticism Without Philosophy” (coauthored with Linda Nicholson) and “A Genealogy of Dependency” (coauthored with Linda Gordon), indicates a much greater openness to the insights of poststructuralism than does Habermas, while still remaining critical of what she takes to be its normative deficits. See Nancy Fraser and Linda Nicholson, “Social Criticism without Philosophy,” in Feminism/Postmodernism, Linda Nicholson (ed.) (New York: Routledge, 1990), 19–38; and Nancy Fraser and Linda Gordon, “A Genealogy of Dependency: Tracing a Keyword of the US Welfare State,” in Fraser, Justice Interruptus: Critical Reflections on the “Postsocialist” Condition (New York: Routledge, 1997), 121–49.
The problem of the subject is an important theme not only in the debate between Butlerian poststructuralism and Benhabibian critical theory, but also in much third generation critical theory, just as it is in twentieth-century continental philosophy as a whole. It surfaces particularly in the work of Benhabib, which articulates a narrative conception of the self, and of Honneth, whose account of recognition entails an intersubjectivist account of the subject.

Elements of Benhabib’s narrative conception of the self are evident already in her classic essay on the Gilligan–Kohlberg debate, in which she criticizes the social contract tradition for failing to realize that “the self is not a thing, a substrate, but the protagonist of a life’s tale” (STS 162), and in her critique of Butler, in which she argues that “a subjectivity that would not be structured by language, by narrative and by the symbolic structures of narrative available in a culture is unthinkable. We tell of who we are, of the ‘I’ that we are by means of a narrative.”43 Similarly, in her book on Hannah Arendt, Benhabib argues that one of Arendt’s most important contributions to twentieth-century philosophy is her idea of the web of relationships and narratives as forming the space of human appearance.44 In her recent work, Benhabib expands on these earlier insights and develops them more systematically. In The Claims of Culture, she argues that “to be and to become a self is to insert oneself into webs of interlocution; it is to know how to answer when one is addressed and to know how to address others.”45 As Benhabib notes, we are all thrown, in the Heideggerian sense, into various webs of interlocution or narrative – familial narratives, gender narratives, narratives of ethnic, racial, religious, national identity, and so forth – and “we become who we are by learning to be a conversation partner in these narratives.”46 Moreover, although we are thrown into these ongoing narratives and thus are not in a position to choose them or our interlocutors, “our agency consists in our capacity to weave out of those narratives and fragments of narratives a life story that makes sense for us, as unique individual selves.”47 We are, in other words, not just the protagonists but also the authors of our own stories.

44. Seyla Benhabib, The Reluctant Modernism of Hannah Arendt (London, Sage, 1996). In this book, Benhabib stakes out a provocative middle-ground reading of Arendt according to which she is neither a Heideggerian or Nietzschean antimodernist nor a Derridean postmodernist but instead a reluctant modernist who therefore has more in common with the Habermasian discourse ethical tradition than most commentators have assumed.
47. Ibid.
In contrast to Taylor, from whom Benhabib borrows the idea of webs of interlocution, Benhabib emphasizes the anti-essentialism of her narrative conception of the self. Because Benhabib insists that the core of the self consists not in any substantive commitments but in an ability or capacity to make sense of our lives by fitting our experiences into a coherent narrative, Benhabib arguably salvages coherence for the self without essentializing it. Moreover, Benhabib insists that she makes no strong claims about the mastery of the narrative self. We are never in complete control of our own narratives, as they must attain some degree of fit with the continually unfolding narratives of those others with whom our own life stories are inextricably intertwined.48

Honneth's intersubjectivist account of the self emerges out of his analysis of the struggle for recognition. As I discussed above, the three practical relations to self – self-confidence, self-respect, and self-esteem – that are made possible by intact mutual recognition – in the forms of love, rights, and solidarity – are conditions for the possibility of individual self-realization and autonomy. Honneth's intersubjectivist account of the self both overlaps with Habermas's – which also draws its inspiration from Mead49 – and departs from it, by offering a thicker and richer conception of self-realization. Honneth also departs from Habermas (and aligns himself more with first generation critical theory) by drawing extensively on the insights of psychoanalysis, in particular, the object-relations psychoanalytic theory of Donald Winnicott.50 Honneth's greater appreciation for psychoanalysis goes hand in hand with what Anderson calls a greater appreciation for the Other of Reason; as such it is conceptually related to his greater openness to the insights generated by Foucault's analysis of power.51 In his inaugural lecture at the Free University of Berlin, Honneth makes clear his dissatisfaction with the narrow focus on rationality in Habermas's work. As he puts it:

As soon as the communication paradigm is grasped not in the sense of a conception of rational understanding, but as a conception of the conditions of recognition, the critical diagnosis of the times may no longer be pressed into the narrow scheme of a theory of rationality.52

48. Benhabib also questions the mastery of the narrative self on the grounds of the psychoanalytic insight that the I is not the master of its own house. See ibid., 349.
50. For Honneth's discussion of Winnicott, see Honneth, The Struggle for Recognition, 98–106. For some remarks on the differences between Honneth and Habermas's uses of psychoanalysis, see Honneth, The Critique of Power, xxx–xxxi.
51. See Anderson, “The 'Third Generation' of the Frankfurt School.”
For Honneth, a truly critical diagnosis of the times needs to be rooted in a fuller conception of subjectivity, one that pays greater attention to the affective and recognitional aspects of our selves.

IV. RECOGNITION AND/OR REDISTRIBUTION?

The issue of how best to understand the problematic of recognition – as part of an intersubjectivist theory of the self and of the necessary conditions for ethical self-realization or as part of a broader conception of injustice that construes recognition on the model of the Weberian notion of status – is a central one in the debate between Fraser and Honneth. This debate arose out of Fraser’s 1996 Tanner Lectures, for which Honneth served as a commentator, and which grew into their coauthored book, *Redistribution or Recognition? A Political-Philosophical Exchange*. However, also at stake here is the much broader question of how best to renew the tradition of critical theory in a post-Habermasian vein. As they write in their introduction, Fraser and Honneth both “believe that critique achieves both its theoretical warrant and its practical efficacy only by deploying normative concepts that are also informed by a structural understanding of contemporary society, one that can diagnose the tensions and contextualize the struggles of the present.”

In her Tanner Lectures and in her 1997 book, *Justice Interruptus*, Fraser is critical of the one-sidedness of the philosophical focus on the cultural politics of recognition, and she situates this critique in the context of what she calls the “postsocialist condition.” In the wake of the fall of communism, Fraser argues, the political and cultural landscape is characterized by an exhaustion of left-wing utopianism, a lack of clear alternatives to the present social order, a rise in recognition-based cultural politics to the relative eclipse of an economic politics of redistribution, and a resurgence of economic neoliberalism. Even worse, social and political theorists reflecting on the current landscape have taken the economic politics of redistribution and the cultural politics of recognition to represent an either/or choice, generating what Fraser argues is a false antithesis. Failing to call this false antithesis into question amounts to evading what Fraser takes to be:

the crucial “postsocialist” tasks: first, interrogating the distinction between culture and economy; second, understanding how both

---

54. See Fraser, *Justice Interruptus*, “Introduction.”
work together to produce injustices; and third, figuring out how, as a prerequisite for remedying injustices, claims for recognition can be integrated with claims for redistribution in a comprehensive political project.55

Indeed, the guiding assumption of Fraser’s work of the mid- to late 1990s is “that the cultural politics of recognition ought not simply to supplant the social politics of redistribution. Rather, the two need to be integrated with one another.”56 Fraser proposes to integrate these two conceptions of politics into a two-dimensional conception of justice that encompasses redistribution and recognition. Contra Honneth, who seeks to ground the entire normative framework of critical theory in the notion of recognition, Fraser argues that we cannot fully understand the predicaments of certain oppressed groups without utilizing both of these analytical frameworks; thus, we need to combine them into a single framework of justice. Also contra Honneth, who maintains that misrecognition is unjust because it is an impediment to full individual self-realization, Fraser construes the wrong of misrecognition as being a function of its impeding some individuals from participating as a peer with others in social life. Hence, she proposes a status model of recognition according to which misrecognition is unjust because through it certain individuals or groups “are denied the status of full partners in social interaction simply as a consequence of institutionalized patterns of cultural value in whose construction they have not equally participated and which disparage their distinctive characteristics or the distinctive characteristics assigned to them.”57 Fraser’s conception of justice is perspectivally dualist, encompassing both misrecognition and maldistribution as analytically distinct but practically entwined forms of injustice,58 and normatively monistic, inasmuch as it brings both types of injustice under the measure of a single normative standard. This standard, which Fraser labels the principle of parity of participation, she defines as follows: “according to this norm, justice requires social arrangements that permit all (adult) members of society to interact with one another as peers.”59

In his reply to Fraser, Honneth underscores three aims of his recognition-based approach to critical theory. First, his approach roots critical theory in a phenomenology of the experience of injustice, as opposed to tying it to the aims and self-understandings of social movements, as does Fraser.60 Second,
third generation critical theory

contra Fraser, Honneth maintains that his recognition theory can do justice to distributional injustices, for even these “must be understood as the institutional expression of social disrespect.” On Honneth’s view, then, “distribution conflicts” are understood as “a specific kind of struggle for recognition in which the appropriate evaluation of the social contributions of individuals or groups is contested.” Third, and finally, Honneth sees the major conceptual issue as how to normatively ground critical theoretical demands for justice. Whereas Fraser attempts to ground these deontologically in her principle of parity of participation, Honneth insists that they must be grounded teleologically in a (formal) conception of the good life.

Hence, the Fraser–Honneth debate raises but leaves unresolved a number of serious questions for critical theory. What is the best pretheoretical reference point for critical theory: social movements or the subjective experience of injustice? Which is better, a dualistic or monistic framework for conceptualizing injustice? Finally, in an echo of Hegel’s critique of Kant, which should critical theory take to be prior, the right or the good? Third and subsequent generations of critical theorists continue to grapple with these and related issues in an attempt to make sense of the social, cultural and political landscape of the early twenty-first century.

V. EMERGING TRENDS IN CRITICAL THEORY:
COSMOPOLITANISM AND GLOBAL JUSTICE

However, as Fraser has argued in her more recent work, the categories of recognition and redistribution may well be insufficient to conceptualize the political conditions of an increasingly globalized, post-Westphalian world. Picking up

---

demands of social movements. For further comment on the role of social movements in Fraser’s critical theory, see Fraser and Honneth, *Redistribution or Recognition?*, 11–16.

63. For Fraser’s argument to this effect, see *ibid.*, 26–48.

64. For insightful discussion of these and other sticking points in the debate, see McCarthy’s review of *Redistribution or Recognition?*, and Christopher Zurn, “Identity or Status? Struggles over ‘Recognition’ in Fraser, Honneth, and Taylor,” *Constellations* 10(4) (2003).

65. For Fraser’s critique of Honneth on this point, see Fraser and Honneth, *Redistribution or Recognition?*, 201–11. For Honneth’s reply, see *ibid.*, 238–47. For further discussion of Honneth’s views on this issue, see also “The Social Dynamics of Disrespect,” 77.

66. In her more recent work, Fraser has argued in favor of expanding her framework even further, to encompass the specifically political question of representation alongside issues of recognition and redistribution. She indicates that this move may be necessary in Fraser and Honneth, *Redistribution or Recognition?*, 68. Actually achieving an expansion of this framework is the chief aim of Fraser, *Scales of Justice*. 
where her work on recognition and redistribution left off, Fraser’s recent work expands her formerly two-dimensional framework of justice into a multidimensional one that can accommodate the specifically political dimension of justice (as opposed to the economic or cultural dimensions highlighted by redistribution and recognition, respectively). Fraser’s focus now is on the issue of political representation, specifically, on the metapolitical issues of who counts as a subject of justice and how questions of the frame of justice get decided now that it no longer goes without saying that the bounded nation-state is the proper frame for matters of justice. Her framework now combines “a multidimensional social ontology with normative monism,” still relying on the norm of parity of participation, now construed in both substantive and procedural terms. Staking out a distinctive ground in the vast literature on global justice, Fraser argues for a democratization of the process by which the boundaries of political questions – issues of who is a subject of justice – are determined.

In a similar vein, Benhabib has also turned in her recent work to focus on the issue of cosmopolitan justice. As she argues in her 2004 Tanner Lectures, we are in a period of world history marked by a transition from international to cosmopolitan norms of justice. The former are binding on states or their authorized agents and only as a function of treaties or agreements between states, whereas the latter “accrue to individuals as moral and legal persons in a worldwide civil society.” This situation generates what Benhabib calls the paradox of democratic legitimacy, a paradox that arises at two levels: first, at the level of the intersection between the political sovereignty of bounded territorial states and moral universality of human rights, and second, at a level internal to democracies themselves, given that they “cannot choose the boundaries of their own membership democratically.” Benhabib attempts not to resolve but to mediate or negotiate these paradoxes through her concept of democratic iterations. Drawing inspiration from Derrida’s notion of iterability, Benhabib defines democratic iterations as “linguistic, legal, cultural and political repetitions–in-transformation, invocations that are also revocations. They not only change established understandings but also transform what passes as the valid or established view of an authoritative precedent.” In her recent work, Benhabib analyzes recent clashes over culture (including the French affair du foulard) and citizenship (including recent debates over German citizenship) and shows how, in these cases, the force of democratic iterations have pushed polities in

68. Ibid., ch. 2.
69. Benhabib, Another Cosmopolitanism, 16.
70. Ibid., 35.
71. Ibid., 48.
the direction of expanding the *demos*. She also argues, *contra* communitarians, liberal nationalists, and some advocates of cosmopolitanism, for “moral universalism and cosmopolitan federalism.”

These and related issues of cosmopolitanism and global justice will no doubt be on the agenda of critical theorists for some time to come. The challenge facing critical theorists of the third and subsequent generations is to continue to craft theoretical perspectives that are capable of illuminating the main dangers and possibilities for change in the world that we now inhabit and to do so without relying for normative support on questionable notions such as the working-class subject or the allegedly context-transcendent ideals of the pragmatic presuppositions of discourse. Each of the third generation theorists discussed here has offered a unique and provocative set of answers to this challenge. Whether they are ultimately successful or not will be for future critical theorists to judge, in light of as yet unforeseen and unforeseeable developments of world history.

Axel Honneth

A renaissance in Spinoza studies took place in France at the end of the 1960s, which gave new impetus to the study of Spinoza’s work and continues to have a marked effect on the direction of research in the field today. The effect of this renewed interest and direction did not remain isolated to France but quickly spread across the continent. Although certain of the figures involved in this event have become rather well known in some academic circles, and their work widely read, the details of these developments and the specific texts that contributed to and sustained this new direction in research have remained largely unknown in the English-speaking world. The aim of this essay, therefore, is to provide a survey of this event, to review the background to these developments, to introduce the main protagonists – along with some of the lesser known but equally important figures – and to single out and assess the key texts, their specific focus and their contribution to the new direction in research.

One of the peculiarities of Spinoza’s philosophy is that the history of its reception has passed through a number of phases, from its predominantly “materialist” reception in the seventeenth century, when Spinozism was reputed to be a form of atheism, to its “pantheist” instantiation during the greater part of the nineteenth century, due predominantly to the Spinozism of German Romanticism. After the polemics and condemnations of the nineteenth century, a number of sympathetic engagements with Spinoza’s work began to emerge at the turn of the twentieth century in France that were intent on its explication and on promoting its comprehension. These works, however, developed only selected aspects of Spinoza’s thought, and when examining the Spinozist system as a whole, there was a propensity to revert to traditional criticisms essentially characterized by the Spinozism of German Romanticism and the substantialist metaphysics that
Hegel ascribed to Spinoza. There was, in other words, no attempt to provide a coherent and consistent account of Spinoza’s thought as a whole. After a number of years of inactivity, the 1950s–1960s witnessed a resurgence of interest in Spinoza scholarship, with research developing in several quite different directions. To begin with, there were the seminars and then the publications of both Martial Guéroult (1891–1976) and Ferdinand Alquié (1906–85), each with rather different methods and conclusions that were somewhat opposed.

Guéroult’s rigorous and systematic engagement with the *Ethics* – in his two-volume study *Spinoza I: Dieu* (1968) and *Spinoza II: L’Âme* (1974) – perfected the philological reading of Spinoza. In these works, which were devoted to studying the logical *order of reasons* that structured the system of the *Ethics*, Guéroult undertakes to demonstrate the unity and coherence of Spinoza’s work that earlier readings had missed by systematically explicating Spinoza’s arguments and reconstructing the structure or system internal to the *Ethics*. In the first volume, which discussed part I of the *Ethics*, Guéroult demonstrates the objective nature of the relation between the attributes, that is, that the attributes are really distinct from one another and yet unified as attributes of the one substance. In the second volume, which discussed part II, he explicates the deduction that necessarily proceeds from the adequate knowledge of the formal essence of the attributes to the adequate knowledge of the essence of things and thereby realizes the third kind of knowledge as it will be later defined in the *Ethics*. The critical analysis of parts I and II only touch on the broader themes of Spinoza’s metaphysics, physics, and theory of knowledge, because Guéroult is primarily concerned with examining the foundations of the *Ethics*. These themes, which are developed in the three other parts of the *Ethics*, were to be the object of a projected third and final volume on parts III–V of the *Ethics*, but Guéroult died shortly after beginning work on it.

In *Le Rationalisme de Spinoza*, Alquié examines the genesis of the system of Spinoza’s *Ethics*. His main objective is to determine whether or not Spinoza’s system lives up to its ambitions to found and justify a rationalism that is absolute. Alquié methodically demonstrates that the concepts of most importance to Spinoza are “effectively unthinkable.” One of the limitations of Alquié’s work is that his examination of Spinozist concepts is conducted from the point of view of Cartesian ideas, but this was not a limitation that Spinoza accepted. Alquié’s work therefore raises the question of how or from what point of view can Spinoza be read such that Spinozist ideas are rendered “thinkable.” It is

1. Alquié’s lectures on Spinoza at the Sorbonne during the years 1958–59 have recently been published; see Ferdinand Alquié, *Leçons sur Spinoza* (Paris: La Table ronde, 2003).
this problematic that will orient future research in Spinoza studies, and this is exemplified by the marked departure by the next generation of scholars from the Cartesian reading of Spinoza exemplified by Alquié, as they draw inspiration instead from the work of Guéroult.

Another important source of inspiration that contributed to enrich this renewal in Spinoza studies were the seminars and the work of Louis Althusser (1918–90). Althusser’s work, marked by a form of structuralism that can be compared to Guéroult, valued the importance of political thought in philosophy. In Essays in Self-Criticism, Althusser notes that his Spinozism was often mistaken for a form of structuralism. Although Althusser actually cites the importance of Spinoza to his own project in political philosophy and repeatedly draws attention to the importance of Spinoza’s philosophy for Marxism, he himself wrote very little on Spinoza. When he did, Spinoza was cast as an important figure in Althusser’s project of freeing Marxism from Hegelian idealism. The recourse to Spinoza made possible a radical critique of historicism, including Hegelianism. However this did not amount to a critique of Hegelianism per se. In France, from the 1960s on, it is from this perspective of an anti-Hegelianism, more or less generalized, that Spinoza is first brought on to the scene.

The generation of thinkers that followed Althusser, despite their own developments leading them in directions not entirely compatible with his thought, adopted the imperative of valuing political thought. One of the main characteristics that distinguishes the resurgence of interest in Spinoza in the 1960s is the attention that is given to Spinoza’s political works – the Tractatus Theologico-Politicus and Tractatus Politicus. As a result of the influence of Althusser, Spinoza’s political texts became another means of addressing some of the issues of coherence and consistency that had troubled commentator’s working on Spinoza’s metaphysics.

The main figures of this renewal in Spinoza scholarship include Alexandre Matheron, Gilles Deleuze, Pierre Macherey, Antonio Negri, Étienne Balibar and Pierre-François Moreau. Each provides a highly original attempt to think through the work and thought of Spinoza focusing on the problem of the relation between Spinoza’s metaphysical and political works. In doing so, these scholars have together irrevocably altered the direction of Spinoza scholarship today. The first generation of scholars, Matheron and Deleuze, independently developed a new ontological interpretation of Spinoza. Matheron’s work, which examines parts III–V of the Ethics, can be seen to complement Guéroult’s

---

unfinished project and to extend it to Spinoza’s political work. Deleuze, on the other hand, develops this ontological interpretation into a new philosophy of power (potentia). The second generation, which includes Balibar, Macherey, and Moreau in France, poses the problem of the movement of immanence, and the fundamental theme of their work is the experience of being. There is also Negri in Italy, who sees in Spinozism the concept of a constitutive thought. Negri makes it his project to develop the political implications of such a thought. The influence of Marxism in these new readings of Spinoza is by no means universal; for example Deleuze’s work on Spinoza is not assimilable to Marxism in any direct way, and nor is Moreau’s more historiographical engagement with Spinoza. There is, however, a consensus about the close relationship between Spinoza’s metaphysics, epistemology, ethics, and political philosophy: so much so that his works themselves are considered to exhibit a remarkable consistency.

A new image of Spinoza is thus affirmed in the wake of the interpretive innovation of Matheron and Deleuze. These texts opened the way to a new set of readings that continued to share a concern to demonstrate the architectonic unity of his major works. The originality of a philosophy of power (potentia) and of its variations has allowed the development of a reading of Spinoza that is no longer solely post-Cartesian, neo-Stoic, or Hegelian. Spinoza now presents a philosophical position articulated between a positive ontology of immanence, a constitutive logic of the imagination, and an affirmative ethics of power (potentia).

In order to further explicate this new image of Spinozism, let us turn to the texts of those responsible for it, beginning with the texts of the first generation of Spinoza scholars in France: Matheron’s Individu et communauté chez Spinoza, published in 1969, and Deleuze’s Spinoza et le problème de l’expression, published in 1968 (although not actually made available until early 1969). Both Matheron and Deleuze cite Guéroult as a major influence on their work. Deleuze argues that:

Guéroult renewed the history of philosophy through a structural-genetic method, which he had developed well before structuralism became fashionable in other disciplines. In Guéroult’s method, a structure is defined by an order of reasons. Reasons are the differential and generative elements of the corresponding system; they are genuine philosophemes that exist only in relation to one another.5

---

Deleuze hailed Guéroult’s work on Spinoza as having made possible for the first time a “genuinely scientific study of Spinozism.”

I. MATHERON

From the methodological point of view, Guéroult’s structural genetic method, particularly as employed in his book on Descartes, also functioned as an ideal model for Matheron. He had initially considered studying Spinoza because of his merit as being a precursor to Marx, but quickly came to realize that it was rather “Marx who has the great merit of being one of the successors of Spinoza in certain fields.” Matheron is one of the first to explore the conjuncture between Spinoza’s metaphysics and his politics, as was suggested by Althusser. He takes Spinoza’s politics seriously, by providing close readings of Spinoza’s political texts, the *Tractatus Theologico-Politicus* and *Tractatus Politicus*.

*Individu et communauté* opens with a definition of *conatus*, and the recognition of its foundational role in Spinoza’s ethics and politics. For Matheron, the *conatus*, or the effort by which an individual strives to persevere in its existence, is the formal element of *any* individual that unifies its material elements and is equated with its power to act. Matheron begins the first chapter with the presentation of the idea of substance as pure activity. Rather than speaking about substance as having an attribute, Matheron speaks about substance as considered from the point of view of an attribute, in order to account for the method followed by Spinoza in the first proposals of the *Ethics*. What follows is that rather than the productivity being a property unfolding from an *a priori* essence of God, Spinoza considers the existence of God, and consequently also his essence, to be genesis and productivity and nothing else. This understanding is supported by both Deleuze and Negri.

In the first part of *Individu et communauté*, Matheron outlines an analogy between the constitution of human individuality and a form of contract characteristic of political systems that he calls the “physical contract.” Drawing on

---

6. Ibid., 155.
10. Ibid., 37–8.
Spinoza’s concept of the *conatus*, Matheron characterizes this analogy according to a principle of self-regulation. For Spinoza, insofar as we act, we preserve our being, and anything that produces effects consequently preserves its being, since the effects that it produces cannot contradict its nature. For example, the free human being, who lives according to reason, endeavors to produce all the effects that follow from their nature as a free human being, and because of this, they tend to preserve their nature as a free human being.

Matheron also considers political systems to be self-regulating systems. The various models of self-regulation are based on the various ways that a mode strives for its preservation. There is a static self-preservation where the identical is reproduced, and there is a dynamic self-preservation where reproduction is achieved each time by rising to a higher level or degree of power (*potentia*). It is the same for individuals: there are those individuals who are preserved in a strict sense, in an identical way, and others who are preserved while developing and by increasing their productivity. Once adequate ideas start to play a predominant role in our mind, it is this second form of self-regulation that is put into play. As far as political systems are concerned, the Hebrew State would be a model of the former (static identity), and the States of the *Tractatus Politicus* – monarchy, aristocracy, democracy – a model of the latter (dynamic identity).

Matheron maintains that the whole domain of ethics could therefore be determined independently of the question of the preservation of identities, and instead in relation to the increase and decrease of the different degrees of an individual’s power (*potentia*) to exist and act that result from their encounters. From the concept of the individual, the central concept that produces creative effects is the principle of the imitation of affects. It belongs to the essence of the human individual to be capable of the imitation of affects and thus of living in interaction with others. It is by means of this imitation of others that human individuals can together form a political individual. The question of the passions, from the point of view of their political productivity, is therefore central to Matheron’s work.

On the basis of the logic of the imitation of affects, Matheron talks about the political productivity of indignation. The subjects of a corrupt sovereign or tyrant would gather against him under the influence of indignation. This would follow a process similar to that of the social contract; however, it would be determined rather by a “physical contract.” Matheron draws on the *Tractatus Politicus* to reconstitute the theoretical genesis of political society independently of a social contract and the rational calculation of utility. Matheron considers the operation of the physical contract by means of the passion of indignation to be possible because, in a hypothetical state of nature, and insofar as men are able to experience indignation, there would never simply be one human being fighting to dominate another, or to steal their possessions. There would always be others
who to some extent would intervene or “meddle in what doesn’t concern them.” According to the logic of the imitation of the affects, they take sides and experience indignation against the adversary. Matheron maintains that ultimately, without any calculation or social contract, an embryonic political society will be formed.

It is, however, necessary not to confuse the affect of indignation and that to which it eventually leads, if the final result is positive. Such a result, which is never guaranteed, always comes from something other than indignation. What is required are positive affects such as enthusiasm for freedom and justice, along with favorable historical and institutional conditions, together with much reflection.11

Once deployed, indignation cannot be extinguished in a society. Matheron characterizes it as a kind of original defect or flaw of political society – the original sin of the state – that can only be neutralized in varying degrees. The constitutions of the Tractatus Politicus attempt to motivate their citizens by positive feelings that limit indignation to the smallest possible role in society. This is achieved by transforming it into an abstracted indignation, directed no longer against specific people, but rather against those who deserve to be punished “in general,” whoever they may be.

Matheron’s reading of Spinoza remains today one of the major references for researchers in Spinoza studies in France. Although those who have recently published works on Spinoza all have rather different theses, they are always within the framework that has been defined by Matheron’s work.

II. DELEUZE

According to the reading of Spinoza that Deleuze12 presents in Expressionism in Philosophy: Spinoza, Spinoza’s philosophy should not be represented as a moment that can be simply subsumed and sublated within the dialectical progression of the history of philosophy, as it is figured by Hegel in the Science of Logic, but rather should be considered as providing an alternative point of view for the development of a philosophy that overcomes Hegelian idealism.13 Indeed, Deleuze demonstrates, by means of Spinoza, that a more complex philosophy antedates Hegel’s, which cannot be supplanted by it. Spinoza therefore becomes a significant figure in Deleuze’s project of renewing the history of philosophy by

13. For a further explication of Hegel’s reading of Spinoza, see the following section on Macherey.
tracing an alternative lineage that challenges the Hegelian concept of the history of philosophy determined by the dialectical logic, and that culminates in the construction of a philosophy of difference. The problem that orients Deleuze's reading of Spinoza is the concept of expression. The first occurrence of the form of the verb *exprimere* that appears in the *Ethics* is in EID6:15 “By God I understand a being absolutely infinite, that is, a substance consisting of an infinity of attributes, of which each one expresses an eternal and infinite essence.” Deleuze argues that, rather than being a definition of substance, Spinoza here begins by characterizing the act of expressing or of being expressed. Deleuze considers Spinoza to have understood and explained expression in terms of the dynamic constitution and production of being, which is what actually constitutes reality.

The strategy of reading the *Ethics* as determined according to the logic of expression marks not only the originality of Deleuze's interpretation of Spinoza, but also one of the points where Deleuze can be considered to depart from the Hegelian and Cartesian Spinoza familiar to Spinoza studies. Rather than reading the philosophy of Spinoza either solely in relation to Descartes, or simply as one stage in the dialectical progression of the history of philosophy, Deleuze traces an alternative lineage in the history of philosophy that expresses the convergence between Spinoza's ontology, the mathematics of Leibniz, specifically his differential calculus, and the metaphysics of Duns Scotus, in particular the concepts of formal distinction, the univocity of being, and individuality. Deleuze does not read Spinoza as a Scotist, but rather, by reading Scotus alongside Spinoza, he examines Spinoza's reformulation of these Scotist concepts in order to develop those aspects of Spinoza's philosophy that are specifically anti-Cartesian. This anti-Cartesian reading of Spinoza provides the framework for the development of a reading of Spinoza that challenges the Hegelian concept of the dialectical progression of the history of philosophy.

Deleuze considers Spinoza's *Ethics* to have given expression to the concept of individuality, whose themes can be found scattered among several other authors

---

15. Spinoza, *Ethics*, I, Definition 6. The following conventional abbreviated notation will be used when referring to Spinoza's *Ethics*: EI for *Ethics*, Part I (roman numerals refer to the parts of the *Ethics*); A for axiom; C for corollary; D for demonstration (or definition if followed by an Arabic numeral); L for lemma; Post. for postulate; P for proposition; S for scholium (Arabic numerals denote the lemma, proposition or scholium number); and, Ap for appendix. Thus EIP8S2 or *Ethics*, I, P8S2 refer to *Ethics*, Part I, Proposition 8, Scholium 2. Citations from the *Ethics* are quoted from *The Collected Works of Spinoza, Volume I*, Edwin M. Curley (trans.) (Princeton, NJ: Princeton University Press, 1985).
of the seventeenth century, most notably Duns Scotus. In relation to the concept of individuality, the Hegelian categories of quantity, quality, and relation, which articulate differences in the distances or dimensions of things (quantity), in their nature (quality), and in their order (relation), are considered by Deleuze to be antedated by the three different dimensions of the individual as presented by Spinoza, namely relation, power (quantity), and mode (quality). The individual is characterized as relation insofar as there is a composition of individuals in relation to one another, or among themselves. Deleuze maintains that it is the highest exercise of the imagination, the point where it inspires understanding, to have bodies or individuals meet according to composable relationships: both the physical composition of bodies and the political constitution of humans. Thus the importance of Spinoza’s theory of common notions, which Deleuze considers to be a cornerstone of the *Ethics*. Deleuze maintains that for Spinoza, to think adequate ideas is not a natural faculty: it is rather a discovery, the product of an encounter. The form of the truth is therefore not given, but is rather obtained by experimentation. It is by means of developing common notions that we gain knowledge. In practice, this involves the experimental organization of ethical encounters: those encounters that allow us to understand the conditions of our knowledge, of our immanent thought. The object of this immanent thought is the body, understood as the product of its engagements with other bodies, ethical or adequate engagements that are experienced as affects, and are expressed by the individual’s power (*potentia*) to act.18

The characterization of the individual as power (*potentia*) indicates the individual’s capacity to compose new relations with other individuals. The concept of *potentia* – translated by the concept of power as force or capacity – is different from that of *potestas* – translated by power in the juridico-political sense of the term19 – insofar as it expresses that which an individual body can do, and which is verified by joy. Composition therefore refers not only to the characteristic relations between individuals, but also to the capacity or potential to create these kinds of relations. With the aid of chapter XVI of Spinoza’s *Tractatus*

19. Guéroult is one of the first to demonstrate the importance of this distinction between *potentia* and *potestas* in Spinoza’s *Ethics*; see Martial Guéroult, *Spinoza I: Dieu (Éthique, I)* (Paris: Aubier-Montaigne, 1968), 387–9. It is later taken up by Antonio Negri, who offers a thorough examination of the social and political implications of this distinction in relation to Spinoza’s work as a whole. I have followed Michael Hardt’s suggestion in the “Translator’s Preface” to Negri’s *The Savage Anomaly: The Power of Spinoza’s Metaphysics and Politics* (Minneapolis, MN: University of Minnesota Press, 1991) to “make the distinction nominally through capitalization, rendering *potestas* as ‘Power’ and *potentia* as ‘power’ and including the Latin terms in brackets where there might be confusion” (*ibid.*, xii).
Theologico-Politicus, Deleuze describes an ethical world where differences in power (potentia) are the sole principle of discrimination.

III. MACHEREY

Pierre Macherey’s Hegel ou Spinoza, which appeared in 1979, is regarded as the definitive text that sets the record straight in regard to Hegel’s reading of Spinoza as presented in The History of Philosophy and The Science of Logic. Macherey maintains that the position that Spinoza is given in the process of the development of philosophical thought by Hegel conditions the very interpretation that Hegel provides of his work.20

The question of whether or not one can find a dialectic operating in the Ethics is one of the defining problematics that Macherey brings to bear on Hegel’s reading of Spinoza. He argues that Hegel transposes the Ethics by using the notions of opposition and contradiction, which are evidently not those of Spinoza, “implicitly making the dialectic, in the Hegelian sense, intervene” in the Spinozist system.21 The simple negation that Hegel locates in the Ethics in this way serves to position the philosophy of Spinoza as one moment in the linear progression of the history of philosophy that is determined according to the Hegelian dialectical logic.22 Macherey considers such a logic to be “manifestly absent” from Spinoza’s work; he suggests rather that “it is Spinoza who constitutes the real alternative to the Hegelian philosophy.”23 What Macherey proposes is “to rethink the dialectic, starting with Spinoza”,24 such a project would require responding to the question of whether or not a concept of historical contradiction free from dialectical negativity is able to be determined in relation to Spinoza.

Hegel argues in The History of Philosophy that, in carrying the Cartesian system to its “furthest logical conclusions,” Spinoza actually sets aside the dualism inherent in that system.25 However, by reducing the attributes to external forms of reflection, of which only two are perceived, Hegel reinstalls in substance “a hidden duality.” “The unity of substance is,” for Hegel, “both resolved and

23. Macherey, Hegel ou Spinoza, 12.
24. Ibid.
undone in the distinction of thought and extension.” This allows Hegel “to rediscover Descartes in Spinoza.” Hegel considers Spinoza to remain constrained by “the same problem of the relation of two distinct entities, between which it is necessary to establish the conditions of an agreement.” “In this sense, Hegel can say that Spinozism is a failed effort to go beyond the limits of Cartesianism.”

Insofar as Hegel’s reading of Spinoza set the tenor of the reception of Spinoza in the shadow of Descartes, it has thereby become one of the most influential interpretations of Spinoza.

This controversy between Hegel and Spinoza turns around the question of whether the attribute, as defined by Spinoza (EID4), is “attributed” to substance by an intellect as a subjective representation, or whether it should rather be considered as belonging to the objective reality of substance. In book two of the Science of Logic, Hegel offers a subjectivist interpretation of EID4. He argues that despite his conception of a unitary absolute substance to which thought is immanent, Spinoza still implicitly appeals to a form of thought that is opposed to any conceivable form of thought found within substance.

Macherey develops an alternative to this Hegelian interpretation, according to which the attributes are understood to be really distinct and the form of understanding implied in this definition, which Hegel construes as an abstract external intellect, can be conceived as an understanding that is immanent to substance. Hegel’s error, Macherey contends, consists in having posed the distinction of the attributes in a relation of opposition. The Spinozist thesis of “an infinity of attributes” (EID6) allows this Hegelian complication to be avoided. Hegel excludes this thesis by retaining only two opposing attributes. The reciprocal irreducibility of the infinite number of infinite attributes, which is the positive expression of infinite substance, is, according to Macherey, “perfectly coherent with their [unity] in substance.” According to Macherey, the attribute belongs to the objective reality of substance, as a positive expression, and therefore as a constitutive form, of substance.

Spinozist thought represents “the positive sign of an anticipated resistance” to the idealism of the Hegelian dialectic. The “true question” that frames Hegel ou Spinoza for Macherey then becomes “what is the limit which separates an idealist dialectic from a materialist dialectic?” Is a Spinozist corrective to the Marxist dialectic, which would consist of a Marxism purged of all Hegelian elements, conceivable? By examining Hegel’s problematic reading of Spinoza, Macherey

29. Ibid.
30. Ibid.
demonstrates that Spinoza eludes the grasp of the dialectical progression of the history of philosophy and thereby restores to the history of philosophy, and also to Marxism, what is valuable in Spinoza as an alternative to Hegel.

IV. NEGRI

The publication of Antonio Negri’s *The Savage Anomaly* in 1981, and of the French translation, which appeared the following year with no less than three separate prefaces by the leading figures in French Spinoza scholarship (Deleuze, Macherey, and Matheron), provoked vigorous debate in Spinozist circles. Negri moves beyond the textual analysis that characterizes the French Spinozists to a consideration of the historical and political context of Spinoza’s philosophical and political writing. Indeed, Negri, more so than his French counterparts, can be seen to pursue the concerns raised by Althusser by developing his hypotheses above all on the terrain of politics.

Negri considers the rediscovery of Spinoza at the end of the 1960s to open a series of fundamental problems associated with the definition of contemporary materialism, which relate to ontology, ethics, and politics. Negri proposes Spinoza as the philosopher of materialism, and by materialism he means the radical operation that allows the analysis of the world according to the real constitution of its power (*potentia*).

In political philosophy, Spinoza is often presented as belonging to the traditional legal lineage, the sovereign line that runs from Hobbes via Rousseau and Kant to Hegel, who give the state a specific dignity and legitimacy by contrasting it with society. This is not the case according to Negri, who recasts Spinoza as representing the linchpin of an antilegalist tradition that begins with Machiavelli and leads to Marx, and is opposed to the hegemony of the tradition of modern political thought. Negri’s thesis is that Spinoza’s theory of state and law is based on the ontological productivity of the multitude as the very agent of politics.

The force of Negri’s work lies in his identification of Spinoza as the first philosopher to see society as “constituted” by the power of the masses or the multitude (*multitudo*). “The *multitudo* is now no longer a negative condition but the positive premise of the self-constitution of right.” Negri maintains that the *multitudo*, a term that rarely appears in the *Tractatus Theologico-Politicus* and only once in the *Ethics*, is absolutely central to Spinoza’s *Tractatus Politicus*. Negri proposes a reading of Spinoza that pits a politics of the multitude against state domination. This culminates in a radically constitutive conception of democracy, which is the expression of the multitude without representation.

Negri argues that Spinoza founds his new concept of human existence on the
dynamic of desire, as an expression of potentia, or natural power, which escapes
the mediation imposed by the artificial order of potestas, which is a Power in
the juridico-political sense of the term. He takes the philological distinction
between potestas and potentia for granted and considers the problem instead as
a philosophical and political issue that affords a new perspective on Spinoza’s
work. Negri seeks to demonstrate how such a Spinozist perspective would afford
a richer understanding of the nature of power (potentia) and thereby provide
new possibilities for contemporary political theory and practice.\textsuperscript{32}

Negri argues that Spinoza’s philosophy can be divided into two parts or
periods, which he calls the first and the second foundations of Spinoza’s meta-
physics. The “first foundation,” which culminates in the first two parts of the
Ethics (I–II), attempts to synthesize the pantheism of the Spinoza circle, what
Negri characterizes as the milieu in which Spinoza’s early work was produced,
by developing a substantialist ontology to its extreme limit. Negri maintains
that this largely conforms to the neo-Platonic utopian idealism that had domi-
nated much of the Renaissance. He argues that it is owing to the limits of
utopian thought that the problems of substantial constitution characteristic of
Spinoza’s first foundation cannot be resolved, except by resorting to idealism
and asceticism.

The break from the first foundation is effected by the Tractatus Theologico-
Politicus, which Negri considers to play an extraordinarily important role in
the history of the development of Spinoza’s thought. Spinoza interrupted the
composition of the Ethics in 1665, and began work on the Theologico-Political
Treatise (1670) before returning to complete the Ethics between 1670 and 1675.
The Tractatus Theologico-Politicus exhibits a tension between a juridical ideology
of the social contract and a recognition of the power (potentia) (and simultane-
ously the right) of the multitude. Negri maintains that in the final chapters of
the Tractatus Theologico-Politicus, Spinoza makes the decisive move in rejecting
the utopia of ideal and substantial constitution and abandoning the problem of
the dialectical mediation of the social contract, in order to reorient his work
towards a conception of ontological “constitution” or of a physical and dynamic
“composition.” This move in Spinoza’s work completely renews the question of
the relation between the individual and the community.

The structural feature of the system of the Ethics that Negri identifies as deter-
mining the separation of the first two parts of the Ethics (I–II) from the last
three parts (III–V), and therefore of the first from the second foundation, is the
role of the attributes in Spinoza’s thought. Negri makes the same interpretation
of the attributes as Hegel. However, in doing so, they each come to opposing

\textsuperscript{32} Ibid., xii.
conclusions about the role of the attributes in Spinoza’s thought. Rather than concluding that this amounts to the insufficiency of the Spinozist point of view of philosophy, as Hegel does, Negri identifies the doctrine of the attributes with the first foundation, and argues that the tensions in the *Tractatus Theologico-Politicus* led to the necessity of overcoming this point of view. He maintains that the attributes start to resemble simple irrelevant contours within the framework of Spinoza’s ontology. Negri dismisses the real, objective explication of the notion of attribute, and opts instead for their removal from the system entirely. By doing so, Negri splits the Spinozist perspective in two: into a purely intellectual, ascetic project (corresponding to the first foundation) on the one hand, and a materialist project (corresponding to the second foundation) on the other. Dividing Spinoza’s major work in two in this way is considered to be a highly controversial move among scholars working in the field of Spinoza studies.\(^{33}\)

This hypothesis, however, is necessary in order for Negri to be able to characterize Spinoza as a materialist. In several later essays, Negri acknowledges that the distinction between the first and second foundations of Spinoza’s metaphysics in the *Savage Anomaly* was overstated, but he nevertheless maintains it as an operative distinction in his own work.\(^{34}\)

The philosophical tensions in the *Tractatus Theologico-Politicus* – the problem of mediation, both in the doctrine of the attributes and of the contract – find their resolution in the materialism of the mature Spinoza (parts III–V of the *Ethics*, together with the unfinished *Tractatus Politicus*), which Negri considers to be a revolutionary materialism based on the constitutive power of the multitude. Negri characterizes the metaphysics of Spinoza’s second foundation as a dynamic transformative ontology, which is “founded on the spontaneity of needs and organized by the collective imagination.”\(^{35}\)

With these arguments Negri hopes to have demonstrated the central role of politics in Spinoza’s philosophy. Indeed he maintains that Spinoza’s thought is an example of how politics intervenes “in” philosophy, that is, from the interior, as distinct from “on” philosophy, from the outside. The enduring point that Negri picks up from the French Spinozists and develops to its logical extreme is that the *Ethics*, despite its manifest content, is already inhabited by a political preoccupation, even if this remains relatively unspoken. This preoccupation, he maintains, allows it to overcome the limits imposed by its initial problematic.

---

In *Spinoza and Politics*, Balibar continues the line of investigation established by his recent colleagues in French Spinoza studies, advocating the inseparability of Spinoza’s metaphysics from his politics. However, Balibar begins with Spinoza’s political works and from this starting-point aims to produce a coherent account of Spinoza’s work as a whole. The result is a more rigorous engagement with the Althusserian problematic of the conjuncture between Spinoza’s metaphysics and his politics. Like Negri, he maintains that each of Spinoza’s texts should be understood as engagements with specific historical, political, and philosophical developments. However, Balibar investigates in far greater detail than earlier commentators the political and historical developments of the Dutch Republic in the latter half of the seventeenth century. He characterizes Spinoza’s political works as a working through of the conflicts constitutive of liberal political theory. He argues that “the TTP could be seen as one great negative argument, a *reductio ad absurdum*.”

36 In the *Tractatus Theologico-Politicus*, Spinoza announces that right is coextensive with power (*potentia*), and that “if the rights-powers of individuals do not combine harmoniously, civil society will be destroyed.” Balibar argues that this is “why men most often establish and respect rules by which their individual powers are combined.”

The most effective rule is that specified in the *Tractatus Theologico-Politicus*, which advocates the total freedom of expression, limited only (but rigorously) by the need to guarantee obedience to the law (TTP: XX). The problem of the *Tractatus Theologico-Politicus* is how to establish a state that can take advantage of the whole active potential of all its citizens, while at the same time securing their freedom of thought, the only one of their rights that Spinoza considers to be inalienable.

For Balibar, as a result of the political developments in the Netherlands after 1672, Spinoza’s interest in the problem of freedom in the *Tractatus Theologico-Politicus* is attenuated in favor of the problem of security in the *Tractatus Politicus*. Balibar argues that this is reflected in the latter parts of the *Ethics*, by the tension between the affective, or passional, and the rational grounds for “sociability” (EIVP37D). As Balibar argues, reason, for Spinoza, does not need to master or transcend the affects or emotions in order to be effective. Instead, the traditional opposition between reason and the emotions is displaced by Spinoza with the difference between active and passive affects. While active affects increase the power of the body to act and simultaneously the power of

---

37. Ibid.
38. Ibid.
the mind to think, passive affects or passions diminish our power to think and to act. The struggle to increase our power to act, “far from pitting us against [other] individuals, as if power were a possession to be fought over, leads us to unite with them to increase our power.”39 This marks the emergence of the multitude or mass on the political stage. It is in the *Tractatus Politicus* that Spinoza takes his postulates concerning power in the *Tractatus Theologico-Politicus* to their logical conclusions. In the *Tractatus Politicus*, the idea of a social contract is no longer one of the foundations of the state. In its place Spinoza offers a description of the process by which individuals with their natural right, that is, their power (*potentia*), come together to create “a collective individual, that is, the State as an individual of individuals.”40 Balibar maintains that “this collective individual has a ‘body,’ which is produced by the combination of the bodies of each and every one” of the individuals of which it is composed. And, in conformity with Spinoza’s metaphysics, he insists the there is an *idea* of this body. This idea is the representation of the body either in the imagination, as “the expression of the collective passions,” or in reason, as “the condition of effective decision (that is, government).”41

The inquiry into the conditions of freedom in *Tractatus Theologico-Politicus* is extended in the *Tractatus Politicus* to the question of how it can be guaranteed under different types of political regime. The security of the citizens of a state from internal conflict, which Spinoza considers to be the greatest threat to the body politic, is guaranteed only “when it is able to constitute itself as a stable individuality.”42 If these conditions are met, then the state can be characterized as “the collective author of every individual action that is in conformity with the law.”43

Unlike Negri, who focuses on the positive, affirmative aspects of the multitude, Balibar insists on the aporetic character of Spinoza’s reflections on the multitude, which he describes as a “mass”:

> How can consensus be produced since the matter of politics is not constituted of isolated individuals but of a *mass*, whose most frequent passion is fear, and to whom everyone belongs, rulers and ruled alike? For a mass, in this sense is a fearful thing, not only to those who govern, but even to itself.44

41. *Ibid*.
Balibar emphasizes that there is a despairing gap between a mass ideally free and reasonable, and a really ignorant and “terrible crowd, when without fear” (TP: VII, 27). The point for Balibar is that the mass does not have an atemporal essence in Spinoza; it rather is a variable power (*potentia multitudinis*), an always unfinished process. Balibar also maintains that the mass behaves as a crowd within a precise institutional framework. The collective response to natural affects that are not easily avoidable are determined by social structures or institutions that use it to establish their own operations of Power (*potestas*).

For Balibar, then, the political question in Spinoza’s work is: which institutions reduce men to being only masses, crowds? The response is that, in theory, every type of regime can have this effect. While Spinoza does assert that an effective democracy would be “the most stable” state, that is, would combine the greatest possible freedom and equality with the greatest possible security, he fails to demonstrate this assertion, because the *Tractatus Politicus* remains unfinished. Balibar maintains that rather than attempting to complete Spinoza’s theory of democracy, the conclusion that we should draw from the state of the unfinished *Tractatus Politicus* should rather be that Spinoza has provided a “theory of democratization that is valid for every regime.”

**VI. MOREAU**

Moreau also considers Spinoza’s works to exhibit a remarkable consistency, and in *Spinoza: L’Expérience et l’éternité*, he aims to demonstrate the systematic unity of Spinoza’s thought. However, rather than beginning with Spinoza’s political work, Moreau turns to the enigmatic fifth part of the *Ethics*. Moreau constructs his reading of Spinoza around the scholium of E V P23, where Spinoza claims that “we feel and know by experience that we are eternal.” Moreau considers this claim to bring together all the difficulties of interpretation of the fifth part of the *Ethics*, and to be the key to the relation between the *Ethics* and all of Spinoza’s other work. Moreau claims that this scholium, and a similar passage from Spinoza’s correspondence with Simon de Vries, indicates that experience has an essential role to play in Spinoza’s thought. Moreau maintains that this notion of experience has been neglected by scholars working in the field of Spinoza studies, as a result of it either being reduced to scientific experimentation, or marginalized along with, and as a necessary component of, imagination and error. Habitually, the logic of Spinoza’s absolute rationalism is reduced to the geometrical method, which is solely represented as a deductive demonstration.

In *Spinoza: L’Expérience et l’éternité*, Moreau proposes to reevaluate the status of experience in Spinoza’s thought.

*Experientia* is not opposed to reason; it is rather the mode of intervention of reason in the fields where reason does not have direct access. It is one of the principle forms of accounting for reality. It is also an essential means for understanding Spinoza’s reflections on language, “our relation to words and to texts, to the passions, to the figure of the State, to circumstantial events, and to the historical destiny of the unforeseen or unexpected.” Moreau engages with the often neglected problem of Spinoza’s epistemology, that is, the problem of conceptualizing inadequate, or, as Spinoza also describes them, partial ideas, and the role they play in the development of adequate ideas of reason. Experience is thus not foreign or extrinsic to Spinoza’s rationalism, but informs our relationship with the world, albeit under the guidance of reason.

One of the concepts that Moreau develops in his analysis is that of the *ingenium*, which is the collective term for the complex of passions of an individual. Each individual is dominated by a particular passion which is determined by its biographical and environmental context, and is therefore different for each individual. It accounts for why, despite all individual human beings being equal, they have diverse capacities both for knowledge and for practical activity. Moreau applies this criterion of the *ingenium* not only at the level of the individual, but also at the collective level. He considers the *ingenium* to mark the point of difference between a singular individual and a community. *Ingenia* vary not only from one individual to another, but also from one society to another, and throughout history. Moreau maintains that it is possible to think the individuality of a people in order to understand the form taken by its legislation. The laws of each state are adapted to the *ingenium* of its people. The *ingenium* therefore contributes to define the proper figure of the state.

While Spinoza does not develop a theory of the *ingenium*, he does mention in passing the traits characteristic of the *ingenium* of the Romans, the Greeks, and the ancient nations, including the Hebrews, Egyptians, and Babylonians respectively. By attributing an *ingenium* to each people, Moreau follows the suggestion of the *Tractatus Theologico-Politicus* and provides a history of the constitution of different legislations by analyzing the relations between the *ingenia* of each people and their systems of law.

---

Since 1968, Guéroult’s philological renewal of the history of philosophy, together with the renewed importance of Spinoza’s political thought, have simultaneously contributed to enrich the resurgence of interest and productivity in Spinoza studies. The Spinoza that is engaged with in the field of Spinoza studies today is no longer solely post-Cartesian, Hegelian, or that of the German Romantics, but also the new ontological interpretation of Spinoza instigated by Matheron and Deleuze. All Spinozist research, in its great diversity, has developed since then in the wake of this interpretive innovation, particularly in France and Italy, but also in Germany and the United States. Spinoza’s metaphysics, which had traditionally been the major focus of Spinoza studies, while not being relinquished, has since been displaced by interest in Spinoza’s ethics and politics, and by attempts to provide systematic readings of Spinoza’s work as a whole, including his political work. This new work on Spinoza’s political philosophy is testament to the ongoing resonance of French Spinozism and continues to provide new possibilities for engaging with debates in ethical and political philosophy, both from the point of view of the history of philosophy, and from the point of view of contributing to contemporary ethical and political thought.

**MAJOR WORKS**

---

47. See, for example, the work of Moira Gatens, Warren Montag, and François Zourabichvili. In *Collective Imagining: Spinoza, Past and Present* (London: Routledge, 1999), Gatens and Genevieve Lloyd reconsider the role of the imagination, as developed in the *Ethics*, both historically and from a contemporary political point of view. The book demonstrates how an appreciation of Spinoza’s philosophy can form the basis of a constructive but critical engagement with contemporary concerns. See also Gatens, *Imaginary Bodies: Ethics, Power and Corporeality* (New York: Routledge, 1996). In *Bodies, Masses, Power: Spinoza and his Contemporaries* (New York: Verso, 1999), Montag makes a contribution to the ongoing discussion of radical democracy by drawing on Althusser’s remarks about the connection between the theory of ideology and Spinoza’s philosophy, as well as the work on Spinoza by Negri, Balibar, and Macherey, to formulate the core problem of his analysis: that there can be no liberation of the mind without a liberation of the body, and, therefore, that there can be no liberation of the individual without collective liberation. Montag thereby extends Spinoza’s materialism in an attempt to characterize the affect of joy as a force of action that leads toward individual liberation. In *Le Conservatisisme paradoxal de Spinoza: Enfance et royauté* (Paris: Presses Universitaires de France, 2002), Zourabichvili undertakes a systematic explication of Spinoza’s theory of relations, centered on the much-debated question of the transformation of modes; and in *Spinoza, une physique de la pensée* (Paris: Presses Universitaires de France, 2002), he undertakes to analyze a “physics of thought” in the philosophy of Spinoza by determining the features of the laws of thought which are the correlates of the laws of bodies.

The term “radical democracy” refers to new ways of thinking about democratic politics beyond essentialist foundations. Radical democrats question not only existing liberal democratic institutions, but also the idea of essential universal foundations on which democracy could be based. Inspired by poststructuralist theories of language and identity, and by poststructuralists such as Michel Foucault, Jacques Derrida, and Jacques Lacan, a number of thinkers have attempted to rethink democracy along radical lines from about 1980 onward. These radical democrats include, among others, Ernesto Laclau, Chantal Mouffe, William E. Connolly, and Slavoj Žižek. Inspired by poststructuralist theories of language and identity, these authors have sought to rethink what radical politics means after poststructuralism.¹

What, then, is radical democracy, and what is radical about it? We can think of the “radical” of radical democracy in two related ways. First, we may note the etymological root of the word, namely the Latin “radix,” root. The radical, then, pertains to the root, to what is fundamental. If we are to think of radical democracy as aiming at the roots and the foundations of democracy, the idea is not to provide a new foundation for democracy, for instance by showing that past and present foundations (natural rights, utility, species being, and so on)

are inadequate and need to be substituted with a new and better foundation (say, rational discourse). That is, the aim is not to root democracy more firmly. Rather, the radical of radical democracy refers to the questioning of foundations. Thus, the question becomes what democracy looks like without foundations, without being rooted in something universal and ahistorical. If radical today also has the connotation of extreme, then the extremism of radical democracy is to push beyond any foundation. If this is how we understand the radical of radical democracy, then the question “What is radical democracy?” cannot be answered with reference to a foundation, root, or essence. This does not mean that there are no roots, only that those roots are contingent and, thus, contestable. Contestation of roots and foundations is central to radical democracy, but these contestations will always be partial and local.

There is a second, related sense of radical. When talking about politics or democracy, radical often implies transcending the present state of imperfectness of democracy. Thus radical politics becomes associated with a revolutionary politics that will take us to the other side, to a perfect democracy and society, as for instance in certain Marxist accounts of the communist revolution and society. Here radicalism would be the solution – once and for all – to the problems of democracy today (alienation, inequality, and so on). The radical of radical democracy does not imply this, however. This does not mean that we should accept the present state of things, or that only incremental changes are possible, changes that do not interfere with the very framework governing contemporary capitalist and liberal societies. That framework is also at stake with radical democracy, but transcending that framework will not necessarily have the form of a revolution, and radical democracy cannot guarantee that all alienation, inequality, and disagreement will disappear.

On the contrary, radical democrats hold that these issues will not simply disappear with the introduction of radical democracy. Radical democracy will itself involve exclusions and inequalities of various sorts. More fundamentally, we can think of radical democracy with a Derridean phrase as only possible as impossible. This means that radical democracy is not a regime with a set of institutions, procedures, and practices that can be realized. It cannot – with another phrase from Jacques Derrida – be present, even as a future present. It is, and will remain, “to come.” Radical democracy is not possible in the sense that it can be known or realized; it is only possible as impossible, that is, as incomplete and imperfect – in short, as “to come.”

We can link this back to the first sense of radical as having no foundation. The question “What is radical democracy?” is an essential part of radical democracy.

---

Radical democracy

Not only are there de facto theoretical and empirical disputes over what radical democracy means and implies, but radical democracy is constituted by dispute and disagreement. If “What is radical democracy?” is part of the essence of radical democracy, then answers to the question “What is radical democracy?” can be only partial and provisional and can never be exhaustive. Thus, we can never rest content that now we know what it is, or now we have implemented it or even with the thought that we will someday realize radical democracy or know what it is. It is in this sense that radical democracy is possible only as impossible, as never present but always “to come.” Thus, radical democracy is difficult – even impossible – to define, even if this is also what I have just tried to do. This difficulty is reflected in the problems others have with radical democracy: it appears elusive, and it is not always clear what is radical about it.3

In the following, I shed more light on radical democracy, first by situating radical democracy in relation to poststructuralism and then in relation to competing approaches within contemporary political philosophy. Subsequently I look at two representatives of radical democratic thought – Laclau and Connolly – and I try to tease out some of the differences between different theorists of radical democracy. I conclude with some remarks on the future of radical democratic thought.

I. POSTSTRUCTURALIST THEORIES OF RADICAL DEMOCRACY AND EARLIER RADICAL APPROACHES TO DEMOCRACY

The points raised above about the nature of the radicalism of radical democracy helps us to understand the differences between poststructuralist approaches to radical democracy (the topic of this chapter) and earlier approaches to radical democracy. In the eighteenth century, Jean-Jacques Rousseau criticized representative democracy – a critique echoed by republicans – in the name of an ideal of direct democracy, where the General Will rules. While radical democrats are sympathetic to the Rousseauian critique of liberal democracy for not addressing deeper issues of inequality and for the lack of a theory of community in liberal theory, they nonetheless have problems with Rousseau’s account of democracy.

They object, first, to the ideal of a pure or perfect democracy with no division and to the ideal of a self-transparent and self-identical demos; these ideals, which are summed up in the Rousseauian General Will, are potentially dangerous, they argue. Second, they object to the very possibility that a new citizen and a new form of citizenship will solve the problems of modern society

once and for all. Together these two points can be expressed as an objection to what Derrida calls the metaphysics of presence: for Rousseau, the people is identical to itself when (literally) coming together and speaking in the name of itself. The will of the people is present, and the people is One. This is why Derrida and Laclau have argued that representation, rather than the presence of the people, is constitutive.4

Similarly, poststructuralist radical democrats distinguish themselves from another earlier radical democrat: Karl Marx. Marx criticized the superficiality of liberal citizenship rights as well as the liberal idea of the disembodied, property-owning individual who stands opposed to other, similar individuals. This critique was carried out in the name of a critical ideal of species being and in the name of a teleological conception of history, of which the communist society was supposed to be the end point realizing human emancipation.

Radical democrats are equally critical of a certain superficiality of liberal democracy, especially the ways in which liberal citizenship abstracts from socioeconomic inequalities and from gender, ethnicity, and so on, while at the same time reproducing inequalities and relations of domination. What is problematic in Marxism, however, is the view that all alienation and inequality can be overcome through a revolution of the present. In addition, radical democrats are skeptical of the foundation of the Marxist argument in a conception of human essence, in a teleological History and in the reduction of identity, consciousness, ideology, and the state to economic and class relations. Thus, radical democrats are critical of the radicalism of Marxist radical democracy in the two senses delineated above: the search for new foundations and the view that alienation and inequality can be transcended. Laclau and Mouffe sum up this part of their radical democratic and post-Marxist objection to Marxism in the following way:

What is now in crisis is a whole conception of socialism, which rests upon the ontological centrality of the working class, upon the role of Revolution, with a capital “r”, as the founding moment in the transition from one type of society to another, and upon the illusory prospect of a perfectly unitary and homogeneous collective that will render pointless the moment of politics.5

Finally, radical democrats are critical of the Marxist view of politics and democracy as superficial, that is, as merely secondary to and derived from the

---

economic base. For radical democrats, politics and democracy are important in their own right. Indeed, they argue that politics is constitutive, and they think of politics not as a regional category (as opposed to the economy, for instance), but as the very moment of the institution of the social (including the economy and what we usually refer to as politics: political institutions, identities, and behavior). It is in this sense that we can also say that representation is constitutive. That is, for radical democrats, politics is not a reflection of something more fundamental (and present); rather, the political refers to the moments in which sociopolitical institutions and practices are instituted or challenged. If there are roots, they are not prior to politics, but instituted – and challenged – by politics.

II. THE HISTORICAL BACKGROUND TO THE EMERGENCE OF RADICAL DEMOCRACY

The radical democratic critique of earlier radical approaches must also be seen against the background of events and developments at the end of the twentieth century. From the 1960s onwards, new social movements and struggles over identity gained increasing importance within mainstream politics. The civil rights movement, the student protests and the protests against the Vietnam War as well as the women’s movement, the environmental movement, and the anti-nuclear protests all challenged the Marxist emphasis on class as the organizing principle of revolutionary consciousness and emancipatory struggles. Class gradually lost its empirical importance as well as its theoretical centrality to the diagnosis of, and solution to, the problems of contemporary capitalist society. In this light, the question became how to think emancipation without tying it to class. This is another sense in which poststructuralist radical democrats are also often post-Marxists.

Another problem faced by Marxists at the end of the twentieth century was the nonappearance of the revolution despite the developed character of capitalism in the West. In fact, the late 1970s and the 1980s saw the emergent hegemony of neoliberalism personified by Ronald Reagan and Margaret Thatcher. Again, radicals were faced by the question of strategy in the face of neoliberal hegemony and the inadequacy of Marxist analyses and strategies.

Finally, the fall of the Soviet bloc and “real existing socialism” reflected the hegemony of capitalism and liberal democracy and a general sense of “the end of history.”6 Again, this was no doubt an important event in terms of rethinking the strategy of the Left, although it must be remembered that most of the Left

---

had already broken with Soviet-style communism after Stalinism and the Soviet invasions of Hungary and Czechoslovakia in 1956 and 1968 respectively. The fall of Soviet communism was, of course, not the end of history, but instead introduced a new period with new challenges that required both theoretical and political responses: the emergence of nationalism and xenophobia in Europe and beyond, the rise of religious fundamentalism, the question of the European Union, globalization and the alter-globalization movements, and so on. As Laclau and Mouffe write: “To reread Marxist theory in the light of contemporary problems necessarily involves deconstructing the central categories of that theory.”

III. THE POSTSTRUCTURALIST INFLUENCE: IDENTITY, LANGUAGE, AND UNIVERSALITY

The poststructuralist conceptions of language, meaning, and identity have been central to the development of new theories of radical democracy. Given the radical democratic critique of the status and centrality of class as a category, this is a useful starting-point for explaining the poststructuralist influence on radical democracy.

For radical democrats, identity is not the reflection of an essence, for instance one’s class position. Class is not a transcendental signified that holds together a set of otherwise disparate identities that can be anchored in an analysis of their class position within the relations of production. Here we can think of identity in terms of the Saussurean sign and the poststructuralist deconstruction of it. Meaning and identity are constituted through relations of difference between signs (or rather, signifiers). That is, we should understand identities not as self-contained, but as relational and constituted through relations to others rather than reflections of an underlying essence or structure.

Identity is constituted within the web of signification, and as such we might think of identity as the effect of the system of differences. However, this comes with the important (post-structuralist) qualification that the structure of the differential relations is never closed or sutured; rather, it is inherently unstable and open to change through the de- and resignification of the signifiers. In other words, the system of differences is marked by some undecidability. For instance, if identity is constituted through relations of difference, we may ask how the system of differences as a whole and the limits of the system are constituted. The answer to that question is undecidable because the whole and its limits would have to be signified by something at once the whole and part of the whole, and

7. Laclau and Mouffe, Hegemony and Socialist Strategy, ix.
at once inside and outside the system. Given that the whole is involved in the signification of each part, every particular identity is marked by this undecidability. Hence, any identity is partly fluid.

Theorists of radical democracy think of identity and the subject in nonessentialist terms. Identities are inherently unstable, although they may have become more or less naturalized. Indeed, we may think about identity not as identity—that is, as something stable and achieved—but as continuous identifications that “fail” in the sense that they never become stable and self-contained.

We do not have simple pluralism in the sense of dispersed identities, nor do we have a simple plurality of identities as if each one of us were the aggregate of more than one identity. This pluralism is a fact of social life, but there is more to identity than this. No identity—even as the aggregate of different identities—is ever One. Identity is always subverted, for instance by a lack (Lacan and Laclau) or by the fact that they are constituted in flows of materiality that cannot be arrested (Deleuze and Connolly).

As a result, radical democrats focus on processes of identification and subjectivation: Which subjects are formed and how? How do these subjects relate to other subjects? What are the implications for citizenship of the ways in which subjects are formed? And so forth. A good example is Connolly’s work on pluralism. Connolly talks about processes of pluralization—rather than simple pluralism—to refer to the ways in which identities are constantly being created and undone, processes Connolly believes that we must actively encourage through, among other things, agonistic respect.8

At this point, it is useful to return to the very beginning of the essay. I argued that one aspect of the radicalism of radical democracy is that it does not claim that radical democracy has an essence. That is, the question “What is radical democracy?” is part and parcel of radical democracy, and this will subvert any definition of it from within. We can connect this to the poststructuralist conception of meaning. Radical democracy—what it “is” and means—is not the reflection of some underlying structure of history or essence of man. Rather, radical democracy must be seen in relation to other forms of democracy and other regimes, and it is not one thing at all times; it is an essential part of radical democracy that it can be contested and resignified.

Poststructuralists talk a lot about language, and poststructuralism is part of the linguistic turn in philosophy.9 However, it is important to make two points here with implications for radical democracy. First, structures are never
entirely open and undetermined. We can talk of partly sedimented structures or discourses. Identities, for instance, can be de- and resignified, but they must be partly determined and fixed in order for us to be able to talk about identities in the first place. Similarly with meaning and society: complete plasticity is impossible, and there must be some fixation of meaning and of structures, for instance a partial determination of what citizenship means. The important questions are, then, what determinations dominate, and how we relate to them. Second, it is important to note that poststructuralists and radical democrats are not idealists. Rather, they treat the social as consisting of meaningful practices (texts in Derrida’s terminology and discourses in Laclau’s terminology). Radical democracy, then, also concerns what we usually think of as “material,” especially the economic sphere, and it is not limited to the creation of new forms of identities (which of course have their own materiality).

On the basis of poststructuralist arguments, radical democrats eschew any form of essentialism and foundationalism. We may add that they are skeptical of grand narratives, to use Jean-François Lyotard’s phrase. For instance, radical democrats are skeptical of the Marxist grand narrative of emancipation and its links to essentialism and teleology; and they are skeptical of the Enlightenment grand narrative of Man, for instance the way it is expressed in the notion of human rights based on human nature. However, this does not stop radical democrats from talking about emancipation, human rights, and other “universals,” although they have a different understanding of these. For instance, they think of emancipation – like democracy – as possible only as impossible. That is, we never achieve full emancipation (and autonomy, nonalienation, and so on), and emancipation is not a critical ideal, not even a counterfactual ideal. Rather, we have continuous emancipations in the plural as continual processes of becoming rather than fixed states of being.

With Judith Butler and Laclau, we can say that, for radical democrats, universals such as emancipation are the result of contingent significations. They are not ahistorical or simply handed down to us as given, and therefore the task is to do genealogies of their conditions of emergence and to resignify them in new ways. For radical democrats, this resignification of universals must of course take place without founding them again in a new essence, teleology, and so on – in short, a new radix, root. Importantly, while radical democrats argue

11. Laclau, Emancipation(s), ch. 1.
that universals are open to resignification, there is no guarantee that it will be a progressive, leftist resignification that will be the dominant one.

IV. RADICAL DEMOCRACY AND CONTEMPORARY DEMOCRATIC THEORY

Radical democrats often distinguish their position through a critique of contemporary liberalism, for instance John Rawls’s political liberalism. Like Marxists and republicans, radical democrats are critical of the liberal notion of the subject and, by implication, the liberal conception of the citizen.13

For radical democrats, one of the problems with the liberal subject is that it is a disembedded and disembodied individual, a kind of abstract individual outside historical and socioeconomic context and without a (gendered, racial, etc.) body. Liberals thereby overlook the ways in which subjects are constituted in the first place. In addition, they reify a certain kind of subject because the liberal subject is not just something shared by all subjects, abstracting from their particularities (as a thin notion of human nature, for instance); rather, the liberal subject is a particular kind of subject, historically associated with certain experiences and constituencies (the property-owning male, for instance).

Another criticism of the liberal subject concerns the rationality of the subject. First of all, radical democrats point out that the liberal subject is endowed with a certain kind of rationality, which is linked to the individual nature of the subject. It is the rationality of an individual standing apart from and facing the physical and social world in a relation of instrumental reason. Theorists of radical democracy are critical of rationality more generally, and especially of the grand narrative of Enlightenment reason. This is not just because we are facing a complex world and cannot have knowledge about everything; more fundamentally, on the basis of the poststructuralist critique of the subject and universals, radical democrats argue that reason is unable to establish its own foundations.

These criticisms of the liberal subject can be drawn together as a critique of autonomy understood as rational self-legislation. Radical democrats do not necessarily reject autonomy as a value, but they are critical of a liberal conception of autonomy centered on the atomistic individual. In addition, as is the case with emancipation, we must think of autonomy as possible only as impossible, that is, as always implicated with some heteronomy because it cannot establish

its own foundations and conditions of possibility. Again we see how the rejection of foundationalism leads to a rethinking of modern ideals – in this case, autonomy – as something that must be renegotiated again and again without ever being fully achieved.

The radical democratic critique of the liberal subject is reflected in the critique of the liberal notion of citizenship centered as it is on the individual, self-interested bearer of rights. Rights, radical democrats argue, do not exhaust the political. Rather, we must also look at how subjects are constituted, and especially how new subjects are constituted, subjects that may challenge existing rights categories. Again, radical democrats do not simply reject rights or citizenship, but argue that a profound rethinking of these is necessary.

More generally, radical democrats do not simply reject liberal institutions (the rule of law, separation of powers, and so on). Those institutions have their value; for radical democrats, this is especially so in the light of the experiences with twentieth-century totalitarianism. Therefore we cannot reject liberal institutions as meaningless and inconsequential. Yet radical democrats insist on the need to be able to contest the liberal institutional framework of rights, citizenship, the rule of law, and so on. Among other things, this is in order to open up the possibility that new and hitherto excluded and marginalized constituencies gain a place within society on a par with the (so far) normal subjects. Thus, radical democracy is also an exercise in denaturalizing and denormalizing what we take as given, including our conceptions of the subject and of citizenship.14

To sum up, radical democrats want to radicalize liberal values and institutions in two different ways. They want, first, to deepen and extend those values and institutions (for instance, to extend equality to ever more areas in society); and, second, they want to rethink those values and institutions without foundations. They see these values and institutions not as natural or ahistorical, but as political all the way down, and in this way they stress their contestability. In short, theorists of radical democracy seek to repoliticize what has been depoliticized.

Deliberative democrats, such as Jürgen Habermas,15 share some of the criticisms of liberalism raised by radical democrats. Thus, deliberative democrats believe that identity and interests are not given to the political process but constituted in it, and they also believe that the subject is not reducible to the self-interested and atomistic individual. Nonetheless, radical democrats are critical of deliberative democracy for some of the same reasons that they are critical of liberalism. First, radical democrats object to the emphasis on rationality and autonomy, even if these are understood by deliberative democrats in inter-

*15. For a discussion of Jürgen Habermas, see the essay by Christopher F. Zurn in *The History of Continental Philosophy: Volume 6*.
subjectivist terms. For instance, theorists of radical democracy have criticized Habermas’s idea of the forceless force of the good argument. Radical democrats have also objected to the emphasis on procedures because they believe that deliberative democrats thereby risk reducing politics to a matter of the right procedure.

In general terms, radical democrats are skeptical of the deliberative democratic conception of dialogue and deliberation. For radical democrats, communication is never transparent, but always marked by relations of power and asymmetry. For instance, some subjects are marked in advance as more rational than others, and some reasons as more reasonable than others. Therefore we need to examine the ways in which the space of dialogue and deliberation is constituted in the first place and what kind of practices and subjects have been excluded.

Similarly, radical democrats are skeptical of any consensus, even if it is the outcome of an allegedly rational discourse. This is not to say that radical democrats are necessarily against any consensus. For instance, Mouffé talks about a consensus on the principles of liberal democracy, namely liberty and equality for all. But, for her, this is a “conflictual” and temporary consensus, and there is no consensus without exclusion: a consensus is always a particular consensus linked to a particular “we” and, hence, to the exclusion of “them.”

Likewise, with regard to consensus, Connolly writes that it is “impossible to participate in discourse without projecting the counterfactual possibility of consensus; but … each attempt to interpret the actual import of that counterfactuality in any concrete setting is also problematical and contestable.” Connolly links this to contestability: “if a pluralizing ethos presupposes a ‘consensus,’ it is mobilized above all around reciprocal appreciation of the contestability of contending presumptions about the fundamental character of being. It is an ironic consensus.” As an ironic consensus, it reflects on its own contingency and the exclusions it implies. The alternative is to think of the relation to the other and of the public sphere in agonistic terms, as suggested by Connolly and Mouffé. This, they argue, will make us more attuned to subjects and constituencies that cannot at present be heard within the public sphere, and it underlines the contestability of the rules that constitute the public sphere.

---

Finally, theorists of radical democracy share the communitarian critique of the liberal disembedded subject and the communitarian emphasis on questions of community and identity as one finds it in Michael Sandel, for instance. However, they have a very different conception of community and identity because they believe that division and disagreement are constitutive. In short, no community is a self-contained whole with clear limits. This is the problem with communitarianism: it risks reifying existing (and past) communal identities. Inspired by poststructuralism, radical democrats do not see communities as closed or self-contained wholes; rather, identities are fluid and situated at the intersection of more than one communal identity.

We can sum up these points against liberal, deliberative, and communitarian approaches in the following way: for theorists of radical democracy, these alternative approaches all in one way or another depoliticize the subject, citizenship, consensus, and communal identities. Radical democracy, then, consists in repoliticizing what has been depoliticized, in showing that what appears to us as natural and ahistorical is in fact contingent, constructed, and contestable.

V. RADICAL DEMOCRACY BETWEEN ABUNDANCE AND LACK

So far, I have focused on poststructuralist radical democratic theory as a whole and distinguished it from earlier radical democratic theory and from competing contemporary approaches. I would now like to focus on debates within radical democratic theory. There are different ways to think about the differences between the various radical democratic theorists, although none of the ways of dividing the field entirely exhausts it.

Giorgio Agamben has suggested a distinction between immanence and transcendence as a way to make sense of the differences among contemporary French philosophers. If we apply this distinction to radical democracy, Connolly, Michael Hardt and Antonio Negri (drawing on Spinoza and Deleuze) would represent the immanence side and Laclau and Mouffe (drawing on Derrida and

---

Lacan) would represent the transcendence side. Here I will take Hardt and Negri and Laclau as representatives of the two sides.

The difference between Hardt and Negri and Laclau concerns whether an alternative to the present liberal-capitalist order will emerge immanently or requires a moment of transcendence. For Laclau, we need a moment of transcendence, albeit a “failed” transcendence. He understands this transcendence in terms of hegemony where a particular element comes to stand in for the whole, thus coalescing a hegemonic consensus around it, a hegemonic consensus that can oppose and dissolve the current hegemony. Hardt and Negri, on the other hand, believe that countering one hegemony with another reproduces a form of politics historically associated with Lenin and the vanguard (the Communist Party, taking over – but ultimately leaving intact – the state, and so on). For them, change must arise from below, from the multitude, and they find hope in, among other things, the alter-globalization movements. Thus, the immanence/transcendence distinction is not merely philosophical, but has important implications for political strategy.

Another way of making sense of debates within poststructuralist radical democratic thought is through a distinction between abundance and lack. This distinction is not unrelated to the immanence/abundance distinction, and Hardt and Negri (abundance) and Laclau (lack) would fall on opposite sides of the abundance/lack distinction. Here I will use the abundance/lack distinction heuristically to present two particular, but important, views of radical democracy, namely those of Connolly and Laclau and Mouffe. The aim is to identify some of the theoretical and political choices facing radical democracy.

Central to Laclau and Mouffe’s work is the category of hegemony, which they rework against its reception within Marxist thought and especially Antonio Gramsci’s theory of hegemony. For Laclau and Mouffe, hegemony

is essentially an operation whereby signifiers or demands are articulated into a chain of equivalence with other signifiers or demands. The chain of equivalence is organized around what Laclau calls an empty signifier, which fulfills the central role of keeping together otherwise disparate elements. In other words, the empty signifier represents what is otherwise absent or lacking, namely the community as a whole. There is thus a lacking fullness or being of the community, which could be a national community, a counter-hegemonic project, and so on. Hegemony consists in “filling” this lack. However, the filling of the lack always ultimately fails, and the lack always returns.

Any communal identity is marked by a lack, which it may try to project onto an external enemy (the figure of the Jew or the Islamic terrorist, for example). Similarly, any identity is marked by a lack, which sets in motion identifications with objects – a football club, a national symbol, and so on – that are supposed to fill the lack. Yet, even though this is how my identity is constituted, those identifications always ultimately fail. It follows that any identity is precarious and constantly renegotiated. It should be clear by now how Laclau thinks of hegemony in terms of lack, an idea he takes from Lacanian psychoanalysis.

Radical democracy is one hegemonic project among others. Specifically it consists in radicalizing the principles of liberal democracy, namely, equality and liberty. For Laclau and Mouffe, this radicalization implies deepening and extending equality and liberty and doing so without new foundations. In her work, Mouffe has focused on radical democracy and what she calls agonistic democracy. Mouffe is interested in how the democratic “we” is established. For her, the democratic “we” is established hegemonically, for instance as a radical democratic “we,” but importantly the “we” is not a closed whole because it is marked by internal division and differences. It is, thus, a “we” that is always unstable and in the process of being renegotiated. Although the “we” does involve limits and exclusions, these are contestable.

Agonistic democracy refers to the space within which different hegemonic projects – radical democracy being one of them – compete for hegemony. This space will be marked by differences and divisions (among “adversaries”), and it will be established through an exclusion of “enemies.” The latter do not accept

---

the principles of equality and liberty, as opposed to adversaries who do, even if adversaries interpret the principles in different ways. Here Mouffe draws on Carl Schmitt to argue for the ineradicability of exclusion and antagonism from politics.

Laclau and Mouffe are interested in the possibility of leftist hegemonic projects after foundationalism, and Mouffe is particularly interested in the way the democratic “we” and the framework for democratic disputes are established. Connolly, too, is interested in how political spaces and relations to others are constituted, but he takes a different approach. For Connolly, it is a question of how existing norms and institutions can be contested and thereby opened up. His focus is on how certain subjects and constituencies are excluded and marginalized, and on how we can relate to these in new ways, thereby giving them a place in the political space. In the process, our own identities and understandings will be put into question, so the process is also one of self-contestation. In other words, it is a matter of pluralization: contesting communal and individual selves and creating new selves.

Politics, for Connolly, concerns the ways in which our identities and our relations to others are articulated: “how an identity is experienced and how it defines itself with respect to different identities.”28 This is what Connolly has in mind when he talks about “agonistic respect,” “critical responsiveness,” and a “generous ethos of engagement”: an agonistic relation to the other that engages with the identity of the other as well as with my own identity. Hence, for Connolly, we should avoid representing others as antagonistic others (as threats, enemies, and so on). In contrast with the respectful and responsive agonistic contests between citizens that are necessary for radical democratic politics, Connolly thinks of antagonism in terms of Nietzschean ressentiment where the self projects its own fragility onto an other, who is then rendered a threat. This is the source of fundamentalism:

> [W]hile every doctrine, culture, faith, identity, theory, and perspective rests upon fundamentals more or less protected from internal interrogation, fundamentalism is a set of political strategies to protect these fundamentals by defining every carrier of critique or destabilization as an enemy marked by exactly those defects, weaknesses, corruptions, and naïvetés you are under an absolute imperative to eliminate.29

---

We should instead constantly engage with the other – including the “fundamentalist” other – in order to engage with ourselves and with what appears most fundamental and natural to us.

Although Connolly’s views bear many resemblances with Mouffe’s position, he believes that there is something missing from Mouffe’s account of agonistic and radical democracy. While Mouffe rightly focuses on the agonistic relations among adversaries, she does not say much about the nature of these agonistic relations. In addition, Connolly believes that we must extend agonistic respect to the excluded others, for instance, the fundamentalist. For Connolly, then, Mouffe too readily accepts that exclusion is constitutive, and thereby she risks taking particular exclusions as given as well as taking the hegemonic way of organizing politics as given. Connolly’s radical democracy is organized as a rhizome, as a network that connects and reconnects in new ways all the time; and he opposes this to a politics that takes the trunk as its model, for instance a hegemonic politics where a “we” is established in the center.

Whereas Laclau and Mouffe draw inspiration from Derrida and Lacan, Connolly gets the image of rhizome and trunk from Deleuze, and in addition he draws on Foucault and Nietzsche. From these thinkers, he gets the view of identity as fluid and the view of the self as constituted in flows that prevent any self – whether an “I” or a “we” – from fully stabilizing. Identity is not to be thought of as something lacking, which would suggest a negation that risks reproducing what is negated. Rather, we should think of identity and of politics in terms of abundance – flows of energy, networks of materiality, processes of becoming, and so on – an abundance that is affirmed as a positive source of a politics of contestation.

VI. CONCLUSION

In conclusion, poststructuralist radical democratic theory is not radical in the sense of providing us with a new and better foundation for radical politics, but rather in the sense of asking what radical politics looks like without foundations. Linked to this, radical democrats do not promise to transcend alienation, inequality, and exclusion, and radical democracy is not an end state that could be reached in practice or even in theory.

This distinguishes poststructuralist radical democrats from earlier radical democrats such as Rousseau and Marx, and radical democracy also differs from alternative contemporary approaches to democracy. The work involved in defining radical democracy does not stop at distinguishing the radical democratic position from other positions, however. One must also examine debates within radical democratic theory – for instance, between theorists of abundance and theorists of lack – as well as the implications of these debates for radical politics.

Where does radical democracy go from here? I would like to suggest two points where theorists of radical democracy have to pay particular attention in the future. First, more empirical work must be done, analyzing and criticizing institutions and practices. Radical democratic theory has tended to be just that – theory; and debates among radical democrats have tended to focus on theoretical issues. Second, radical democratic theory must pay attention to what we usually call the economic sphere. This is not an attempt to argue for the priority of the economic, but merely to highlight the fact that so far radical democrats have said relatively little about capitalism and the economic sphere.

A final point concerns the present and future debates about radical democratic theory. Recently there has been a challenge to radical democracy from theorists such as Hardt and Negri, Agamben, Alain Badiou, and Slavoj Žižek, who all promise a more radical analysis of and break with contemporary liberal and capitalist society. Whether this new radicalism can in fact be cashed in without giving up on the radicalism of radical democracy in the sense identified above is one of the questions of dispute between, for instance, Laclau and Žižek. Žižek argues that Laclau and Mouffe’s radical democracy ultimately

32. Exceptions here include the uses made of Laclau’s theory of hegemony to analyze historical and contemporary discourses. See the contributions in David Howarth et al. (eds), *Discourse Theory and Political Analysis: Identities, Hegemonies and Social Change* (Manchester: Manchester University Press, 2000); and Francisco Panizza (ed.), *Populism and the Mirror of Democracy* (London: Verso, 2005).

*34. For a discussion of some of these theorists, see the essay by Emily Zakin in *The History of Continental Philosophy: Volume 8*.

buys into a liberal-capitalist ideology because it is too superficial and does not address what really matters according to Žižek, namely the capitalist mode of production. Laclau, on the other hand, retorts that Žižek remains trapped in old essentialist and foundationalist categories such as class, while never actually providing us with a way out of the existing order. Thus, the current debates about radical democracy still turn on the correct understanding of the “radicalism” of radical democracy, that is, whether democracy must be rooted in something more fundamental.36

36. I would like to thank Rosi Braidotti, Saul Newman, Alan D. Schrift, Lars Tønder, and the anonymous reviewer for their comments on earlier drafts of this chapter.
In an essay published in 1988 entitled “New Ethnicities,” Stuart Hall announced the end of innocence for the “essential black subject.” Learning from the complex geography of black identity formations within occidental modernity, it is perhaps also possible to insist even more incisively on the end of innocence for the hegemonic “white subject.” This would evoke a critical constellation in which the very idea of a “Black Atlantic,” as proposed by Paul Gilroy, becomes a philosophical challenge to the assumed neutral, hence universal, coordinates for comprehending modernity. In such a situation, voices that apparently reach us today from the peripheral margins of a once dying colonialism and a seemingly now distant imperial past, acquire an unsuspected centrality in the reformulation of a philosophical and critical agenda seeking to respond to the complexities of a worldly inheritance that is not only ours to explain and direct. The work of Aimé Césaire, Frantz Fanon, Édouard Glissant, Ranajit Guha, and the continuing elaborations of Hall, among others, insist in their critical challenge to contemporary thought and cultural analysis (Spivak, Bhabha, Gilroy), interrogating a world yet to come. A discursive formation – European philosophy – seemingly directly inherited from a tradition that was inaugurated on the shores of the Mediterranean by the Greeks, is here interrupted. It is neither cancelled, ignored, nor simply subverted; rather, it is forced to travel in an altogether more extensive space. A continuity that is nurtured and guaranteed by

questions apparently generated from within the autonomous realm of thought is potentially disrupted and dispersed.

Precisely one of the ways to think the philosophical and cultural impact of cultural and postcolonial studies in the anglophone world would be to consider the life and career of the fundamental figure of Stuart Hall.3 Having moved from the Caribbean to Europe, he represents an entwining of a critical and biographical figure, that leads, after empire, to thinking “without guarantees,” now viewed through the supplementary lenses of race, gender, and ethnicity. This is a worldly location that cannot be ignored or simply separated from critical statements. To be a “black” male, and the “subject” of a “sound colonial education” (Derek Walcott), is by no means merely an individual trait. It is precisely this dimension – the biopolitical location of the voice in a critical cartography profoundly characterized by asymmetrical powers – that ignites what has probably acquired the most prominence in the field of cultural and postcolonial studies and its potential impact on contemporary philosophical configurations: the question of identity. To what degree the insistence of a body located, marked, and constructed by historical, political, cultural, and economic forces is allowed to intervene in the configuration of “philosophy” is by no means clear. Its ambiguous status disseminates a disturbance, an interrogation.

It is this slightly unruly, even irreverent, appropriation that induces a critical disposition whereby the “external” and the unrecognized, or “non-philosophical,” irrupts into the field. In this scenario, the postcolonial body – historically marked and culturally located – is not so much a figure that seeks to establish an identity; he or she, as Fanon pointed out many decades ago, has already been thoroughly subjected to one: “Look, a Negro!”4 He or she is rather a figure that reveals identity: its mechanisms, its disciplining, its ideologies. In this critical exposure the procedures and protocols of identity are disturbed and defamiliarized. Here, thinking the very grounds of thought, unpacking the imposed “burden of representation” (Kobena Mercer), and refusing to “be” what was previously ordained, leads into what can be considered a critical multiculturalism.5 The very question of identity (for whom? where, when, and how?)

3. Stuart Hall was born on February 3, 1932, in Kingston, Jamaica. Educated at Oxford, and influenced by the work of Althusser, Foucault, Gramsci, and Marx, he served as Director for the Centre for Contemporary Cultural Studies, University of Birmingham (1968–79), and taught at the Open University (1979–97). Among his most important works are Encoding and Decoding in the Television Discourse; Resistance Through Rituals: Youth Subcultures in Postwar Britain; Policing the Crisis; and Questions of Cultural Identity.

becomes problematic for all, and not merely for those previously located in the designated marginality and subaltern positions of black, native, indigenous, and other: everything that disturbs the colorless universality of whiteness. Here Paul Ricoeur’s meditations on “oneself as another,” Julia Kristeva’s “strangers to ourselves,” and Jacques Derrida’s suggestive exploration of a “monolingualism,” are declined into the rougher intercultural grammar of a quotidian becoming that consistently frustrates philosophical finitude.6

There is also the need here to acknowledge the overspill, interaction, and heterogeneous gestation of thought emerging between developments in continental philosophy, associated with “Paris,” but actually coming out of a far wider configuration that includes anticolonialism and, in particular, the Algerian war, and the nascent British discourse of cultural studies. In the latter case, a post-imperial island is injected with the socially suggestive rigor of structuralism and a reconfigured Marxism sustained by the critical and problematic import of language itself. While the structuralist “dissolving” of man – from Lévi-Strauss and Althusser to Foucault and Derrida – will also come to be read in terms of the restrictive geography implicitly referenced in the humanist and existential Marxism – the “white mythologies” – that dominated post-1945 critical European thought and philosophy.7

This suggests a conjunctural analysis of the coming together and shaping of a critical constellation in the 1960s and 1970s, in which empire, colonialism, and their subsequent cultural and historical fall-out in diverse national formations, in particular those of Britain and France, intertwine in a critical constellation in which the weakness of Anglo-American empirical thought, already under pressure from student disavowal and the cultural secession of youth, is intersected by radical, systematic perspectives (in both the political and epistemological sense) coming from France. Accompanying and fertilizing these developments is the elaboration of British cultural studies through its “break” with a native literary tradition and, subsequently, with the existing modalities of the profoundly limited empiricism of the social sciences. This latter move is to be read less as simply settling accounts with the disciplinary inheritance of “English literature,” “sociology,” or “history,” and rather more in terms of crossing these,

and other, disciplinary paths, in the critical appropriation of such problematic concepts as “culture,” the “social,” the “political,” and the “historical.”

Essential to this overall constellation was not merely the production of interdisciplinary and intercultural spaces, but also a pronounced irritation with the self-serving institutionalization of “knowledge” as an autonomous academic pursuit. Nineteen sixty-eight, of course, but also, and as a consequence of that initial rebellion, the emergence of the critical excavation and evaluation of the archive of occidental modernity understood as a systematic network of power and associated knowledge “affects.” Here, a Marxist inheritance eventually came to be interrogated by what it historically often ignored: the “peripheral” and “subaltern” voices of empire, colonialism, and gender. If feminism was a common thread, although diversely accented, between Paris and London, the attention to race and ethnicity was altogether more acutely considered in Britain. In this critical undoing of culture, now considered as a historical process and a shifting, consensual arrangement of power, there is also the significant reprise of the complex historical and political understanding of cultural formations elaborated in the 1930s by the Sardinian intellectual Antonio Gramsci, who is touched on in Althusser, persistently evoked by Hall at the Centre for Contemporary Cultural Studies in Birmingham, and extensively explored by Ranajit Guha \(^8 \) and the Subaltern Studies Group in India.

I. THE REFUSAL TO BE THE OTHER

It is at this point that it becomes legitimate to ask whether, for example, Fanon’s *Les Damnés de la terre* (*The Wretched of the Earth*; 1961) is to be considered a philosophical text.\(^9\) The very question poses a potential reconfiguration of the philosophical if we are to include it or, conversely, an institutional restriction if we exclude it. Fanon’s writings most certainly invade and interrupt any thinking that considers itself to be universal and the epitome of humanity. In his preface to the text, Sartre famously defines Fanon as carrying out a “strip-tease of our

---

8. Ranajit Guha (1922– ) is an Indian historian, influenced by the work of Antonio Gramsci, and most noted for his critical reconfiguration of historical studies with the Subaltern Studies Group.

9. Frantz Fanon (July 20, 1925–December 6, 1961; born in Martinique; died in Bethesda, Maryland, USA) studied medicine at the University of Lyon (1947–51). Among his influences are Césaire, Sartre, and Senghor. He served as Chef de service at the psychiatric hospital of Blida-Joinville, Algeria (1953–56) and on the editorial board of the Algerian liberation movement (Front de Libération Nationale, or FLN) newspaper *El Moudjahid*. Among his important works not cited elsewhere in this essay is *L'An V de la révolution algérienne* (*A Dying Colonialism*) and *Pour la révolution africaine* (*Towards the African Revolution*).
humanism.” It was from such a universalism that the chilling certainty of a racist legislation descended on the planet.

In the cultural codification of difference, only the European is a moral subject capable of proposing universal values. History in the colonial world is hence exclusively the history of the colonizer and an extension of the European metropolis. The colonized is immobilized, fixed in her subaltern status, and stabilized in the repetition of a cultural identity that is not permitted to disturb the teleological movement of the colonizer’s “progress.” This is a complex constellation that while obviously theoretical is not always obviously philosophical per se; or, rather, it evokes a philosophical insistence that is continually bent to a cultural and political will. Against theoretical and scholarly rigor, attention is paid to the performative instance of critical thought. There is the enunciation of a volatile location destined to irritate inherited categories of understanding with an ambivalence that insists on the complexity and opaqueness of the world that thought seeks to discipline and render transparent. To insist on what sticks out in language is, as the Indian historian Ranajit Guha forcefully argues in History at the Limit of World-History, to deviate and subvert a linearity that anticipates its conclusions; it is to snap the chains of that history which considers itself to be the unique reason of the world. It is precisely to reintroduce what that language has avoided and negated.

As an interdisciplinary approach to the analyses of contemporary culture, cultural studies has historically posed some forceful epistemological objections to the social sciences and accompanying critical configurations. This has been accompanied by the significant analytical contamination of previously distinct popular and elite cultures. Shifting the aesthetic concerns of literary studies and art history into the critical conundrum of culture as a “whole way of life” (Raymond Williams), has led to thinking critically with other languages and texts rather than simply those inherited from a “Great Tradition” (F. R. Leavis) and its endorsement in the nation’s literary canon, educational programs, museums, and libraries. In this sense, Bob Marley and reggae music can appear as critically suggestive as Goethe contemplating the possibilities of Weltliteratur or Heidegger considering the question of technology.

At this point there exists no external space. Everything presses in on the center in a political and cultural geography that renders disciplinary distinctions and unilateral perspectives problematic in the proximity of immediate complexities. We are encouraged to undertake what Edward Said calls a “contra-puntal reading” of the situation. There is now no “native,” “other,” or “slave” to

11. Edward Said (November 1, 1935—September 25, 2003; born in Jerusalem, British Palestine; died in New York) received a BA from Princeton University (1957) and a PhD from Harvard University (1964). Influenced by Auerbach, Foucault, Gramsci, and Vico, Said spent his career,
legitimize the “progress” of a Hegelian logic or maintain a differential distance, only negated figures and repressed partners in the shared historical realization of modernity. In the complex and uneven act of framing, occidental modernity, rendered in its planetary transit susceptible to postcolonial criticism, loses unique possession of its languages.

To return to Fanon: for this French educated Martiniquan, Europe is not about the fulfillment of humanity, but historically represents the mystification and blocking of its realization. The West holds humanity in hostage, and humanism is transformed into a hypocrisy that consistently evades a “humanisme à la mesure du monde [humanism that is the measure of the world].”12 Similarly, “underdevelopment” is not the sign of European superiority but rather an insulting term whose genesis reveals the cruel centrality of colonialism in the making of the modern world: “L’Europe est littéralement la création du Tiers-Monde [Europe is literally the creation of the Third World].”13 The planet remains in the historical vice forged by Europe, “which never stops talking of man yet massacres him at every one of its street corners, at every corner of the world.”14 In Peaux noires, masques blancs (1952), Fanon is the doctor of a colonial hospital – caught between a Sartrean dialectic of two single subject positions sustained in antagonism and the split Lacanian subject unable to confirm him or herself – who describes psychic relationships sustained in the murderous embrace between the colonizer and the colonized. He is also the critical voice who announces the refusal to be the other.

Object of the exception – “Look, a Negro!” – the subaltern is (mis)recognized and has no other choice than that of shattering the mirror, refusing an imposed alterity. As the mute and immobile object of Western history, she has no alternative but to violate that which frames her or him as object in order to appropriate the right to narrate (Said, Bhabha). To insist on the right to disrupt an imposed and inherited history is not to evoke a philosophy of violence, but is rather to reply to the structures that sustain and disseminate violence; in primis, the reign of terror, as Michael Taussig describes it, that constitutes the space

---

beginning in 1963, in the Department of English and Comparative Literature at Columbia University. Among his more than twenty-five books are: Orientalism; Covering Islam: How the Media and the Experts Determine How We See the Rest of the World; Musical Elaborations; Culture and Imperialism; and Reflections on Exile. [*] Said’s work, along with that of Spivak and Bhabha, is discussed in detail in the essay by Eduardo Mendieta in The History of Continental Philosophy: Volume 8.

of European colonialism and its mission of imposing its “self” on the rest of the world.\textsuperscript{15} Here we are brought into the “heart of darkness” to confront the structures of violence, the violence of the structures, that cage the colonial and subaltern within modernity itself: nothing is separate, all is coeval as Johannes Fabian points out.\textsuperscript{16}

We are here excavating the archive of modernity, where conditions of thought are inextricably woven into the making of a world designed to mirror, sanction, and extend that very same thought. Even those most directly affected by the rhetoric of the “progress” of the rule of reason – slaves waging war for their freedom on an eighteenth-century island in the French Caribbean – continue to be excluded from the historical, political, cultural and philosophical account: “I met History once, but he ain’t recognize me.”\textsuperscript{17} The historically excluded, the cultural other, the racially abnegated, cannot be absorbed without inducing a sea change in the cartographies of thought (and power). We here return to Fanon’s insistence on the necessity to escape the clutches of a hegemonic history – that of the colonizer who continues to narrate the metropolis on the colonial soil that he is stealing – which leads to sabotaging his historiography and geography, that is, his specific elaboration of time and space.

It was another Martiniquan, the poet Aimé Césaire,\textsuperscript{18} who drew out the terrible equivalence between colonialism and Nazism. Once again Fanon reminds his readers of this disturbing vicinity: “It was my philosophy professor, a native of the Antilles, who recalled the fact to me one day: ‘Whenever you hear anyone abuse the Jews, pay attention, because he is talking about you.’”\textsuperscript{19} The real “scandal” of the Nazi exercise of power consisted precisely in introducing directly into the heartlands of Europe the colonial discipline and discrimination of its internal populations. These were not distant crimes perpetrated against “native” and “savage” Arabs, Africans, Indians, and other non-Europeans, but were rather directly exercised on the bodies and lives of white, “civilized”

\textsuperscript{18} Aimé Césaire (June 25, 1913–April 17, 2000; born in Martinique; died in Fort-de-France, Martinique) travelled to Paris supported by a scholarship, and was educated at the Lycée Louis-le-Grand and the École Normale Supérieure. Poet, politician, and one of the founders of the \textit{Négritude} movement, Césaire returned to Martinique in 1939, where he taught at the Lycée Schoelcher, and was a powerful influence on Frantz Fanon. His political career began in 1945, when he was elected mayor of Fort-de-France, and he served for many years as Martinique’s \textit{député} to the French National Assembly.

\textsuperscript{19} Fanon, \textit{Black Skin, White Masks}, 122.
Europeans, now selected and segregated according to racialized hierarchies that had been perpetuated for centuries overseas. Here the Shoah, and the exceptional concentration of an industrialized genocide, enters another genealogy: that of the long history of colonial terror now exercised on European soil. Auschwitz becomes the extreme, shocking realization of the debt of European modernity to colonial reason.\textsuperscript{20} As a commentator has recently suggested, “Césaire takes the camp – to the degree that its exceptional status permits the comprehension of the concentrated colonial universe – as symbolizing, to paraphrase Giorgio Agamben’s formula, the biopolitical \textit{nomos} of colonialism.”\textsuperscript{21} We are brought to Albert Memmi’s noted affirmation that, in its inescapable structural inequality, every colonial system is a form of fascism.\textsuperscript{22}

\textbf{II. COLONIAL CARTOGRAPHIES}

Philosophy as an institutional practice, as a discursive field, was historically dependent as a part of the very formation of modern Europe, on the persistent distance and differing of the metropolitan center from the colonial periphery that permitted the (violent) maintenance of the illusory and hierarchical distinction between separate worlds. Yet this framing is consistently betrayed by the political and cultural economy that establishes and identifies “center” and “periphery,” “First” and “Third” World, “developed” and “underdeveloped,” within a common cartography of differentiated powers. For the very sense of “Europe,” its authority and reason, is dependent, as the Congolese philosopher Valentin Y. Mudimbe has carefully argued, on the existence and invention of “Africa,” “Asia,” “Oceania,” and the “Americas.”\textsuperscript{23}

“In the 1950s, Octave Mannoni, Frantz Fanon, and Albert Memmi transformed the paradigm of colonial studies.”\textsuperscript{24} To this apt observation by Françoise Verges, it would surely be no exaggeration to argue that such voices have grown

\textsuperscript{20} Césaire, \textit{Discours sur le colonialisme}; Discourse on Colonialism.

\textsuperscript{21} Dino Costantini, \textit{Una malattia europea} (Pisa: Edizioni Plus, 2006), 218.

\textsuperscript{23} Valentin Y. Mudimbe, \textit{The Invention of Africa: Gnosis, Philosophy and the Order of Knowledge} (Bloomington, IN: Indiana University Press, 1988).

\textsuperscript{24} Françoise Vergès, \textit{Monsters and Revolutionaries: Colonial Family Romance and Métissage} (Durham, NC: Duke University Press, 1999), 11. Octave Mannoni (1899–1989) was a psychoanalyst who spent more than two decades in the French colony of Madagascar. On returning to France, he was much influenced by the work of Jacques Lacan. He is most widely known for his book \textit{Prospero and Caliban: The Psychology of Colonization} (1950). Albert Memmi (1920– ), whose mother tongue was Arabic, is of Jewish origin and was brought up in French
in volume in the radical reconstitution of critical thought throughout the developed world since that decade. Breaking the “implacable dependence” (Memmi) between the colonizer and the colonized, it has subsequently become impossible to ignore a fracture destined to vibrate throughout the body of occidental thought, its abstract purity now stained by the contingent disruptions of unruly histories, negated bodies, and the brutal inscriptions of power. Here the repressed colonial archive, and hence the secret histories of the historical and cultural making of modernity and its overall political economy, can no longer be evaded or marginalized.

At this point, we can ask, with Gayatri Chakravorty Spivak, who is the “we” of philosophy?25 In her extended discussion of the anthropological moment of Kantian reason in the context of The Critique of Reason, the Bengali critic points to the Kantian evocation of the non-European native as the limit case of reason: “He is only a casual object of thought, not a paradigmatic example. He is not only not the subject as such; he also does not quite make it as an example of the thing or its species as natural product.”26 In other words, the presence of the native of Tierra del Fuego is not required, need not even exist, for the passage of philosophy to occur. Such “natives” sustain a narrative – anthropological, exotic, instances of the sublime – that does not yet bear the European signature of history. As the author of A Critique of Postcolonial Reason (the very title announces a doubling and dispersal of the inherited imposition of a Kantian logic) concludes: “We find here the axiomatics of imperialism as a natural argument to indicate the limits of the cognition of (cultural) man … The subject as such in Kant is geopolitically differentiated” (CPR 26–7).

The reply at this point is most certainly not about how to appropriate the “native informant” in order to mend and ultimately reconfirm a reconfigured discourse – yet a further imperial invocation – but precisely to leave the gaps, the holes, in critical language open, ambiguous, susceptible to eventual suturing into another place, another language, another subject- hood.

colonial Tunisia. He is known as both a novelist and for his critical work The Colonizer and the Colonized (1957).

25. Gayatri Chakravorty Spivak (February 24, 1942– ; born in Calcutta, India) received a BA in English from Calcutta University (1959), and a PhD in comparative literature from Cornell University (1967). Influenced by Derrida, Guha, and Said, she has taught at the University of Pittsburgh and, since 1991, Columbia University, where she is now a university professor and Director of the Center for Comparative Literature and Society. Among her most important works are: her “Translator’s Preface” to Derrida’s Of Grammatology; In Other Worlds: Essays in Cultural Politics; The Post-Colonial Critic; and A Critique of Postcolonial Reason: Towards a History of the Vanishing Present.

Two centuries after Kant, such objections can still be moved against those who are apparently among the most radical expression of contemporary critical thought: Michel Foucault and Gilles Deleuze. In some densely argued pages in *A Critique of Postcolonial Reason*, Spivak deconstructs the unsuspected architecture of an ingenuous homogeneity in the Parisian referencing of subaltern struggles in both the First and the Third World. Via an intellectually staged ventriloquism, she argues, the rest of the world is still reduced to the rules of representation that render transparent the philosopher’s will. Subjected to totalizing maps of power and desire, to the *vertreten* and *darstellen* of political and ideological representation, there is a simultaneous disavowal of the asymmetrical, inconclusive, and lived complexities of other, worldly subjects. As Spivak puts it, referring to Foucault and Deleuze, the “Third World can enter the resistance program of an alliance politics directed against a ‘unified repression’ only when it is confined to the third-world groups that are directly accessible to the First World” (CPR 277). This is to forget the important advice of Assia Djebar: “Don’t claim to ‘speak for’ or worse, to ‘speak on,’ barely speaking next to, and if possible very close to …”27

There is, as Spivak notes, no space for a “counterhegemonic ideological production” (CPR 255). In this “empirical register of resistance talk,” intellectual radicalism ends up playing witness to “capitalist colonialism” and its “positivist empiricism” (CPR 254–5). With the abstract concepts of the working class, the subaltern, and the multitude, political and ideological representation is reduced to the purity of an abstract plane, however folded and multiplied, that provokes the lines of flight, or relay, of theory itself, confirming the philosopher’s desired will to revolt, while it paradoxically “restores the category of the sovereign subject within the theory that seems most to question it” (CPR 261).

The provenance of the pronouncement continues to configure the analytical constellation in a “topographical reinscription of imperialism” that invariably, even in its most radical formulations, exposes First World concerns (CPR 279). The failure and refusal to track discontinuity – geographical, economical, social, and cultural – in the differentiated but entwined complexity of what is clearly now a planetary mode of production and being ensures the sovereignty of the occidental subject as the subject of history. In such a manner, Foucault’s clinic, asylum, and prison, like “determinitalization” in Deleuze and Guattari, “seem to be screen-allegories that foreclose a reading of the broader narratives of imperialism” (CPR 279):

---

This reintroduces the constitutive subject on at least two levels: the Subject of desire and power as an irreducible methodological presupposition; and the self-proximate, if not identical, subject of the oppressed. Further, the intellectuals, who are neither of these S/subjects, become transparent in the relay race, for they merely report on the nonrepresented subject and analyze (without analyzing) the workings of (the unnamed Subject irreducibly proposed by) power and desire. (CPR 264–5)

Beyond the troubling unconscious and the disturbance of ambiguity, all is dispersed into mobile vectors where dynamic monads form dualisms but avoid contaminating contradictions and the potential locations of critique: a machine “without organs.” The subaltern is not allowed to invest in her itinerary, for she is already produced and spoken for in a logic overdetermined by economical, political, and cultural powers that are also theoretical. This particular subject – subaltern, oppressed, in resistance, and in revolt – belongs, as Spivak bluntly puts it, “to the exploiters side of the international division of labor. It is impossible for contemporary French intellectuals to imagine the kind of Power and Desire that would inhabit the unnamed subject of the Other of Europe” (CPR 265). I think we can safely substitute occidental for “French” on this point. The eventual hole, rent, and discontinuity in this discursive tissue challenges the sanctioned ignorance of a simulated identification with the “other,” which is always about some form of self-investment. It registers precisely what exceeds and escapes “my” world as an insistent irreducibility: a perpetual interrogation and interruption of my “self” and its associated languages of meaning and managing the world.

This is not, of course, to suggest that such critical languages are unable to travel fruitfully elsewhere. However, it is precisely the fact of their being “othered” in the elsewhere that proves pertinent. Europe, once systemized in the Caribbean, for example, proposes a radical reassessment: from Fanon’s stern insistence on taking the limits of European humanism seriously to Glissant’s fluid, Deleuzian-influenced, explorations of the political and poetical conditions of créolité.28 Here a continual metissage of languages, histories and cultures propose a profoundly Caribbean critical perspective in which Europe, Africa,

---

28. Édouard Glissant (1928– ; born in Martinique) is a poet and writer, critically renowned for promoting a Caribbean and postcolonial understanding of critical creolization that produces a complex archipelago of shared difference. He draws inspiration from Deleuze and Guattari’s work on rhizomatic becoming and “minor” literatures. Glissant’s most important critical writings in English are Caribbean Discourse: Selected Essays, and Poetics of Relation. [*] For further discussion of Glissant, see the essay by Rosi Braidotti in The History of Continental Philosophy: Volume 8.
and the Americas are critically conjoined in earshot of the terrifying rhythms of slavery and its racist aftermath. Here, where the so-called “periphery” radically reassess the “center,” the teleology of occidental “progress” is dispersed in an altogether more complex, unfinished, and rhizomatic becoming.

III. THE VIOLENCE OF IDENTITY

The historical sovereignty of this discourse, its position, its power, is founded, as Foucault himself insisted in *L’Archeologie du savoir* (1969), on the organizing principles of the occidental *ratio* in its relationship with all other societies. The elsewhere is always a product, an extension, and an “invention” of that cultural and historical order: a European mandate on the rest of the planet. The violence of the ensuing dichotomies is the violence of thinking the world in a manner that only mirrors your “self.” As Mudimbe, following Foucault, points out, this is precisely the “epistemological possibility” of the discourse in question: the possibility and subsequent disciplining of thought that produces anthropology, comparative linguistics, geography, sociology, history, and the social sciences in general, as part of a precise historical and cultural, hence epistemic, formation.

The power and violence of language is evidenced in the success of conceptual systems able to take possession of the world in such a manner that they are universally recognized. To be recognized implies inhabiting this syntax. The structural violence of thought is enacted precisely in becoming a “subject.” As Judith Butler argues, the subject must first be subjected, that is, subordinated and disciplined by the languages that permit her or him to appear and to act as a recognizable agent; that is, as a “subject.”29 Here we can register in the discursive formation of an “Orient,” an “Africa,” “underdevelopment,” the “South,” the “subaltern,” an “other,” the power of language that is simultaneously the language of power inscribed in the categorization of the world: the objectification of a precise subjectivity.

What is being entertained here is the undoing and dispersal – *not the cancellation* – of that configuration of knowledge, leading, in turn, to the unwinding of the legislative authority of the West as the unique subject of history. This is to push thinking into uncharted territory, for, to borrow a metaphor from urban geography, it suggests a vast and indefinite area – like the sprawling urban slums and shanty towns peopled by a complex, anonymous, marginalized underclass that is neither recognized as urban nor rural – that lies between disciplinary definitions and other modalities of knowledge (or gnosis, as Mudimbe puts

---

it). If the former presents themselves in terms of an epistemic and rigorous configuration of knowledge that pretends to impose itself universally and hence unilaterally, the latter, as a heterogeneous and unsystematic interrogation of that configuration, sets a limit, proposing an insistent border that provokes a transit, a translation, an elsewhere.

The occidental institution of philosophy rarely recognizes the full significance of this critical challenge. When there is seemingly a direct response – Deleuze, Negri, and Hardt – it remains locked within the confirmation of its own discursive horizon. As Spivak rightly points out, the other, as subaltern, multitude, immigrant, sustains, rather than shatters, the authority of the critical paradigm. It is precisely here that the deconstructive turn within occidental reasoning becomes most suggestive and subversive: as the internal “outsider,” as the voice that speaks the “West” without being fully reducible to the law of its logos: thinking on the threshold of metaphysical certainties. If less direct, interesting symptoms have also emerged in the Italian proposal of “weak thought” (Gianni Vattimo and Pier Aldo Rovatti) and the necessary recognition of the undoing of the metaphysical will. More recently there have been the precise considerations of Giorgio Agamben on the critical limits of representation and the authorization of its reason confronted with the incommensurable instance of genocide, the death camp, and the essential violence on which the liberal state establishes and, ultimately, propagates its legitimacy.

To return to Butler’s observations on our subjection in the languages in which we appear, act, and become “subjects,” the complex traffic between occidental thought and the seemingly external space of the non occidental has now to be located in the coeval coordinates of a shared planetary spatiotemporality. The distance sought by a discipline is ontologically shrunk to a disturbing proximity, and the precise ethnoscape (Appadurai) and location (Bhabha) of a discursive formation that declares itself universal looms into view.

If the West has worlded the world, if modernity has become the syntax of historical, cultural, and economic exchange, then Fabian’s crucial idea of a shared or coeval time undermines an occidental epistemology intent on constructing, cataloguing, and distancing “objects” of study, polity, and rule. It is precisely here, as Bhabha argues, that the mimicry, repetition, and dissemination of

---

*30. “Weak thought” is discussed in this volume in the essay by Silvia Benso and Brian Schroeder.
33. Fabian, Time and the Other.
modernity leads to the performative realizations of everyday hybridization, creolization, and métissage, leads to the emerging critical problematic of translation: historical, cultural, and poetical. If this is by now a well-rehearsed debate in anthropology and postcolonial literary and cultural studies, it continues to propose a radical, but largely unsuspected, reconfiguration of the social and human sciences tout court. It is in this profound sense that the practices of the disciplines, and their scriptural economies of facts, documents, texts, and testimonies, always remain instances of interpretation, sites of ambivalence: are always historical and political acts. Philosophy is neither immune nor able to secede from this constellation.

Against this expansion of critical horizons we can conclude this journey by returning to Stuart Hall. Hall’s earlier important work on the seemingly local configurations of television and the media in contemporary British culture was motivated by attention to the construction and articulation of a social, political, and cultural consensus. It was subsequently refined in his highly influential elaborations of the interactive construction of race in the positioning and defining of the racialized subject in the unfolding narration of the nation. This critical work rendered the performative affects of a language deeply political. It also rendered highly problematic the assumed neutrality and accompanying authority of the disciplinary voice (from sociology and social history to political and media commentary) that is analyzing, explaining, and defining the actors involved. Increasingly in Hall’s more recent work, it has been in the altogether less-guaranteed spaces provided and provoked by the languages of the visual arts that such arguments have found an increasing resonance. The turn to these languages, and a seemingly aesthetic discourse, has paradoxically provided the means to probe, provoke, and propagate a wider sense of the “political.” In the 1980s and the Thatcherite epoch characterized by riots and resentment against racialized policing, and the tightening definitions of nation and citizenship, the radical insistence on being both black and British challenged a narrowing of social and cultural perspectives. This spilled over, not only into the streets, but also into an avantgardist black arts movement. The photographic, film and visual

34. Homi K. Bhabha (November 1, 1949– ; born in Mumbai, India) received a BA from the University of Mumbai and a PhD in English literature from Christ Church, Oxford University. Among his influences are Derrida, Foucault, Lacan, and Said. He has taught in the English Department at the University of Sussex (1978–94), in Humanities at the University of Chicago (1996–2000), and as Professor of English and American Literature and Language at Harvard University (2001– ), where he also is Director of the Humanities Center. His best-known work is The Location of Culture.

35. Apart from many articles and talks on the argument, the culmination of Hall’s direct involvement in these critical artistic processes has been his promotion and overseeing of the realization of the new location of the Institute of International Visual Arts (Iniva) and Autograph ABP at Rivington Place that opened in London in 2007.
work of young black artists such as Isaac Julien, Mona Hartoum, Keith Piper, Sonia Boyce, Eddie Chambers, and Sutapa Biswas, along with many others, opened up an important series of interventionary spaces in Britain. Through challenging more conservative understandings, the simultaneous occupation of aesthetic and ethical discourses (art and philosophy) achieved the conjunctural realization of a new critical constellation. Here, in the interdisciplinary and intercultural spaces registered and explored in the visual frame, inherited understandings of identity, language, and art were effectively reconfigured.

In this hybridizing space, sustained in the ambivalence between poetics and philosophy, critical distinctions between institutional and discursive competence (for example, between cultural and postcolonial studies) become increasingly difficult to maintain in a differentiated but shared planetary mesh. Critically attuned to the complex orchestration of location, the very idea of maintaining historical, cultural, disciplinary, ethnic, and religious autonomies sharply signals the rhetorical limits of “globalization.” It is surely against this inherited positioning of authority and “knowledge” that occidental philosophy is required to measure itself. Its very identity, as with all identities, is perhaps less to be defended and rather to be disturbed and dissipated in order that other possibilities, other horizons, other hopes can acquire cultural shape and historical force.
THE “ETHICAL TURN” IN CONTINENTAL PHILOSOPHY IN THE 1980S

Robert Eaglestone

There is a general consensus that the late 1970s and 1980s saw an “ethical turn” in continental philosophy. Yet, like all generalizations about moments and movements in the history of philosophy, this overstatement has some truth about it. On the one hand, there was a change in the tenor of discussions; on the other, it is unclear if this was a wider “turn” or an “excavation” of a layer of thought brought to the surface by intellectual, cultural, and social events or the sudden elevation of one philosophical and theoretical conversation over others. The aim of this chapter is to explore this moment, its origins, and its significance. However, the nature of the subject matter makes this discussion much more complex.

Philosophizing about ethics is hard, especially in the continental tradition, because “ethics” is never just one topic among others; it is not what Heidegger calls “a classroom matter.”1 Faced properly, questions of ethics are interwoven with the most demanding questions that can be asked. Theodor Adorno finds a line in Sartre’s Morts sans Sépulture that expresses this:

[It] is said by a young resistance fighter who is subjected to torture, who asks whether one should live in a world in which one is beaten until one’s bones are smashed. Since it concerns the possibility of the affirmation of life, this question cannot be evaded. And I would think that any thought which is not measured by this standard, which does not assimilate it theoretically, simply pushes aside at the

---

outset that which thought should address – so that it cannot really be called thought at all.\(^2\)

Ethics as a field of inquiry should not only challenge us, as it were, intellectually. It also overwhols the disciplines and structures that try to analyze, describe, or encapsulate it, and so to attend to ethics – to the standard Adorno rightly demands here – is not just to attend to a narrow philosophical subject but to attend to an almost-infinite series of demands and questions across a huge range of discourses: technological, ontological, juridical, historical, cultural, social, and aesthetic.

Moreover, as the citation from Adorno suggests, there is a key sense in which the continental and analytic/Anglo-American traditions of ethical inquiry differ. Where the analytic/Anglo-American tradition of ethical inquiry can often appear etiolated, inquiring either into the meaning of ethical language or into the “professional ethics” of, say, doctors, the continental tradition is profoundly and self-consciously interwoven with history, both the history of philosophy and what one might call (hoping to encapsulate both considerations of the “history of being” and the micro-histories of the political) the histories of the world. This is to say that while the analytic/Anglo-American tradition often allies itself to law and legalistic frameworks, the continental tradition finds resources in the political, the historical, the literary, and the religious.

It is with these two ideas in mind – the sense that ethics is not simply one discourse among others, and the sense of its inextricable interweaving with history in the continental tradition – that the “ethical turn” of the 1980s has to be located. As I have suggested, like most “turns” in the history of philosophy, the shift in interest in relation to ethics was not so much a “turn,” or even a “return,” but more a twist in a continually changing and developing path. It represented a change both in thought and in the historical and cultural context of that thinking, but it did not generate a revolution. Its origins can be traced through two paths: through the historical conditions and intellectual questions that led to it and through the surge of interest in the major figure in this turn, Emmanuel Levinas.

I. HISTORICAL AND CULTURAL CONTEXT

The late 1970s and early 1980s were disorienting times for continental philosophy. First, and perhaps most urgently, a huge array of interlinked issues that

stemmed from the nature and history of modernity were making an impact on intellectual life and work. The broad scope of issues included: feminism and other questions of gender relations and sexuality; questions about race, racism, and of the postcolonial settlement, about migration and state power; the relation between indigenous and migrant traditions and collective memories (“multiculturalism”); increasing flexibility of capital and global markets; contrasts between secular and religious frameworks; the changing nature of the industrial base in the West and the onset of the “digital age” – indeed, many of the complex cluster of issues that have come to be located in the early twenty-first century under the banner of “globalization.” In addition, the rapid rise of technology raised questions from the fields of medicine and science about the nature of humanity in relation to bodily life and to consciousness. Finally, the environmental movement began to gather momentum in the late 1970s and early 1980s, and began to raise philosophical and ethical questions. While some of these issues and positions for inquiry found themselves in allegiance, others found themselves competing for intellectual space. All investigate the limitations of ethics as an intellectual location and questioned ethical frameworks from their particular standpoint.3

Second, many of the fundamental questions put to Western thought by, for example, Nietzsche and Freud, two “masters of suspicion,” and in a more technically philosophical way by Husserl and by Heidegger, seemed to reemerge, as if generations had awoken from the nightmare of the Second World War and the happy dream of the 1960s. The great questions of the late nineteenth century that pertained to ethics in this broader sense – questions of nihilism, of science, of post-theological humanity – and the reemergence of questions that had begun to circulate at the beginning of the twentieth century – of order, of subjectivity, of what the human might be, of technology – seemed to rearticulate themselves and demand new answers. In addition, the experience of the Holocaust and other genocides, of vicious colonial wars and of voices previously unheard by the mainstream philosophical traditions became added to this complex mélange. Institutionally, too, there were changes. Thinkers from the canon of European thought – such as Husserl and Heidegger, but others, too – had been sidelined by other, principally analytic but also sociological and psychological ways of approaching issues and problems. In the US, these philosophers were isolated even within philosophy departments because they were seen to be engaged with “the history of philosophy” and were rarely taken seriously, except in departments that explored the philosophy of religion. However, intellectual changes,

*3. Many of the issues mentioned here – including gender and sexuality, postcolonialism, citizenship, environmentalism, and globalization – are discussed in essays in The History of Continental Philosophy: Volume 8.
often stemming from literature departments, created a new interest in the thinkers from this canon, and this itself led to a renewed interest in ethics.

Third, and perhaps most importantly, the political realm was radically changing: a generation earlier, the crimes of Stalinism and the events of the Hungarian uprising of 1956 led some intellectuals either into a wholesale reevaluation of their ethical and political commitments, or they engaged in arguments that often became farcical defenses of communism and Stalinism or of an exhausted and corrupt leftist tradition. By the 1970s, the failure of Marxism had become clear: the collapse of the “events” of 1968 in Paris (in which, of course, many French intellectuals had been involved), the crushing of the Prague “Spring,” and the realization of the horrors of Mao’s “Cultural Revolution” were all part of this, which coincided with the rise of an intellectually aggressive new Right, of which the apotheosis was the presidency of Ronald Reagan and premiership of Margaret Thatcher. The withering away of a broadly Marxist intellectual framework, which had generated either sufficient answers or, at the very least, provided a marxisant discourse for intellectual inquiry, meant that in the late 1980s and early 1990s, Marxism no longer offered convincing answers to questions of justice, especially social justice. Indeed, none of the previously established systems, either extant or ideal, could answer the political and social questions put to them.

In one way, all three of these areas – the changing status of political ideologies, rapid historical and social change, and the return of the most demanding intellectual questions – were often, and sometimes clumsily, summed up in the term “postmodernism.” In this light, the question arose as to the “ethics of postmodernism,” meaning the ethical response to all these complex interrelated issues and, in turn, what they meant for more traditional conceptions of ethics.

However, in a more profound way, these issues were bound up with a changing conception of – to speak very broadly – “otherness,” and it is this concept that underlies much of the renewed interest in ethics. Of course, the term “otherness” is in one sense banal and too general, and led, naturally, to all sorts of banalities and generalities that amounted to little more than exhortations to “be good” or “play nicely.” However, “otherness” also points to a complex series of interactions between the world and systems of thought. It can mean both a concrete living other, a person, persons, or categories of traditions that are different from the accepted conventions or general consensus. It can also be understood to mean that which is outside, an indefinable thing outside the system that indicates that the system is not closed. This second sense of “otherness,” for example, underlies much of Derrida’s work. Deconstruction, he says, is:

a search for, but itself the consequence of, the fact that the system is impossible; it often consists … in making appear – in each alleged
system, in each self-interpretation of and by a system – a force of dislocation, a limit in the totalization ... it consists ... in remarking ... that what has made it possible for philosophers to effect a system is nothing other than a ... certain incapacity to close the system.4

It consists, in other words, of encountering the outside through an analysis that is other to the dominant discourse. And it is Derrida’s work – itself and its influence – that played a crucial role in the “ethical turn.” However, Derrida’s own thinking, especially in relation to otherness, was shaped in turn by his encounter with the work of Levinas, a figure whose philosophical considerations of the other are unparalleled. Indeed, it is fair to say that, perhaps led by Derrida, the major influence in the turn toward ethics in the 1980s was the surge of interest – in France and in the anglophone world – in Levinas. As Alain Badiou writes, in a backhanded compliment, it is to Levinas “that we owe, long before the current fashion, a kind of ethical radicalism.”5

II. Levinas’s Life and Work

Unlike many philosophers, who, in Heidegger’s dictum, were born, thought, and died, Levinas’s life was involved with the major events of Europe in the twentieth century and his biography is a useful way of situating his philosophical and ethical work and its relationship to history. Born in 1906 (or, in the then Russian Calendar, December 1905), in Kovno in Lithuania, his family was part of the large Jewish community there. Fleeing the German occupation in 1915, Levinas’s family moved to Ukraine, and returned to Lithuania in 1920. In 1923, he went to study philosophy in France, and then in 1928, he traveled to Germany, to further explore Husserl’s work. While in Germany, however, he was exposed to the work of Heidegger. In 1930, he married, became a French citizen, did military service and took a job teaching for the Alliance Israélite Universelle in Paris. Drafted into the army in 1939, he was captured by the Germans in 1940 and imprisoned in a camp for Jewish prisoners of war. His status as a French soldier protected him from being murdered in the Holocaust. However, while his wife and daughter were hidden in France, the rest of his family in Lithuania were murdered by the Nazis or by Lithuanian nationalists.

After the war, Levinas returned to France and became director of the École Normale Israélite Orientale. Mixing in philosophical circles in Paris, Levinas

published papers on a number of themes connected to ethics. He also began a study of Talmud with an enigmatic but influential master, Monsieur Chouchani. Levinas became actively involved in Jewish intellectual life and became a major figure in the Jewish community, often giving radio talks and speaking at events. His first book, *Existence and Existents*, was published in 1947. However, the first of his two most important books, *Totality and Infinity*, was not published until 1961. Levinas taught at three well-known universities in Paris: in 1964, he was appointed Professor of Philosophy at Poitiers, in 1967 at Paris-Nanterre, and in 1973 at the Sorbonne. His second major book, *Otherwise than Being, or, Beyond Essence*, was published in 1974. Although he retired in 1976, he continued teaching and writing. In the 1980s and 1990s, many conferences were organized to discuss him and his works. In 1996 Levinas died after a long illness.

Levinas's work is rooted in the phenomenological tradition and interwoven with a concern for Judaism and religion, and with the impact of the Shoah on European Jews. Hence, his work draws on the prominent intellectuals of the European canon and is intimately interwoven with the Holocaust, an event that has led to more ethical questioning than any other in Europe. There is not space here to fully do his work justice, but only to explain why his work became of interest.

Levinas's work is centrally, almost exclusively, concerned with ethics. However, he proffers a number of meanings to the conceptualization of “ethics”: ethics refers to the traditional philosophical discipline; it refers to his own philosophical discourse; and it refers to one's own relation to the other. As I have suggested, his work is both phenomenological and oriented by a tradition of phenomenology, drawn from Husserl and principally, although he was sometimes evasive about this, from Heidegger. The agonistic relationship between Levinas and Heidegger has prompted a significant amount of critical commentary that frequently begins with Levinas's remark that there was a “profound need to leave the climate” of Heidegger's philosophy that is linked with his “conviction that we cannot leave it for a philosophy that would be pre-Heideggerian.” Again, in a 1981 interview, Levinas said that “I think that one cannot seriously philosophize today without traversing the Heideggerian path in some form or other.”

6. “Monsieur Chouchani” was the pseudonym of a mysterious Jewish teacher who in post-Second World War Paris and elsewhere mentored a small number of distinguished students, including Levinas and Elie Wiesel. His gravestone in Montevideo, Uruguay, where he died in 1968, bears the epigraph written by Wiesel, “The wise Rabbi Chouchani of blessed memory. His birth and his life are sealed in enigma.”

speaks of the “debt” that every contemporary philosopher owes to Heidegger, “a debt that he often owes to his regret.”9 Stupefied and disappointed by Heidegger’s active Nazism in 1933, Levinas continued utterly to despise Heidegger and his Nazi sympathies while admiring Being and Time as one the greatest works of philosophy. Even so, he asks if we can “be assured … that there was never any Echo of Evil in it?”10 Still, as Levinas says, “Mont Blanc is Mont Blanc,” meaning that however he feels, the influence is there.11

Levinas’s crucial development of Heidegger’s thought, which reveals a great deal about Levinas’s work and about the ethical turn, can be seen by considering where each locates the “origin” of philosophy. If, for Heidegger, the experience of philosophy, of Dasein’s being an issue for itself, begins with being-toward-death, and the associated phenomena of anxiety and care, it becomes the task of fundamental ontology to uncover these. In contrast, Levinas finds another, and for him, more important and “pre-ontological” starting-point: the encounter with the other. For Levinas, “ethics is first philosophy,” by which he means that it is the actual concrete encounter with the other, with the “face” of the other, that underlies our sense of self and identity, and this in turn is the beginning of Levinas’s understanding of what philosophy is. Philosophy begins, as it were, with the other. For Heidegger, death has mine-only-ness (Jemeiningkeit): “dying … is essentially mine in such a way that no one can be my representative” and it is through this angst that Dasein comes to its authenticity and individuality.12 For Levinas, on the other hand, what generates crucial awareness, and self-understanding, is revealed in the underpinnings of existence – what it means to be other. He writes: “‘Me’ is not an inimitable nuance of Jemeiningkeit that would be added on to a being belonging to the genus ‘soul’ or ‘man’ or ‘individual,’ and would thus be common to several souls, men and individuals.”13 In other words, one’s sense of subjectivity is not a category in a philosophical anthropology or a defining character of what it is to be “human.” Rather, it is the basis of any such definition in the first place: “it is I, I and no one else, who am a hostage for the others. … The self in a being is exactly the not-being-able-to-slip-away-from an assignation” (OTB 26–7). The experience of ethics is that which underlies the self and is inescapable. Because ethics is not solipsistic but

11. Levinas, God, Death and Time, 158.
is (not just “comes from,” but is) the experience of the other or, as Levinas calls it, “proximity,” ethics is experienced as “obsession” (OTB 101): “responsibility justified by no prior commitment” (OTB 102); being “summoned as someone irreplaceable” (OTB 114); “being-in-one’s-skin, having-the-other-in-one’s skin” (OTB 115); the “unconditionality of being hostage” (OTB 117); “an accusation which I cannot answer, but for which I cannot decline responsibility” (OTB 127).

A crucial passage in Otherwise than Being illuminates this. He asks: “[Why] does the other concern me? What is Hecuba to me? Am I my brother’s keeper?” His answer is that these questions:

have meaning only if one has already supposed the ego is concerned only with itself, is only a concern for itself. In this hypothesis, it indeed remains incomprehensible that the absolute outside-of-me, the other, would concern me. But in the “pre-history” of the ego posited for itself speaks a responsibility, the self is through and through a hostage, older than the ego, prior to principles.

(OTB 117)

He is suggesting that before we think of ourselves as ourselves, we must consider our relationship to others because we are already responsible for the others who people the world. We are, to use one of his many terms for the experience of obligation, their hostages, and their very otherness – rather than some shared quality, such as national identity – imposes this burden on us. One of his key terms for this experience of the ethical both stems from and is named “the face.” By this he means that when we face someone, before we decide how to respond (to give or not to give a beggar money, to wish someone “good morning” or to turn away), we are already put into a relationship with them. This unconditional responsibility is not something we take on or a rule by which we agree to be bound; instead, it exists before us and we are “thrown” into it, without any choice.

Levinas’s work, then, is not aiming to offer a new moral or ethical system or provide a regulated moral standard; rather, it is an attempt to understand how our obligations to others arise, and this means that it is a form of metaethics. This aspect of Levinas’s thought has caused some confusion. With the exception of some of his radio talks, Levinas’s own philosophical work is not exhortative to an ethical life or a moral or political code. Rather, it is descriptive of the grounds of possibility of such codes – and indeed of all human interaction – in the first place. Levinas is not demanding that we become aware of the other, but
is instead arguing phenomenologically that we always already are aware of the other. For example, in one of the most complex passages in *Totality and Infinity*, Levinas argues that murder already acknowledges the ethical relationship. He suggests that murder is not the domination or use of someone, the turning of another person from an end to a use. Instead, it is to recognize them as Other, as beyond one's power: the “Other is the sole being I can wish to kill.” One does not speak of killing a chair, or of murdering a cup of coffee. (One might speak of murdering – rather than butchering – a cow, which would raise the question, if, for Levinas or post-Levinasian thought, animals can be “other” in this ethical sense). The importance of Levinas’s work, however, lies not only with the work itself; it also lies with its influence and reception, with how it became the fulcrum for the “ethical turn.”

III. LEVINAS’S THOUGHT AND THE “ETHICAL TURN”

Levinas’s thought is often understood as deeply interwoven with that of his friend and philosophical colleague, the critic and novelist Maurice Blanchot. Levinas and Blanchot met as students, and throughout their lives, their works responded to each other. Blanchot’s thought is varied and complex, and in general focused on but not limited to the aesthetic, broadly defined. In this ethical context, there are three key elements that intertwine with Levinas (and are an influence on Derrida). The first is his unswerving thinking of singularity: in relation to literature, for example, he writes that:

> the essence of literature is precisely to evade any essential characterization, any affirmation which would stabilize or even realize it: it is never already there, it is always to be rediscovered or reinvented. It is never even certain that the words “literature” or “art” correspond to anything real, anything possible, or anything important.15

That is to say, the categories of “art” and “literature” already overcode or cover up the singular event of the literary text: to properly encounter a work of literature we cannot look for a “core” of the literary, a generic marker that all literary texts share. This is even more the case with the event of a human: like Levinas, Blanchot believes there is no “genus” of man. Each is a singularity and this

---

creates “the infinite relation of one person to another” which “obligates beyond any obligation.” In turn, this leads to the importance of the idea of “witnessing” to Blanchot. This is not “witnessing” in the sense of reporting back an event, but, in the language he develops from Levinas, a “saying,” a witnessing of the event of the human. One consequence of this is what he sees – in a book mainly if implicitly about Levinas, The Infinite Conversation – as the impossibility of ever “having done” with questioning. Finally, and again in protracted literary dialogue with Levinas – and with his own right-wing views from the 1930s – Blanchot is centrally concerned with the Holocaust. His poetic/philosophical fragmentary meditation, The Writing of the Disaster is in no small part about this.

There are also congruencies between Levinas’s work and the thought of Vladimir Jankélévitch, a thinker very little known outside France, as Levinas’s short account of him in Outside the Subject illustrates. Like Levinas, Jankélévitch was influenced by Bergson, and sought to develop an ethics – like Levinas – as “first philosophy” that both underlies and is not delimited to declarations of principles. He is perhaps best known for his discussion about the relationship between forgiveness and the genocide of the European Jews. Here, often with the blackest humor, he argued against the possibility of forgiveness for the Nazi crimes:

Today when the sophists recommend forgetfulness, we will forcefully mark our mute and impotent horror before the dogs of hate; we will think hard about the agony of the deportees without sepulchers and of the little children who did not come back. Because this agony will last until the end of the world.

Here, both his sense of ethics and his division of “scientific” time and duration, developed from Bergson, bring to the fore the inexhaustibility of the Shoah.

This way of conceptualizing ethics – as interwoven with metaphysics, as first philosophy – that is common to Levinas, Blanchot, and Jankélévitch, and was taken up by others, as I will suggest below, is strikingly different from some others and is the core of the “ethical turn.” In contrast, for example, Foucault’s late work is sometimes discussed or named as ethics. In a way, this has some purchase; however, his work focused more on the “technics of the self” – that is, the historical, political and cultural matrices that form subjectivity and the

18. Derrida’s essay “On Forgiveness” also addresses Jankélévitch’s work.
the “ethical turn” in continental philosophy

possibility of resistance to them or action within them – than on ethics per se, even as he attempted to develop ways of thinking about “how to live” in the contemporary situation of modernity.

IV. THE RECEPTION OF LEVINAS’S WORK AND THE “ETHICAL TURN”

During the 1960s and 1970s, Levinas’s philosophy – his early essays and his two major books Totality and Infinity and Otherwise than Being – remained fairly obscure and seemed to have a limited effect outside of a very narrow philosophical and Jewish intellectual circle. In the Anglo-American world, too, this was the case. Translations of his work were published in an untimely manner and very little critical commentary was produced. Even so, Levinas’s work made an impact in a number of significant places. As I have suggested, his lifelong friend Blanchot was greatly influenced by Levinas’s work and wrote both of and on him. Jean-François Lyotard, too, was greatly influenced by Levinas and discussed his work at length in his most important book, The Differend (1986).

In the philosophy of religion, Levinas’s work made an impact and attracted commentary from, among others, leading theologian Jean-Luc Marion and Pope John Paul II. While Levinas argued that he articulated “a clear distinction, in what I write, between philosophical and confessional texts,” he could not “deny that they ultimately have a common source of inspiration.” If philosophy and religion “happen to be in harmony … it is probably because every philosophical thought rests on pre-philosophical experiences.” Whether Levinas was, at heart, a religious thinker, or one who analyzes some of the phenomenological experiences of religion that are widely shared, is a matter for debate. One must note, however, that the influence of religion in his work has been of interest to theologians. Equally noteworthy, his work does play a large role in Dominique Janicaud’s polemic about phenomenology and religion in French philosophy.

Another major thinker, influenced in some part by Levinas’s work, was Paul Ricoeur. Ricoeur is a significant figure in European thought, and his work is

---

19. The first book on his work was Edith Wyschogrod’s Emmanuel Levinas: The Problem of Ethical Metaphysics (The Hague: Martinus Nijhoff, 1974).
20. Kearney, Dialogues with Contemporary Continental Thinkers, 54.
23. For a more extensive discussion of Ricoeur’s philosophy, see the essay by Wayne J. Froman in The History of Continental Philosophy: Volume 6.
characterized by a desire to synthesize differing traditions, both within European philosophy and, especially in his work most centrally concerned with ethics, *Soi-même comme un autre* (*Oneself as Another,* 1990), European and analytic traditions. His work on ethics drew on the conceptions of “virtue ethics” developed by, among others, Alasdair MacIntyre, with whom he had worked closely. Ricoeur’s work had long been concerned with the nature of narrative: in relation to the ethical, he argued that the *ipse*, the self-consistency of a self, is constructed in and understood through, and as, a narrative. Our identifications with our own narratives (which shape our habits, and our ways of seeing ourselves) lead us to moral behavior – preeminently exemplified, for Ricoeur, in keeping one’s word. Perhaps the main consequence of this view is that it becomes impossible for us to see ourselves in isolation from others: instead, this view leads us to understand ourselves as constantly accountable to and responsible for others.

However, central to the “ethical turn” and to the reception and development of Levinas’s work was the influence it had on the work and the thought of Jacques Derrida. *Totality and Infinity* was the subject of a long essay by Derrida, written in 1964, entitled “Violence and Metaphysics.” This wide-ranging and complex essay is, as Robert Bernasconi suggests, not simply a critique by Derrida of Levinas, but one of the earliest of Derrida’s deconstructive readings; indeed, it is “a key document both in Derrida’s development of deconstruction and in the reception of Levinas’s own ethical thinking.”24 In this essay, Derrida’s chief argument is that in *Totality and Infinity* what is fundamental is not ethics *per se* but rather Levinas’s phenomenological method of “uncovering” ethics. Derrida argues that this means that “ethics finds within phenomenology its own meaning, its freedom and its radicality.”25 For Levinas, Derrida suggests, it is the way in which ethics is represented by phenomenological thought that reduces ethics to representation; the “meaning of the non-theoretical as such (for example, ethics or the metaphysical in Levinas’s sense)” is only made clear by “theoretical knowledge.”26 Ethics, then, is not “first philosophy.” Rather, the representation of the ethical by phenomenological thought becomes first philosophy: the nontheoretical, the “true representation” of the face, is understood only through the theoretical, in this case, through the methodology of phenomenology.

Derrida has returned to Levinas and recognizably Levinasian themes throughout his work. However, many of Levinas’s ideas – the idea of the trace, for example – were taken up and transformed by Derrida. In fact, it is possible to see Levinas’s own work after “Violence and Metaphysics,” including *Otherwise than Being*, as a response to Derrida’s intervention. It is through Derrida’s work that a generation of philosophers associated with him and with deconstruction were influenced by Levinas. Indeed, much of the “ethical turn” can be seen as a response to Derrida’s own Levinas-influenced shift of emphasis over his prolific career from linguistic and epistemological questions (broadly understood) to ethical and political ones.

Like Derrida, Levinas’s influence on the philosopher Jean-Luc Nancy can also be seen, although he engages more directly with political and communal concerns. In *The Inoperative Community* (1982), Nancy seeks to develop an idea of community beyond the traditional understanding of Western philosophy, which posits a shared characteristic communality – a “communitarian essence” – that makes up a community. Instead, he posits a community of those who have nothing in common, a community made up precisely because they share having nothing in common save their finitude. Indeed, a community is thought out precisely “on the basis of a shared mortality which cannot be subsumed into any communal project or collective identity … the exposure of each singular existence, its being-outside-of-itself, to a death which is revealed in and through the death of others.” What creates the thought of a community is what exceeds it. In this, like Levinas, he prioritizes Mitsein, being-with, over Dasein. He continues to develop this theme – that our commonality lies not in any quality, but in our very experience of finitude and estrangement – in *Being Singular Plural* (1996), where he puts forward the idea that it is each of our being as singular that marks our communality.

V. PROBLEMS WITH LEVINAS AND THE “ETHICAL TURN”

There are two sorts of problems that are raised by the ethical turn within the history of contemporary philosophy. The first concerns the possible religious element of the turn in general, and in particular in Levinas’s thought; the second concerns the relationship between the ethics espoused in this turn and the political.

Levinas’s apparent religious commitments – whether or not they structure his more rigorous philosophical thought – have raised a range of questions. Indeed, one early and critical account by Gillian Rose argues that Levinas simply presents “Judaic theologico-political prophecy or ethics in philosophical terms as the end of philosophy.”\(^{30}\) It is unclear if the very idea of “the other” is not simply a cover for the “divine other.” This is central to a number of critiques of Levinas’s thought by leading contemporary thinkers. Badiou, for example, is highly critical of Levinas. While – rightly – he dismisses much vague talk of “the ethics of difference” that Levinas’s work has inspired as “strikingly different from Levinas’s actual conception of things,” he argues that Levinas is at base a religious thinker.\(^{31}\) Badiou goes further, and more interestingly, he states that “the ethical primacy of the Other over the Same” (what he takes to be the core of Levinas’s thought) requires “that the experience of alterity be ontologically ‘guaranteed’ as the experience of a distance, or of an essential non-identity, the traversal of which is the ethical experience itself. But nothing in the simple phenomenon of the other contains such a guarantee.”

In order for Levinas’s ethics to function, then, Badiou asserts that it needs an axiom, that “ethics requires that the Other in some sense be carried by a principle of alterity which transcends mere finite experience.” Badiou contends that Levinas calls this principle the “Altogether-other” and “it is quite obviously the ethical name for God.” Badiou continues by arguing that this means that Levinas’s philosophy is “annulled by theology” and that “every effort to turn ethics into a principle of thought and action is essentially religious … ethics is a category of pious discourse.” In his book After Finitude (2006), Quentin Meillassoux makes a similar charge, accusing a whole tradition of phenomenological thought of “fideism.” While it is true that Levinas himself was a religious man, and his work is influenced by religious thought, and that uncovering the implicit workings of a reliance on the divine is a valid task for philosophers, there is much in these critiques that is open to question. Badiou bases his claim on an issue in Levinas’s work – the fact that the alterity of the other cannot be guaranteed, or may not “occur” – that is present as an issue in Totality and Infinity, but that is explicitly addressed in Otherwise than Being. There, the “said” – the concretization of the other in a way that prevents its work as a rupture – overgrows the “saying” – the rupture caused by otherness. Moreover, Levinas never claims in his philosophical work that the “altogether-other” is Divine, and it need not be for his work to function as a description of the moment of ethics. Finally, while for Badiou the operation of axioms is crucial for philosophy, for

---

Levinas, axiomatic thought is only one part of philosophical work more widely understood.

Slavoj Žižek, too, shares some of these reservations, especially about the possible role of the Divine. Moreover, he finds the stress on the Face, in *Totality and Infinity* – which is changed in *Otherwise than Being* – too strong, even fetishist. Further, and again, without apparently having read *Otherwise than Being*, where Levinas addresses the question of social justice and the “third,” Žižek questions how an asymmetrical ethics – one in which the “I” is responsible to the Other – can form a communal justice.

Žižek’s concerns point to the second array of questions, about the nature of the ethical turn and the political. And it is in Derrida’s use of Levinas that we see this issue in the “ethical turn” being addressed. This relationship is complex: it is not simply a matter of an “exhortative” gesture; after all, one does not need philosophy for preaching, or for trying to live the good life. Rather, the ethical turn, taking its cue from Levinas and from the phenomenological tradition, was not at first a political philosophy but rather a painstaking reflection on thought and on the traditions and canons of European thought itself that were aware of the exclusion or (often murderous) transformation of otherness. Hannah Arendt – like Levinas, a student of Heidegger – wrote, in *The Origins of Totalitarianism*, that we:

> can no longer afford to take that which was good in the past and simply call it our heritage, to disregard the bad and simply think of it as a dead load which by itself time will bury in oblivion. The subterranean stream of western history has finally come to the surface and usurped the dignity of our tradition. This is the reality in which we live. And this is why all the efforts to escape from the grimness of the present into nostalgia for a still intact past, or into the anticipated oblivion of a better future, are vain.32

The ethical turn was focused, then, on this “subterranean stream,” which had “come to the surface” (after all, “Nazism was not born in a desert,” Derrida writes).33 It was the sense that Western thought was, as Levinas described it, an “Omnivorous philosophy” in which “‘I think’ comes down to ‘I can’ – to an appropriation of what is, to an exploitation of reality.”34 That is, the ethical turn can be seen as an attempt to disrupt the metaphysics of comprehension, the

---

34. Levinas, *Totality and Infinity*, 46.
gesture that characterizes Western thought. But this is not a rejection of Western thought or of politics. Levinas argued, instead, that this moment of engagement with the other, this:

putting into question of the same by the Other … is, beyond knowledge, the condition of philosophy … not only attested by the articulations of Husserlian thought … but also appears at the summits of philosophies: it is the beyond-being of Plato, it is the entry through the door of the agent intellect in Aristotle; it is the idea of God in us, surpassing our capacity as finite beings; it is the exaltation of theoretical reasoning in Kant’s practical reason; it is the study of the recognition by the Other in Hegel himself; it is the renewal of duration in Bergson; it is the sobering of lucid reason in Heidegger.35

The other is both the foundation and the demarcation of the limits of Western thought. However, this putting into question or thinking the limits can happen only in the conceptual language that is available: the language shaped and characterized by the Greek *logos*. For the West, no other conceptual language is easily available. Yet from this, thinkers have begun to develop and structure senses of political commitment. Of course, Levinas’s work has offered a way of discussing ethics that was outside traditional *marxisant* models and drier, more analytic forms of ethical inquiry. That is, his work simply offered a way to discuss ethics and politics when no others were available or convincing. More than this, as I have suggested, it also brought the reflective critique of thought (traditions of thought inherited from Heidegger and strands of phenomenology) into an ethical arena. Even though Levinas’s own politics were conservative, and sometimes, as Howard Caygill has argued, open to question even in light of his own philosophical commitments, the discussion of ethics began to make a bridge between philosophical and political commitments.36

Indeed, in “Violence and Metaphysics,” Derrida proleptically suggests that this sort of approach to ethics is an “ethics without law and without concept, which maintains its non-violent purity only before being determined as concepts and laws.”37 That is, this understanding of otherness could not become a dictate of a series of moral axioms: it is beyond, although foundational for, law and politics. This might suggest its inapplicability to the political in any sense. Indeed, much in the “ethical turn” reflects an intellectual response to

---

the Cold War: not by (pace Arendt in the 1950s) contrasting communism with
democratic liberalism, but rather by revealing that any system itself (liberal,
socialist) is a totalizing one. Evaluating systems in this way, in a globalized era,
might be seen as enabling a new world order or it could, more sinisterly, be seen
as an abdication of political responsibility. It is precisely this suggestion that
one of the leading thinkers of the “ethical turn,” Simon Critchley, has sought to
address. Critchley’s first book, The Ethics of Deconstruction, aimed to uncover
the role that Levinas’s thought played in Derrida’s work and to argue that decon-
struction was ethical in Levinas’s sense. His recent work continues to develop
this line of thought and to explore the impact of the ethical turn on current
political thought. Critchley argues that “ethics without politics is empty … poli-
tics without ethics are blind … we need ethics in order to see what to do in a
political situation.”38 He argues that the problem with much traditional thinking
about politics is that it is “archic: it is obsessed with the moment of founda-
tion, origination, declaration, or institution that is linked to the act of govern-
ment, of sovereignty, of establishment of a state” (128). In contrast, the form of
politics that he develops, from the ethical turn, is what he describes as “anar-
chical meta-politics.” By this, and following up Levinas’s suggestions, Critchley
is not suggesting that anarchy should be a new “arche” – another political cate-
gory – but that it should be the “negation of a totality and not the affirm-
tion of a new totality … a radical disturbance of the state, a disruption of the
state’s attempt to set itself up or erect itself into a whole” (122). “We might say,”
he continues, “that ethical anarchy is the experience of the multiple singulari-
ties of the encounter with others that defines the experience of sociality” (123).
This means that politics, while guided by ethics, cannot respond to “systemic or
structural laws” (132), or overarching principles, but requires “subjective inven-
tion, imagination and endurance, not to mention tenacity and cunning” (132).
The result of the ethical turn in philosophy is to “construct political subjectivi-
ties that are not arbitrary or relativistic, but that are articulations of an ethical
demand whose scope is universal and whose evidence is faced in a concrete
situation. This is dirty, local, practical and largely unthrilling work” (132).

In a similar vein, Judith Butler’s recent work circles around Levinasian themes
and responses to political questions. Like Critchley, she seeks to link the ethical
and political realms through a consideration of the Levinasian face, through
issues of vulnerability. She writes that if:

the humanities has a future as cultural criticism, and cultural criti-
cism has a task at the present moment, it is no doubt to return us to

38. Simon Critchley, Infinitely Demanding: Ethics of Commitment, Politics of Resistance (London:
Verso, 2007), 120. Subsequent references to this text are cited parenthetically by page number.
the human where we do not expect to find it, in its frailty and at the limit of its capacity to make sense. We would have to investigate the human at the limits of what we can know, what we can hear, what we can see, what we can sense.39

Critchley, Butler, and others are seeking philosophically informed ethical/political responses from outside the conventional Left/Right positions and are a part of the continuing legacy of the “ethical turn.”

VI. CONCLUSION

I have argued that the transformation in continental philosophy in the 1980s, resulting in the “ethical turn,” was a response to political, cultural, and historical events. The growing number of new areas of philosophical interest and a return to older questions that analyze, both practically and intellectually, the Marxist tradition led to a reconsideration of the category of “otherness.” While Jacques Derrida was perhaps the central, and most well known, figure in this, the primary influence was Emmanuel Levinas, and much of the “ethical turn” can be seen as an exploration and development of themes in his philosophy.

Rooted agonistically in the phenomenological tradition and in a philosophical consideration of the darkest moments of twentieth-century European history, Levinas argued that “ethics was first philosophy”; that is, that our ethical commitments originate in the concrete experience of our encounter with the other and that this “precedes” ontology and subjectivity, that “the self is through and through a hostage, older than the ego, prior to principles” (OTB 117). Until the 1970s and 1980s, this work had a narrow but significant influence. Over time it has become a major force in the theorization of ethics. Although the Levinasian approach – and the “ethical turn” in general – has been criticized for being apolitical and religious, its influence and legacy remains in the work of many recent thinkers who have countered these claims by developing further these Levinasian insights.

11

FEMINIST PHILOSOPHY: COMING OF AGE

Rosi Braidotti

I. THE MULTIPLE TEMPORALITIES OF FEMINIST THOUGHT

Around 1981, as Jane Gallop put it in her homonymous book, the second feminist wave enters officially into the academic curriculum of American universities. The baby-boomers, whose restlessness and egalitarian aspirations shaped the politics and the cultural revolution of the 1970s, come of academic age in the 1980s and go knocking on the doors of academia, demanding reforms of the canonical curriculum that will reflect the concerns and anxieties of their generation. The disciplinary area that is most receptive to the theoretical insights, the political passions and the innovative style of the radical epistemologies of the social movements of the 1960s and 1970s is not, predictably enough, philosophy. The academic, institutional practice of philosophy is still quite conservative at the dawn of the 1980s, as argued in this volume by Judith Butler and Braidotti. It tends to resist against the swelling tide of radical philosophies and the social and political turmoil of the period. A crucial element of this hostility is related to the “Franco-American disconnection,”¹ and it underscores the extent to which French poststructuralist thought actually shaped the theoretical concerns of the rebellious generation who entered US academia at the end of the 1970s and was thus well placed to shape the agenda throughout the 1980s.

This is not to say, however, that the impact of French thought was uncontro-
versial, or that other traditions within continental philosophy did not impact posi-
tively on the development of feminist philosophies through the 1980s.

For instance, the German critical theory school continues to exert a produc-
tive influence on feminism, in the astute commentaries provided by a new
generation of scholars, but also in original elaborations. For example, Seyla
Benhabib and Nancy Fraser provide new insights into democratic analyses of
societal institutions and social movements. Drucilla Cornell pursues a different
route to radical democracy by combining the methods of deconstruction and
psychoanalytic theory to the analysis of social phenomena.

The legacy of phenomenology also endures and grows, for example through
Iris Marion Young’s illuminating analyses of public policy, race politics, and
democratic practices. The phenomenology of race is enriched by the original
gender perspectives introduced by Linda Alcoff, while Christine Battersby
engages in productive dialogue with both phenomenology and poststructural-
ism. One of the areas of phenomenology that grows exponentially in the period
is the field of “Beauvoir studies,” especially after the death of the grand lady in
1986. Deirdre Bair publishes Simone de Beauvoir’s official biography in 1990, while
critical overviews of Beauvoir’s impact on contemporary feminism begin
to appear. This field of study will intensify at the end of the century and the
start of the new millennium.

    Margaret A. Simons (ed.) Feminist Interpretations of Simone de Beauvoir (University Park, PA: 
    Pennsylvania State University Press, 1995). For an overview see Karen Vintges, Philosophy
Another field that grows fast in these years is feminist moral philosophy, which reaches greater heights with the theory of an “ethics of care” proposed by the social psychologist Carol Gilligan and developed into a new social theory of citizenship by Joan Tronto. One of the most eminent feminist moral philosophers is Virginia Held, who combines the radical insights of feminist activism with broader ethical concerns. Of great significance is also the work of Martha Nussbaum, who applies universal but situated ethical principles to public policy and urgent global social issues. Analytic philosophy was itself not immune from the contagious creativity of the era. The pace and quality of these new developments is such that it blurs the boundaries between established schools of thought and national traditions.

Nonetheless, French philosophy was clearly the inspirational force that propelled the most innovative theoretical developments for the feminist philosophers of the period throughout Europe and elsewhere. Even the more skeptical-minded feminist philosophers have to come to terms with the challenges of difference. French thought is thus the hidden agenda that makes

---

11. See, for example, Joan C. Tronto, Moral Boundaries: A Political Argument for an Ethic of Care (New York: Routledge, 1993).
15. The most significant works in this tradition are the Milan Women's Bookstore Collective's elaboration of Sexual Difference: A Theory of Social-Symbolic Practice (Bloomington, IN: Indiana University Press, 1990). This was developed into an original critique of the history of philosophy by Adriana Cavarero in In Spite of Plato. In German, the significant contributions are Herta Nagl-Docekal and Herlinde Pauer-Studer's edited collection Denken der Geschlechterdifferenz: Neuen Fragen und Perspektiven des feministische Philosophie, and Andrea Maihofer's Geschlecht als Existenzweise: Macht, Moral, Recht und Geschlechterdifferenz. In Spanish, the pioneering work is done by Celia Amorós in Hacia una critica de la razón patriarcal and by Maria Santa Cruz, Marie-Luisa Femenias, and Anna-Maria Bach on Mujeres y filosofía in Latin America.
16. This school, initiated by Janet Radcliffe Richards's The Skeptical Feminist: A Philosophical Enquiry, is pursued by Mary Hawksworth's “Knowers, Knowing, Known: Feminist Theory and Claims to Truth,” which is a critical assessment of feminist postmodernism. Susan Hekman's Gender and Knowledge: Elements of Postmodern Feminism makes important progress on
traditional philosophers cringe with irritation and mistrust at the sight of new philosophical questions, supported by unfamiliar and foreign sounding terminology: subjectivity, discourse, materiality, and power as restrictive or negative (potestas), but also as positive and empowering (potentia). The impact of French poststructuralism on feminist theory is an epistemological upheaval: the French imports are clearly the fallout of what could be called “high” poststructuralism, namely the work of Lacan, Foucault, Derrida, Deleuze and their feminist counterparts Kristeva, Cixous, Kofman, Irigaray, and others. This process of theoretical marketing, however, is not even: some texts – notably those of Foucault, Derrida, and Kristeva – enter rapidly into what Edward Said aptly labeled as the “travelling theories” mode, while others, notably those of Deleuze and Irigaray, had to wait much longer before being “discovered.” The different rhythms of translation of these texts had a significant impact on the influence they exercised on Anglo-American feminism.

The effect of French poststructuralism was nonetheless instant and significant. In the mid-1980s, as American feminism plunges into the “sex-wars” that will divide its radical wing, the notion and the politics of difference move materialism, while Anne Phillips's *Democracy and Difference* attempts an interesting dialogue between continental feminism and the British liberal tradition.

17. For a discussion of the work of many of these figures, see the essays in *The History of Continental Philosophy: Volume 6*. The French feminism phenomenon was analyzed lucidly by Claire Duchen in *Feminism in France: From May '68 to Mitterrand*, and it reads as a textbook case of cultural branding on the part of major English-language publishers. I analyzed the cultural marketing exercise with Jane Weistock in “Herstory as Recourse,” in *Hecate*.

18. This movement is led by the linguistically oriented school, inspired by Jacques Lacan, Jacques Derrida, and Roland Barthes, that was centered in the Yale School of literary theory (for a discussion of the Yale School, see the essay by Jeffrey T. Nealon in *The History of Continental Philosophy: Volume 6*). The main feminist figures of this movement had a lot of influence on feminist philosophy, notably Barbara Johnson in *The Critical Difference* and *The Feminist Difference: Literature, Psychoanalysis, Race and Gender*. Shoshana Felman combined psychoanalysis and semiotics in inspiring ways in *What Does a Woman Want? Reading and Sexual Difference*, whereas Marjorie Garber adapted them both to cultural studies in *Vested Interests: Cross-dressing and Cultural Anxiety*. The pioneer of French feminist theory in the US was Domna Stanton, who worked on *The Female Autograph: Theory and Practice of Autobiography from the Tenth to the Twentieth Century*, a women-centered literary canon. Nancy Miller in *The Poetics of Gender*, Alice Jardine with *Gynesis*, Naomi Schor in “Dreaming Dissymmetry”; and Catharina Stimpson in *Where the Meanings Are*, developed radical perspectives on the specificity of the feminist approach to textual criticism. An inspiring deconstructivist like Gayatri Spivak also bases her interventions on the postpsychoanalytic and Derridian understanding of the ontological value of subjectivity and the primacy of the power relations that structure it.

19. The core argument of the “sex wars” was the campaign against pornography, which soon developed into a larger dispute about sexual politics and the understanding of sexual freedom. The influence of Andrea Dworkin and Catharine McKinnon resulted in a prohibitionist approach to sexual practices, which produced both an alliance with the Christian Right and a violent reaction by radical feminists and sexual liberationists. French philosophy provided
The epicenter of the new philosophical developments stays in Paris, but a widespread diaspora of poststructuralist ideas takes place through the institutional basis for this movement of thought in the US, such as literary theory, comparative literature, cultural studies, and film theory. Philosophy departments place themselves at a clear and explicit distance from these fashionable trends and close ranks. This hostility will continue to grow throughout the 1980s as the “theory wars” rage through American universities under the combined effect of Reagonomics, neoconservatism, and the rise of the religious Christian Right. Poststructuralism did not fare much better on its home turf, especially after the presidential election of Mitterrand in 1981, when a wave of “new philosophers” (André Glucksmann, Bernard-Henri Lévy, etc.), turned its back on the philosophical giants of the previous generation.

By 1995, the game will be over and the counter-offensive against poststructuralism will have won the day. Gayatri Spivak, looking back over this period in 2003, speaks of the death of a discipline to indicate the decline and fall of poststructuralist-driven literary theory and comparative literature in the US academy. Nonetheless, the hegemonic hold that high poststructuralist thought had over the most critical and creative minds of that academic generation endures. Spivak’s analysis covers the external pressures of a fast-changing world driven by globalization, technological mediation, cultural hybridization, and the rising economic power of the global South. Spivak also stresses, however, the internal flaws of what she considers an incurably Eurocentric system of thought. Gallop herself, writing in 1997 about a controversial lawsuit instigated by her lesbian students, spells out in unequivocal terms the political debacles generated by the rise of identity politics and the extent to which they absorbed the best energies of poststructuralism.

Narrating the course of feminist philosophies in the 1980–95 period means having to take into account this complex political and institutional history. The impact of high poststructuralism is in some ways a specifically American phenomenon, but it is connected to the French and European scene not only historically, but also through conceptual and personal ties: a whole generation of

---

21. See also my essay in *The History of Continental Philosophy: Volume 8*.

22. See, in this regard, the essay by Iain Chambers in this volume.

graduate students and junior academics actually studied in Paris or read French theories as part of their often independently chosen curriculum. I was one of them and this personal involvement does not simplify my task in this chapter and increases my accountability accordingly. Because of the diasporic nature of poststructuralist philosophies of difference and subjectivity, however, and as a result of their enormous generative force, feminist philosophies in the 1980–95 period simply explode in an outburst of creativity. So much so that it is daunting to even attempt to account for the successful social and intellectual revolution that marks the coming of age of an entirely new generation of feminist philosophers who grew up with and after high poststructuralism.

The changing historical context also plays its hand in rendering feminist philosophy especially complex in this period. The twin phenomena of the fall of the Berlin Wall in 1989 and the enlargement of the European Union,24 as well as the new wave of wars that emerge in the period (the first Gulf War, the Falklands War, and the Yugoslav and Balkans War), have major impact on the development of continental and transnational feminism.25 The single most important development, however, is the expansion of feminism both east and west of the former border. In the former West, the institutional growth and consolidation of the field results in the creation of new PhD programs in women’s studies. On the other side of the border, feminist philosophical voices from former Eastern Europe can now get a wider audience. This phenomenon is so vast and rich that it deserves a fuller treatment than I can grant it here. Suffice it to stress the importance of original political thinkers trained in philosophy, such as Zarana Papic, whose work on nationalism and subjectivity remains fundamental. Dasa Duhacek provides important analytical insights into Eastern European radical feminism as a critique of the patriarchal aspects of the Yugoslav communist state. Rada Iveković challenges narratives that assume the centrality of a Western philosophical perspective by adopting a broadened, antinationalist and postcolonial perspective.

As a consequence of these historical upheavals and intellectual developments, this chapter could not adopt a chronological structure, let alone a linear one. Nonlinearity has been a distinctive trait of feminist theory since the 1980s. In her seminal essay on women’s time, also published in 1981, Julia Kristeva

---

25. Already at the beginning of the 1990s, feminist theory provides the basis for innovative critiques of globalization. Influential pioneers in this field are the political theorist Cynthia Enloe in The Morning After: Sexual Politics at the End of the Cold War, and the work of Inderpal Grewal and Caren Kaplan on transnational feminism in Scattered Hegemonies: Postmodernity and Transnational Feminist Practices.
stresses the cyclical, circular nature of female temporality, which she connects both to the specific rhythms of female embodiment and to the social division of labor that assigns women to the most repetitive and unappreciated tasks. Genealogical returns, not chronological continuity, fix the beat of feminist discursive production. The multiple temporalities of feminist philosophy spell patterns of becoming that challenge academic habits of linearity. I will attempt to account for these complex phenomena by drawing a cartography based on a generously broad, yet selective, bibliography of the main sources.

II. THE “INTERMEDIATE” GENERATION

The feminist philosophers who came after poststructuralism were too young to be real baby-boomers, but at the same time old enough to be eye-witnesses to the world-changing events of the 1970s and 1980s. I call the generation of feminist philosophers between 1981 and 1995 the “intermediate” generation, although what exactly it is intermediate between is open for discussion. At the start, it clearly follows “high poststructuralism,” but what succeeds it – be it the third wave or a feminism yet to come – is still an open question. Truly poststructuralist in their desire to apply the great theoretical insights of the previous generation to a variety of social and discursive practices, feminists of the intermediate generation simultaneously pursue the aims of the second feminist wave and lay the foundations for future developments. They are the agents of the “long march through the institutions,” which brings an entire new intellectual generation into academic positions, and with it a new theoretical and political agenda for the institutional practice of philosophy.

Although they are the real heiresses of high poststructuralist thought, there is no official testament to ensure the transmission of ideas, and not all of them had direct contact, either as students or colleagues, with the French master-thinkers who shaped that philosophical movement. They function in English and not all of them can read the French texts in the original, but this diasporic mode of thinking in translation, far from being a problem, turns into the strength of this particular generation of thinkers. Within the English language, many of the feminist philosophers of this period are not from the USA: for instance, the great pioneer of feminist philosophy Lorraine Code is based in Canada, whereas under the influence of Genevieve Lloyd, Australian feminist theory blossoms

27. Genevieve Lloyd (1941– ) studied philosophy at the University of Sydney and then at Somerville College, Oxford. Her DPhil, awarded in 1973, was on time and tense. From 1967
and spreads worldwide. In the US, while many are products of philosophy departments, they tend to gather in interdisciplinary fields – as is the case for Butler, Cornell, and Elizabeth Grosz – although some manage jobs in continental philosophy, like Fraser and Alcoff.

In its diasporic and transnational mode, the intermediate generation of feminist philosophers embraces the concept of difference, but with the explicit aim of making it function differently. They recast feminist theory along a complex line of interrogation that includes race, sexual orientation, and age, and will target the main tenets of equality-minded feminism and question the view of the subject that is implicit in the political program of traditional emancipation in Europe and the liberal feminist politics of equal opportunities in the Anglo-American world. Irigaray’s question “Equal to whom?” could be taken as the war cry for the following generation, which refused to take equality as homologation or reduction to Sameness. The crucial idea is that difference functions as a multi-layered concept not only between binaries, but also among diverse groups and more especially within each category. The “difference within” instills a constitutive distance between each concept and the metaphysical illusion of presence. It is a hiatus between the signifier and the signified in which the solidity of all meanings oscillates, stumbles, stutters, and falters. The positivity of difference, that is to say, the potential for radical transformation that is carried by subjects who are both socially and symbolically described as “others,” becomes the focal point for both the political struggles and the theoretical debates.

28. The Australian phenomenon is worthy of special note for the high quality and the overwhelming quantity of feminist philosophy it produces. Starting from Lloyd’s critique of the masculinity of the history of philosophy in *The Man of Reason*, a whole generation is raised in this tradition. I am proud to be one of Lloyd’s students. Carol Pateman develops important aspects of feminist political theory, and Elizabeth Grosz very early develops French philosophical insights, as will Moira Gatens. The trend will continue in a more diasporic vein after the period covered in this volume with Penelope Deutscher and Claire Colebrook, both of whom now teach in the US.

In terms of the philosophical agenda, the focus shifts accordingly from the humanist individualism of the liberal tradition in the US and the residual humanism of the Marxist traditions in Europe and Latin America to different figurations for the nonunitary structure of subjectivity. Humanist thought assumed a unitary and rational subject in charge of his/her historical endeavors; with the “death of Man” announced by Foucault and the subsequent “death of Woman” predicated by the high poststructuralist feminists, however, this unity is replaced by open structures and an emphasis on processes of subject formation rather than substances. As a consequence, high feminist poststructuralism was antihumanist in that it critiqued from within all the unitary identities because they assumed phallo-logocentric, Eurocentric, white supremacist, anthropocentric, and standardized views of what constitutes the humanist ideal of “Man.” This militant antihumanism intersects productively with postcolonial and race perspectives, which critique humanism for its racist connotations and racialized bias and propose instead the critique of universalist white supremacy, and non-Western forms of radical neohumanism.

For all feminists inspired by poststructuralism, “difference,” or more specifically, the notion of “otherness,” functions through dualistic oppositions that confirm the dominant vision of the subject. In other words, the dominant apparatus of subjectivity is organized along a hierarchical scale that rewards “sameness” by defining the sovereign subject as the zero-degree of difference. By extension it also posits subcategories of difference – through processes of sexualization, racialization, and naturalization – and distributes them along a scale of asymmetrical power relations. Deleuze calls it “the Majority subject” or the Molar center of being, Derrida labels it “phallo-logocentrism,” Irigaray calls it “the Same,” or the hyper-inflated, falsely universal “He,” whereas Hill Collins calls to accountability the white and Eurocentric bias of the subject of humanistic knowledge. The lessons of race and postcolonial theories are of the greatest

31. See, for instance, bell hooks' influential Yearning (Toronto: Between the Lines, 1990).
importance to add a political inflection as well as higher degrees of complexity to this philosophical understanding of difference.

Whereas the generation that came of age philosophically with Beauvoir stressed transcendence and rationality, the difference thinkers stress immanence and a nonessentialist brand of embodiment. From Lacanian psychoanalysis they borrow the notion of the materiality of the linguistic sign and from deconstruction the critique of phallo-logocentrism. But over and above all borrowing, this “intermediate” generation of feminist philosophy rises to the challenge of great theoretical creativity and innovates both on categories of thought and on methods. They progress from the critique of classical dualistic notions of difference to the affirmation of diversity, and from the classical opposition transcendence–immanence to new epistemological schemes that allow more complex understandings of what exactly is the “matter” that poststructuralist materialism or deconstructive materiality are all about. However influenced by poststructuralism, the generation that is operational in the 1980–95 period thinks across borders and in an interdisciplinary manner that actually consolidates the entire field of feminist philosophy in powerful new ways.

III. GENDERING THE MASTER’S VOICE

The generation of feminists situated between 1980 and 1995 was the first to enjoy the institutional presence of supportive and talented women teachers and supervisors, many of whom were feminists themselves. The effects of the actual, physical presence of women lecturers in philosophy departments starting from the 1970s and 1980s cannot be stressed enough, and the influence of these teachers on the generation of radicalized younger women philosophers emerging from feminism was enormous.

The philosophical underpinnings of feminist teaching became a matter of great concern for the generation that pioneered feminist and women’s studies in academic institutions. The premises rest on a number of notions derived from classical historical materialism but enriched by a gender perspective. In this respect, feminist philosophy has much in common with other critical epistemologies such as the radical pedagogy of Paulo Freire, liberation theology, and postcolonial and race theories. The main philosophical premises are the following: first, that the aim of a philosophical education is to cultivate the multifaceted aspects of the common humanity we share. This humanism stands in stark opposition to more utilitarian definitions of higher education, let alone the narrower functionalism that will spread throughout the 1990s as an effect of neoliberal economics and its academic managers.
Second, the basic unit of reference for a philosophical education is not liberal individualism but a social constructivist notion of the subject as a sociopolitical entity defined by material forces and relations. For feminism, these material social relations are linked to both production and reproduction and thus can be said to be embedded and embodied. This vision of the subject supports the humanist ideal described above in believing that education is a collective civic endeavor whose ultimate aims are freedom and equality of chances through socially enacted networks of solidarity.

Third, the neutrality of scientific knowledge, which follows from the idea of the self-regulating structure of rationality, and the method of dispassionate objective observation are challenged. The grounds for contestation are the same social constructivist notions defined above. The universalistic pretensions of the subject are debunked by an epistemic approach based on Adrienne Rich’s idea of “the politics of location.”34 This is both a method and a strategy that makes sense of diversity among women. The category of sexual difference is not only understood as the binary opposite of the dominant phallo-logocentric subject, but also as the virtual potential for multiple differences.

The strategy of the politics of location is coupled with epistemological and political accountability. This is understood as the practice that consists in acknowledging and unveiling the power locations that one inevitably inhabits as the site of one’s identity. Because a “location” is not a self-appointed and self-designed subject-position, but rather a collectively shared and constructed space, it refers to a process of consciousness-raising through the intervention of others. “Politics of locations” produce cartographies of power that rest on a form of self-criticism, a critical, genealogical self-narrative, that is relational and outward-bound. It then follows that feminist knowledge is an embodied, interactive process that brings forth complex aspects of our existence, especially our own implication with power. Thus, black women’s texts and experiences make white women see the limitations of their locations, truths and discourses. In Deleuzian language, it “de-territorializes” us, that is, it estranges us from the familiar, the intimate, the known, and casts an external light on it. The strategy of estrangement or defamiliarization transforms our knowledge of ourselves and others. This entails a critique of science and a thorough examination of the networks of power that constitute and sustain science as a social practice. In this respect, feminist epistemology shares a great deal with the radical thought of Feyerabend, Kuhn, and Foucault.

Last but not least, feminist genealogies come into operation by adopting the strategy of “thinking back through the women” to draw inspiration from the past. For Virginia Woolf this tactic was also a style of writing and a practice

of citation. Women-centered approaches are highly recommended to all the women who aspire to have a mind of their own and to reconnect with the deeper sources of their creativity. This is a groundbreaking development in itself and it becomes even more striking when read in a historical perspective. The previous generation of feminist philosophers—those who came of age in Europe in the 1950s and 1960s—settled into an ambiguous relationship to the actual institutional practice of philosophy. Beauvoir herself was not allowed to teach in the Grandes Écoles that train the French elites. Others, such as Françoise Collin, were pioneer feminist philosophers who deliberately chose to function in self-run collectives or marginal organizations. Owing to the historical context, that generation continued to engage in dialogue more readily with the great male philosophers of the continental tradition than with any living women, let alone cross-referring to their own peer group. The high poststructuralist generation did not fare much better, although they did acknowledge some of the great, dead women intellectuals of the past.

Michèle Le Doeuff, in her work on the philosophical imaginary, was one of the first to raise the question of what she aptly named the Heloise complex: women being devoted head and body to great philosophical masters who tend to take advantage of their love in every possible way. The second feminist wave was to change all this, but the effects on the pedagogical front were slower than the speed of social transformation.

Furthermore, if footnotes and bibliographies are the manifestation of democracy and belonging in a text, there is no question as to the undemocratic and often self-referential nature of a great deal of the feminist texts produced in France in the 1980s by the generation of high poststructuralism, starting from the holy trinity of French feminism itself: Irigaray, Cixous, and Kristeva. Almost in reaction to it, the intermediate generation made a point of using the scholarly

---

35. Françoise Collin is not well known enough in the anglophone world, although she is a pioneer on feminist philosophy in the francophone world. Belgian-born, and a classmate of Luce Irigaray and Jacques Taminiaux at the University of Louvain, she founded the feminist journal *Les Cahiers du Grif* in 1973 and moved the editorial office to Paris in 1981. She wrote a widely acclaimed study of Blanchot, *Maurice Blanchot et la question de l’écriture*, in 1971 (reprinted in 1986), and was the first to write on Hannah Arendt in France. She also coedited the best French anthology on feminist philosophy, *Les Femmes de Platon à Derrida: Anthologie critique* (2000).

apparatus of notes as a genealogical tool. They also took great pedagogical care to empower the critical independence of mind of younger generations of thinkers. This position can be summed up as a healthy disregard of the wholly male lineage in the history of philosophy on the one hand, and a passionate commitment to thinking through female feminist genealogies on the other. The latter implies an explicit recognition of the collective character of most knowledge claims and discursive production as well as the acknowledgment that the politics of citation are textual means by which alternative discursive communities can be constructed and radical democracy implemented.

The new forms of institutionalization also had methodological consequences: footnotes and bibliographies become all important and move to the center of the debates. Cartographies, collections, anthologies, and, after a while, encyclopedias, glossaries, and reference manuals in feminist theory are brought into existence and come into operation. The creation of new journals forms an integral part of these efforts to consolidate and expand the insights of modern-day feminism into philosophy: Hypatia: A Journal of Feminist Philosophy was founded in 1986 and remains a reference title in the field. Jane Flax argues that a metathetical turn takes place in feminist philosophy at this time, which marks the beginning of a shift of paradigm. This is due to the sheer quantitative expansion of feminist practitioners of philosophy, but also to a qualitative leap in thinking: key concepts, accepted methods, and conventional procedures are questioned and redefined in original ways.

Let me illustrate it with some examples. In 1983, Alison Jaggar produced one of the very first taxonomies of feminist philosophy, Feminist Politics and Human Nature. It rests on a system of political classification of the different feminist schools of thought (socialist, Marxist, liberal, and radical). The influence of Marxism is then at its apex, as shown by the works of Angela Davis and Ti-Grace Atkinson. A few years later in 1986, the epistemologist Sandra Harding and the philosopher Jean Grimshaw were already in a position to adopt more specific and original categories of thought to do justice to the theoretical creativity of the feminist movement. Of special significance among them is “standpoint

40. See Jean Grimshaw, Philosophy and Feminist Thinking (Minneapolis, MN: University of Minnesota Press, 1986).
41. This was also the case for Hester Eisenstein’s Contemporary Feminist Thought, the first comprehensive account of feminist theory.
feminist theory,42 which covers the full range of feminist philosophies of difference by privileging the epistemological insights of marginal subjects. Standpoint theory is also one of the feminist branches that intersect most productively with antiracist thought and links gender issues to race and postcolonial considerations.43 By 1995, Jaggar and Iris Young had so much original feminist philosophical material at hand that they could edit a fully fledged companion to feminist philosophy, covering every major school and tradition of philosophical thought, all monotheistic and a few other religions, and the different constituencies within feminism itself. This shift and expansion of perspective took barely a decade.44

The politics change accordingly. Again, it may be useful to look at the publications to prove the point. In the 1980s very few collections on women and philosophy were available in the academic market. Carol Gould and Marx Wartofsky’s Women and Philosophy: Toward a Theory of Liberation (1976) and Mary Vetterling-Braggin, Frederick Elliston, and Jane English’s Feminism and Philosophy (1977) are among the first, followed closely by Marilyn Frye’s The Politics of Reality: Essays in Feminist Theory in 1983. Although they make a claim to difference, these early works are in the spirit of equality-minded or emancipatory feminism in that they are focused on the under-representation of women both in philosophy departments and in the male domination of the actual curriculum of the history of philosophy. This is typically the “women and/in philosophy” phase, which inserted women as an additive to existing philosophical and disciplinary categories, as evidenced by the leading publications of those days.45

Adding women to philosophy, however, could not leave the rules of the disciplinary game unchanged. It resulted instead in a frontal attack on the male domination of the philosophical canon and a concerted effort to dislodge the masculine subject from its falsely universal sovereign position. Lloyd’s The Man of Reason, published in 1984, is the seminal text in this tradition. The feminist revisions of the history of philosophy pursued by Nancy Tuana in a

44. Tina Chanter, writing in Ethics of Eros in 1995, could legitimately speak of a feminist rewriting of the philosophers.
45. See, for instance, Jean Elshtain on social and political thought, Eva Kittay and Diana Meyers on moral theory, Ellen Kennedy and Susan Mendus on political philosophy, Andrea Nye on humanist thought, and Katharina Bartlett and Rosanne Kennedy on legal theory.
series of appraisals of key thinkers also contribute significantly to rethinking the canon.\textsuperscript{46}

High poststructuralism challenged equality and highlighted the difference that feminist philosophers can make to the actual practice of philosophy. The generation that followed radicalized the concepts and methods and developed entire institutional, pedagogical, and methodological structures that brought the full potential of difference into concrete materialization and actual operation. This was not a flat application of pre-established principles, but rather the active creation of new ways of thinking. In so doing the post-poststructuralists of the intermediate generation ended up altering the very theoretical premises from which they had started, innovating on content and concepts. They also established a firm corpus of feminist scholarship that institutionalized the idea of collective teamwork as a key feminist method.

\section*{IV. THE INTERDISCIPLINARY FACTOR}

The institutionalization process, combined with the emphasis on the positivity of difference, produced a high degree of interdisciplinarity in the philosophical works of this period. Thus, a collection such as Linda Nicholson’s \textit{Feminism/Postmodernism}, although not strictly philosophical in itself, was influential across a broad academic field and affected the philosophical debates of the times. Considering the fact that many of the feminist philosophers of the poststructuralist generation found jobs outside academic philosophy, an accurate cartography of the period should therefore exceed the institutional boundaries of the discipline and include an interdisciplinary range of contributions.

Comparative literature, cultural, and film studies are of great importance, as I indicated above, especially volumes such as Teresa de Lauretis’s \textit{Technologies of Gender} and Sarah Franklin, Celia Lury, and Jackie Stacey’s \textit{Off-centre: Feminism and Cultural Studies}. Once again the impact of race and postcolonial theory is of crucial philosophical importance, with texts such as Spivak’s \textit{In Other Worlds}, Hill Collins’s seminal \textit{Black Feminist Thought}, and the growing influence of Chandra Mohanty.\textsuperscript{47} Feminist legal theory provides new insights especially

\textsuperscript{46} Also significant in this vein are the writings of Linda Zerilli on high liberalism, Robin Schott on Kantianism, and especially Susan Bordo on Descartes. In France see Sarah Kofman, \textit{Le Respect des femmes} (Paris: Éditions Galilée, 1982); Cathérine Chalier, \textit{Figures du féminin: Lecture d’Emmanuel Levinas} (Paris: La nuit surveillée, 1982); Elisabeth de Fontenay, \textit{Diderot ou le matérialisme enchanté} (Paris: Grasset, 1981).

through the invention of the method of intersectionality\textsuperscript{48} and the poststructuralist critical theory of the law of Drucilla Cornell. Ecofeminism also comes of philosophical age with the early Donna Haraway and the pioneer work of Val Plumwood.\textsuperscript{49}

The interdisciplinary approach provides new themes for feminist philosophy. Lesbian theory, diversified by the impact of postmodernism, evolves through two spearheads: one is Rich’s theory of the lesbian continuum, which locates the lesbian experience within a continuum of female sexuality defined in terms of constant woman bonding. As a result of this nondisruptive positioning of lesbian desire, Rich can defend lesbian motherhood in the key text \textit{Of Woman Born}. Rich then goes on to develop woman-centered perspectives in art, culture, and science in seminal texts such as \textit{Of Lies, Secrets and Silence} and \textit{Blood, Bread and Poetry}. The other spearhead is Monique Wittig, who takes the antithetical viewpoint that a lesbian is not a woman, but a “third sex” who escapes the gender dichotomy and refuses to be defined by it. This will prove influential for queer theory throughout the 1990s.

An inspiring discipline for philosophy was feminist theology, which, with towering figures such as Mary Daly\textsuperscript{50} leading a new movement of thought as well as practice, challenges Christian monotheistic logocentrism, just as Muslim feminists such as Fatima Mernissi\textsuperscript{51} question Islam. Interest in mystical thinkers of previous generations such as Simone Weil\textsuperscript{52} intensifies and the vast cluster of feminist spirituality will grow throughout the 1990s, producing what will become known as a postsecular turn in feminist theory.\textsuperscript{53}

Psychoanalysis and film theory exercise huge influence, in spite of great feminist resistances to the idea of the unconscious as a principle of nonclosure of the subject. Key figures such as Jane Flax straddle the shaky ground between philosophy and the discourse of the unconscious by being practicing psychoanalysts. While Irigaray and Kristeva evolve respectively into the left wing and right wing of post-Lacanian psychoanalysis, Juliet Mitchell\textsuperscript{54} is by far the most

\textsuperscript{49} See especially Val Plumwood, \textit{Feminism and the Mastery of Nature} (New York: Routledge, 1993).
\textsuperscript{50} See Mary Daly, \textit{Gyn/Ecology: The Meta-Ethics of Radical Feminism} (Boston, MA: Beacon Press, 1978).
\textsuperscript{53} See on this issue my “In Spite of the Times: The Postsecular Turn in Feminism,” \textit{Theory, Culture & Society} 25 (2008).
important influence in psychoanalytic thinking for an entire generation of English-speaking Lacanians. Teresa Brennan\textsuperscript{55} is heiress to this tradition and pursues it in an original manner, while Jessica Benjamin\textsuperscript{56} brilliantly bridges the gap between Lacanian and object-relation psychoanalytic theory.

The single most significant interdisciplinary coalition of the 1980s, however, is the new galaxy formed by women, gender, and feminist studies departments and programs, which grow from self-run classes into a strong academic movement that aims at reforming the curriculum and forces a revision of what counts as scientifically acceptable knowledge. The leading journal in feminist theory, \textit{Signs: a Journal of Women in Culture and Society}, was founded in 1975. In Europe, the institutional rise of women's studies occurs later, as argued by Griffin and myself in \textit{Thinking Differently}, but the theoretical creativity of feminist philosophies is strong from the start. Feminism in Europe draws inspiration from a political genealogy that takes the great women philosophers of European history as major points of reference and claims them as political leaders of the movement. Thus, a pedigree is created that runs from Mary Wollstonecraft to Simone de Beauvoir, to Rosa Luxemburg, and Hannah Arendt, with the historical event that is the women's movement as a central junction. From the 1960s on, this genealogy diversifies into a number of branches, all of which confirm the discursive privilege and prestige accorded by the feminist movement to its key women philosophers – to their critical skills as well as their visionary spirit. What is especially innovative about feminist philosophy, in fact, is the courage with which it turns critique into affirmation. As Joan Kelly argued,\textsuperscript{57} feminism carries a double-edged vision that combines oppositional consciousness with deep empowering creativity. The affirmative element within the feminist recomposition of knowledge is one of this generation's most lasting theoretical legacies.

Women's studies, and gender and feminist studies, bring a necessary dose of supplementary knowledge to the academic practice of the discipline of philosophy. It is no coincidence that so much focus falls, in this period, on epistemological studies of the power structures that affect scientific knowledge production.\textsuperscript{58} Discourse as power is such a foundational idea in the 1980s that feminist theory

\textsuperscript{56} See Jessica Benjamin, \textit{The Bonds of Love} (New York: Pantheon, 1988).

\textsuperscript{58} See Kathleen Lennon and Margaret Whitford (eds), \textit{Knowing the Difference: Feminist Perspectives in Epistemology} (New York: Routledge, 1994); Alison M. Jaggar and Susan Bordo (eds), \textit{Gender/Body/Knowledge: Feminist Reconstructions of Being and Knowing} (New Brunswick, NJ: Rutgers University Press, 1989).
is almost equated with the critique of epistemology. Sandra Harding\(^59\) provides a canonical classification system of feminist thought, whereas feminists with a scientific background, notably Evelyn Fox Keller, Donna Haraway and Elizabeth Spelman, play a key role in this first wave of feminist epistemology.\(^60\) Isabelle Stengers strikes a singular note of her own, pleading for a more systematic conceptual dialogue between feminism and science.\(^61\) Linda Alcoff produces systematically the best cartographies of feminist philosophy and epistemology.\(^62\)

The main epistemological debate of this era takes place between Harding and Haraway on the issue of the alleged relativism of postmodernist feminism. Harding privileges the claims to difference made by standpoint theory and is initially dismissive of poststructuralist critiques of reason. Haraway provides a strong rebuke of this position in 1988 in her seminal essay “Situated Knowledges: The Science Question in Feminism and the Privilege of Partial Perspectives.” By the early 1990s a new consensus is forged in the feminist epistemic community on the need for a revised but “robust” notion of objectivity that avoids both universalism and relativism in the pursuit of alternative ways of grounding feminist knowledge claims.

V. FROM CORPO-REALITY TO MATTER-REALISM

Looking back over the intellectual development of the generation of feminist philosophers within and after poststructuralism, what strikes me is the original brand of embodiment and bodily materialism they developed, in a variety of different but interrelated conceptual ways. This materialist line of thought is different from the more linguistically oriented branch of poststructuralism mentioned (see note 18). They develop together, not so much in opposition as alongside each other, in constant dialogue and often in loving antagonism.\(^63\)

In the last section of this essay, I will consequently concentrate on the concept of bodily materialism and how it developed throughout the 1990s. Feminist

---

63. I am grateful to Judy Butler for this felicitous formulation.
philosophy in this period combines in innovative ways phenomenological theories of embodiment with Marxist and psychoanalytic elaborations of the complex social and symbolic interaction between bodies and power. This approach grants an ontological value to the embodied roots of the subject, while resisting essentialism, and hence it also upgrades the issues of subjectivity and of sexuality to a greater degree of complexity than the high poststructuralist generation itself. The notion of the body is transformed from a substance dualistically opposed to the mind, to a dynamic process of embodied interactions: relationality becomes a keyword. The intermediate generation coins the term “corpo-reality” to designate the form of dynamic bodily neomaterialism that they read back into high poststructuralism.

What is characteristic of the thinkers of this generation is that, inspired by Spinoza’s monistic political ontology, they adopt a different political ontology from the Hegelian–Marxist generations that preceded them. They differ, in other words, from social constructivist oppositions between selves and society, because they either do not assume or openly challenge an exterior and prior grid of codification of meanings or master-signifiers that would somehow imprint social codes on the embodied subjects. They are, so to speak, less structuralist than the poststructuralists. In the work of Grosz, Gatens, Butler, or myself, one finds attempts to account for bodies as material and symbolic formations that are always already immersed in strategic conditions and relations of power. Because power, after Foucault, is not only or necessarily conceived in negative terms, however, its effects are perceived as multiple, contradictory, and productive. Power produces, among others, forms of active resistance to the very conditions it engenders.

Thus, the scheme of dialectical opposition is abandoned in favor of more complexity in accounting for the codes and the sociosymbolic processes that constitute the subject as a bounded field of relations to multiple others. The emphasis falls on relational processes of transformation and also on the contradictory power effects that constitute embodied subjects. The political ideal is as transformative as the ethics that sustains it: how to actualize empowering alternative technologies of self–other relations by experimenting with new ways of relating to a multiplicity of others. A sort of neoasceticism will emerge from this, although reformulations of political agency in the period include also, alternatively or in combination: transnational feminist forms of micropolitical action on a global scale; a radical adaptation of Foucaultian politics of

resistance; the politics of melancholia and the politics of affirmation. This is the neomaterialist punch of feminist politics after high poststructuralism.

The materialist corpo-reality branch of feminist philosophy is sociopolitical in orientation and draws inspiration from Foucault and Deleuze, although they are equally attentive to Derrida and the material effects of language on the world. It emphasizes the crucial notion that sexuality is an integral part of the embodied structure of the subject: one is always already sexed. Sexuality is conceptualized, especially in Romance languages like French, as a general life force that cannot be adequately contained within the dichotomous view of gender defined as the social construction of differences between the sexes. Social constructivism meets its limitations when confronted by the ontological shift to sexuality as life itself. Whereas high poststructuralist feminist theory is solidly ensconced in social constructivist methods and political strategies, thinkers of the next generation affirm and explore the ontological aspects of sexuality and sexual difference, and not only its constructed elements.

As a consequence, it is not so much the case that sexuality is caught in the sex-gender binary, but rather that it enjoys more transversal, structural, and vital connotations. Sexuality as life-force provides a nonessentialist ontological structure for the organization of human affectivity and desire. This notion clearly opposes the position of the linguistic mediation school, which argues that the discursive structure of gender functions as a coercive grid that constructs social relations and identities. The counterargument is that sexuality is a constitutive force that is always already present and hence prior to gender, although it intersects with it in constructing functional subjects in the social regime of biopolitical governmentality.

The early work of Foucault stresses the central importance of sexuality as a constitutive force that is targeted by social technologies of control, discipline, and punishment. The feminist commentators on Foucault are aware of the specific brand of bodily materialism that is at stake here. Butler’s appropriation of Foucault for queer theory in *Gender Trouble* is especially significant as it acquires a paradigmatic status especially in US feminism. All these thinkers

66. For more details on this issue see my ”The Uses and Abuses of the Sex/Gender Distinction in European Feminist Practices,” in *Thinking Differently: A Reader in European Women’s Studies*, Gabriele Griffin and Rosi Braidotti (eds) (London: Zed Books, 2002).

deal with corpo-reality and provide different answers to the question of how to disengage sexuality from the dominant masculinist, logocentric, ethnocentric, heterosexist, and anthropocentric codes of representation. The latter is taken in the double sense of cultural mediation and political intervention, as Spivak argues in her seminal essay “Can the Subaltern Speak?” As a result, how to disentangle sexuality from identity politics and the formulation of flat countsexual identities – even within feminism – is more than ever the question.

Deleuze-inspired feminists advocate a vision of the body as a sexually preconstituted, dynamic bundle of relations that is especially interesting. In opposition to the linguistic school – whose leading feminist thinkers opposed Deleuze’s vitalist materialism vigorously – Deleuzian feminists develop the notion of the materialist roots of embodied subjectivity and explore the transformative potential of a different concept of the political. They stress that the political advantage of this monistic and vital approach is that it provides a more adequate understanding of the fluid and complex workings of power in advanced capitalism and hence can devise more suitable forms of resistance.

The long-term result of these explorations of corpo-reality or embedded and embodied materialism is a serious reconsideration of what counts as the “matter” for materialist feminist thought. Radical emphasis on a Spinozist monistic ontology results in overcoming the classical opposition “materialism/idealism” and move towards a dynamic, nonessentialist and relational brand of materialist vitalism. “Matter-realism” designates the contemporary form of radical neomaterialism that emerges from corpo-reality and will also become known as vital politics or posthuman feminism.

By the early 1990s, the biogenetic and information technologies revolution provide the historical backdrop for some significant shifts. The change of

---

68. This is especially the case for Alice Jardine in Gynesis and Judith Butler in Subjects of Desire.
focus is deliberate and comes in response to fast-shifting global changes\textsuperscript{71} and technological innovations. Mostly thanks to Haraway’s agenda-setting work on cyborg-feminism,\textsuperscript{72} a younger generation of scholars gets inspired by an empiricist form of matter-realism, which combines realism with a twenty-first-century understanding of “matter” as a self-organizing principle. This generation of philosophers drops the endless critiques of representation that had become the trademark of high poststructuralism in the linguistic branch, to turn with renewed interest to ontological and epistemological questions. Claire Colebrook\textsuperscript{73} is a notable example: resting on Deleuzian premises, she explores the potential of vitalist thought and argues for feminist reappraisals of contemporary technoscientific culture in a nondeterministic frame. What matters about this matter-realism, in other words, is the concept of “matter” itself: the switch to a monistic political ontology stresses processes, vital politics and nondeterministic evolutionary theories\textsuperscript{74} as exemplified by Karen Barad’s work on “agential realism.”\textsuperscript{75} Feminist epistemology and science studies replace cultural studies as priority research areas and comparative literature ceases to be the main arena for these debates, as Spivak noted in \textit{Death of a Discipline}.

One of the main implications of this shift of perspective is that matter-realist feminists return again to sexuality, rather than the sex–gender distinction, to explore more specifically the notion of sexuality beyond gender. The polymorphous perversity of sexuality as an ontological force is emphasized, in opposition to a majoritarian or dominant line that privileges heterosexual reproductive sex. An important question that can be raised – after the making of Dolly the sheep in 1996 and the poststructuralist critiques of phallo-logocentrism – is: what happens to gender if sexuality is not based on oppositional terms? What

\textsuperscript{71} For a more detailed analysis, see my “A Critical Cartography of Feminist Post-postmodernism,” \textit{Australian Feminist Studies} 20(47) (July 2005).

\textsuperscript{72} Donna J. Haraway (1944– ) is an American feminist and professor in the History of Consciousness Program at the University of California, Santa Cruz. She earned a degree in zoology and philosophy at Colorado College and received her PhD in the Department of Biology at Yale in 1972. She wrote her dissertation on the functions of metaphor in shaping research in developmental biology in the twentieth century. She writes on biology, technoscience and feminism. Among her main texts are \textit{Primate Visions: Gender, Race, and Nature in the World of Modern Science} (1989), \textit{Simians, Cyborgs, and Women: The Reinvention of Nature} (1991), and \textit{Modest Witness@Second Millenium. FemaleMan®_Meets_Oncomouse™: Feminism and Technoscience} (1997).

\textsuperscript{74} Indicative of this trend is Elizabeth Grosz’s \textit{Becomings: Explorations in Time, Memory and Futures}.

happens when there is sexuality without the possibility of either heterosexual or homosexual union? Patricia MacCormack\textsuperscript{76} rests on Deleuze and Guattari’s idea of radical empiricism and on Irigaray’s emphasis on the sensible transcendental, to stress that corporeal becoming or transformations are open-ended and not necessarily contained by sociosymbolic forms, such as phallo-logocentrism or established categories. The ethics of becoming is rather an ethology of the forces that propel the subject to become by overcoming both forms and categories, deterritorializing all identity formations. By extension, this means that sexuality is a force, or constitutive element, that is capable of destabilizing gender identity and institutions: sexuality beyond gender. Another example of the same tendency is Luciana Parisi’s innovative adaptation of Guattari and Lynn Margulis\textsuperscript{77} to produce a schizo-genesis of sexual difference and of endosymbiosis as an organic variable of autopoeisis.\textsuperscript{78} The new matter-realism stresses the self-organizational capacity of matter, which results in questioning any ontological foundation for difference while avoiding social constructivism. Sexuality beyond gender is the epistemological but also political side of contemporary vitalist matter-realism. It consolidates a philosophical genealogy that includes creative deterritorializations, intensive and hybrid crossfertilizations and generative encounters with multiple and nonhuman others.

VI. CONCLUSION

A cartographic account cannot be concluded, but it must end. In this essay I have tried to steer a collective-minded course among a multiplicity of productive, innovative, radical developments in feminist philosophy that were inspired by French poststructuralist theories but thrived mostly in exile and in the diaspora. I have tried to show that the multiple temporalities of feminist theory and the essentially nonlinear character of feminist philosophy came to a greater degree of critical focus after high poststructuralism. The degree and quality of the scholarship produced in the period under review is such as to warrant the claim of a genuine “coming of age” of feminist philosophy. Central to the success of what I also referred to as the “intermediate” generation is the loyalty it shows to feminist theoretical and political genealogies. This non-oedipal and hence productive relationship to preceding generations of women philosophers

\textsuperscript{76} See Patricia MacCormack, \textit{Cinesexuality} (Aldershot: Ashgate, 2008).
is strengthened by the fact that many of these were the actual teachers of this generation of scholars, and so they are connected by ties of gratitude and respect. This certainly describes my own position as both a member of this generation and the cartographer of this chapter, a position for which I hold myself accountable by making both my own and my colleagues’ work visible for inspection as explicitly as possible.

If one keeps in mind furthermore that one of the main effects of the fast-growing process of institutionalization of feminist knowledge initiated by my generation was to produce a higher level of continuity in feminist thinking than we are historically used to, it follows that the question of the temporalities of feminist thought becomes even more complex as both a concept and as a practice. It results, for instance, in an acceleration of consciousness that produces a more acute sense of feminist intergenerational justice toward the future generations who will inherit and hopefully pursue this great tradition of scholarship. The so-called feminist third wave79 is closely linked to the “intermediate” generation that built on the legacy of high poststructuralism and moved beyond.

A cartographer is no prophet. The impressive scholarship produced in feminist philosophy in this period is still very much ongoing and in the making and there is no telling which new directions it will take. I have tried, wherever possible, to indicate the points of convergence and divergence both within this generation and between this and the high poststructuralist generation that preceded it, especially on questions of difference, sexuality, embodiment, and materialism. At present one of the most promising lines of development is the one that challenges the deeply seated anthropocentrism that lurks beneath even the most self-assured feminist antihumanism inherited from high poststructuralism.80 The nonhuman – animal, technological, ecological, and planetary – “others” are raising new questions that may trace new interconnections between feminism and animal rights, technology studies, disability, and ecological issues in the frame of the complex political economy of the globally connected world we now inhabit. Feminist philosophers confront the third millennium of Western philosophical history fully aware that they are historically relative newcomers in this discipline and have only just started to play an active role in it. They have also learned from postcolonial and race studies the need to decenter Western hegemony and look beyond ethnocentric boundaries, in a transnational perspective that refuses to equate continental philosophy with the continent of

Europe. Feminist philosophers pursue this critical line of inquiry, more sharply than ever, with acquired maturity and renewed vitality and inspiration.

**MAJOR WORKS**

Having noted the importance of bibliographies and the citation of sources, it is incumbent on me to include some of the major feminist texts that played a significant role in the period 1980–95.

Young, Iris M. *Throwing Like a Girl and Other Essays in Feminist Philosophy and Social Theory*. Bloomington, IN: Indiana University Press, 1990.
In his official report to the French government in 1991 regarding the state of philosophy in France – titled *The Theological Turn of French Phenomenology* – Dominique Janicaud claims that philosophy (in particular phenomenology, the dominant mode of French philosophy today) has been overtaken by theology.¹ In effect, he accuses Emmanuel Levinas and Jean-Luc Marion, along with Michel Henry and Jean-Louis Chrétien, of having appropriated phenomenology for distinctly “theological” concerns. Given both that Janicaud’s report covers the years 1975–90 (roughly the same period as this volume) and that the theological turn (which in many ways coincides with the so-called “return to religion” in Europe) is surely the most important development in continental philosophy of religion during those years, the concerns of that report and the theological turn in general are the focus of this essay. Since that theological turn is largely distinct to French philosophy, this essay primarily traces its definition and development, as well as the ways in which theological and religious concerns affect not only

---

¹. Dominique Janicaud, *The Theological Turn of French Phenomenology*, Bernard G. Prusak (trans.), in Dominique Janicaud et al., *Phenomenology and the “Theological Turn”: The French Debate* (New York: Fordham University Press, 2000); originally published as *Le Tournant théologique de la phénoménologie française* (Paris: Éditions de L’éclat, 1991). It should be pointed out that, in addition to Janicaud’s text, there is a much earlier one that takes up this debate: Mikel Dufrenne, “Pour une philosophie non-théologique” [In defense of a nontheological philosophy], in *Le Poétique*, 2nd ed. (Paris: Presses Universitaires de France, 1973). There he argues that Derrida, Maurice Blanchot (1907–2003), Gilles Deleuze (1925–95), and others resort to negative theology in their philosophies of difference and absence. As we will see, Derrida explicitly denies this charge. Further, Dufrenne’s charge is much less strong and has proved considerably less influential than that of Janicaud.
philosophical discourse but also phenomenology’s very structure.² Foremost at issue are the questions of (i) the relation between faith and reason (or knowledge), (ii) how God relates to human beings and whether God can be properly addressed, and (iii) whether phenomenology is properly theologically neutral. As will become clear, these questions cannot be answered without considering how the introduction of “revelation” into phenomenology threatens to reverse the very structure of the intentionality that is at the heart of phenomenology.

Of course, one cannot begin to speak about more recent French philosophy of religion without tracing at least a basic outline of the German philosophy that heavily influences it. French philosophy’s recent development is particularly indebted to five German figures: Immanuel Kant, G. W. F. Hegel, Friedrich Nietzsche, Edmund Husserl, and Martin Heidegger. Less directly, it is also connected to the French philosopher Paul Ricoeur. A short word regarding each is in order.

I. PHILOSOPHICAL BACKGROUND

First, in the Critique of Pure Reason (1781), Immanuel Kant (1724–1804) claimed that he “had to deny knowledge in order to make room for faith.”³ Here it might seem that faith is given the upper hand. Yet in Religion Within the Boundaries of Mere Reason (1793), it becomes clear that these roles have been reversed.⁴ The very fact that Kant insists on religion being limited by reason means that anything religious that does not pass the rigorous test of reason must be either reinterpreted or jettisoned. Although Kant is hardly the first to pit reason against faith, the pattern of reason’s hegemony that he sets up becomes paradigmatic for the subsequent development of continental philosophy of religion. It is a pattern to which recent philosophers (such as Levinas and Marion) have responded

---

² Although the theological turn comes about amid an intense engagement with German philosophy, it is truly a French phenomenon without a German counterpart. Interestingly enough, when the Dutch philosopher Hent de Vries writes his text Philosophy and the Turn to Religion, his examples are exclusively French. It is worth noting that other figures could be included here – for example, Blanchot, Stanislas Breton (1912–2005), Jean-François Courtine (1944– ), and Jean Greisch (1942– ) – but the limits of a brief chapter like this make hard decisions necessary.

⁴ Immanuel Kant, Religion Within the Boundaries of Mere Reason, in Religion and Rational Theology, Allen W. Wood and George Di Giovanni (eds and trans.) (Cambridge: Cambridge University Press, 1996); originally published as Die Religion innerhalb der Grenzen der blossen Vernunft (Königsberg: Friedrich Nicolovius, 1793).
quite vehemently. Moreover, it also raises the question of what counts as “faith” and what as “reason.” That it is also one’s own reason that judges faith is clear from Kant’s 1784 essay “What is Enlightenment?” As he puts it there: “Have courage to make use of your own understanding!”

Second, although G. W. F. Hegel (1770–1831) wrote a great deal on religion, it was his *Phenomenology of Spirit* that proved particularly influential for French philosophy. Surprisingly, even though the text had been published in 1806, Hegel’s great work only arrived in France when Alexandre Kojève lectured on it in the 1930s. Many of those who would become prominent philosophers in France either heard him lecture or else read Jean Hyppolite’s translation of the text (published in two parts in 1939 and 1941) and his influential commentary on it that appeared in 1946. Because Kojève’s reading of the *Phenomenology* was particularly dominated by Hegel’s famed master–slave dialectic, much of subsequent French philosophy became obsessed with Hegel’s dialectical system that was, on the one hand, all encompassing and thus seemingly inescapable and, on the other hand, dependent on negation and so inherently violent. Whether one can escape this totality and the negation of violence prove to be central concerns of recent French philosophy.

Third, Nietzsche contends that the notion of absolute knowledge or any kind of totality is simply the product of human conceit. Moreover, he claims that the very project of adequation of thought to the thing it thinks is misguided and thus the correspondence theory of truth is highly problematic. Moreover, Nietzsche thinks that violence and suffering are irredeemably tragic, whatever “meaning” we may (vainly) attempt to give them. In (in)famously proclaiming that “God is dead,” Nietzsche announces the end of Christianity as any kind of moral grounds for Western culture. Yet he also declares the death of any metaphysical or even any totalizing project. Strangely enough, while Nietzsche had

---

9. For Nietzsche’s famous pronouncement, see *The Gay Science* (1882), §125.

arrived in France before the turn of the nineteenth century (well before Hegel), his influence on French philosophy becomes particularly widespread and strong beginning in the 1960s and 1970s. Precisely in light of Nietzsche the question arises of what it could mean to move from a totality in which everything can be recouped to one of fragmentation, loss, and tragedy.

Fourth, only a few years before Hegel's *Phenomenology* reached France, Edmund Husserl (1859–1938) had visited Paris. Although the reception of his lectures, delivered in 1929 and substantially revised, expanded, and published posthumously as the *Cartesian Meditations* (1950), was initially largely negative, interest in Husserl's phenomenological method eventually became widespread. For Husserl, the motto of phenomenology is “to the things themselves [zu der Sachen selbst].” Thus, the concern in phenomenology is to arrive at an “*adaequatio intellectus et rei,*” literally, an adequation of the intellect and the thing. Husserl works this out in terms of intentionality, intuition, and immanence. We “intend” an object by way of consciousness and it is thus “intuited.” While there are degrees to which an object can be fully intended (or made present to consciousness), the goal is a kind of “adequation,” in which the intended object is fully immanent to consciousness and so “itself there,” “immediately intuited.”

Put in phenomenological terms, the act of thinking (*noesis*) becomes the exact equivalent to its object (*noema*). Husserl explains this by way of what he calls “the principle of all principles” in which “everything originarily ... offered to us in ‘intuition’ is to be accepted simply as what it is presented as being, but also only within the limits in which it is presented there.” While this principle would seem to call for a strict phenomenological neutrality, in which the object sets the conditions for its appearance, both Levinas and Marion will argue that the “limits” of which Husserl speaks place the *subject* in control of the object. This problem becomes all the more acute in Husserl’s later philosophy in which the transcendental ego becomes central: “The world of transcendent ‘res’ is entirely referred to consciousness and, more particularly, not to some logically conceived consciousness but to actual consciousness.”

---

on my consciousness, then am I not the ground of that world? And, if so, how can there be an “otherness”? Does one not lose exactly the sense of the particularity of the object or the other? Such was a problem that Husserl certainly recognized, and it is addressed at length by Levinas.

Fifth, this question of how the “other” appears to me also concerned Heidegger (1889–1976), although he provides more than one answer. On the one hand, in Being and Time (1927) Heidegger speaks of the true phenomenon as “the showing-itself-in-itself [das Sich-an-ihm-selbst-zeigen].” On the other hand, Heidegger speaks of the necessity of logos (one might say the “logy” in phenomenology) that not only “lets something be seen” but also is a “letting [something] be seen as something.” This latter aspect Heidegger terms the “as-structure [als-Struktur]” of perception and knowledge. (or, simply put, the “as such”). Thus, Heidegger’s conception of how a phenomenon appears encounters the same difficulties as Husserl’s principle of principles: ostensibly, the object appears just as it is, but then the process of interpretation – whether in the guise of Heidegger’s “as” or Husserl’s “limits” of the horizon of consciousness – itself appears. Heidegger seems to realize the problems with his earlier position and speaks differently in his “Letter on Humanism” (1947). There he speaks of language as beyond human control. In contrast to “language” and “thought,” both of which imply the possibility of control or mastery, Heidegger juxtaposes “saying” and “thinking.” To quote him: “thinking … lets itself be claimed by being so that it can say the truth of being” To think or to say is an attempt to understand without claiming mastery. However, now the divine is situated within being, since “only from the truth of being can the essence of the holy be thought,” and “only in the light of the essence of divinity can it be thought or said what the word ‘God’ is to signify.” Finally, though, in “The Onto-theo-logical Constitution of Metaphysics” (1957), Heidegger acknowledges that the logos of philosophy has dominated theology. “Metaphysics is a theology, a statement about God, because the deity enters into philosophy.” Yet “the deity can come into philosophy only insofar as philosophy, of its own accord and by its own nature, requires and determines that and how the deity enters into it.” Such is not the God of Abraham, Isaac, and Jacob, but one that has been called “the god of the philosophers.” Heidegger reminds us that “man can neither pray nor

17. Ibid., 56.
19. Ibid., 267.
sacrifice” nor “fall to his knees in awe nor can he play music and dance before this god.”21 In effect, “God” has been reduced to the fundamental principle of metaphysics.

Sixth, while the French philosopher Paul Ricoeur22 does not have quite the influence on those implicated in the theological turn as do the preceding philosophers, he does demonstrate the complexity of introducing theological concerns into the realm of phenomenology.

II. PAUL RICOEUR

Although there were a number of prominent French thinkers in the twentieth century who were working from an explicitly Christian perspective – for example – the medievalist Étienne Gilson (1884–1978) and the existentialist Gabriel Marcel (1889–1973) – Paul Ricoeur – a devout Protestant from the Alsace – was a pioneer in bringing theological concerns together with the phenomenological method.23 Much like Levinas and then Marion, Ricoeur sought to keep his philosophical and theological writings separate, being particularly unwilling to use any theological authority in a text of philosophy.24 Yet the influence of theological concerns and even theological concepts are to be found in all of his work, which effectively meant that he was kept outside the major Parisian intellectual circle (a situation that changed substantially with the publication of Time and Narrative in the 1980s). Largely sympathetic to the existential project of Marcel, Ricoeur took Husserl’s eidetic reduction to be a more rigorous way to describe the embodied self.25 Yet he likewise concludes that Husserl’s reductions are too essentialistic and thus not concrete enough. The result is Ricoeur’s

22. For a more extensive discussion of Ricoeur’s philosophy, see the essay by Wayne J. Froman in *The History of Continental Philosophy: Volume 6*.
23. Paul Ricoeur (February 27, 1913–May 20, 2005; born in Valence, France; died in Chatenay Malabry) was educated at the University of Rennes (1933), the Sorbonne (1934–35), and received a *doctorat ès lettres* from the Sorbonne in 1950. His influences included Arendt, Gadamer, Heidegger, Husserl, Jaspers, Kant, and Levinas, and he held appointments at the University of Strasbourg (1948–56), Sorbonne (1956–66), University of Nanterre (1966–80), University of Louvain (1970–73), and University of Chicago (1967–92). [*] For a discussion of Marcel, see the essays by Felix Ó Murchadha and Andreas Grossmann in *The History of Continental Philosophy: Volume 4*.
“hermeneutical phenomenology” that first turns to analyses of the voluntary and involuntary aspects of human action in *Freedom and Nature*. In *Fallible Man*, Ricoeur’s phenomenological analysis comes to the conclusion that evil is made possible precisely because, although human beings are finite, they tend to expect to achieve a level of infinitude (whether in respect to perception or knowledge or simply in terms of everyday practice). It is precisely in not seeing the whole of this equation that evil occurs. In the companion volume to *Fallible Man* – *The Symbolism of Evil* – Ricoeur sets his analysis in a hermeneutical context of religious symbols and myths. In effect, we can understand ourselves only in the context of myth and theology rather than in some sense of pure phenomenological neutrality. Ricoeur’s thought subsequently turned to questions of hermeneutics more generally and his primary contributions to philosophy are these hermeneutical texts, rather than more explicit theological ones. All along, however, he continued to write shorter texts on theology, philosophy of religion, and biblical exegesis – and those theological concerns continued to be in the background of his more explicitly philosophical texts. We will see a similar pattern in both Levinas and Marion.

### III. THE RADICALLY TRANSCENDENTAL OTHER: EMMANUEL LEVINAS

Somewhat like Hegel, Emmanuel Levinas\(^26\) is another interesting case of delayed reception. Although he published his first book (on Husserl\(^27\)) in 1930 and played a major role in introducing both Husserlian and Heideggerian phenomenology to France, only with the publication in 1961 of *Totality and Infinity* does he begin to gain significant recognition. Yet, by the 1980s, his thought had become highly influential in French philosophy, which is why Janicaud singles him out as having so radically affected phenomenology.\(^28\) While Levinas reacts to both Husserl and Heidegger, he reads all of modern thought and the entire history

---

26. Emmanuel Levinas (January 12, 1906–December 25, 1995; born in Kaunas, Lithuania; died in Paris, France) was educated at the universities of Strasbourg (1923–30) and Freiburg (1928–29), and received a *doctorat d’université* from the University of Strasbourg (1930) and a *doctorat d’état* from the Sorbonne (1961). His influences included Buber, Heidegger, Husserl, Marcel, Rosenzweig, and Wahl, and he held appointments at the Alliance Israélite Universelle (1934–39), École Normale Israélite Orientale (1946–79), University of Poitiers (1964–67), University of Paris X–Nanterre (1967–73), and University of Paris IV–Sorbonne (1973–76).

28. Janicaud notes the, in his view, unfortunate coincidence of Levinas’s *Totality and Infinity* appearing the same year – 1961 – as the death of the leading atheistic phenomenologist – Maurice Merleau-Ponty.
of Western metaphysics as an attempt to arrive at a mastery of all “otherness” in order to achieve a totality precisely by way of adequation in which there is “the rigorous coincidence between the thought” and the object “which this thought thinks.”

When he goes on to say that this places everything – including God – within the “gesture or movement of being [gest d’être],” he is clearly criticizing both Heidegger and the entire tradition of metaphysics. One could say that the impossibility of an adequation is a problem of metaphysics or epistemology. Yet Levinas takes this in a different direction, declaring this to be primarily an ethical problem, so that ethics becomes “first philosophy.” Thus, although what Levinas writes has deep metaphysical and epistemological implications, the implications of his thought are first and foremost ethical and religious.

If Levinas is right, then this requires rethinking the very structure of philosophy. Whereas Kant had extolled the virtue of thinking for oneself – what he calls “autonomy” – Levinas claims that only acting “heteronomously,” in which the Other curbs my freedom, is truly ethical. It becomes clear that Levinas is presenting us with a markedly different notion of freedom when he writes that “the presence of the Other, a privileged heteronomy, does not clash with freedom but invests it.” In effect, I am only really free when I serve the Other. Who exactly, though, is this “Other”? As it turns out, this question concerns not just ethics but also epistemology and metaphysics, for Levinas cannot specify who this Other is. To do so would make a claim of knowledge of the Other that neither Levinas nor any of us can (epistemologically) make precisely because the Other – in her very Otherness – always escapes our grasp (metaphysically and epistemologically). Any claims to truly know the Other are, further, unethical in that they do violence to whomever they presume to describe. So an absolute givenness (donation) or knowledge (in the sense of adequation) of the Other is out of the question. Instead, the Other appears to us as a “face” that “is present in its refusal to be contained.” Given Levinas’s religious perspective, the paradigmatic figures for the Other are the powerless, or those whose power paradoxically comes from being destituted: “The Other who dominates me in his transcendence is thus the stranger, the widow, and the orphan, to whom I am

30. Whether or not to be consistent in capitalizing “Other” is a complicated question for commentators on Levinas. For a discussion of this issue, see Adriaan Peperzak’s introduction to Levinas’s Basic Philosophical Writings, Adriaan T. Peperzak et al. (eds) (Bloomington, IN: Indiana University Press, 1996), xiv–xv.
32. Ibid., 194.
obligated. Moreover, according to Levinas, the face breaks into my world and leaves me traumatized. Naked and destitute, the face still commands my respect.

Obviously, Levinasian ethics are of a most rigorous sort. Yet he is not giving us merely an ethics but also a philosophy of religion, in which the two are closely intertwined. In effect, we encounter God by way of the human Other, who “is indispensable for my relation with God. . . . The Other is not the incarnation of God, but precisely by his face, in which he is disincarnate, is the manifestation of the height in which God is revealed.” In the very midst of our relation to the Other, God is revealed. Thus, the relation to the Other constitutes “religion” for Levinas. Of course, in making the Other so very much a part of our relation to God, Levinas further complexifies what – given his concept of the Other – is already complicated. How, exactly, are we to differentiate between the human and the divine Other? Levinas’s early writings provide relatively little guidance on such a question. Yet, in “God and Philosophy” (1975), he addresses this explicitly:

God is not simply the “first other,” the other par excellence, or the “absolutely other,” but other than the other, other otherwise, other with an alterity prior to the alterity of the other, prior to the ethical obligation to the other and different from every neighbor, transcendent to the point of absence, to the point of his possible confusion with the agitation of the there is [il y a].

If the human Other cannot be truly known or mastered, it must be all the much more so for the ultimate Other.

Here it is helpful to consider Derrida’s respectful although incisive critique of Levinas. While he shares Levinas’s concerns, he criticizes Levinas for providing such a hyperbolic conception of Otherness and attempting to go beyond traditional metaphysical categories. First, Derrida points out that precisely the ability to identify the Other as another ego is what makes it possible to

33. Ibid., 215.
34. Emmanuel Levinas, Otherwise than Being, or, Beyond Essence, Alphonso Lingis (trans.) (The Hague: Martinus Nijhoff, 1981), 111.
35. Levinas, Totality and Infinity, 78–9.
36. In a later text, Levinas puts this even more strongly: “In the other, there is a real presence of God. In my relation to the other, I hear the Word of God. It is not a metaphor; it is not only extremely important, it is literally true. I’m not saying that the other is God, but that in his or her Face I hear the Word of God” (Entre Nous: On Thinking-of-the-Other, Michael B. Smith and Barbara Harshav [trans.] [New York: Columbia University Press, 1998], 110).
perceive the human Other as “Other, and not a stone.” Derrida makes the point that recognizing the dissymmetry of the Other first requires recognizing the symmetry. While Levinas is attempting to get beyond a conception of the Other found in Husserl in which the Other is analogous to the self, the danger is that the Other becomes so undifferentiated that it loses the features that make the human Other worthy of being treated as human. Second, Derrida insists that it is the very tradition of Greek philosophy that Levinas criticizes that makes his own venture possible. “One still has to philosophize (to say it and think it),” writes Derrida quoting an ancient Greek. Further, one cannot (and here Derrida quotes Levinas himself) “arrest philosophical discourse without philosophizing.” As hard as it might be for some to imagine Derrida insisting on the need for the classical concepts of metaphysics, such is how he responds to Levinas.

However, Levinas resists any dominance by a philosophy that “compels every other discourse to justify itself” and opines that “rational theology accepts this vassalage.” He refuses to move to something like “faith,” insisting that the very dichotomy of faith and reason has been set up by philosophy so as to make reason superior to faith. In a defiant tone, he responds to Derrida by saying: “Not to philosophize would not be still to philosophize.” However, one of the complexities of Levinas’s thought is that he actually borrows from a variety of philosophers. The idea of the Good as “beyond being [epekina tes ousias]” he takes from Plato and applies to God. Here the idea is that God cannot be thought of in terms that would apply to being (an idea also found in Plotinus). Levinas finds an ally in Descartes, in one sense, when Descartes speaks of his idea of an infinite, perfect being that he discovers in his mind. In the same way that Descartes concludes that he – a finite, imperfect being – could never have conjured up an idea of such a radically different being, Levinas sees this as an example of God “breaking into” human consciousness. However, a problem emerges at this point. While Descartes seems to think that this idea of infinite perfection is an idea that all would have, many of Descartes’s readers have pointed out that it is much more likely owing to the Christian culture in which he lived. In the same way, it would seem that Levinas’s God is distinctly theological – and, specifically, Jewish. Levinas himself speaks of “the revealed God of our Judeo-Christian spirituality” who “shows himself only by his trace, as is said in Exodus 33.”

40. Ibid., 77.
The problem that Levinas faces is twofold: On the one hand, if this trace is identifiable with God, then how can one speak “adequately” of God who is so unidentifiable? This is simply a divine version of the problem of relating to the human Other that Levinas also raises. Would a religious believer not want to be able to make at least limited suppositions about God’s identity and character in order to have something to believe? On the other hand, one could argue that Levinas has simply imported a specifically Judeo-Christian idea of God and acted as if this were a purely “philosophical” move. It is not surprising that Janicaud contends that in Levinas “phenomenology has been taken hostage by a theology that does not want to say its name.” On Janicaud’s reading, Levinas is simply doing a kind of theology, all the while claiming to do straight philosophy. But here Janicaud is claiming something Derrida had already said nearly three decades before.Speaking of *Totality and Infinity*, Derrida asks (rhetorically) “independent of its ‘theological context’ (an expression that Levinas would most likely reject) does not this entire discourse collapse?” Of course, Levinas often claims that his philosophy and his theological writings are separate, pointing out that he had separate publishers for his philosophical and theological writings. As true as that may be, what Janicaud – and much milder critics or even some friends – assert is that his theological commitments make their way into his philosophy. Janicaud puts it rather bluntly: “*Totality and Infinity* is the first major work of French philosophy in which this theological turn is not only discernible, but explicitly taken up within a phenomenological inspiration.” Certainly, it would be hard to see Levinas as anything but a theological thinker who appropriates philosophical language for a distinctly theological cause, one that – in a rather different way from Kant – makes room for faith. But of course, the question might be asked: What is so wrong with that? Are philosophers not allowed to bring their metaphysical or ethical commitments into their writing?

Yet here we come to the very heart of the phenomenological project. For Husserl, the goal of phenomenology is to leave what he calls “the natural standpoint” and move to a kind of theoretical neutrality. On this point, Husserl sounds remarkably Kantian: to be a person “who thinks for himself [Selbstdenker]” one

42. Janicaud, *The Theological Turn of French Phenomenology*, 43.
44. In an interview, Levinas insists that he keeps “separate very clearly these two types of work [Talmudic commentary and philosophy]. I even have two publishers; the one publishes my confessional texts, the other my texts which are called purely philosophical.” See Emmanuel Levinas, “Interview with François Poirié,” in *Is It Righteous to Be? Interviews with Emmanuel Lévinas*, Jill Robbins (ed.) (Stanford, CA: Stanford University Press, 2001), 62.
must first be freed from “all prejudices.” Husserl explicitly insists that – as part of the phenomenological method – one must “bracket” anything other than the phenomenon itself. According to phenomenological orthodoxy, one concentrates only on the object as it is immanently given to consciousness. But, of course, it is the object as constituted by the ego. Thus, the phenomenological I is central. In contrast, Levinas reverses this phenomenological structure (a reversal found also in Henry, Marion, and Chrétien): whereas the subject had in effect been in control of the object, the subject is now “subject” to the object. For Levinas, the principle “object” that reverses the gaze (so that it is not the gaze of the subject looking at the object but the other way around) is the (face of the) Other, epitomized for him by those traditionally counted as among the “least.” In effect, the organizing that was previously delegated solely to the intentionality of consciousness is now being more directed by the other.

Understandably, then, Janicaud can speak of Levinas having “shattered” the phenomenological order. But here it must be asked as to exactly who is being more true to phenomenology. Husserl’s “principle of principles” can be read as either privileging the object or the subject, depending on which phrase of it one emphasizes – either “accepted simply as what it is presented as being” or “only within the limits in which it is presented there.” Although one can argue that Levinas provides a distorted phenomenology – one that moves from a more active to a more passive subject and from phenomenological immanence to transcendence – that move could also be viewed as simply establishing the privilege of the object (noema) over the subject (ego). What is all the more remarkable about this move is that it is done in the name of ethics. Levinas would argue that the privileging of the self has been the guiding form philosophy has taken since its beginnings, whether in phenomenology or simply philosophy in general, and to do “ethics as first philosophy” requires privileging the Other and not the self.

47. Janicaud published an additional “report” on French philosophy in 1998 titled *La Phénoménologie éclatée (Phenomenology “Wide Open”: After the French Debate)*. The term “éclatée” means “to rupture” or “to shatter.” Thus, “phenomenology shattered” would be an alternative translation. In any case, that Janicaud would use such strong language gives an idea of what he think is at stake and how fundamentally he thinks Levinas disrupts phenomenology’s structure.
48. Levinas is also discussed in detail in the essay by S. K. Keltner and Samuel J. Julian in *The History of Continental Philosophy: Volume 4*, and by Robert Eaglestone in his essay in this volume.
Although Michel Henry’s principal works on Christianity and phenomenology come after 1995 – the time frame of this volume – a brief word on his work is appropriate, if for no other reason than that Janicaud includes Henry as part of the theological turn. Although The Essence of Manifestation is ostensibly a phenomenological text, there is every reason for Janicaud to detect in it a turn toward the theological insofar as Henry makes the reversal similar to that found in Levinas (and, as we will see, also in Marion). By critiquing the privileging of the subject in both Husserl and Heidegger, Henry clearly champions the phenomenality of the phenomenon. Henry’s focus is the very phenomenon of “manifestation,” which, in effect, is revelation, as he will come to term it in his later work. For Henry, manifestation is fully immanent, so much so that “there is nothing transcendent.” But then the question is: manifestation of what? Ultimately, the answer turns out to be manifestation of manifestation itself, which turns out to be God. It is no accident that Meister Eckhart makes more than a short appearance in The Essence of Manifestation, nor that the search for the absolute leads us to a version of God that is inspired by Eckhart.

However, Henry goes beyond Eckhart, for God is life itself and, because we are alive, God is fully present to us. It is in his later writings that this theme of God as life is developed. There, Henry works out what it means to say that “living is possible only outside the world, where another Truth reigns.” Within Christianity, Henry claims, the very meaning of the word “truth” means something quite different than it does within the realm of empirical sciences. Whereas scientific truth alienates, Christianity provides a radical phenomenology that reveals the ultimate. The result, though, is not theology but phenomenology. Henry’s conception of God is considerably different from that of Levinas or Marion, who would emphasize the transcendence or “otherness” of God. Henry,

49. Michel Henry (January 10, 1922–July 2, 2002; born in Haiphong, French Indochina (now Vietnam); died in Albi, France) was educated at the Lycée Henri IV, and the University of Lille (1941–45), where he also received a doctorat du troisième cycle (1960). His influences included Heidegger, Husserl, Hyppolite, Kandinsky, Marx, Ricoeur, Sartre, and Wahl, and he held appointments at the Centre National de la Recherche Scientifique (1956–60), the University Paul-Valéry Montpellier (1960–82), and visiting appointments at the École Normale Supérieure, Sorbonne, Louvain, University of Washington (Seattle), and the University of Tokyo.

51. See, for example, ibid., 309–35, 683.

in contrast, stresses God’s immanence to us. But in making God and revelation central to phenomenology, Henry remains nevertheless strongly linked with Levinas and Marion. We return here (and will do so again in what follows) to the question of just who is being most faithful to Husserl’s “principle of principles.” Like Levinas, Henry would consider himself to be one of the “true” phenomenologists. Yet, while Henry accepts most of the basic principles of Husserlian phenomenology, he reverses intentionality. In effect, intentionality is suspended in order to allow the object to be manifest in total immanence. What Henry thus explains is the very givenness of the phenomenological appearance. In this regard, it is no accident that Marion clearly acknowledges his indebtedness to Henry for the latter’s earlier work on givenness.  

In his later work, Henry makes a claim that is very similar to that of Chrétien: that the structure of Christianity ultimately teaches us about the structure of phenomenology. It is the question of whether phenomenology is most itself when it is thoroughly secular and naturalistic or whether it is only truly phenomenological when placed into a decidedly Christian context. Janicaud, of course, is going to side with the former option. It is also significant that Henry gives us an account of suffering and violence that turns out to be much more like that of Chrétien than Derrida. Life, according to Henry, is constituted by a comingling of suffering and joy. They are our basic Stimmungen (moods) and they are joined in such a way that they cannot be separated. Henry goes so far as to speak of “suffering and joy together and without distinction.” In seeing them as so close and without clear distinction, Henry sounds very much like Chrétien, as will become readily apparent.

V. THE PROBLEM OF IDOLATRY AND THE NATURE OF GIVENNESS: JEAN-LUC MARION

The central concerns of Levinas are certainly those of Jean-Luc Marion, although Marion’s interest in avoiding violence to the other and in reversing

56. Jean-Luc Marion (July 3, 1946– ; born in Meudon, France) was educated at the Lycée Condorcet (1964–67), École Normale Supérieure (1967–70), and University of Paris IV–Sorbonne (1970–74), and received from the Sorbonne a doctorat du troisième cycle in 1974 and a doctorat d’état in 1981. His influences include Alquié, Balthasar, Derrida, Descartes,
the structure of phenomenology are very much motivated by his Roman Catholicism. Like Ricoeur and Levinas, Marion tries to keep separate his more “philosophical” from his more “theological” works.57 Yet, as with Levinas, both critics and supporters have argued that the separation is not quite so clear as Marion maintains. Much of Marion’s work is developed in relation to the themes of idolatry and what he terms the “saturated phenomenon.” As early as *The Idol and Distance* (1977), Marion had proclaimed Nietzsche’s idea of the “death of God” to be no more than the death of a god who rightly should die, the god of the philosophers – an idol that “does not have any right to claim, even when it is alive, to be ‘God.’”58 According to Marion, such idols have taken the form of Plato’s form of the Good, Aristotle’s “thought thinking itself,” Plotinus’s One, Kant’s “moral founder,” and Hegel’s *Geist*. To Heidegger’s rhetorical question “will Christian theology one day resolve to take seriously the word of the apostle and thus also the conception of philosophy as foolishness?”59 Marion responds: “To take seriously that philosophy is a folly means, for us, first (although not exclusively) taking seriously that the ‘God’ of onto-theology is rigorously equivalent to an idol.”60

At the heart of *God Without Being* is the discussion of idols and icons. The idol is like a mirror, in which we see our own reflection. In contrast, the icon is like a window through which we look to something beyond. Whereas the idol satisfies the gaze, “the icon summons sight in letting the visible … be saturated little by little with the invisible.”61 Given that Paul speaks of Christ as the “icon” of God (Col. 1:15), Marion thinks of Christ as the model for icons, all of which are what he would term “saturated phenomena.” Whereas according to Husserl’s “principle of principles,” the object of consciousness appears “within the limits” of consciousness, Marion contends that some phenomena simply “exceed” those limits, so that intuition is overwhelmed by that which is given. It is the *subject*,

60. Marion, *The Idol and Distance*, 18.

then, that makes for a lack of *adaequatio*. While saturated phenomena come in a variety of types, it is revelation that particularly concerns Marion. In effect, the saturated phenomenon is a reworking of Kant’s “aesthetic idea,” which “furnishes much to think,” so that “no determinate thought, or concept, can be adequate” to it.\(^\text{62}\) Marion likens such an experience to that of one who comes out of Plato’s cave and into the light of the sun. The experience is one of bedazzlement, in which the intuition of intentionality is simply overwhelmed by sheer excess. “Something is experienced as unbearable to the gaze because it weighs too much upon that gaze. … What weighs here is not unhappiness, nor pain, nor lack, but indeed glory, joy, excess.”\(^\text{63}\) The revelatory force of the saturated phenomenon unseats the ego, which loses control of its object (to which it, in effect, becomes subject).

Marion identifies two sorts of idolatry. The first is that of onto-theology and what he says in this regard resonates with Heidegger’s critique. However, Marion accuses Heidegger of holding God captive to “Being,” a move we noted earlier in Heidegger’s “Letter on Humanism”: “Beyond the idolatry proper to metaphysics, there functions another idolatry, proper to the thought of Being as such.”\(^\text{64}\) To counter this move, Marion attempts “to think God without any conditions, not even that of Being.”\(^\text{65}\) Here one is reminded of Levinas and his desire to think “otherwise.” In place of a God “within” Being, Marion speaks of a God “without being,” a God who is *agápê*, who appears to us as *gift* and thus cannot be mastered by intuition. As we will shortly see, Marion later develops this theme of givenness (*Heidegger’s es gibt, Levinas’s *il y a*), extending it to all of phenomenology and claiming that “the phenomenon therefore manifests itself insofar as it gives itself.”\(^\text{66}\)

Strongly influenced by negative theology – *apophasis* or the “*via negativa*,” which (simply put) is a way of speaking about God by saying what God is not – Marion insists that “predication must yield to praise,” so that “faith neither speaks nor states.”\(^\text{67}\) Yet Marion is unwilling simply to accept the alternatives of assertion and negation. Instead, he postulates a “third way,” in a manner similar to Levinas’s “otherwise.” As Marion asserts, “the language of praise plays its own game.”\(^\text{68}\) In effect, Marion envisions a “language” that is beyond the true and false logic of predication. He further insists that negative theology – or at least *his* version of negative theology – “does not aim to reestablish a ‘superessentiality’,

63. Ibid.
64. Marion, *God Without Being*, 41.
65. Ibid., 45.
68. Marion, *The Idol and Distance*, 193.
since it aims neither at predication nor at Being.”

It is unclear whether Marion can successfully assert the possibility of a “third way” and, regarding this claim, Derrida has been one of his sharpest critics (as we will see shortly).

In the end, the question of exactly what Marion is attempting to accomplish can be answered in more than one way. On the one hand, in such texts as God Without Being, Marion can be said to be doing philosophical theology in a phenomenological mode. There he makes very explicit theological claims, for instance that “only the bishop merits, in the full sense, the title of theologian,” and that theology only properly takes place in the moment of the Eucharist. There, and in other such theological texts, Marion’s faith commitments are in full force and his attempt to move beyond metaphysics is distinctly theological in nature. On the other hand, his phenomenological trilogy (Reduction and Givenness, Being Given, and In Excess) attempts to move beyond metaphysics phenomenologically, as well as to open up a phenomenological space for nonimmanent (that is, transcendent) phenomena (which would include, although not be limited to, specifically religious phenomena). Thus, these phenomenological texts have very important theological implications, even though they are not theological per se. As Marion himself notes, Being Given works out the nature of saturated phenomena (including that of revelation) in a way that God Without Being could only do “bluntly” and by “direct recourse to theology.”

To move beyond metaphysics phenomenologically, Marion moves from focusing on either intentionality and intuition (Husserl) or being (Heidegger) to givenness. He makes this move by concentrating on what he takes to be even more primordial than Husserl’s “principle of principles”: “so much reduction, so much givenness” (or “the more reduction, the more givenness”), a principle that Marion invokes from Husserl’s The Idea of Phenomenology. According to this principle, the phenomenon must be (i) given intrinsically (purely from itself), (ii) irrevocably (essentially given), and (iii) radically (so that at heart it is characterized by givenness). Since phenomenological givenness is prior to consciousness, it cannot be controlled by consciousness. Instead, the I – which Marion terms the “interloqué” – is compelled to answer to the phenomenon. “Deposed from autarchy and taken by surprise,” the I experiences a reversal in that its logos is no longer in control and this “prohibits the interloqué from comprehending” in the sense of complete adequation. In effect, Marion (again, like Levinas and Henry) turns the usual phenomenological stance around.

autonomous subject becomes the one who is interrogated – l’interloqué (the interrogated one) – whom eventually Marion comes to term l’adonné (the gifted one). The one who is gifted is in effect called – and thus must respond.75

Although Being Given is ostensibly about phenomenology’s structure, it is telling that when Marion discusses the call, he turns to the classic call of God to Samuel, in which Samuel’s response is “here I am.” For Being Given tells the story not just of all objects that are given to us but likewise the story of the ultimate given: revelation. This raises the question of the “as such” or the hermeneutics that Marion employs. We noted earlier that Heidegger insists that phenomena must be interpreted “as” something. But Marion’s conception of the saturated phenomenon in effect derails the “as such” aspect of intuition. As he puts it, “the claim to the ‘as such’ has no right to be made.” To this claim Derrida responds: “Then would you dissociate what you call phenomenology from the authority of the as such? If you do that, it would be the first heresy in phenomenology. Phenomenology without the as such.” Marion responds by quoting Levinas: “‘Without horizon [i.e. the as such] there is no phenomenology.’ [To which Marion adds:] And I boldly assume he was wrong.”76 Hermeneutics is effectively pushed aside, becoming a moment not of the first or initial appearance but of later reflection. The question, however, is whether Marion is justified in so doing, on two different levels. On the one hand, does Marion’s account remain truer to the things themselves than the standard phenomenological “orthodoxy”? On the other hand, does the claim that the saturated phenomenon appears without any conditions being imposed by consciousness prove more truly “orthodox” phenomenologically? Not surprisingly, Janicaud thinks that Marion has a horizon, namely one imported from theology. The result is that, “despite all the denials, phenomenological neutrality has been abandoned.”77 But, again, precisely the question of whether such “neutrality” is either possible or desirable is what is at issue.

VI. THE QUESTION OF THE MESSIANIC: JACQUES DERRIDA

One can argue that the question of negative theology – or something very much like it – can be found throughout the thought of Jacques Derrida.78 Not only

75. Marion makes explicit reference to Jean-Louis Chrétien’s The Call and the Response (discussed below). See Being Given, 287.
77. Janicaud, The Theological Turn of French Phenomenology, 68.
78. Jacques Derrida (July 15, 1930–October 8, 2004; born in El-Biar, near Algiers, French Algeria; died in Paris, France) was educated at the Lycée Louis-le-Grand, École Normale
does he explicitly address the notion, but even the idea of the “messianic” in his late philosophy clearly has something like the structure of negative theology. As early as the essay “Diff érance” (1968), Derrida recognizes that his thought might seem almost “indistinguishable from negative theology.” However, he goes on to point out that both difference – which encompasses both “to differ” and “to defer” – and deconstruction concern the possibility of presence to consciousness and thus thought and language in general, whereas negative theology has to do with both theological thought and language that claim a “superessentially beyond the finite categories of essence and existence.”

Derrida returns to the logic of negative theology in “How to Avoid Speaking: Denials” (1987), particularly the denial by negative theologians that Derrida argues can be read only as being an assertion. In this respect, negative theology repeats the logic of Plato’s “beyond being.” Just like Plato, Dionysius actually “asserts” that “God is the Good that transcends the Good and the Being that transcends Being.”

Yet Derrida accuses this “logic” of “going further than is reasonably permitted. That is one of the essential traits of all negative theology: passing to the limit, then crossing a frontier.” On the other hand, negative theology does not just go beyond what is permitted: it likewise proves to be kenotic. “Negative theology empties itself by definition, by vocation, of all intuitive plenitude,” becoming in effect “kenôsis of discourse.” One might say that negative theology proves to be exactly the opposite of Husserl’s adaequatio: not a “full intuition” but “an empty or symbolic intending” or “inadequation.” As to the question of Marion’s “third way,” Derrida responds: “Even if it is not a predicative affirmation of the current type, the encomium [i.e. praise] preserves the style and the structure of a predicative affirmation.” Whereas Derrida thinks that prayer might have no particular person to whom it is addressed, he insists that praise always assumes some attributes of the being or thing praised, and so it is never directionless.

Despite their differences regarding the possibility of a “third way,” Derrida in effect creates his own “third way” in the concepts of *différence* and the messianic. For *différence* is neither pure sameness nor otherness and the messianic partakes of no particular messianism – Christian, Jewish, Muslim, or otherwise – but is a pure structure that has no need of any particular revelation. Although the concept of the messianic is one that Derrida adopts only in his later philosophy, he sees deconstruction as messianic in that it is always pointing us to the future – *l’avenir* – a future that is unforeseeable and thus unpredictable, and therefore never arrives. For this reason, Derrida claims that “*deconstruction is justice,*” in the sense that deconstruction is always trying to bring about justice but justice is always on the way and never present.83 “Deconstruction” is an elusive term to describe, although Derrida insists that it is not a “method.” Instead, it is the questioning, modifying, and reformulating of all formulas and beliefs that naturally takes place precisely because all beliefs and formulas are always open to question and rethinking. Deconstruction serves justice by asking whether particular laws serve justice. Since laws can never perfectly embody justice, Derrida thinks we must always be vigilant.

Yet Derrida’s concern for justice is not just ethical but also religious in nature. *The Gift of Death* brings together these two concerns. Beginning with Jan Patočka’s claim that hidden within the responsibility of Christian ethics are the secrecy and mystery of the cultic, Derrida argues that Christianity has a fundamental mystery at its heart. The problem arises in that ethical responsibility is neither simply to the singular other nor to some universal rule. Reinterpreting the French euphemism for suicide – *donner la mort*, literally, “to give death” – Derrida maintains that ethics is always a sacrificing of oneself for another. Christianity promotes such a sacrifice, but it must be done in secret. Borrowing heavily from Kierkegaard’s account of the near-sacrifice of Isaac by Abraham, Derrida emphasizes that Abraham cannot give a rational or ethical account for his action, which means he must act in secret. It is this secrecy that, for Derrida, applies to all ethical actions. If one were to explain one’s actions, then one “loses the possibility of deciding or the right to decide. Thus every decision would, fundamentally, remain at the same time solitary, secret, and silent.”84 There is an essentially aporetic quality to responsibility, then, since it is neither simply an accounting for one’s action (by recourse to the universal) nor a nonaccounting for one’s action. Further, while God does ultimately reward Abraham, there is no “payback.” Precisely the willingness to offer his son as a sacrifice without having

any expectation of reward is the reason he receives a reward. Neither morality nor faith, for Derrida, partakes in economic exchange. Instead, the logic is that of the gift – a true sacrifice – in which there is no calculation or expectation. Yet such a “gift” is not merely difficult but represents for Derrida “the impossible,” “the very figure of the impossible.”

Christianity – in its very structure of morality and faith – exemplifies this logic. Or else, and this would be Nietzsche’s view, it merely appears to do so. The Gift of Death ends with a question: when Jesus instructs his disciples to give in secret (Matthew 6), are they truly giving a gift or partaking in an even more calculating way in economic exchange?

As much as Derrida at times valorizes Christian morality, he speaks of his own religious beliefs by saying “I quite rightly pass for an atheist,” although he also says “I pray, as I have never stopped doing.”

Derrida wrestles with the question with which Augustine wrestled: “What do I love when I love my God?” The result is an interesting way of combining Kant’s making room for faith and his demand that religion remain within the bounds of reason. Admitting that reason is always interlaced with faith, Derrida is critical of “dogmatic faith” that “claims to know” and thus “ignores the difference between faith and knowledge.”

It would seem that, again like Kant, Derrida’s faith is primarily moral in nature. Derrida is uncomfortable with any concrete “messianism,” for he sees them as inherently violent and too sure of themselves. Instead, he speaks of the “messianic” in general, which is “the opening to the future or to the coming of the other” who arrives as an “absolute surprise.” For Derrida, such a general messianicity is possible by way of a “nondogmatic doublet of dogma … a thinking that ‘repeats’ the possibility of religion without religion.”

However, Derrida can be questioned in a number of respects. Certainly one danger is that Derrida’s “undecidability” could simply lead to indecision. Derrida insists that it ought not, but Derrida’s own lack of decision (regarding, say, messianism and the messianic) demonstrates this tendency. Further, a general messianicity that is derived from singular beliefs seems at odds with Derrida’s concern to protect singularity. For is messianicity not necessarily connected to some concrete messianism? Yet perhaps the most troubling aspect of Derrida’s thought is that requirements for both justice and faith seem so high that they

88. Ibid., 57.
could never be properly instantiated. Both are always avenir (to come) and thus (seemingly) can never arrive.

**VII. THE VOICE OF THE CALL: JEAN-LOUIS CHRÉTIEN**

Jean-Louis Chrétien’s “phenomenology” is difficult to characterize. That he subtitles one of his books “Phenomenology of the Promise” might lead one to the conclusion that his thought is linked to Derrida’s l’avenir. But Chrétien maintains that “the promise always already surrounds us.” The promise is both to come and yet already here. That kind of paradoxical formulation is at the heart of Chrétien’s philosophy, which often evokes that Heideggerian phrase “always already [immer schon].” Although Janicaud admits that Chrétien writes with care and nuance, he insists that Chrétien is writing against the theological backdrop of Christ’s incarnation. Of course, Chrétien does nothing to hide his influences: he cites both philosophers and theologians abundantly and frequently centers his meditations around passages from both Hebrew and Christian scriptures. Thus, although he writes on such topics as the body, the presence of the voice, and testimony, his take on them is distinctly theological, which leads Janicaud to wonder how they could be phenomenological. Indeed, that Chrétien would have essays titled “The Obliqueness of the Human and the Obliqueness of the Divine in the Christian Conversations of Malebranche” and “The I and Sin according to Kierkegaard” – in which Chrétien takes seriously the implications of sin for the constitution of the self – would only seem to strengthen Janicaud’s claim. Yet, whereas Marion would insist that his phenomenology of the “givenness” of the saturated phenomenon is “strictly phenomenological” (even though, strangely enough, it leads to a “theophany”), Chrétien would say that including theological voices actually illuminates the phenomena, resulting in what he insists is

---

90. Jean-Louis Chrétien (July 24, 1952– ; born in Paris, France) was educated at the Lycée Henri-IV (1969–71), École Normale Supérieure (1971–75), and Fondation Thiers (1977–80), and received a doctorat de troisième cycle from the University of Paris IV–Sorbonne (1983) and habilitation à diriger des recherches from the University of Paris IV–Sorbonne (2004). His influences include Aristotle, Augustine, Claudel, Heidegger, Levinas, Philo of Alexandria, Plato, Plotinus, and Porphyry, and he has held appointments at the University of Paris XII–Crétteil (1981–88), University of Paris IV–Sorbonne (1988– ).

something that is “rigorously phenomenological.”94 The result is a clash between a minimal, naturalistic phenomenology and a radical phenomenology that is either somewhat secretly or quite explicitly motivated by religious concerns.

Although Chrétien writes on a wide variety of topics, the theme of a call that “wounds” is one that appears in multiple texts and can be considered a dominant motif in his thought. One might even argue that it is the heart of the theological turn not just in Chrétien but French phenomenology in general. For Chrétien insists that the call that comes to us always already precedes us and also has the effect of decentering us and constituting us. It is yet another example of the usual phenomenological paradigm being turned on its head. “We speak only for having been called,” says Chrétien, who also claims “we are entangled in speech as soon as we exist.”95 In place of a privileged, autonomous subject, Chrétien sees us as intersubjectively constituted, so that our voice is never really our own. As such, we are part of an ongoing conversation and an ever-evolving hybridity of both speech and self. Indeed, Chrétien pushes this intersubjectivity to a point where the idea of the “self” as discrete is seriously challenged. And that challenge is clearly presented within a theological context.

In that regard, when Chrétien says that “each new encounter shatters us and reconfigures us,”96 it is not incidental that the phrase appears in an essay on prayer. Yet what is remarkable about that essay is how Chrétien uses prayer – a specifically religious phenomenon – to illuminate speech and conversation in general. Whether in prayer or in conversation with a human other, one is both touched by the other and touches in return. This movement is further complicated by Chrétien’s claim that any response to a call “also calls out in turn and appeals to other calls.”97 So the structure of the call is not merely two-way but multidirectional. Speech comes to us as gift and so we both give back and give away. For Chrétien, the problem of the gift (and thus economic exchange) simply is not a “problem” for him (as it is for Derrida) precisely because of a fundamental “inequality” of gifts. As he puts it, “no response will ever correspond. The perfection of the answer will lie forever in its deficiency, since what calls us in the call is from the start its very lack of measure, its incommensurability.”98 Is there a problem, though, with this logic? That gifts cannot be measured means that there can be no reciprocity involving measurement (no “even exchange”).

94. Marion, “The Saturated Phenomenon,” 215; Chrétien, The Call and the Response, 33. Although Chrétien is particularly speaking here of “human sight” and even poses this as a rhetorical question, he undoubtedly sees himself as doing rigorous phenomenology.
98. Ibid., 23.
Yet, if the response is always deficient, then is there not some kind of measuring that must have already taken place insofar as the response is deemed to have not measured up? Chrétien does not really answer this question, although his claims about “nothingness” function as a way of at least addressing it. He claims that we possess “nothing” and so, when the gift comes to us, we cannot really possess (let alone measure) it but respond only by passing it on. Chrétien’s argument would seem to be that since none of us can possess the gift and all of us possess only nothingness, we are always exceeded by the gift.

All of this exchange is deeply connected to wounding. It is not just that anyone who speaks “opens himself to more than himself and to others,” but that every “opening up” is like a kind of wound. Chrétien is speaking particularly of prayer when he writes that it “exposes [the one praying] in every sense of the word expose and with nothing held back.”99 Prayer in particular is “always agonic” for it opens us up to God and even the act of prayer is a kind of “suffering.” Here it is helpful to remember that many encounters with God in the Hebrew Bible are ones in which the one called by God is opened up. For example, in one of the earliest, Moses hears God speaking to him from the burning bush and replies: “Here I am,” which signifies that he is willing to be at God’s disposal. When we think of “suffering,” we tend to forget that its original meaning – and its French equivalent “suffrir” – is “to submit to.” Although Chrétien also has in mind the idea of being in pain, that notion of submitting is first and foremost. We become a “subject” before God, since “all prayer confesses God as giver by dispossessing us of our egocentrism.”100 So the same reversal that we found in Levinas and Marion is likewise found in Chrétien. But this is a painful reversal and decentering, precisely because we so want to be in the center. It should be no surprise, then, that Chrétien sees prayer as an agonic struggle and Jacob’s wrestling with the man or angel or God in the book of Genesis as paradigmatic. What takes place is a violent and prolonged encounter in which there is both a wound (Jacob’s hip is displaced) and a blessing (Jacob becomes Israel). Although not all such encounters with God (or with human others, for that matter) are so agonic in nature, Chrétien sees at least something agoniac in prayer itself, since even the act of submitting to God is a struggle.

Unlike Levinas – and particularly unlike Derrida – Chrétien does not simply want to eliminate all violence or suffering (although here he is quite close to Henry, who, as we noted, sees suffering and joy as inextricably linked). So he has a very different response to the problem of violence as posed by Hegel. In

100. Ibid., 153. Chrétien clearly has this idea of the “Here I am” in mind for, elsewhere, he speaks of “the gift to which one is opened without recourse, about being the only one who can say Me voici, here I am,” in Jean-Louis Chrétien, The Unforgettable and the Unhoped For, Jeffrey Bloechl (trans.) (New York: Fordham University Press, 2002), 120.
one sense, Chrétien can be viewed as simply more realistic than either Levinas or Derrida, for he thinks that struggles in which there is suffering or violence simply describe the human condition. Although some might be willing to level the charge of falling into an all too easy justification of evil, Chrétien has a highly nuanced account of suffering and violence in which he maintains that “the benediction can wound.”\textsuperscript{101} Here the reference is again to Jacob’s struggle. Chrétien points out that it is hard to see in the narrative who is the victor or vanquished. Any simple interpretation of who “wins” here would be naive. So Chrétien does not provide a theodicy but a phenomenology that attempts to think “loss, wound, and passivity, as well as forgetting and fatigue” from the point of view in which “there is no philosophical parousia.”\textsuperscript{102} Precisely because there is no such parousia, thinking of loss, wound, and suffering either as wholly gratuitous or as ultimately good – or at least offset by good – is simply impossible. For Chrétien, we are left in the phenomenological middle in which good and evil come mingle, a world in which evil often masquerades as good and good is often less good than we take it to be. But it is likewise a world in which evil is not always quite as evil as guessed or feared. Chrétien is no wide-eyed optimist, but he is too nuanced as a phenomenologist to reduce the phenomena to any simple categories. The result is that the reader is left with a certain unease, for there is no real resolution or clear conclusion, just a meditation on the phenomena that leaves them in all of their complexity and paradox.

Yet Chrétien does envision a kind of parousia. In much the same way that he affirms a kind of memory beyond that remembered, so he speaks of a future that cannot be anticipated, one that “exceeds all expectation, and thereby founds anticipation.”\textsuperscript{103} Here Chrétien’s “anticipation” and a future exceeding expectation sounds like Derrida’s messianic and l’avenir. Chrétien himself says that “the unhoped for is what transcends all our expectations.”\yet, unlike Derrida, Chrétien sets this within a decidedly Christian context. As he goes on to say, “at the point where Revelation permits hope to become hope in God and confidence in God’s promise, the unhoped for is charged with a new meaning.”\textsuperscript{104}

\textbf{VIII. CONCLUSION}

With Levinas, Henry, Marion, Chrétien – and even Derrida – phenomenology both goes in a distinctly theological direction and undergoes a startling

\textsuperscript{101} Jean-Louis Chrétien, “Retrospection,” in \textit{The Unforgettable and the Unhoped For}, 122.
\textsuperscript{102} \textit{Ibid.}, 126.
\textsuperscript{104} Chrétien, \textit{The Unforgettable and the Unhoped For}, 105, 107.
phenomenological reversal. These moves have had a number of significant consequences. First, the Kantian move of “making room for faith” is put into question. Is it reason making room for faith or – as with these first four philosophers – faith being kind enough to make room for reason? Second, given this uncertainty of who is making room for whom, the very assumption of the superiority of reason over faith is put into question. No longer is it clear which truly has the upper hand. And it is Derrida, the one who “rightly passes for an atheist” – who particularly points this out. Third, whether violence is simply gratuitous and so should be minimized at all costs may be the conclusion of Derrida, but it is not that of either Henry or Chrétien. Although hardly champions of violence or suffering, they conclude that the picture is considerably more complicated. Fourth, whatever one makes of them, the challenges to phenomenology posed by Levinas, Henry, Marion, and Chrétien cannot be simply ignored. They are rigorous, substantial, and made precisely in the name of phenomenology. Fifth, all four of these thinkers provide helpful ways for moving philosophy of religion beyond its Babylonian captivity to onto-theology.

Of course, the debate is hardly over. Since 1995, there have been plenty of new works, topics, and voices. Yet one thing is clear: while once somewhat moribund, continental philosophy of religion has come back to health in a vigorous way and shows no signs of abating.

Although the linguistic turn has been praised as the major philosophical achievement of contemporary philosophy, there is also another important “turn” that – I will argue – has been in fact more epochal and philosophically significant if considered in terms of its long-term impact across traditions and in its influence in shaping the contemporary philosophical agenda. For while the linguistic turn has been pivotal in the emergence of some trends and schools of thought within analytic and continental philosophy, the performative turn has not only created trends and schools within these traditions but has in fact challenged their boundaries, leading to the emergence of perspectives that live across traditions or in the interstices between them. Not only has the turn to performance resulted in the development of philosophical perspectives that are hard to classify and impossible to pigeonhole, but their proponents and followers have engaged in multifaceted and multilayered debates that span across traditions and even across disciplines, reshaping theoretical landscapes and challenging their most basic assumptions. In a broad range of philosophical issues concerning identity, knowledge, and values, performative approaches have flourished, transforming and enriching philosophical research and calling for interdisciplinary collaborations that reach beyond the boundaries of philosophy (especially in feminist theory, race theory, social epistemology, political philosophy, and aesthetics). But what exactly am I calling “the performative turn”? In this introduction I will briefly sketch what the philosophical turn to performance entails, setting the stage for my account of its occurrence across philosophical traditions and for my exploration of the consequences and implications of its legacy in the philosophical movements of the twentieth century and in the philosophical agenda of the twenty-first century.
The performative turn can be said to have taken place in different ways in different places: different philosophical traditions have put performance at the center of philosophical debates and have called attention to the crucial connection between philosophical problems and human actions and practices. Many would argue that in the continental tradition this turn had been in the making for centuries, culminating with the Romantic movement of the nineteenth century establishing a deep and intimate connection between subjectivity and its expressions in action. Charles Taylor, for example, has traced the development of an expressive tradition in European philosophy of language from Hamann, Herder, and Humboldt to Husserl, Heidegger, and Habermas.¹ Others have also emphasized the performative aspects of Romantic expressivism, with its emphasis on cultural practices as constituting (as well as expressing) human values, human taste, human reality, and human knowledge. In this sense Hegel himself can be seen as a major contributor to the performative turn.² But I am more interested here in highlighting how the turn to action and performance took place at the threshold of the twentieth century, reconceptualizing philosophical problems within continental thought during that century. In this sense, although we can trace its historical roots much further, the performative turn in twentieth-century continental philosophy is closely linked to the refocusing of interpretative questions in practical terms: by focusing on action and performance, traditional epistemic issues concerning human understanding became social, political, and historical issues.

We can identify three philosophical movements that made crucial contributions to the performative turn in European thought: Marxism, with its reversal of the traditional relationship of theory to practice; phenomenology, with its analysis of the lifeworld; and hermeneutics, with its dynamic and immanent approach to understanding grounded in historically situated practices of interpretation. The Marxist philosophy of praxis brought to the fore the social and political aspects of traditional epistemic questions, presenting a new methodological approach to interpretation with the critique of ideology. Interestingly enough, in the early twentieth century even phenomenological theories of subjectivity were reoriented toward the practical and the social, with Husserl himself moving the focus of his philosophy from intentional meaning-conferring acts to the lifeworld – an intersubjectively shared background that supports meaning and

². See John McCumber, *Poetic Interaction* (Chicago, IL: University of Chicago Press, 1989), and *The Company of Words* (Evanston, IL: Northwestern University Press, 1993). If the latter book argues for an interpretation of Hegel as one of the creators of the linguistic turn, the former can be said to show Hegel's crucial contributions to the performative turn.
communication. In this way phenomenology moved from an intentionalistic semantics to a social pragmatics that re-cognizes socialization into a form of life as a prerequisite for meaning and understanding. It is this priority of the practical and the social that grounded the convergence between phenomenology and Marxist philosophy – otherwise quite different schools of thought – that we see, for example, in the early Marcuse or the later Sartre. On the other hand, hermeneutics also brought the epistemology of interpretation to the realm of concrete sociohistorical practices. From Dilthey to Gadamer and Ricoeur, the rethinking of interpretative methodologies in the human sciences resulted in the rich situating of reason in society and history and in the provocative reconceptualization of interpretative subjectivities as embodied in language and action.

The performative turn was produced rather differently in the analytic and pragmatic schools of thought within Anglo-American philosophy. I will be teasing out some parts (or threads) of this complex story in the next two sections, so here I will simply lay out the two criteria I have used to compose the story I will tell about the development and impact of the performative turn. In the first place, I want to explore the intersection between the performative turn and the linguistic turn. Therefore, I will focus on those performative theories that are also at the same time theories of language and communication. In the second place, since I want to identify those performative insights that have had an important impact across philosophical traditions, the protagonists of my story will be those philosophers whose performative approaches have influenced and shaped discussions in a wide range of philosophical schools. For this reason, I will give priority to authors such as Wittgenstein and Austin over others such as Ryle and Grice. For, although Ryle’s logical behaviorism and Grice’s pragmatics have been highly influential performative theories, they have been comparatively less pivotal in generating philosophical discussions of performance across traditions.

5. I am here calling attention to the contribution of hermeneutics to the performative turn, but perhaps this should be qualified, for, although there are performative strands in this school of thought, not all hermeneutic approaches are performative and there are indeed some idealistic tendencies within hermeneutics.

I will articulate a two-part story about the performative turn in analytic and pragmatist philosophy. In the first part of my story I will focus on some central figures in Anglo-American philosophy (Austin, Dewey, and Wittgenstein in particular), tracing the impact of their central ideas not only among their followers but also, and more importantly, among theorists of different philosophical traditions (Butler, Cavarero, and Habermas, among others). This section will already highlight the beginnings of a process of hybridization between philosophical traditions, a productive *mestizaje* that makes one hopeful about new generations of theorists who are problem-oriented and are willing to use conceptual tools from a variety of sources, without letting their allegiances to particular traditions become obstacles to their reflections or to the philosophical dialogues in which they engage. In the second part of my story I will sketch my own account of the emergence of *post-analytic philosophy* as a result of the linguistic and performative turns. I will highlight the strength of this new school of thought in reconceptualizing fundamental questions concerning normativity in performative terms. By focusing on the interrelations between language and action, problems concerning knowledge, values, and reality appear in a new light. My analysis will underscore the generative potential of the American performative turn in reconceptualizing traditional philosophical problems and creating new ones.

I will also highlight an important weakness in post-analytic philosophy: what I call the *evasion of identity*. Until recently the authors in this school of thought for the most part neglected issues of identity and thereby disregarded some of the most important ideas and cultural developments of the twentieth century. We can add to W. E. B. Du Bois’s claim that the problem of the twentieth century was the problem of the color line, that it was also the problem of the gender and sexual lines. But most post-analytic American philosophers – from Quine and Sellars to Davidson and Putnam – missed an opportunity to incorporate in their theorizing some of the most important sociopolitical and cultural movements of modern times: the civil rights movement, the women’s liberation movement, and the sexual liberation (and GLBT) movement. This suggests not only an intellectual oversight, but also an important disconnect with (and possibly a lack of concern for) some of the most central problems of the contemporary world. How can one philosophize about knowledge without taking into account issues of gender and race when women and racial minorities were being excluded from the institutions in charge of producing and disseminating knowledge? How can one theorize about human relations and disregard race, gender, sexual orientation, and class in a society in which racism, sexism, and homophobia are rampant, and economic oppression everywhere?

These criticisms against analytic philosophy have been forcefully voiced by many. But they still apply to an important degree even to post-analytic philosophy. And this lacuna becomes all the more dramatic in a school of thought that is oriented toward action and performance. But there have been some important exceptions in this respect (Stanley Cavell being perhaps the most notable) and glimpses of concern for identity issues have appeared here and there in post-analytic philosophy, especially in the late 1980s and 1990s. I will discuss how the evasion of identity in post-analytic philosophy is being addressed by some and I will argue that repairing this evasion requires a dialogue among philosophical traditions that is critical and challenging – in identifying and contesting gaps and exclusions – as well as mutually enriching – in sharing existing theoretical resources and strategies and creating new ones. There is reason for hope, I will contend, and it lies in the recently developed and ongoing collaborations across philosophical traditions and across disciplines. I will conclude with a brief note on the philosophical agenda for the twenty-first century, which must be pluralistic, interdisciplinary, and cross-cultural in order to address the needs and concerns of the multicultural and globalized communities of today.

I. THE PERFORMATIVE LEGACY

I will start developing my account of the performative turn in analytic and pragmatist philosophy by calling attention to the similarities of the views of communication and action of two central figures in these philosophical traditions: Wittgenstein and Dewey. I focus on these two authors because of their unparalleled influence and their converging contributions to the performative and linguistic (or better yet, communicative) turns of early-twentieth-century philosophy. As I have argued elsewhere, Wittgenstein and Dewey share a similar contextualist view that underscores that words are inextricably interwoven with actions. The intimate bond between words and actions is precisely what the Wittgensteinian notion of a language-game is supposed to highlight: “I shall … call the whole, consisting of language and the actions into which it is woven, the ‘language-game’”; “the term ‘language-game’ is meant to bring into promi-

---

8. For an extended discussion of Wittgenstein, see the essay by John Fennell and Bob Plant in *The History of Continental Philosophy: Volume 3*.

nence the fact that the speaking of language is part of an activity, or of a form of life.”¹¹ In a similar vein, Dewey understands language as a form of agency: “language is primarily a mode of action”;¹² and the inseparability of words and actions is at the core of his “naturalistic” account of language as “the tool of tools.”¹³ In short, the performativity of language is the centerpiece of Dewey’s and Wittgenstein’s contextualism. As Wittgenstein puts it, “words are deeds.”¹⁴

Wittgenstein and Dewey call our attention to the pragmatic contexts of communication; they stress that language and its contexts of use are action-oriented. As I have argued in detail elsewhere,¹⁵ both Wittgenstein and Dewey explain the contextual formation and transformation of meaning in a strikingly similar way. They both argue that the meaning of words and sentences becomes contextually determinate through the tacit agreement in action of the participants in communicative practices. This suggests that the meaning or interpretation of a speech act is not in the hands of anyone in particular, but in the hands of all speakers/writers taken collectively, that is, in the hands of the linguistic community. But this can be understood in different ways: as emphasizing the fixity of meaning established by social and pragmatic means; or as underscoring the instability of meaning that is always scattered and dispersed in a multiplicity of communicative encounters in heterogeneous pragmatic contexts. The former understanding of the semantic role of communal agreement is the one suggested by a consensus view of meaning such as Kripke’s community interpretation of Wittgenstein on meaning and rule-following.¹⁶ A nonrelativistic and nonskeptical version of the consensus view of meaning can be found in Peirce’s semiotics and in Habermas’s account of communicative action.¹⁷ On this transcendental view, what fixes meaning is not the de facto (and perhaps arbitrary) consensus of a contingent community but, rather, the rational consensus of an idealized

---

¹¹. Ibid., §23.
¹³. Ibid., 134.
¹⁵. See my Speaking from Elsewhere, ch. 1.
¹⁶. On Kripke’s skeptical reading of Wittgenstein in Wittgenstein on Rules and Private Language, the lack of semantic foundations is compensated by the arbitrary decisions of the community and thus, on this decisionistic view, what the community decides is the new foundation of language, the be-all and end-all of meaning and communication. It is worth noting that the Kripkean reading of Wittgenstein has been very influential although it has also come under heavy attack in recent years.
community. Semantic foundations are here found in transcendental idealizations that operate as regulative ideals: Habermas’s Ideal Speech Situation and the idealized community of all possible participants in communication; or the Peircean notion of the End of Inquiry, invoked by Hilary Putnam in *Reason, Truth, and History*. According to these transcendental views, our communicative practices are grounded in and guided by idealizations that are always implicitly presupposed and make our communicative interactions possible; and the determinacy and stability of our meanings are to be measured by their asymptotic approximation to the full determinacy and permanent fixity that would be achieved under idealized conditions. But appeals to idealizations are notoriously problematic, among other things because they are always formulated from a situated and partial perspective, and it is unclear how these appeals can overcome the contextualized relativity from which the transcendental views try to escape. Also problematic is the fact that, according to these transcendently idealized views, semantic determinacy requires a background agreement not only in action (in ways of doing things), but also in content (in ways of representing things) and, therefore, a strong semantic uniformity across speakers and linguistic communities. But it is not at all clear that, for the meanings that circulate in our communicative practices, this strong semantic uniformity should be conceived as possible, required, or desirable, even as an idealization.

There is an alternative way of understanding the semantic role of practical agreement and how semantic determinacy is communally achieved in our communicative practices. This is what I have termed – in my interpretation of Wittgenstein’s and Dewey’s semantic views – the idea of contextual determinacy, according to which meanings acquire transitory and imperfect determinacy when contextualized, that is, when situated in pragmatic contexts of communication. Even when they become sufficiently determinate for the purposes of communication, meanings remain unstable and heterogeneous: that is, they remain open to contestation, rather than fixed once and for all; and they become constituted by different perspectives and voices within them, without necessarily becoming uniform and suppressing disparities and dissent.

The instability and heterogeneity of meaning have been emphasized by a variety of contemporary perspectives on communication in analytic and continental philosophy, by theories as different as those of Donald Davidson and Judith Butler. For Davidson, all we need to share for successful communication is a passing theory (not a prior theory) of interpretation. The meanings

---

19. Davidson and Butler are addressed in detail by, respectively, John Fennell and Gayle Salamon in essays in *The History of Continental Philosophy: Volume 8*. 
that we share in successful communicative encounters are simply the result of a transitory convergence of perspectives. These meanings can be entirely *ad hoc*; there is no need for shared meanings to be previously *prepared* or ready-made. Davidson’s argument tries to establish that the interpretative task that interlocutors face is the task of *adjusting* their theories of interpretation until they *converge*. On Davidson’s view, communication is a matter of *mutual adjustment* of theories of interpretation, a process of interpretative negotiation or give and take between speakers who are constantly reinterpreting each other. For Davidson, the meanings that come first in the order of interpretation are *transient meanings*: first meanings are transitory meanings constructed for the purpose of a particular communicative exchange and there is no reason to think that they will survive that exchange. According to this view, the meanings that matter for the purpose of communication have no semantic stability whatsoever. They are the *ad hoc* constructs of *converging passing theories*.20 Davidson’s account of meaning and communication in terms of converging passing theories leads to a radical redescription of the traditional notions of language and linguistic competence. As Davidson puts it, his account gives new content to “the idea of two people ‘having the same language’ by saying that they tend to converge on passing theories.”21 But this seems to relativize and ultimately dissolve *the very notion of a language*, for “any theory on which a speaker and an interpreter converge is a language” and “then there would be a *new language for every unexpected turn in the conversation.*”22 Thus, on Davidson’s view, the notion of a shared language becomes *philosophically irrelevant*; it is simply not needed for a philosophical theory of communication and communicative competence. Thus, on this view, the notion of a shared language is replaced with that of an *idiolect*, and communication is understood as the intersection in passing of the individualistic perspective of particular interlocutors who come into contact.

The instability and heterogeneity of meaning are understood and explained in a very different way in social accounts of language and communicative interaction. It is a mistake to assume (as Davidsonians often do) that a social perspective will necessarily conceive of language as a set of stable conventions that

20. The core of Davidson’s controversial argument is that we can always bring prior theories closer and closer together until they ultimately converge in passing theories that fit one another: no matter how far apart the prior theories of two interlocutors may be, it is always *in principle* possible to tinker with them – to adjust them and transform them – in a process of self-correction, until they converge (so that the speaker intends the hearer to interpret her utterance in a particular way, and the hearer uses a passing theory that interprets the utterance in just that way).

turn meanings into reified, ready-made products that are homogenized across speakers and fixed once and for all. This is not true of all social accounts that depict language as a shared social practice. In particular, it is not true of those social accounts that conceptualize language from a performative perspective, for the focus here is language in action, that is, language as a living practice (parole) and not as an inert system of signs or code (langue). On these social and performative views, meanings emerge from the clashing and meshing of perspectives that are shared in communication through the use of signs. And given that meanings are continually tied to this interactive process of relating communicative perspectives, they display an intrinsic semantic instability and heterogeneity that cannot be fully eliminated; for, no matter how much commonality of perspective we find, no matter how successful processes of semantic homogenization and stabilization happen to be, there is always the possibility of diverse (even diverging) perspectives appearing and disrupting the semantic life of our signs. In this sense, meanings are always in the making; the process of meaning formation (and re-formation) always remains open to new perspectives; and, therefore, there is always a residual semantic heterogeneity and instability that cannot be eliminated. Different articulations of this social-performative account of the openness, fragility, and fragmentary nature of meanings can be found in the pragmatist tradition and in contemporary continental philosophy.

In the pragmatist tradition, we find a highly influential social-performative account of meaning in George Herbert Mead’s *Mind, Self, and Society*. For Mead, meanings go beyond the purely “psychical”; they belong to the interactional, that is, to intersubjective processes of communicative interaction. Mead’s interactionism yields a relational view of meaning. On this view, meaning is a relation among certain phases of social interaction: a communicative action, a reaction to it, and the resulting act that completes the interaction. As Mead explains his interactional semantic view, “the logical structure of meaning” consists in “a threefold or triadic relation between gesture, adjustive response, and resultant of the social act which the gesture initiates.” Mead emphasizes that the specifically human forms of communication that require meanings involve a very peculiar kind of cooperation. What characterizes the kind of cooperation made possible by human language, what defines communicative interaction with symbols, is that it requires reflexivity: that is, the capacity to take the attitude of the other toward oneself. All gestures are tools for the coordination of action. But what distinguishes gestures with meaning is that they carry with them an attitude that

23. In *Speaking from Elsewhere*, I have tried to offer a full account of this point, drawing on the diverse but curiously converging perspectives of Bourdieu, Butler, Dewey, Mead, and Wittgenstein.

is *mutually recognized* by sender and recipient. For Mead, symbolic interaction involves the reversibility of roles or communicative perspectives. He develops his distinctive symbolic interactionism through his theory of role-taking. The claim about the mutual recognition of communicative attitudes involved in the thesis of reflexivity or reversibility seems fairly intuitive and uncontroversial. What is far more problematic, though, is the claim about similarity of response in speaker and hearer that Mead also includes in his account of reflexivity. It seems wrong to say that meaningful gestures have the *same* effect on issuer and addressee. If I issue a verbal threat, my threatening noises do not scare me and I do not feel threatened. For, indeed, to *recognize* is not to be similarly affected. One can reply that the claim about similarity of response that Mead’s reversibility thesis makes only involves that the speaker must know (or have some sense of) what it is like to be the recipient of the address— for example, what it is like to be the object of a threat, even if she does not feel threatened. This is indeed more plausible, but still problematic in some cases: For example, must the harasser know what it is like to be harassed? Must the abuser know what it feels like to be mistreated? Do slave-holders really have an inkling of what it feels like to be dominated? Mead seems to go too far when he claims that meaningful symbolic interaction requires “an arousal in the individual himself of the response which he is calling out in the other individual, a taking of the role of the other, a tendency to act as the other person acts.”

Similar issues appear in the social-performative accounts of contemporary continental philosophy, although the emphasis here is not on mutual recognition, but on misrecognition or lack of recognition; and on the incongruity of communicative perspectives, rather than on the meshing and coordination of perspectives. In these accounts the notion of communicative interaction is articulated through the notion of a *voice* and, thus, the themes of semantic instability and heterogeneity are developed in terms of the *plurivocity* of meaning. A good example of this can be found in the work of Adriana Cavarero. By calling attention to the voice, Cavarero brings to the fore three crucial aspects of symbolic performance: its embodiment, its singularity, and its relationality. The sound of the voice is always something unique, a concrete particular. But the material particularity of a voice, its concreteness and uniqueness, can be produced and recognized only in relation to other voices. In other words, the peculiar embodied singularity of a voice can be achieved only relationally. As Diane Perpich puts it, “voices are inherently plural and relational,” for to speak is to address another, and therefore, it “presupposes the other (and still other

25. Ibid., 73.
others) by virtue of the plurivocity of language.” 27 This plurivocity of language is contained and maintained in each particular voice, in which the voices of past and future speakers resonate: “In speaking, I speak a language that was already given to me by others, a language that contains already a plurality of voices and a consequent plurality of shades of meaning.” 28 A voice always echoes other voices; and with this reverberation through chains of voices, each voice becomes performatively entangled in a network of voices. 29 As Butler puts it, combining the performative views of Austin and Althusser, the voice of an I “is an inherited set of voices, an echo of others who speaks as the ‘I.’” 30 I will come back to Butler’s influential account of plurivocity and symbolic agency, but first let us move from meaning to illocution, that is, from semantic issues about the content of our speech acts to pragmatic issues about their performative force. For we need to elucidate the role of our consensus of action not only in the formation and circulation of meanings, but also in the configuration of illocutionary forces. That is, we need to interrogate also the role of practical agreement in establishing the force of our speech acts, and ask whether there is also heterogeneity and instability in the things that we do with words, and not only in the things we say; in other words, whether performative fixity and homogeneity (either socially or individualistically achieved) are to be expected in our communicative practices. I will start by calling attention to J. L. Austin’s celebrated ideas and how his insights and distinctions have been read and used in the speech act theories developed in different philosophical traditions.

Austin famously formulated the notion of performative utterances, emphasizing that our verbal pronouncements are not only sayings, but also doings, that is, they not only convey certain contents but also perform certain acts. Austin proposed a threefold distinction for the analysis of speech acts: locutionary content, that is, the representational information conveyed by the utterance; illocutionary force, that is, the kind of strength that our words have and makes our utterances the kinds of acts that they are (e.g. promising, threatening, prohibiting, etc.); and perlocutionary effects, that is, pragmatic consequences that are not specifically linguistic or semantic but are achieved through our locutions (e.g. amusing, charming, scarring, etc.), although their achievement is not guaranteed by the locution itself – that is, by the very act of enunciation

28. Ibid.
29. Bringing together continental and pragmatist perspectives, in Speaking from Elsewhere I have analyzed this phenomenon of reverberation as the echoing that maintains meanings alive, being both the source of semantic stability and the source of semantic innovation.
– but is dependent on the reception of the words enunciated by the audience or addressees. Austin focused on the first two elements for the evaluation of speech acts. He emphasized that while the correctness of its representational content depended on the truth conditions of the utterance, the appropriateness of its illocutionary force was to be assessed in terms of its felicity conditions, that is, those conditions under which the kind of act the utterance tries to produce is felicitously achieved. Austin remarked that the kinds of acts we can perform in and through language depend on the linguistic practices and social institutions available to us. So, for example, it is because we have the particular institution of marriage that we have that under certain conditions the words “I hereby pronounce you husband and wife” produce an act of marriage felicitously, while under other conditions they do not; and it is because we have the particular linguistic practices that we have, codifying certain illocutionary forces and not others, that saying “I promise you so-and-so” is, under normal conditions, the issuing of a promise. Austin also suggested that, although they emerged socially, illocutionary forces are inscribed in the speech acts themselves, so that our utterances reflexively call attention to the kind of act they try to perform, that is, sometimes they do this explicitly (“I hereby promise you X” or “I hereby warn you about Y”) and sometimes implicitly (“I will do X” or “Beware of Y”).

This suggestion has been taken up and elaborated by some speech act theorists. It is what Habermas has termed the self-referentiality of speech acts. Habermas emphasizes that this is in fact the fundamental feature of linguistic performativity that distinguishes linguistic acts from nonlinguistic acts:

An observer can only understand a nonlinguistic action when he knows the intention that is supposed to be satisfied through it. Speech acts, on the other hand, identify themselves. Because in carrying out an illocutionary act a speaker simultaneously says what he is doing, a hearer who understands the meaning of what is said can, without further ado, identify the performed act as some specific action. ... The acts carried out in a natural language are always self-referential.31

But of course not every speech act theorist agrees with the thesis of self-referentiality, and contemporary speech act theory is in fact divided over the question of whether illocutionary forces are implicitly and internally present in the act, in its underlying structure; or whether, alternatively, they are a matter of interpretation or negotiation in which external factors also play a role. I want to call attention to two very different readings and uses of Austinian ideas in this

---

31. Habermas, Postmetaphysical Thinking, 64, some emphasis added.
respect: those of Searle and Habermas, on the one hand; and those of Cavell and Butler, on the other hand. The authors in the first group underscore the reflexivity of linguistic performativity and they argue that illocutionary forces are implicit in the very structure of the speech act, whereas authors in the second group reject the idea that illocutionary forces are self-contained within the act, arguing that the force of any given speech act is always interpretable and negotiable, that it depends on its reception and on the consequences it effects, on its social uptake and its productivity within a performative chain. From this disagreement there emerge two very different kinds of speech act theories. The Searlian and Habermasian variety tries to systematize speech acts through their internal analysis, arguing that, at any given time, we can fix and catalogue the kinds of linguistic actions and illocutionary forces available to us. By contrast, the alternative formulation of speech act theory calls into question the alleged fixity and systematicity of linguistic performativity, rejecting the idea that illocutionary forces can be systematically classified, that is, that we can come up with a systematic catalogue of the speech acts that can be performed in our communicative interactions. The Cavellian and Butlerian variety of speech act theory thus underscores the instability and uncontrollability of illocutionary force.

Can speech acts and their illocutionary forces be fixed and controlled? According to the sociological reading of Austin, the answer is yes: linguistic conventions and standardized procedures and rituals fix and maintain the illocutionary force of our speech acts. But this reading (often assumed by speech act theorists) was challenged by interpreters of Austin such as Cavell and Shoshana Felman. These authors emphasized the excessive nature of linguistic performativity, that is, the fact that our performances always exceed the norms and expectations contained in established practices and institutions. On this view, while previous practice and established procedure do constrain what we can do with our words, they do not determine, fix, or fully control our linguistic performances, which are carried out through our embodied voices and writing styles in such a way that not every aspect of what is done can be anticipated and normatively domesticated. Our linguistic performativity is always producing according to established expectation, but always failing to produce as expected. And this constant failing and exceeding are directly related to the embodied nature of performativity. As Felman puts it, embodiment is “the blindspot of speech,” the point at which speaking necessarily fails to recognize itself and what it does: “language is inhabited by the act of failing through which the body is

lacking to itself: the act of failing through which the body’s doing always fails to speak itself, whereas the speaking never fails to do.”33 On Felman’s view, speakers are blind because their speaking bodies are always ignorant about what they perform and always say something they do not intend. Following Felman, Butler explains this blindness or ignorance of the speaking body as follows: “the body is the blindspot of speech, that which acts in excess of what is said, but which also acts in and through what is said.”34

Feminist theorists such as Butler and Felman have called our attention to the corporeal dimension of performativity: it is not an inner subjectivity, but a body that speaks. And this corporeal dimension of speech affects crucially our discursive agency: which body speaks (a male or female body, a racial body, an ethnic body, etc.) has a tremendous impact on the illocutionary – that is, on the kind of speech act it is and the force attached to it; on the perlocutionary – that is, on the effects or consequences of the speech act; and on the semantic and interpretative – that is, on the content of the speech act as a whole and the meanings ascribed to its components. This emphasis on the body that is characteristic of performative views informed by phenomenological perspectives is lost in analytic and post-analytic performative theories; and this is an important reason (perhaps the most important reason) why those theories have failed to address fundamental philosophical issues concerning identity that are bound up with the philosophical questions concerning the normativity of language and action. I will develop this diagnosis in the next section.

II. THE EMERGENCE OF POST-ANALYTIC PHILOSOPHY AND THE EVASION OF IDENTITY

In the story I am developing here, I am emphasizing the crucial significance that the convergence of the performative turn and the linguistic turn had for the development of post-analytic approaches. But of course this is not the only factor that played an important role in the emergence of post-analytic philosophy. For example, naturalism has had an enormous impact on the reconceptualization of philosophical problems, and another (not necessarily competing, but perhaps supplemental) story about the emergence of post-analytic philosophy could be told with naturalism as its main protagonist.35 Not surprisingly the emergence of a philosophical movement often has many facets and

33. Ibid., 78.
34. Butler, Excitable Speech, 11.
*35. For a part of this story of the impact of naturalism on post-analytic philosophy, see the essay by John Fennell in The History of Continental Philosophy: Volume 8.
it involves many components in complex interaction with one another; and all
this complexity perhaps can only be captured in the composite image offered by
multiple accounts of that historical development. So the account presented here
hopes to be a contribution to such a complex story.

As discussed in the previous section, by focusing attention on the relation
between language and performance, the performative turn raises a broad spec-
trum of issues concerning content and force, bringing together in a rich way a
host of epistemic and sociopolitical issues concerning representation and action.
More specifically, I want to emphasize as a major consequence of the legacy of
the performative turn in the last part of the twentieth century the rethinking
of normativity, that is, the reconceptualization of normativity in performative
terms from the engaged perspective of the speaker and agent participating in
communicative practices. This was done in different ways in continental philos-
ophy by, for example, Habermas and Lyotard. But it was also done in a very
particular and powerful way in the 1980s and 1990s by a group of philoso-
phers who were drawing on two philosophical traditions: the analytic tradition
informed by the performative turn and the pragmatist tradition from Peirce and
Dewey to Quine and Sellars. The philosophers who contributed to the forma-
tion of a post-analytic school of thought include, among others, Stanley Cavell,
Robert Brandom, John McDowell, the later Hilary Putnam, and Richard Rorty.
These philosophers draw on classical American pragmatists as well as on rebel-
lious analytic philosophers such as Davidson, Evans, Quine, and Wittgenstein.
In what follows I will briefly highlight some of the crucial contributions of these
authors to the reconceptualization of normativity in performative terms. I will
also emphasize the shortcomings of these post-analytic views of normativity, in
particular, the neglect of issues concerning embodied identity that, I will argue,
result in an evasion of the political in philosophical reflections of normativity. I
will give a separate treatment to Cavell, whose work (unlike that of other post-
analytic philosophers) brought together the normative and the sociopolitical in
a way that is highly sensitive to philosophical questions concerning embodied
identities.

It is important to note that Wilfrid Sellars (1912–89) laid the groundwork of
American post-analytic philosophy with his critical rethinking of central ques-
tions in the analytic tradition. Incorporating important insights from the prag-
matist tradition, the Sellarsian rethinking of analytic philosophy involved the
critique and rejection of central tenets or assumptions concerning “immediacy”
and the empirically “given.” Sellars taught and deeply influenced some of the
major contributors to post-analytic philosophy, especially Rorty and Brandom.
His critique of “the Myth of the Given” in the landmark essay “Empiricism and
the Philosophy of Mind” (1956) had an influence in the US (although not in
Europe) comparable to that of Quine’s “Two Dogmas of Empiricism” (1951)
and Wittgenstein’s *Philosophical Investigations*. Sellars shared Quine’s and Wittgenstein’s hostility to immediacy, but the role of his critique of sense-data empiricism in challenging and revolutionizing analytic philosophy has not been recognized by historians of Anglo-American philosophy until recently. Mainly motivated by the work of his disciples, the 1990s saw a revival of Sellarsian ideas and an exploration of their implications. Sellars described his own philosophical project as an attempt to usher analytic philosophy out of its Humean and into its Kantian stage. Using as a motto the Kantian dictum that “intuitions without concepts are blind,” Sellars argued against the empiricist foundationalism that was pervasive in analytic philosophy. His critique of “the Myth of the Given” tried to show the impossibility of finding empirical foundations, that is, objects of direct acquaintance that appear “immediately before the mind.” Sellars proposed a “psychological nominalism” according to which “all awareness of sorts, resemblances, facts, etc., in short all awareness of abstract entities – indeed, all awareness even of particulars – is a linguistic affair.” According to Sellars, as soon as our mental states or episodes enter in the realm of the meaningful and knowable, they are in “the logical space of reasons,” that is, in the normative space created by our sociolinguistic practices of justification. As he puts it, “in characterizing an episode or a state as that of knowing, … we are placing it in the logical space of reasons, of justifying and being able to justify what one says.” For Sellars, our mental and cognitive lives are inseparable from our social justificatory practices; they are subject to the norms implicit in these practices. Insofar as it is intelligible, everything we think, say, and do is answerable to the reasons that can be mobilized by the fellow speakers and agents we encounter in our practices. The conclusion of Sellars’s critique of “the Myth of the Given” is that we cannot get outside language, that we cannot “break out of discourse,” that our rational lives are bound up with our discursive practices. Intelligibility and rationality are not governed by norms that are somehow given prior to our discursive practices; they are, rather, discursively regulated by the practices we develop and the norms underlying these practices. This immanent view of the norms of intelligibility and rationality inspired new and provocative reflections on normativity in the 1990s.

A systematic internalist account of normativity as immanent in our discursive practices was articulated by Brandom in *Making it Explicit*. This account elaborates some of the central insights of Sellars’s immanentism concerning normativity while at the same time going beyond it. As Rorty puts it, Brandom’s book “offers the first systematic and comprehensive attempt to follow up on

---

37. Ibid., §36.
Sellars’s thought,” “an attempt to usher analytic philosophy from its Kantian to its Hegelian stage.” 38 The starting-point of Brandom’s view of normativity is the fundamental Kantian and Sellarsian insight that our “judgments and actions are to be understood to begin with in terms of the special way in which we are responsible for them.” 39 According to Brandom, our discursive responsibility or answerability as thinkers and agents is not to formal norms of thought and action that exist independently of our practices, but rather, to the practical norms implicit in the inferential connections among judgments and actions that are forged in our discursive practices. Thus he proposes a material inferentialism that derives conceptual contents and conceptual norms from the normative assessments that we make in our actual discursive practices, rather than the other way round, that is, rather than our normative appraisals being derived from and grounded in conceptual norms and contents that are somehow given prior to and independently of our practices. Brandom rejects the formalist idea that every inference is based on the logical form of the propositions involved and hence on content-independent rules of logical syntax. Instead, his inferentialism focuses on relations of material inference that are based on the content of the propositions involved. On this view, semantic content derives from what we actually say and do in our discursive practices; more specifically, the content of a proposition derives from its “circumstances of application” and its “consequences of application.” 40 Brandom’s inferentialism offers an alternative to representationalism, 41 that is, to the view that contents are somehow given prior to and independent of the inferential relations in which they enter in our discursive practices. Brandom describes the justificatory practices that create the normative space of reasons as the practices in which we “keep score” of the normative correctness of our actions and utterances. On his view, these “score-keeping” practices have to be harmonized following the normative desiderata and principles that emerge from the practices themselves and from the normative orientations of their agents toward the world and toward each other. Brandom concludes his material-inferentialist account of normativity with the “social self-consciousness” that a community of “score-keepers” can reach through the expressive practices of making things explicit, a “social self-consciousness” that involves “the complete and explicit interpretive equilibrium exhibited by a community whose members adopt the explicit discursive stance

40. Ibid., 116–32.
41. Brandom divides philosophers into “representationalists” (such as Descartes and Locke) and “inferentialists” (such as Leibniz, Kant, Frege, the later Wittgenstein, and Sellars).
toward each other.”

Brandom’s unified and Hegelian picture of normativity contrasts with the fractured view of normativity that seems to emerge from Davidson’s account of interpretation. On the Davidsonian view, language is inevitably splintered into idiolects and the only unification of semantic and normative assessments we can have is local and ephemeral, achieved through mutual adjustments of our theories of interpretation in fragile and transient encounters in discursive practices. Building on this Davidsonian account, Rorty has elaborated a thoroughly pluralistic and relativistic view of normativity based on a deflationary theory of truth. In a number of essays published in the 1980s and 1990s, Rorty interprets Davidson’s view as a radical deflationism about truth that explains agreement with the world in terms of agreement with each other, thus reducing objectivity to solidarity. With this problematic interpretation, Rorty wants to assimilate Davidson’s view to the social-practice approach to truth inaugurated by Dewey, Heidegger, Sellars, and Wittgenstein. Against the representationalist paradigm that views truth as correspondence with a language- and mind-independent

42. Brandom, Making it Explicit, 643.
43. Ibid., 4.
44. Among contemporary analytic philosophers, Davidson is perhaps the one who has had the deepest impact on post-analytic philosophy of the 1980s and 1990s, either by inspiring his followers – such as Rorty – to develop the normative implications of his views, or by inspiring his critics – such as Putnam – to develop alternatives.
45. In such a theory, truth is deflated of philosophical content, that is, it is not given any metaphysical or epistemic content. Instead, it is taken as something simple and indefinable that cannot be reduced to something more basic (such as the epistemic property of coherence or the metaphysical property of correspondence). Deflationary theories typically treat the notion of truth as unproblematic and intuitively understood, and they elucidate it as it operates in the assertoric attitudes of speakers, that is, in their attitude of holding something to be true (which is taken to be the most basic semantic attitude in communicative interaction).
47. Rorty’s interpretation of Davidson is problematic for a number of reasons. To begin with, Davidson himself has emphasized that his account of interpretation in terms of Tarskian theories of truth for particular languages takes truth as the most primitive semantic notion and does not provide a theory of truth – deflationary or otherwise – being in fact quite antithetical to any such theory. On the other hand, many have read Davidson’s view of interpretation and his methodological maxims (including the principle of charity) as showing that agreement with the world and with each other are inextricably interwoven but cannot be reduced to one another, so that objectivity and intersubjective agreement should be thought of as interrelated but irreducible notions.
world, the social-practice paradigm contends that the normativity of truth can be fully captured by elucidating the normative structure of the communicative practices in which truth claims are raised, challenged, and settled. Rorty emphasizes that there is always the danger of falling back into the representationalist paradigm by thinking of truth as going beyond the limits of our practices and the consensus of their participants. We are tempted to think this way when we look for an external or transcendent dimension of truth that can explain the limitations and imperfections of our current practices and the fact that they are always open to change and improvement. Any appeal to an extra dimension of validity that relates our practices to something beyond themselves is, according to Rorty, “an unfortunate slide back into representationalism.”

Rorty argues that both Heidegger and Sellars are “backsliding” social-practice theorists because the external or transcendent dimension of correctness is retained in the former’s notion of “disclosedness” and in the latter’s notion of “picturing.” Rorty praises Brandom for rejecting Sellars’s attempts to revive the “picturing” relationship between language and world that Wittgenstein formulated in the *Tractatus*, thus bringing post-analytic philosophy to a new stage.

Arguing against this tempting but regressive “backsliding,” Rorty proposes a thorough-going internalism and deflationism that eradicates the illusion of transcendence once and for all. Following Davidson, he argues that holding something to be true should not be understood as the ascription of a property that ties statements to a conceptual scheme or a set of assertibility criteria or semantic rules, but rather as the mere expression of assent and agreement, that is, the expression of harmony between our assertoric attitude and that of others with respect to particular claims.

Rorty acknowledges that there is a gap between truth and assertibility, but he argues that this gap does not take truth outside our assertoric practices, but simply reflects the fallibilist attitude in our orientation toward truth, that is, our openness to be proved wrong. Rorty emphasizes that, far from being incompatible with the social-practice strategy of explaining objectivity in terms of solidarity, fallibilism actually strengthens it, for it is indicative of our predisposition to extend agreement beyond our community, to seek more

49. As Rorty puts it, “Brandom stands to ‘Empiricism and the Philosophy of Mind’ as Davidson … stands to ‘Two Dogmas.’ Both men cultivate their respective teacher’s central insight by stripping it of accidental accretions” (Rorty, “Introduction,” 8).
50. This is explained through an elucidation of the disquotational use of the truth predicate. As suggested by Tarski’s Convention T, in disquotational contexts what the use of the truth predicate does is to express commitment to the assertion quoted and, therefore, it is equivalent to its repetition (hence the redundancy property of truth): “‘p’ is true = p.” This exemplifies the Sellarsian and Davidsonian strategy of explaining truth in terms of one’s own language, “idiolect,” or web of belief.
solidarity, rather than to transcend agreement. But this consensus view, Rorty insists, should not be assimilated to a rule-conforming view of normativity, for it is based on the Wittgensteinian insight that normativity is not a matter of obedience to codifiable standards, but rather, a matter of “give-and-take participation in a cooperative social project.”

Rorty’s neopragmatism and his consensus theory of truth have been criticized by many contemporary figures, such as Jürgen Habermas in European philosophy and John McDowell within the post-analytic movement. Both Habermas and McDowell have replied to Rorty’s relativistic approach to truth and normativity in a similar vein, arguing that Rorty’s view fails to accommodate the normative attitudes and the realist intuitions of participants in communicative practices. But while Habermas’s argument focuses on the unconditionality of truth, McDowell develops his objection through an argument about the objectivity of truth. Habermas argues that Rorty’s radical “epistemization” of truth reduces validity to coherence with current standards and therefore neglects what was right about the correspondence theory of truth, namely, the notion of unconditional validity. For Habermas, unconditionality is rooted in the everyday realism of our communicative practices: it is a formal presupposition of the participants in communication in the lifeworld that extends itself into the discourses in which their problematized claims are vindicated or “redeemed.” Habermas maintains that what Rorty’s relativistic pragmatism misses is precisely this everyday realism that provides the “normative reference point” for our truth claims and their discursive “redemption.”

McDowell, on the other hand, argues that Rorty’s relativistic pragmatism lacks realism and misses the objectivity of truth, that is, the answerability to the world of our truth-seeking practices of inquiry. McDowell warns that Rorty and other relativists try to impose a false dichotomy on us: either inquiry is thought to be answerable to a language- and mind-independent reality, or, alternatively, it is thought to be answerable to nothing but the norms of current practice. McDowell agrees with Rorty that we should reject the illusory transcendence of a language- and mind-independent reality, but he insists that we should understand the internality of truth differently. On his view, that truth is internal to our practices of inquiry does not mean that it is reducible to agreement within those practices, but, rather, that it involves an orientation to the world that is embedded in the normative standpoint of our practices. McDowell contends

---

52. The rest of this paragraph has been adapted from an introduction I wrote for José Medina and David Wood (eds), Truth: Philosophical Engagements across Traditions (New York: Blackwell, 2005), 96–7.
that the norms of inquiry transcend consensus: they demand of truth-seekers that they have *the world in view*. Having *the world in view*, he argues, constitutes an “innocuous transcendence” – a harmless appearance/reality distinction – which does not require any metaphysical picture, for it is fully explicable in terms of the norms of objectivity immanent in our practices. According to these norms, inquiry is normatively beholden both to our practices and to its subject matter.\(^{54}\)

A similar *minimal* (or *commonsense*) *realism* can be found in the work of Putnam in the 1990s.\(^{55}\) Moving away from the metaphysical realism he defended in the 1960s and 1970s and from his “internal realism” of 1980s,\(^{56}\) Putnam argues that we need to dissolve the false dilemma between metaphysical realism and antirealism or deflationism about truth. On the one hand, Putnam rejects the metaphysical realist conception of truth as correspondence with a language- and mind-independent reality, which makes truth inaccessible and skepticism inescapable. But, on the other hand, Putnam argues that antirealists and deflationists go too far in the opposite direction and mistakenly deny the claim that truth can be recognition-transcendent in any sense. Against the deflationary views of truth inspired by Ramsey, Tarski, and Davidson, Putnam contends that being true cannot be identified with being verified or with being assertible. Through his interpretation of Wittgenstein, Putnam develops an alternative view of truth that supports a commonsense realism (“a second naiveté”) that avoids the metaphysical and epistemic idealizations of his earlier realist views. This view preserves the core semantic insights of deflationary views; namely, that truth is internal to language and that the face of our cognitive relation to the world is the face of meaning. However, *pace* deflationists and antirealists, Putnam argues that the *new face of cognition* must make room for the concepts of representation and correspondence with reality. Putnam rejects the idea of representation as an “interface” between two independent relata, language and

---

54. See John McDowell, “Towards Rehabilitating Objectivity,” in *Truth: Philosophical Engagements across Traditions*, Medina and Wood (eds). A full discussion of the metaphysics and epistemology behind McDowell’s *realism* can be found in his *Mind and World*.
56. This is the *realism* that Putnam defended in *Reason, Truth, and History*. Trying to overcome the omniscient perspective or God’s-eye view presupposed by his former metaphysical realist view, what Putnam’s internal realism did was to internalize this ideal observer within our practices so that, instead of being judged according to an external perspective, truth was to be determined according to ideal standards of justification that can be derived from our practices (although our actual practices never reach ideal epistemic conditions). This internal realist view identifies truth with idealized consensus and is in line with Peirce’s and (the early) Habermas’s epistemic view of truth.
the world. He suggests that the notions of representation and correspondence should be internalized, that is, that they should be understood in terms of the representational activities that take place in everyday linguistic practices. This view depicts the recognition-transcendence of truth as well entrenched in the normative presuppositions of ordinary practices. According to Putnam, what this shows is that we have a symbolic access to the world, a linguistic contact with reality, which goes beyond our powers of recognition. With this neopragmatist internalism, Putnam claims to have rescued realist intuitions without metaphysical or epistemic idealizations.

Being caught up in the metaphysical and epistemic disputes of the realism–antirealism debates, the post-analytic rethinking of normativity in pragmatic terms has a very abstract flavor, which contrasts with the more historicized and politicized texture of reconceptualizations of normativity in pragmatic terms in continental philosophy: for example, in Jean-François Lyotard’s *The Postmodern Condition* or *The Differend*, or in Pierre Bourdieu’s *Language and Symbolic Power*. In European philosophy, the social and the political take center stage in the pragmatic rethinking of normative concepts – even in the most universalist and analytically minded of continental philosophers, Habermas. By contrast, although post-analytic and neopragmatist philosophers appeal to a situated speaker and agent, they still invoke or presuppose an abstract subject, namely, the speaker and agent who can become situated in *any* practice, without paying special attention to the historical and cultural specificity of that practice or to the particularity of subjects in it. By leaving the performative processes of differentiation unspecified, these neopragmatist views treat differences as empirical details that add nothing of substance to our philosophical elucidations of normativity; and by relegating differences to a secondary level of analysis that is extraneous to the structure of normativity, the subject presupposed by these views becomes (even if unintentionally and inadvertently) a homogenous and universal subject that remains uniform across all practices and agential positions within those practices.

This is what I call *the evasion of identity* (and diversity, we could add) in post-analytic philosophy, which occurs when subjectivities are not socially differentiated and do not become corporealized in historically concrete identities that are culturally specific and have been genderized, sexualized, ethnicized, and racialized. As we will see, this evasion is not equally present in all post-analytic philosophers, but it is a very common phenomenon in this school of thought, and one that often goes unrecognized or unacknowledged. This is all the more surprising given the fact that most of post-analytic philosophy is produced and discussed in the identity-obsessed culture of the US. By contrast, identity issues become unavoidable in the performative theorizing that takes place in the contemporary European context. And even thinkers who are not themselves drawn to these issues are forced to address them. Thus, for example, although issues of identity
and diversity did not take center stage in Habermas’s theory, his followers and critics have forced him to include issues of gender, race, and multiculturalism in his theorizing.

By contrast, the pressures of the intellectual milieu in post-analytic philosophy are rather different, discouraging the theorization of differences and making it difficult to address issues of identity and diversity as an integral part of the philosophical elucidation of normativity. Normative reflections on identity and diversity in this context are typically categorized as empirical discussions within social and political philosophy, without there being a presumption of a deep and intimate connection between these discussions and those of normativity in epistemology, metaphysics, philosophy of language, and philosophy of mind, whereas there seems to be such a presumption in continental philosophy. Even the arguably most political of post-analytic thinkers, Rorty, does not seem to be capable of developing a full theoretical engagement with identity questions because his views are developed within the framework of liberalism and a difference-blind conception of justice. Many of Rorty’s readers are likely to have a different impression: a picture of Rorty as a thinker preoccupied with identity and diversity. But this is in fact a false impression, or at least a superficial one, for it is clear that Rorty’s prolific production does not contain robust discussions of race, ethnicity, and sexual difference. The appeals to identity in Rorty’s work are often appeals to formal notions of nationality, for example a difference-blind and culturally neutral notion of American identity, to vague notions of cultural identity (“we Westerners”), or to ideological notions (such as political identity or socioeconomic class – “we bourgeois liberals”), which are informed by a liberalism that claims to be above the internal differences of a multicultural society.57

The evasion of identity rests on – and at the same time reinforces and hardens – a double evasion: the evasion of the body and the evasion of the political. As discussed in the previous section, with the notable exception of Cavell and some other neo-Wittgensteinians (more on this later), post-analytic performative theories have often treated speech acts as disembodied – despite there being numerous influential arguments to the contrary within the performative legacy (from James and Wittgenstein, for example). On the other hand, post-analytic theories of normativity often exhibit a peculiar inability to put the normative aspects of language or communication in a political perspective, paying attention to power dynamics. In this way the evasion of identity brings up a more general problem: the evasion of politics. Despite having a wealth of political

thought to draw on in the American pragmatist tradition (in Dewey and his followers, for example), the kind of neopragmatism that has become most visible and influential in post-analytic philosophy seems to be less politically sensitive than contemporary European pragmatism. It is important to notice how certain normative issues that are immediately put in the context of power structures and power dynamics and are regarded as political problems concerning justice are treated rather differently when power relations and power differentials are taken out of the equation. Take for example the issue of the normative significance of *style*, of situated and embodied uses of language. Depending on how this issue is conceptualized, it may or may not appear as a crucial sociopolitical issue about the normativity of language and communication. In this respect, William James offered an interesting insight into the power dynamics of language use at the beginning of the twentieth century. In “The Social Value of the College Bred” (1907), James argues that democracy requires for its survival the normative elucidation and critique of the issue of “tone,” which is at the core of an entire machinery of social reproduction. It is the question of “tone” that is at the basis of the creation and maintenance of prestige and sociocultural power, of the power of one’s voice, that is, of one’s capacity to speak effectively and to be listened to. James calls attention to our sensibility to what counts as the “proper tone” and to the social imperative that “we ourselves must use the proper tone, which we, in turn, must have caught from our own teachers.” Linking democracy and education, he goes on to say:

It all reverts in the end to the action of innumerable imitative individuals upon each other and to the question of whose tone has the highest spreading power. As a class, we college graduates should look to it that ours has spreading power. It ought to have the highest spreading power.58

The mechanics of this “spreading power” – how it is acquired, used, and reproduced – is what Pierre Bourdieu59 explained with his notions of “linguistic capital” and “cultural capital,” and with his account of how they are accrued in “linguistic markets” and how they operate through social distinctions and the creation of “a field” in which a habitus can flourish. There is no comparable treatment of the normativity of style in post-analytic philosophy. Thus, while this Jamesian insight about “tone” has been fully elaborated in European philos-

*59. Bourdieu is the focus of an essay by Derek Robbins in *The History of Continental Philosophy: Volume 6.*
ophy (especially by Bourdieu and his followers), it has received little attention by contemporary mainstream neopragmatists in the American establishment. But of course the normative and political significance of issues of identity and diversity are not always disregarded or minimized in post-analytic philosophy. In fact, it has been receiving increasing attention in recent years, as references to these issues in their reflections on normativity have become more frequent. Robert Brandom, for example, illustrates his account of material inference with a discussion of derogatory terms such as “Boche.” The goal of inferential analysis, Brandom argues, is to make explicit the circumstances and consequences of the application of a term, thus bringing to the fore the material-inferentialist commitments underlying its use. The problem with a value-laden term such as “Boche” is that it involves descriptive circumstances of application (concerning nationality: being German) and evaluative consequences of application (i.e. being deemed cruel). Thus Brandom argues: “If one does not believe that the inference from German nationality to cruelty is a good one, one must eschew the concept Boche. … One can only refuse to employ the concept, on the grounds that it embodies an inference one does not endorse.”

Brandom remarks that highly charged words such as “nigger” and “whore” present a similar problem: “they couple ‘descriptive’ circumstances of application with ‘evaluative’ consequences.” By making explicit the normative presuppositions and implications of the use of our terms (what we are committing ourselves to with their use), we can bring our concepts under rational control. In this way Brandom defends his expressive inferentialism as a version of the Socratic method, that is, as “a way of bringing our practices under rational control, by expressing them explicitly in a form in which they can be confronted with objections and alternatives.”

It is certainly praiseworthy that Brandom illustrates his expressive inferentialism and Socratic intellectualism with a discussion of derogatory terms, thus addressing normative issues concerning identity and politics. This indeed enriches the applications of the normative apparatus of his expressive theory. But we should not conclude that the issues of prejudice, hate speech, and stigmatized identities have taken center stage. Discussions of the sociopolitical aspects of normativity and their relation to differentiated identities remain incidental. These discussions take the form of mere allusions or illustrations, without being knitted into the core of the philosophical elucidations of normativity being developed. Thus, although normative issues concerning identity are acknowledged and used in recent post-analytic philosophy, this school

of thought seems to be still under the sway of what I have called the evasion of identity, even if it is slowly breaking out of it.

Stanley Cavell, however, has been the most prominent exception within the post-analytic movement in this respect. From early on, his elucidations of normative concepts that regulate our speech and action (“truth,” “knowledge,” “justice,” “authenticity,” etc.) included discussions of differentiated identities; and more importantly, these discussions were a constitutive and integral part of his neo-Wittgensteinian and Emersonian framework. This is not entirely surprising since Cavell has been one of the few thinkers in this school who has given special attention to the embodied nature of speech and to the social and cultural conditions that sustain the force and content of our speech acts. Cavell’s skepticism and perfectionism call for a constant evaluation and critique of our speech and action, which require an examination of the sociopolitical structures and institutions that shape our lives. In his normative elucidations, speakers and agents do not remain abstract subjects; they have differentiated and embodied identities. This has become particularly perspicuous in Cavell’s work on film in the last two decades, which is motivated by and structured around normative issues concerning gender (and, to a lesser extent, race\(^64\)). In *Pursuits of Happiness*, Cavell analyzes the genre of remarriage comedy in Hollywood films from the 1930s and 1940s. This analysis offers a critical commentary on the gender norms underlying the contemporary institution of marriage and on the available social scripts for gender dynamics. According to Cavell, remarriage comedies contain the normative depiction of an aspiration: a partnership between equals who are mutually appreciative as an ideal we should aspire to. These films, Cavell argues, envision a relation of equality between human beings that we may characterize in Emersonian terms as a relation of rightful attraction, of expressiveness, and of joy – a relation that is presented as rare to find, but as exemplary of the possibilities of our society. But although in these films gender relations are informed by the ideal of a conversation between equals, remarriage comedies implicitly convey the problematic privileging of the male within an apparent atmosphere of equality, for marriage and remarriage function as the vehicle for

\(^{64}\) Cavell has addressed normative issues concerning race and racial relations in a couple of places: in his reading of *Othello* in *Disowning Knowledge: Six Plays of Shakespeare*, in which he examines the racial dynamics underlying erotic and skeptical attitudes (the racial dimensions of desire and suspicion); and in his 1996 presidential address to the American Philosophical Association (“Something Out of the Ordinary,” *Proceedings and Addresses of the American Philosophical Association*), and his 1998 Spinoza lectures (see Stanley Cavell, *Philosophy the Day after Tomorrow* [Cambridge, MA: Harvard University Press, 2005], esp. ch. 3, 61–82), in which he develops an analysis of Fred Astaire’s dance routines in the Hollywood film *The Band Wagon*, an analysis that is at the service of his rethinking of the Kantian notion of subjectivity in Emersonian terms.
the creation and re-creation of “the new woman” through her education by the man. In *Contesting Tears*, Cavell expands his critique of cultural depictions of gender dynamics with an analysis of another Hollywood genre: what he calls “the melodrama of the unknown woman.” These melodramas negate marriage as the route to creation, to a new and original integrity; and they explore an alternative route: metamorphosis, the radical and melodramatic change of a woman’s identity. In these films the re-making or re-structuration of identity is presented as a process of self-creation that often has tragic consequences. This process takes place outside the institution of marriage and outside the idealized conversation with men as equals. As Cavell puts it, women’s “integrity or metamorphosis happens elsewhere, in the abandoning of that shared wit and intelligence and exclusive appreciation. This elsewhere is a function of something within the melodrama genre that I will call the world of women.”65 Especially intended for female audiences, these “women’s films” or “tear-jerkers” theorize our desire and “have designs upon our tears”; they provide powerful gender scripts. As Cavell explains in Emersonian language, the melodramas problematize and call into question the relation of equality idealized by remarriage comedies, while gesturing toward self-reliance insofar as they demand that expressiveness and joy be sought first in relation to oneself. Although strongly criticized by some feminist theorists,66 Cavell’s film analyses have offered influential ways of theorizing and reflecting on the normativity of desire, education, and the process of identity formation in our society and culture. His work has certainly helped to bring discussions of normativity to a concrete level of differentiation and thus to escape the evasion of identity and difference.

III. PERFORMATIVITY IN THE PHILOSOPHICAL AGENDA OF THE TWENTY-FIRST CENTURY

Following Cavell’s lead, other Wittgenstein scholars have broadened contemporary discussions of normativity by addressing issues of identity and diversity. The recent post-analytic literature contains Wittgensteinian analyses of gender and sexuality67 as well as of race, ethnicity, class, and nationality.68 Among these

---

scholars, it is important to mention the pioneering work of Naomi Scheman. Drawing on feminist theory and queer theory, Scheman’s Wittgensteinian analyses have addressed normative issues concerning intelligibility and agency. Her work on silence and nonsense has thematized relations of oppression in our discursive practices, focusing on the speech and action of marginalized and disempowered subjects. Scheman’s notions of “intelligible nonsense” and “meaning in spite of senselessness” suggest that certain possibilities, experiences, and actions are rendered unintelligible by the discursive norms of our linguistic practices, but that nevertheless it is conceivable and in principle possible that we will be able to find or create new discursive contexts or new practices in which those possibilities, experiences, and actions become intelligible. As many feminist, queer, and race theorists have emphasized, it is often the case that what the normative structure of our practices renders unintelligible is not simply particular experiences and actions, but entire identities and the lives they lead. Scheman, for example, shows how the identity and life of the transsexual are rendered unintelligible by heteronormativity, and how the identity and life of the secular Jew are rendered unintelligible by Christianormativity. As a result, she contends, transsexuals and secular Jews are forced to “live as impossible beings.”

As Scheman explains, “placement at the intelligible center is always a matter of history, of the playing out of privilege and power, and is always contestable.” These normative and political contestations have been explored by a new generation of Wittgensteinians influenced by Scheman, working on gender and sexuality as well as on race and ethnicity. This literature emphasizes that we have to take responsibility for marginalized or excluded possibilities, which can become critical and transformative possibilities. More generally, we have to take responsibility for the relations of inclusion and exclusion that constitute our practices and normatively shape the lives of those within them.

---

70. Ibid., 132.
72. Bringing together Deweyan, Wittgensteinian, and Bourdieuan perspectives and developing a thoroughly pluralistic view of discursive practices, I have also explored the possibilities for thought, speech, and action that lie elsewhere, outside the normative centers of what is considered mainstream or normal. See my Speaking from Elsewhere.
Indeed, the rethinking of agency and responsibility – I contend – constitutes the core of the philosophical agenda for performative theories in the twenty-first century.

Judith Butler has articulated better than anyone the philosophical challenges posed for our notions of agency and responsibility by the emerging, post-sovereign views of identity and subjectivity:

Untethering the speech act from the sovereign subject founds an alternative notion of agency and, ultimately, of responsibility, one that more fully acknowledges the way in which the subject is constituted in language, how what it creates is also what it derives from elsewhere. Whereas some critics mistake the critique of sovereignty for the demolition of agency, I propose that agency begins where sovereignty wanes. The one who acts (who is not the same as the sovereign subject) acts precisely to the extent that he or she is constituted as an actor and, hence, operating within a linguistic field of enabling constraints from the outset.73

We need a conception of discursive agency and discursive responsibility that transcends traditional conceptions of sovereign subjectivity. After overcoming abstract conceptions of subjectivity that take subjects outside the rough ground of power relations and sociocultural conditions and constraints, we need to rethink the notions of agency and responsibility in a new way.

In Speaking from Elsewhere, I have tried to contribute to this reconceptualization with my contextualist view of discursive agency and my notion of echoing responsibility: the responsibility we have to take as discursive agents for echoing voices and their speech acts (including utterances and silences). Echoing responsibility is a more robust notion than it may seem at first sight, for it concerns crucial normative issues and the mobilization of our discursive powers to tackle these issues. The issues we are confronted with as speakers are whether a legacy of use is worth maintaining and in what way, whether the received use should be modified and how. In any performative chain in which we participate, we should ask ourselves: What are the transformations that are needed in this chain, if any? And how can they be produced? These normative questions involved in the echoing responsibility of speakers reveal that although our discursive agency is not absolute or autonomous, it contains nonetheless tremendous transformative powers that often go unrecognized and unexploited. Our echoing responsibility refers to the negotiations that are constantly taking place in our communicative exchanges and discursive responsiveness to one another. Although we are

73. Butler, Excitable Speech, 15–16, emphasis added.
typically not aware of these ongoing discursive negotiations, our speech acts are nonetheless situated in them; and given the position our speech acts come to occupy in performative sequences, they make particular contributions to the implicit negotiations that animate the performative chains.

On my view, discursive agency should be conceived first and foremost as a process of negotiation. When we speak we are implicitly negotiating legacies of use with our interlocutors as well as with possible communication partners from the past and from the future. The negotiation processes through which the meaning and force of our speech acts are manufactured and reproduced, made and remade, are processes of re-signification. Whether they result in the maintenance of a legacy of use or in its transformation, our speech acts always re-signify. In any performative chain there is always a continuum of cases of possible re-signification ranging from the closest fidelity available to us (which always involves differences in the speech situation that are regarded as negligible) to radical reversals of meaning and force. As Butler puts it: “There is no possibility of not repeating. The only question that remains is: How will that repetition occur, at what site, juridical or nonjuridical, and with what pain and promise?”74 In other words, we are doomed to repeat, but how we repeat is up to us. My notion of echoing tries to broaden this notion of repetition or citation by including silences among the speech acts that re-signify in performative chains (without explicitly repeating or citing). With the proper support of the discursive context in which speakers find themselves, a legacy of use can be echoed in a silence and critical demands can be imposed on this legacy by silent speakers. When properly contextualized, certain silences can be construed as the refusal to repeat, as a kind of negative echoing; and therefore, they constitute critical interventions in our performative chains.

The reconceptualization of the notions of agency and responsibility constitutes a point of convergence in the contemporary philosophical debates across traditions, and a cornerstone of new performative theories in the twenty-first century. In a recent book, Giving an Account of Oneself, Butler has developed a powerful exploration of the intersections among identity, agency, and responsibility. Other explorations of these intersections have also been developed by contemporary authors who bring together in their approaches phenomenological, hermeneutic, and post-analytic theories.75 There are many contemporary problem-oriented approaches that resist and undermine traditional classifications. I take this to be good news and reason for hope in a future philosophical community that is not bogged down by inflexible frontiers and oppositions,

74. Ibid., 102.
75. See, for example, Linda M. Alcoff, Visible Identities: Race, Gender, and the Self (Oxford: Oxford University Press, 2006); and my Speaking from Elsewhere.
a community whose members can enjoy a new flow of ideas and freedom of movements across traditions and disciplines, tapping into theoretical resources wherever they may fall – although not without taking into account their history and the background in which they are rooted.

As a postscript to my account of the performative turn and its legacy, I hope to have shown in this brief, concluding section that the philosophical agenda of the twenty-first century calls for collaborations across philosophical traditions and across disciplines. To end on an optimistic note, I have also called attention to a promising process of hybridization in contemporary post-analytic philosophy, with the emergence of authors who use theoretical resources elaborated on both sides of the Atlantic and are repairing the philosophical evasion of identity, diversity, and the political that has afflicted the Anglo-American tradition. Progress in facing the theoretical challenges of performative approaches in this century are likely to come from the dialogue between these neo-Wittgensteinians and neoprpagmatists who have incorporated identity issues in their theorizing and performative theorists working within continental philosophy. This dialogue has the potential of being mutually corrective and enriching, for their participants can identity and challenge each other’s theoretical presuppositions as well as sharing and complementing their theoretical strategies and conceptual tools.
This essay is a joint venture between two thinkers who address philosophy’s multiple lives in the period 1980–95, that is to say, the time span covered by this volume, which roughly coincides with the period from which our graduate training came to an end to our mid-career. The authors, trained in philosophy, built quite a philosophical curriculum and full academic careers while always being housed outside the disciplinary quarters – one employed in rhetoric and comparative literature departments and the other in gender studies. From these relatively marginal positions, we will attempt to account for the many shifts in philosophy’s excursions towards multiple outsides, by stressing their experimental, transgressive, but also systematic and engaged character.

The essay has accordingly a triple aim. First, we aim to focus on the growth of several kinds of new philosophical practice in the period under scrutiny, by providing a synoptic overview of the most relevant developments. Second, we want to map our continuing involvement with a discipline that institutionally did not welcome the critical theories and theorists of the 1970s and 1980s, but rather tended to exclude or marginalize us. To achieve this goal, we will rely on autobiographical accounts and personal information in order to document the specific shifts of location and contextual conditions that affected the practice of philosophy in this period. As a result, this chapter will mix personal voices and individual accounts with the more standard academic tone. The sections related to the former appear in italics.

Third, we argue that the emergence of new experimental modes and venues of thinking combine to form both creative tensions and contradictions that have left a problematic legacy for future generations of philosophers. Writing about them is a way of making ourselves accountable for this legacy.
I. THE GROWTH OF NEW KINDS OF PHILOSOPHICAL PRACTICE

Throughout the 1980s, in response to both external prompts and internal dynamics, the practice of philosophy expanded toward activities that were outside the established institutions of the discipline. We will call these extramural or real-life trajectories “philosophy outside its bounds.” Concretely, this way of designating an operation of thought means that throughout the 1980s philosophical concepts burst out of their formal academic setting in modes of concrete engagement with the world, continuing in a new way the activist dispositions of the 1960s and 1970s, but also reflecting the changing conditions of culture, in ways that are both informed by, and informing, the arts and media culture.

The experience of the intense political activism of the 1970s had demonstrated not only that philosophy is capable of taking on a different role in public venues than the one traditionally accorded it within the university, but also that it could find renewed energy and inspiration in doing so. What happens through the 1980s, therefore, is not only a quantitative change in philosophy’s expansion toward the outside, but also a qualitative shift. Philosophical practice grows into and out of locations and activities that were not traditionally associated with it, and it does not remain confined to the historical venues and actors linked to political “engagement” and activist social movements. Domains into which this new kind of expansion took place include the media, the corporate world of business management, medical ethics, and popular culture. As a result, philosophy “takes place” in different times and venues, functioning as part of humanitarian efforts, as modes of popular and public culture, and as art practices. It engenders not only informed scholars, but also engaged citizens and discerning consumers.

French philosophers have a long established tradition of intervention in social, cultural, and political life, as public intellectuals, social critics, and activists. The figures of Jean-Paul Sartre and Simone de Beauvoir stand high in this tradition, lending their support to a variety of crucial causes such as decolonization, socialism and antiracism (Fanon and Césaire), feminism and pacifism. They also founded new journals and publication venues, such as Les Temps modernes, Libération, and Questions féministes. There is, however, a difference in the scale and mode of engagements of the philosophers who come after them. They intervene on questions of justice, human suffering, responsibility, economic and social sustainability, and global belonging, making use of visual culture and media and reflecting on its meaning, and they do so not in the name of an engagement with Marxist or any other ideology, but rather as an end in itself. They prioritize the critical analysis of power relations at both the macro and the micro levels as the main task for philosophers.
Michel Foucault and Gilles Deleuze captured both the spirit of the times and its profound ambivalence when they posited the emergence of a new type of function for the philosopher as public intellectual. If the contrast with the received Hegelian model of the universalistic philosopher as rational guardian of the moral development of mankind (the gender is not a coincidence) is easily drawn, the difference from the engaged or “organic” intellectual of the previous generation of Marxist and existential thinkers requires more cautious phrasing. As Foucault and Deleuze put it:

At one time, practice was considered an application of theory, a consequence; at other times, it had an opposite sense and it was thought to inspire theory … In any event, their relationship was understood in terms of a process of totalization. For us, however, the question is seen in a different light. The relationships between theory and practice are far more partial and fragmentary. … The relationship which holds in the application of a theory is never one of resemblance. … Practice is a set of relays from one theoretical point to another and theory is a relay from one practice to another. … A theorizing intellectual, for us, is no longer a subject, a representing or representative consciousness. … Representation no longer exists; there’s only action – theoretical action and practical action which serve as relays and form networks.

The main legacy of “high poststructuralist” thought, therefore, is that the political and conceptual contestation of the totalizing power of the discipline of philosophy does not inaugurate a “crisis” for its own sake. It is rather an encouragement to pursue philosophy by all possible means and hence it is a sign of great theoretical vitality. Coherent in their practice, the poststructuralists conjugate philosophy in the plural and move it toward social, political, and ethical concerns. They see themselves as “specific” intellectuals, providers of critical services, analysts of the conditions of possibility of discourse, working with ideas that are also programs for action rather than dogmatic stockpiles of beliefs. This style is “problematizing” in its radical empiricism, or antiuniversalism, and in the awareness of the partiality of all philosophical statements. As a result, the kind of philosophy that emerged in the late 1980s was on the edge of institutionalization, embodying what Foucault called “permanent critique.” Because

---

1. Foucault and Deleuze are discussed in essays by, respectively, Timothy O’Leary and Daniel W. Smith, in The History of Continental Philosophy: Volume 6.
of this radical commitment to philosophy and its outsides, training as philosophers while being activists at that point in time actually meant having to ask fundamental questions such as: Why think? How can we connect the practice of thinking to larger social and ethical concerns? How can we resist the negative and oppressive aspects of the present? What is philosophy all about and how can it help us lead politically useful, socially productive, and morally adequate lives?3 These questions were also our entry-point into the discipline.

What attracted us both to poststructuralism is that it was one of the answers to the decline of modernist utopias, mostly Marxism and various brands of post-Marxist master narratives of politics. It was an attempt to rearticulate a radical sense of materialism, embodiment, and accountability and to redefine the question of praxis in terms of ethical agency. Last but not least it made it not only possible, but also necessary, to connect the task of philosophy to the challenges coming from the new social movements – mostly those associated with feminists, gay and lesbian rights, environmentalists and peace activists, racial and ethnic minorities in the context of postcoloniality. Critical philosophical theory challenges the dominant representation of the subject of knowledge and develops it into a critique of the hidden assumptions about who is entitled to do philosophy and to what ends.

**Early formations**

JB: The period of 1980–1995 was one in which I became trained officially as a PhD in philosophy but entered into teaching environments in which I taught the humanities more generally, including social theory. Because I was at Yale University for both my undergraduate and graduate training, and there were some very pronounced tensions between literary studies and philosophy as well as acute conflicts between traditions and styles of philosophical reflection, I was constantly aware of a number of boundaries that had to be negotiated, especially if I was somehow to “succeed” in getting a PhD and a position of employment.4 It is important to add to this autobiographical sketch my own involvement at the time with the Women’s Center in the city of New Haven, where most of the feminists were not involved with the university at all, and my engagement with an emergent movement of lesbian and gay activists, many of whom were in New York. So I did not have a single “track” that I followed, and I was aware at every turn that I would

4. For an earlier consideration of this period, see my “Can the ‘Other’ of Philosophy Speak?,” in *Undoing Gender* (New York: Routledge, 2004).
have to negotiate certain boundaries and limits if I were to “survive” within the institutional forms that were available to me. Of course, I was in an enormously privileged position as a US academic at one of the most elite schools, but my life did not center there, and I believe that when my name was called out at the graduate ceremonies for my undergraduate degree, no one there knew who I was. So I was constantly escaping: in my apartment, reading; on the train to New York; in the bars, pursuing conversations and political actions outside the academy on sexuality, rights, representation, power, coalitions, social norms, psychic life. These were sites of enormous intellectual intensity, and in many ways they prompted and informed the kinds of questions that I brought into my own academic work, especially my philosophical work.

RB: Philosophy has always been part of my life and culture. Growing up in Italy in a socialist family committed to anti-fascism, I got accustomed early on to ideas like freedom, justice, and responsibility. Besides, in Italian high schools, just like in France, philosophy was a compulsory subject of study; I delighted in it. When I migrated to Australia at the age of fifteen, I hated having to give up philosophy to embrace whatever the syllabus was in Melbourne inner city high school in the early 1970s – the period just prior to the emergence of Australian multiculturalism. Philosophy came to represent a sort of surrogate home and a vulnerable but resilient feature of my intellectual genealogy. I had taken a few of my philosophy books with me; more were sent to me by my maternal uncle, a Catholic priest who worked with Italian migrants in Switzerland. Some were his own, from his school days, and I turned those thin yellowed pages with respect and relish. They were in Italian, of course, and signified some sort of safety and a safeguard of my own cultural identity. In between attending “remedial English” classes for new migrants and doing the normal homework, I made sure to complete the Italian philosophy curriculum. This consisted essentially of the history of philosophy in chronological order, with emphasis on the great classics; Plato, Aristotle, Saint Augustine, Seneca, Marcus Aurelius were among the favorites. So many of them were foreigners, exiles, displaced people – like Spinoza for instance – I felt we all shared in a radical form of non-belonging. With Pascal I confronted my adolescent self-doubts; from Voltaire I learned the powers of a relentless wit. My diaries of those days are full of references to them. It was years before I got upset by the fact that there was not a woman in sight in this philosophical canon. Because of the intimate relationship to those texts, philosophy became both a permanent feature of my mental landscapes and a private site marked by the oscillation between loss and belonging. It

both confirmed and challenged my sense of identity, of being a European migrant and an Italian-French-speaker. It was a rather classical and old-fashioned idea of European culture, modeled on an Enlightenment-based idea of human progress through the deployment of reason, truth, and justice. Later on I ended up questioning all this, of course, but for many years those philosophy texts were my most trusted friends and loyal companions. I felt we shared a secret.

JB: In the early 1970s, I discovered philosophy through reading some key texts that I found in the basement of my home – books that my parents had bought for their college education and had shelved there with the expectation that they would never be read again. It was paradoxical that I would go to the basement, lock the door behind me, to secure some distance from my parents only to find myself engrossed by their books. I would put on music, and write some in a diary, but I would also comb those shelves looking for texts that might help me to think about how to live. So as I reached for some of those books – Spinoza’s *Ethics* and Kierkegaard’s *Either/Or* in particular – I was quite literally reaching for philosophy as a kind of guide, a source of wisdom, as a book that might accompany me in my confused despair and longing in order to find a way. I certainly had not had a course in philosophy, and yet I understood that these books were about the search for wisdom – and I wanted some. I had had some exposure to philosophical thinking at my synagogue, but it wasn’t until I took the books down and started reading that I had the experience of needing these books, quite literally, in order to survive. Of course, it was in Plato that one found an explicit set of definitions for philosophy, ones that had to do with learning how to live and, more specifically, how to live or lead the good life. I wanted to be able to survive, and it seemed to me that survival was not possible unless I could secure meaning for life. I also knew that survival was not quite enough, that one had to live well, that one had to somehow identify and pursue a good life. If there was no good life to have, then why live at all?

I was operating out of a certain adolescent darkness, to be sure, but I was also quite passionate about reading. I read because I was passionate, and did not know what to make of my passions. I also read about the passions, thinking I might finally understand conceptually something about human nature or the human life that would make my own predicaments less singular and personal. So reading about passion made me a passionate reader of philosophy. And both Spinoza and Kierkegaard were nothing without the former’s emphasis on desire, and the latter’s notion of passion and faith.

RB: In 1973 I enrolled at university and read for a joint degree in literature and philosophy. It was what they called “continental” philosophy, which was marginal
in Australia, in relation to the dominant British analytic tradition. To me, this was the heart of the matter. I took to phenomenology with great enthusiasm: Merleau-Ponty's insight into embodiment and memory resonated with my experience. I was also fascinated by Freud's psychoanalysis with the emphasis on the instability, but also the stubborn, repetitive structure of identity formations. I will never forget reading Juliet Mitchell's introduction to Lacan: a true revelation! This was the high 1970s in all their impetuous intensity, of course, and I was working on Althusser just as the fast-growing women's movement and the anti-Vietnam moratorium contributed to politicize issues of identity, political subjectivity, and resistance. The Australian scene was dominated by figures of the caliber of Germaine Greer, whose passionate politics shaped both my thinking and the way I wanted to live my life. All of a sudden philosophy was all around me, literally in the streets. It provided both alternative social values and new mental spaces. With my friends the discussions centered on issues of social justice, anticolonialism, women's rights, and nonviolence. I expected philosophy to teach me about responsibility, justice, community, and how to combine theory and practice with coherence and dignity.

I was very fortunate in having as my BA supervisor a great and important teacher, whose influence will continue throughout my adult life: Genevieve Lloyd. She was just getting started then on her landmark volume *The Man of Reason* as she taught me the history of philosophy. With a PhD from Oxford, Genny Lloyd was completely acceptable to the analytic philosophers, while her heart was in continental philosophy. A most remarkable intellect, she transmitted her passion for Spinoza while she taught Foucault as part of the basic curriculum. That's how I came to choose to move to Paris in the late 1970s, to study philosophy at the Sorbonne. I did not even wait for the BA graduation ceremony.

Paris at the time was, philosophically, the most exciting place on earth. While I enrolled for my postgraduate degree in what they called “history of systems of thought,” which was related to Foucault’s Chair at the Collège de France, I savored everything the city had to offer intellectually. Foucault’s magisterial courses on biopower are forever engraved in my mind, while Irigaray held seminars in makeshift locations after Lacan threw her out of his “École freudienne” for excessive independence of mind. It was not until I started attending Deleuze’s seminars at Vincennes that I discovered what great philosophy in the making was all about. Cixous and Lyotard were also teaching there: it was like a whirlpool of activity that took my breath away.\(^6\) I became more and more intrigued by the collective character of philosophical thoughts in general and more particularly of so many utterances and knowledge claims that I had learned to call my own. Thinking seemed to happen in groups, in the company of others. Although it was formatted and framed by reason,

thinking was an outward-bound, external, and often reactive activity, driven by forces and affects which acted independently of the rational will. I experienced this insight with almost joyful relief and grew suspicious of both claims to liberal individualism from the Right and also of the identity politics that was so central to the Left theories of the time. I was increasingly critical of rigid claims to steady identities and rooted subject positions. I re-routed myself towards more fluid and multilayered understandings of what makes a subject.

JB: As I grew older, I found out that I could take a college class in this subject called “philosophy,” something that I approached with great enthusiasm. I had prepared myself in high school by reading parts of Plato and Aristotle, the tradition of classical political liberalism (some Locke and Montesquieu), and a rather large swath from the legacies of existentialism, including existential theology. At the same time, I was reading texts from the antipsychiatry movement, and starting to read feminism and texts from the Black Power movement (Eldridge Cleaver, especially). I understood myself to be a radical, even a revolutionary, although my thoughts on these subjects were somewhat confused. When I did arrive at my first university course, I could not really understand what kind of philosophy this was. The term “philosophy” became something of a category in crisis. We were reading Plato’s Republic and John Rawls’s early essays on justice, and we were asked to focus on certain kinds of semantic problems and argumentative forms in both texts. Although I learned to do this with some difficulty, I could not see at all how any of this “philosophy” was related to the question of how best to live a life, how to find and know the good life, how to secure those kinds of meanings that might make life seem livable and worthwhile.

Where was the investment, the sense of quest, the sense of existential urgency? It was one thing to ask “How do I know what the good life is, and how do I go about living it?” That question presumes that the “I” in the sentence is an existing person who has an investment in pursuing the answer to the question posed. That “person” dropped out of the picture in my first encounter with institutionalized philosophy. Instead, we thought about the meaning of the word “good.” Now, of course, one cannot simply ask what the good life is without having some sense of what the word “good” is doing in the question. There are several ways in which “good” can be used, and it seems obligatory to parse these various meanings and to offer a justification for the particular usage at issue in the question posed. And there were epistemological problems that compounded the semantic ones: Even if there is a life that we might reasonably call “good,” how might we come to know it? And do we have the appropriate cognitive capacity to know it at all? In this context, philosophy turned out to be a reflection on the confused meaning of words (ordinary people use language in a confused way, but philosophers seek to alleviate language of its confusion or to show that the confusions make impossible any substantive progress.
on a particular problem). Or philosophy turned out to be a reflection on the limits of what we can know. If we could gain a clear picture ("clear pictures" were very important) of the limits of what we can know, then we would cease to ask certain kinds of highly speculative questions and reconcile ourselves to matters that were decidedly more narrow and workable.

I was, of course, driven into a sense of embarrassment about my own philosophical passions, especially since the questions that I most wanted to ask and pursue were for the most part discredited as worth pursuing in that form. I felt that my own questions were too passionate and too large. I remember learning how to do the kind of analysis that those philosophers required of their students, and I am sure that it helped me to formulate arguments with greater clarity than I otherwise would have. But I did, from the outset of my encounter with the institution of philosophy, understand that I would have to go underground in order to pursue what I meant by "philosophy." It was only later that I came to understand that this is an institutional feature of philosophy: it helps to produce a certain underground even as it discredits the underground that it produces. In addition, it also spends a fair amount of its time showing how the kinds of questions and the modes of thinking that take place in "ordinary" life are in need of an idiomatic reduction, reformulation, simplification, and amplification.

Of course, the question of whether certain modes of philosophy have an idiom is an important one. I made the mistake, for instance, of thinking in my first philosophy course that it made a difference that Plato's *Republic* was written in dialogue form. What was the importance of counterposing voices within the text? Of interruptions? Of silences? Of the places where the text breaks off? Did the occasional belching of the interlocutor "say" something in the text? Did it draw attention to the body in the dialogue or to a dimension of language that was articulate in ways that could not be reduced to semantic content? What about the status of fables or stories in philosophical works? Were they simply ways of "illustrating" a set of philosophical points that could just as easily be offered in propositional form? Or were they important ways of sustaining "arguments" in nonpropositional modalities? Were they also ways of calling into question the centrality of argument to philosophy itself? How were we to understand irony, narrative, and voice as philosophical features of the text? Did it really not matter who was talking, and to whom, and whether or not something true was constituted and conveyed in that exchange?

RB: The core of my philosophical interest was by now set on questions of identity, responsibility, becoming a subject of both knowledge and transformative politics or praxis.

The main questions I kept asking were: How can we do justice to experiences that have no recognition in the language and practice of conventional wisdom, common sense, reasonableness? What is the appropriate language in which to
express silences and missing voices? The politics of discourse and the limits of representation became crucial concerns. So much of our collective embodied experience – as women, gays, pacifists, leftists – seemed somehow pitched against what was discursively acceptable or even sayable. Philosophy was as much part of the problem as part of a possible solution; deconstructing it seemed imperative. The existential component of my philosophical work was boosted at this time by another major event: I undertook a long personal psychoanalysis in French, with a brilliant nonaligned psychoanalyst. This was not uncommon at the time: a “slice” (as they called it then) of psychoanalytic treatment was considered an integral part of a philosophical education. Lacan’s influence on this generation was immense, of course, and I think beneficial in the long run: he recommended not working with psychoanalytic concepts unless one had actually undergone at least some practice. Lacanian psychoanalysis clearly aspires to gain philosophical credentials by highlighting the structural function of desire and inventing a suitable method to deal with it. Seven years later, I simultaneously chose to stay on in Europe, although not in Paris, and to accept a job in the margins of academia, namely in an interdisciplinary women’s studies department, which I had the fortune of founding and directing when I moved to Utrecht in 1988.

The amazing opportunity to be able to start up an entirely new program is a typically Dutch phenomenon: here I was, a relative youngster and a foreigner, and Utrecht put me in charge of creating a new academic program from scratch. In the USA, in the few places where women’s studies programs were being created at the time, it was usually senior women scholars who were appointed in virtue of their having “earned” the right to opt out of their disciplines. The reason for this comes down to two main factors: the first is the impetus and the political power of the Dutch Left throughout the 1970s and 1980s. The grass-roots movement was huge and it shared in the spirit of May ’68 that declared that we should not trust the older generation (or anybody much over thirty). This made it imperative to appoint a younger person to the job. The second reason was more pragmatic: giving a temporary (tenure came many years afterwards) albeit senior job to a relatively unknown foreign entity bypassed all the local quarrels and made it easier for the institution to assess my work on strictly objective grounds. Thus, everything was indexed on producing results quickly and efficiently. When it became clear that this was the case, the Utrecht women’s studies program received wide recognition and I earned my tenure. But that took about ten years.

Working in a feminist academic environment, which means an interdisciplinary, intellectually experimental, and politically progressive – if not downright transgressive – context, had its advantages. It made it possible to combine my feminist political passions with academic work and life, which had not happened until now. The price to pay, however, was to accept my distance from the institutional practice of philosophy. This focus allowed me to liberate my own philosophical
thought from a number of institutional habits. Not the least of these was the respect for the authority of the history of philosophy, and hence also the deferential implementation of ways of thinking that had much more to do with the past than with the actual present: for instance, the idea that philosophy should be self-referential and do justice to its own history, before it even attempts or claims to make a significant impact on that history. That's the first habit I swapped for a renewed sense of social relevance: gender, feminist, and women's studies theories became my favorite location. They functioned like navigational tools between academic practice and its “outsides” and provided much-needed theoretical focus. More importantly even, they kept me motivated to go on thinking, doing philosophy even though I had no authority, nor anybody recognizing my work as of philosophical importance. I was simultaneously on my own in the margins and stunned to see how crowded and theoretically vibrant the margins actually were.

JB: Because of my oldest interests and my newest questions, my own teaching and writing became interdisciplinary with time. But this did not mean that I “left” philosophy behind. My works engaged feminism, psychoanalysis, anthropology, law, politics, performance studies, sociology, social theory, literature, and literary theory. This range has been very important for me in my adult career; it not only produces all kinds of conversations, but it imposes the task of translating from one domain of thought into another. It also allows one to develop a critical position that belongs to no discipline, but which is quite essential to understanding the task of the university more generally. I would point to these two features of intellectual work – translation and critique – as central to my own current practices. It means that I need to draw on all kinds of work if I am to pursue some of the questions that focus my work: How do unlivable lives become more livable? How do we analyze and transform the situation in which a nation such as my own becomes wildly righteous when it openly murders some populations and madly outraged with horror when it sees other populations being destroyed, or sees itself as vulnerable to injury? The good life: Who defines it? Who controls it? Who has access to it, and what terms do we need in order to enfranchise those who are not recognized as having anything to say or claim?

Perhaps the issue here has to do with whether we understand philosophy as an enclosed and self-regulating institution that defines itself over and against other forms of knowledge, or whether we actually understand the obligation of philosophy to be open precisely to a wide domain of intellectual activities in order to engage in a knowing way with the world whose truth it claims to know. This would mean that philosophy, to be responsive to its world, has to be a decentered undertaking.
II. A CHANGING CONTEXT

Philosophy meetings in cafes, in conferences, in feminist collectives, gay and lesbian political meetings, antiwar rallies and demonstrations, editorial boards, bars, and film festivals, in transnational contexts, all move beyond the specific “sites” of legitimate institutionalization to produce the possibility of thinking philosophy in the world. This was important to us both as philosophers and feminists and gay and lesbian activists. We form an “intermediary generation” that witnessed some key moments in the history of feminism: respectively the “sex wars” in the USA and the rise of the “feminism of difference” in Paris. We may be the first generation of philosophers who did have the chance to study with great feminist thinkers such as Genevieve Lloyd, Seyla Benhabib, and Luce Irigaray. But this first-hand experience also taught us bitter lessons from the start: some feminist philosophers were traditionally not well received in philosophy departments and had to find other venues for seminar activity and collective discussions. These interrelations were only occasionally supported by institutional “sites”: most of the interesting discussions took place elsewhere. And even today, the university sites where philosophy takes place often include interdisciplinary programs outside departments of philosophy: “women’s studies,” “feminist studies,” “media studies,” “cultural studies,” as well as centers and institutes for “humanities” or “critical theory.” As these interdisciplinary programs are more developed in the USA than in Europe, this leaves many European radical philosophers as homeless as before.

The media and the publishing world, of course, have helped. The period 1980–95 saw a real explosion of alternative publication venues often within existing publishers such as Routledge in the US/UK, Suhrkamp in Germany, Éditions de Minuit in France, and Editori Riuniti in Italy. Academic publishing reflected this shift in the institutional settings of philosophy, recognizing the desire to make philosophy popular, and the demand to produce texts that travel in nonphilosophical quarters. Thus, the genre of do-it-yourself or self-help manuals in the teaching of philosophy emerged as a fast-selling sector. These new cultural forms for philosophical engagement go beyond the essay and the book, establishing broader sites of textuality and practical engagements at the same time that they continue certain modes of philosophical inquiry. It is

---

*7. See Rosi Braidotti’s chapter on feminism in this volume.
9. In particular, the Routledge series “Thinking Gender,” started by philosophy editor Maureen MacGrogan and the cultural studies series supported by Bill Germano should be noted. And Suhrkamp was without question the leading publishing house for philosophical books in Germany in the period 1980–95.
remarkable, as we go through our CVs, to see how many experimental journals we published in and how many brand new – and sometimes very short-lived – publications we actually took the risk of publishing in. We are very aware, however, that taking this sort of risk by publishing in marginal journals and with nonacademic publishers may have directly contributed to many members of our generation actually not getting tenure in “first tier” philosophy departments. Considering how the political climate has changed, it may still constitute a risk today.

RB: Most of my mid-career in philosophy was built by reading and publishing in challenging and thought-provoking journals such as Radical Philosophy, L’Autre Journal, where Deleuze and Lyotard published regularly, and the Italian MicroMega and Aut-Aut.10 We were surrounded by brand new journals, magazines and printed material of all kinds: Questions féministes (1981), Sorcières (1976), La femme d’en face (1979). My very first academic publication was in Hecate (founded in 1976), the Australian radical feminist journal, where I published a critical review of the anthology New French Feminism; the second was in Penelope, the feminist history journal founded in 1979 by the Paris VII-Jussieu collective of Michelle Perrot. For years my monthly articles in the feminist magazines Histoires d’Elles (1978) and the Italian Noi Donne (1948) mattered far more than anything that may have helped me gain academic credibility. If I can name my favorites from those days, they would be the UK-based M/F (1978), Feminist Studies (1979) and Women’s Studies International Forum (1978); the newly founded Signs (1975) directed by my mentor Kate Stimpson, and the

---

10. Radical Philosophy is a journal of socialist and feminist philosophy. It was founded in 1972 in response to the widely felt discontent with the sterility of academic philosophy at the time (in Britain completely dominated by the narrowest sort of “ordinary-language” philosophy), with the purpose of providing a forum for the theoretical work that was emerging in the wake of the radical movements of the 1960s, in philosophy and other fields.

L’Autre Journal is a theory and culture magazine that started publication in December 1984 with Michel Butel as general editor. It quickly acquired cult status among philosophers because of the original and clever manner in which it addressed the main philosophical questions of the day. A second series started up again in May 1990. The title exists now as a blog linked to the website of Le Monde.

MicroMega is a political, cultural, social, and economic magazine, published bimonthly in Italy. Founded in March 1986 by the editors Giorgio Ruffolo and Paolo Flores d’Arcais, it is an elite journal publishing long essays and reports by leading philosophers, scientists, and other personalities.

Aut-Aut is a leading Italian philosophy journal founded by Enzo Paci in 1951 with a strong phenomenological orientation. Between 1974 and 1976, the philosopher Pier Aldo Rovatti took a leading role in the editorial board and turned the journal into a crucial forum for discussion of Marxism, poststructuralism, and related political and ethical issues. The journal is published today as an independent critical journal.
Belgian-based Cahiers du Grif (1973), where I worked for many years alongside Françoise Collin. The first acknowledgment of my work came in an interview with Hazel Rowley in another Australian radical feminist magazine: Refractory Girl (1972). But I was not alone in this: all around me, everybody was starting up journals, magazines, and alternative publications. This was before the internet multiplied these efforts – we were still very Gutenberg Galaxy then. For instance, Paul Patton and Meaghan Morris produced the first English translations of Foucault, Deleuze, and Irigaray for the Sydney-based Working Papers in general philosophy. Colin Gordon, at the same time, was building up Ideology & Consciousness to greater heights than ever. Of course, I could not resist the temptation of starting something on my own as well, so together with my friend Alice Jardine we made a brilliant start to what would become a one-issue only hit: Copyright was the perfect manifestation of the adventurous interdisciplinary spirit of the time: smart, cutting-edge, highly theoretical, and totally broke! Almost everyone who contributed to that issue went on to an incredible academic career, but the journal did not make it past the first issue.

JB: In the US, intellectual excitement revolved around the journal differences, established by Elizabeth Weed and Naomi Schor in 1989, but also the galvanizing work of Gayatri Chakravorty Spivak and Joan Wallach Scott. It seemed as if philosophical questions of materialism, experience, identity, and the subject were now being taken up by literary critics and radical historians, and that these philosophical concepts were being probed in order to sharpen a set of critical modes within politics. There were debates happening at the conferences for women historians (the “Berkshire” conference), the Socialist Scholars conference, the Barnard College “Scholar and Feminist” conferences, the Rethinking Marxism conferences, and very often the debates were fierce between those who saw potential in continental theory and those who did not. Rarely did anyone stop to ask whether Marx himself was a continental philosopher. Debates broke out as well in The New York Times and the Nation, and although the animus was strong against certain modes of “deconstruction,” it was also clear that such modes of thought had pervaded not only the academy, but Left intelligentsia. People worried about the end to foundations, the loss of disciplinary boundaries, and the lack of clear norms. But, in fact, all of these concepts were being rethought in light of new historical formations, and the process of change was not easy for many to accept. The experience in the US was that the explosion of new cultural venues for reflection that were contaminated by poststructuralist and other philosophies went hand in hand with a higher degree of specification of the practice of philosophy, which struck a distinctly interdisciplinary note of its own. Some early journals in this vein are: Critical Inquiry (started in 1974), Diacritics (1977), boundary 2 (1970), Glyph (1977), and others. A new generation of interdisciplinary journals also comes into being. I am thinking for
instance of media, film and art theory, and the creation of highly theoretical journals in these fields, such as Camera Obscura (1976), October (1976), Feminist Review (1979); sexuality and cultural studies also grew at an explosive rate, with journals such as Semiotext(e) (1974), SubStance (1971), and Hypatia (1986).

The extent to which the institutional practice of philosophy recognized and accepted interaction with this parallel universe of highly scientific, but transgressive, publications needs to be mapped more carefully than we can do here. Suffice it to say that, whereas the US remained more open to these boundary-breakers, the European university system, traditionally dominated by the disciplines, proved more resistant. The emergence of philosophers within mainstream culture, the arts, and the media is important to read therefore in light of this rejection, as well as a sign of the engagement of philosophers in public politics. Although the figure of the philosopher as public intellectual has deep roots in European culture, it became a more global phenomenon as the US and Australia succumbed to the “theory wars” in the late 1980s and throughout the 1990s. Think, for instance, of the role that philosophers play in human rights struggles, in nongovernmental organizations such as Médecins sans Frontières, in Amnesty International, Human Rights Watch, and Greenpeace. Consider how many poststructuralist thinkers have made significant contributions to human rights discourse in recent years. By extension this means that law has become a site for the reflection on key philosophical categories such as justice, force, futurity, and the imaginary. Legal discourse also gets positively contaminated and a school of critical legal theory emerges with conferences on law, culture, and the humanities as well as journals with the same focus.

The transdisciplinary philosophical impetus is so intense and stimulating that a new classification emerges under the rubric of “critical theory.” Bookstores start to make separate sections to accommodate the proliferations of publications in a counter-philosophical philosophy. This counter-philosophy continues certain modes of philosophical inquiry, but in cultural venues and through media that establish philosophy as impure, hybrid, crossing genres and media. Although philosophical films have claims to a certain status in experimental

12. A case in point is the conference at the Benjamin N. Cardozo School of Law at Yeshiva University in New York on “Deconstruction and the Possibility of Justice” in October 1989, at which Jacques Derrida presented “Force of Law: The ’Mystical Foundations of Authority.’” Following that conference, Derrida returned to Cardozo on an annual basis.
13. “Critical Theory” here has a broader extension than writings associated with Frankfurt School critical theory, whose “third generation” is discussed by Amy Allen in her essay in this volume.
media (e.g. Jarman on Wittgenstein;\textsuperscript{14} the recent film on Iris Murdoch, \textit{Iris}; Cornell West appearing in \textit{The Matrix}; Derrida in \textit{Ghost Dance}; and more recently, Astra Taylor’s \textit{Examined Life}, with extended discussions with eight major philosophers), the evolution of the media presence of philosophers and philosophical talk shows and programs in the period 1980–95 is quite striking. Again, the change is in scale and quality, supported also by the restructuring and transformation of the old medium of television in this period. There are some important precedents of mediated philosophy,\textsuperscript{15} of course, but the pace definitely picks up in the period we are discussing. This is evidenced by the creation of new televisions channels that carry the French-German ARTE in 1992,\textsuperscript{16} the French “Apostrophes” (which ran from 1975 to 1990), and many French radio programs, including “France Culture” (which has at least three ongoing philosophy shows), “RAI Radio Fahrenheit” in Italy, and “Kulturzeit” in Germany.

The undisputed media stars of the period in France are the philosophically undertitillating group known as the “Nouveaux Philosophes,” who created the phenomenon of philosopher-writer/TV producer and film-maker Bernard-Henri Lévy. Regularly featured nowadays in the pages of glossy magazines such as \textit{Vanity Fair}, Lévy built a brilliant and controversial career by striking a conservative tone politically, while targeting the previous generation of poststructuralist thinkers for systematic attack.

The situation was no less lively in Germany,\textsuperscript{17} where the philosophical media star is Peter Sloterdijk, who has been running his successful talk show since 2002 on a range of interdisciplinary topics.\textsuperscript{18} From 1988 to 2000, the German television station Westdeutscher Rundfunk ran a very high quality and ambitious series of features on philosophical topics: “Philosophie heute” (Philosophy

\textsuperscript{14} Derek Jarman’s film \textit{Wittgenstein} (BFI, 1993). See also Derek Jarman and Terry Eagleton, \textit{“Wittgenstein”: The Terry Eagleton Script and the Derek Jarman Film} (London: BFI Publishing, 1993).

\textsuperscript{15} Tamara Chaplin’s \textit{Turning on the Mind: French Philosophers on Television} argues that already in the 1950s French television featured regular discussions of philosophy and philosophers. See for instance the program \textit{Lectures pour tous} (1953–58), in which Bachelard and Foucault appeared, and Sartre and Camus were often discussed.

\textsuperscript{16} ARTE (Association Relative à la Télévision Européenne) is a Franco-German television network started in 1992. It describes itself as a European culture channel and aims to promote quality programming especially in areas of culture and the arts. ARTE is also available in Belgium, the Netherlands, and Canada via cable, and the Australian Special Broadcasting Service translates many ARTE programs into English for broadcast on its own television network.

\textsuperscript{17} With sincere thanks to Dieter Thoma for this targeted information.

\textsuperscript{18} Since 2002, Peter Sloterdijk and Rüdiger Safranski have been presenting on the German public television channel Zweites Deutsches Fernsehen a philosophical talk show, similar to “Apostrophes,” called “Philosophisches Quartett,” which deals with a broad range of social questions.
today). In the US, there are now philosophy talk radio shows and popular venues in which large questions in philosophy and religion are pursued. More recently, both Pierre Bourdieu and Jacques Derrida have been the “stars” of feature-length documentaries: Pierre Carles’s La Sociologie est un sport de combat (2001) and Kirk Dick and Amy Z. Kofman’s Derrida (2002). The authors of this article, however, are neither immune from nor external to television, video and new media coverage and appearances, and thus the question of assessing the general impact of these mediated forms of philosophical inquiry is more topical than ever. As a generation we watched the rise of this new, alternative media culture and also saw how negatively the university reacted to it – to be a media star was equated then with shallowness and lack of scientific rigor. Thus we have to raise an issue that we find still relevant today: Are philosophers commodified cultural “spectacles” in such instances, or do they appeal to intellectual need through a popular medium? Is it the case that philosophy turns into a fundamentally different activity when it becomes a media event?

III. THE INSTITUTIONAL DIMENSION

At the same time, however, philosophy as a discipline and a formal institutional space was concerned not to lose its core identity in the midst of such hybridization processes. There were clearly struggles, increasingly sectarian, over what “counts” as philosophy or, minimally, “good philosophy.” And institutions house these battles with the presumption that the walls they build will continue to stand. From 1980 to 1995, the public debate around the critical legacy of the 1970s grew more bitter and contested. The rise of Reagonomics and Thatcherite authoritarianism installed a climate of right-wing political backlash, which could not fail to attack the credibility of European and especially French poststructuralist theories. These were dismissed by the political Right as being both relativistic and a sign of wishy-washy liberalism. The debate was even more acrimonious among French philosophers, many of whom turned their backs on their youthful radicalism, especially after François Mitterrand’s election to the French presidency. It was disconcerting to say the least, although somehow predictable, to watch the oedipal struggle between the philosophers of the 1960s and the generation that followed. The media-driven nouveaux philosophes, mentioned above, turned vehemently against the very home-grown philosophical theories

19. More than a hundred features were produced, including portraits of leading philosophers and documentaries on controversial topics, many of which can be found via the website www.wdr.de. The program producer edited a volume with some of the interviews; see Ulrich Boehm (ed.), Philosophie heute (Frankfurt: Campus, 1997).
of their teachers and older poststructuralist brothers that we, the foreigners and outsiders, were both reading and drawing such inspiration from. Among a relatively older generation, born in the 1940s, philosophical revisionism set in, offering at best a reappraisal of decent neohumanism\(^{20}\) or a single-minded critique of the allegedly murderous character of communism,\(^{21}\) and at worst media-savvy glamour.\(^{22}\) On the other hand, among people of our generation, born in the 1950s, the reaction was ferocious: Alain Finkielkraut, and Luc Ferry and Alain Renaut indicted without appeal the events of 1968 as a symbol of left-wing authoritarianism and revolutionary violence.\(^{23}\) Adding insult to injury, they accused all poststructuralist philosophies of complicity with terror and mass murder. This coincided with the media revolution we discussed above and with the new media-cracy turning against both the spirit and the philosophical and political agenda of 1968. The key insights of poststructuralist philosophy survived in exile along the transatlantic axis.

Deleuze was one of the first to comment on this hasty and fallacious historical dismissal of critical radicalism in both politics and philosophy. Targeting the fame-seeking narcissism of the nouveaux philosophes, Deleuze stressed the political conservatism that results in the reassertion of the banality of individualistic self-interest.\(^{24}\) This is constitutive of the neoconservative political liberalism of our era and of the arrogance with which it proclaimed the “end of history.”\(^{25}\) Deleuze stressed instead how critical philosophers have tried to avoid the arrogance of the universalizing posture. Other leading figures of philosophical poststructuralism, such as Lyotard, Dominique Lecourt, and the gay activist Guy Hocquenghem, also took a clear stand against the trivialization and self-serving dismissal of the spirit of radical philosophy.\(^{26}\)

\(^{26}\) See Jean-François Lyotard and Jacob Rogozinski, “La Police de la pensée,” L’Autre Journal 10 (1985); Dominique Lecourt, Les Piètres penseurs (Paris: Flammarion, 1999); published
On the other hand, some modes of institutionalization have sought to take into account the subversive and transformative reach of new philosophical movements. Thus, at the same time as the backlash set in, new forms of creative institutionalization also started up. These were ways in which the corporate discipline itself both reconfirmed its traditional institutional settings and went on to occupy new and powerful institutional grounds. Examples are firstly the Vincennes University experiment with new structures of thought and scientific investigation, with high degrees of social accountability and a healthy distance from the canonical tradition of the disciplines. This radical pedagogy was supported by and central to the work of Gilles Deleuze. Second, the foundation of the Collège International de Philosophie in 1983 in France. Both authors participated in the Collège activities: one the very year of its foundation and the other in recent years. Organizations such as the International Association of Philosophy and Literature and the Society for Phenomenology and Existential Philosophy (SPEP, founded in 1962) are at once outside disci-

28. The Collège International de Philosophie (Ciph), located in Paris, was cofounded in 1983 by Jacques Derrida, François Châtelet, Jean-Pierre Faye, and Dominique Lecourt in an attempt to rethink the teaching of philosophy in France, and to liberate it from any institutional authority (most of all from the university). The Collège recognizes that philosophy is better served by being located at “intersections” such as philosophy/science or philosophy/law. Attendance in seminars is open and free, just as in the Collège de France.

29. The International Association for Philosophy and Literature, founded in 1976 and directed since its inception by Hugh Silverman, is, according to its website (www.iapl.info), “dedicated to the exchange of ideas and scholarly research within the humanities. Founded to provide a context for the interplay of Philosophy, Literary Theory, and Cultural/Aesthetic/Textual Studies, the IAPL brings together scholars from the full range of disciplines concerned with philosophical, historical, critical, and theoretical issues.”

30. SPEP has its origins as an idea of Harvard University professor John Wild (1902–72) for a new professional society devoted to the examination of recent continental philosophy, and in particular the works of Heidegger, Husserl, Merleau-Ponty, and Sartre. After Wild left Harvard in 1961 to become Chairperson of the Department of Philosophy at Northwestern University, he and an organizational committee including his two Northwestern colleagues, William Earle and James Edie, George Schrader of Yale University, and Calvin Schrag, a former student of Wild’s at Harvard, who had recently accepted an appointment at Purdue University, founded SPEP. According to its website (www.spep.org), “SPEP is the Society for Phenomenology and Existential Philosophy, a professional organization, founded in 1962 and devoted to supporting philosophy inspired by continental European traditions. With a membership of over 2500 people, it is one of the largest American philosophical societies, and strives to encourage work not only in the philosophical traditions of phenomenology and existentialism, but also in all those areas commonly associated with ‘continental
plinary settings, but also help to define the discipline on new grounds. Similar organizations formed in Canada (Canadian Society for Hermeneutics and Postmodern Thought, which later became the Canadian Society for Continental Philosophy\(^{31}\)); in Australia (Australasian Society for Continental Philosophy\(^{32}\)) and in the UK (Society for European Philosophy and Forum for European Philosophy\(^{33}\)). The emergence of a strong feminist presence in these societies philosophy,' such as animal studies, critical theory, cultural studies, deconstruction, environmental philosophy, feminism, German idealism, hermeneutics, philosophy of the Americas, post-colonialism, post-structuralism, psychoanalysis, queer theory and race theory. We foster discussion on all philosophical topics, from art and nature to politics and science, and in the classic philosophical disciplines of metaphysics, epistemology, ethics, and aesthetics. SPEP is actively committed to philosophical pluralism and to the support of historically under-represented groups in the philosophical profession.”

31. According to its website (www.c-scp.org) “The Canadian Society for Continental Philosophy” was founded in 1984 under the name “Canadian Society for Hermeneutics and Postmodern Thought.” Its broad purpose is to promote scholarship in several traditions of continental philosophy by means of an annual conference and other activities. Current members include scholars and graduate students working in such fields as German idealism, existentialism, phenomenology, hermeneutics, critical theory, feminism, postmodernism, poststructuralism, and deconstruction, from various disciplinary approaches within the humanities, social sciences, and fine arts.

32. According to its website (www.ascp.org.au) “The Australasian Society for Continental Philosophy” was established in 1995 as the revamped “Australasian Society for Phenomenology and Social Philosophy,” with the aim of becoming the region’s premier reference point for people working with continental philosophy. The Society endeavors to promote the interdisciplinary exchange of ideas inspired by the diverse traditions of European thought (such as phenomenology, existentialism, critical theory, hermeneutics, feminism, deconstruction, poststructuralism, and so on), and to develop productive links with other international societies and associations that share similar goals and views.

33. Since 2004, the Society for European Philosophy (SEP) and the Forum for European Philosophy (FEP) have held a joint annual meeting. Originating as an idea of Andrew Benjamin, then at the University of Warwick, in response to the unjustly poor performance of nonanalytic departments in the UK Research Assessment Exercise, the SEP held its first meeting in 1998 at Birkbeck College, establishing a venue for philosophers in the UK to present their work in the various traditions of modern European philosophy. Among its principal organizers, in addition to Benjamin (who served as Chair from 1997 to 2001), were Christine Battersby, Andrew Bowie, Howard Caygill, Simon Critchley, Peter Dews, Joanna Hodge, Peter Osborne, and Jonathan Rée. The FEP began in the spring of 1996 out of a desire to promote wider dialogue and exchange between philosophers working within and out of the different European traditions in philosophy. For its first year, the FEP was guided by an ad hoc and entirely provisional executive committee chaired by Alan Montefiore and including Lilian Alweiss, Catherine Audard, Nick Bunnin, Simon Critchley, Marian Hobson, Anthony O’Hear, and Jonathan Rée. According to its website (www.lse.ac.uk/collections/forumForEuropeanPhilosophy), the FEP, currently located at the London School of Economics, is an educational charity that organizes and runs a full and varied program of philosophy and interdisciplinary events in the UK. These include seminars, reading groups, public lectures on a range of themes and socially relevant topics, book discussions, public debates on the idea of European philosophy and an annual conference.
has changed the focus of public discourse in recent years, but feminists were also coming together in the 1970s and 1980s in organizations like the International Association of Women Philosophers. And the Radical Philosophy Association and the Society for Women in Philosophy became important venues for philosophers who were thinking and working at the juncture of new social movements and philosophical reflection. Further input came from associations that had specialized in high-profile philosophical events and took a radical turn in this period: for instance, the Cerisy Colloquia, and the critical theory meetings in Dubrovnik and later in Prague.

34. According to its website (www.iaph.org), the International Association of Women Philosophers is a professional association that aims at countering the under-representation of women in philosophy everywhere. It provides a forum for interaction and cooperation among women engaged in teaching and research in all aspects of philosophy, with a particular emphasis on feminist philosophy. Founded in 1974 in Würzburg (Germany) the IAPh has gradually grown into an international organization with 380 members from thirty-five different countries.

35. The Radical Philosophy Association (www.radicalphilosophy.org) was founded in 1982. They define themselves in the following way: “RPA members struggle against capitalism, racism, sexism, homophobia, disability discrimination, environmental ruin, and all other forms of domination. We also oppose substituting new forms of authoritarianism for the ones we are now fighting. Our efforts are guided by the vision of a society founded on cooperation instead of competition, in which all areas of society are, as far as possible, governed by democratic decision-making. We believe that fundamental change requires broad social upheavals but also opposition to intellectual support for exploitative and dehumanizing social structures. Our members are from many nations and continue a variety of radical traditions including (but not limited to) feminism, phenomenology, Marxism, anarchism, post-structuralism, post-colonial theory and environmentalism.”

36. The Society for Women in Philosophy (www.uh.edu/~cfreelan/SWIP) was founded in 1972. Although clearly not an organization devoted to continental feminism, it has nevertheless sponsored important debates and discussions in that area.

37. According to its website (www.ccic-cerisy.asso.fr) The International Cultural Centre of Cerisy-la-Salle was founded as far back as 1952 by the association of the Friends of Pontigny-Cerisy with the aim to support and organize exchanges among intellectuals, scholars, artists and concerned well-read individuals the world over. The centre organizes every year, from June to September, a number of important international conferences. Most of the significant French philosophers have attended events at Cerisy.

38. According to its website (http://www.iuc.hr/#), the Inter-University Centre Dubrovnik (IUC) was founded in 1971 at the height of the Cold War and became one of the most important venues for the exchange of ideas by scholars from both the East and West. The IUC is currently an independent international institution for advanced studies. It is a meeting ground for learning and scholarship and is cosponsored by some two hundred member universities and institutions of higher learning around the world. It is maintaining high standards of independent scholarship, but at the same time, it is looking for opportunities in bridge-building in a region of the world that must continue to rededicate itself to pluralism. Its agenda focuses on the social sciences and the humanities, with special emphasis on issues of postcommunism and European integration. The academic programme offers a full curriculum of open postgraduate courses, conferences and symposia, and residencies.
Thus, the practice of philosophy was enriched and innovated by this proliferation of new initiatives, structures and venues that ran and still run alongside the institutional academic practice of professional philosophers. The result is that two almost parallel universes emerged and contacts and cross-references between them became controlled and restricted. Our generation of philosophers and critical thinkers zigzagged in between these separate spheres, trying to connect them, translate from each other and recompose both an agenda and a community across their borders. We had to learn to cultivate and negotiate with complex and internally contradictory modes of multiple belonging.

IV. WHAT IS EUROPEAN ABOUT CONTINENTAL PHILOSOPHY?

The two authors stood on the opposite shores of what has become known as the great “Trans-Atlantic dis-connection.” The 1980–95 period saw the restructuring of the privileged relationship that connects the US to the French cultural and philosophical elites. The landmark date of 1989 stands as a point of reference in this context. This produced two simultaneous effects, which shaped the philosophical debates in the period. First, in the general American academic debate of the day, the discursive equation between “Europe” and “French theory” was challenged by broader, more Europe-wide perspectives. Second, as we argued before, French philosophy came under violent attack from the mainstream of the philosophical profession and the political Right, for being obscure, self-referential, radical, and, in any case, foreign. The late 1980s in Europe was a period of political hope built on the collapse of the Berlin Wall and the rise of great – albeit short-lived – expectations about the future of the European Union. In terms of philosophy, however, the backlash against the critical theories of the 1960s and 1970s gained extra momentum and was no less strong and reductive in Europe than in the US. Considering the relatively higher degree of acceptance of interdisciplinary methods in the North American universities, however, a genuine dissemination of poststructuralist and critical theories did occur there. This took place less through philosophy than comparative literature and English departments, as well as gender, cultural and postcolonial studies. If anything, considering the growth of parallel organizations and associations, more English-speaking philosophers adopted the terminology and the philosophical agenda

of poststructuralism than their European counterparts. Paradoxically enough, most of the leading French thinkers of the poststructuralist generation were awarded honorary and prestigious Chairs at leading American universities, while their work was either criticized or ignored at home.

The Franco-German philosophical relationship was also restructured significantly in this period. While analytic philosophers continued to make jokes about “the Nothing” – considered to be among the most preposterous of Heideggerian inheritances – some left-wing critics came to associate the difficulty and ostensibly obscurantism of German and French philosophy with suspect or weak political positions. Especially vehement was also the criticism and political rejection of the French philosophers on the part of the Frankfurt School and especially by Habermas, who was no less critical of the French than the analytic camp. This Franco-German hostility is also significant because at the same time Habermas’s critical theory is engaging and being engaged by Rawls and other analytic political and social theorists. This movement stood in stark contrast to the politically animating force of phenomenology and poststructuralism, including its Nietzschean variants, for feminist theory and radical philosophy in the US. Representative of this anti-poststructuralist trend is also the Institute for Human Sciences, based in Vienna and Boston, which acts as a significant relay-point toward Eastern Europe and strikes a distinctly conservative note both on moral issues and on the idea of Europe.

It was precisely the effort to get beyond certain entrenched identitarian ways of thinking that intellectuals on the Left, especially the feminist Left, turned to poststructuralism. Whereas a dominant trend in US left politics was to stake one’s claim in identity and experience, the countertrend sought recourse to

41. Kristeva has been a recurring visitor at Columbia University for years; Derrida and Lyotard held positions at Irvine; and Foucault visited California regularly. Among those who never entered this transatlantic institutional connection, Irigaray and Deleuze stand out.

42. For instance, the feminism of difference was largely ignored as irrelevant in France and sent into exile, as exemplified by the difficult career of Luce Irigaray. For a detailed account of this feminist controversy, see Claire Duchen, Feminism in France: From May ’68 to Mitterrand (London: Routledge, 1986).

43. The case of Paul de Man is emblematic of this approach, as is the “Heidegger affair,” initiated by the publication of Victor Farias’s Heidegger et la nazisme in 1987.

44. According to its own website (www.iwm.at), the Institute for Human Sciences (IWM) is an independent institute for advanced study in the humanities and social sciences, founded in 1982. Seeking to bring together academics and intellectuals from Eastern and Western Europe, the IWM is linked to its North American affiliate, the Institute for Human Sciences at Boston University, and it contributes to policy and cultural dialogue between Europe and the US and Canada. Research at the institute is currently focused on five fields: “Sources of Inequality/Social Solidarity”; “Religion and Secularism”; “United Europe – Divided Memory”; Cultures and Institutions: Central and Eastern Europe in a Global Context”; and “The Philosophical Work of Jan Patocka.”
poststructuralism to ask how identity categories are constructed, how difference is effaced, and how we might think more critically about how the field of intelligible politics is established and regulated. In this way, poststructuralism offered a way out of identitarian forms of pluralism and toward the possibility of making new political subjectivities.

This transgressive but productive aspect of poststructuralism was felt strongly in Germany, where, after reunification in 1989, new philosophical initiatives flourished. Under the influence of Foucault especially, there was a turn away from sociology and back to philosophy, based on the premise that thinking is not so much about institutions or external constraints, but about interpreting everyday life and being involved as an individual.45 It renewed possible forms of “engagement” but in a less abstract sense. Since 1981 there has also been a rise of the so-called “Philosophical Praxis”46 in Germany and Switzerland, which aims at overcoming academic philosophy and turning thinking into “practice” in the social, corporate, and ethical sense of the term. Very significant was also the relaunch of the East German journal Deutsche Zeitschrift für Philosophie, which became the most important philosophical journal in the German-speaking world, with Axel Honneth as the primus inter pares of the editorial board. The journals Texte zur Kunst and Kunstforum International also have considerable philosophical ambitions, mainly in the area of postmodern thought.

The shifting philosophical landscape in the aftermath of 1989 allows for the emergence of cross-European perspectives, which alter the terms of the historical Franco-American privileged relationship. Europe emerged as a contested but highly productive forum for discussions.47 New collaborative initiatives were undertaken, often with the financial backing of the European Commission. Most notable among them are the already mentioned ARTE television, the European Journal of Women’s Studies (1994), the European Journal of Cultural Studies (1998), and the journal Lettre International, which is as pan-European as any publication could be.48

---

*45. See the chapter by Dieter Thömm in this volume.
46. The leading figures of this movement are Gerd Achenbach (www.achenbach-pp.de) and Wilhelm Schmid (www.wilhelm-schmid.de). Achenbach was involved in the founding of the "Internationale Gesellschaft für philosophische Praxis" in 1982 (www.igpp.org). Schmid has been highly successful with books on the “art of living” and is a popular public lecturer.
47. For further discussion of this issue, see the essay by Rosi Braidotti in The History of Continental Philosophy: Volume 8.
48. According to its website (www.lettre.de/english), Lettre International is an international and interdisciplinary publication that was started in France in 1984 and in Germany in 1988. It has a unique format that connects several editorial boards in Europe, rests on a transcultural worldwide network of contributors and contacts, and is published in many languages. It is a high-quality magazine that aims to promote the advancement of world consciousness by bringing together the diverse approaches of economics, politics, art, philosophy, and literature.
RB: On the issue of Europe, my existential and the philosophical lines of questioning converged and became almost synchronized. As I said, my first encounter by becoming a migrant was with Europe in exile, Europe in migration. And this was in some way a formative moment, where I became aware not only of the contingent nature of identity, but also the extreme complexity of something that we could call Europe subject positions. I think I became aware of my Europeanness in this moment of distance, of dis-identification, of loss, of taking my departure from the self-evidence of that location. Philosophically, as my work focused more on the project of decentering the subject and the practice of critical theory, I learned a great deal from race and postcolonial philosophical studies. The critique of Eurocentrism evolved as the counterpart of the rejection of the universalizing powers of self-reflexive reason. The self-aggrandizing gesture that positions “Europe” as a concept that mobilizes and enhances the higher human mental faculties has to be deflated, regrounded and held accountable. More specifically it has to be read alongside the devastating historical phenomena that have been central to the alleged civilizing mission of the European “mind”: colonialism, racism, fascist denial of Otherness. It was clear to me that recognizing this corrupt historical legacy, while also acknowledging the great aspects and qualities of our culture, was the beginning of wisdom and also of historical lucidity. As Glissant and Balibar argue, it is also the end of a self-replicating sense of ignorance about those “others” who constitute such an integral part of European culture, including philosophy. The early awareness that so many of my favorite philosophers were foreigners, migrants, exiles, grew into the project of returning European critical theory to its specific location. Another Europe is possible, one that rejects the imperial posture and its arrogant pretensions and accepts its new historical role as a significant peripheral. So, becoming accountable for my Europeanness coincided with my becoming aware of the impossibility of being one, in the unitary sense of the term. Becoming nomadic seemed the most appropriate option for an antinationalist, antiracist, non-Eurocentric and Europe-based feminist philosopher. French philosophy remained an existential and cognitive travel companion in this trajectory.

JB: It seems clear that we cannot take into account our formations in European philosophy without thinking about the sense of “Europe” we were inheriting and how, politically, it becomes a certain obligation to contest and redefine Europe right now. It wasn’t until I started studying philosophy at Yale that I came to understand how conflicted the question of philosophy could become. At that time, the division was between “analytic” and “continental,” but that did not really explain very much about why people were so angry, why they wanted other people to lose their jobs, why they were angry enough to move to the other side of the country to get away
from those with whom they disagreed. But it was then that I also became involved in other sorts of activities, including the reading of literature (which I loved) and certain political activities outside the academy. In literature classes, I could think about all kinds of dimensions of language, including address, ellipsis, metonymy – many of the important contributions of structuralism and poststructuralism. These kinds of readings were difficult and demanding, and they clearly had their own rigor as well; they very often took aim at those philosophical texts that regularly dismissed the ways in which language figured so centrally to their claims of truth. Accordingly, they were dismissed as “nonsense” by some faculty in philosophy. So I also learned quickly that one could not take that kind of analysis into a philosophy course, and I learned to divide myself for the purposes of getting through those programs. Because of my political engagements and an emerging political way of thinking about the world, I had to figure out whether the kinds of questions that were raised in those political contexts could “translate” into a philosophical idiom. And sometimes my concerns made me have to break with the idioms altogether.

If we go back to the heartfelt question I posed in the basement of my parents home (my own version of Plato’s cave) – “How do I lead a good life?” – then I would say that the question has not really changed for me, although it has taken on new dimensions that are quite important. The “I” who poses the question – how are we to think about this subject, a subject who can pose a question to itself, capable of reflexivity? And this life? What do we make of Adorno’s important supplement to Socrates: how does one lead a good life in a bad life? In other words, if this life is pervaded by forms of power and domination that demean the value of life, and if only certain lives are regarded as valuable, and others not, then how do we rethink in political ways how the “goodness” of life is distributed unequally? How do I live, or how do we live in a context in which “life” itself has been brutally appropriated by reactionary forces (“pro-life”) or where certain lives, such as those my government kills in war, are not considered worthy of the name of “life”? This suggests to me that there can be no pursuit of the moral question “How do I live?” without an engagement with a social and political question: what has been made of life, and how do we understand those forms of power that differentiate between lives worth living and sheltering and lives worth neglecting and destroying?

The question of the “I” who would live, or seek to live well, became a permanent problem for my academic work. It seemed that the “I” who could speak, who could query life, could only become audible and only gain standing to the extent that the speaking subject conformed to certain gender norms, and that “the speaking I” was already a profoundly complex matter – politically saturated and textually consequential. The “I” who would speak and pose its question has to be “recognized” within those norms that make the speaking subject visible and audible. But if those norms constrain who may speak by masculinizing the position of the speaking subject, for instance, then we have to be able to ask political questions
about how established enunciatory positions depend on constitutive exclusions. Through what methods and means do we open up the sites of articulation to contest these hegemonic claims? In my early work on gender, I wondered whether there could be an “I” who was not already supported by established gender norms, but this meant only that new formations of subjectivity were crucial in order to disrupt disciplinary power in the domain of sexuality and gender.

V. PHILOSOPHY OUTSIDE ITS BOUNDS

Philosophical works are now varied in their form and argument, and they are part of a shifting landscape of unauthorized explorations that avoid blind loyalty to established institutional norms but also trace modes of belonging that are activated in the context of political and artistic engagement. Philosophy no longer belongs to a single site, but emerges as a mode of intervention that crosses time and space, forming global circuits of community as it goes. It is important to note, however, that these circuits of community are not based on sameness, but on persistent and animating differences. Indeed, “difference” is in some ways the rallying point for both a new and open mode of philosophizing and a form of political solidarity.

RB: Speaking as a philosopher who defends a materialist theory of becoming, I see my task as the passionate search for alternatives in our ideas and representations of human subjectivity. I believe that philosophy and critical theory have to be something else and possibly more than the protocol of critiques and other rules of reason. Institutional philosophy gets so technical: often little more than an elaborate mechanism of interpreting and footnoting canonical texts, it reduces intellectuals to the status of guardians of the great dead white men of Western culture. I think critical theory can be much more than that. I’m a feminist, I am a philosopher, and this double allegiance makes it imperative to go on looking for new ways of thinking about the kind of subjects we have become: not for the sake of narcissistic self-glorification, but rather for the contrary reason – in order to develop adequate cartographic accounts of the sort of subjects-in-process, in transition and in mutation, that we have already become. There is no question that we are in serious trouble understanding the world we’re living in. The deficit of representation is gigantic and it is not due to the fact that we are lazy and fundamentally stupid, but because advanced capitalism is moving so fast, and in such a schizoid manner, as to defy simple interpretations. It is a nonlinear, and fundamentally irrational, system. To make sense of this insanity and of its structural injustice and violence is something that is beyond the forces of one, single individual; therefore theory should be a collective endeavor aiming to draw adequate cartographies of
the world we’re living in. We need to compare notes on how we see these forces moving, make mappings of ideas that can be points of resistance, compare notes on these maps in a very humble, situated, and partial manner. To be aware of the power that we have as Europeans, as Americans, or Westerners, by a world plagued by the “clash of civilizations.” Critical theory is about this type of accountability that lends us the courage to go beyond the established habits and the institutional conventions. We should see mental habits even when they’re traditions of thought, as forms of legalized addictions that we need to grow out of. We have to cultivate the humble recognition of the collective nature of our utterances, that is to say, of how much we owe, theoretically and existentially, to others.

JB: My belief is that philosophy takes place any time and every time that a set of assumptions are called into question. And this is central to what we both understand as “critical” philosophy. When we go to the “root” of a problem, we exercise radicalism, which is why philosophy is only doing its job when it is radical. The exercise of critique is not a positive philosophical position, but it is a practice or, indeed, an “attitude,” to cite Foucault, that asks after the means by which truth becomes established, and the terms through which truth becomes justified. If disciplinary hermeticism is one means through which a certain regime of truth gets established, then it would only be by opening up the borders that the radical vocation of philosophy might be pursued. This means affirming the necessarily interdisciplinary context for contemporary knowledge, but also maintaining a reference to the world – to life, to lives in the plural – as they are lived and as they die. We can only ask how to live the good life if we understand that that life is shared and if we have the means for translating that complex commonality of living beings (human and nonhuman). And we can only call into question entrenched modes of living and dying (such as those that are most intensely and consequentially executed in war), if we become critical of the very ways in which our knowledge is delimited in advance. This does not mean that anything and everything is permitted as knowledge, but only that we do not take institutional prohibitions as the intrinsically wise. If we ask about how disciplines are made and enforced, we pose a set of critical questions, drawing from a philosophical tradition of critique, but subjecting the institution of philosophy to such critical questions. It is in this sense that critique is the term that calls into question whether philosophy can, or ought to be, fully identified with its institutionalized forms. This suggests as well that the “underground” to philosophy, the “philosophy” that lives and thrives outside philosophy is crucial to making sure that the critical tradition of philosophy remains contemporary and alive.

RB: The strength of philosophy as a discipline of thought is that it has codified not only its own discursive rules of argumentative reason, but also forms of profound disagreement. Philosophy is proud of both acknowledging and even rewarding the
systematic practice of theoretical disobedience and textual disrespect. Rather, this
discipline encourages us to conjure up the best way to respect traditions while
innovating on it, even by betraying it. Critical theory since Erasmus of Rotterdam
has formulated both the rhetorical schemes and the propositional content required
to sustain this balancing act. Too much of contemporary philosophy is unable to
question the authority of the past and is ever so willing to comply with it. It is as if
this discipline has accepted with resignation a sort of archival function, to become
a mausoleum of past ideas, a contemplation of inspiration lost.

It is crucial to combine critique with creativity, thinking with affectivity and
passion, theory with active social engagement in the world we inhabit. All this is
connected to the ethical impulse to really try to make a contribution in a histor-
ical time when the sense of the collective community is collapsing. I see the task
of philosophy as that of being worthy of our times by accepting complexity and
contradiction in a creative mode, so as to insert some positive energy into the
public debate. We can do this with Spinoza and Deleuze: invigorate this passion for
doing and making it into a collective enterprise. We can also do it with the feminist
Emma Goldman, who famously stated that, if it did not make her want to dance,
this was no revolution that she cared to be a part of. In this world in which every-
thing is privatized and commodified, and where individualism rules supreme, we
need to put the “active” back into activism. This is the sort of affirmative theory
that can’t be disconnected from the collective task of constructing social horizons
of hope. Which I consider as fundamental enough to make me want to take a few
chances – for the hell of it, that is to say, for the love of it.

Chronology 209
Bibliography 229
Index 243
“Continental philosophy” is itself a contested concept. For some, it is understood to be any philosophy after 1780 originating on the European continent (Germany, France, Italy, etc.). Such an understanding would make Georg von Wright or Rudolf Carnap – respectively, a Finnish-born philosopher of language and a German-born logician who taught for many years in the US – a “continental philosopher,” an interpretation neither they nor their followers would easily accept. For others, “continental philosophy” refers to a style of philosophizing, one more attentive to the world of experience and less focused on a rigorous analysis of concepts or linguistic usage. In this and the accompanying seven volumes in this series, “continental philosophy” will be understood historically as a tradition that has its roots in several different ways of approaching and responding to Immanuel Kant’s critical philosophy, a tradition that takes its definitive form at the beginning of the twentieth century as the phenomenological tradition, with its modern roots in the work of Edmund Husserl. As such, continental philosophy emerges as a tradition distinct from the tradition that has identified itself as “analytic” or “Anglo-American,” and that locates its own origins in the logical analyses and philosophy of language of Gottlob Frege. Whether or not there is in fact a sharp divergence between the work of Husserl and Frege is itself a contested question, but what cannot be contested is that two distinct historical traditions emerged early in the twentieth century from these traditions’ respective interpretations of Husserl (and Heidegger) and Frege (and Russell). The aim of this history of continental philosophy is to trace the developments in one of these traditions from its roots in Kant and his contemporaries through to its most recent manifestations. Together, these volumes present a coherent and comprehensive account of the continental philosophical tradition.
that offers readers a unique resource for understanding this tradition's complex and interconnected history.

Because history does not unfold in a perfectly linear fashion, telling the history of continental philosophy cannot simply take the form of a chronologically organized series of “great thinker” essays. And because continental philosophy has not developed in a vacuum, telling its history must attend to the impact of figures and developments outside philosophy (in the sciences, social sciences, mathematics, art, politics, and culture more generally) as well as to the work of some philosophers not usually associated with continental philosophy. Such a series also must attend to significant philosophical movements and schools of thought and to the extended influence of certain philosophers within this history, either because their careers spanned a period during which they engaged with a range of different theorists and theoretical positions or because their work has been appropriated and reinterpreted by subsequent thinkers. For these reasons, the volumes have been organized with an eye toward chronological development but, in so far as the years covered in each volume overlap those covered in the subsequent volume, they have been organized as well with the aim of coordinating certain philosophical developments that intersect in a fashion that is not always strictly chronological.

Volume 1 begins with the origins of continental philosophy in Kant and the earliest responses to his critical philosophy, and presents an overview of German idealism, the major movement in philosophy from the late eighteenth to the middle of the nineteenth century. In addition to Kant, the period covered in the first volume was dominated by Fichte, Schelling, and Hegel, and together their work influenced not just philosophy, but also art, theology, and politics. This volume thus covers Kant’s younger contemporary Herder, and his readers Schiller and Schlegel – who shaped much of the subsequent reception of Kant in art, literature, and aesthetics; the “Young Hegelians” – including Bruno Bauer, Ludwig Feuerbach, and David Friedrich Strauss – whose writings would influence Engels and Marx; and the tradition of French utopian thinking in such figures as Saint-Simon, Fourier, and Proudhon. In addition to Kant’s early critics – Jacobi, Reinhold, and Maimon – significant attention is also paid to the later critic of German idealism Arthur Schopenhauer, whose appropriation and criticism of theories of cognition later had a decisive influence on Friedrich Nietzsche.

Volume 2 addresses the second half of the nineteenth century, in part as a response to the dominance of Hegelian philosophy. These years saw revolutionary developments in both European politics and philosophy, and five great critics dominated the European intellectual scene: Feuerbach, Marx, Søren Kierkegaard, Fyodor Dostoevsky, and Nietzsche. Responding in various ways to Hegelian philosophy and to the shifting political landscape of Europe and
the United States, these thinkers brought to philosophy two guiding orientations – materialism and existentialism – that introduced themes that would continue to play out throughout the twentieth century. The second half of the nineteenth century also saw the emergence of new schools of thought and new disciplinary thinking, including the birth of sociology and the social sciences, the development of French spiritualism, the beginning of American pragmatism, radical developments in science and mathematics, and the development of hermeneutics beyond the domains of theology and philology into an approach to understanding all varieties of human endeavor.

Volume 3 covers the period between the 1890s and 1930s, a period that witnessed revolutions in the arts, science, and society that set the agenda for the twentieth century. In philosophy, these years saw the beginnings of what would grow into two distinct approaches to doing philosophy: analytic and continental. It also saw the emergence of phenomenology as a new rigorous science, the birth of Freudian psychoanalysis, and the maturing of the discipline of sociology. Volume 3 thus examines the most influential work of a remarkable series of thinkers who reviewed, evaluated, and transformed nineteenth-century thought, among them Henri Bergson, Émile Durkheim, Sigmund Freud, Martin Heidegger, Edmund Husserl, Karl Jaspers, Max Scheler, and Ludwig Wittgenstein. It also initiated an approach to philosophizing that saw philosophy move from the lecture hall or the private study into an active engagement with the world, an approach that would continue to mark continental philosophy's subsequent history.

The developments and responses to phenomenology after Husserl are the focus of the essays in Volume 4. An ambiguity inherent in phenomenology – between conscious experience and structural conditions – lent itself to a range of interpretations. While some existentialists focused on applying phenomenology to the concrete data of human experience, others developed phenomenology as conscious experience in order to analyze ethics and religion. Still other phenomenologists developed notions of structural conditions to explore questions of science, mathematics, and conceptualization. Volume 4 covers all the major innovators in phenomenology – notably Sartre, Merleau-Ponty, and the later Heidegger – as well as its extension into religion, ethics, aesthetics, hermeneutics, and science.

Volume 5 concentrates on philosophical developments in political theory and the social sciences between 1920 and 1968, as European thinkers responded to the difficult and world-transforming events of the time. While some of the significant figures and movements of this period drew on phenomenology, many went back further into the continental tradition, looking to Kant or Hegel, Marx or Nietzsche, for philosophical inspiration. Key figures and movements discussed in this volume include Adorno, Horkheimer, and the Frankfurt School,
Schmitt, Marcuse, Benjamin, Arendt, Bataille, black existentialism, French Marxism, Saussure, and structuralism. These individuals and schools of thought responded to the “crisis of modernity” in different ways, but largely focused on what they perceived to be liberal democracy’s betrayal of its own rationalist ideals of freedom, equality, and fraternity. One other point about the period covered in this volume is worthy of note: it is during these years that we see the initial spread of continental philosophy beyond the European continent. This happens largely because of the emigration of European Jewish intellectuals to the US and UK in the 1930s and 1940s, be it the temporary emigration of figures such as Adorno, Horkheimer, Lévi-Strauss, and Jakobson or the permanent emigration of Marcuse, Arendt, and Gurwitsch. As the succeeding volumes will attest, this becomes a central feature of continental philosophy’s subsequent history.

Volume 6 examines the major figures associated with poststructuralism and the second generation of critical theory, the two dominant movements that emerged in the 1960s, which together brought continental philosophy to the forefront of scholarship in a variety of humanities and social science disciplines and set the agenda for philosophical thought on the continent and elsewhere from the 1960s to the present. In addition to essays that discuss the work of such influential thinkers as Althusser, Foucault, Deleuze, Derrida, Lyotard, Irigaray, Habermas, Serres, Bourdieu, and Rorty, Volume 6 also includes thematic essays on issues including the Nietzschean legacy, the linguistic turn in continental thinking, the phenomenological inheritance of Gadamer and Ricoeur, the influence of psychoanalysis, the emergence of feminist thought and a philosophy of sexual difference, and the importation of continental philosophy into literary theory.

Before turning to Volume 7, a few words on the institutional history of continental philosophy in the United States are in order, in part because the developments addressed in Volumes 6–8 cannot be fully appreciated without recognizing some of the events that conditioned their North American and anglophone reception. As has been mentioned, phenomenologists such as Alfred Schutz and Aron Gurwitsch, and other European continental philosophers such as Herbert Marcuse and Hannah Arendt, began relocating to the United States in the 1930s and 1940s. Many of these philosophers began their work in the United States at the University in Exile, established in 1933 as a graduate division of the New School for Social Research for displaced European intellectuals. While some continental philosophy was taught elsewhere around the United States (at Harvard University, Yale University, the University at Buffalo, and elsewhere), and while the journal *Philosophy and Phenomenological Research* began publishing in 1939, continental philosophy first truly began to become an institutional presence in the United States in the 1960s. In 1961, John Wild (1902–72) left Harvard to become Chair of the Department of Philosophy at Northwestern University. With a commitment from the provost of the university
and the Northwestern University Press to enable him to launch the Northwestern Series in Phenomenology and Existential Philosophy, Wild joined William Earle and James Edie, thus making Northwestern a center for the study of continental philosophy. Wild set up an organizational committee including himself, Earle, Edie, George Schrader of Yale, and Calvin Schrag (a former student of Wild’s at Harvard, who was teaching at Northwestern and had recently accepted an appointment at Purdue University), to establish a professional society devoted to the examination of recent continental philosophy. That organization, the Society for Phenomenology and Existential Philosophy (SPEP), held its first meeting at Northwestern in 1962, with Wild and Gurwitsch as the dominant figures arguing for an existential phenomenology or a more strictly Husserlian phenomenology, respectively. Others attending the small meeting included Erwin Straus, as well as Northwestern graduate students Edward Casey and Robert Scharff, and today SPEP has grown into the second largest society of philosophers in the United States. Since those early days, many smaller societies (Heidegger Circle, Husserl Circle, Nietzsche Society, etc.) have formed and many journals and graduate programs devoted to continental philosophy have appeared. In addition, many of the important continental philosophers who first became known in the 1960s – including Gadamer, Ricoeur, Foucault, Derrida, Lyotard, and Habermas – came to hold continuing appointments at major American universities (although, it must be mentioned, not always housed in departments of philosophy) and, since the 1960s, much of the transmission of continental philosophy has come directly through teaching as well as through publications.

The transatlantic migration of continental philosophy plays a central role in Volume 7, which looks at developments in continental philosophy between 1980 and 1995, a time of great upheaval and profound social change that saw the fruits of the continental works of the 1960s beginning to shift the center of gravity of continental philosophizing from the European continent to the anglophone philosophical world and, in particular, to North America. During these years, the pace of translation into English of French and German philosophical works from the early twentieth century as well as the very recent past increased tremendously, and it was not uncommon to find essays or lectures from significant European philosophers appearing first in English and then subsequently being published in French or German. In addition, the period covered in this volume also saw the spread of continental philosophy beyond the confines of philosophy departments, as students and faculty in centers of humanities and departments of comparative literature, communication studies, rhetoric, and other interdisciplinary fields increasingly drew on the work of recent continental philosophers. Volume 7 ranges across several developments during these years – the birth of postmodernism, the differing philosophical traditions of France, Germany, and Italy, the third generation of critical theory, and the so-called
“ethical turn” – while also examining the extension of philosophy into questions of radical democracy, postcolonial theory, feminism, religion, and the rise of performativity and post-analytic philosophy. Fueled by an intense ethical and political desire to reflect changing social and political conditions, the philosophical work of this period reveals how continental thinkers responded to the changing world and to the key issues of the time, notably globalization, technology, and ethnicity.

The eighth and final volume in this series attempts to chart the most recent trends in continental philosophy, which has now developed into an approach to thinking that is present throughout the world and engaged with classical philosophical problems as well as current concerns. The essays in this volume focus more on thematic developments than individual figures as they explore how contemporary philosophers are drawing on the resources of the traditions surveyed in the preceding seven volumes to address issues relating to gender, race, politics, art, the environment, science, citizenship, and globalization. While by no means claiming to have the last word, this volume makes clear the dynamic and engaged quality of continental philosophy as it confronts some of the most pressing issues of the contemporary world.

As a designation, “continental philosophy” can be traced back at least as far as John Stuart Mill’s *On Bentham and Coleridge* (1840), where he uses it to distinguish the British empiricism of Bentham from a tradition on the continent in which he sees the influence of Kant. Since that time, and especially since the early twentieth century, the term has been used to designate philosophies from a particular geographical region, or with a particular style (poetic or dialectical, rather than logical or scientistic). For some, it has been appropriated as an honorific, while for others it has been used more pejoratively or dismissively. Rather than enter into these polemics, what the volumes in this series have sought to do is make clear that one way to understand “continental philosophy” is as an approach to philosophy that is deeply engaged in reflecting on its own history, and that, as a consequence, it is important to understand the history of continental philosophy.

While each of the volumes in this series was organized by its respective editor as a volume that could stand alone, the eight volumes have been coordinated in order to highlight various points of contact, influence, or debate across the historical period that they collectively survey. To facilitate these connections across the eight volumes, cross-referencing footnotes have been added to many of the essays by the General Editor. To distinguish these footnotes from those of the authors, they are indicated by an asterisk (*).

CONTRIBUTORS

Bruno Bosteels is Associate Professor in Romance Studies at Cornell University. He is the author of Badiou and Politics (2009) and Marx and Freud in Latin America (forthcoming). He also serves as general editor of Diacritics.

Rosi Braidotti is Distinguished Professor in the Humanities at Utrecht University in the Netherlands and founding Director of the Centre for the Humanities at Utrecht University. She was the founding Chair and Professor of Women’s Studies in the Arts Faculty of Utrecht University (1988–2005), Scientific Director of the Netherlands Research School of Women’s Studies (1995–2005), set up the Network of Interdisciplinary Women’s Studies in Europe (NOI&SE) within the Erasmus Programme in 1989, and has been elected to the Australian Academy of the Humanities. She has published extensively in feminist philosophy, epistemology, poststructuralism, and psychoanalysis, and is the author of several books, including Patterns of Dissonance (1991), Nomadic Subjects: Embodiment and Sexual Difference in Contemporary Feminist Theory (1994), Metamorphoses: Towards a Materialist Theory of Becoming (2002), and Transpositions: On Nomadic Ethics (2006).

John Fennell is Assistant Professor of Philosophy at Grinnell College. His work, which focuses principally on naturalist and antinaturalist approaches to meaning and mind, has appeared in European Journal of Philosophy and International Journal of Philosophical Studies.

Jonathan Maskit is Assistant Professor of Philosophy at Denison University. He has published numerous articles and book chapters on continental environ-
mental philosophy and environmental aesthetics. His work has appeared in *Philosophy & Geography; Ethics, Place, & Environment; Research in Philosophy and Technology*; and *The European Journal of Geography*. He is currently working on a book about conceptions of nature in philosophy and art.

**Todd May** is Class of 1941 Memorial Professor of the Humanities at Clemson University. He is the author of ten books of philosophy, most recently *The Political Philosophy of Jacques Rancière: Creating Equality* (2008), *Death* (2009), and *Contemporary Movements and the Thought of Jacques Rancière* (2010).

**Eduardo Mendieta** is Professor of Philosophy at Stony Brook University and is the author of *Global Fragments: Globalizations, Latinamericanisms and Critical Theory* (2007). He has translated and edited several volumes by and on Enrique Dussel.

**Dorothea Olkowski** is Professor of Philosophy, former Chair of Philosophy and former Director of Women's Studies at the University of Colorado at Colorado Springs. She is the author of *The Universal (In the Realm of the Sensible)* (2007), and *Gilles Deleuze and the Ruin of Representation* (1999), editor of *Resistance, Flight, Creation: Feminist Enactments of French Philosophy* (2000), and coeditor of books that include *Gilles Deleuze and the Theater of Philosophy* (with Constantin V. Boundas; 1994), *Feminist Interpretations of Maurice Merleau-Ponty* (with Gail Weiss; 2006), and *The Other: Feminist Reflections in Ethics* (with Helen Fielding, Gabrielle Hiltman, and Anne Reichold; 2007). She has recently completed the manuscript for a book called *Nature, Ethics, Love*.

**Gabriel Rockhill** is Assistant Professor of Philosophy at Villanova University and the Director of the Atelier de Théorie Critique at the Centre Parisien d’Études Critiques and the Collège International de Philosophie. He is the author of *Pour un historicisme radical: Entre art et politique avec Jacques Rancière* (forthcoming), the coeditor of *Politics of Culture and the Spirit of Critique: Dialogues* (with A. Gomez-Muller; 2010), and the editor and translator of Jacques Rancière’s *The Politics of Aesthetics* (2004).

**Gayle Salamon** is Assistant Professor of English at Princeton University. She works on phenomenology, feminist philosophy, and queer theory, and is the author of a manuscript on embodiment and transgender subjectivity, *Assuming a Body* (2010).

**Emily Zakin** is an Associate Professor of Philosophy at Miami University. She is coeditor of *Derrida and Feminism: Recasting the Question of Woman* (with
Ellen K. Feder and Mary C. Rawlinson; 1997) and Bound by the City: Greek Tragedy, Sexual Difference, and the Formation of the Polis (with Denise Eileen McCoskey; 2009), and has published articles on psychoanalysis, French feminism, and political philosophy. She is also coeditor of the journal philoSOPHIA (SUNY). She is currently writing a book called Tragic Fantasies: The Birth of the Polis and the Limits of Democracy.
INTRODUCTION

Todd May

There is a nostalgia in recent French philosophy for the glory years surrounding May ’68 and its aftermath. The early writings of Jacques Derrida, the genealogical works of Michel Foucault, Gilles Deleuze’s *Difference and Repetition* and his subsequent work with Félix Guattari, much of the most influential work of French feminists such as Luce Irigaray and Julia Kristeva: these writings are rooted in that turbulent period. Of course, the turbulence was not restricted to France. The Prague Spring, the anti-Vietnam War demonstrations, and the Six-Day War and the beginnings of the Israeli occupation were all expressions of a time in which nothing seemed stable and everything appeared to be up for grabs.

It seems that turbulent times often produce great culture. This is the lesson of the Renaissance, and seems to have been repeated in the late 1960s. Moreover, for continental philosophy there is another period that exemplifies this lesson, one that has its own nostalgia. This is the existentialist period of the 1940s, when Jean-Paul Sartre and Maurice Merleau-Ponty led a movement that responded to the Second World War and postwar period with a body of work that remains powerful to this day. (One might also cite the emergence of the Frankfurt School in Germany in the 1930s.)

If the rise of important philosophical thought is associated with times of change and instability, however, this nostalgia may be misplaced. The period covered by this volume, roughly the 1990s to the present day, is perhaps as great a period of upheaval as that of either the 1940s or the 1960s. In order to verify this, let us canvass a few of the changes during our recent history.

First, and most obviously, one might point to the fall of the Berlin Wall in 1989 and the subsequent collapse of the Soviet Union. This collapse marked the definitive end of traditional Marxism as a theory of resistance to capitalism. Of
course, Soviet Marxism had long been discredited in continental philosophy. The turning point for this change could indeed be marked with the date of May 1968. However, until the demise of the Soviet Union, the world in which philosophy took place remained a bipolar one. At the macropolitical level, if not the micropolitical one, the alternatives that presented themselves were American capitalism and Soviet (or Chinese) Marxism. With the demise of this bipolar world (or at least, in the Chinese case, its Marxist aspect), a global structure that had remained intact for the entirety of the post-Second World War period disappeared. No longer could American policy be justified by and strategized around countering communism, and no longer could opposition to the US look for support to a relatively stable bloc of communist states. Developing countries (or, in some cases, their corrupt leaders) could no longer hope to develop or enrich themselves by playing off one side against the other. What the first President George Bush called the New World Order is not necessarily an order at all.

The end of Soviet communism is said by some to have resulted in a unipolar world. But this does not capture the complexity of the times. Consider a second change: the rise of the virtual electronic world. Of course, during the twentieth century electronic communications and media developed by leaps and bounds. Radio, television, the telephone: all these changed the way people interact with one another. But no form of media communication has raised the questions of how we do and should interact with one another as urgently as the rise of the internet, and with it email communication and its subsequent forms of texting, and so on. The 1990s was the decade in which virtual communication became a primary, if not the primary, mode of business and social communication. Proximity in space and time was eclipsed by forms of interaction that allowed people to communicate across times, and especially places, that had previously been inaccessible. Moreover, this communication could be far richer (or, depending on one’s viewpoint, far more impoverished) than was previously possible. These changes raised the questions of what it is to be human and what human interaction could – and should – consist in.

These two changes have been inseparable from a third one: economic globalization. The fall of the Soviet Union removed any barriers from the spread of global capital, and the rise of electronic communication has facilitated that movement as well as the coordination of diverse activities by transnational corporations. Economic globalization has integrated national economies and fostered a neoliberal approach to economic production. This approach, which has in many ways replaced the previous welfarist approach to economics, emphasizes deregulation, privatization, and the removal of trade barriers. The dominance of neoliberalism can be explained by the rise of economic globalization. Capital likes deregulated markets and the ability to flow easily from one market to another, and so will tend to drift toward those markets that foster deregulation and trade,
while capital will be disinvested from other markets. With the rise of electronic communication, the movement of capital away from welfarist states and toward neoliberal ones becomes much easier. And thus welfarist states all tend to drift toward neoliberalism in order to keep capital from fleeing their countries.

Neoliberal economic globalization is related to another change, one that has largely affected developing countries. It is a particular kind of postcolonialism, one that has not only political but economic roots. Postcolonialism is not a new phenomenon. One might say that postcolonialism has been around since the end of colonialism, which began its major decline in the early 1960s. The postcolonial period has been a difficult one. Corrupt totalitarian states in Africa, failed Marxist projects in Latin America and Asia, and the intervention of the US and the former Soviet Union, as well as the devastating legacy of colonialism, have left many developing countries bereft. However, the rise of economic globalization has presented a new set of challenges to postcolonial states. Rather than political colonialism, they face an economic imperialism that is distinct in nature but not perhaps in effect from the previous colonial projects. The current postcolonial period is one of economic integration as well as exploitation. This period presents new obstacles to those who seek to understand and to change the developing world. These obstacles can be seen in sharp relief, particularly when we understand the contemporary urbanization of much of the developing world. More people now live in cities than in the countryside (although, ironically, in the US a plurality of people now inhabit the suburbs). This urbanization, or mega-urbanization, intersects with economic exploitation in explosive ways.

Related to but distinct from postcolonialism is a fifth change: the emergence, particularly in the 1990s, of identity politics. Feminist politics, black politics, and gay and lesbian politics all staked their claim to recognition during this period. One might date the birth of identity politics as early as the late 1960s and early 1970s. During that period, Marxist thought, which had previously held sway on the Left, began to give way to more decentered ways of conceiving oppression. Rather than reducing all oppression to class exploitation, thinkers and activists began to conceive of various oppressions as having their own character and history. To be sure, it was recognized that there were relationships among these oppressions. But they resisted reduction to a single type of oppression or domination that would ground or explain them. Since the 1970s, universities have begun to offer courses, and then minors, and finally majors in areas such as black studies and women’s studies. By the 1990s, such thought became perhaps the dominant mode of conceiving progressive politics. Although identity politics has come under increased scrutiny and faced much skepticism in the past five to ten years, it remains an important element in the current intellectual and political context.
The sixth change, one that intersects with most of the others, is the change in the biosphere, especially global warming and the increasing demand for fossil fuels. Awareness of environmental degradation and the limits of natural resources has been with us for some time. The first Earth Day took place nearly forty years ago, in 1970. However, for many people environmental concerns have been, until recently, removed from everyday life. This is no longer the case. From the devastations of Hurricane Katrina and the tsunami of 2004 to the leaps in food and gasoline prices, the role played by the biosphere in limiting and determining our lives is very much in evidence. Moreover, there is a complex interaction between neoliberal economic globalization and environmental concerns. It is difficult, for instance, to reconcile a free and unregulated market with the preservation of energy sources or with the reduction of greenhouse gases. Of course, neoliberal theorists have offered market solutions to these issues, but the failure of those solutions is blindingly obvious.

These changes – the collapse of the Soviet Union, the pervasion of electronic media, economic globalization, the emergence of postcolonialism, the rise of identity politics, and the urgency of the environment – have combined to create a world that is very different from the world of twenty or twenty-five years ago. If upsurges in cultural creativity are fostered by turbulent times, we certainly live in a time that is propitious for such creativity. Rather than engaging in nostalgia for earlier thought, it would perhaps be better to ask ourselves whether there are types of thought that are equal to our times. Although there remains much to be learned from the thinkers canvassed in the previous volumes in this series, we should not remain content to look back wistfully at selected periods at the expense of seeking to understand and utilize our own historical situation for further thought and reflection.

As the essays in this volume demonstrate, there is much current creative work that seeks to grapple in one way or another with our time. Cut loose from the moorings of traditional Marxism, liberalism, linguistic thought, transcendental ethics, or other constraints that seem anachronistic in this period of upheaval, current continental thought is focused on giving voice to our time and the possibilities it offers. It does not reject longstanding philosophical questions of who we are, what we know, and how we should live. But it asks those questions with an eye to our current context. There is, for many who write continental philosophy, an urgency that stems from a recognition of the importance of what is happening today. The essays here cover a variety of perspectives within current continental philosophy that do not shirk the task of thinking ourselves and our tasks within the context of our situation.

Because of this orientation, contemporary continental philosophy is marked by normative concerns, that is, concerns about how we are called to take up our context or how that context calls on us. This normativity might be overlooked,
since there is no single thinker devoted to ethics in the way, for instance, that Emmanuel Levinas was. However, this is not because there are no ethical concerns at play in the work of the thinkers considered here. To the contrary, many of the philosophers whose names appear in the following pages assume the significance of ethics specifically and normativity generally in their writing. They see normative concerns so woven into the fabric of our lives and our situation that they find no need to offer a distinct and isolated *ethical* position. Whether it is a question of feminism and the concerns of patriarchy, the environment, art and aesthetics, the politics of postmodernism, or even science studies, the normative impact and consequences of one’s thought and one’s views are inseparable aspects of many of the philosophers whose work is canvassed throughout this volume.

In the opening essay of the volume, “Rethinking Gender,” Gayle Salamon traces the recent history of feminist thought, particularly as it appears in the work of Judith Butler. Butler’s has been one of the most influential voices in recent years, particularly in feminist and queer theory. Her identity politics, however, is not essentialist in character. In fact, it is precisely the opposite. As Salamon points out, “Butler rethinks gender by casting it as a performative, a doing rather than a being.” Rather than being the products of an inescapable essence, our gender identities are largely constructed by our social and historical circumstances. This type of thought cuts against both more conservative views that seek to justify a woman’s subordinate role by reference to her sexual identity and, at the same time, essentialist feminisms, such as that of Irigaray, that seek to ground resistance to patriarchy in the nature of being woman.

If gender is a performative, then resistance can take the form of alternative performances, performances that are outside the recognized gender roles. Both Butler and Monique Wittig call for such alternative performances, although they differ on the role of language in these performances. Can the traditional language used to describe sex and gender be shaped to new use, as Butler often seems to believe, or must we, with Wittig, abandon sexual categories altogether?

Gabriel Rockhill takes up the question of the place of aesthetics in recent continental thought, particularly as it appears in the writings of Alain Badiou and Jacques Rancière. He argues that Badiou and Rancière offer us novel ways of conceiving aesthetics. For Badiou, art is one of the four procedures of truth he outlines in his major philosophical works, works that are discussed in Bruno Bosteels’s essay in this volume, “Thinking the Event.” In keeping with the tradition of high modernism, Badiou offers art a privileged place in human activity. Badiou’s notion of truth, however, is a unique one. A truth brings an event that had previously been foreclosed by a situation into the situation. So truths, including artistic truths, do not just reveal or discover; they also resist the situation in which they take place.
Rancière, in contrast to Badiou, refuses to recognize art as a more or less trans-historical category. There is no art in general; rather, there are regimes of artistic practices. These different regimes have different themes associated with them. Modern artistic practices, in contrast to those characteristic of artistic regimes up until the early to mid-1800s, are characterized by a particular egalitarianism. They are not egalitarian in the sense that they promote political equality. Rather, they reject the idea of higher and lower themes and plots, and treat all aspects of life as equally worthy of artistic treatment.

The political side of Rancière’s egalitarianism, as well as that of several other thinkers coming from the Marxist tradition, is taken up in Emily Zakin’s essay “Rethinking Marxism.” She shows there that although many contemporary political theorists reject any form of orthodox Marxism, they nevertheless remain influenced by it, and in particular by the structuralist Marxism of Louis Althusser. Rancière was a student of Althusser’s, as was Badiou. Rancière broke with Althusser, however, in the wake of the events of May ’68, in order to think a more egalitarian political view than was characteristic of his teacher.

Rancière and Badiou are not the only thinkers whose work engages the Marxist tradition. The Slovenian thinker Slavoj Žižek has combined a Lacanian view of psychoanalysis, a Hegelian view of the movement of history, and a Marxist sensitivity into a combination that seeks to understand the self-undermining way people carry out their political projects. For their part, Ernesto Laclau and Chantal Mouffe see the gaps that Žižek cites in political projects to be the very stuff of politics. A democratic politics is always centered on the antagonisms inherent in any social order. Where Žižek finds the futile project of restoring a seamless order, Laclau and Mouffe find the place in which the hierarchy of a given social order is contested. Finally, for his part, Giorgio Agamben concerns himself with the rise of a particular biopolitical order, one in which the state claims for itself unlimited power in the “state of exception,” and people are treated as nothing other than sheer life, to be disposed of as befits state interests.

Bruno Bosteels’s essay focuses on the work of Badiou as a whole. Badiou’s thought has, in keeping with much of recent French philosophy, focused on the event. The concept of the event is an important one in recent French thought, particularly in the philosophy of Deleuze. In general, invoking the concept of the event marks a change in or break with a particular situation or configuration. It announces, or is, something novel, something that cannot be captured in the terms of the situation or configuration within which it arises. As such, the event has a positive valence. It is a moment of creativity. Badiou gives the idea of the event his own inflection, drawing from mathematics and particularly from set theory. For Badiou, set theory reveals a positive ontology, since it allows us to think pure multiplicity. Within that pure multiplicity, an event is that which inheres in the multiplicity but has not been represented in the situation. For
Badiou, Bosteels writes, “The event is this something, which is almost nothing, but which suffices to trigger a radical transformation of the situation as a whole.” Events, in short, are revealings of truth in the sense that Rockhill captures in his discussion of Badiou and art. As such, Badiou’s sense of events is distinct from that of Deleuze, for whom truth is not the issue in events. For Badiou, truth and the event are coextensive, while for Deleuze the idea of truth is on the hither side of the event: events do not reveal truth, but instead, as Nietzsche would also have it, they are indifferent to truth.

Badiou’s recent thought has departed somewhat from the path that characterizes his earlier work. He introduces the concept of appearing, which seeks to keep the materialism of his dialectical materialism intact. In both his earlier and later thought, however, Badiou sees himself as renewing the Platonist tradition. Philosophy is a matter not of creation or of relativism, but of truth. And while philosophy does not create truths – only the “truth procedures” of politics, science, art, and love can do that – philosophy seeks to think the character of truth and of the compossibility of the truths of the distinct truth procedures.

John Fennell’s “Rethinking Anglo-American Philosophy” reminds us that Anglo-American philosophy, particularly in recent years, is much richer than many continentalists recognize. Among continental philosophers, there is a tendency to think of Anglo-American philosophy as encompassing a narrowly analytic focus. The work of Donald Davidson, John McDowell, and Robert Brandom belies this view. They offer more encompassing accounts of who we are that provide important points of intersection with recent continental thought.

Drawing from the work of Ludwig Wittgenstein, Wilfrid Sellars, and W. V. Quine, the three Anglo-American figures who form the focus of Fennell’s essay resist the easy reductionism of earlier analytic models of thought. Each of them finds a rich normative dimension to human thought and language, a dimension that cannot be explained in purely physical terms. Whether it is Davidson’s appeal to interpretation, Brandom’s inferentialism, or McDowell’s concept of second nature, the antireductionism of these thinkers allows their thought to intersect with the wider social concerns of many continental philosophers. In particular, as Fennell notes, these thinkers can be seen as “continuing the breakthrough to hermeneutics and phenomenology (already begun by Wittgenstein and Sellars) within Anglo-American philosophy.”

If Anglo-American philosophy is widening its scope to include concerns traditionally associated with continental thought, so too continental thought is increasingly embracing the concern with science often associated with analytic work. Dorothea Olkowski’s “Rethinking Science as Science Studies” shows how science, considered as a human practice, is something other than a calculative and alienating project of the kind criticized by Martin Heidegger and those who follow him. Instead, it is a type of engagement with the world that has complex
relationships with both its own theories and methods and the society in which
it takes place.

Science often provides idealized models of reality. However, those models
are themselves intertwined with conceptual frameworks that are present in the
surrounding society. Therefore, rather than thinking of science as an insular
and ahistorical project, thinkers like Bruno Latour, Isabelle Stengers, and Ilya
Prigogine are returning an understanding of science to the social conditions with
which it interacts. In addition, Stengers and Prigogine re-engage science with
the complexity of the world, showing that the world is far more complex than
earlier, simpler models would have us believe. This, in turn, intertwines science
with notions of chaos and complexity that are also current in the surrounding
social context.

That surrounding social context, particularly in its European mode, is
the topic of Rosi Braidotti’s “European Citizenship.” Braidotti notes that the
Eurocentric orientation of much European political history has come under fire
and has recently been abandoned by many of the thinkers who seek to under-
stand Europe's current standing and role. The current European scene is both
postcolonial and posthomogenous. It can no longer hold itself up as a model of
human development and thus intervene (and exploit) other cultures; and the
internal character of each of its countries is no longer monolithic. Immigration
and globalization raise questions for Europe that cannot be answered by appeal
to older nationalist models.

These questions are occurring across a variety of registers. Some, such as
Jürgen Habermas, argue for a new cosmopolitanism that sees members of Europe
as world rather than national citizens. Others, such as Étienne Balibar, seek to
turn reflection on Europe toward its own history and struggles, with an eye both
on seeing its failures and on recognizing the process of struggles against those
failures that can be seen as part of a trajectory of liberatory thought. Still others,
for example Derrida, urge Europe to take up an engagement with its Others,
an engagement that will bring its own concepts into permanent instability and
self-critique.

Eduardo Mendieta’s “Postcolonialism, Postorientalism, Postoccidentalism”
stays on the political register, but shifts the focus from Europe to the developing
world. He considers the rise of postcolonial thought, particularly in the wake
of Edward Said’s seminal book Orientalism. In that work, Said argues that the
West has projected onto the East the notion of the Other, an Other against which
it then identifies itself. This idea of self and other and the play of identifica-
tion has been taken up by more recent thinkers who are grappling with the effects of
colonization and the attempt to form identities in the wake of its decline.

Gayatri Spivak takes up the critique of the West’s representation of non-
Western populations. She shows how the West, by representing itself as universal,
assumes an ahistorical, paternalistic, and often racist orientation toward non-Western countries and cultures. Homi Bhabha, by contrast, sees a more fluid process at work, one in which identification takes place, in a Lacanian fashion, by seeking to assume a position that is barred to one. As Mendieta writes, “Bhabha's work combines productively Lacanian psychoanalysis with Foucaultian genealogy, in order to make more nuanced Said's and Spivak's analyses of the discourses of imperialism and colonialism.” For their part, Enrique Dussel, Fernando Coronil, and Walter Mignolo expand Said's view in different directions, particularly in light of the experience of colonization and postcolonization in Latin America.

In recent years, environmental concern has generated environmental thought and reflection in both the Anglo-American and continental traditions. Jonathan Maskit's “Continental Philosophy and the Environment” takes up recent continental thought as it grapples with issues that have arisen over the course of the past several decades. Rooted in the ontological considerations of Heidegger and the critiques of capitalism tracing back to the work of Theodor Adorno and Max Horkheimer, recent environmental thinking seeks to intertwine both an ontology of the relationships of humans with nature and the politics of capitalism that has destroyed those relationships.

Maskit notes that in Germany, where environmental issues have played an important role in public politics – Germany has long had a strong Green Party – theoretical reflection has, unexpectedly, been less developed than in the US or France. In France in particular, the work of Michel Serres, Latour, and especially Félix Guattari has undercut the opposition between humanity and nature. Drawing on both Heidegger's reflections on the relation of human to Being and Deleuze's antihumanist ontology, French theorists have engaged in a rethinking of social, environmental, and intra-subjective relationships.

My own contribution turns to the ways in which thinkers have directly confronted globalization, and to a lesser extent US hegemony. Taking up a number of thinkers whose work has already been canvassed, it divides the responses to globalization into four categories: critiques of media and the spectacle; proposals for a renewed vision of democracy; a conception of the rise of the multitude; and a renewal of the anarchist tradition. These categories are not exhaustive, nor do they necessary conflict with one another. However, they provide a framework within which to consider how recent continental thought has reflected on the time in which we live. Are we dominated by the media we have created to the point where we have become its creatures? How should we think democracy under new, more globalized conditions? Can we conceive of the globalized world as being sustained by a multitude whose energies can also liberate it from its oppressive aspects? Does the decline of the Marxist tradition open the way for a more egalitarian, anarchist-oriented conception of politics?
These are the questions that drive many of the thinkers who want to understand – and to change – a world whose geographical borders seem increasingly irrelevant.

All of the essays in this volume confront, in one way or another, the turbulent times in which we live. They take up one or more of the six themes I alluded to earlier. They are driven, although from different angles, by concerns about what is happening to us and what can be done about it. In that sense, the authors of these essays demonstrate that continental philosophy need not be nostalgic. It has risen to the task of thinking the present, and probably in ways that will yield thinkers to be read long into the future. Who, among the current crop, will be our next Heidegger, our next Merleau-Ponty, our next Foucault? Or will it be that, in the complexity of our time, none will assume a dominant position, but instead reflection will become a more collective effort? Maybe there will be no superstars, but rather a constellation that makes sense when seen as a pattern.

One figure who is currently on the horizon, and who should be mentioned even if only in passing, is François Laruelle. Laruelle’s books have yet to be translated into English, but he has been influential in recent French thought. His “nonphilosophy” challenges traditional philosophy by accusing it of positing an identity between thinking and reality, an identity that is ultimately an idealism. His project is to abandon this positing in favor of a thought that experiments with new conceptual possibilities that he sees as previously barred from philosophy.

These considerations bring us to the question of the future of continental philosophy. Is there anything we can say about where continental thought will head, given its current situation? Prediction, of course, is a hazardous business. Nevertheless, even with limited predictive ability one can read a few current trends that might have a future. Among these, one of the most salient is interdisciplinarity. Contemporary continental philosophy is not only engaged with its time; it is also, and partly because of this, engaged with other areas of study and research. We can see this in the essays for this volume. The philosophical positions discussed here are in conversation with science, art, political science, the media, literature, and environmental studies. This, I believe, stems both from philosophy’s engagement with the world and from an internal development of philosophy – both continental and Anglo-American – over the course of the twentieth century. The latter has to do with the demise of philosophical foundationalism, perhaps last seen in a full-blown way in the thought of Edmund Husserl.

The story behind this demise is a longer one than can be told here. It concerns the end, or perhaps exhaustion, of philosophy’s attempt to be a foundation for all knowledge. The upshot of this end or exhaustion is that philosophy takes itself to stand no longer behind or beneath other areas of study, but rather alongside them. This, in turn, opens the door to conversation with other areas of study. When philosophy’s task is no longer to stand outside other disciplines,
it can borrow from them without a loss of its own integrity. We have seen this happening over the course of the latter part of the twentieth century, and it will likely continue.

Just as the boundaries between philosophy and other disciplines are beginning to break down, so is the internal boundary between Anglo-American and continental philosophy. For several decades, continental philosophers have referred to Anglo-American ones: Wittgenstein, John Austin, Saul Kripke, and more recently Brandom have found their way into continental thought. Conversely, Anglo-American philosophers have taken an interest particularly in the thought of Heidegger, Habermas, Merleau-Ponty, and Foucault. We can expect these borrowings to continue, especially since Anglo-American philosophy has in some quarters become more synoptic in its vision. Rather than being content with addressing small, specialized problems, many Anglo-American philosophers, chief among them those discussed in Fennell’s essay, are attempting to build larger philosophical visions.

Alongside internal and external interdisciplinarity, one might expect that continental philosophy will seek to speak to a larger audience. There are several reasons for this. First, interdisciplinarity requires that those from other traditions can understand what one is saying. Interdisciplinary conversation, by its nature, cannot remain specialized. Second, in seeking to address the world in which we live, continental philosophy will have to find a way to address that world in terms people can understand. The turbulence of our times needs reflective understanding. Only by reaching out to a larger audience can philosophy provide that understanding. Finally, philosophy, like many of the liberal arts, is struggling against its marginalization by the corporatist mentality that has become dominant in many universities. As universities, partly driven by financial constraints, throw their resources into money-making ventures like the applied sciences, the humanities often find themselves under academic siege. The resort to arcane language and self-absorption will only reinforce the image of the humanities as irrelevant to students’ concerns. Alternatively, when philosophy uses its resources in the service of reflection on people’s lives and their situation, it struggles against the forces of marginalization. That struggle may, in fact, be threatening to the powers that be. After all, philosophy has always been a form of critical reflection. However, if critical reflection remains a part of university life, it is the task of philosophy as much as any discipline to contribute to it.

These are only a few of the directions continental philosophy may take. I would not want to hazard anything more fine-grained than that. However, as the volumes previous to this one have shown, the twentieth century was a rich one for continental philosophy. And as this volume demonstrates, recent continental thought retains a strength and vitality that allows it to keep asking important
questions in the context of the time in which those questions are asked. Who we are, where we are, and what we might be remain its concerns; in a world fraught with uncertainty, there can be no greater intellectual task than to reflect rigorously on them.
1

RETHINKING GENDER: 
JUDITH BUTLER AND FEMINIST PHILOSOPHY

Gayle Salamon

The historically fraught relationship between gender and philosophy has sometimes served to obscure the mutual necessity that has bound them together. Gender is that without which philosophy could not proceed, and yet it has historically evaded notice as a philosophically significant concept. Luce Irigaray has demonstrated the extent to which the feminine has haunted philosophy all along, unincorporated and unacknowledged but central to its projects. If philosophy has been silently marked by gender, it is equally true that gender is in some sense marked for philosophy. Monique Wittig describes the relation between gender and philosophy as a question of ownership, and has framed their connection thus: “As an ontological concept that deals with the nature of Being, along with a whole nebula of other primitive concepts belonging to the same line of thought, gender seems to belong primarily to philosophy.” Wittig makes this assertion about gender in something of a disparaging mode, chastising philosophy for its unthought and reflexive conflation of gender with the natural order of things while also consigning gender to philosophy as a way of dispensing with it as yet another “primitive concept” relegated to irrelevance. The problem with gender in philosophy, according to Wittig, is that its putative self-evidence has rendered it invisible, and philosophy has become the end point at which gender transforms from a speculative question into an unnoticed fact.

*1. For a discussion of Irigaray, see the essay by Mary Beth Mader in The History of Continental Philosophy: Volume 6.

Despite this lack of sustained attention – or perhaps because of it – gender persists as a question in and for philosophy. Even outside the domain of philosophy proper, some of the most influential feminist discourses have been those that take gender seriously as a philosophical problem, from the robust critique of ontology and neat Cartesian inversion offered by the “Am I?” of Denise Riley’s *Am I That Name?* to the epistemological critique incited by Joan Scott’s reading of the power of gender as a category of historical analysis. Both the concept of gender and feminist discourse as a whole have been given an explicitly philosophical genesis by at least one author: Donna Haraway has argued that “all the modern feminist meanings of gender have roots in Simone de Beauvoir’s claim that ‘one is not born a woman.’”3 This genealogy understands gender, in any conceptual deployment, to already be engaged in a mode of critique, and offers gender as a way of questioning and challenging the naturalization of the social and identity formations that accrue around sex. This critical and interrogative relationship need not go by the name of “gender” at all, and indeed does not in Beauvoir’s case. Locating the birth of gender with Beauvoir’s philosophical critique asserts a kind of deontologization of gender from the start, since the essence of gender is then located in the relationship between “sex” and a critique meant to unseat presumptions of its naturalness or givenness.

Gayle Rubin’s essay “The Traffic in Women” (1975) is often cited as the moment when the distinction between “sex” and “gender” became codified in feminist thinking, primarily because of her introduction of the phrase “sex/gender system,” which she defines as “the set of arrangements by which a society transforms biological sexuality into products of human activity, and in which these transformed sexual needs are satisfied.”4 Rubin holds that sex, sexuality, and gender are unthinkable apart from the culture that gives them meaning, and elsewhere describes the relationship between biology and sexuality, paraphrasing Claude Lévi-Strauss, as “Kantianism without a transcendental libido.”5 Rubin’s phrase soon began to circulate to support the idea that sex and gender were two different kinds of things that worked in concert as a system, and “The Traffic in Women” is often cited as the origin of the theorization of sex as biological raw material overlaid with a something nonmaterial called gender. However, this is a misreading: although Rubin’s piece was indeed the first in this area to use the term “gender” to refer to identity and behaviors that are culturally tied to sexual dimorphism, it was clearly not her intent to formulate sex as biological

and gender as cultural, since she is clear in her assertion that “sex as we know it – gender identity, sexual desire and fantasy, concepts of childhood – is itself a social product.” Rubin does not always distinguish between sex and gender; indeed, there are moments when the slash between sex and gender in the sex/gender system functions as a sign of collapse or dissolution rather than a marker of disjunction. Nor does she parse gender and sex and sexuality, although she will argue for their conceptual and methodological separateness a decade later in “Thinking Sex” (1984).

The work of Judith Butler (1956– ) has a singular place in this genealogy. Butler completed her PhD in philosophy at Yale University in 1984, where she worked with phenomenologist Maurice Natanson, and has spent most of her career to date in the Departments of Rhetoric and Comparative Literature at the University of California at Berkeley. All of Butler’s work might be described as an exploration of the conditions of possibility of the subject, where the condition that has received Butler’s most sustained attention is gender. Butler rethinks gender by casting it as a performative, a doing rather than a being, and her theory of gender performativity can be read as a continuation of a tradition in twentieth-century French philosophy that finds its point of germination in Beauvoir’s *The Second Sex*, although Beauvoir serves as an explicit interlocutor only in Butler’s earliest work. In tracing the genealogy of Butler’s reconceptualization of gender within and beyond its philosophical context, we will not ask what Butler’s concept of gender does, less still what it is. We will ask instead after the conditions of gender’s emergence and the possibilities of its subversion, psychically and socially, and suggest that a tension between legibility and possibility, between the structuring force of that which is given and the yet unseen horizon of the possible, motivates Butler’s engagement with the philosophical tradition in her articulation of gender performativity.

True to Haraway’s assessment, Beauvoir’s dictum also functions as a point of departure for Butler, particularly in the kinds of speculation it invites about choice and situatedness in relation to gender. Beauvoir is also a temporal starting-point for Butler’s work, in that Butler quickly leaves the existential and phenomenological paradigm in which Beauvoir writes in favor of more psychoanalytic terrain, although some have asserted that the importance of her earlier phenomenological and, in particular, existential engagements has been overlooked. Butler reads Beauvoir’s assertion as an invitation to use insights about the formation and acquisition of gender as a kind of critique, with the aim of social transformation

---

7. Butler’s account of performativity is discussed in some detail in the essay by José Medina in *The History of Continental Philosophy: Volume 7*.
and change. In her earlier work, Butler’s emphasis on gender as a doing rather than a being is a critique of ontology similar to Beauvoir’s: a counterargument against fixed, essential, or materialist understandings of sex and gender. Butler offers this critique of gender determinism as given alongside a critique of gender as a free choice, and this dual critical impulse – the desire to deny gender and sex as essential or inevitable while at the same time rejecting a conception of gender (or sex) as a project freely chosen by a willful subject – is a persistent refrain in Butler’s work and present in her earliest writings on the subject. These critical impulses are mobilized through her engagement with different philosophical figures, where Jean-Paul Sartre comes to stand in for the willful agent who would choose gender (“a ‘project’ in Sartrean terms”9) and Beauvoir’s “become” is read sometimes as echoing that Sartrean project and sometimes as challenging it. Butler’s conception of gender is a challenge to certain ideas that have long preoccupied philosophy: the possibility of universalizability; the metaphysics of substance; the relation between spirit and flesh. If the challenge that she poses to traditional conceptions of sex proceeds by arguing against a metaphysics of substance in thinking sex and gender, this challenge does not proceed through rejecting the language of philosophy or leaving its domain, but rather by reassembling its terms elsewhere. Butler offers Beauvoir as the progenitor of an “act” theory of gender, reading her formulation of woman’s becoming as establishing gender as a “stylized repetition of acts,” and the language of “acts” as Butler deploys it borrows from both speech act theory and phenomenology.10 Butler has recently defined gender as “a practice of improvisation within a scene of constraint,” and for Butler the question of gender involves two different kinds of inquiry.11 The first is a description of the limits of intelligibility that constitute the borders of gender, and attention to how that constitution designates some subjects as livable and marks others as abject. Butler emphasizes the mutually constituting nature of these different positions, where that which is unassimilable to the domain of proper gender must still persist as a necessary and structuring ideal, giving coherence and boundedness to the category that excludes it. Her discussions of gender melancholia, most fully explicated in *The Psychic Life of Power*, describe just this structure, whereby those homosexual attachments that must be repudiated in order for the subject to achieve normative sexuality (and also gender) remain alive and stubbornly held at the heart of heterosexuality. The proximity and persistence of these repudiated

identifications or objects do not persist despite the subject; they are rather what form the subject:

My sense is that it is always the case that the subject is produced through certain kinds of foreclosure – certain things become impossible for it; certain things become irrecoverable – and that this makes for the possibility of a temporarily coherent subject who can act. But I also want to say that its action can very often take up the foreclosure itself; it can renew the meaning and the effect of foreclosure. For instance, many people are inaugurated as subjects through the foreclosure of homosexuality; when homosexuality returns as a possibility, it returns precisely as the possibility of the unraveling of the subject itself: “I would not be I if I were a homosexual. I don’t know who I would be. I would be undone by that possibility. Therefore, I cannot come in close proximity to that which threatens to undo me fundamentally.” Miscegenation is another moment …

Now I think it’s possible sometimes to undergo an undoing, to submit to an undoing by virtue of what spectrally threatens the subject, in order to reinstate the subject on a new and different ground. What have I done? Well, I’ve taken the psychoanalytic notion of foreclosure, and I’ve made it specifically social. Also, instead of seeing that notion as a founding act, I see it as a temporally renewable structure, and as temporally renewable, subject to a logic of iteration, which produces the possibility of its alteration.¹²

This then is the first kind of inquiry that Butler follows regarding the nature and operation of the psychic and social norms that constitute us as sexed and gendered subjects. Butler is committed to keeping a number of tensions in play with this formulation, most significantly the tension between the seemingly fixed norms of sex and gender, which always come to us from elsewhere, and the ability to style one’s life in opposition to or to the side of those norms. This tension is inherent in her definition of gender, with its unresolvable pull between “improvisation” and “constraint.” That conceptual balance requires a methodological tension as well, a pairing of the psychic with the social, so that the weight of the symbolic determinism of the socially enforced norm might be met with the possibility of choosing otherwise that iterability affords. The result is an undoing at the level of the subject as well as the symbolic; it is not only the

subject that is undone in this instance, but also some of the rigidity of the structure of the Lacanian symbolic.13

The notion of the “otherwise” occupies the second kind of inquiry Butler pursues: an interrogation of that “we” who are constituted as sexed and gendered subjects and an asking after the conditions of life on the sexual margins. Butler is interested in expanding the domains of legibility for those who violate the norms of gender and sexuality, and doing so without appeal to a shared sense of identity. That expansion cannot be achieved by simply enumerating a list of gender configurations that might supplement male and female, since such a list would quickly become proscriptive or positivist. Butler wants to secure gender as an open site of as yet unarticulated possibility in order to resist the kind of foundationalism or ontological thralldom that would restrict the realm of the possible to its normative iterations. The task of recognizing gender as it is lived outside norms necessarily entails a holding open or a suspension of the position, thus supplanting a description of norms with what might be considered a speculative project in a Hegelian sense. Describing gender becomes a matter of describing the way that it is done and the way that it is undone, and if gender is a doing, that doing is accomplished in several different modes at once.

There have been attempts to divide Butler’s early work on gender from her later work in various ways: psychic versus political, normative versus ethical.14 It could be suggested that the first decade of her work has been concerned with doing, and the second with undoing, evidenced by her recent works *Undoing Gender* and *Giving an Account of Oneself*, in which she poses the question: what does it mean to become undone by another? One of the limitations of such pairings is that they reinstall just the sorts of binaries that Butler’s work seeks to undo. She uses Michel Foucault, for example, not only oppositionally to a Sartrean view of the relation between subject and world, but augmented with feminist theory at the same time as it is used in conjunction with more psychoanalytic or intrapsychic models. Butler asks that we attend to the constrictions and the violence wrought in the service of gender norms and the unequal distribution of that violence onto bodies depending on their markers of race, class, ethnicity, and ability, while at the same time insisting that we not misrecognize genders lived on the margins as necessarily marked by fatality. This paradox is central to Butler’s theory of gender: to recognize the power of norms, to understand that there is no way to live outside the grasp of that power, and yet to affirm

---

13. For a more detailed discussion of the symbolic, see the essay by Charles Shepherdson in The History of Continental Philosophy: Volume 5.
that such power can never be fully constituting, and that the future iterations of gender possibility cannot be mapped or predicted. We must both expand the bounds of what is recognized as a livable life, as fully human, yet must not understand legibility to be the sole precondition for a livable life. It is to this end that Butler has focused on undoing, in her most recent work on gender, using the term not in the sense of relinquishing or dismantling gender, but rather as a way to describe a more reflexive movement, a moment of vulnerability or openness that comes about in the face of my encounter with the other. If she is not quite calling for gender to be dismantled when she speaks of undoing, she is writing in favor of a partial dismantling of the conditions of its legibility, a disruption of its taken-for-granted signifying practices.

There are other paradoxes in the relation between sex and gender as Butler outlines them. Through an explanation of the ways in which girls are socialized into women, and her attention to the efforts and labors of becoming a woman, Beauvoir’s reconception of sex as a series of acts provides the ground for what is for Butler a still more trenchant question: how can an understanding of gender as a stylized repetition of acts, where those acts come to materialize as something called sex, help us resignify gender itself as something that might have a slant on or critical relationship with the norms of both sex and sexuality? Although she is often described as a theorist of gender rather than of sex, Butler has been consistently committed to frustrating the distinction between those two terms, from before Gender Trouble to her most recent work. In her 1987 essay “Variations on Sex and Gender,” she asks if Beauvoir’s insights about sex as chosen rather than given ought to make us conclude that “the very distinction between sex and gender is anachronistic.” That distinction between sex and gender had been parsed in various ways within the tradition of feminist philosophy. It at first seems that what Beauvoir calls “sex” maps rather neatly onto the meaning that “gender” will have a few decades later, particularly her description of sex as a “project.” Butler reads Beauvoir as eventually making the distinction between sex and gender in her description of the body as a “situation,” which effectively circumvents the possibility of understanding sex as either essential or a simple bodily attribute.

Butler has said that her decision to use the term gender rather than sex or sexual difference was influenced by Gayle Rubin’s use of the term in “The Traffic in Women.” Butler makes clear that gender is more than simply the contemporaneous name for sex, arguing that such a conflation has the effect

---

of denying decades of feminist scholarship challenging the presumptions of sex and the unequal relations of power that rely on those presumptions. That feminist scholarship has insisted that while differences of sex have historically masqueraded as natural, an understanding of gender difference necessitates attention to relations of power and the unequal distribution of its material effects. The use of “gender” as a deliberate replacement for sex has a political and historical importance that becomes erased if gender is understood merely as a stand-in for sex. In figuring gender as a form of address, Butler is making gender do something specific that sex had not. The feminist distinction between the two made a point similar to Beauvoir’s by insisting that women are such by virtue of social processes and cultural norms rather than a natural unfolding of a biological process that determines sex. In this frame, gender does its work by exposing both the conditions of possibility and the material effects of sex. Insisting on their conceptual distinctness secures the critical edge of gender, and helps denaturalize the binary of sex, whose “constitutive ambiguity” can be covered over or lost by a distinction that would understand gender as cultural and sex as natural, or gender as a behavioral role and sex as a material fact.17

However, that critical edge can also be dissipated to the extent that gender retains its conceptual distinctness, particularly its difference from sexuality. Butler has advanced both of these positions in “Against Proper Objects,” claiming that if we are to understand “gender” to mean something other than simply “sex” and avail ourselves of its potential to disrupt binary notions of sexual difference that are commonly understood to be inevitable – and inevitably dimorphic – then we must allow the category itself to become corrupted. The imbrication Butler asks us to attend to there is not an ambiguity between sex and gender, but rather the ambiguity between gender and sexuality, with the denotative slipperiness of the category of “sex” shuttling between them. This is a disciplinary as well as conceptual problem; studies of sexuality that struggle to emphasize the difference between the domains of gender and sexuality can end up advocating a lesbian and gay studies that cannot attend to the kind of gender diversity represented by, for example, transsexuality. Gender then loses its critical edge to the extent that it remains a “proper object” acting as a heteronym for sex. Importantly, though, this distinction between sex and gender is conceptual rather than material. It points to a political and discursive history rather than a bodily fact. In other areas of her work, Butler makes clear that sex and gender cannot be separated, even if they are not entirely reducible to one another. Indeed, her challenge to traditional ways of thinking gender lies precisely in her insistence that their distinctness at the level of the body is a

myth, that parsing gender as behavioral (social and immaterial) and sex as bodily (biological and material) is to misconstrue them both. Butler sees sex as only retroactively installed as the purportedly material cause of the effect of gender, and asks “whether sex was not gender all along.”18 At the level of the body, there is no significant distinction between sex and gender.

Butler’s theory of gender is also deeply engaged with other philosophical sources whose own legacies are not primarily concerned with gender, and the philosophical influences on her articulation of gender performativity are many. Although she occasionally engages analytic philosophy – her use of J. L. Austin’s concept of performativity is one example – most of her interlocutors are from the continental tradition, from the engagement with Hegel that characterizes all of her work to the theories of deconstruction and iteration popularized by Jacques Derrida. She also works with less canonically philosophical figures, making much use of the reconfiguration of the relation between inside and outside, the psychic and the social offered by Sigmund Freud, Jacques Lacan, and Jean Laplanche, and the question of power and its effects on bodies and subjects as articulated by Foucault. Butler often theorizes by using works that do not themselves address the question of gender as a philosophical problem. Foucault’s analyses of bodies and power, for instance, emphasize sexuality and have little to say about gender; Butler’s reworking of his insights about the productive capacities of power are used in the service of gender. And the theory of the materialization of sex offered in Bodies that Matter’s “The Lesbian Phallus and the Morphological Imaginary” uses Freud to articulate a queer morphological imaginary, but it is the Freud of The Ego and the Id discussing pain and narcissism to which she turns, rather than the Freud of sexual difference. The project of rethinking gender as articulated in Butler’s work is thus both deeply rooted in philosophical antecedents and heterodox in its approach to the question of gender.

These antecedents are clear in Butler’s use of language, since gender, as she demonstrates, is always a matter of language. This does not mean that gender is disembodied or nonmaterial, since the effects of discourses of gender are inevitably and emphatically embodied. Gender performativity takes part of its logic from Austin’s notion of the performatory utterance, in which language has a creative rather than a descriptive function. For Austin, a performatory utterance is one in which the speaker enacts that which he or she describes through that speaking. Butler enlarges the scope of the concept of performativity beyond the exclusively linguistic framing of Austin’s examples and also the explicitly contractual force of performative utterances, replacing Austin’s

contractual emphasis with a less defined and more expansive capacity: what she has referred to, using a phrase of Pierre Bourdieu’s, as the “social magic” of performativity. One does not vow gender, or ever articulate it fully or finally; this would be to misunderstand performativity as merely performance, the willed and staged acts of a choosing subject. Rather, gender is an embodied kind of belief. We speak and are spoken by gender at once, able to exert some control over its manifestation even as we are unable to choose the ways our acts signify, or who might receive them, or the conditions under which that performance is legible. Austin makes the distinction between felicitous and infelicitous conditions for a performative utterance, noting that certain conditions must be met in order for a performative to “succeed” and enact itself. So too for the performance of gender, in which the subject is constrained by categories that exceed her even as she may struggle to remake them in the shape of her own life. Butler suggests that gender is a constant navigation between these straits: one’s ability to choose, on the one hand, and the constriction of that from which one is able to choose on the other.

Butler’s challenge to binary categories, her disinclination toward intentionality, the careful attention to ambiguity in language that marks her close readings, and her adamance that there is no outside to the text, or the textual, would seem to mark her methods as deconstructionist. In one account, Butler offers Derrida’s reading of Franz Kafka’s “Before the Law” as the impetus for her theorization of gender performativity:

I originally took my clue on how to read the performativity of gender from Jacques Derrida’s reading of Kafka’s “Before the Law.” There the one who waits for the law, sits before the door of the law, attributes a certain force to the law for which one waits. The anticipation of an authoritative disclosure of meaning is the means by which that authority is attributed and installed: the anticipation conjures its object. I wondered whether we do not labor under a similar expectation concerning gender, that it operates as an interior essence that might be disclosed, an expectation that ends up producing the very phenomenon that it anticipates. In this first instance, the performativity of gender revolves around this metalepsis, the way in which the anticipation of a gendered essence produces that which it posits as outside itself. Secondly, performativity is not a singular act, but a repetition and a ritual which achieves its effects through its natural-

rethinking gender

ization in the context of a body, understood in part as a culturally sustained temporal duration.20

We can note the traversal of disciplinary boundaries at the very origin of Butler’s theory of gender, so that Butler’s rhetorical reading of a philosophical reading of a literary text gives rise to a theory of gender. Both philosophically grounded and disciplinarily itinerant, Butler moves between the literary, the philosophical and the rhetorical, less to establish multiple origins for her theory of gender than to unmoor all of them.21 Her account of performativity replaces a proper and singular origin with an iterative chain where each iteration is different from the last, and none of those iterations ought to be taken for a cause. Gender and language are both representational practices that work through self-referential citation; language, according to poststructuralist accounts, achieves its effects through its references to other language, rather than reference to the material world of nonlinguistic things that it purports to represent. Gender, too, achieves its effects through its approximation of certain impossible idealizations of dress, comportment, desire, and behavior, and its performances are citations of these idealized norms rather than the precipitate of a material origin called sex. Also marked here are the ways in which both gender and language are bound to, even driven by, a kind of inevitable failure: the impossibility of a full or final performance that would finally settle the question of gender, thus requiring the performance to be endlessly repeated.

In Kafka’s tale as retold by Derrida, the supplicant waiting before the law attributes an authority to the law, but the law’s authority does not precede the attribution. Butler suggests that gender, too, works by this same logic: gendered acts, behaviors, and even a felt sense of gender are mistakenly assumed to emanate from an internal essence called sex, but that essence is in fact produced retroactively, posited as the necessary cause for the acts that come before it. She has applied the same argument to sexuality as well, noting that heterosexuality, when it is understood to be the origin against which homosexuality mimetically fashions itself, is only retroactively installed as a response to the challenge of the putative copy, thus reversing the terms that would understand the origin as necessarily prior to the copy.22

At stake is the question of language and its relation to gender: the way language both describes and enacts gender. If Beauvoir offers a conception of

Volume 8
sex unmoored from the biological ground of the body and the necessity of determinism, Wittig offers a framework for understanding the discursive means by which this becoming occurs. For Wittig, as for Butler, sex happens through gender: Wittig understands that one becomes a woman through being captured by the linguistic sex that is gender. Language is thus the site and the mechanism for the reproduction and dissemination of sex. Butler’s and Wittig’s positions have many similarities on the question of the power of language, although they eventually part ways on the question of whether norms can be resisted, or only resignified. Can we offer resistance through language, or only by refraining from it? Is resignification possible? Butler does seem to suggest that Wittig has keenly understood something about the way that gender becomes materialized into sex: “if gender itself is naturalized through grammatical norms, as Monique Wittig has argued, then the alteration of gender at the most fundamental epistemic level will be conducted, in part, through contesting the grammar in which gender is given.”

Butler’s position on Wittig is not singular; in her later thought, she takes some distance from Wittig’s stance on the bodily and conceptual violence engendered by language and naming. Wittig’s response to the power and coercive violence of naming (a response that itself changes over the course of her own writing) is to refuse to name, to insist that a disidentification with the terms “man” or “woman,” and a resistance to the terms “boy” or “girl,” necessitates a refusal to use those terms either as markers of identity or even as tools of description. For, according to Wittig, these terms are always enactors rather than just descriptors.

If the lesbian is not a woman, nor for Wittig can she exactly be masculine: she is that which is and must remain oppositional to both of those categories. For Wittig, the lesbian is “beyond the categories of sex” because woman is a concept that draws its meaning exclusively from its relation to man, whether “economically, or politically, or ideologically.” That relation is servitude, and to the extent that the lesbian embodies and lives a refusal of men, she exists outside this servitude and therefore outside the system of gender altogether. Wittig’s fierce oppositionality is articulated systemically at the level of class, in that the lesbian is described as an “escapee” from women as a class, and the goal of this escape is nothing less than the destruction of heterosexuality as a governing system.

The Butler of Gender Trouble has much in common with Wittig (or at least the early Wittig) on the question of naming, and Butler considers Wittig distinctive among the French feminists for her trenchant critiques of heterosexism and its linguistic dissemination. But in her later work Butler is reluctant to affirm the

23. Butler, Gender Trouble, xix.
possibility of a safer space outside of the violent power of language that Wittig appears to demand. In recasting the terms of language and in her project of focusing on the iterability of gender rather than the grammar of gender, Butler is in effect refusing to refuse to name. In describing her position on questioning presuppositions through careful deployment of language and the limits of what that deployment can achieve, Butler describes the change in her ideas on language and intentionality. She writes:

The qualification I would like to add now, seven years later [after the publication of *Bodies That Matter*], is that although one can very often take a term like “masculine” and dislodge it from its metaphysical moorings – one can say, for example, that “masculine” does not necessarily apply exclusively to ostensibly anatomically male bodies and that it can function in another way, like, let’s say, in the way that Judith Halberstam talks about “female masculinities” – it is important to question what of the prior context is brought forward as a kind of residue or trace. It is also important to question what new ontological effects the term can achieve, because to liberate it from its prior moorings in an established ontology is not to say that it will not acquire a new one.

Spivak understood this when she reneged on her notion of “strategic essentialism.” She at first thought she’d be able to use a term like “Third-World woman” and just have it be strategic rather than metaphysically grounded. It didn’t have to describe her (or anyone else) fully or exhaustively; it could be relieved of its descriptive function. But, of course, it does begin to describe, because the author who strategically intends it as “X, Y, or Z” has also to recognize that the semantic life of the term will exceed the intention of the strategist and that as it travels through discourse, it can take on new ontological meanings and become established in ways that one never intended. So, I guess I would be a little less optimistic about the possibility of a radical unmooring than I was in 1993.26

Butler’s conception of gender shares much with Wittig’s, perhaps surprisingly, on the question of materiality. She has been taken to task for failing to attend to materiality, perhaps because what finally interests her most are the ways in which our bodies come to be through discourse, where that discourse is not always easy to disentangle from the body that it engenders. Gender and gesture become indistinguishable. For Butler and Wittig alike, there is an immensely

generative power in language, a power that, in true performative fashion, brings about that which it names. But Wittig understands both gender and sex – as concepts, as categories, as linguistic practices – to be damaging for women, so to utilize the terms is to perpetuate the hierarchical division with inevitably dangerous consequences. Indeed, the theory behind Wittig’s refusal to name can be understood as a kind of performativity, where the term “woman” works like a sovereign performative, materializing itself into reality through its incantation, its enaction in language.

For Wittig, sex and gender are distinct and distinguishable. Gender happens in language and sex is bodily. Yet they can each produce the other, and gender is complicit in the dissemination and perpetuation of distinct sex. But this does not mean that sex is simply bodily and gender is discursive and by contrast immaterial. Wittig describes gender as the enforcement of the law of sex through language, where the effects of that enforcement are bodily effects, and not merely linguistic ones. She writes, in a phrase that Butler cites: “Language casts sheaves of reality around the social body, stamping it and violently shaping it.” This is not merely an alignment of culture against nature, flesh against the word. This body is not blank and unsignifying before submitting to the violent shaping of language; it is a “social body” from the start. When describing the origins of this phrase, Wittig explains that she had acting specifically in mind, once again making the act – an event that is bodily, that is temporal, but gestural rather than material – central to the relation of thinking gender.27

Wittig insists on a certain kind of categorical purity, rejecting the term “woman” for its ideological complicity with heterosexism. Refusing the conventional way that language is given, she uses the powers of neologism and refusal to recraft the categories of sex through deployment or withdrawal of grammatical gender. This same chiasmic relation to the categorical and attention to the conditions both of its constitution and its contamination can be seen in Butler’s articulation of gender. For Wittig, the solution to heterosexism lies in creating new language, as in the experimental grammatical and pronominal structures of her novels L’Opoponax and Les Guérillères, or utterly refusing the common parlances through which gender is given, as she does when she calls for abandoning, and ultimately destroying, the term “woman.” Gender as a grammatical problem gains its solution through abdication. Butler proceeds by different means, taking her distance from Wittig on the issue of conceptual purity within gender, and the question of contamination within language. For Butler, as for Derrida, there is no outside position from which we might utterly refuse the terms of language. She has described Gender Trouble as a text whose genealogy is philosophical, feminist, and political, and whose aim is the subversion of the

category of sex precisely through use of the term, rather than through its refusal. Critical subversion for Butler necessitates the use of the contested term or structure in order to change it, rather than a radical or revolutionary break with that term or structure.

It is in dealing with subversion and otherness that Butler’s Hegelian legacy is most profoundly manifest, both conceptually and rhetorically. Hegel appears in Butler’s work as a way to reckon with radical alterity and subjectivity. It has been suggested that Hegel’s greatest importance for Butler’s theorization of gender is seen in her reading of Hegel’s Antigone in Antigone’s Claim, because the figure of Antigone is, for Butler as well as for other feminists, “the crucial point of encounter between feminists and Hegel.”28 Useful as the protofeminist Antigone is for Butler’s discussions of gender, kinship, and the state, other aspects of Hegel’s philosophy are still more influential for her thought. Hegel’s influence can explicitly be found in her discussions of his account of the relation between the lord and the bondsman of Phenomenology of Spirit,29 but his legacy is also apparent in the ways Butler understands recognition and desire to constitute subjects, or her insistence that the subject is never self-identical, and this in social, psychic, and relational terms. A less attended to but perhaps still more pervasive Hegelian influence is rhetorical. Butler has this to say on the issue of linguistic difficulty and the work of speculative grammar in Hegel:

For instance, when Hegel talks about the “speculative sentence,” he is trying to work against the propositional form as it’s been received. When he says, “The subject is spirit,” the first inclination, the one that received grammar in some sense prepares us for, is to establish the subject as the subject of the sentence, and then “spirit” becomes one way of determining or qualifying that subject. But, of course, what he wants us to be able to do is to reverse that sentence, to recognize something about how the “is” functions: it doesn’t just point linearly in one direction; rather it points in both directions at once. He wants us to be able to experience the simultaneity of that sentence as it functions in its double directionality. Now that’s a very hard thing to do given how profoundly inclined we are by what Nietzsche called the “seductions of grammar” to read in a linear way.30

*29. See, in this regard, the essay by Terry Pinkard in The History of Continental Philosophy: Volume 1.
Butler’s reading bears some similarity to her reading of Nietzsche’s assertion that there is no “doer behind the deed”31 when explaining that there is no pregendered subject who performs individual acts of gender and thus collects the attribute of gender to add to an already established personhood, but rather the subject becomes a subject only through those acts. Hegel enacts this unexpected reversal at the level of the sentence, so that the very grammar is made to enact its concept, a different iteration of performative language. The relation between subject and object, cause and effect, becomes, in Butler’s terms, doubly directional. The task she enjoins us to when thinking about gender is to become keen readers of what kinds of gendered possibilities language prepares us for, the normative constraints on what is possible that are wrought by our habitual practices of language. She also demonstrates how we might learn to read in excess of this preparation.

For Butler, language in this speculative mode, with all of its difficulty, can be a way of helping us think otherwise. The speculative mode, a kind of conceptual unfolding enacted through a confounding of the propositional form, is what Butler invites us to enter when thinking about gender. Thinking gender otherwise means attending to transsexuality, transgender, intersexuality, and as-yet-unarticulated others: what Butler calls the “otherwise gendered.”32 It is vital to note that this expansion of possibility is not quite the same as radical invention, and thinking about gender in a speculative mode does not mean musing about gender in an entirely fictive or futural way, or dreaming up wholly new genders, although this might have its own pleasures. It is rather about making those lives currently lived on the perimeters of gender and sexual legibility more recognizable and thus more livable. Expanding the horizon of possibility of gender is the task that Butler enjoins us to in both Gender Trouble and Undoing Gender. The last paragraph of Gender Trouble concludes: “The task here is not to celebrate each and every new possibility qua possibility, but to redescribe those possibilities that already exist, but which exist within cultural domains designated as culturally unintelligible and impossible.”33 The linguistic work of redescription is undertaken in order that we might apprehend the world more clearly as it is, an effort that sounds unmistakably phenomenological in its method. The task is undertaken, though, not just so the world might be seen with greater clarity, but also so that it might be changed. The seemingly esoteric mode of speculative grammar thus marries with the ethical imperative to articulate a future of open possibility, in order to increase the livability of those “otherwise gendered” subjects whose lives are most precarious:

32. Butler, Undoing Gender, 28.
33. Ibid., 148–9.
How do drag, butch, femme, transgender, transsexual persons enter into the political field? They make us not only question what is real, and what “must” be, but they also show us how the norms that govern contemporary notions of reality can be questioned and how new modes of reality can become instituted. ... Some people have asked me what is the use of increasing possibilities for gender. I tend to answer: Possibility is not a luxury; it is as crucial as bread. I think we should not underestimate what the thought of the possible does for those for whom the very issue of survival is most urgent.34

RECENT DEVELOPMENTS IN AESTHETICS: 
BADIOU, RANCIÈRE, AND THEIR 
INTERLOCUTORS
Gabriel Rockhill

The following examination of the most recent developments in French aesthetics requires two preliminary remarks. First, the framework of analysis will be largely philosophic in nature, meaning that it will focus on the work of two major thinkers who have provided novel accounts of aesthetics: Alain Badiou and Jacques Rancière. Unfortunately, this means leaving aside extremely significant developments in the work of lesser-known thinkers such as Yves Michaud and Christian Ruby, art historians such as Georges Didi-Huberman, sociologists of the likes of Nathalie Heinich and Eric Macé, literary critics such as Antoine Compagnon, and film theorists such as Raymond Bellour. Second, it is important to note that what is sometimes perceived by the English-speaking world as a significant generational gap between “recent developments” in the French intellectual avant-garde (the work of Badiou and Rancière) and the writings of their predecessors is partially an effect of parallax in transatlantic visibility. Indeed, it is true that Badiou (1937– ) and Rancière (1940– ) were the junior faculty members at the University of Paris VIII–Vincennes-St. Denis and were largely in the shadow of the founder of the philosophy department, Michel Foucault (1926–84), and prestigious faculty members such as Jean-François

1. Jacques Rancière (1940– ; born in Algiers) was a student at the École Normale Supérieure in the early 1960s. He began teaching at the University of Paris VIII–Vincennes-St. Denis in 1969, and occupied the Chair of Aesthetics and Politics from 1990 until his retirement in 2000. He was an active participant in the journal Révoltes logiques from 1975 to 1986, and he was a Director of Programs at the Collège International de Philosophie from 1986 to 1992. For biographical information on Alain Badiou, see the essay by Bruno Bosteels in this volume.
Lyotard (1924–98) and Gilles Deleuze (1925–95). However, they are not far in age from Jacques Derrida (1930–2004) and are of the same generation as Jean-Luc Nancy (1940– ), Philippe Lacoue-Labarthe (1940–2007), and Etienne Balibar (1942– ). The massive importation of “poststructuralist theory” into the anglophone world, often at the expense of other intellectual developments, has created the unfortunate illusion that nothing else of great importance has been going on in France since the 1960s.

I. ALAIN BADIOU

Unlike many of his French compatriots, Badiou is a self-proclaimed systematic thinker. Although his position on aesthetics has developed since his early writings, I will focus on the more detailed description and systematized account of art he has provided since Being and Event (1988) and particularly Manifesto for Philosophy (1989). In these works, art, and more precisely “the poem,” is identified as one of the four truth procedures that – along with science, politics, and love – constitute the conditions of philosophy. Truth procedures are not, according to Badiou, founded on the encyclopedic accumulation of knowledge. Properly speaking, knowledge (le savoir) exists when correct statements are made about a given state of affairs, and nothing occurs that is not in conformity with the rules that regulate this state of affairs. Knowledge can therefore allow us to make veridical (véridique) statements through a process of discernment and classification, but it cannot attain truth (la vérité), which means that knowledge is fundamentally about “situations.” Truth for Badiou is a “post-evental” process dependent on a pure event that supplements the situation, an event that can neither be named nor represented by the resources available in the situation. As a process or procedure, truth introduces an immanent break by tracking the effects of the supplementary event within the situation itself.

Badiou’s examples of events include the following: the various instances of what he calls “modern poetry,” Galileo’s scientific revolution, the French Revolution, and Plato’s theorization of love in the Symposium. For each of these events, the same basic process occurs: an undecidable event arises at the edge of the situation; a subject proclaims its existence and decides to relate to the situation from the point of view of the supplemental event; the truth procedure undertaken by the subject attempts to reconfigure the situation in relation to the

3. For reasons of space, the current analysis focuses on Badiou’s theoretical, as opposed to literary, writings.
truth of the event, which requires resisting the doxa or “knowledge of the situation" in the name of the evental truth of the Idea.\(^4\) This means that, at least at one level, Badiou has an interventionist, process-oriented conception of truth: “There is only authentic truth under the condition that we can choose truth.”\(^5\)

If truth is an evental hole in our situational knowledge produced via poetry, science, politics, or love, what, then, is philosophy? First of all, Badiou rejects what he takes great pleasure in castigating as modern sophism and historicist philosophizing. Against the modern sophists, which include the vast majority of his French predecessors, he maintains that there is indeed a definition of philosophy that is a historical invariant (since its inception in ancient Greece). “Philosophy,” he writes, “is a construction of thought in which it is proclaimed, against the art of the sophists, that there are truths.”\(^6\) It is important to add, however, that philosophy is not itself a truth procedure, which means that it does not produce truths. The role of philosophy is to track down and stake out truth procedures in order to group them together in a unified conceptual space. It provides a systematic framework – a “shelter” – for the protection of artistic, scientific, political, and amorous truths. There is, moreover, always the danger of suturing philosophy to one of these truths and putting at risk its role as the neutral guardian of truth procedures. According to Badiou, this has been the case in recent history: philosophy was sutured to science under the reign of positivism; it was sutured to politics in Marxism; and it has been sutured to poetry since the time of Nietzsche.\(^7\) For the philosophic renaissance advocated by Badiou to be successful, philosophy has to be de-sutured from the four truth procedures.

In relation to his immediate predecessors in France, Badiou’s most notable difference is his stalwart emphasis on Platonism. In the realm of aesthetics, this

---

4. For the sake of concision, I am primarily drawing on Badiou's more schematic account of events in books such as Manifesto for Philosophy and Ethics. For a more detailed account, which introduces the important distinction between the “situation” and the “state of the situation” (as well as between presentation and representation, count-as-one and the count of the count, structure and metastructure, etc.), see Being and Event, Oliver Feltham (trans.) (London: Continuum, 2005).

5. Alain Badiou, Petit manuel d’inesthétique (Paris: Éditions du Seuil, 1998), 86; all translations of French works are my own. See also Handbook of Inaesthetics, Alberto Toscano (trans.) (Stanford, CA: Stanford University Press, 2004), 54. Badiou rejects, however, what he calls “speculative leftism,” which imagines that interventions are founded solely on their own iconoclastic desire for new beginnings instead of being temporally inscribed in the circulation of events that have already been decided on. Strictly speaking, it is the event that founds the possibility of an intervention even though it is only through an intervention that an event “exists” by circulating in the situation.

means that art for him does indeed have an essence that is a historical invariant: it is a singular thought process of Ideas that traces the ephemeral event in the real. This is illustrated by the art form that Badiou openly identifies, in rather Heideggerian fashion, with the very essence of art: the poem. At its core, a poem is an act of naming, for all time, an undecidable evental presence at the limit of the situation. Moreover, as an act of naming the disappearance of that which is presented, “every poem is an interruption of language, conceived as a simple tool of communication.” In short, a poem is a nominal trace of the event in the sensible that displaces the parameters of the given aesthetic situation. This is precisely what distinguishes true art from false art: the former introduces an immanent break by bringing Ideas into the situation, while the latter simply capitalizes on possibilities already inventoried within the situation. Art is only true art, and truly acts on an event, if it is an event of thought.

---

8. It is, of course, open to debate whether this is Plato’s own view of art or, more precisely, poiēsis.
9. The influence of Heidegger is readily visible in Badiou’s work on aesthetics. However, it would be a mistake to hastily identify their positions without being attentive to the points on which they diverge. Although a detailed comparison of their work goes well beyond the framework of the current analysis, it is nonetheless possible to highlight a series of similarities and differences. Regarding the points of convergence, both Heidegger and Badiou agree that: (i) art has an essence; (ii) the essence of art is the becoming or occurrence of truth; (iii) art can be distinguished from non-art based on its relation – or lack thereof – to truth; (iv) great art, which is the only true art, is clearly distinguishable from entertainment and other forms of non-art; and (v) poetry constitutes the very essence of art. Among their points of divergence, the following list can serve as a starting-point: (i) art is only one truth procedure among four according to Badiou, whereas it becomes one of the central, privileged avenues for truth in Heidegger; (ii) truth is defined as an evental hole in the situation for Badiou, while it is understood as alētheia or unconcealedness by Heidegger; and (iii) Badiou explicitly rejects Heidegger as a romantic and accuses him of suturing philosophy to poetry. At a more general level, one of the clear dividing lines between Badiou and Heidegger is their interpretation and evaluation of Platonism. Badiou repudiates what he labels Heidegger’s “poetic ontology” and the latter’s critique of the Platonic retreat from poetic alētheia due to his interpretation of Being as idea. Against Heidegger’s conception of the history of metaphysics, Badiou valorizes Platonism as an essential part of the originary moment of philosophy insofar as it participates in the birth of “mathematical ontology.”
11. Badiou spurns the “Christly [christique]” vision of truth inherent in the idea that the work of art is both a truth and an event (Badiou, Petit manuel d’inesthétique, 24; Handbook of Inaesthetics, 11). However, he nonetheless states: “Since the poem is an operation, it is also an event” (Petit manuel d’inesthétique, 51; Handbook of Inaesthetics, 29).
12. Badiou appears to be remarkably close to Deleuze on this point and, in particular, to the position outlined in his two-volume analysis of film. Among his numerous objectives, Deleuze wanted to demonstrate that the great film directors had thought with images in much the same way as great thinkers (see Cinéma I: L’Image-mouvement [Paris: Éditions de Minuit, 1983], 7; Cinema I: The Movement-Image, Hugh Tomlinson and Barbara Habberjam [trans.] [Minneapolis, MN: University of Minnesota Press, 1986], xiv). This explains, moreover, the centrality of Henri Bergson in his analysis, whose philosophical thinking on movement and
It is important to highlight in this regard that Badiou rigorously maintains the “principle of genericity,”\textsuperscript{13} which he inherited in part from Sartre’s \textit{What Is Literature?}, and ultimately from Aristotle’s \textit{Poetics}. The opening sentence of the latter work clearly announces the first two axioms of this principle. Aristotle proposes to discuss: “both poetic art in itself and its forms [\(peri\ poie\text{tik}\text{e}\ aut\text{e}s\ te\ kai\ ton\ eido\text{n}\ aut\text{e}s]\).” This means that: (i) art – more specifically \(poie\text{tik}\text{e}\) – exists as a distinct entity in and of itself; and (ii) art or \(poie\text{tik}\text{e}\) is naturally divided into a set of distinct forms or genres. A third axiom is added later that, in the case of Badiou, has been only partially systematized: (iii) the forms or genres of art are arranged according to a natural hierarchy. As we have seen, the essence of art in general is defined by Badiou as “a thought whose works are the real.”\textsuperscript{14} He believes, moreover, in the universality of great works of art, which in striving toward the infinite bear eternal witness to the existence of events.\textsuperscript{15} Regarding the delimitation of the arts, Badiou states that “there is in reality no way to move from one art to another. The arts are closed. No painting will ever change into music, no dance into a poem.”\textsuperscript{16} We have already seen, concerning the hierarchical organization of the arts, that the poem is the acme of art because it names the undecidable event in a language that extracts itself from the standard situation of language. Dance, to take an example from the opposite end of the spectrum, is not even properly speaking an art. Since it lacks words, and therefore the possibility of naming the event, it is only “the sign of the possibility of art, such as it is inscribed in the body.”\textsuperscript{17} Theater, while not occupying the imperial place

\textsuperscript{13} Although I am borrowing this expression from Rancière, I am not using it in the exact same sense that he does in \textit{La Parole muette}.\textsuperscript{13}

\textsuperscript{15} See Badiou, \textit{Petit manuel d’inesthétique}, 75; \textit{Handbook of Inaesthetics}, 46. A similar idea is developed in “Fifteen Theses on Contemporary Art”: “Art is not the sublime descent of the infinite into the finite abjection of the body and sexuality. It is the production of an infinite subjective series through the finite means of a material subtraction” (103–4).

\textsuperscript{16} Badiou, \textit{Petit manuel d’inesthétique}, 127; \textit{Handbook of Inaesthetics}, 82.

\textsuperscript{17} Badiou, \textit{Petit manuel d’inesthétique}, 109 (see also 97, 107); \textit{Handbook of Inaesthetics}, 69 (see also 61, 67–8). Seven years later, in \textit{Le Siècle} (Paris: Éditions du Seuil, 2005), Badiou writes that dance is, since the Russian ballets of Isadora Duncan, “a major art [\textit{un art capital}]” (224; \textit{The Century}, Alberto Toscano [trans.] [Cambridge: Polity, 2007], 159). As with the example in note 11 of the relationship between Badiou’s stance on truth and his critical comment regarding the Christly vision of truth, it is unclear whether this is an oversight on his part, a
of the poem, is nonetheless the positive obverse of dance: it is the arrangement of a near physical presentation of an Idea, which does have recourse to words. To return to the lower end of the spectrum, film is classified as the lowest art form because it is “an impure art.”\(^{18}\) Whereas painting is the art of donation that provides an integral presentation of the Idea, and music invents the pure time of the Idea by exploring the configurations of the movement of the thinkable, film combines allusions to the more mimetic arts and can only serve, at best, as an art of visitation where Ideas pass by but are never fully embodied.\(^{19}\) For film to properly act as an art, it therefore appears to have only one path open to it: it has to show that it is only film and that “its images only bear witness to the real insofar as they are manifestly images.”\(^{20}\) The principle regulating the hierarchy of the arts is the Platonic principle of the proximity to the Idea. The poem is closest to the Idea and therefore comes first, followed apparently by theater (Badiou has yet to systematize these relations). Painting and music seem to be the median arts, whereas film is clearly the lowest and dance is excluded (the precise position of some of the other arts remains unclear). The delimitation of the arts is not strictly speaking based on their media or empirical characteristics but on the very being of each individual art. This is why Badiou delimits his claims regarding the principles of dance in the following way (a delimitation that could be generalized to all art forms): “Not [the principles] of dance thought out of itself, its technique and its history, but dance such as philosophy receives and protects it.”\(^{21}\) Ultimately, just as the distinction between art and non-art is founded on the existence or nonexistence of thought, the arts are themselves delimited philosophically according to an aesthetic ontology, and they are placed in a hierarchy based on their proximity to the Idea.\(^{22}\)

contradiction in his work, an element easily clarified within his system or, in this particular case, the sign of an evolution in his thinking.

20. Alain Badiou, “Dialectiques de la fable,” in Alain Badiou et al., Matrix: Machine philosophique (Paris: Ellipses, 2003), 120. While it is true that all art forms, according to Badiou, have their own limit where they alienate themselves from “true art,” it is clear that film is the lowest of the arts because it runs the greatest risks, especially when compared, for instance, to the risks of literature: “Film, that great impurifier, always runs the risk of pleasing too much, of being a figure of debasement. True literature, which is rigorous purification, runs the risk of getting lost in a proximity to the concept in which the effect of art is exhausted itself and prose (or poetry) is sutured to philosophy” (Petit manuel d’inesthétique, 135; Handbook of Inaesthetics, 88).
21. Badiou, Petit manuel d’inesthétique, 99; Handbook of Inaesthetics, 62–3. In another statement that could be generalized for all of the arts, Badiou asserts, regarding film, that formal elements must be invoked only to the extent that they contribute to the passing of the Idea (Petit manuel d’inesthétique, 131; Handbook of Inaesthetics, 85).
22. Strictly speaking, Badiou claims that his delimitation of the arts is not based on genres but on “configurations.” A configuration is an identifiable sequence that produces a truth for a
In the opening essay of his major work on aesthetics to date, *Handbook of Inaesthetics* (1998), Badiou provides an account of the relationship between his own project and what he sees as the three preexisting schemas for thinking the connection between art and philosophy. According to the *didactic schema*, to begin with, “art is incapable of truth, ... all truth is exterior to it.” As “the charm of a semblance of truth,” art must, therefore, either be condemned or used in a purely instrumental fashion. The *romantic schema* takes the opposite approach by asserting that art alone is capable of truth. Finally, the *classical schema* follows the didacticians in maintaining that art is incapable of truth, but it redefines the essence of art as mimetic. Art’s distance from truth is thereby no longer worrisome precisely because its destination is not truth. On the contrary, art qua mimetic semblance has a therapeutic function, and the rules of art are to be deduced from this function. When Badiou inquires into recent developments in the arts and art theory, he concludes that the twentieth century has not introduced any new schemas. Identifying the three major dispositions of twentieth-century thought as Marxism, psychoanalysis, and hermeneutics, he asserts that: “Marxism is didactic, psychoanalysis is classical, and Heideggerian hermeneutics is romantic.” The avant-garde movements (from Dadaism to the Situationists) only added a mediating schema, the *didactico-romantic schema*. It is against the backdrop of this account that Badiou proposes a new, fourth, schema for thinking the relationship between art and philosophy. What is lacking in all prior work, according to him, is a way of thinking art’s relation to truth as being both immanent and singular: truth is immanent in art and art is a singular form of truth irreducible to other such forms. It is this very simultaneity that Badiou wants to defend in claiming that art is in and of itself a singular truth procedure. He baptizes this new schema “inaesthetics.”

Badiou has developed his account of contemporary art in *The Century* (2005). Throughout this book, artwork from the twentieth century is marshaled to bear witness to the subjective nature of the century, which Badiou defines as the “passion for the real [passion du réel].” The works cited are not used, particular art, and it is philosophy’s role to outline such configurations. As examples, Badiou cites “Greek tragedy,” “classical music,” and “the novel” (*Petit manuel d’inesthétique*, 26-7; *Handbook of Inaesthetics*, 13). His rejection of the term “genre” for these art forms is an additional indication that the delimitation of the arts is of a deeply philosophic nature.

26. “Fifteen Theses on Contemporary Art” is an equally good example that focuses on art in the era of “globalization.”
27. In addition to the criticisms of Badiou’s work that will be highlighted in the conclusion, it is worth noting that his personification of “the century” is rife with historiographical problems, including those poignantly described by Henri Focillon: “We have trouble not conceiving a
properly speaking, as historical documents, but rather as forms of testimony (témoignage) that attest to the subjective commitments of the century. Badiou thus remains faithful to the idea that art thinks in and of itself, and he is primarily interested in how the century has thought itself through art and the three other truth procedures. His central claim is that all four truth procedures became impassioned with the real in the twentieth century. They attempted to bring the Idea – qua real – into reality by radical acts of foundation aimed at new beginnings, which were disjunctively synthesized with acts of destruction. The entire century, he argues, was structured by nondialectical battles, which manifested themselves in the art world through the constant avant-garde struggles to overcome preexistent, classical forms in the name of an Idea. At the very end of the book, Badiou gives “less esoteric” names to the war of the century, which the reader will easily recognize as a battle between Badiou’s major philosophic concepts: the Idea and reality; the event and the situational state of affairs; truth and opinions; and so on.28

It is therefore not difficult to reconcile Badiou’s references to historical developments with his more systematic, ahistorical work on aesthetics: even though circumstances might change with time, the very essence of art nevertheless remains the same.29 This central idea is perhaps best illustrated in the preface to Logiques des mondes (2006), where Badiou claims that in spite of all of the circumstantial differences separating Picasso from the creators of the cave paintings at Chauvet-Pont-d’Arc, their respective renderings of horses nonetheless attest to the same fundamental truth: the eternal Idea of a horse. The multiplicity of worlds does not preclude, according to Badiou, the existence of universal truths.

II. JACQUES RANCIÈRE

While it is true that Rancière’s early work on politics and history shows signs of a longstanding interest in aesthetics, it is primarily since the 1990s that he has

---

presented what has become a general account of the arts. Unlike Badiou, who has written relatively few books dedicated exclusively to art, Rancière’s publication record over the past twenty years constitutes a veritable tour de force in the field of aesthetics. It might be said that whereas Badiou is more interested in establishing a totalizing philosophic system in which aesthetics plays a significant role, Rancière has dedicated his intellectual energies to making a singular intervention in the field of aesthetics, in much the same way as he has done in the fields of history and politics. He obviously does not share Badiou’s penchant for grand theories, and his philosophic strategies owe more to guerrilla warfare than to epic frontal offensives à la Badiou.

This difference in scope and strategy is at least one of the reasons that the Badiou–Rancière debate has largely been a dialogue de sourds, that is to say, an exchange in which they talk past one another. In spite of running in the same intellectual circles, they have had little or no public debate on the two common areas of interest that seem to provide natural points of discussion: aesthetics and politics. On the one hand, Badiou’s major essays on Rancière all deal with the question of politics (with only a few passing comments on aesthetics), and the latter has not provided a developed response to Badiou’s account of their fundamental dissensus in this area. On the other hand, Rancière’s articles on Badiou are all dedicated to the question of aesthetics, and his former colleague has yet to reply to Rancière’s detailed criticisms of his faulty methods and interpretations.

In one of the rare passages where Badiou explicitly engages with Rancière’s aesthetics, he tries to situate him within what he calls the “subjectivity of the century” by suggesting that some of his work is a “sophisticated echo” of what he sees as the Tel Quel thesis, that is, that the formal mutations of art are more political than politics itself. Whether or not one agrees with the orientation Rancière has taken in his recent writings, it is important to avoid restricting

his work – as Badiou appears to be doing in this passage – to the opposition in postwar France between content-based commitment and formal commitment. Successful or unsuccessful, Rancière clearly wants to take a decisive step in aesthetics by breaking with both the Sartrean notion of prosaic commitment and the Tel Quel claims regarding the political potential of aesthetic form. To take but two representative publications, it might be said that what Rancière wants to reject is the simplistic choice between following Sartre’s work in What Is Literature? (1948) and Barthes’s formalist reworking of Sartre’s thesis in Writing Degree Zero (1953). Rather than looking for the political dimension of art in the content of prose or in the third dimension of form (what Barthes calls l’écriture, distinct from both la langue and le style), Rancière wants to shift the conceptual tectonic plates on which this opposition is based. The very notion of “politicized art” presupposes that art and politics are distinct entities that can be joined, either by prosaic content (Sartre) or through writing as a social function (Barthes). However, it is precisely this presupposition that Rancière wants to reject. Art and politics, he claims, are in fact consanguineous insofar as they are both distributions of the sensible (partages du sensible), that is, ways of organizing the field of sensory experience by determining what is visible and audible, as well as what can be said, thought, made, or done. As a distribution of the sensible, art is inherently political precisely insofar as it presents a common world of experience (replete with a set of shared objects and recognized subjects), which distinguishes what is possible from what is impossible.

Rather than the Tel Quel group, the most obvious predecessor to Rancière’s work is Foucault. Although Foucault was occasionally close to the Tel Quel group, his understanding of literature in his early writings goes beyond the framework of formal commitment. Literature was seen as a unique discourse born with the emergence of the modern epistēmē and the appearance of the human sciences around the end of the eighteenth century. In negating the existence of man and resisting the instrumentalization of language, it was properly speaking a “counter-discourse” aimed at bringing language back to its brute being, which had been buried since the Renaissance. The historical appearance of literature is thus structurally equivalent to the return of the repressed at the end of the classical age: the brute being of nonrepresentational language in its open relationship with madness (and after the “death of God”). All said and done, literature “compensates” European culture for its repression of madness by abandoning the strict Cartesian delimitation between reason and unreason, thereby allowing language to escape from the imperial mastery of the rational human subject.34

34. Literature also acts as the rabbit hole that allows Foucault to go through the looking glass of the modern epistēmē, as is evident most notably in the role played by Borges in the preface to The Order of Things.
Although Rancière does not share Foucault’s preoccupation with madness and collective repression, the latter’s historical approach to literature is essential to Rancière’s project: “The genealogy of the concept of literature that I have attempted in La Parole muette [Silent speech], or in my current work on the systems of art, could be expressed in terms close to Foucault’s concept of episteme.” Like Foucault, Rancière takes art to be a historically constituted practice that is always situated within a framework of possibility. This framework, which Rancière calls a regime instead of an epistêmê, has undergone significant transformations through the course of history. These changes vaguely follow the historical delimitation outlined by Foucault in his early work between the classical age and the modern age. However, Rancière’s regimes differ from Foucault’s epistêmès in a few important ways. First, regimes are not mutually exclusive chronological blocks. Unlike epistêmès, the chronology of regimes conforms to Augustine’s description of the temporality of human souls in The City of God: although they are created in time, they will never perish in time. The ethical regime of images, which was born in ancient Greece, and the representative regime of arts, which dominated the classical age, both persist in the modern age, that is to say, the age that has been marked by the emergence of the third major regime: the aesthetic regime of art. Rancière thereby rejects the idea that structural blocks hegemonically dominate a given epoch until being cataclysmically replaced, through a discontinuous event, by another structural block. Although Foucault’s position was more nuanced than this since he did allow for the possibility of a “counter-discourse” such as literature, it is nonetheless clear that, for Rancière, the “modern” era is characterized by conflicting regimes and that there are no tragic events separating historical epochs. To borrow from one of André Robinet’s criticisms of Foucault, which perfectly applies to Rancière’s reworking of Foucaultian epistêmès, the conflict is not between time periods but within them.

These differences in historical methodology lead to a divergence in hermeneutic practice. At least in his early work, Foucault tended to interpret individual works of art as signs of their times that reveal structural conditions of

---

possibility. Rancière is more interested in showing how individual works of art make choices within and between conflicting regimes by actualizing certain potentialities and ignoring others. Works of art can still be held up as indices of their historical conjuncture, but Rancière tends to focus on the ways in which each individual work carves out a unique space between the axioms of various regimes. He wants to avoid monolithic accounts of art-historical epochs in favor of a more detailed analysis of the specificity of individual works. In methodological terms, this amounts to saying that Rancière resists one of the working assumptions of what is called “structuralism,” namely that there is a single set of determinants behind the totality of phenomena. At the same time, he is generally allergic to the “poststructuralist” reflex that consists in claiming that every structure is fissured and de-centered.37 In short, Rancière rejects the simplistic choice between a totalizing structure and a de-centered structure by postulating that competing frameworks and axioms are at work within the same time period.

This being said, the backdrop to all of Rancière’s recent studies in aesthetics is never difficult to discern: the three regimes of art, which are so many “distributions of the sensible.” The ethical regime of images, to begin with, is best exemplified in the work of Plato. Within this regime, images are arranged and distributed according to their origin and their *telos*, based on how they can best educate the citizenry and contribute to the *ethos* of the community. The representative regime of arts, rooted in Aristotle’s critique of Plato, liberated “the arts” from the communal *ethos* by redefining them as fictional imitations of action. This amounted to isolating an autonomous domain of fiction founded on a series of axioms of representation: the hierarchy of subject matter and genres, the principle of appropriateness by which modes of expression and action are to conform to the subject matter and genre, and the privileging of speech over action. The aesthetic regime of art abolishes the autonomous domain of fiction by blurring the lines between art and life. It also dismantles the axioms of representation by dissolving the hierarchy of subject matter and genres, promoting the indifference of style with regard to content, and privileging writing over the present truth of speech.

Since Rancière’s work concentrates primarily on the contradiction between – and within – the representative and aesthetic regimes of art, it will be helpful to elucidate one extended example of this conflict. In the representative regime, which dominated the classical age, there was a strict hierarchical distinction between subject matter worthy of representation and subject matter that was best left outside of the artistic frame. Since around the end of the eighteenth

37. I use the categories “structuralism” and “poststructuralism” as purely heuristic tools. Since this is not the place to assess their explanatory power, let it suffice to say that I think they should be used with the utmost caution in discussing developments in postwar French thought.
century, this hierarchy has been widely contested in the name of the egalitarian principle that anything can become the subject matter of art. Rancière cites the example of Flaubert’s decision to write an entire novel on the adulterous affairs of a promiscuous, bourgeois woman prone to novelistic fantasy: *Madame Bovary*. However, he traces this “aesthetic revolution” back to the later Kant and German Romanticism, where he finds an attempt to overcome the representative hierarchy between intelligent form and sensible matter (which is perhaps most visible in Schiller’s concept of *Spiel*).

It is precisely this egalitarian principle of the aesthetic regime that would later allow for the emergence of the mechanical arts of photography and film. Rancière argues, against Walter Benjamin, that in order for these to be recognized as arts, it was first necessary that it be recognized that anything could become the subject matter of art, including the recording of brute reality devoid – in principle – of all aesthetic hierarchies. In other words, photography and film became possible only after the artistic revolution that introduced the aesthetic regime of art. The technological revolution, for Rancière, came after the artistic revolution. He makes a very similar argument concerning the historical emergence of psychoanalysis, which only became possible after the breakdown of the representative hierarchy between consciousness and the unconscious, *logos* and *pathos*.

Rancière refers to art within the aesthetic regime in much the same way as his American counterpart, Arthur Danto: the art of the commonplace (*l’art du quelconque*). Since there is no longer any hierarchy of subject matter in the aesthetic regime, anything – any commonplace object or occurrence – can in principle become art. This is, of course, what Danto has argued in his more recent analyses of the art world since Andy Warhol’s 1964 *Brillo Box* project. In producing objects that were visually identical to industrially produced Brillo boxes and lacked the artist’s signature, Warhol definitively dissolved the borders between art and commonplace objects. Although the Danto–Rancière debate has yet to occur, it is nonetheless easy enough to underscore one inevitable point of contention. For Rancière, unlike for Danto, the postmodern era is not a separate historical sequence; it is only the unfolding of possibilities inherent in the aesthetic regime of art since approximately the late eighteenth century. In other words, Warhol’s *Brillo Box* project is nothing more than a

---

*38. Schiller is discussed in the essay on aesthetics by Daniel Dahlstrom in *The History of Continental Philosophy: Volume 1*.  
contemporary variation on a theme going back to Flaubert, Schiller, and other artists of the aesthetic regime. As with Foucault’s discontinuous events, Rancière rejects the idea of a “postmodern break.”

In spite of this difference in historical analysis and in historiographical method, Rancière and Danto both at least partially agree on the fundamental contradiction of the art of the commonplace. We can take as an example here Joseph Beuys’s 7000 Eichen project, which he began in 1982 for Documenta 7 by planting oak trees in Kassel, Germany, and which he hoped would be extended throughout the world as a global mission to effect social and environmental change. In Rancière’s terms, the contradiction of such art of the commonplace can be expressed in two ways: (i) “Art of the commonplace” is only commonplace by losing its status as art (in the case of Beuys, the artist is confounded with the urban planner or forester); (ii) “Art of the commonplace” must not be entirely commonplace in order to remain art (the artistic gesture of planting trees is maintained only by its link to Beuys’s name as an artist, implicitly manifest in the columnar basalt markers accompanying the trees). Danto privileges the first formulation of this contradiction by arguing that the distinction between art and non-art is no longer guaranteed by a systematic historical narrative: “today there is no longer any pale of history. Everything is permitted.” In the contradictory era of the “end of art,” it is up to the philosopher to distinguish between what is properly art and what is not. Rancière emphasizes both formulations of this contradiction and maintains that there is no way of resolving it. In fact, he views it as a “productive contradiction” insofar as the search for solutions has been the driving force behind two centuries of artistic production.

III. CONCLUDING QUESTIONS

Although there is much more that could be said about Badiou and Rancière, it should at least be clear to what extent their positions on aesthetics differ. First of all, Rancière rejects Badiou’s Platonic essentialism in favor of a historical approach to artistic regimes. It is not surprising, therefore, to see him castigate Badiou for talking about Plato’s theory of art, reminding him that for Plato and the ethical regime of images, “art” in the singular did not exist, but only images properly distributed for the good of the ethos. According to Rancière, there is no art in general: there are only aesthetic practices and theories within historical regimes. In conformity with his explanatory and synthetic polemics, by which his criticisms of authors simultaneously serve to situate these exact same authors within his own theory, Rancière perceives behind Badiou’s anti-aestheticism an

41. Danto, After the End of Art, 12.
odd mixture between the ethical regime of images and the aesthetic regime of art. On the one hand, Badiou aligns himself with the modernism born out of the aesthetic regime, that is, the attempt to embrace the singularity of art while refusing its forms of dis-identification (where the limits between art and non-art dissipate). On the other hand, Badiou’s “ultra-Platonism” – which is ultimately indebted to the romantic Platonism of the aesthetic age – reveals his adherence to one of the axioms of the ethical regime: art is of value only insofar as it serves to instruct us on the Idea. Both of these positions have a common goal, which is to construct a philosophic bulwark against the aesthetic regime’s dissolution of the “proper” of art. If this bulwark is destined to failure, it is precisely because the proper of “modern” art, according to Rancière, is to be improper, to disturb and unsettle hierarchical distributions of the sensible such as the one that elevates art above the commonplace.

We can add to Rancière’s primary criticism of Badiou a list of additional problems that are visible in his work on aesthetics. To begin with, his theorization of art is largely dependent on a historically specific conception of art that is unique to the modern age. By assuming that art is an iconoclastic gesture refusing the norms of the day in order to venture beyond the givens of the situation, Badiou’s working understanding of art is clearly rooted in a romantic ideal proper to the modern age. However, this historical specificity is not recognized and assumed as such, and the iconoclastic conception of art is hegemonically imposed as a universal on the entire history of art. Second, Badiou relies on a simplistic distinction between true art and entertainment that he unquestioningly inherits from a hierarchy operative in the social field, which has been analyzed in detail by Pierre Bourdieu in *La Distinction*. Third, Badiou – much like Sartre – doggedly adheres to the principle of genericity while focusing on an era (the past two centuries) in which the distinctions between the arts have been regularly called into question, both in theory and in practice. Finally, Badiou’s approach to art is largely dependent on what might be called *illustrative hermeneutics*. Like many of his fellow admirers of Jacques Lacan, he tends to “discover” in art an illustration of his own philosophic concepts. It is true, of course, that he has gone to great lengths to try to show that this is not the case.

43. Another essential question for Badiou is whether his work in *The Century* has served to supplement his illustrative hermeneutics with a form of *illustrative historiography*: is the supposed “passion for the real” simply a projected illustration of Badiou’s concepts in terms of a century-long battle over them? For an extremely pertinent sociological analysis of these illustrative strategies in philosophic discourse, see Pinto’s *Les Philosophes entre le lycée et l’avant-garde* (Paris: L’Harmattan, 1987).
He repeatedly affirms, for instance, that art *thinks for itself* and that the philosopher cannot think in its place. However, if we follow Badiou’s logic through to the end, we cannot help but wonder if he has done anything other than philosophically colonize the art world. As we have already seen, the distinction between art and non-art, as well as the delimitation and hierarchization of the arts, is based on defining art strictly in terms of thought and reifying the Platonic distinction between Ideas and opinions. In claiming that art *thinks*, has Badiou not already commandeered the very essence of art by making it coterminous with the privileged material of philosophy (thought)? Is the apparent elevation of art (art *thinks* like philosophy) not simply a disguised denigration (art is only of value, and therefore only truly art, if it is elevated – by the philosopher’s act of recognition – to the supposedly superior level of philosophy by thinking)? Is art not always secondary to philosophy since artistic practice is of value and interest only insofar as it produces thoughts, which are then humbly welcomed by philosophers into the palace of Ideas? Is this not why assiduous readers such as Rancière cannot help but recognize which artistic “thoughts” actually make it into the realm of Ideas, which are always more or less subtle translations of Badiou’s own ideas? If these questions are answered in the affirmative, then Badiou can be legitimately criticized, like his fellow traveler Slavoj Žižek, for using art as an illustration of his own concepts while feigning an illuminating process of discovery. It is important to remind ourselves in this regard that the *illustration* of a philosophic idea in a work of art no more *explains* the work of art than it *proves* the philosophic idea; it simply *extends* a preexistent theory through a rhetorical logic of transubstantiation by which philosophic ideas are translated more or less cunningly into artistic practices.

Rancière’s project is equally open to a series of criticisms. To begin with, his descriptive account of the regimes of art is thus far devoid of any developed genetic account that explains *why* these regimes emerged. Part of this is due to his allergy to the social sciences and to “externalist” accounts of the arts that directly engage with the transformation of institutions and artistic practices.

---

44. In “Esthétique, inesthétique, anti-esthétique,” Rancière writes, concerning Badiou: “The poem only says what philosophy needs it to say and what it feigns to discover in the surprise of the poem” (in *Alain Badiou*, 491).

46. For a detailed critique of Rancière on this point, see my “Démocratie moderne et révolution esthétique”, in *La Philosophie déplacée*, Cornu and Vermeren (eds).
in the modern era. Second, the scope of Rancière’s description of the three major artistic regimes needs to be qualified. From the ancient Greeks down through the present, these are apparently the only regimes that have existed, and yet Rancière has still not provided any detailed account of the Middle Ages or the Renaissance. Moreover, although he occasionally makes reference to the “Western tradition,” it is unclear to what extent these regimes are unique to a particular geographic or cultural region. Third, his affirmation of the consubstantiality of art and politics is justified only as a historical claim demonstrated through the analysis of specific artistic and intellectual communities. When this assertion is transformed into an ontological constant, it is in dire need of proof in order to be validated. It is arguable that, as things stand, the ontological affirmation of the consanguinity of art and politics is simply based on defining them tautologically as distributions of the sensible. If this is the case, nothing can preclude anyone else from defining art and politics in different ways and drawing alternative conclusions. Affirmation and proof are only equivalent within arguments of authority.

This last problem in Rancière’s work points to one of the fundamental issues – and problems, I would argue – that links Rancière and Badiou: the ontologization, or meta-ontologization, of aesthetics. Although Rancière goes to great lengths to show that art is a thoroughly historical phenomenon, his readers cannot help but be struck by at least one level of ontologization. He affirms that works of art have a politics inherent in their very being, which is independent of any explicit political intention on the part of the artist and distinct from the gradual constitution of a work of art through its circulation in the social field. Works of art are produced as a combination of the various “objective politics” inscribed in the distribution of the sensible and manifest in the plastic and narrative field of possibilities at a given moment. As a philosopher of art, Rancière

47. Foucault’s break with his early position on literature is enlightening in this regard (see Roger-Pol Droit, Michel Foucault, entretiens [Paris: Éditions Odile Jacob, 2004]).
49. See Rancière, “The Janus-Face of Politicized Art:” “Commitment is not a category of art. This does not mean that art is apolitical. It means that aesthetics has its own politics, or its own metaphysics. That is what I was saying earlier regarding Flaubert and microscopic equality. There are politics of aesthetics, forms of community laid out by the very regime of identification in which we perceive art (hence pure art as well as committed art). Moreover, a ‘committed’ work of art is always made as a kind of combination between these objective politics that are inscribed in the field of possibility for writing, objective politics that are inscribed as plastic or narrative possibilities” (in The Politics of Aesthetics, Gabriel Rockhill [trans.] [London: Continuum, 2004], 60).
appears to be the only one who has access to this objective political being of art. While it is true that he highlights the historical constitution of this political being, there is little or no room for a veritable account of the circulation and reception of works of art in the social field and how this social dimension relates to the political potential of works of art. The very being of art is fixed in relation to the possibilities inherent in the regimes of art. Since Badiou lacks Rancière’s historical sensibilities, his theorization of art is founded on a much more explicit aesthetic ontology. As we have seen, the very being of art is defined in terms of an unchanging structural relationship between situations and events: art is a truth procedure that bears the trace of the passage of the event and interrupts the representational situation in which it occurs by naming “the un-nameable.” This mode of being of art is precisely what qualifies it – and what has ostensibly always qualified it – as art proper. The discrepancy between these respective forms of aesthetic ontology allows us to conclude by returning to one of the most fundamental differences between Rancière and Badiou: whereas the latter disdains historicism as a sophistic flight from the mighty heights of Platonism, the former insists on the need to situate art theory and practice within the flow of time, including the theory and practice of his Platonist colleague.\textsuperscript{50}

\textsuperscript{50} See Badiou’s revealing comments on his relation to Rancière at the end of Logiques des mondes: L’Être et l’événement, 2 (Paris: Éditions du Seuil, 2006), where he claims that they have a common philosophic fidelity to the “red” sequence (1965–80) in spite of their different relation to history (ibid., 586–7).
In “The Logic of Totalitarianism,” Claude Lefort assesses the failure of “the Marxist or quasi-Marxist Left”¹ in France to formulate a concept of totalitarianism, allocating the entirety of its theoretical elaboration to the (ostensible) Right and thus leaving its portrayal vulnerable to development and appropriation by the liberal and the conservative movements. Lefort argues that this breakdown of critique can be attributed to a number of interrelated factors, among them the traumatizing effect of Stalinism, an “opposition to liberalism,” the illusion of immanent revolution, and the contemptuous view of the state “as a mere organ of society” that expresses the confluence of political and economic forces (LT 278): in short, to Marxism and its fundamental rejection of the state. In place of the fiction of the state, Lefort claims, the Marxist project declares all power to be social power, not political power. In rendering this judgment, Lefort laments the lack of traction that “analyses like those of Hannah Arendt” found.² While Slavoj Žižek in Did Somebody Say Totalitarianism? agrees that “until two decades ago, Leftist radicals dismissed her as the perpetrator of the notion of ‘totalitarianism,’”³ in contrast to Lefort he assesses the current academic stature of Arendt as a sign of “the theoretical defeat of the Left – of how the Left has accepted the basic coordinates of liberal democracy (‘democracy’ versus

---

² For a discussion of Hannah Arendt, see the essay by Peg Birmingham in The History of Continental Philosophy: Volume 5.
‘totalitarianism’, etc.)” (DSST 3) and colludes in maintaining the academic and governing status quo.

In charting the space in which Marx has been thought and rethought, and Marxism redeveloped, in current continental philosophy, the dual concepts of the state and totalitarianism, and the concomitant tension between the political and the social that these concepts mark, can be helpfully utilized as a prism through which to appraise the field. There are those, such as Chantal Mouffe and Ernesto Laclau, who explicitly embrace democracy and call for hegemonic rearticulations of the state and the political sphere; and there are those, such as Alain Badiou, Giorgio Agamben, and Žižek, who reject or are ambivalent about democracy, or are apprehensive of the alliance between the state and the political, and who thus call for an articulation of the political outside all state forms. Finally, there is Jacques Rancière, whose sympathies are with democracy although he redefines it as a project wholly incongruent with the state. This essay will attempt to situate these philosophers and their varying connections and divergences. In the first instance, we must begin with how “the political” is defined, since it is on this definition that many of the other aspects of the rethinking of Marx are built.

While Lefort and Arendt locate politics in the division between society and the state, Rancière argues that this division itself is a product of partitioning, of giving a part, or carving up the sensible world into what can and cannot be seen or heard. This work of giving and maintaining order is characterized by Rancière as the sphere of policy or the police. In the preface to Disagreement, Rancière explicitly takes up the premise that Marxism has “turned the political into the expression, or mask, of social relationships,” and the conclusion that with its collapse, “the social and its ambiguities” have been abandoned in favor of a purified political philosophy. Rancière counters that the return of political philosophy is belied both by the evacuation of political activity that is concurrent with its supposed resurrection, and by the oxymoronic sterility of the phrase “political philosophy” itself, which, insofar as it theorizes law and order, or the arkhe of distribution, might better be called a philosophy of the police. Philosophy, he writes, only “becomes ‘political’ when it embraces aporia or the quandary proper to politics” (D ix), which is the quandary of equality. While “the self-proclaimed ‘restorers’ of politics and of ‘its’ philosophy revel in the opposition of the political and the social” (D 91), Rancière asserts to the contrary that “the ‘philosophical’ return of politics and its sociological ‘end’ are one and the same” (D 93).

Rancière elegantly captures the current state of political theory and its various conundrums in both *On the Shores of Politics* and *Hatred of Democracy*. In the former, he is particularly attuned to the glib and self-congratulatory proclamations of a politics that claims to be freed from philosophical hopes for a more perfect world. Declaring the end of “utopian islands and millenarian dreams,” these oracles instead reassure us of “more accessible earthly paradises.” 5 “One might merely smile,” Rancière scoffs, “at the alacrity with which political administrators look forward to the time when politics will be over and they can at last get on with political business undisturbed” (OSP 3). The crux of this overcoming and putting to rest of politics is the demise or ruin of utopian promise, “for the original evil,” as this narrative tell us, “was the promise itself,” fundamentally “murderous” in its complicity with the future telos of a community (OSP 5). Politics has, at last, in this view, abandoned “the programme of liberation and a promise of happiness” (OSP 6) and thus awakened to the insidious transformation of dreams into nightmares (*ibid.* ) and the promise of the best into the “promise of the worst” (OSP 9). In the later *Hatred of Democracy*, Rancière further specifies what these supposed terrors are within democracy characterized as the reign of excess: the erosion of borders; the dissolution of politics into limitlessness; the devouring of the state; and “the religion of the collective and the blind fury of the hordes.” 6 The haters of democracy, Rancière attests, have falsely characterized “a childish humanity whose dream of engendering itself anew leads to self-destruction” (HD 28). Summed up, these formulations amount to an elegiac mockery of the thesis that “democracy = limitlessness = society,” an insistence that the rumors of the death of politics have been greatly exaggerated.

Political philosophy, meanwhile, seems immortal, its death always deferred in the repeated attempts to make the political identical with itself, closing the gap between politics and the police. Rancière conceptualizes the life of political philosophy under three main rubrics: archipolitics, parapolitics, and metapolitics. Archipolitics is associated with Plato and indicates a foundation that is completely realized “with nothing left over” (D 65). In archipolitics, the community is wholly saturated with law such that *physis* and *nomos* are fully identified and contingency has been eliminated (D 68). Parapolitics is associated with Aristotle, and later Hobbes, and indicates a struggle for dominion or the formulation of a social contract that determines sovereignty. And metapolitics is associated with Marx and the idea that political conflict will come to an end when its motor, the economic processes that drive it and produce “a radical surplus

---

of injustice” or “absolute wrong” (D 81), are fully resolved. Insofar as meta-
politics conceives of politics as merely a lie or mask, “the social is always ultimately
reducible to the simple untruth of politics” (D 83). If the social is “the truth of
politics” (ibid.), the truth of its lie, then all politics is mere ideology (D 85) and
the Marxist withering away of the state produces, or aims to produce, a pure
administration that would perfectly map the social body. Metapolitics thereby
repeats the archipolitical dream of closure, the end of politics in its “absolutiza-
tion” (D 86). Rancière, however, distinguishes his own project from the Marxist
one insofar as he takes the people to be “different from itself, internally divided”
(D 87). Neither the state nor society is a unity, and the people cannot be equated
“with a sociologically determinable part” (D 99), since they have no place in
the established order. What nonetheless might continue to go by the name of
class struggle is the equality “of anyone and everyone” (D 17), an equality that
is presupposed by the social order that attempts to deny it.

Rancière thus reconceives class struggle as staging the spectacle of equality. In
class struggle, a speech act “subjectifies the part of those who have no part” (D
38) by making possible “a space where they are countable as uncounted” (D 39)
or where their status as speakers of the logos, of words and not merely noise, can
be comprehended as universal. He claims that “the party of the rich has only ever
said one thing, which is most precisely the negation of politics: there is no part of
those who have no part” (D 14). This party is “antipolitical,” policing the parts of
a contractual society. But, since the arkhe is always premised on a “lie that invents
some kind of social nature” (D 16), any social order will be contingent and will
always ensure a dispute or disagreement, an “equality that gnaws away at any
natural order” (ibid.). Hierarchy, the order of the city, is confronted with anarchy,
its disordering. Without arkhe, the claims of politics to sublimate chaotic nature
and produce security, stability, and equal representation are disrupted and poli-
tics cannot be identified “with the self of a community” (D 64).

The bedrock of this presupposition of equality lies in the equality of under-
standing that any speaking being is also a logical being, that the disjunction
“between logical animals and speaking animals” (D 22) is itself never a given but
always the effect of a social and sensory ordering and thus “the very dispute that
institutes politics” (ibid.) by establishing domination. The quandary of equality
thus presents a disjunction between two logics, the egalitarian logic of politics
and the distributive logic of the police, the latter characterized by Rancière as
the form of governance that defines the “configuration of the perceptible” (D
29), arranging sensible reality, ordering and allocating “ways of doing, ways of
being, and ways of saying” (ibid.), giving each body its “particular place and
task” (ibid.), and pursuing, in utilitarian fashion, the happiness or good of the
community. As the name Rancière gives to the rules and policies that govern
what can appear and who can be counted, a regime of “total visibility” (D 104),
the police are also the order of identity and exchange, negotiating conflicts of interest, defining properties and predicates and determining “a population exactly identical to the counting of its parts” (ibid.). Politics, to the contrary, disrupts or challenges the distribution of bodies in social space precisely because it is an activity that springs from “the part of those who have no part” (D 30), that is, those whose placement or configuration is heterogenous to what the police order renders perceptible.

Rancière argues that a “wrong” is perpetuated whenever people are “deprived of logos” (D 23), condemned “to the night of silence or to the animal noise of voices expressing pleasure or pain” (D 22), that is, whenever their voices are taken to be of no account, thereby instituting a gap between speech and logos. But while social bodies might be subject to an inegalitarian distribution, as speaking beings they can demonstrate their equality.7 As demonstrable, equality is the “incommensurable” that “ruins in advance the project of the city ordered according to the proportion of the cosmos and based on the arkhe of the community” (D 19). Foundation, measurement, ratio, the mission of a single logic or principle of unity that could capture the good of all and found the state on its secure basis, is thereby impossible, although its quest is the source of all politics, since “politics such as it is is encountered, always in place already, by whoever tries to found the community on its arkhe” (D 18). Equality is thus portrayed, in contrast to the description of order, as, variously, quandary, aporia, heterogeneity, disagreement, antagonism, incommensurability, interruption, polemic, and paradox, that is, as the foreign principle of politics.

Never simply given, neither an essence nor a goal, neither a tool nor a means (D 33), the principle of equality is pure premise, the permanent assumption of politics in its dispute with the police. This premise is activated in its performance, a performance that is simultaneously a subjectification and a disidentification, bringing into being a who that can “measure the gap” (D 36) that it itself manifests, the gap between the acknowledged count of the social and natural order and that which cannot be counted in the given terms of perception, within its frame of reference or field of experience. Rather than a founding or giving form, politics for Rancière is a decomposition and disruption of the regime of appearance. Although the wrong is a miscount, politics is not a better accounting or the providing of an “exact count” (D 28), which would be merely

7. For Rancière, women’s exclusion from universal suffrage is exemplary of the paradox of excluding some from “the equality of all before the law” (D 41). Women, in this example, is not the group of those who share a set of properties or the name of a collective body or social category; it is instead “the class of the uncounted that only exists in the very declaration in which they are counted as those of no account” (D 38). The demonstration of equality exposes the nonuniversality of universal law, the illogic of the logic of the count. This exhibition of logos thereby contradicts and counteracts the ruling order’s attempts to deny the logos to some.
another policing of demographic categories in administration of particularities; as a response to miscount, “politics exists because those who have no right to be counted as speaking beings make themselves of some account” (D 27).

Politics is thus disagreement or “the practices driven by the assumption of equality between any and every speaking being and by the concern to test this equality” (D 30). This emphasis on process and practice underlines the performative dynamic Rancière attributes to politics, the theatrical or dramatic element of its staging. In its contestation of the partition of the sensible, politics is “aesthetic in principle” (D 58, emphasis added). In its subversive presentation of equality, the “act of equality” (D 34) has an evental aspect that “cannot consist in any form of social bond whatsoever” (ibid.). Politics is “upsetting” (D 49) because its speech act poses the truth of equality against the lie of social reality, contradicting in its performance (its aesthetic event) the non-count of the speaker as a speaking being. This spectactularity makes apparent what the police render incomprehensible, showing the speaker to be a speaking being. So, while the police create order and form a social bond, politics disrupts established harmony (D 28) and invents “worlds of dissension” (D 58). Politics thus only and always confirms, stages, demonstrates, asserts, dramatizes, and/or occupies equality, and it is this activity, this performance, this speech act, that thereby subverts any social order, a subversion that is not the aftereffect of the demonstration but the demonstration itself. So, whereas the police “can procure all sorts of good” (D 31) and indeed have the good as their telos (promoting security and tranquility), political activity secures nothing, stabilizes no social bond, promises no fully realized city; it does nothing but stage over and over again the demonstration of equality, which is its “sole principle” (ibid.). And this principle is decidedly not an arkhe since it founds no order; it is fundamentally anarchic, “the name of nothing” (D 35). The scandal of politics is “its lack of any proper foundation” (D 61). It has no identity or essence and no remedy that would resolve its difference from itself. The distinction between police and politics, Rancière claims (in one of many departures from Althusser8), does not mirror

8. For all the authors discussed here, departures and divergences notwithstanding, Althusser appears to have played a decisive role, insofar as his structuralist reading of Marx, his bringing together of Freud (and Lacan) and Marx, and his theory of the subject of ideology, provide the frame of reference (the academic state or situation, we could say) of philosophical Marxism. Both Badiou and Rancière, and for similar reasons, break with Althusser’s structuralism as (over)determining the logic of the situation in a way that impedes the possibility of a break with that situation or an irruption from within. For Althusser, whose work rests on a sharp if complicated epistemological distinction between science and ideology, the subject is fundamentally entangled with ideology, is in fact subjectivized by ideology even while constitutive of it; ideology is an identificatory practice. Badiou and Rancière, however, ally subjectivation with truth and with disidentification. [*] For a discussion of Althusser, see the essay by Warren Montag in The History of Continental Philosophy: Volume 6.
that between state and society; it does not proclaim the State a dead and rigid machine opposed to the life of society (D 29).

If the people are not equal to themselves, democracy cannot be reduced to social relations nor to any coincidence between form and content, law and spirit, individual and community. This imaginary “idyllic state” of consensus or the “inclusion of all” (D 116), which is always counterposed to totalitarianism, Rancière renames “postdemocracy” (D 95), the nihilistic reassertion of unity and totality, or the identity of humanity with itself, whose image serves as the basis of many critiques of so-called democracy. Against the postdemocratic order of consensus, entangling state and society without residue, Rancière asserts that democracy is the “mode of subjectification” that disrupts or interrupts the “order of distribution of bodies as a community” (D 99). As bodies, the many are doomed to “a purely individual life that passes on nothing to posterity except for life itself, reduced to its reproductive function” (D 23). Rancière thus makes a fundamental distinction between animal being and speaking being. The premise of equality, that is, of equality before the *logos*, although a premise, nonetheless depends for its demonstration on the postulate that “the modern political animal is first a literary animal” (D 37), entangled in the gap “between the order of words and the order of bodies” (*ibid.*), between voice and violence.

Rancière develops this account of the political speech act around mathematical and literary tropes, features that are reinforced by Alain Badiou with his reliance on Lacanian psychoanalysis and Cantorian set theory. Badiou’s thought will be treated in the next essay. We can, however, offer a preliminary contrast between these two students of Althusser here. Rancière and Badiou diverge significantly in at least two ways: first, in their assessment of democracy and democratic promise; and second, in their assessment of the rights of man. In the first instance, Badiou accuses Rancière of being too much a democrat,9 not enough of a militant, and in the end still a political philosopher (M 120), while not doing either politics or philosophy (M 115–16). For Rancière, democracy is first of all anarchy (HD 41); it “is neither a society to be governed, nor a government of society, [but] is specifically this ungovernable on which every government must ultimately find out it is based” (HD 49). As neither government nor society, “it is the action that constantly wrests the monopoly of public life from oligarchic governments, and the omnipotence over lives from the power of wealth” (HD 96) and is thus the “vision that even today sustains the hope of a communism or a democracy of the multitude” (*ibid.*). While Badiou concurs that politics is action that disrupts the state, he claims that even democracy, in a formula adopted from Lenin, is merely a “form of State” (M 79) or an “exercise

of sovereignty” (*ibid.*). Thus, just as the State must wither away, so too must democracy, which, precisely through its romanticization, devolves into “mass sovereignty” (M 88) or “terroristic-fraternity” (89). Since politics, or communist politics, “strives for its own disappearance” (M 80), Badiou proposes an appeal to “equality’ or ‘communism’ but certainly not the word ‘democracy’” (*ibid.*). “Democracy’ can be retrieved as a political category,” Badiou argues, only as “a politics of emancipation [that] does not have the State as its ultimate referent” (M 92); it is then the designation for “the effectiveness of politics” (*ibid.*). Even so, the quarrel with Rancière seems more semantic than fundamental: Badiou writes, in a turn of phrase that could just as well have been written by Rancière, that the work of the “emancipatory process” is toward the impossibility “of every non-egalitarian statement concerning the situation” (M 93).

This divergent appraisal of democracy is echoed, second, in a conflicting verdict on human rights. For Rancière, the demonstration of equality is the staging of a “nonexistent right” (D 25), the right of those who have no rights. A right, for Rancière, “is not the illusory attribute of an ideal subject; it is the arguing of a wrong” (D 89), and thus rights emerge in their declaration, in the demand that lays claim to equality, in the repudiation of the status quo and its count or misconit. Marx’s essay “On the Jewish Question” is then the quintessential metapolitical text in Rancière’s view, marking a gap between man and citizen, society and state, political and human, whose destiny is to be overcome (M 82, 87). But politics for Rancière takes place in the interplay between police law and its declamatory dispute; Marx’s critique of human rights as merely bourgeois rights presupposes an end to the alienating split of subjectivity, the possibility of its being perfectly identical with itself without disjunction. The rights of man, however, are not rights that predicate or belong to the human, but a subjectifying claim that entails disidentification. Rancière offers a formula for rights in his essay “Who is the Subject of the Rights of Man?”: “the Rights of Man are the rights of those who have not the rights that they have and have the rights that they have not.” In formulating this paradox, Rancière argues that Arendt’s critique of human rights renders them either tautological or empty. Rather than viewing the rights of man as either rights of the already politicized citizen or nonexistent, the impasse attributed to Arendt, Rancière contends that this dilemma is itself an artifice of the ruling configuration and that in action that lays claim to rights, this given is disputed and the subject politicizes itself.

---

By contrast, Badiou characterizes his work as “a political attack against the ideology of human rights and a defense of antihumanism.”12 In doing so, he claims to be launching a wholesale critique of “democratic totalitarianism” (E lv) and the dominant themes of progressive politics, even and especially those that might appear as most radical. His work begins with two premises that might at first seem irreconcilable, and proceeds from there to develop a series of oppositions. The first premise is that universality entails what he calls “eternal truth,” and the second is that such truths are not transcendent but immanent; there is no “heaven of truths” (E 43). These premises are resolved as “an ethics of singular truths” (E lvi), a resolution that requires clear contrasts between truth and knowledge, subjective and objective, event and situation. The event is a singular break with the situation, the subject is induced by truth, and truth remains uncaptured by the order of knowledge that it ruptures. What Badiou means by an ethic, in contrast to the reigning ethics, is continued fidelity to the event of the universal as a break with history and militant adherence to truth.

In The Sublime Object of Ideology, Slavoj Žižek distinguishes the Althusserian idea of ideological alienation from the Lacanian one of fundamental antagonism. In the former, still consistent with “the traditional Marxist notion of social antagonism,”13 there is both a prioritization of a particular antagonism that is considered determinative in the last instance and the possibility of resolving that antagonism within history. By contrast, the Lacanian deadlock does not prioritize a particular antagonism and holds out no hope of final resolution. In this way, according to Žižek, it exemplifies the “post-Marxist” break with utopian logics. The psychoanalytic account of the subject is not accidental to this post-Marxist logic: “the ‘death drive,’ this dimension of radical negativity, cannot be reduced to an expression of alienated social conditions, it defines la condition humaine as such: there is no solution, no escape from it” (SOI 5).

The idea of harmonious being, whether within or between human beings, is a dangerous aspiration, even a “totalitarian temptation” (ibid.), and the gesture or hope toward reconciliation is the gesture of terrorism. We must instead discover

disguising the working of power, Lefort contends that human rights are neither individualist nor unitary, but are a bond of “antagonism” (ibid., 266, 272) or “plurality, fragmentation, heterogeneity” (ibid., 271) that threatens the fantasy of a One and “the loving grip of the good society” (ibid., 272). Lefort’s analysis is, however, significantly different from Rancière’s insofar as it privileges the limitation of power that the law symbolically enacts (i.e. it privileges the state). Nonetheless, there is a promissory element in Lefort’s depiction that is not wholly divergent from Rancière’s characterization.

a “modus vivendi” (a “form-of-life” in Agamben’s terms) with this “terrifying dimension” of destruction and impossibility that is inculcated by language.

Crucially, the psychoanalytic theory of antagonism does not derive it from social causes. Antagonism is rather an irreducible element of psychic formation, of a fundamental aggressivity within that no amount of cultural change can dispense with. We must instead reverse the presupposition of social constructionism: social antagonisms are themselves founded on “an original ‘trauma,’ an impossible kernel which resists symbolization, totalization, symbolic integration” (SOI 6). This traumatic element of “a blind automatism of repetition beyond pleasure-seeking self-preservation” reveals the impossibility built into the pursuit of goods. The project of capitalism, maintaining the circulation of goods in a cycle of generation and degeneration, of expenditure, consumption, exhaustion, and collapse, bringing them into being and passing away, is thus inherently and internally self-destructive, an effect of its own limit.

In understanding this critique of goods, it is useful to bring together, as Žižek does, the Marxist and Freudian notions of “fetish.” For Freud, the fetish has a very specific meaning and purpose, serving as a substitute for the mother’s missing phallus. The fetish appears where the other’s castration is too intense, too traumatic and uncanny, to bear; in place of the missing object, the fetishist installs one that can be made present, thereby exemplifying the psychical mechanism of disavowal whereby a belief is simultaneously retained and given up. Fetishism is thus a very peculiar articulation of the fort–da game: a mode of playing with absence and presence in which the replacement object signifies both castration and not castration, the traumatic perceptual presence of an absence (the encounter with castration) and the reassuring absence of a presence (the denial of reality). The fetish is a kind of monument to absence insofar as it both buries and commemorates the horror of castration, thereby testifying to the very reality it denies, its displaced presence. The formula, as Žižek borrows it from Octave Mannoni, of “I know very well but all the same I don’t believe it,” carries this doubled relation to knowledge, acknowledging reality while nonetheless retaining a belief that runs counter to it.

For Marx, the fetish also serves a veiling function, presenting as magically apparent the commodity that in fact is the objectification of the labor process and dissociating its value from the value of human freedom that this process eradicates. The commodity is thus granted a level of autonomy, independence,

and self-sufficiency that the worker is not. Its displacement of value holds at bay the labor relation that brings it into being, and it thereby takes the place of, substitutes for, the missing social relation. The commodity then appears as transcendent, enigmatic, and mystical, a social thing “whose qualities are at the same time perceptible and imperceptible,” fantasmatically replacing “a definite social relation between men.”

Both of these types of fetishism, the Marxist and the Freudian, function through mechanisms similar to that of the dreamwork: it is not merely a latent content that is concealed (this attachment to content is itself fetishistic according to Žižek), but rather “the ‘secret’ of this form itself” (SOI 11), its work of condensation and displacement (i.e. of overdetermination) that makes possible its genesis. The real question with regard to both the work that forms the dream and the work that forms “the value of a commodity” (ibid.) is how or why this form has been assumed. In the pursuit of goods, the disturbing, strangely familiar secret is less the fundamental lack of a fully harmonious social relation than the very process of disavowal, of knowing and not believing, that gives it form. Through this disavowal of reality (the reality that the social does not exist), fetishism procures the ever-widening circulation of goods, goods that, in keeping consumers attached to objects whose value is misplaced and whose source is not admitted, both reject and retain, pervert and procure, the idea of phallic fullness that never was and can never be: this is the object that has the power to fully satisfy me. The free circulation of goods takes the place of human freedom and equality, fills in for their lack, such that the false universalism of bourgeois rights and duties is not simply an inadequacy to live up to its own ideals, but a constitutive fantasy that structures social reality: not a delusion, but a fetish-work that generates and gives shape.

While the discussion of fetishism may have seemed a detour, it is crucial not only to understanding the entanglement of psychoanalysis with contemporary Marxist thought, but also to understanding the critique of democracy and rights developed by the militant Left. For Žižek, democracy is a political fetish and he presses for the courage to abandon “democracy” as the master-signifier of the chain of political signifiers (SOI 78). Crucially for Žižek, the fetish conceals a lack, not a positivity, around which social relations are articulated (SOI 49). The disavowal of absence, the absence of a social relation, explains for Žižek the romanticized attachment to fraternal democracy that nonetheless retains an inability to acknowledge that the father is dead. Fetishism, whether Marxist or Freudian, thereby indicates a fundamental political truth: the splitting of reality that indicates an internal (not external) antagonism, dislocation, and disruption within any perceptual or articulated form of understanding, a gap between

what we know and what we believe. The effect of disavowal is then a habitual vacillation between the vernacular of contingency and the quest for security; without the guarantee of fullness or the fullness of guarantee, the brother–citizen–fetishist reintroduces the paternal function over and over again in the biopolitical gesture of optimization that impedes political action. Sovereignty, or the fear of its absence, is intimately tied to biopower, as both undergird the violence of law and the liberal democratic illusion of freedom and equality.

Žižek pointedly disparages the predominant multiculturalist mode of respecting the “other” that prevails in the “New World Order that poses as the tolerant universe of differences,” just as he mocks the rise of identity politics and its etceteral structure (race, gender, sexuality, etc.). Žižek finds the “underlying ontological vision” of an “irreducible plurality of particular constellations, each of them multiple and displaced in itself” (WDR 65), to be vapid and arid. This vision, the latest variant of nihilism, “masks the underlying monotony of today’s global life” (WDR 68), while also encouraging the pseudo-radicalism of taking pleasure in dreaming about and demanding things one does not really want.

But, whereas Žižek sees in democracy the disavowal of social antagonism, Laclau and Mouffe define radical democracy precisely as social antagonism. In *Hegemony and Socialist Strategy*, Laclau and Mouffe reflect on the demise of what they characterize as “the Jacobin imaginary.” This imaginary had rested on a series of assumptions now in crisis: the epistemological and ontological privilege of the working class, the promise of revolution, and the fantasy of social unity that would “render pointless the moment of politics” (HSS 2). In rethinking Marxism and its stakes, Laclau and Mouffe take the concept of “hegemony” as a “fundamental nodal point of Marxist political theorization” (HSS 3), and moreover one whose logic is heterogenous to other basic Marxist categories (*ibid*.), especially to the rationalism of dialectical materialism and its presumption of historical necessity. Hegemony provides the basis for the development of contingency, as against necessity, and thus for the specificity of a variety of social struggles. Laclau and Mouffe thus describe their project as elaborating a “new conception of politics” (*ibid.*) that is explicitly both “post-Marxist” and “post-Marxist” (HSS 4), a dual emphasis that marks a trajectory that simultaneously insists on and departs from its Marxist origin. In this joint formulation of radical democracy, Marxism becomes repoliticized (and to some extent de-economized) in a transformation of emancipatory discourse that situates it within the clamor and claims for universality on the part of various particularities.

With Lefort, Laclau and Mouffe assert as well that just as democracy opens the possibility of “hegemonic articulations” (HSS 187), it also carries the imminent possibility of a totalitarian logic that would attempt to reoccupy the space of power, fill in its missing substance, and control its “radical indeterminacy” (HSS 188). Their work thus articulates a fundamental alliance with the Marx of class consciousness and a departure from the Marx of economic determinism and historical materialism, isolating these two strands from one another. In later and separate works, Laclau and Mouffe further pursue the theme of antagonism and democratic struggle. I will focus on just one exemplary essay here.

Laclau’s essay “New Reflections on the Revolution of Our Time” perhaps most explicitly clarifies which principles he retains from Marx and which he leaves behind. He calls this work a “manifesto,” and presents the argument of the essay “as a logical sequence of its [Marxism’s] categories” (NRRT 4). Laclau here charts a distinction between negativity and objectivity, or between antagonism and contradiction (NRRT 7), affiliating the former with the political and the latter with the social (NRRT 35). With this schema, Laclau articulates the fundamental tension between the political and the social by arguing that while political action seeks a “reconciled and transparent society” (ibid.), such a society would be the annihilation of politics. Politics seeks its own impossibility in the realization of a harmonious social totality, since such a society would no longer be properly political (ibid.). Laclau here adamantly distinguishes between social totality, on the one hand, and politics, on the other. The social is defined as the realm of “the sedimented forms of objectivity” (ibid.) and it is formulated on the model of the oikos and its good government with which it is taken to be homologous; the political is defined as the realm of subjectivity and it is formulated on the model of the polis or city taken as a site of dissension rather than of good government. The social is the realm of goods as potential or proto-totality (including not only material goods, but most especially the good of the community), and its logic requires ever better management; the political is outside this order of exchange and regulation, and is the realm of freedom. According to Laclau, there is politics because there is “subversion and dislocation of the social” (NRRT 61). And yet, and herein lies the crux of the paradox, the domain of the political founds itself on the creation of some, however imaginative or contentious, vision of ideal closure and reconciliation. Since the social is internally uneven and antagonistic, the subject is “thrown up” (NRRT 44) into a political world of freedom by social and subjective dislocation and incompleteness.

20. Cf. Rancière’s claim that “every politics works on the verge of its radical demise” (D 91).
Laclau also distinguishes between subjects and subject-positions or the location of individuals within sedimented social forms. Identities, for Laclau, are established only through relations of difference and are thereby immanently self-sundering; there is no pure externality but instead a “constitutive outside” of identity, such that differences always already inhere in the formation of any identity. Rather than an integrative gesture that inscribes identity in a social whole, as a subject-position, politics in this view is that which interrupts the inscription of particular and predicated subjects into a social whole. While predication and identification particularize us as parts of a whole, members of subsets, thereby divesting us of singularity, interruption singularizes a subject in calling him or her to a task uniquely her own. As the dissemination of the singular rather than the sum total of particulars, the universal cannot be integrated into the whole, a constitutive failure that points to the future possibility of radical democracy since it requires us, as Laclau puts it, “not to understand what society is but what prevents it from being” (NRRT 44). The universal functions through the dislocation of subjects who are not fully placed socially and whose freedom lies in the failure of the structure to fully constitute an identity (ibid.). To restate the political paradox, then, we could say, with Laclau, that politics aims toward an “impossible object [society] and thus toward the elimination of the conditions of liberty itself” (ibid.). Politics is irreconcilable with the very element that makes politics possible, both because of the paradox earlier discussed – that subjectivity and politics would annihilate their own founding conditions if fully achieved – and also because its possibility lies in the rootless, groundless ground beyond life and history where the signifier emerges.

As Žižek clarifies, the “radical” of radical democracy must be taken in a paradoxical sense, as it does not aim “at a radical solution,” but instead acknowledges “a kind of postponing of a fundamental impossibility” (SOI 6). It is thus not a “pure, true democracy; its radical character implies, on the contrary, that we can save democracy only by taking into account its own radical impossibility” (ibid.). The only solutions are particular ones, and they always entail a radical irresolution, a permanent deadlock. In “An Ethics of Militant Engagement,” Laclau writes about his theoretical relation to Badiou, taking up Žižek’s claim in The Ticklish Subject that Badiou and Laclau share a “deep homology” insofar as both turn away from the Hegelian and Marxist notion of “reconciliation between Universal and Particular.”21 They instead, according to Žižek, assert “a constitutive and irreducible gap,” although this gap is different for each. For Laclau it can

be characterized as “the gap between the Particular and the empty Universal” or as that between “the differential structure of the positive social order … and properly political antagonism.” For Badiou, it is “the gap between Being and Event” (ibid.). For both, there is a dimension of “decision.” While Laclau professes to find Badiou’s thought “congenial,” especially in its affirmative and emancipatory commitments, he also questions the ontological and mathematical underpinnings of Badiou’s epistemology and its capacity to distinguish truth and disaster. Thus, although Badiou, Žižek, and Laclau can come across as allied insofar as they all borrow fundamental premises from Lacan, Žižek seems a necessary hinge figure here, the one that binds them together.

Agamben is noticeably less psychoanalytic in his perspective, and his work is premised on eminently non-Marxist sources and suppositions, in particular those of Carl Schmitt, Arendt, and Michel Foucault, allying these three together in a remarkable amalgamation of their conceptual leverage. From Schmitt, Agamben takes up the concepts of sovereignty and the state of exception; from Arendt that of totalitarianism and the critique of human rights, as well as the rise of government as administration of an all-encompassing social sphere figured on the order of the oikos; and from Foucault the concept of biopower. Were we to situate Agamben within Rancière’s rubric, we could perhaps view his work as a version of the modern metapolitical view that sees “the democratic gap as a symptom of untruth” (D 91). Certainly Agamben aims at a certain closure or overcoming of a rift in being. At the same time, his work can be understood as offering a critique of the imbrication of modern parapolitics and archipolitics in a form of sovereignty whose resultant terror aims at establishing an absolute community (D 81). In any case, Rancière also explicitly criticizes Agamben for endorsing Arendt’s argument about human rights, as discussed above (WSRM 302).

In Homo Sacer, Agamben argues that “the production of a biopolitical body is the original activity of sovereign power,” where this biopolitical body is taken to be “bare life” or homo sacer. Whereas Foucault claims that the entrance of zoe (natural life) into the polis is the fundamental condition of modernity, Agamben argues that the bond that attaches zoe to bios, the natural to the political, is “absolutely Ancient” (HS 9). Unlike Foucault, therefore, who charts a historical passage of the primary modes of power and their historical dominance from the reign of sovereignty to juridicality to discipline and biopolitics, Agamben sees

---

a structural imbrication among these forms of power: the convergence between the juridical and the biopolitical, the law and the body, is the permanent nucleus of sovereignty. If the political history of modernity or the modern history of politics thus charts an increasing “indistinction” between bare life and the law, one also marked by the collapse of democracy into totalitarianism, this confusion is realized in the biopolitical invasion of sovereignty into the everyday activities of the vulnerable body such that the camp rather than the city becomes the site or nomos of human (animal) being, the triumph of universal homelessness. Democracy is then defined by its biopolitical condition, allied always already with totalitarianism. The political project that is demanded is a politics that is no longer founded on the exception of bare life (which, precisely as exception, is always included) and its unity with law (HS 11). In the juncture between homo sacer and sovereignty, between life and law, sovereignty and biopower are the dirty secret of one another: each liminal, crossing, becoming the other, entailing a confusion between them.

Bare life is neither natural life (zoe) nor political life (bios), but something that emerges from their “zone of indistinction,” just life, nothing but life, sheer life, life itself, life abandoned to itself and to death, neither zoe nor bios, neither physis nor nomos (HS 84–5, 88, 106). As sacred, bare life is “life exposed to death” (HS 88) or homo sacer, defined by Agamben as the one who can be killed but not sacrificed and who is thus outside all law, human or divine, political or theological, abandoned to and by the law. The double exclusion of homo sacer from human and divine law points toward an “originary political structure prior to the distinction between sacred and profane, religious and juridical” (HS 74). Thus, “the sacredness of life, which is invoked today as an absolutely fundamental right in opposition to sovereign power, in fact originally expresses precisely both life’s subjection to a power over death and life’s irreparable exposure in the relation of abandonment” (HS 83). The sacred is the mark of sovereign excess, its access to and grasp of the body. In bringing sovereignty together with bare life, Agamben writes that “the sovereign is the one with respect to whom all men are potentially homines sacri, and homo sacer is the one with respect to whom all men act as sovereigns” (HS 84).

In Žižek’s view, the liberal–totalitarian state of emergency that Agamben theorizes, a state that produces only survivors, entails an alliance between victimization, humanism, and the pursuit of goods insofar as they are all oriented by the biopolitical project of the optimization of life (WDR 107). Sovereignty and biopower are then the flipside of each other: the bifurcated and dual formation of law that describes the way in which capital, and terror, operates. Žižek thus characterizes the liberal mode of subjectivity as itself homo sacer (WDR 71), thereby aligning Agamben with the questioning of democracy (WDR 97). And certainly Agamben’s politics cannot be assimilated into the radical–democratic
project (WDR 98); he is not interested in renegotiating the limits of inclusion and exclusion or the limit that separates citizen from *homo sacer* (WDR 98, 100). There is no place in Agamben for such a democratic project of renegotiation and there is, in fact, no democratic subject, but only a democratic consumer and survivor. In the postpolitical regime of biopolitics, we are all *homo sacer* (WDR 100). With no democratic way out, a messianic dimension lurks in Agamben’s theory, pointing toward a future where mere life would no longer be the ultimate terrain of politics (*ibid*.), simultaneously a suspension of mere life and an embrace of mere life.

In *Means Without Ends*, Agamben argues that Marx’s critique of the rights of man and his theses about human emancipation have become archaic: “The Marxian scission between man and citizen is thus suspended by the division between naked life (ultimate and opaque bearer of sovereignty) and the multifarious forms of life abstractly recodified as social–juridical identities.”25 Human rights provide no defense in camps, but simply secure the operation of biopower. Nonetheless, Agamben continues to maintain a discourse of emancipation, one that defines it as overcoming of division and “the possibility of a nonstatist politics” (MWE 8–9) as opposed to state sovereignty. In arguing for a form of life that “must become the guiding concept and the unitary center of the coming politics” (MWE 12), Agamben proposes a new relation between *zoe* and *bios*, one that does not depend on their sacrificial split. Here we have both a conjunction with and a departure from Badiou. Both Badiou and Agamben condemn the biopolitical or bioethical hold on life, the means by which the state keeps the human in its grip. For Badiou, however, the only answer to state policy is a militantly subjective politics, while for Agamben *happiness* itself becomes the source of a revolutionary form of life, a way of closing the gap that permits the zones of indistinction to dispense terror and dispense with life. As Agamben puts it at the conclusion of *Homo Sacer*, the “biopolitical body that is bare life must itself instead be transformed into the site for the constitution and installation of a form of life that is wholly exhausted in bare life and a *bios* that is only its own *zoe*” (HS 188). It might be edifying to read this opaque passage alongside a similarly opaque selection from *State of Exception*, in which Agamben envisages that “one day humanity will play with law just as children play with disused objects” (SE 64). Taking these together, Agamben suggests that the journey before us, embroiled in the enigma of our political plight, will lead to an overcoming and an arrival at justice, or failing that, we will find “unprecedented

65

Volume 8
biopolitical catastrophe” (HS 188). In evading this dire option that he himself has so thoroughly investigated, Agamben reaches for the messianic.

Agamben’s political conclusions tend to bifurcate, or combine, the Heideggerian and the Benjaminian. From Heidegger, he adopts the idea of “the end of the history of being” (MWE 110). From Walter Benjamin, he adopts the idea of a uniquely revolutionary form of violence, one that, citing Benjamin, “neither makes nor preserves law, but deposes it” (SE 53). In this combination, Agamben foresees a double end: of the history of being and of the history of the state. This would be a politics of pure means, without ends, a revolutionary politics, and also the coming into history of “anarchic historicity” (MWE 111). If, also with Benjamin, the state of exception has become the rule, fundamental and exemplary, then only an “anomic violence” (SE 54), that is, a violence that does not return to the law, a violence that is “pure” in the sense of being absolved of all attachment to the law, either as constituted by it (i.e. the police) or constitutive of it (i.e. mythical violence), can transform, or better overturn, or even better dissolve, “the relation between violence and law” (SE 63). Because it is neither constitutive nor constituted, pure violence operates as a means without ends (SE 61), an absolute medium or mediation that is thereby also a dissolution. Pure violence would enact a “play with law” (SE 64) such that “the world appears as a good that absolutely cannot be appropriated or made juridical” (ibid.). Rather than a politics “contaminated by law,” Agamben proposes instead “political action,” a revolutionary event “which severs the nexus between violence and law” (SE 88), thereby allying “pure means” with “human praxis” (ibid.). Only this absolute violence can break with the order of the state in its homogenizing biopoliticization. Here, as with Badiou, we have a Marxist idea of an anti- or post-state politics, one that does not run from violence. As a politics beyond the law, pure, wholly removed from the violence of law or the law of violence, it is divine.

What seems clear for all the philosophers discussed in this essay is that the social is viewed, if not always as a fetish, at least suspiciously; it does not exist just as the people does not exist, since there is no self-identity. This is a kind of antihumanism, as well as an antideterminism. Thus we see that the opposition between humanism and determinism has been superseded because both are rejected, the one for its argot of victimization, of the sacrificial, suffering human

27. There is an obviously theological dimension to much of contemporary Marxism. Badiou, Žižek, and Agamben in any case pay heed and homage to Benjamin’s notion of divine violence. And, following a trajectory that seems to radically depart from Benjamin, both Žižek and Badiou treat St. Paul as a crucial figure.
animal, the other for its adherence to the logic of the situation. Instead we have a subjectivization that breaks with its history, a constitutive self-sundering, and a thinking of emancipation as making the claim to equality, via disagreement, dissensus, and antagonism. Disidentification, rather than class consciousness, has become the basic tenet of class struggle. Refusing to acquiesce or collaborate in the demise of politics, pursuing the impossible, and not merely, as Žižek cogently characterizes what passes for radicalism today, embarking on “an unending process which can destabilize, displace, and so on, the power structure” through “endless mocking parody and provocation” (WDR 101), the philosophers discussed here retain a shared fidelity to Marx’s legacy by repudiating postpolitical nihilism and adamantly adhering to the task (act, presentation, supposition, appearance) of emancipation and universality.
There can be no doubt that the notion of the event constitutes one of the core concepts in contemporary philosophy, cutting across the divide between so-called “continental” and “analytic” thought. From Martin Heidegger to Jacques Derrida and from Alfred North Whitehead to Donald Davidson, a modern or contemporary philosopher can be defined as one who develops the conceptual tools necessary to think through the peculiar nature of an event as such. The result of this agreement is actually a striking paradox. The event, which in most versions is supposed to mark an unprecedented break with the status quo, has itself become today a matter of strict consensus. What should be absolutely singular and chance-like is on the verge of being drowned out in the bland unanimity of nonthought. In the words of the late François Zourabichvili: “The theme of the event lies at the center of philosophical preoccupations today, it animates the most daring and the most original projects. But the spirit of the time does not provide in and of itself a philosophy and should not mask irreconcilable differences.”

To save the event from the risk of complete shipwreck in this process, few endeavors could be more urgent than an overview of the history and theory of the event, or rather of events in the plural, since the uses of this concept are so numerous and variegated as to block nearly all possible

---

comparison. Indeed, there seem to be as many versions of the concept of the event as there are philosophers who claim to stand in its lineage.

Alain Badiou⁴ is certainly among the more forceful proponents of a full-bodied doctrine of the event, one polemical and ambitious enough to compete with alternative versions that can be found in the works not only of Heidegger or Derrida but also of Michel Foucault, Gilles Deleuze, or Jean-François Lyotard.³ It is precisely through the category of the event that Badiou, as he puts it in his Manifesto for Philosophy, proposes to take one more step in the reconfiguration of modern philosophy over and against the widespread declarations of its imminent end, crisis, or closure, especially in the guise of Western metaphysics: “A single step. A step within the modern configuration, the one that since Descartes has bound the three nodal concepts of being, truth and the subject to the conditions of philosophy.”⁴ For Badiou, the event is that which ties these three nodal concepts into a single philosophical knot. How then can we capture the singular force of this use of the concept of the event, if at the same time we want to avoid the generalized state of homonymy that surrounds it in the context of contemporary thought? Wherein lies the pull of Badiou’s treatment of being, truth, and subject by way of the event? How can we account for the fact that this pull now seems to have become unstoppable, especially among newer generations of students, artists, scholars, activists, and so on?

I. TRAJECTORIES

In order to highlight the singularity of Badiou’s ongoing philosophical project, I propose to mark three trajectories in and out of his thinking of the event. The first one is conceptual and tries to come to grips with the way in which being, event, truth, and subject fit into a unified philosophical system. Badiou in fact is adamant about what he considers to be the necessarily systematic nature of philosophy insofar as “it is of the essence of philosophy to be systematic, and no philosopher has ever doubted this, from Plato to Hegel” (MP 65). On the most general level, we could say that Badiou’s system, like Hegel’s, remains dialectical

---

2. Alain Badiou (January 17, 1937– ; born in Rabat, Morocco) was educated at the École Normale Supérieure (1956–61) and gained his habilitation in 1989. His influences include Althusser, Canguilhem, Lacan, Mao, Marx, and Sartre. He has held appointments at the University of Reims (1965–69), the University of Paris VIII–Vincennes-St. Denis (1969–99), and the École Normale Supérieure (1999–2006).

³. The work of Deleuze, Derrida, Foucault, and Lyotard is treated in individual essays in The History of Continental Philosophy: Volume 6.

in that it seeks to think both substance and subject at the same time. It does so, however, by splitting each of these terms. Badiou defines the dialectic precisely in terms of a logic of scission, instead of the textbook versions of negation and sublation or the negation of negation: “The dialectic, so to speak, is itself dialectical in that its conceptual operators, which reflect reality, are all equally split.”5

Being itself, to begin with, never amounts to a full substance – say, the substance that ultimately is life itself for the Spinozists Deleuze and Toni Negri. It is true that both Deleuze and Badiou inscribe being in a metaphysics of the multiple, or of multiplicity. Being not only is multiple, but it is actually a multiple of multiples. No matter how far you go, in strictly ontological terms you never reach a substantial halting point, except the void: in Badiou’s case, the empty set or null set, marked \(\emptyset\). This is one of the possible readings of the death of God, namely, the One “is” not. Being is multiple, not One. But Badiou’s ontology more specifically takes as its point of departure an “originary scission” or Two at the very heart of being \(qua\) multiple, namely, the split between inconsistent and consistent multiplicity. It does so, moreover, by claiming that mathematics is the discourse of ontology.

For Badiou, mathematics in its unfolding historicity, from the ancient Greeks to the distinctly modern revolutionary invention of set theory after Georg Cantor, says everything that can be said about being \(qua\) being. This claim marks the shockingly ambitious opening wager of his undeniable masterpiece *Being and Event*:

> Our goal is to establish the meta-ontological thesis that mathematics is the historicity of the discourse on being \(qua\) being. And the goal of this goal is to assign philosophy to the thinkable articulation of two discourses (and practices) which are not it: mathematics, science of being, and the intervening doctrines of the event, which, precisely, designate “that-which-is-not-being-\(qua\)-being.”6

*Logics of Worlds*, as a matter of fact, proposes a theory of appearing (or “great logic,” as opposed to logic in the “small” sense of a combination of linguistic or grammatical rules) to supplement the theory of being (philosophy as “metamathematics” or set-theoretical “metaontology”) expounded in the first volume of *Being and Event*:

If *Logics of Worlds* deserves the subtitle *Being and Event*, it is to the extent that the traversal of a world by a truth, initially grasped in its type of being, this time finds itself objectivated in its appearing, and to the extent that its incorporation into a world unfolds the true in its logical consistency. (LW 38)

Prior to thinking logical consistency, however, the question is how to develop an ontological discourse based on sheer inconsistent multiplicity, when everything that presents itself belongs to consistent multiples.

Badiou thus affirms that even if the One “is” not, “there is” One. This means that oneness is only the effect of an operation that counts-as-one, whatever there is in a given situation. Consistent multiplicity presents multiple ones, counted as so many x’s or y’s. Whatever precedes the operation of counting itself, the stuff that is pure inconsistency without one, remains strictly speaking out of reach of all presentation. To accomplish the difficult task of thinking inconsistency, therefore, will involve the entire trajectory of Badiou’s thinking, from the dialectic of void and excess all the way to the theory of the subject of truth in the final meditations of *Being and Event*. In fact, unlike what happens in *Logics of Worlds*, which begins by positing a metaphysical theory of the subject from the start, there is a principle of retroactive clarification at work in *Being and Event*, insofar as the earlier meditations become effectively thinkable only under the condition of the later ones. The possibility of thinking inconsistency as such thus arrives in actual fact only if and when there happens to be a subject at work who is faithful to an event.

Before reaching this point we must grasp how, in addition to the division between consistent and inconsistent multiplicity, there is a second split central to Badiou’s philosophical system: the one that separates presentation from representation, or a given situation from the state of this situation. In set-theoretical terms, presentation counts the elements of a set whereas representation counts the parts or subsets of a set. It is a count of the count, not exactly a recount but a peculiar redoubling of the count. Representation thus operates according to the logic of the power set, \( p(\alpha) \), which is the set of all subsets of \( \alpha \). It does for inclusion (\( \subset \), or “is a subset of”) what presentation does for belonging (\( \in \), or “is an element of”), without for a moment undoing the fact that the latter defines the only verb of the ontological discourse for Badiou. It is one thing, for example, to count the members or citizens (elements) of a nation, and another to count them a second time in terms of groups or classes (parts), according to age, race, occupation, sexual orientation, legal status, and so on. In fact, Badiou argues that the political state typically wants nothing to do with singular members but only with classes, or interest groups, which is why the play on the double meaning of the state, both in its strictly political sense, as “State,” and in its
everyday usage, as in “a state of affairs,” is justified. In set theory, the pivotal theorem of excess then holds that there is an inevitable excess of parts over elements, of inclusion over belonging, or of representation over presentation pure and simple: \( p(\alpha) > \alpha \). This is not only intuitively clear for finite situations, insofar as anyone can grasp that there are more ways of grouping the elements of a set into subsets than there are elements in the original set: far more importantly, set theory – in an event of its own – also demonstrates formally that, in the cases of infinite sets, there is no way to measure by how much the cardinality of the power set exceeds the cardinality of the original set. Badiou calls this the “impasse” or “deadlock” of ontology: “The gap between \( \alpha \) (which counts-as-one the belongings, or elements) and \( p(\alpha) \) (which counts-as-one the inclusions or parts) is, as we shall see, the point in which the impasse of being resides” (BE 83). This impasse is quite literally the turning point around which pivots the whole conceptual artifice of Being and Event.

Thus, in the ontological investigation, any attempt to present being qua being, that is, any attempt to present presentation itself, hits an insurmountable obstacle in the guise of the excess of representation over presentation pure and simple. What seems at first to be an utter obstacle, though, quickly turns into an enabling moment that will trigger pure inconsistency itself, so to speak, to come to pass “in person,” at least if we keep in mind that \( \text{en personne} \) can also signify “in nobody” or “anonymously” in French. To understand this move, it is essential to add that the excess of representation over presentation that constitutes the impasse of ontology is not in turn a purely structural given. It is not simply of the order of the always-already in the sense of a deconstructive orientation; rather, what seems to be a structural impasse both signals and requires at the same time the exceptional intervention of a subject. The excess of any structure of representation over and above its own resources, in other words, is a question of a rare and contingent occurrence. It appears only where something happens that goes against the state of what is normally given. The event is this something, which is almost nothing, but which suffices to trigger a radical transformation of the situation as a whole: the supplement of what happens over and above what is. However, an event, too, is in some way split. It is not a miraculous or mystical occurrence coming from beyond but something that always happens, whenever it does happen, within a singular situation in this world. What makes such a happening into an event for a given situation is its evental site that is symptomatic of the situation as a whole. Thus, on one hand, an event certainly can be seen as purely self-referential; ontologically speaking, self-belonging is even the only feature – condemned in set theory – that describes the event. On the other, though, it is tied to the situation by way of the evental site whose elements it mobilizes and consequently raises from minimal to maximal existence. And of the evental site, perhaps symptomatically, there is no matheme.
A truth, then, is the sum of consequences that can be drawn from the faithful investigation of the situation from the point of view of its supplementation by an event. The most important feature of a truth is its generic nature. In set-theoretical terms, a generic set is one without attributes or predicates that would define “what” counts as an element of the set. Badiou, referring to the mathematician Paul Cohen’s 1963 proof of the existence of generic sets, names this the one notion that sums up all *Being and Event*. This is because a truth, understood as a process or procedure instead of as a property of logical statements in the narrow sense, investigates and treats a given situation from the point of what is most generic, indistinct, or anonymous about it. Ultimately, taking off from the symptomatic site where a certain miscount or impasse uncovers the point where the state of a situation fails to guarantee its own consistency, this amounts to nothing less than a thinking of the being of that situation as pure generic or indiscernible inconsistency. It is also for this very reason that a truth is strictly speaking universal. Not only does it relate to a given situation from what is most anonymous and generic about it, but precisely because no particular attributes are required, such an investigation is also in principle addressed to all.

It is worth stressing, since this is a common misconception, that Badiou does not treat truth as a revelatory or mystical experience of gaining access to being *qua* being. It is not a question of staring ourselves blind on truth as on the sun in Plato’s allegory of the supreme Idea of the Good; sticking to the same allegory, we must also return to the cave of illusory shadows. This is why Badiou introduces both a further scission – this time between truth and truthfulness or veridicality – and a new operation, forcing, which somehow links the two. Forcing, we might say, extending its strictly set-theoretical meaning, is the moment of the putting-to-work of truth: “A term forces a statement if its positive connection to the event forces the statement to be veridical in the new situation (the situation supplemented by an indiscernible truth). Forcing is a relation *verifiable by knowledge*” (BE 403). This is how a truth, which breaks with our current encyclopedia of knowledge, nonetheless produces new knowledges as well.

A subject, finally, is the local instance of fidelity to a truth procedure. “I term *subject* any local configuration of a generic procedure from which a truth is supported” (BE 391). It is the subject who is in charge of investigating the consequences of a truth in the present and forcing its supposed completion back on the situation at hand. For Badiou as for Lacan, the subject is fundamentally split. Unlike Lacan, however, Badiou does not ascribe this split to the individual’s subjection to the law of the signifier but rather to the subject’s incorporation in a truth process, which usually separates a part that is inscribed in normality (the mortal individual or human animal) from the militant part that is involved in the elaboration of the truth itself (the Immortal).
We are now in a position to understand in what sense Badiou's system can be concentrated in a single formulation from *Being and Event*: “The impasse of being, which causes the quantitative excess of the state to err without measure, is in truth the pass of the Subject” (BE 429). This means that in the end, the task of thinking substance and subject at the same time implies, as it were, a barring of both terms of the dialectic. By the same token, we come to understand in what sense philosophy circulates between a doctrine of being and an intervening doctrine of truth, that is, between ontology and the theory of the subject.

Badiou’s philosophical system in *Being and Event*, to put it differently, appears at first to hover around three (and now, with *Logics of Worlds*, four) fundamental concepts: being (and now also appearing), truth, and subject, tied together as if in a Borromean knot by way of a unique doctrine of the event. In actual fact, however, not only are almost all of these concepts subject to a dialectical scission (consistent/inconsistent being, presentation/representation, event/evental site, truth/truthfulness, mortal animal/immortal subject), but there are also a number of intercalated or intermediary concepts (such as the notion of forcing, not to mention points, bodies, and organs, all of which are added in *Logics of Worlds*) without which this philosophy risks lapsing into various forms of idealism or precritical dualism.

Badiou indeed wants his philosophy to be not just dialectical but materialist as well. After having reviewed his teacher Louis Althusser’s canonical works under the title “The (Re)commencement of Dialectical Materialism,” now in *Logics of Worlds* he seems to square the circle with a plea for nothing less than a renewal of the materialist dialectic against the dominant ideological climate that the book calls democratic materialism: “After much hesitation I have decided to name my enterprise – or, rather, the ideological atmosphere in which it gives vent to its most extreme tension – a *materialist dialectic*.”7 Beyond its latest polemical edge, this materialist side of Badiou’s philosophy can be understood on several different levels. Ontologically speaking, for instance, the axiom of separation posits the hypothetical existence of at least one set (the empty set) to which the properties of further operations can be applied. It thus defeats the idealist belief in the all-powerfulness of language that seems to accompany the aftermath of the linguistic turn. In the same vein, logically speaking, the theory of appearing may well amount to a phenomenology but it refuses to give to the subject a constituent role any more so than ontology would to language or to logic in the narrow sense. Badiou also postulates that every appearing is

---

anchored in a minimal component, or real atom, of being. This runs counter to
the whole paradigm of virtuality that runs from Bergson to Deleuze and from
Brian Massumi to Elizabeth Grosz. Finally, and perhaps above all, materialism
also applies to the concept of philosophy itself. For Badiou, philosophy is never
a self-generated speculative discourse but is conditioned from the outside by the
nonphilosophical – aside from being threatened from within, as we will see, by
an antiphilosophical tendency as well.

Thus, we could say that Badiou’s philosophy too presents a “thinking of the
outside,” albeit in a slightly different sense from what Maurice Blanchot or
Deleuze had in mind when they used this expression to describe the work of
Foucault. For Badiou, this supposes, against any and all speculative–idealist
temptations, that philosophy itself does not produce any truth. To believe other-
wise, no matter how flattering it may well seem to the philosopher, always has
disastrous consequences for philosophy itself. A truth always originates in an
event, but philosophy is strictly speaking unable to give rise to an occurrence of
this nature. Events instead happen in the so-called truth procedures, which are
also the conditions of philosophy.

The basic materialist principle behind this conception of the philosophical act
thus holds that truths in the plural are produced outside philosophy in the four
generic procedures of truth that are art, science, politics, and love. What philos-
ophy does rather modestly amounts to developing the conceptual toolbox to
think the truths at work in such scientifc discoveries, amorous encounters, polit-
ical sequences, or artistic confgurations. The task of philosophy, in other words,
consists in creating a conceptual space of compossibility for the various truths
produced in its time. “The specifc role of philosophy is to propose a unifed
conceptual space in which naming takes place of events that serve as the point of
departure for truth procedures,” Badiou afirms in his Manifesto for Philosophy:

It does not establish any truth but it sets a locus of truths. It conff-
urates the generic procedures, through a welcoming, a sheltering,
built up with reference to their disparate simultaneity. Philosophy
sets out to think its time by putting the state of procedures condi-
tioning it into a common place. (MP 37)

In the end, this distinction between philosophy and its conditions is only another
way of afrying the materialist primacy of practice over theory.

Put otherwise, the truths of art, politics, science, and love stand in themselves
as forms of thinking; they need not wait for the philosopher to tell them what
counts as “the political” or “the aesthetic” and so on. But philosophy can think
through such thinking. Badiou proposes for instance that philosophy become
a kind of metapolitics:
By “metapolitics” I mean whatever consequences a philosophy is capable of drawing, both in and for itself, from the notion that real politics are forms of thought. Metapolitics is opposed to political philosophy, which claims that since politics does not think, it falls to the philosophers to think “the” political.⁸

Badiou’s proposal for an inaesthetics,⁹ likewise, is neither an aesthetic theory nor a philosophy of art; and metamathematics, finally, should not be confused with an epistemology or a philosophy of mathematics.

II. GENEALOGIES

A second trajectory, which I would call genealogical, could take us in a number of different directions. There is the question, first, of the continuity or discontinuity in Badiou’s philosophy: whether his work presents some kind of break between an “early” and a “late” Badiou, as historians of philosophy are so fond of establishing in the cases of Wittgenstein or Heidegger or Lacan. I favor a more continuist line of arguing, but this interpretation is by no means uncontroversial, even now that Badiou seems to have joined his voice to those of us who plead for an ongoing renewal of the materialist dialectic. Second, there is also the question of the relation among Badiou’s major works. He himself speaks of “the dialectic between my two ‘big’ books, the old one and the new one,” referring to the two volumes of Being and Event, and thus to the dialectic “of onto-logy and onto-logy, or of being and appearing” (LW 527). But I would make the case that Theory of the Subject, which Badiou himself recently described as his “first ‘big’ book of philosophy,”¹⁰ actually mediates between the other two, insofar as the version of dialectical materialism embraced in this earlier book encompasses a notion of the event – mentioned but not yet fully developed under this name – as both a vanishing cause (the event conceived of ontologically as a flash of self-belonging, an instant that disappears as soon as it appears) and as a new consistency (the event as incorporated logically in a disciplined body that must endure and be able to treat at least a few points). Read in this way, as Badiou’s third “major” book, Theory of the Subject could serve as the very embodiment of the necessary dialectic between Being and Event and Logics of Worlds.

---

⁸ Alain Badiou, Metapolitics, Jason Barker (trans.) (London: Verso, 2005), xxxix (translation modified).
⁹ Badiou’s inaesthetics is discussed in this volume in the essay by Gabriel Rockhill.
In addition to such potentially rather scholastic questions, however, I would also like to propose a slightly different take on Badiou’s genealogical trajectory. This involves studying how, to put it in Nietzschean terms, “he became who he is” by following a spiraling fidelity to three maitres, meaning both “masters” and “teachers,” namely, Sartre, Althusser, and Lacan. Thus, in a rare autobiographical statement, “The Philosopher’s Avowal,” Badiou writes: “There are the immediate teachers, the ones we meet at school; and then there are the philosophical master-teachers. During the decisive period of my formation, I have had three: Sartre, Lacan, and Althusser.”¹¹ Badiou began by thinking that he would follow in Sartre’s footsteps as a novelist, playwright, and committed intellectual. His success as a student of philosophy, however, would decide otherwise for him. Thus, after his entry into the École Normale Supérieure, his encounter with Althusser’s Marxism would force him for years to push the investigation of the structure to the point of its immanent breakdown or deadlock. But, as we saw, this impasse is itself the retroactive effect of a subjective intervention. Thus, whereas Althusser was forever unable to perceive in the notion of the subject anything but an effect of ideology, Badiou finds in Lacanian psychoanalysis a theory of the divided subject with which to supplement the basic principles of structuralist Marxism. Fidelity to the event and its consequences then allows for a renewed understanding of the old notion of commitment that Badiou openly inherited from Sartre: his first and most formidable love, both in a literary and a philosophical sense, perhaps on a par only with Stéphane Mallarmé and Samuel Beckett.

To achieve this seemingly impossible triangulation, finally, we must consider the role of Badiou’s Maoism. Indeed, as I have argued elsewhere, it is the sequence of Badiou’s so-called “red years,” roughly from 1968 until the backlash of 1977 with the arrival of the Nouveaux Philosophes, that alone enables his unique articulation of Sartre, Althusser, and Lacan.¹² Thus, it should not come as a surprise if Logics of Worlds, in which Badiou forcefully returns to the tradition of dialectical materialism, or the materialist dialectic, also begins and ends with reflections on Mao. This is at least in part due to the fact that Badiou himself in more recent years has come to the realization that an effective transmission of his philosophical system also presupposes the transmission of the experiences – be they political or artistic or otherwise – that make up much of its genealogy.

¹² For a more detailed account of Badiou’s Maoist years, see my “Post-Maoism: Badiou and Politics,” Positions: East Asia Cultures Critique 13(3) (2005). This special issue, which is titled “Badiou and Cultural Revolution,” also contains a bibliography of Badiou’s Maoist group, UCFML, or Union des Communistes de France (marxistes-léninistes).
III. POLEMICS

As Badiou’s philosophical system kept spiraling outward, its polemical force also underwent a snowball effect. This then opens up a third trajectory for traversing Badiou’s thinking. From the start, in fact, much of his conceptual labor has been determined by his opponents: adversaries, I should say, more so than enemies, even though there is no shortage of the latter and they are not spared either. It is just that they receive little to no philosophical credit. Even his three master-teachers, perhaps with the sole exception of Sartre, have been the object of frontal assaults and partial criticisms, respectively: Althusser, who is targeted most vitriolically in *De l’idéologie*, and Lacan, throughout Badiou’s writing but most succinctly in *Theory of the Subject*.

Subsequently, Badiou’s polemic with Deleuze, based on a long correspondence and summed up in *Deleuze: The Clamor of Being*, is meant to pinpoint the precise nature of a fundamental divergence – being or life itself as the singular event versus events as breaks with the normal representation of being – in the midst of an overarching convergence regarding philosophy as a metaphysics of infinite multiplicity against the jargon of finitude.13 In addition, much of *Being and Event* (including its title) represents a coming to terms with the “poetic” hermeneutical ontologies of presencing influenced by the work of Heidegger, as opposed to the “axiomatic” metamathematical ontology that Badiou proposes. This last polemic in particular still deserves to be unpacked in greater detail. Finally, Badiou has never ceased writing models of review articles that usually lead to the clarification of an intimate disagreement, particularly in relation to French philosophy.14

Aside from these individually oriented polemics, Badiou’s work has also reopened the debates both old and new with the adversaries of the tradition of philosophy as such. First and foremost among these adversaries, of course, we find the sophists, or those who make up the tradition of what Badiou, in his *Manifesto for Philosophy*, calls the “Great Modern Sophistry” (MP 98). This diatribe against the sophists – including Nietzsche or Wittgenstein as the major figures and Richard Rorty or Gianni Vattimo as minor ones – is what we would come to expect from a self-proclaimed Platonist. Indeed, as Badiou writes in an essay on Lacan, “the antisophistic argumentative rage constitutes the ‘tumos’ of philosophy, i.e., its core of polemical anger, since its origin.”15 Perhaps more

14. Most of Badiou’s reviews and notes on French philosophy are collected in the small volume *Pocket Pantheon*. For a general panorama, see Alain Badiou, “The Adventure of French Philosophy,” *New Left Review* 35 (September–October 2005).
interesting than this age-old rage, though, is the fact that in addition to, and partially overlapping with, the sophists, the adversaries of philosophy in the way Badiou seeks to reground it also include a respectable series of so-called “antiphilosophers.”

In Badiou’s hands, the understanding of antiphilosophy obviously is not limited to the otherwise quite difficult reconstruction of Lacan’s usage of the term. Instead, the category emerges as the name for a longstanding tradition of thinkers who, with regard to the dominant philosophical trends of their time, situate themselves in the strange topological position of an outside within or of an internal exteriority, adopting a range of attitudes that typically oscillate between distance and proximity, adoption of a range of attitudes that typically oscillate between distance and proximity, admiration and blame.

Based on his readings of Nietzsche, Wittgenstein, and Lacan, as well as the occasional reference to Kierkegaard, Rousseau, and St. Paul, Badiou distinguishes a number of features that make antiphilosophy into a coherent tradition in its own right. First, the assumption that the question of being, or of the world, is coextensive with the question of language; second, and as a consequence, the reduction of truth to being little more than a linguistic or rhetorical effect, the outcome of historically and culturally specific language games or tropes that therefore must be judged, or even mocked, in light of a critical-linguistic, discursive, or genealogical analysis; third, an appeal to what lies just beyond language, or at the upper limit of the sayable, as a domain of meaning or sense, irreducible to truth theoretically understood; and, finally, in order to gain access to this domain, the search for a radical act, such as the religious leap of faith or the revolutionary break, the intense thrill of which would disqualify in advance any systematic theoretical or conceptual elaboration. Of course, not all antiphilosophers share these features in their totality, or not to the same extent. Whereas Nietzsche’s filiation with the sophists is explicit in his work, for example, by contrast there are certainly many theses in Lacan’s conception of truth and meaning that bring him closer to an antisophistic stance that every contemporary philosopher, in Badiou’s view, should traverse. In fact, the tension between the first two of these features and the last two produces a characteristic vacillation that, even within the work of a single antiphilosophical thinker, can range from a purely constructivist viewpoint, which reduces truth to what can be discerned in the existing language systems, all the way to the yearning for a mystical beyond, pointing toward the other side of language.

The most important element in the characterization of an antiphilosopher, without a doubt, is the reliance on a radical gesture – the act – that alone has the force of destituting, and occasionally overtaking, the philosophical category of

---

This article is published in a shorter and slightly modified version as “Anti-Philosophy: Plato and Lacan,” in *Conditions*, Steve Corcoran (trans.) (London: Continuum, 2008), 228–47.
truth. In the case of Nietzsche, to give but one eloquent example, Badiou qualifies this antiphilosophical act as “archi-political,” whereby the prefix is meant to draw a clear line of demarcation between the act for antiphilosophy and the event for philosophy – even though the same “events” in the common sense of the word, for instance, the French Revolution or the Paris Commune, may be at stake. Badiou first posits that Nietzsche’s relation to politics, which he sees as significantly overdetermined by 1789 or 1792, is one of rivalry and mimicry. To be more precise, the antiphilosopher is never content with putting his thinking under condition; instead, he will absorb the energy of a given event – in politics or in art or even in love and in science – so as to make it his own. Not only does this entail a significant amount of suturing of philosophy onto the event, but it also goes one step further by turning the ensuing notion – in this case the act that breaks in two the history of the world – into an explosive that can be used both to dethrone traditionally conceived philosophy and to mock really existing politics:

The philosophical act is, I would say, archi-political, in that it proposes itself to revolutionize all of humanity on a more radical level than that of the calculations of politics. From this let us retain that archi-politics does not designate the traditional philosophical purpose of finding a ground for politics. The logic, once again, is a logic of rivalry, and not one of founding oversight. It is the philosophical act itself that is archi-political, in the sense that its historical explosion will show, retroactively, that the political revolution properly speaking has not been truthful, or has not been authentic.16

Badiou draws important lessons from this reading of the antiphilosophical act, first and foremost with regard to the necessary restraint and reserve philosophy should show in front of the events that condition it. Otherwise, the risk is great that only an antiphilosopher’s personal experience can guarantee the authenticity of the proposed break, as in Nietzsche’s Ecce Homo, whereas all philosophy for Badiou presupposes the possibility of separating a truth statement from the question “Who is speaking?” In fact, this decisive role of the speaking subject constitutes a final feature that is typical of antiphilosophy. It reveals the extent to which the experience of a radical act can be transmitted only in a near-autobiographical style that is inseparable from the subject of the enunciation. This explains the experimental, writerly side of antiphilosophers.

present in Nietzsche’s aphorisms, Kierkegaard’s diaries, Lacan’s seminars, or St. Paul’s epistles:

Why? Because as opposed to the regulated anonymity of science, and against everything in philosophy that claims to speak in the name of the universal, the antiphilosophical act, which is without precedent or guarantee, has only itself and its effects to offer by way of attesting to its value.17

In the end, though, the fate of the antiphilosopher may well be to bequeath to the philosopher the task of avoiding the disastrous consequences of claiming truth itself to be within its purview: the disaster, that is, of presenting itself as a truth procedure. As Badiou writes in Manifesto for Philosophy:

The key to this turnabout is that philosophy is worked from within by the chronic temptation of taking the operation of the empty category of Truth as identical to the multiple procedures of the production of truths. Or else: that philosophy, renouncing the operational singularity of the seizing of truths, is itself presented as being a truth procedure. Which also means that it is presented as an art, a science, a passion or a policy. (MP 128–9)

Precisely for this reason, however, the philosopher must stay in the closest proximity to the antiphilosopher, who alone keeps him on guard against the temptations of religion, disaster, or the “service of goods” pure and simple:

I think that all three – but Nietzsche’s case is without doubt the most dramatic – in the last instance sacrificed themselves for philosophy. There is in antiphilosophy a movement of putting itself to death, or of silencing itself, so that something imperative may be bequeathed to philosophy. Antiphilosophy is always what, at its very extremes, states the new duty of philosophy, or its new possibility in the figure of a new duty. I think of Nietzsche’s madness, of Wittgenstein’s strange labyrinth, of Lacan’s final muteness. In all three cases antiphilosophy takes the form of a legacy. It bequeaths something beyond itself to the very thing that it is fighting against. Philosophy is always the heir to antiphilosophy. (Ibid.)

This, in the final instance, would be the legacy that Nietzsche, Wittgenstein, and Lacan bequeathed to all those who seek to (re)affirm the possibility of philosophy today.

**IV. PROSPECTS**

To conclude, let me now turn to the possibility of thinking with Badiou, that is, not just of continuing the exegetical commentary on Badiou's own thinking, but of actually putting his thought to work so as to think the events of our time or of previous times. In the preface to *Being and Event*, Badiou indeed insists that he wants his philosophy to serve as a toolbox to think events in any or all of the four conditions of truth that for him are science, politics, love, and art:

> The categories that this book deploys, from the pure multiple to the subject, constitute the general order of a thought which is such that it can be *practised* across the entirety of the contemporary system of reference. These categories are available for the service of scientific procedures just as they are for those of politics or analysis. They attempt to organize an abstract vision of the requirements of the epoch. (BE 4)\(^{18}\)

While seemingly self-effacing, however, the suggestion of practical availability and service also presents us with a number of problems. Perhaps these problems even amount to authentic aporias – otherwise not a very common term in this thinker’s personal vocabulary – which somehow would be inherent in Badiou’s philosophy: not necessarily shortcomings, but inevitable side-effects of the enormous gravitational pull of his thinking.

If one reads the meditation on Mallarmé in *Being and Event* (Meditation 17), for example, one does not obtain an analysis of Mallarmé as an event in French symbolist or postsymbolist poetry so much as a commentary on Mallarmé as the poet–thinker of the eventfulness (or eventality, *événementialité*) of the event. “A poem by Mallarmé always fixes the place of an aleatory event; an event to be interpreted on the basis of the traces it leaves behind,” Badiou posits at the opening of this pivotal meditation (BE 191).

\(^{18}\) See also, somewhat less modestly, the end of Badiou’s preface to the English translation of *Being and Event*: “I would like this book to be read, appreciated, staked out, and contested as much by the inheritors of the formal and experimental grandeur of the sciences or of the law, as it is by the aesthetes of contemporary nihilism, the refined amateurs of literary deconstruction, the wild militants of a de-alienated world, and by those who are deliciously isolated by amorous constructions” (BE xv).
Of course, it is one thing to read Mallarmé as the poet-thinker of the event-like nature of the event (l’événementalité de l’événement) and quite another to read his work as an event in nineteenth-century French poetry. It is almost, though, as if Badiou’s meditation, by a strange inward necessity, were unable to preserve the radical innovation in the history of poetry addressed by the second reading except by replacing it with, or displacing it onto, the concentrated rigor and self-contained formalization of the first approach.

Something similar happens in the case of Badiou’s sections on Paul Valéry’s Marine Cemetery at the end of Logics of Worlds. Here too the poem is read as a subtle disposition of the different elements and processes involved in the transformative change produced by an event. “This poem is, in our terms, the history of an event,” Badiou writes (LW 455); and in a footnote, he adds that Valéry matches Mallarmé’s extraordinary skills in this regard:

> It is the question of the “pure event” that connects the Mallarmé of A Cast of Dice and the Valéry of Marine Cemetery: under which conditions can the poem capture what lies beyond what is, what purely happens? And what then is the status of thought, if it is true that such a happening strikes at thought’s corporeal support? (LW 516, translation modified)

In both of these cases, poetry is not read as an event so much as in terms of a poetic theory of the event qua event.

Badiou’s readings of Mallarmé and Valéry demonstrate an almost boundless confidence in the powers of thought to think the event, except that, in the process of this demonstration, most events, which are supposed to give rise to the various truths that condition philosophy from the outside, become transposed into so many theories of the event, of truth, of the body, or of the subject, and so on. In other words, it is as if Badiou’s philosophy, instead of serving the truths that are produced outside it in the four conditions or generic procedures, could not avoid looping these instances back onto themselves before tying them in with a strictly intraphilosophical apparatus – namely, his own.19

---

19. When I asked Badiou about this in an interview a few years ago, he admitted that this was indeed a real problem, one “which obviously entails a rather large amount of philosophical appropriation of the condition.” In fact, he added, it might be the only plausible way to argue that his philosophy carries a dogmatic streak in it, insofar as “I submit the condition to the conditioned.” See my “Can Change Be Thought? A Dialogue with Alain Badiou,” in Alain Badiou: Philosophy and Its Conditions, Gabriel Riera (ed.) (Albany, NY: SUNY Press, 2005), 257. I cannot agree, in this regard, with Alberto Toscano’s vote of confidence in Badiou’s “inaesthetics,” in the translator’s note to Handbook of Inaesthetics (Stanford, CA: Stanford University Press, 2004), when he writes: “Rather than seeking to welcome (that is, to absorb)
If these strategies may seem justifiable on the part of a philosopher whose thought operations are by definition unique to philosophy even though they are conditioned by events outside it, there comes a point where such selective appropriations and displacements of the condition back onto the conditioned, or of the events back onto the philosophy of the event, can become real obstacles to that philosophy’s application. Indeed, it is not difficult to imagine how the available options for such an application are reduced to two mirroring extremes. Either we could privilege the systematicity of the philosopher’s conceptual apparatus, in which case the events studied by application actually risk becoming nothing more than illustrations of concepts extrinsic to the events themselves, or we could privilege the radical break introduced by the events in question at the expense of the philosopher’s systematization, in which case the events risk becoming the occasion for a typically antiphilosophical appeal to the ineffable singularity of experience, over and above its impoverished conceptualization.

My proposal for renewing the task of theory, as different from philosophy properly speaking, derives from a desire to trace a diagonal across these two extremes so as to produce an effective and applied thinking of the event that can still learn a great deal from Badiou’s work. I could phrase this by returning to my initial statement that to be a philosopher today means to think the event. We might then ask: Is this also true the other way around? In other words, does thinking the event always require that one be a philosopher? I would argue that theory has a role of its own to play in this context – one comparable to the role of psychoanalysis for the condition of love, or to the role of inaesthetics for art, or metapolitics for politics, when they are not yet equated with philosophy as such. This also means that a theoretical treatment of events that take place within the various truth procedures need not worry about the simultaneous presence and philosophical reflection of all four of them.

Badiou’s requirements for philosophy are perhaps overly demanding if it is our aim to take him up on his offer of applying the conceptual apparatus of Being and Event. In his Manifesto for Philosophy, for instance, he even goes so far as to suggest that, in the absence of a strict compossibility among the truths produced in all four of these conditions, philosophy also ceases to exist. “We shall thus posit that there are four conditions of philosophy, and that the lack of a single one gives rise to its dissipation, just as the emergence of all four conditioned its

the poem into the realm of speculative thinking in a hermeneutic vein, Badiou’s approach is committed both to declaring the autonomy of artistic procedures (poetic or literary, cinematic or theatrical) and to registering what he calls their ‘intraphilosophical effects’” (ibid., x). Or, rather, Badiou may very well be committed to this ideal, but whether he manages to live up to it in his own work is a different question. I would argue, in particular, that Badiou’s Handbook of Inaesthetics and Metapolitics are not quite examples of the method they are meant to introduce in the philosophical treatment of art and politics, respectively.
apparition” (MP 35). I would argue that we need not follow the philosopher in these exorbitant demands. My proposal is rather to work more closely on the conditions, as it were at the grassroots level, all the while trying to stay clear of the pull by which the philosopher almost inevitably seems to tie the conditions back into the conditioned. This task, by which I would redefine the field of theory or critical theory, involves a precarious balancing act between, on the one hand, the quasi-transcendental if not outright transcendent repetition of the essence of the event and, on the other, the empiricist diluting of the event into the prior conditions or prerequisites that explain away the chance surprise of its emergence.  

MAJOR WORKS

20. A version of this article was first presented as a public lecture at the 2006 School of Criticism and Theory, Cornell University. With thanks to this program’s director, Dominick LaCapra, for his kind invitation, and to members of the audience for their numerous questions and objections.

**Thinking the Event**

If, as Richard Rorty suggests, there are three seminal works of post-Second World War English-speaking philosophy that ushered analytic philosophy into its “post-analytic” phase – W. V. O. Quine’s “Two Dogmas of Empiricism” (1951), Wittgenstein’s *Philosophical Investigations* (1953), and Wilfrid Sellars’s “Empiricism and the Philosophy of Mind” (1956) – what could be called, rather unimaginatively, its “post-postanalytic” phase can usefully be understood as working through a certain naturalism about meaning, mind, and reason common to all three.¹ I use the tentative expression “a certain naturalism” because I think there are two different senses of naturalism lurking in these works that need to be separated and whose separation is crucial to understanding how Donald Davidson, John McDowell, and Robert Brandom take up the legacy of Quine, Wittgenstein, and Sellars.²

---

² Donald Davidson (March 6, 1917–August 30, 2003; born in Springfield, Massachusetts) was educated at Harvard University (BA, 1939; PhD, 1949). Influenced by Anscombe, Kant, C. I. Lewis, Quine, Ramsey, Spinoza, Tarski, and Wittgenstein, he held appointments at Queens College, CUNY (1949–51), Stanford University (1951–67), Princeton University (1967–70), the Rockefeller University (1970–76), the University of Chicago (1976–81), and the University of California, Berkeley (1981–2003). He has written more than a hundred articles, which have been assembled in five volumes of collected papers: *Essays on Actions and Events; Inquiries into Truth and Interpretation; Subjective, Intersubjective, Objective; Problems of Rationality; and Truth, Language, and History.*

John McDowell (March 7, 1942– ; born in Boksburg, South Africa) was educated at New College, Oxford (BA, 1965; MA, 1969), where his influences included Dummett, Evans,
I. NATURALISM AND NEO-KANTIANISM: QUINE, WITTGENSTEIN, SELLARS

The two forms of naturalism to be distinguished are the naturalization of meaning, mind, and reason and the naturalistic reduction of them. The first form of naturalism consists in the rejection of transcendent abstrata, like Meanings (with a capital “M”) that are knowable a priori, that bear necessary relations to each other, and that are expressed in analytic statements. Naturalism in this form consists either in rejecting the notion of Meaning as a kind of non-spatiotemporal entity belonging in some extra- or super-natural, Platonic form-like realm or else in rejecting some Cartesian immaterial mind-substance categorically distinct from anything in corporeal nature. Although different, both reject anything beyond the natural and in this respect express a similar form of naturalism: naturalism qua anti-super-naturalism. The second form of naturalism amounts to the denial of any normative-rational dimension to human beings and thus denies a normative-rational dimension to the basic human activities of justifying claims to knowledge, holding contentful mental states, and speaking meaningful language. Naturalism in this second sense consists in reducing (or eliminating) the is/ought, cause/reason, fact/norm distinctions. This form of naturalism is reductive naturalism, naturalism qua non-normativism. Put positively, anti-super-naturalism is the weaker claim that human beings and their rational activities of making claims to knowledge, holding mental states, and speaking a meaningful language, are natural phenomena that belong to, or form a part of, the larger natural world. As natural objects and phenomena inside this larger natural order, human beings and their activities are open to the kind of law-governed explanation that all natural objects are and that natural science strives to uncover. Non-normativism or reductive naturalism is the stronger claim that human beings and their activities are nothing but natural objects and phenomena, that not only are they open to being understood in the vocabulary of the natural science and the explanatory apparatus of natural law, but that they can be exhaustively explained in such terms. Quine advocates both forms of

Hegel, Kant, Rorty, Sellars, Strawson, Wiggins, and Wittgenstein. He began his career as a fellow at University College, Oxford (1966–86), and since 1986 has taught at the University of Pittsburgh. Selected major works include: Mind and World; Mind, Value, and Reality; and Meaning, Knowledge, and Reality.

Robert Brandom (March 13, 1950–; born in New York) was educated at Yale University (BA, 1972) and Princeton (PhD, 1977). Influenced by Dummett, Frege, Hegel, Heidegger, Kant, David Lewis, Rorty, Sellars, and Wittgenstein, he has spent his career, beginning in 1976, at the University of Pittsburgh. His major works include: Making It Explicit; Articulating Reasons: An Introduction to Inferentialism; and Tales of the Mighty Dead: Historical Essays in the Metaphysics of Intentionality.
naturalism, whereas Wittgenstein and Sellars hold the first but not the second; for them meaning and reason are to be naturalized (de-super-naturalized, de-transcendentalized) without being naturalistically reduced. Their position I term neo-Kantianism since it insists on Kant’s distinction between “ought” and “is,” on the irreducibility of “norms” to “facts,” while denying that this irreducibility requires the positing of another, transcendent realm or immaterial substance wherein such norms exist or subsist. Thus, Wittgenstein and Sellars prise apart the issue of the normativity of meaning and reason from commitment to a two-world/two-self metaphysic, arguing that meaning and reason can be de-transcendentalized without being stripped of their normative character.

Quine’s epistemic holism is the basis of his commitment to the first sense of naturalism. Epistemic holism, the thesis that sentences go to experience all at once for confirmation or disconfirmation, has the consequence that all sentences are open to revision on the basis of experience; that is, none are analytic, a priori, or necessary. In the context of radical translation, this leads to translational inde Terminacy: that “There is a rabbit” and “Gavagai” are assented to and dissented from under the same sensory conditions (which is what experience comes to in this context) need not entail they have the same meaning, since this experiential datum is compatible with “Gavagai” meaning “There is an undetached rabbit part” or “There is a stage in the history of a rabbit,” and so on. Hence Meanings – what such analytic hypotheses of a translation manual express – are indeterminate. If Quine’s holism leads to this weaker sense of naturalism, his scientism commits him to the stronger sense: not just to the elimination of Meanings but to the evacuation of meaningfulness (intentionality, normative-rationality) from the activities of justifying claims to knowledge, holding contentful mental states, and speaking a meaningful language. Epistemology becomes “naturalized epistemology”: the theory of knowledge becomes the merely descriptive enterprise of reporting how we in fact arrive at our beliefs rather than the normative enterprise of determining whether how we arrive at them is how we (rationally) ought to. Philosophy of mind becomes behaviorist psychology, where intentional mental

Quine’s adoption of radical translation as the methodological starting-point for inquiring into meaning immediately de-transcendentalizes or pragmatizes it because it holds that all there is to the meaning of a sentence or mental state (whether another’s or one’s own) is whatever the practice of giving the meaning, that is, radical translation, can recover of it. This has the effect that conclusions at the level of the epistemology of meaning (whether we can know the meaning) are immediately conclusions at the level of the metaphysics of meaning (whether there is any meaning to be known), and that they apply in the first-personal case as well as the third-personal case: “radical translation begins at home” (Willard Van Orman Quine, Ontological Relativity and Other Essays [New York: Columbia University Press, 1969], 46).
states, such as beliefs and desires, get understood in purely behaviorist terms of
correlations between (dispositions to) gross bodily behaviors and sensory stim-
ulations, and as a consequence their intentionality is eliminated. Philosophy of
language becomes a kind of behavioral sociolinguistics: the theory of meaning
becomes nothing more than the activity of correlating a translatée’s assent/dissent
behavior in response to sensory stimulation with a translator’s; understanding
and speaking a language is no longer considered an essentially meaning-
freighted activity; it is just the acquiring of certain regular correlations between
sights (stimulations) and sounds (verbal responses), and thus as an activity is no
different in kind from a parrot vocalizing or a dog heeling on command.

Wittgenstein and Sellars both embrace the first form of naturalism; they part
company with Quine in resisting the second form. For Wittgenstein as for Quine,
if the meaning of a term is understood as transcendent to use (i.e. as Meaning),
as some kind of rule over and above ordinary use that lays down in advance of
use what the term means, then meaning so conceived is indeterminate. Hence,
Wittgenstein advocates a use-based account – the meaning of a term depends
on how the linguistic community in fact uses the term – which expresses his
commitment to the de-transcendentalization of meaning (the elimination of
Meaning) since it locates the meaning of a term in the actual *de facto* uses made
of it by language users. However, while locating meaning in actual practices of
communal linguistic use, Wittgenstein, unlike Quine, does not want to reduce
meaning to mere regularities in communal linguistic behavior, for this would
rob meaning of its essential normative dimension: if meaning were identified
with actual regularities in use, then since actual uses contain mistaken uses, such
an account would build mistakes into the meaning of a term, which would in
turn mean that there is no such thing as the correct, determinate meaning of a
term. To obtain the neo-Kantian position that makes meaning *dependent on* but
*not reducible to* regularities in actual communal use, Wittgenstein’s key notions
of custom, practice, and form of life are conceived in normatively rich rather
than naturalistically reduced terms, not as observable regularities in community-
wide linguistic behavior resulting from stimulus–response conditioning, but as
*normatively structured* regularities instilled through practices in which masters
*instruct, evaluate, correct*, and so on, novices in the use of terms. In doing so
they point the way to showing how the normativity of meaning can be natural-
ized (found in actual use) without thereby being naturalistically reduced.

Sellars’s attack on the “Myth of the Given” is similarly an attack on reductive–naturalistic accounts of meaning and knowledge, for his problem with
“the Given of experience” acting as a foundation for meaning and knowledge is

---

that it fails to attend to the normative-rational dimension of these phenomena. Although animals and machines, like persons, are sensation-capable, that is, they can register the impacts of the experiential “given,” there is a fundamental difference between the person who says “This is red” when having a red experience and the parrot trained to produce the sounds “T-h-i-s-i-s-r-e-d” when the red light flashes, or the photocell rigged up to a speaker that stutters the same sounds when a red object passes before its sensor. The difference is, he thinks, that the content-bearing (intentional) states of the person essentially bear normative-rational (e.g. logical and epistemological) relations to other contentbearing states: the thought that this is red entails the thought that this is colored, is compatible with the thought that this is round (and also with the thought that this is not round), is contradictory with the thought that this is green, provides evidence for the thought that this is not a Granny Smith, and so on. These logical and epistemological relations, which are distinctive of intentional activity, are normative in that if one has the first thought one ought (rationally) to have the other thoughts, independently of whether one does in fact have them. As such they express relations that cannot be completely captured by natural laws that operate at base with the category of temporal sequence; that is, when this happens that will happen, for whether or not one does as a matter of fact have the thought that this is colored after having the thought that this is red, nevertheless the latter thought ought (rationally) to be had. In this way, Sellars argues that what is distinctive of contentful states is that they bear these normative-rational relations to each other, that they have a location in “the logical space of reasons,” which cannot be reduced to the natural lawlike relations of before and after, or cause and effect.6 For Sellars, it is because “the given of experience” can only stand in temporal or causal relations, rather than normative-rational relations, to content-bearing states that it cannot be the foundation of such (normative-rational) content-bearing states, and thus why any attempt to derive content from “the given” would be “of a piece with the naturalistic fallacy in ethics,” that is, attempting to derive “ought” from “is”.7 Furthermore, this normative

7. *Ibid.*, 19. Sellars readily acknowledges that his critique of “the Given” reprises Hegel’s critique of Sense-Certainty in the *Phenomenology*: experiences must be contentless if they are to be certain, but experiences that have no content cannot enter into logical or epistemological relations with beliefs. Hence they are unable to serve as semantic or epistemic foundations. For example, in the opening section of *Empiricism and the Philosophy of Mind*, Sellars refers approvingly to Hegel as “that great foe of ‘immediacy’” and characterizes his work as continuing the assault on “the Given” initiated by Hegel (*ibid.*, 14), and later, he refers to his attack on the given as an “incipient Méditation Hégélienne” on the notion (*ibid.*, 42). McDowell and Brandom, who are heavily influenced by Sellars, also see their work having deep affinities with Hegel.
dimension of beliefs and utterances, this locating of a belief or utterance in the logical space of reason, which is constitutive of its being contentful in the first place, is understood by Sellars to be socially achieved. One learns the meaning of color words, and thus grasps color concepts and forms justified beliefs about the colors of things, from others – for example, from those who have already mastered the language game of color predication – through practices of instruction, evaluation, correction, and so on. So for Sellars, as for Wittgenstein, content is constituted by normative-rational relations that in turn are constituted in the actual social practice of language learning where the inferential and epistemological relations that judgments bear to each other are instilled.

A central theme of Davidson’s, McDowell’s, and Brandom’s work is that each in its different way aims to elaborate this Wittgenstein–Sellars-initiated, neo-Kantian middle ground that accepts the Quinean abandonment of a transcendent-to-practice notion of meaning (anti-super-naturalism) while rejecting the elimination of normativity (non-normativism): Davidson in the subtle treatment of the relation between reason and cause that emerges in his charity-constrained, triangulated account of radical interpretation; McDowell in the role that “second nature” plays in his naturalized Platonism; and Brandom in the social-fallibilistic character of his deontic scorekeeping account of meaning.

II. DAVIDSON: CHARITY AND TRIANGULATION

While Davidson has much in common with his teacher, Quine, there are crucial differences between them in their general philosophical outlooks and conclusions. The commonalities concern their shared methodological starting-point of radical translation (or radical interpretation) and their agreement over the core doctrine of holism. These have the effect of committing Davidson to the Quinean conclusions of the rejection of the analytic/synthetic (a priori/a posteriori, necessary/contingent) distinction and the elimination of Meanings (meaning indeterminacy). As such, they express Davidson’s commitment to a general de-trascendentalization of meaning and reason, and so to naturalism qua anti-super-naturalism. Two central differences concern the difference in the data on which radical interpretation/translation is based and the different status that the principle of charity has in radical interpretation/translation. These differences signal Davidson’s commitment to the essential normative-rational character of meaning and belief and thus mark his refusal to have the naturalization of meaning and reason lead, as it does in Quine, to the naturalistic reduction of meaning and reason. Hence, they express his neo-Kantianism: his resistance to naturalism qua anti-normativism while at the same time embracing naturalism qua anti-super-naturalism.
Even though Davidson more or less adopts the Quinean methodological starting-point of radical translation, at the outset there is a highly significant modification in his conception of the data available to the radical translator, which gets signaled in his terminological shift from “radical translation” to “radical interpretation.” As against conceiving of the data as a speaker’s assent/dissent behavior under certain sensory stimulations, Davidson takes the data of radical interpretation to consist in a speaker’s *holding a sentence true* when certain conditions obtain *in the world*. That is, not only is there a difference between them over what the speaker is responding to (not the experiences of speaker, i.e. states of affairs in the world *-as-they-affect-the speaker*, but states of affairs in the world *itself*), the nature of *what* the response is is also different (not verbal behavior, i.e. mere noise production, but the attitude of holding true). The difference is that the attitude of holding true, as opposed to the mere production of noise, is minimally contentful; it is not dumb sounds but a state with a content – namely, *that* a certain sentence (whatever it means) is meaningful, is being held true. It signals at the outset of Davidson’s account that the data of radical interpretation are not to be understood, as they are for Quine, in the very stripped back, reductive-naturalistic terms of physical noise in response to sensory stimulation, but rather as intentional.

The other major difference between them concerns the status of the principle of charity as a constraint on radical translation/interpretation, and this difference brings to center stage Davidson’s irreducibly normative-rational conception of human beings and their activities as against Quine’s reductively naturalistic conception. In order to resolve the impasse in translation/interpretation created by the holistic interdependence of meaning and belief, both think that the translator/interpreter is to employ the principle of charity. The principle of charity obliges the translator/interpreter to make a charitable assumption about what the speaker believes – the charitable assumption being that the translator/interpreter is to attribute true and/or rational beliefs (according to the interpreter) to translatees/interpretees *in the main*, and on the basis of this, use the speaker’s assent/dissent behavior or what the speaker holds true to determine what the speaker’s utterances mean. The difference between them arises over the force of the obligation to translate/interpret charitably. For Quine, the constraint to translate charitably has at most a pragmatic force: one should translate others charitably (e.g. as not believing contradictions, as holding beliefs about rabbits rather than undetached rabbit parts or time-slices of rabbits) if one wants to interact with them in a hassle-free way. For Quine, it is *possible* to translate others as holding mostly false and irrational beliefs by our lights; it is just that pragmatic considerations to do with ease of understanding and facility in communication and interaction counsel one against doing so. For Davidson, on the contrary, this is not possible: interpreting them in a way that has them holding false or irrational beliefs in the main either
means that one’s interpretation is thereby wrong or the creatures we are interpreting are not creatures engaged in belief-holding, language-using activities after all. The principle of charity not merely has hypothetical, pragmatic force but is a categorical, constitutive constraint on interpretation: interpreting them so that, for example, their beliefs abide by noncontradiction or that they hold beliefs about whole rabbits rather than about spatial or temporal parts of them, in the main, is required not merely if one wants to understand them more easily, but if one is to find them understandable at all, that is, if they are to be belief holders, creatures capable of meaningful or interpretable activity period.

Davidson’s theory of belief and meaning attribution, then, gives an essential role to normative-rational considerations, for to insist that charity is constitutive of interpretation is just to insist that normative rationality is a constitutive constraint on holding beliefs or speaking a language. It means that for Davidson these human activities are a lot richer than a purely reductive–naturalistic account would have it, involving in addition an irreducible normative-rational dimension. This is Davidson’s neo-Kantianism since it insists on the Kantian conception of human beings as essentially rationally autonomous agents and not merely causally determined or law-governed objects. However, this needs to be handled carefully: while distinguishing reason from cause, or the normative from the nomological, Davidson needs to be careful not to completely exile them from each other for this risks making reason completely other to nature and thereby courts a form of super-naturalism about meaning and reason, the avoidance of which is necessary if he is to maintain the Quinean naturalized position on Meanings to which he is also committed. That is, if Davidson is to tread the fine line of holding the first sense of naturalism while denying the second, he owes us an account of how he can have normative-rational relations without positing

8. Like radical translation, radical interpretation and the principles that govern it result in metaphysical as well as epistemological claims about meaning (see note 4). Consequently, I move between epistemological formulations of the thesis that charity is constitutive of content (e.g. what it is to attribute beliefs or take someone to be a belief holder) and metaphysical formulations of it (e.g. what it is to be a belief or believer).

9. Donald Davidson, “Radical Interpretation,” in *Inquiries into Truth and Interpretation* (Oxford: Clarendon Press, 1984), 137. The various features of Davidsonian charity can be seen to mirror some core concepts of Gadamerian hermeneutics. In attributing to interpreters what interpreters find true or reasonable, and in this attribution being a condition of interpretation rather than something interpretation may or may not bear out, charity functions very much like Gadamer’s notions of tradition or prejudice: the inescapable background of basic beliefs that an interpreter cannot help but bring with her to any attempt to understand another person or text. In addition, charity in both these respects resembles what Gadamer calls a “hermeneutics of trust”: the fundamental presupposition or trust that others have a basic sensibleness to them, or that they share a world with us (whatever the differences in beliefs about this world there may be between us), which is necessary for understanding others to be possible in the first place.
an other-worldly realm or substance, or, put conversely, he needs to show us how normative-rational relations are in some sense continuous with ordinary, natural-worldly phenomena and relations, while not thereby being reduced to them. The causal principle of content determination, which gets its full elaboration in the theory of triangulation, is where this subtle position on the relation between reason and cause, the normative and the natural, gets worked out.

On Davidson’s fully fledged triangulation account of content determination, the content of a belief and the meaning of an utterance are the result of a process of triangulation between the world, the speaker/interpretee, and the hearer/interpreter. The causal principle forms a part of the triangulated process, and as a constraint on interpretation says that the content of a belief (and hence the meaning of a sentence) is determined by what state of affairs in the world causes it. The basic idea is that an interpreter, by knowing what conditions obtaining in the world cause him to hold true a belief or sentence of his own language, and by noticing that an interpretee holds true an utterance of his own language under the same conditions, puts forward the interpretative hypothesis that the meaning of the interpretee’s utterance is the same as the one he utters under those same conditions. In this way an interpreter can figure out the meanings of an interpretee’s beliefs and sentences (knowledge of another’s mind) by using his knowledge of a common world about which both interpreter and interpretee are speaking and holding beliefs (knowledge of the world) and his knowledge of the language-world relations of his own language (knowledge of his own mind). While this is the basic strategy, matters are not nearly so simple: the above account makes it seem as if one first had independent knowledge of the contents of one’s own mind and language as well as independent knowledge of the external world (by simply being in causal contact with it), from which one then gains knowledge of other minds. However, rather than seeing knowledge of other minds as dependent on these other two kinds of knowledge, Davidsonian triangulation contends that knowledge of the content of our own mental states, knowledge of the mental states of others, and knowledge of the external world all come into being together. In particular, knowledge of other minds is implicated in knowledge of one’s own mind and knowledge of the external world: the intersubjective is not dependent on the subjective and objective; rather, there is an interdependence between the subjective and the intersubjective and an interdependence between the objective and the intersubjective. I will look at the reasons behind each interdependence and in doing so show how the subtle position on reason and cause emerges.

While the term “triangulation” appears in Davidson’s later work, its presence is discernible in his earlier, constitutive charity account. Regarding the.

---

10. It first appears in the 1983 paper, “A Coherence Theory of Truth and Knowledge,” after which it gets more constant discussion in, for example, “Epistemology Externalized” (1990),
interdependence of the subjective and the intersubjective, this is present at the outset in the methodological standpoint of radical translation, for if in general whatever there is to the content of mental states and the meaning of sentences is whatever can be recovered from the third-personal position of the radical interpreter, then not only would others not be belief holders or language users unless they were interpretable by one, but also one would not be either unless interpretable by others. Like Quinean radical translation, Davidsonian radical interpretation “begins at home.” Davidson’s reason is the familiar Wittgensteinian one against the possibility of a private language: if one by oneself were the authority on the contents of one’s own mental states and utterances, then whatever seemed to one to be their meaning would just be their meaning, and therefore they would not mean anything determinate at all. It is only if there is another present to interpret what their content is that there is any chance of an independent check on their having a stable, determinate content, even to oneself. Thus, one’s having contentful mental states and one’s speaking a meaningful language requires the other; determinate subjective content requires intersubjective interpretation.

Furthermore, being interpretable to another requires a common world that both speaker and hearer are responding to, talking about, holding beliefs concerning. It cannot be based on subjective experience for the reason just outlined, which is why Davidson takes the data of radical translation to be holding sentences true in response to states of affairs in the world and not to experience (sensory stimulation). In his later work, this requirement gets expressed in the causal principle: that the contents of others’ (and one’s own) beliefs and utterances are what cause them in the objective world. Thus, the objective is required for the intersubjective. However, what the objective cause is of each of our mental states and utterances cannot be straightforwardly identified, this time for familiar Quinean–Davidsonian reasons: whenever we are in causal contact with whole, spatiotemporal objects, we are in causal contact with undetached parts of them, time-slices in the histories of them, and so on. Although the requirement that the cause be something objective or common to both of us rules out any subjective causal antecedent in the form of experience, this still leaves a multitude of objective causes to choose among. In order to fasten on whole objects rather than undetached parts or time-slices of them as the cause (and thus the content) of the mental states and utterances, interpreters need to make an assumption about what normative similarities in the world interpretees are responding to: namely, that interpretees respond to the same

saliencies in the world that interpreters do, that they live in the same similarity-spaces as interpreters do (e.g. that they notice and respond to whole objects, not undetached parts or time-slices of them). Unless this assumption is made, there is no way for the causal principle alone to determine what the objective cause and thus content of the belief or utterance is. That is, in order to have any determinacy in the identity of the objective cause we need to mobilize the whole intersubjective, charity-constrained apparatus of radical interpretation: that interpretees believe what interpreters do in the main, that interpretees hold obvious (to interpreters) empirical beliefs, that what they are causally responsive to is what we are, namely whole objects rather than spatial or temporal parts of them. Objectivity is thus dependent on intersubjectivity: the objective cause is not something directly identifiable by speakers and hearers, but rather is a construct of the entire intersubjective, triangulated, normative-rational process of interpretation.

Of course with the introduction of the causal principle in triangulation, a question arises about its compatibility with the principle of charity, which is the familiar question of the compatibility of reason and cause. For if content is constitutively constrained by charity, content is determined by normative-rational factors: what one believes is, for the most part, what one rationally ought to believe. However, if the causal principle governs content attribution, content is determined by a causal relation between a belief and the states of affairs in the world that cause it: what one's beliefs are about are what in fact cause them in the world. The first determines the meaning of sentences and the content of beliefs by means of a normative-rational mechanism; the second according to a facto-causal mechanism. The problem is that these mechanisms or principles need not coalesce, which is just to hold that reasons are distinct from causes: the cause of a belief need not provide a good reason for it, and thus the belief attribution demanded by normative-rational considerations need not be the belief attribution suggested by consideration of the causal factors. Davidson's way round the tension involves recognizing the difference between claiming that reason and cause are distinct and claiming that reason and cause are incompatible: to say they are distinct is merely to say that they need not go together, whereas to hold they are incompatible is to hold that they cannot go together. The first, unlike the second, allows for the possibility that they can go together, that reasons can be causes.11 Although we cannot infer from the fact that something is a cause of a belief that it provides good reason for it (because of the distinctness of reason and cause), likewise we cannot infer from the fact that something is a cause of a belief that it is thereby not a reason for it (because in being distinct they are not

11. This position, that reasons, while distinct from causes, can nevertheless still be causes, is the cornerstone of his philosophy of action.
thereby incompatible). Reason and cause, although distinct, are not incompatible; rationality, although distinct from and thus irreducible to causality and the realm of the natural, is capable of coexisting with it: it does not require anything super-causal or super-natural. It is this insight on the subtle relation between reason and cause that emerges from Davidson’s theory of content, which paves the way for his neo-Kantian middle position: one that allows him to hold that there is an irreducible normative-rational dimension to human beings and their meaning-bearing activities without having to posit anything beyond the natural. This middle position is even more evident in his philosophy of mind: anomalous monism, as the name suggests, is a form of nonreductive physicalism that aims to combine physical monism (i.e. anti-super-naturalism) with the idea that there are no strict type identities obtaining between the mental and the physical (i.e. antireductive naturalism).

III. McDowell: Naturalized Platonism and Second Nature

The problem that McDowell explicitly addresses in *Mind and World*, a problem he takes to arise with the modern scientific revolution of the seventeenth century and its attendant “disenchantment” of nature, is the problem we have been focused on: the problem of providing an adequate account of the place of rational, intelligent, meaningful activities in a thoroughgoing natural world. At the outset, McDowell signals his commitment to de-transcendentalization for he refuses to configure the problem in Cartesian “substance” terms of how two categorically distinct substances fit in the same world, preferring instead the de-reified, Kantian–Sellarsian terms of types of processes or “kinds of intelligibility”: how rational processes (e.g. thinking and speaking a language) fit into a realm of thoroughgoing natural processes, or how two different kinds of intelligibility – the kind that belongs to “the space of reasons” and the kind that belongs to “the realm of law” – that cannot be reduced to one another can nevertheless apply to one and the same process (thinking or speaking) or thing (human agent). Seeing the problem in these de-reified terms immediately makes space for a middle position between Platonism (or dualism) and reductive naturalism, for rather than there being two metaphysically distinct regions or things, there is just one process or thing, and a natural empirical process or thing at that, which is open to two ways of being understood.

The structuring dilemma of *Mind and World* is the one that structures this essay; indeed, my understanding of the contemporary landscape of Anglo-American philosophy is indebted to McDowell. The horn of the dilemma I call reductive naturalism is McDowell’s “bald naturalism,” and the horn that I call super-naturalism McDowell refers to as “rampant Platonism.” McDowell’s
term for the middle position between the two horns is “naturalized Platonism.” Naturalized Platonism aims to respect rationality, the production and consumption of meaning, as *sui generis* (and thus avoid bald naturalism) while insisting that such states and activities are part of, arise in, and reflect features of our natural way of living (and thus avoid rampant Platonism). His strategy is to link reason and nature not by relocating rational thought and intentional activity within the bounds of the realm of law (*à la* reductive naturalism), but by expanding the bounds of nature to include more than the realm of law. The key concept that is to effect this reconception of the natural, this expansion of nature beyond the realm of law, is the concept of “second nature.” This notion of second nature is the notion of normative nature: the idea that the domain of the normative (rational thought or intentional activity generally) is natural. Both parts of the term “second nature” are important for showing how naturalized Platonism is meant to avoid bald naturalism and rampant Platonism. To insist on a *sui generis* domain of the normative or the rational, and hence resist reductive naturalism, seems to force one into rampant Platonism: the postulation of an ideal realm of meanings and normative-rational relations radically disconnected from what goes on in the natural, phenomenal world. In order to avoid the metaphysical postulation of a Platonic other-world of ideal rational relations, the normatively constrained ideal space of reasons must be natural in some way, but not in the way that a rock’s falling to the ground is (which might be thought of as a paradigm of a process of “first nature”). If it were, rational processes would be understood in the same general law-governed terms and McDowell would be advocating some form of reductive naturalism. Call this other sense of nature, in which thought and other intentional activities are natural, “second nature.” In short, the “nature” part of “second nature” is important in order for McDowell’s naturalized Platonism to avoid rampant Platonism; and the “second” part of “second nature” is important for his view to extend the notion of nature beyond objects of first nature (i.e. as coextensive with whatever is susceptible to the kind of law-governed explanations characteristic of natural science) to normative phenomena, and hence to avoid bald naturalism.

To expand nature beyond the realm of law, which is what the notion of second nature is designed to do, produces a problem the avoidance of which is behind the original thought that naturalism and rampant Platonism exhaust the space of possibilities in the modern era; it seems to involve a renunciation of scientific modes of explanation of the natural world, “a crazily nostalgic attempt to re-enchant the world” and be a reversion to a medieval way of thinking about nature that divines meaning in “the movement of the planets or the fall of a

What makes bald naturalism and rampant Platonism seem to exhaust the philosophical options for accounting for mind in the natural world in the first place is that any attempt to reconceive or expand nature to include normative phenomena looks like a prescientific re-enchantment of the natural world in which natural objects are understood to be freighted with meaning and purpose. It is therefore incumbent on McDowell to explain this notion of “second nature” that extends without renouncing the modern scientific conception of nature.

While explicitly acknowledging that this concept is drawn from Aristotle’s account of the development of ethical character – “the best way I know to work into this different conception of what is natural is by reflecting on Aristotle's ethics”\(^\text{14}\) – it also counts as part of its ancestry Hegel's notion of *Sittlichkeit* – “I would like to conceive this work [*Mind and World*] as a prolegomenon to a reading of the *Phenomenology*”\(^\text{15}\) – and the Wittgensteinian notions of custom, practice, and form of life.\(^\text{16}\) What all these notions have in common is that they take the normative as irreducible to the natural but as nevertheless arising out of ordinary (natural) human phenomena: namely, historically concrete, socially articulated, normatively structured practices of learning, habituation, and enculturation. Each takes rationality to be a normatively rich, not naturalistically reduced, natural phenomenon, thus as not exhaustively explained by similarities in stimulus–response behavior (Quine) but by similarities in normative nature, by agreements in judgments of normative similarity (Wittgenstein–Sellars–Davidson). They are what constitute McDowellian shared “second nature,” that is, our nature as normatively governed creatures. Hence second nature is that aspect of ourselves constitutive of (practical) ratio-

\(^{13}\) Ibid., 72.

\(^{14}\) Ibid., 78.

\(^{15}\) Ibid., ix. Although McDowell does not explicitly use the Hegelian notion of *Sittlichkeit*, his general sympathy with Hegel and his explicit invocation of the closely related Hegelian notion of *Bildung* make it appropriate. *Sittlichkeit* refers to the customary way of being of a people: their cultural institutions, social mores and roles, and so on. In short, it refers to how a community constructs meaning for itself insofar as this is embodied in historical–social practices and roles. Moreover, in its *ultimate* dialectical form, *Sittlichkeit* refers to a community’s norms once they have been subjected to communal question, dispute, rational examination, and reflection, and adopted on the basis of their being authoritative for this historicized formation of reason. With *Sittlichkeit*, then, Hegel introduces a nonmetaphysical, custom-based, historically situated conception of reason that has both the elements McDowell seeks in the notion of second nature: normativity and no metaphysical inflation.

nality in Kant’s sense, which in being constituted in actual, social practices, is de-transcendentalized.

Similarly, in McDowell’s primary source for the concept of second nature – Aristotle’s account of how an individual can learn to be moral – we get a model for how a natural entity such as a human being can grasp and participate in normatively structured conduct and develop a second (normative) nature. Aristotle’s account of how virtue is acquired explains how ethical demands are recognized as such by ordinary individuals as a result of their exposure to proper upbringing and initiation into the appropriate ethical customs and traditions. Such individuals acquire at the end of this social initiation a reflective awareness of the validity of these ethical demands: not just a recognition of what it is to be virtuous or to have a good character, but also a justification of this (what Aristotle calls “the that” and “the because” of virtue). Ethical requirements are demands of reason that one comes to understand and accept given the right education and socialization (*Bildung*); the right education and socialization enable one to develop a “responsiveness” to the rational-ethical demands (develop “practical wisdom”) and in doing so achieve a rational-ethical character. Moral education, socialization into the right form of life, which is an actual occurrence in the ordinary natural world, produces a rational-ethical nature in a flesh and blood, historico-social human being, that is, in a natural (not transcendent) self who, in developing a sensitivity to the rational requirements of ethical character, is not only subject to a natural-lawlike process but recognizes and responds to the normative demands of ethical-rationality. Hence a non-super-natural process produces an ethical nature, a capacity to be responsive to normative-rational demands constitutive of ethical character. In this account we have the development in natural individuals of second nature, the recognition of what it is to be virtuous and why, which while not to be understood on the model of the lawlike relations between external events (characteristic of first nature), is nevertheless just as much a part of the nature of human beings as getting hungry. Such an account is meant to “naturalize” the space of reasons not in the manner of bald naturalism (i.e. by reducing normative-rational talk to lawlike regularity talk) but by making our normative rationality a perfectly un-special (natural) characteristic of ordinary human development and living, part of the everyday social practices of real human beings.

**IV. BRANDON: DEONTIC SCOREKEEPING**

In Brandom’s monumental *Making It Explicit*, the middle position between Platonic super-naturalism and reductive naturalism about meaningfulness is
also to be won by working out in detail or “making explicit” the Wittgenstein–
Sellars social practice-based account of the normativity of meaning and it has
three central features: pragmatism, inferentialism, and socialized fallibilism. The
pragmatic characteristic of his view consists in his de-transcendentalization of
meaning through the adoption of the Quine–Wittgenstein–Sellars practice-
centered approach of looking for the normativity of the meaning of a term in
our actual use of the term in asserted judgments. On this approach, since the
meaning of a term waits on its use in asserted judgments, judgments that express
the meaning of terms (what pre-Quine would be analytic statements) are deter-
mined by the actual making of judgments employing those terms (synthetic
statements). Thus Brandomian pragmatism can be equivalently expressed, as
Quine’s anti-Platonism can be, as the abandonment of the analytic–synthetic
distinction.

Just as Quine’s abandonment of the analytic–synthetic distinction is based on
holism, Brandom’s pragmatism is closely related to inferentialism (his Sellarsian
term for holism). For Brandom, the thing about judgments is that they are infer-
entially related to other judgments, and the place a judgment occupies in the
web of interrelated judgments is determined by the inferential relations it bears
to these other judgments and that they bear to it. So if a term’s meaning is deter-
mined by its use in asserted judgments, and these are inferentially articulated,
then the inferential relations of judgments that the term occurs in constitute its
meaning. This inferentialist picture of meaning contrasts with the representa-
tionalist account: instead of an assertion, for example, “This is red,” meaning
what it does in virtue of referring to a particular state of affairs in the world,
its meaning is a function of its inferential relations, for example, relations of
implication to other sentences (e.g. “This is colored”), relations of incompat-
ibility to still other sentences (e.g. “This is blue”), and so on. However, these
meaning-constitutive inferential relations should not be thought of in the strict
formal logical way of deductive consequence and contradiction, but as relations
of material inference. Importantly for Brandom, material inferences – infer-
ences from, for example, “X is west of Y” to “Y is east of X,” from “It is raining
in the vicinity of X” to “The roads around X are wet” – are perfectly proper as
they stand; their validity does not derive from the application of a logical prin-
ciple (e.g. modus ponens) after the addition of a suppressed major premise, for
example, “If X is west of Y, then Y is east of X,” or “If it is raining in the vicinity
of X, then the roads are wet around X.” In fact, Brandom suggests the explana-
tory order is the other way round: the validity of deductive logical principles is
based on the self-standing validity of material inferential moves. This explana-
tory prominence given to the proprieties of material inference means that what-

ever normative rationality formal logic has must already be present in material inferential proprieties, and so is in keeping with the pragmatism of looking to actual use and actual inferential proprieties for the foundation of the normative.

These two features of pragmatism and inferentialism naturalize meaning, that is, see it as constituted by actual use and the material inferential relations obtaining in actual use, and in doing so face the usual danger of reductive naturalism (what Brandom calls “regularism”): of identifying meaning with purely de facto regularities in assertional use and inferential behavior, and thereby eliminating its normative dimension. In order to preserve the normativity of meaning and remain faithful to his goal of carving out a middle position that naturalizes normativity without naturalistically reducing it, Brandom introduces into his view a third, normatively imbued, social-fallibilist feature. The pragmatist and inferentialist characteristics of conceptual content are explicated in the deontic (normative) terms of obligation and permission – or as Brandom prefers “commitments” and “entitlements” – that are designed to ensure that actual use and the material-inferential relations obtaining therein are normative from the outset, with the normative element in turn getting a social-fallibilist characterization in the form of deontic scorekeeping.18 This deontic scorekeeping account of meaning normativity involves seeing the material inferential relations between judgments that constitute the meaning of terms occurring in them as commitments and entitlements that a speaker undertakes by asserting a judgment and that are instituted socially by a scorekeeper who assesses (keeps score of) these commitments and entitlements by attributing them to the speaker and by undertaking the same or different ones himself. Speaking a language is thus understood in Sellarsian terms as taking part in “the game of giving and asking for reasons”; indeed, deontic scorekeeping is the attempt to make explicit what goes on in this game, because to make an assertion is to undertake commitments and entitlements, which are things that stand in need of reasons (from other commitments and entitlements) and which can be used as a reason (for still other commitments and entitlements). The normativity of meaning is to be got from this being a reason-giving, reason-requiring activity, where reason in turn is understood in a social, material-inferential way.

The basic idea here is that any given assertion carries with it commitments and entitlements to other assertions: for example, to assert “This is red” is to be committed to “This is colored” and “This is not blue,” and also to be entitled to “This is the color of a ripe tomato,” but it is incompatible with commitments to “This is blue” and “This is not colored,” and so on. This account avoids devolving into a form of reductive naturalism that eliminates normativity because these commitments and entitlements are not identified with those a speaker in fact

18. Ibid., 180–98.
undertakes but those he should undertake, where the ones he should undertake are the ones a scorekeeper attributes to him and undertakes himself. However, in turn, the commitments and entitlements that a speaker should undertake are not identified with those a given scorekeeper in fact attributes and undertakes, for these latter can be kept score of by another scorekeeper’s undertakings of commitments and entitlements, and so on. In this way, the normativity of meaning is preserved, for what commitments and entitlements an assertion should issue in is never identified with what any speaker or scorekeeper takes them to be. The possibility of a gap between the commitments and entitlements undertaken by a speaker and a scorekeeper, as well as between scorekeepers, is what supplies the normative ingredient, and it is an ingredient supplied by the social-fallibilist structure of deontic scorekeeping. Brandom’s idea here is that to avoid reduction of the normative to the non-normative (naturalistic reductionism), one must have the ability to draw the seeming–being distinction, that is, be able to distinguish between what a speaker or scorekeeper believes an assertion commits and entitles the speaker to and what it does commit and entitle the speaker to. And what is needed to draw the seeming–being distinction is a fallibilist conception of any given speaker’s and scorekeeper’s undertakings of commitments and entitlements, since fallibilism is just the idea that one may always be wrong, that how things seem to one need not be how they are. Thus what his social account of normativity requires are the resources to fund a fallibilist conception of any given scorekeeper’s attributions of commitments and entitlements, and Brandom thinks what is needed to fund fallibilism is that deontic scorekeeping have the structural capability to generate ever new and different scorekeeping perspectives. That is, he thinks that it is deontic scorekeeping’s inbuilt fallibilist structure, a structure that guarantees the permanent possibility of further scorekeeping perspectives, that ensures there is a genuine, objective normative dimension to the practice. Objective normative assessment is the result of a structural difference in perspectives between speaker and scorekeeper, and between one scorekeeper and another.19

Hence it is this structural feature of deontic scorekeeping – of providing for the permanent possibility of perspectival differences between commitments and entitlements undertaken by speakers and scorekeepers – that allows for fallibilism and stops the normativity of meaning (which is constituted by these undertaken commitments and entitlements) from simply reducing to the de facto say-so of any particular speaker or scorekeeper. Further, the normativity thus funded is immanent to the social practice of scorekeeping: the seeming–being distinction is drawn not by invoking some independent-of-all-scorekeeping-practices standard of assessment (against which a given scorekeeping assessment

19. Ibid., 597.
can be judged, namely, the Meaning), but rather by having a mechanism for constructing an independent-of-this-scorekeeping-practice standard of assessment by having the permanent possibility (for any scorekeeping assessment) of another scorekeeping assessment against which it can be assessed. Hence the middle position of a naturalized account that at the same time avoids naturalistic reduction is attained: naturalization is achieved by looking for the normativity of meaning, in Wittgenstein–Sellars fashion, solely within the actual social practice of speakers and scorekeepers undertaking and attributing commitments and entitlements in what they assert; and reductive naturalism is eschewed because an objective normative dimension is preserved by the fallibilism of this practice.  

V. CONCLUSION: CONTINENTAL CONNECTIONS

One source of the analytic–continental divide was Russell’s and Moore’s banishing of the British Hegelianism of T. H. Green and F. H. Bradley from its hegemonic position in the British academy in the late nineteenth and early twentieth centuries. The strain of neo-Kantian post-analytic philosophy I have been tracking in this essay welcomes Hegel (at least in the cases of McDowell and Brandom) back into the English-speaking philosophical fold and promises a rapprochement between current Anglo-American and continental philosophy. In endeavoring to delineate a neo-Kantian, neo-Hegelian position that naturalizes (in the sense of socio-historicizing) mind and meaning (Geist) without naturalistically reducing them, Davidson, McDowell, and Brandom represent an important counter-current to the reductive naturalism that has generally pervaded English-speaking philosophy after Quine and which helped to keep the divide in place. Interestingly, it is a reductive naturalism that was not a part of the foundations of the analytic tradition – a founding tenet of the tradition was Frege’s antipsychologism about logic and meaning – but was a positivist-influenced, Quinean addition, which, once jettisoned, reacquaints the tradition with its neo-Kantian, Fregean origins, allowing it again to take seriously Kant’s image of human beings and human activities as essentially rationally autonomous and not merely naturally law-governed. It also brings contemporary Anglo-American philosophy into conversation with the post-Kantian, post-Hegelian traditions in continental philosophy of hermeneutics and phenomenology.

which always took this Kantian point seriously. The fundamental distinction in hermeneutics between Geisteswissenschaften and Naturwissenschaften is rooted in this Kantian insight: it is because mind and meaning are autonomous in Kant’s sense – domains of normative-rational connection rather than simply domains of natural law-governedness – that the “sciences” that study them are different in kind from the sciences of nature. As Davidson might put it, mind and meaning are anomalous (i.e. a-nomological, not reducible to operations describable by natural scientific laws) because they are autonomous (i.e. normative-rational phenomena). Likewise, Husserl’s Fregean rejection of psychologism, which is foundational for instituting phenomenology as a discipline, is precisely a critique of naturalistically reductive conceptions of mind. If phenomenology is “philosophy as rigorous science,” it is because it is not a “rigorous” natural science, but because it rigorously attends, in a way that natural sciences of the mind do not, to the ineliminable intentionality of consciousness, the meaning-laden, normative-rational structures that mediate human encounters with the natural world. In similarly stressing the irreducible normative-rational dimension of human interactions in and with the world, I think it not too much a stretch to speak of Davidson, McDowell, and Brandom as continuing the breakthrough to hermeneutics and phenomenology (already begun by Wittgenstein and Sellars) within Anglo-American philosophy.

23. It may even be a characterization they would embrace. I have noted already McDowell’s and Brandom’s affinity for the continental tradition, especially Hegel; in McDowell’s case this extends to Gadamer (see e.g. McDowell, Mind and World, 115–19), and in Brandom’s to Heidegger (e.g. Brandom, Tales of the Mighty Dead, chs 10, 11). Even Davidson, who had no great admiration for Hegel, had a well-known regard for Gadamerian hermeneutics; see in particular the closing paragraphs of his contribution to the “Library of Living Philosophers” volume devoted to Gadamer, “Gadamer and Plato’s Philebus,” in The Philosophy of Hans-Georg Gadamer, Lewis Edwin Hahn (ed.) (Chicago, IL: Open Court, 1997).
RETHINKING SCIENCE AS SCIENCE STUDIES: LATOUR, STENGERS, PRIGOGINE

Dorothea Olkowski

I. BRUNO LATOUR

At the end of Pandora’s Hope: Essays on the Reality of Science Studies, Bruno Latour1 sums up, succinctly, both the method and result of his account of social theory and science studies. Science studies, he declares, is not critical or debunking; it simply shifts attention from the theory of science to its practice. What looked like different and unconnected theoretical questions turn out, in practice, to be tightly intertwined.2 This simple formulation is the expression of what has been called Latour’s constructivist position with respect to science studies. On the basis of “actor network theory,” which describes the manner in which scientific facts are created by and through networks of human and nonhuman actors, Latour proceeds to an examination and refutation of the avowed modernist distinction between nature and culture.3

1. Bruno Latour (June 22, 1947– ; born in Beaune, France) was educated at the University of Bourgogne and received a doctorat d’état from the University of Tours in 1975. His work was influenced by Marc Augé, Harold Garfinkel, Roger Guillemin, Charles Péguy, Michel Serres, and Gabriel Tarde. He has held academic appointments at the Centre de Sociologie de l’Innovation at the École Nationale Supérieure des Mines (1992–2006), the Jonas Salk Institute for the Biological Sciences (1975–76), the London School of Economics, Harvard University, and Sciences Po Paris (2006– ).
Latour believes that “the only way to understand the reality of science studies is to … pay very close attention to the details of actual scientific practice, the way anthropologists do when they live among ‘foreign tribes’” (PH 24). This requires following scientists into the laboratory or into the field, as Latour does when he accompanies four scientists investigating the shifting boundary between savannah and forest in Brazil, where he, indeed, pays close attention to the details of actual scientific practice. But the questions Latour poses in this situation are those he brings to it: How do these scientists pass from what he calls “ignorance to certainty, from weakness to strength, from inferiority in the face of the world to the domination of the world by the human eye?” (PH 30). In contrast to the completely preconstructed universe of the laboratory, the question of whether the Brazilian savannah and forest are advancing or receding with respect to one another establishes a minimalist laboratory. It is demarcated in a grid of coordinates by the botanist to record the emergence of species and variations of growth. The botanist cuts particular specimens and brings them with her to her local university office. Detached from the forest, the specimens are now separated, preserved, classified, and tagged, then reassembled, reunited, redistributed according to principles developed by the botanist and her discipline. “With so many trumps in hand, every scientist becomes a structuralist” (PH 38) and the forest is “reduced to its simplest expression” (PH 39). For their part, the pedologists organize the space of the forest utilizing surveying techniques (PH 43). The land itself is said to be transformed into a “proto-laboratory – a Euclidean world where all phenomena can be registered by a collection of coordinates” (ibid.). As the soil samples are collected, the geo-morphologist records the coordinates of each location, the number of the hole from which they have been extracted, the time, and depth, as well as any available qualitative data. Once they are collected, she sends the samples to laboratories around the world where chemical composition, grain size, and radioactivity can be measured (PH 46). The upshot of this activity is that every studied aspect of the forest belongs both to the world of things and to that of signs. Science studies is to focus precisely on this hybrid, the materiality of the soil and the coding of the sign.

For Latour, all scientific work in the field and in the laboratory, such as that of Louis Pasteur, also extensively profiled by Latour, raises a fundamental question. This is the question of an “alternative to the model of statements that posit

---

4. Who, we might ask, is foreign?
5. There is no indication from the botanist herself how she sees this activity.
6. Qualitative considerations include texture, color, and earthworm activity.
a world ‘out there’ which language tries to reach through a correspondence across the yawning gap separating the two” (PH 141). In the field, as dirt and plant samples are gathered and studied, “each element belongs to matter by its origin and to form by its destination,” that is, no rupture appears between things and signs and “elementary forms of mathematics … are used to collect matter through the mediation of a practice embodied in a group of researchers” (PH 57–8). Mediation produces what Latour calls a hybrid consisting of form and matter, skilled bodies, and groups arranged in a continuous space-time, a regulated series of transformations, transmutations, and translations. This kind of knowledge does not refer to the world “out there” but to an immanent world that keeps “something” constant through a series of transformations, an immanent world of coherence and continuity, the same meaning through a series of transformations. For example, matching the color of soil samples with a standardized color chart pierced with holes, the material soil samples can be read literally as a text, as belonging to a color code that can be communicated anywhere in the world (PH 58–60). This test is preceded and followed by a multitude of others that, more radically, put a sign in place of a thing. Finally, the signs are assembled and a diagram is constructed that takes the place of the original situation, revealing otherwise invisible features of the savannah–forest transition.

Latour calls this process translation. He claims, initially, to utilize a semiotic model but semiotics operates only within translation. “All reasoning is of the same form; one sentence follows another. Then a third asserts that these are identical even though they do not resemble one another … the second is used in place of the first, and a fifth affirms that the second and the fourth are identical.” In this way, a sentence is displaced and translated, all the while pretending not to have moved, to have stayed faithful. Yet as Latour’s many diagrams attest, there is a structure here as well as a system. For example, not only do the elements of knowledge exist in continuous space-time, but the chain they form conforms to the dictates of dynamical systems as defined by classical physics; it must be reversible, closed, atomistic (consisting of numerous distinct elements or actors in Latour’s terminology), and, within limits, deterministic. Like the atoms described in Newton’s laws of motion, truth must be transportable in either direction along this chain such that “truth-value circulates here like electricity through a wire”; it moves continuously through a closed system or area. Although the chain has no limit at either end, whatever gets added on must participate in

---

7. The elements referred to here are elements presented in a scientific text that includes Latour as an author (PH 56).

the series nature of the transformations in accordance with the elements of the immanent system: locality, particularity, materiality, multiplicity, and continuity at one end; compatibility, standardization, text, calculation, circulation, and relative universality at the other. Each stage is thereby matter for what follows and form for what precedes. The two directions represent the limits of the system, the rules of reduction and realism at one end and amplification and relativism at the other. Once such rules are in place, they remain in place, and the phenomena Latour describes well up in the middle between the two limits, then pass up and down the chain of transformations (PH 70–74).10

If it can be said that a network of actants all contributed to the scientific phenomenon called savannah–forest encroachment, what can be said of Pasteur’s laboratory? “Pasteur encountered a vague, cloudy, gray substance sitting meekly in the corner of his flasks and turned it into the splendid, well-defined, articulate yeast twirling magnificently across the ballroom of the Academy” (PH 145).11 Doing away with the epistemological–ontological divide, as Latour claims to do, entails granting historicity to the humans doing research as well as to the microorganisms they are researching. So Latour states that Pasteur changed the microorganisms by means of a simple recourse to the idea that rather than two realms there are many. In this, Latour bows in the direction of Idealism, returning to humans the possibility of activity without reopening a subject–object dichotomy between nature and mind or society. In other words, action, far from being a property of humans, belongs to an association of actants, human and nonhuman, able to exchange competences and offer one another new possibilities, goals, and functions (PH 182).12 The actants involved in Pasteurization include Pasteur himself, the culture medium, the ferment, the Lille laboratory, the French Academy, and on and on. In place of a single referent, one finds an entire series of transformations that make up the reference, and every change in the series of transformations circulates the reference, as Latour expresses it (PH 147–50). So the claim that a scientific phenomenon exists arises from the claim that it is entrenched in an expensive and massive institution, involving a site, laws, people, and customs that provide the mediations needed for actors to establish, maintain, and substantiate newly emerging entities (PH 157, 307, 311).13 The implication of this new view of science is that there is no normal science and there are no paradigms in the Kuhnian sense because there is no single coherent research program. Instead, there is a vast network consisting

---

10. In his description over these pages, Latour’s onto-epistemology clearly resembles that of Gilles Deleuze in that both are modeled on mathematical dynamical systems.
11. Latour refers to Pasteur as Prince Charming and his microbes as Cinderella.
12. Following from this, Latour substitutes the term collective for the old word, society. A collective is an exchange of human and nonhuman properties inside a corporate body (PH 193).
13. See PH 303–11 for a full glossary of terms.
of various kinds of “actors” moving both forward and back, undergoing transforma-
tions. This is why, if an entity, such as Pasteur’s microbes, circulates, the impact can be reversed, extended into the past making “the microbes the substrate of other people’s unwitting actions” (PH 169).14

Latour’s analyses of these two exemplary series of actants reveals what is for him a categorial error. Reflecting on the notion of translation, or network, he concludes that the work of those who study society remains incomprehen-
sible if it is segmented into its three habitual categories of nature, politics, and discourse.15 Each of these points engages in two sets of practices but conceives of them as completely separate from one another. The first of these two practices, “translation” or “mediation,” creates mixtures between hybrids of nature and culture, but also between nature, politics, and discourse. The second, “purifi-
cation,” creates and maintains two entirely distinct ontological zones, one consisting of humans and one of nonhumans. It separates and maintains as separate nature, culture, and discourse. In other words, the modern critical stance purifies the networks, but the networks rely on what has been purifi ed to carry out their translations. And yet, “we have never been modern” according to Latour, insofar as we simultaneously direct our attention to both purifi cation and translation and do not separate them (WM 11). Although a certain amount of intellectual effort has been devoted to the study of the opposition between science and discourse, virtually none has been directed to that between science and politics. However, science and politics may be defi ned by a common text, that of the constitution. Just as politicians draft a constitution for states, so scien-
tists draft one for nature, and each constitution has been draft ed by excluding the power of the other (WM 14).

If the moderns conceived of hybrids as (impossible) mixtures of radically disconnected pure forms, for example, Nature/Society or Nature/Subject, then let us become premodern, deploying the middle as the point of departure from which point of view the pure extremes are but provisional and partial.16 Crucially, the place of the object will be modifi ed; no longer the realm of things-in-themselves, it will belong to the community that recognizes how and to what extent objects construct subjects. From now on all actors have historicity and the extremes of Nature and Society can be utilized as relative reference points useful in differentiating intermediaries. In addition, then, to the horizontal (x) axis at each end of which the two pure extremes are located, Latour calls for

14. See PH 170. Substance here means “the work of retrofi tting that situates a more recent event as what ‘lies beneath’ an older one” (ibid.).
16. “A mediator, however, is an original event and creates what it translates as well as the entities between which it plays the mediating role” (WM 78).
the addition of a vertical (y) axis, one that registers variations in the stability of entities from event to essence with the assumption that all actants proceed from existence (below the horizontal axis) to essence (above the horizontal axis). However, very little, in fact no activity can be discerned above the horizontal axis in the essential sectors. It appears that all events find their reality in the existential realm, the depths analogous to the depths of the earth itself where magma erupts and forms relatively stable sites. It is, then, by this means that the “ontology of mediators” has a variable geometry, and the so-called essence of an event or actant is simply the trajectory that links each of its manifestations in the x–y plane (WM 86, 83).17

II. ISABELLE STENGERS AND ILYA PRIGOGINE

Isabelle Stengers18 emerged internationally as a philosopher of science, along with coauthor and chemist Ilya Prigogine,19 on publication of their book, Order Out of Chaos: Man's New Dialogue with Nature. There they argue that if “in the classical view, the basic processes of nature were considered to be deterministic and reversible … [t]oday we see everywhere, the role of irreversible processes, of fluctuations.”20 Stengers and Prigogine reformulate this world as open, complex, probabilistic, and temporally irreversible. Thus Order Out of Chaos is an account of the conceptual transformation of science from classical science to the present, particularly as it applies to the macroscopic scale, the scale of atoms, molecules, and biomolecules, with special attention to the problem of time, a problem that

17. That this is a dynamical system operating in what is called ideal or mathematical state space should by now be evident.
18. Isabelle Stengers (1949– ; born in Belgium) received her degree in chemistry at the Université Libre de Bruxelles, where she is currently a professor in the philosophy of science. Her work has been influenced by Sandra Harding, Serres, Gilbert Simondon, Shirley Strum, and Whitehead.
19. Ilya Prigogine (January 25, 1917–May 28, 2003; born in Moscow, Russia) received a licence en sciences chimiques in 1939, a doctorat en sciences chimiques in 1941, and was made Agrégé de l’Enseignement Supérieur en Chimie Physique in 1945, all at the Université Libre de Bruxelles. His work was influenced by Bergson, Théophile De Donder, Jean Timmermans, and Alan Turing. Prigogine held appointments at the Université Libre de Bruxelles, the International Solvay Institute in Brussels (1959–2003), as Professor of Physics and Chemical Engineering at the University of Texas at Austin (1967–2003), and as Visiting Professor of Chemistry at the Enrico Fermi Institute for Nuclear Studies and the Study of Metals at the University of Chicago (1961–66). He was Professor of Physics and Chemical Engineering at the University of Texas at Austin (1967–2003), Regental Professor (1977–2003), and Ashbel Smith Professor (1984–2003).
arose out of the realization that new dynamic states of matter may emerge from thermal chaos when a system interacts with its surroundings. These new structures were given the name dissipative structures to indicate that dissipation can in fact play a constructive role in the formation of new states (OC 12). Stengers and Prigogine thus take us from the static view of classical dynamics to an evolutionary view arising with nonequilibrium thermodynamics, based on time irreversibility. Simultaneously, “one of the main themes of this book is that of a strong interaction of the issues proper to culture as a whole and the internal conceptual problems of science in particular” (OC 19). Thus, the reorientation from the classical to the contemporary view is, for them, equally reflected in the conflict between the natural sciences and the social sciences and humanities. If the development of science has been understood to shift away from concrete experience toward abstraction, this is, the authors believe, a consequence of the limitations of classical science, its inability to give a coherent account of the relationship between humans and nature. Many important results were repressed or set aside insofar as they failed to conform to the classical model. In order to free itself from traditional modes of comprehending nature, science isolated and purified its practices in the effort to achieve greater and greater autonomy, leading it to conceptualize its knowledge as universal and to isolate itself from any social context (OC 19–22).

Nevertheless, Stengers and Prigogine are alarmed by contemporary criticisms of science, such as that of the philosopher Martin Heidegger, who levies what they see as an unrestricted condemnation of modern science, insofar as Heidegger seems to identify science with the subjection of nature (OC 32–3). Equally, they are concerned with the contemporary shift away from science toward mysticism. Neither of these alternatives provides the direction they seek. The enthusiasm for modern science that arose in the sixteenth century and, in many respects, continues unabated today, arose, they posit, as an extension of the age-old effort of humankind to organize and exploit the world and to understand

---

21. Equilibrium thermodynamics studies the transformation of energy, and the laws of thermodynamics recognize that although “energy is conserved,” when energy is defined as the capacity to do work, nevertheless, nature is fundamentally asymmetrical; that is, although the total quantity of energy remains the same, its distribution changes in a manner that is irreversible. See P. W. Atkins, The Second Law (New York: Scientific American Library, 1984), 8–13.

22. The French title of this book, an earlier and slightly less developed version, reflects the “new alliance” between science and culture.

25. Latour picks up this theme from Stengers and Prigogine.
humankind’s place in nature. However, while the ancients remained preoccupied with the question of why certain natural processes occur, the moderns ask only how, and answering this question involves activity, the manipulation of physical reality rather than its passive observation. Thus, unlike its predecessor, modern science learned to prepare and isolate physical reality to make it conform to an ideal conceptual scheme (OC 37–41). Experiment is an art with no guarantees of success. It requires choosing an interesting question that embodies a theory’s implications, abstracting a natural phenomenon from its environment, and staging it to test the theory in a manner that is both reproducible and communicable. Additionally, modern science can engage in a thought experiment, governed entirely by theory (OC 42–3). What is crucial here is that the scientist cannot force nature to respond the way the scientist wishes; there is, in effect, a dialogue between humans and nature, not a dictatorship.

But science writes in a mathematical language, so the world appears to be homogeneous, as a result of which the simple can always explain the complex. Moreover, the scientific view may have arisen, in part, owing to the mutual amplification of theological discourse and science, a resonance located in the medieval insistence on the rationality of God, who could be counted on to provide a basis for the world’s intelligibility. Humans, utilizing scientific experiments, sought to view the world from this same divine viewpoint. This is how, Stengers and Prigogine claim, the aim of modern science came to be that of discovering the unique truth about the world, one that excludes the observer and reflects the divine point of view (OC 44–52). For modern science, the central theoretical and practical problem was to find a way to define a continuously varying speed, instantaneous changes in position, velocity, and acceleration, and the state of a body at a given instant. The nearly miraculous explanation came in the form of a single force called gravity. Any pair of material bodies, planets or atoms, is linked by the same force of attraction that operates in the universe as a whole, any local variations being too small to have an impact. Given an initial state, the general law deduces the series of states the system will pass through, and a single state is sufficient to define both the future and the past of any system. This is the meaning of reversibility. Classical dynamics required bold assumptions: a world in which all trajectories are reversible. And yet, the active experiments carried out by scientists remained extraneous to the idealized, reversible world they describe (OC 57–61). This sort of tension between science and society remains thematically central. Stengers and Prigogine are quite explicit that they look for a convergence between nature and the mind that knows, perceives, and creates science. The ideal of a being who could calculate

26. “If the velocities of all the points of a system are reversed … [t]he system would retrace all the states it went through during the previous change” (OC 61).
the future and past of the world, starting from the observation of an instantaneous state, is not an ideal they endorse (OC 77).

This raises the question: What is the relation of philosophy to science? Is philosophy the queen of the sciences or only the handmaiden? For Stengers and Prigogine, the answer to this question is closely associated with their understanding of time, which, they claim, can bridge the spiritual and physical aspects of nature, including human nature. To this end, they narrate the rediscovery of the arrow of time by science. Moving from the study of heat to the conservation of energy, the first and second laws of thermodynamics, linear and nonlinear thermodynamics, self-organization, chaos, dissipative structures, evolution, complexity, open systems, relativity, uncertainty, and finally to temporal evolution in quantum systems, leads to the conclusion that the reversibility of classical dynamics is a characteristic of closed dynamic systems only, and that science must accept a pluralistic world in which reversible and irreversible processes coexist.27 In place of general, all-embracing schemes that could be expressed by eternal laws, there is time. In place of symmetry, there are symmetry-breaking processes on all levels, and yet, temporal irreversibility has become the unifying source of order on all levels. For classical dynamics, time was a geometric parameter; as such, this conception was part of a general drive to eliminate time, to reduce the different and the changing to the identical and permanent. Although Bergson, in 1922, attempted to introduce and defend (against Einstein) the possibility of a multiplicity of coexisting “lived” times, for Einstein, intelligibility remained tied to immutability (OC 293–4). It is precisely this “denial of becoming” that led to the rift between science and philosophy (OC 298).28 Thus, Stengers and Prigogine propose a structure that takes its orientation from the observer, “who measures coordinates and momenta and studies their change in time,” leading to the discovery of unstable dynamic systems, intrinsic randomness, and irreversibility, and proceeding to dissipative structures and from there back to the time-oriented observer (OC 300). All scientific activity is time-oriented and the scientist must come to see herself as part of the universe she describes. Irreversibility is not universal; it requires a minimum of complexity in the dynamical system, such that with an increase of complexity, the role of irreversibility increases (OC 301).29 If the philosopher and mathematician Gottfried Leibniz’s monadology is “the most

27. These theories and others along with their philosophical implications are discussed at length in Order Out of Chaos.
28. By the time scientists began to consider time irreversibility, philosophy had already been relegated to the sidelines.
29. “The world of classical science was a world in which the only events that could occur were those deducible from the instantaneous state of the system … [T]he objects chosen by the first physicists to explore the validity of a quantitative description … were found to correspond to

117
Volume 8
consequential formulation of a universe from which all becoming is eliminated,” one can look to Charles Sanders Peirce, Bergson, and Lucretius for original and “pioneering step[s] toward the understanding of the pluralism involved in physical laws” (OC 303). Therefore Stengers and Prigogine conclude that, contrary to the model put forward by Thomas Kuhn, change in science does not occur as a result of a crisis, a nearly violent disruption of an otherwise homogeneous and conservative scientific community. Although they concede that crises do occur, science can also be characterized by problems that arise as the consequence of “deliberate and lucid questions asked by scientists who know that the questions had both scientific and philosophical aspects”; in other words, change occurs as a result of both the “internal logic of science” and “the cultural and social context of our time” (OC 309).

Following the publication of Order Out of Chaos, Stengers made a concerted effort to go her own way as well as to forge new intellectual ties to other scientists and philosophers. Stengers begins by questioning the concept of complexity in the discourse of science, a concept that comes to the fore when the relevance of a simple model and that model’s relation to what is complicated, but not necessarily complex, becomes an issue. Just because a phenomenon requires a probability treatment does not imply complexity, which is distinguishable from the complicated real, characterized by approximations that limit us, but which can still be identified.30 Close to but not identical with emergence, which refers to a physical genesis of the new, complexity, Stengers argues, implies a conceptual genesis, an expression of the limited character of the conceptual tools appropriate to simple models but which cannot be prolonged as relevant (PI 12). Insofar as complexity is conceptual, it sets out problems. For scientists, “complexity arises when they must accept that the categories of understanding that guided their explorations are in question, when the manner in which they pose their questions has itself become problematic” (PI 13).31 Thus, one does not discover complexity with respect to objects with a history; rather, complexity is constitutive of a living object (PI 14). This is especially the case when science studies beings produced by history that are also capable of history; that is, the meaning of this being’s interrogation may also present problems for the being itself. The intrinsic complexity of living systems thus imposes the necessity for intelligent

---

a unique mathematical description that actually reproduced the divine ideality of Aristotle’s heavenly bodies (OC 305–6).

30. Isabelle Stengers, Power and Invention, Paul Bains (trans.) (Minneapolis, MN: University of Minnesota Press, 1997), 7, 10. Hereafter cited as PI followed by the page number.

31. “Complexity is not a theory, an exportable general model. The ‘complex’ lesson of dissipative structures is … this gravitational factor that, according to circumstances, can be insignificant or ‘change everything’” (PI 13).
experimentation, avoiding silencing the interrogated being (PI 17). A related and formidable distinction in physics is that between phenomenological and fundamental laws, the former tied to irreversible evolutions and the latter to reversibility. Laws of physics are fundamental insofar as they go beyond appearances to unify the diversity of physical phenomena. From this perspective, the distinction between before and after is merely phenomenological, and uncertainty regarding the future is an effect of ignorance (PI 21–2). What physicists do not see, according to Stengers, is the existence of two types of deterministic laws. One is a science of movement or dynamics, for which the velocity at a given instant is equal to the cause producing it. The velocity must be sufficient to allow the body to regain the altitude it lost, thereby joining past and future through the sign of identity, which is understood as a syntactic rule, a rule defining velocity, force, and acceleration (PI 24, 25). The second, based on the study of unstable dynamic systems, allows a rapprochement of sorts between fundamental laws and phenomenology. In a highly unstable system, starting from quasi-identical states, originally indistinguishable systems will behave dissimilarly and only a God capable of defining the instantaneous state of a system with infinite precision could calculate the trajectories (PI 27). This distinction exposes the limits of the physicist’s ideal without abandoning fundamental laws. Closely related is the question of change, whether it is imposed from the outside or is immanent to things. Modern science set itself up in opposition to the latter, establishing the dominance of the idea of change as nothing but movement, yet with two possibilities. Either change is due to chance collisions of atoms or there is a force exterior to masses responsible for movement (PI 33). Indeed, such a force was put in place in the form of mathematical universal laws of dynamics, which imply that an object of dynamics can be completely understood, meaning that the totality of its past and future can be deduced. And yet, Joseph Fourier’s formulation of the law of heat diffusion, insofar as it characterized an intrinsically irreversible process, the first to be given a mathematical expression, was a scandal for science, since it brought forth the realization that dynamics, describing nature as obedient and controllable, corresponds only to a particular case. The importance of unities such as photons and electrons, whose processes imply irreversible interaction with the world, gradually came to into view (PI 48). Insofar as these transitions are smooth, continuous processes, they promote an acceptance of the autonomy of things, and the opening of new alliances with nature and with natural and productive processes of all types (PI 56, 59).

32. Insistence on attention to the sensitivities of the interrogated subject is fundamental in Stengers’s thinking overall.
33. This is the principle of sufficient reason.
Such transitions and transformations, no matter how smooth and continuous, raise certain important questions. If science had once been understood entirely in terms of fundamental laws, then is it science and scientists that propose changes to this understanding? Or, is it nonscience? Exactly what counts as science can be determined only in a precise context. Innovations and transformations are creations, organizing the examination of phenomena, which “produce the criteria on the basis of which the accepted innovations will be described a posteriori as ‘obviously’ scientific” (PI 82). The implication Stengers draws is that science is a collective activity producing its own norms and responses to these norms, thereby linking scientists and allowing them to work. It is this collective activity, rather than objectivity, however one defines it, that connects scientists who engage in scientific activities, but only insofar as it attracts their interest (PI 82, 83).34 This question of what is science and what makes one a scientist haunts Stengers’s work. What concerns and worries her is the “condemnation of nature to exploitation, the subject and object to separation,” and “the splintered figure of the other of the identity of science” (PI 110–11).35 Rather than Kuhnian official scientific maps and scientific rationality guaranteeing access to phenomena, Stengers proposes a structure of interconnections and relations of expression between otherwise separated populations, keeping alive the possibility of a certain jouissance, that moment when a small detail destroys a grand generalization that the road map had guaranteed.

These considerations culminate in Stengers’s The Invention of Modern Science, a philosophical work in which she engages directly with the dominant philosophies of science to examine the epistemological and social relations between philosophers and scientists.36 For scientists, Stengers argues, Kuhn’s claim that in normal science, scientists do what they have learned to do, that is, utilize a paradigm to study scientific phenomena, preserves what is essential.37 What is essential is autonomy, the preservation of the community as the norm and as condition of the possibility for a fruitful exercise of science (IMS 5). This is crucial in several respects. Guided and supported by the community, individual scientists are freed from accounting for their choices and research priorities

34. “To interest someone means … to act in such a way that this thing … can concern the person, intervene in his or her life, and eventually transform it” (PI 83–4).
35. “I would like to express the deep uneasiness aroused in me by the binary characterization that the modern sciences seem to produce, constructing their identity through opposition with an other” (PI 111).
and they confidently confront even the most disconcerting phenomena. Such “tacit knowledge” is crucial to the scientist who plays the role of an expert or connoisseur who has the capacity to evaluate research within the domain of her expertise (IMS 6–7). Nevertheless, while the concept of the paradigm guarantees cumulative progress and consensus in the sciences, Kuhn also proposed a principle of symmetry that requires the researcher to be attentive to everything outside the research paradigm, such as relations of force, social games of power, differences of resources, or impure interests (industry, the state). Is it not the case, after all, that scientists do, in fact, draw on all the resources of society (IMS 9)? How could they continue their research without the resources supplied by the social, political, technological, and economic environment? Even so, Stengers maintains, scientists do attempt to conceal their relation to everything outside science. Thus the attacks aimed at technosciences for failing to distinguish between the productions of science and those of technical and technological production, as well as feminist critiques aimed at the identification of scientific rationality with male values, fall short of their goal insofar as, unlike Kuhn, these critiques accept what scientists say about themselves without question. Only Kuhn’s questioning of the mode of knowledge, the relation of normal science to what is outside it, opened a wound and fomented a revolt. Scientists might accept the social nature of their discipline, yet they insist that it is more than that, that there is an element of reality, and that if scientists have to justify their actions as socially interested, it will be increasingly difficult for them to pursue minor areas of research. Moreover, they hold out the fear of being overtaken by the interests of those who accuse them of being interested.

In acknowledging this problem, Stengers takes up the cause of science as much as that of philosophy. As she argues,

the philosophers were requiring of the sciences (which they do not practice) that they justify the practice of the philosophers of science; that sciences illustrate a definition of scientific rationality which the philosophers could then disengage, so as to know better than the scientists, what defines scientists as such. (IMS 14)39

To stem the emergence of oppositional forces, Stengers proposes that philosophy should be willing to practice the “Leibnizian Constraint,” not to maintain as its ideal the reversal of established sentiments since they may be precisely

39. In fencing, to disengage is to perform a maneuver that changes the line of attack.
what give meaning and interest to one's problem (ibid.). What, after all, is the point of studying science if not to try to open scientists to what their established identity led them to refuse, combat, or misunderstand? And if the words we use clash with others, scandalize and provoke hateful misunderstandings, producing greater rigidity in order to protect each one's position, then constructing differences using language that leaves irreducible oppositions is clearly counter to the goal of opening science to its own outside. Thus, a version Latour’s “principle of irreduction” will be called into play, that of not putting oneself in the position of a judge who knows what science or politics is and who gives or refuses to give one of these terms the power to explain the other. Neither unveiling the truth behind appearances nor denouncing the appearances that veil the truth, Stengers guards against the mobilizing power of language, the formation of antagonistic camps and recruits to populate them. In this way, she hopes to make room in society for the recovery of a taste for an interest in science and technology, a taste that allows one to take them seriously, but also to laugh at them in a way that does not mock and is not ironic. Rather, laughter is directed toward the life of power when power conceals itself behind objectivity or rationality. Can we not laugh with the scientists? How, she inquires, can this situation be brought about (IMS 17)?

Stengers formulates a creative proposal. Is it not the case, she asks, that scientific theories require the invention of a world that they then render intelligible and to which they give signification? Such a situation undoubtedly calls for careful description. Does this situation conserve the idea of a pure mathematical and experimental science juxtaposed with an impure external milieu that constantly threatens to invade it? Or, as Stengers suggests, can we take the scientific paradigm to be a manner of intervening in the world, an intervention that creates what it explains in a competent, discussable, and astute manner that constitutes the paradigm as an event (IMS 49)? In such an intervention, every fact is an artifact, dictated by experimental conditions that produce observable phenomena. Nevertheless, even if we accept the redefinition of the paradigm as an event, we might ask about the necessity of paradigms. That is, without a paradigm, are the claims of scientists nothing but ideological claims? This inquiry brings us back to the relation between science and its other, its nonscience, and the assertion that science must have autonomy and demarcation. One might, like Hannah Arendt, put into question the false opposition between a truth of which “man” is the measure and a pure rational truth, that is, between poeisis

40. In spite of her admiration for Deleuze, Stengers is not unwilling to diverge from his philosophy in this and in other key respects.
41. “A great number of actors, all of whom have been, in one way or another, produced by the text, undertake to draw lessons from it. All are situated in the space it has opened; none can claim to have a privileged relation of truth with it” (IMS 67).
and praxis when the latter is understood in the Greek manner as performative speech for the sake of immortality that excludes useful or necessary acts (IMS 61).\textsuperscript{42} Indeed, this became an important aspect of the distinction between humans and animals as only those who seek immortal fame do not live and die like animals! In this regard, Stengers’s claim that the baboons studied by Shirley Strum \textit{do politics} radically overturns the notions of purity and demarcation and brings to light the disqualification of women, foreigners, and others as political actors. Stengers’s goal is not to eliminate the difference between science and sociology but, precisely, to open up a space where the distinction between the two can be constructed; not to deny that there is a difference between science and nonscience but also not to declare that scientists have privileged knowledge of what this difference that singularizes them signifies (IMS 62, 64, 67).

What is called for, according to Stengers, is the construction of a point of view from which modern science can be understood as a contingent process, a process whose statements belong to the order of the possible in the context of scientists working with other scientists. This is a point of view that acknowledges the difference between opinions and what can be demonstrated (IMS 80, 81, 83). So, for example, we might say that Galileo’s law of motion is relative to an order of created fact, an artifact of the lab such that the different falling motions and the three concepts of speed that he develops give way to a motion both unique and decomposable in terms of independent variables, controllable by the operator and capable of forcing the skeptic to admit that there is only a single legitimate way to articulate them. This is a world, both fictive and concrete, that yields to one method of interrogation, as only this method has the power to silence critics and rivals. Simultaneously, it is an abstract world: things will have been eliminated if the experimental apparatus does not permit their categories to be defined (IMS 84–5, 90). If the method of science produces truth with regard to a reality it invents \textit{and} discovers, this reality guarantees the production of truth when the constraints of the procedure are respected and the scientist submits to an event that cannot be reduced to the simple possession of knowledge but rather gathers those who are interested, who are willing to risk the intervention of this event in their own problematic field of interrogation (IMS 91, 92).\textsuperscript{43} Thus, to bring a scientific event, say the theory of the big bang, into existence, specialists must multiply the links between this event and work of scientists who do not

\textsuperscript{42} See Hannah Arendt, \textit{The Human Condition} (Chicago, IL: University of Chicago Press, 1998), 12–21, especially: “The task and potential greatness of mortals lie in their ability to produce things – works and deeds and words – which would deserve to be and, at least to a degree, are at home in everlastingness” (ibid., 19).

\textsuperscript{43} “Interest derives from \textit{inter-esse}; to be situated between …. Those who let themselves become interested in an experimental statement accept the hypothesis of a link that engages them” (IMS 95).

123
Volume 8
belong to this specialty. Unlike communicative rationality, which seeks agreement, scientific rationality seeks to make one forget the contingent singularity of the invention of an experimental practice, so as to make the phenomenon available for other work, to make it objective and to theorize it, to make it construct a representation of reality as it exists outside the laboratory (IMS 105, 107).44

All of this, of course, crashes up against the rocks of modern science and modern life. Kuhnian paradigms no longer form as science mobilizes rapidly through technological innovation, leaving no time to think data through or search for subtle correlations. Scientists are both drawn to and ruled by the imperative to provide society with useful information. Lead scientists and principal investigators have become “patrons” recruiting allies and financing for their growing laboratories. They speak different languages to different constituents, including the “incompetent” public; they are encouraged by “philosophers who learned in school that science would decipher laws that characterize phenomena objectively and their task would be to think this” (IMS 118), and by the errors of those sociologists who trust the rhetoric addressed to the public, “not realizing that the information they have access to reduces them to impotence” (IMS 124). But it should be the case, Stengers advises, that when these scientists leave the laboratory, the change of milieu implies a change of practices, an acknowledgment that it is part of their scientific, ethical, and political responsibility to affirm the selective character of their knowledge, thereby separating science and power (IMS 128, 134). Silencing rivals in order to assert the power to represent phenomena, declaring nonlaboratory sciences such as evolution impotent, the association of a free subject with one freed of opinion, the stabilization of the subject–object relation: these are some of the unfortunate consequences of confusing the event of science in theoretico-experimental practices with the production in laboratories of allies who fail to recognize the limits of their invention-discovery, who fail to separate science from power (IMS 130, 133). This is echoed in the feminist perspective of Sandra Harding, who endorses the impassioned activity of Galileo and Newton while decrying the discourse on method and objectivity that makes their work authoritative (IMS 133, 21).45

Additionally, the limits of theoretico-experimental sciences must be established in the face of newly emerging sciences and field sciences such as computer simulation. The latter produces no theory, only models that cannot be constructed in the laboratory, and finds nothing but constraint in mathematical laws. Or, there are the field sciences, which must collect indices and reconstitute concrete

44. “Every theory affirms a social power, a power to judge the value of human practices. No theory is imposed without social, economic, or political power being at play, somewhere” (IMS 113).
situations rather than representing phenomena like functions with independent variables, and which tend to be interdisciplinary and open to uncertainties rather than proofs. And, there are the scientists, like psychoprimatologists who are faced with creatures (rats, baboons, humans) who are interested in the questions they are asked, or who have brought new beings into existence that cannot be sent out into a nature that is no longer a natural environment for them (IMS 135–46).

Acknowledging this multiplicity of interests makes way for the invention of a new image of science, one that no longer represents the world as offered up in order to be deciphered in terms of obstacles to be skirted, reduced, or ignored. In order for the multiplicity of scientific practices to be represented, science would have to consider a slowing down of its current mobilization, a slowing down that gives voice to the “Parliament of Things,” proposed by Latour. The Parliament of Things is a space of mediators with room for both Natures and Societies, where their representatives all speak in the name of some invention, some “object-discourse-nature-society whose new properties astound us all and whose network extends from my refrigerator to the Antarctic by way of chemistry, law, the State, the economy, and satellites” (IMS 154).46 Such a point of view is neither revolutionary nor reformist, insofar as it puts into question both the concept of ruptures in the continuum of smooth space and the possibility of continuous progress. In this it is truly paradoxical, proving that even epistemology requires invention, the invention of the ways that make possible becoming interested – inter-esse – in others, and, in turn, making them interested as well, not via the realm of intersubjective or communicative rationality, but rather through the invention of links arising as disparities (IMS 153–5).47

As Stengers states, the scientist’s profile will have to change: neither a patron nor a practitioner of normal science, lacking any common ground, the scientist will recognize herself as a representative of the problem that both engages and situates her. And so, Stengers asks, is not every innovation made on the basis of a risk, “a quantitative intensification of already-existing putting into relation” (IMS 158–9)? If so, then let us recognize this risk, let all sensibilities, not just those of scientists, formulate problems, and let us not forget that our practices must hold up when put to the test.

47. Like Latour, Stengers appears to advocate an onto-epistemology based on that constructed by Deleuze. However, in her call for a slow-down and in her problematization of continuous, smooth space, she may well be indicating the need for something else. See as well my The Universal (In the Realm of the Sensible) (Edinburgh: Edinburgh University Press, 2007), ch. 1, for a proposal concerning such an alternative onto-epistemology.
This essay argues that the establishment of the European Union as a constitutional, political, and cultural project, and, more specifically, the enlargement of the European Union to include former Eastern bloc countries after 1989, constitute a break in the scholarship about Europe as a philosophical concept. This claim does not imply any causal connection between the events, but rather draws new analytic categories, which I will outline and explore in this essay.

The starting premise is that the classical scholarship on the philosophical idea of Europe had settled on the consensus that it coincides with the universalizing powers of self-reflexive reason. This idea, formulated in the eighteenth century and canonized by Hegel’s philosophy of history, transforms Europe into a universal attribute of the mind that can lend its quality to any object. The self-reflexivity at stake in this definition of Europe was reasserted by Edmund Husserl in the 1930s as a “historical teleology of the infinite goals of reason.”

This self-aggrandizing vision assumes that Europe is not just a geopolitical location, but rather a concept unfolding through space and time, which can be applicable anytime and anywhere, provided the essential criteria are met. Europe announces itself as the site of origin of critical reason and self-reflexivity. Equal only to itself, Europe as universal consciousness therefore transcends its specificity or, rather, posits the power of transcendence as its distinctive characteristic and universalism as its particularity. This makes Eurocentrism into more than just a contingent matter of attitude: it is a structural element of

philosophical thought, which is also embedded in both theory and institutional and pedagogical practices.

I will focus on two features of this Eurocentric paradigm. The first is a universal claim about the structure, value, and function of reason. The second is the importance of the dialectics of self and other, or the binary logic of identity and otherness as the motor for the formation of subjectivity. Central to this universalistic posture and its binary logic is the notion of “difference” as pejoration. Subjectivity is equated with consciousness, universal rationality, and self-regulating ethical behavior, whereas Otherness is defined as its negative and specular counterpart. Insofar as difference spells inferiority, it acquires both essentialist and lethal connotations for people who get branded as “others.” These are sexualized, racialized, and naturalized others, who are reduced to the status of disposable bodies. Because their history in Europe has been one of lethal exclusions and fatal disqualifications, they raise issues of both power and exclusion and the need for ethical accountability.

This universalistic self-image has been challenged and displaced by alternative visions of the philosophical status of Europe. These challenges are both internal to philosophy as a corporate discourse with a formidable institutional history and external to it. The internal interrogation line is drawn along the debate about the “crisis of reason” that has occurred since the early days of poststructuralism between its proponents and opponents. The external fault line is drawn by intersecting critiques developed by radical epistemologies such as feminism, environmentalism, and postcolonial, race, and critical legal theories. They are formulated as a response to concrete world-historical events, such as colonialism, fascism, and communist totalitarianism, which exemplify the atrocities that were committed in the name of Europe’s universal civilizing mission. These historical events are set off against the self-aggrandizing narratives derived from the Enlightenment. What emerges from this juxtaposition is a variety of new critical and creative modes of addressing the question of Europe as philosophy.

The European Union as the immediate social and political context in which these competing views emerge adds to their political and ethical urgency. It also sets the arena for a contested debate about what kind of political, moral, and legal entity Europe is in the process of becoming. This essay aims at providing an overview of the main trends of thought in this debate.

Before going any further, however, some careful distinctions need to be made between perspectives situated within the European continent itself and the terms of the debate within the Anglo-American world. I find it especially important to

---

*2. Some of these alternative visions are discussed by Eduardo Mendieta in “Postcolonialism, Postorientalism, Postoccidentalism,” in this volume.
take distance from the often polemical tone the notion of Europe has acquired in US academic debates centered on French philosophy, especially on issues related to humanism, postmodernism, and relativism. A clear example is Martha Nussbaum’s influential statement in *Cultivating Humanity* in favor of two interlocked ideas that pertain to the classical paradigm of European thought: first, an unquestionable appeal to the authority of the history of European philosophy since Greek antiquity; second, the notion that the exercise of philosophical reason is a moral enterprise. This moral universalism concretely results in the liberal American translation of classical European humanism into elitist ideals about higher education, citizenship, and political participation. These beliefs in turn support a transhistorical and ethnocentric civilizational reading of this discipline as a universalistic discourse that is structurally antithetical to any localized, situated perspectives, which are reduced to relativism.

The philosophical opposition to this traditional view confirms the Eurocentric universalistic paradigm, albeit by negation. Recent critiques of the explicit racism of the great continental philosophers are conceived as deconstructions of this Eurocentric and masculinist bias in the teaching of the history of philosophy. Robert Bernasconi’s critical analysis of the racist elements within philosophy contests the equation of continental philosophy with Europe as a geographical and historical entity. It rather needs to be extended to include the multiple ethnic others and foreign influences that have nurtured and fueled continental thought. Bernasconi argues also that the institutional racism of philosophy is such that there is hardly any work on the history of African philosophical traditions and the contribution they have made to the discipline. It is therefore urgent to compose alternative, non-Europe-based histories of continental philosophy as a transnational enterprise.

These critiques exemplify a trend that is also alive in European thought today. The operative words here are “situated perspectives.” Both the critique of ahistorical Eurocentrism and the quest for alternative genealogies of thought express a form of ethical and political accountability that requires adequate understandings of one’s embedded and embodied perspectives. Michel Foucault’s cartographies of power provide a conceptual and methodological example of this approach, as do the feminist politics of locations as situated knowledges and Gilles Deleuze’s concept of radical immanence. For all these thinkers, to stress the situated structure of philosophical knowledge also means to recognize its partial or limited nature. The immediate consequence of this acknowledgment is both ethical and methodological. It requires a specific form of accountability for the production of philosophical ideas. The critiques of both universalism

---

and of liberal individualism are fundamental starting-points to rethink the interconnection between the self and society in an accountable manner. This nondualistic situated ethics accounts in a nonrelativistic manner for the complex power mechanisms at play in the enunciation of scientific discourse.

For philosophers situated in Europe today, the European Union project has to do with the sobering experience of taking stock of our specific location. The opposite of the grandiose and aggressive universalism of the past, this is a situated and accountable perspective. Daniel Cohn-Bendit recently stated that for this European project to work, we must start from the assumption that Europe is the specific periphery where we live and that we must take responsibility for it. Imagining anything else would be a repetition of that flight into abstraction for which our culture is (in)famous.

As a consequence, the working definition of Europe adopted in this essay takes a firm and critical distance from the Eurocentric universalism that is taken for granted in the dominant philosophical debates in North America, both by its supporters and by its opponents. I argue that as a result of the European Unification project, but also as a factor that sustains it, the philosophical question about Europe is no longer that of identity, but rather the process of rupture from and transformation of its imperial and undemocratic past. In other words, it is not about who Europeans are, but about what they are capable of becoming. Europe has to become the site of self-criticism and self-transformation on the basis of the hard-won lessons of its rich, dramatic, and complex history. Europe today stands for the ethical obligation to be accountable for its past history and the long shadow it casts on its present politics. In this respect, the political project of the European Union marks a radical redefinition of Europe’s relationship to its outside, or its constitutive others. Insofar as this project is ongoing, it is both contested and fraught with internal contradictions. It follows, then, that the consensus about the displacement of the old universalizing notion of Europe produces a range of options regarding the alternatives. That philosophical consensus itself, however, is beyond dispute.

I. THE EUROPEAN UNION AS NEW DISCURSIVE FRAME

Historically, the project of the European Union originates in the defeat of fascism and Nazism after the Second World War and is grounded in antifascism, antinationalism, and antimilitarism. The life and work of one of the initiators

of the project of European federation – Altiero Spinelli – testifies to this. In the context of the Cold War, however, the new European Community also functioned as a showcase of Western superiority and streamlined the reconstruction of Europe’s war-torn economy. The moral and political bankruptcy of European “civilization” was exemplified by the Holocaust, perpetuated against the Jewish and Roma populations, among others, as well as the persecution of homosexuals, communists, and other groups of people by the Nazi and fascist regimes. The legacy of racism, extermination, and violence of European history comes under criticism in the second half of the twentieth century, first in the aftermath of fascism and subsequently as a commentary on the atrocities of communism. The continental Europe that emerged from the war was philosophically impoverished. As a result of Nazi persecution of Jewish intellectuals, the loss was human first and foremost, but some philosophical ideas also perished. Marxism and psychoanalysis were the critical theories that Nazism violently eradicated. The Cold War, which kept Europe and the world split and dichotomized, and demonized Marxism, did not facilitate the resurgence of those critical theories in the continent where they had originated. Their re-implantation back into Europe entailed a self-critical discussion about the role of totalitarian thought in European cultural, political, and intellectual history that took place within the Frankfurt School, the Yugoslav school of Marxism, and the Italian brand of “Euro-communism,” as well as within French philosophy, which acted as a regenerator of a self-reflexive and critical continental philosophy of the subject in the post-Second World War period.

It is significant in this respect that the French poststructuralists reappraised the very thinkers – Marx and Freud – whom the Nazis had banned. Unlike the structuralists, who also returned to Marx and Freud, they focused as well on the other totalitarian movement of the twentieth century and analyzed the limitations and the horrors of communism. This generation, however, also rescued the transformative potential of Marx’s own philosophical texts against the political conservativism of the institutions that controlled Marxist (and psychoanalytic) dogma. In their view, the crux of the problem was the universalizing theory of the subject that is implicit in these theories: under the cover of historical materialism, or of the unconscious, the subject of critical European theory preserved a unitary, hegemonic, and teleological place as the motor of human history. Accountability for European history therefore took the form of unhinging the subject from unitarian identities, freeing it respectively from the dictatorship of a libido dominated by Oedipal jealousy, and from the linearity of a historical telos that had married reason to the revolution, both of them vowing violence.

A third historical element that affected the critique of the old idea of Europe is colonialism. The persistence of the colonial question in the work of the post-structuralists is visible: they rejected Eurocentrism and the classical definition of European identity in terms of humanism, rationality, and the universal. They stressed instead the need to open it up to the “others within” in such a way as to relocate diversity as a structural component of European subjectivity. Best expressed in Julia Kristeva’s idea of becoming “strangers to ourselves,” this deconstructed vision of the European subject is active also in Hélène Cixous’s and Jacques Derrida’s reappraisal of their Algerian Jewish roots. Other significant contributions that point strongly in this direction are: Gayatri Spivak’s vocal advocacy of new postcolonial subjects that asserts the noncentrality of European hegemony; Deleuze's critique of majoritarian European languages; Massimo Cacciari’s work on Europe as an archipelago open to the influence of other cultures; Gianni Vattimo’s reflections on Europe, Christianity and secularity; and Foucault’s involvement in the Iranian revolution.

II. THREE BRANDS OF PHILOSOPHICAL EUROSKEPTICISM

Three varieties of Euroskeptic have appeared that also contain vocal elements of doubt about the possibility of redefining Europe as a nonethnocentric,

---

7. See Hélène Cixous, “Mon Algériance,” Les Inrockuptibles 115 (August 20, 1997), 70. Published in English as “My Algerian in Other Words, to Depart not to Arrive from Algeria,” TriQuarterly 100 (Fall 1997).
multileveled concept in today’s world. They have developed accordingly into different forms of Euroskepticism.

Politically, on the Continent, the opposition to the European Union is led by the nationalistic center and the authoritarian Right, which is both xenophobic and in denial of the legacy of fascism. As Stuart Hall put it, the great resistance against the European Union, as well as the American suspicion of it, is a defensive response to a process that aims at overcoming the idea of European nations. The short-range effect of this process is a nationalist wave of paranoia and xenophobic fears, which is simultaneously anti-European Union and racist. Thus, the expansion of European boundaries coincides with the resurgence of micro-nationalist borders and fictional ethnicities at all levels in Europe today. Unification coexists with the closing down of borders; the common European citizenship and the common currency coexist with increasing internal fragmentation and regionalism; a new, allegedly postnationalist, identity coexists with the return of xenophobia, racism, and anti-Semitism.

Strong opposition to the European Union is also voiced, however, by the nostalgic Left, which seems to miss the topological foundations for international working-class solidarity and refuses accountability for the political violence of communist regimes the world over. The cosmopolitan tradition of socialism militates against the European dimension. This results in the paradox of making the far Left as Euroskeptical as the far Right.

The critique of Eurocentrism by race and postcolonial theory is also negative about Europe’s transformative potential for self-renewal through ethical and political accountability. This Euroskepticism is best expressed by Gayatri Spivak, who turns the tables on the deconstruction of ethnocentrism in A Critique of Postcolonial Reason. Spivak suggests that this high level of self-reflexivity is merely Europe’s exacerbated expression of its discursive hegemony, recast in a weakened mode of decentered subjectivity. For Spivak the “crisis” of European identity has become the preferred modus vivendi of continental philosophers and their chosen manner of silencing the vocal minorities that crowd the margins of the globalized world.

I find all three brands of Euroskepticism unconvincing and therefore do not share their cynical dismissal of critiques of Eurocentrism by European philosophers. On the contrary, contemporary continental philosophy has taken apart the notion of Europe, so as to expose its internal fractures. This high degree of complexity highlights one of the central features of the globalized condition,

namely, the inadequacy of simple binary thinking. How to think the simultaneity of potentially contradictory social effects is the question. The response to this challenge is neither the exaltation of neo-universalism under the aegis of American liberal education, nor the retreat into negativity and relativism. It rather consists in new forms of situated European accountability.

III. SUBJECTIVITY REVISITED: ON EUROPEAN CITIZENSHIP

The primary effects of the unification project and of globalization on the philosophical notion of Europe concern ethical subjectivity and citizenship. The classical model that linked citizenship to belonging to a territory and a community – a nation-state and a culture – and opposed it to a condition of statelessness, is no longer adequate. De-linking the three basic units that compose citizenship – the ethnic origin or place of birth; the nationality or bond to a nation-state; and the legal structure or actual citizenship – sets the conditions for both the radical transformations that are needed in European subjectivity, and the greatest opposition to them. These three factors are disaggregated and disarticulated from each other and become rearranged in a number of interesting ways.

First, let me both acknowledge and then immediately leave aside the neoliberal side of this process, which is exclusively concerned with the defense of advanced capitalism. Insofar as free movement of workers and capital is a central feature of the global economy, deregulated capitalism promotes constant flows and displacements. The problem with this position is twofold: first, it restricts free mobility to capital and data; second, the speed of circulation is such that capitalism erodes its own foundations and thus undermines the nation-state, devastates the environment, and wastes human lives. For these reasons, neoliberalism is not very innovative as a philosophical project. As I stated at the start of this essay, the philosophically interesting projects combine a focused attention on situated practices with ethical accountability in their social analyses of transnational capitalism. Consequently the effects of the globalized and so-called “flexible” labor market, including the de-linking of ethnicity and nationality from citizenship, have to be analyzed in terms of the power differentials and the patterns of exclusion and discrimination they entail. Similarly, the re-bundling of entitlements and benefits in packages of new citizenship rights has to be analyzed as political processes.

There is a further problem: The neoliberal definition of the European Union as a global capitalist power expresses a reactive tendency toward a sovereign sense of the Union. This is also known as the “Fortress Europe” syndrome, and has been extensively criticized in that it entails the belief in an ethnically pure Europe. The question of ethnic purity is the germ of Eurofascism and runs the risk of producing a European form of apartheid.14 Present-day Europe is struggling with alternative models of citizenship at a time of increasing social exclusion, racism, and xenophobia. That the new inclusive sense of citizenship and the tendency toward a reactionary, fortress mentality coexist makes European citizenship into one of the most contested areas of political and social philosophy.

A disaggregated idea of citizenship emerges from the current European Union situation: as a bundle of rights and benefits that can accommodate both nationals and migrants. This project aims to accommodate cultural and ethnic diversity without undermining European liberal democracies, the benefits of the European welfare state, and the universal idea of individual human rights. Let me examine some significant examples of this transformative project.

IV. TRANSNATIONAL EUROPEAN CITIZENS

Étienne Balibar’s15 redefinition of the concept of European citizenship plays a foundational role in the shift of paradigm about Europe as a philosophical idea.16 Balibar is the most eminent representative of the Spinozist democratic tradition that has proved so influential in shaping continental political philosophy.17 The main feature of this school of thought is the definition of the subject not in terms of autonomy and individual rights. The emphasis falls instead on

15. Étienne Balibar (1942-; born in Avallon, France) studied philosophy at the École Normale Supérieure with Louis Althusser (1960–65) and at the Sorbonne in Paris, received his PhD in philosophy from the University of Nijmegen (1987), and his habilitation from the University of Paris I (1993). He began his long career at the University of Paris in 1969, eventually serving as Professor of Political Philosophy at the University of Paris X–Nanterre from 1993 until his retirement in 2002. Currently, he is Emeritus Professor of Moral and Political Philosophy at Nanterre and Distinguished Professor of Humanities at the University of California, Irvine. In addition to his other works cited elsewhere in this essay, his most important works include: Reading Capital (with Louis Althusser; 1965), Masses, Classes, Ideas (1994), The Philosophy of Marx (1995), Spinoza and Politics (1998), and Citoyen Sujet, Essais d’anthropologie philosophique (forthcoming).
16. See Étienne Balibar, We, the People of Europe? and Politics and the Other Scene, Christine Jones et al. (trans.) (London: Verso, 2002).
multilayered flows of forces that express a subject’s quest for freedom through the understanding of the condition (both positive and negative) of one’s specific power locations.

Balibar’s democratic project starts from the necessity to learn the lesson of the great human tragedies engendered by European history in the twentieth century. This systematic disregard of human rights makes it imperative to learn and re-elaborate the historical memory with renewed ethical urgency. The learning process, according to Balibar, starts from the recognition of the legacy of fascism and of colonialism and proceeds to take in the effects of Europe’s global expansion throughout the whole planet. This process of hybridization forces the recognition of the structural importance of Otherness on the constitution of the European subject. This ongoing learning process simultaneously defeats Eurocentrism and elevates the marginal epistemologies of postcolonial and gender theories to a higher philosophical status.

Balibar takes on critically the idea of the universal power of the law and reminds us that rights are the results of historical struggles and contestations, not of deduction from preexisting general principles. Although the new constitution of the European Union shows both supranational elements and cosmopolitan anticipations, Balibar argues that European citizenship needs to be redefined in transnational terms that draw the hard lessons of the past and meet the complexities of the global age. The point for Balibar is neither to relink nationhood and citizenship by transposing them to a supranational level, nor to declare them obsolete. The point is to turn the question of the European political subject and of citizenship into a process, a work-in-progress. The self-evidence that accompanies so much contemporary cultural racism has to be lifted out of this debate. It is a question of redefining community, belonging, and power mechanisms of exclusion.

The process of the European Union is taken as both part of the global economy and an attempt to move beyond the essentialist grounds on which European nationalism has prospered. Balibar redefines Europe as a transnational space of mediation and transformation. This new European identity is internally differentiated and hence nonunitary and committed to transcultural hybrid exchanges. It is a situated perspective based on multiple border crossings, on confrontations with shifting frontiers and borders, and on a deep commitment to pacifism and human rights.

A more militant version of this position has been developed by another neo-Spinozist political philosopher: Antonio Negri, who developed with Michael Hardt the theory of the necessity of the political project of the European Union as an antidote to the sovereign power of the United States. The European Left has reacted with energy to the historical evidence of the dislocation of European supremacy and the coming of a belligerent American empire. Marxist
philosophers, however, have been slow to understand the nondialectical and schizophrenic nature of advanced capitalism, as was articulated, for example in Deleuze and Félix Guattari’s two volumes of *Capitalism and Schizophrenia: Anti-Oedipus* and *A Thousand Plateaus*. In both *Empire* and *Multitude: War and Democracy in the Age of Empire*, Hardt and Negri combine a monistic Spinozist political economy with a post-Marxian brand of materialist analysis of labor conditions under advanced capitalism. The productive space of becoming-revolutionary is located in the notion of the politically mobilized multitude as the motor of world resistance. The European Social Forum\(^\text{18}\) is a good example of a social movement that expresses the democratic mobilization by the people themselves against the hegemony of imperial power.

In terms of European citizenship this means that the constitutive power lies with the people, or the multitude, which has the power to resist state sovereignty and to redefine the public sphere. Peace, multilateral international relations, and multilevel constitutional arrangements are the key features of the Europe of multitudes.

V. COSMOPOLITANISM REVISITED

Considering the complex power relations and internal fractures induced by the globalization process and the European Union, the relevance of contemporary cosmopolitanism as political philosophy, as an ethics of human empathy, and a constitutional and institutional design is thrown open for questioning. And so are its links with its classical and modern predecessors.

Jürgen Habermas’s work, in *The Postnational Constellation*, on the universal value of republican institutions and the emphasis on rational argumentation as the precondition for social justice and democratic governance are relevant to the question of Europe.\(^\text{19}\) It is also predictable, in keeping with his philosophical agenda centered on rational cosmopolitanism and communicative ethics. Habermas has defended the novelty and relevance of the European Union as a political and philosophical factor in what he calls the postnational constellation. Contrary to the brutal instrumentalism of unbridled capitalism on the

---

18. The European Social Forum is an annual conference held by members of the alter-globalization movement (also known as the Global Justice Movement), which emerged from the World Social Forum and follows its charter of principles. It aims to allow social movements, trade unions, nongovernmental organizations, refugees, peace groups, anti-imperialist groups, and antiracist and environmental movements to come together and discuss themes linked to major European and global issues.

19. For a detailed discussion of Habermas, see the essay by Christopher F. Zurn in *The History of Continental Philosophy: Volume 6*.
one hand and the Schmittian belligerency of the US on the other, Europe can and, according to Habermas, should become the political incarnation of a moral community that lives by the normative ideals of Kantian neocosmopolitanism. This means the rule by law, not by force, and the principles of hospitality, not of hostility. Habermas calls for a serious European constitution, that is to say, Europe as a political project that would involve the consolidation of a European public sphere that might strengthen the shared political culture of European democracies and welfare states.

Habermas explores the key philosophical issues raised by the event of the European Union: the security of the rule of law; the sovereignty of the territorial state; collective identity and the democratic legitimacy of the nation-state. The focus of Habermas’s argument is the critique of the intolerance, xenophobia, and racism that accompany the structural changes in the postnational constellation. This deficit in democratic procedures is as problematic morally as it is urgent politically. The ethnically mixed and multicultural structure of postnational societies exemplifies the de-linking of nationality and cultural identity from citizenship and the workings of the state, which causes both discomfort and great opportunities. Habermas’s point is that “to the degree that this decoupling of political culture from majority culture succeeds, the solidarity of citizens is shifted onto the more abstract foundation of a constitutional patriotism.”20 This results in renewing the sense of civil solidarity and of a universalism sensitive to difference. Against the postmodernists and the liberals alike, who, for diametrically opposed reasons refuse universally binding values, Habermas argues that the only way to meet the challenges of the postnational condition is to renew democracy through the framework of the European Union. Egalitarian universalism and constitutional patriotism in a postnational democracy remain the ideal.

Following Habermas, in her recent work on European citizenship, Seyla Benhabib21 interrogates critically the disjunction between the concepts of nation, the state, and cultural identity. Solidly grounded in her theory of communicative ethics, Benhabib works toward the elaboration of new rules of global democracy within a multicultural horizon. A self-professed Kantian cosmopolitan,22 Benhabib argues forcefully that “democratic citizenship can be exercised across national boundaries and in transnational contexts” and defends the European Union accordingly.23 She is especially keen to demonstrate that the distinction between national minority and ethnic group does very little to determine

---

whether an identity/difference-driven movement is democratic. In its current phase, cosmopolitanism has emerged as the dominant progressive ethos of the globalized world in that it is expected to neutralize the potential conflicts of heterogeneous and fast-changing globalized societies.

More critical thinkers within the poststructuralist tradition, however, challenge this view and investigate the notion that neutralization of differences may not be the most effective way of dealing with contemporary societies. Considering the history of difference as pejoration, this approach runs the risk moreover of perpetuating traditional forms of exclusion and disqualification. What is absolutely clear in a poststructuralist perspective is that the universalistic assumption of one common measure of norms and values based on reason, which is constitutive of classical cosmopolitanism, is untenable nowadays. Diverse forms of thinking pan-human belonging and ethical interconnection are both available and necessary, starting, for instance, from pacifism. Politically, cosmopolitanism promises the end of wars and the dawn of an age of perpetual peace through global trade, “global civil society,” and governance. The recent escalation of wars on terror, however, challenges these premises. Important political, normative, and policy implications are involved in this debate between those promoting cosmopolitanism and those who see a return to a new form of warmongering imperialism.

Derrida strikes his own note on the cosmopolitan issue. Starting from the primacy of the Self–Other relation and also from its paradoxical nature, he emphasizes the impossibility for any culture to be self-evident in the sense of coinciding with itself – and with ideals of cultural sameness. Derrida argues that the Other is constitutive of the Self and acts as an irreducible element of otherness within, as an internal fracture or endless differentiation within, which cannot and must not be resolved. In light of its long history of universal posturing, Europe today, argues Derrida, has a moral obligation to turn the question of its identity into the contemplation of the limits of its universality. Simultaneously a very old culture and younger than ever – because it does not quite exist yet – the European Union offers new modes of interrogating the aporetic relationship that ties Self to Other in a productive spiral of contradictions. Neither reducible to the old mastery as a centralizing, hegemonic power, nor dispersed into endless regional and sub-cultural fragments, Europe has to become an event, a process, a self-reflexive contemplation of its own finitude.

Faithful to his ethical project, Derrida outlines a list of ethical obligations that Europe must undertake toward its others and hence toward itself. These include: the critique of totalitarianism; the rejection of racism and xenophobia; the duty of hospitality and openness to strangers; and a commitment to democracy as an unfinished project that is still to come and hence requires all our collective dedication. Contemporary cosmopolitanism, for Derrida, must respect these ethical rules and adopt a political stance that implements them.

VI. PLANETARY SELF-REFLEXIVITY

Derrida’s contribution to the European debate is not the only one, however, to support a transformative kind of cosmopolitanism. Starting from the definition of Europe as an endless adventure of the human spirit and a process of self-quest, for instance, Zygmunt Bauman’s reflections on Europe connect to his criticism of the project of modernity. Bauman acknowledges that the modern age has reached an aporetic moral condition by having functioned under the twin banners of universality and steady-state-bound foundations, the worst examples of which are revolutionary violence and totalitarianism. These threaten the common good and undermine the autonomous responsibility of the moral self, while proclaiming loudly the need for clear and stable values. Lamenting the facile association of the postmodern era with moral relativism, Bauman stresses instead the specific ethical challenge represented by postmodernity. This can be summed up as an increased degree of self-examination, the loss of the grandiose illusions that drove modernity to excess, and a renewed sense of sobriety in setting social and moral goals. Postmodernity is modernity without illusions.

25. Zygmunt Bauman (1925– ) was born to nonpracticing Jewish parents in Poznan, Poland. In 1939, after the Nazi invasion, he escaped to the Soviet Union with his family. After the war, Bauman returned to Poland and studied sociology and philosophy at the University of Warsaw. He completed his MA in 1954 and became a lecturer in Warsaw, where he remained until 1968. After completing his habilitation, in 1962 he was appointed to the Chair in Social Sciences at the University of Warsaw. In 1968, the anti-Semitic campaign led by the Polish government forced Bauman out of his job and out of the country. Having had to give up Polish citizenship to be allowed to leave, he first went to Israel to teach at Tel Aviv University, before accepting a Chair in Sociology at the University of Leeds, where he is currently an Emeritus Professor. Bauman’s published work extends to approximately thirty books and well over a hundred articles. In addition to his other works cited elsewhere in this essay, his most important works include: Between Class and Elite: The Evolution of the British Labour Movement – A Sociological Study (1972), Modernity and The Holocaust (1989), Thinking Sociologically: An Introduction for Everyone (1990), and Globalization: The Human Consequences (1998).

This sobering loss of illusions is crucial for the process of redefining Europe as a philosophical notion. The civilizing mission formulated in the eighteenth century was betrayed, or rather fulfilled perversely, by modernization narrowly defined as an economic process. Challenging the Kantian equation of moral and legal norms, Bauman stresses the gratuitousness, the lack of self-interest, and hence the profoundly nonrational nature of many moral choices that are made for the good of the world. This essential gratuitousness defeats the logic of means–end, the economist calculations of gains and profits, which is so central to mainstream morality. Bauman’s postmodern ethical project stresses instead the primacy of ethics over politics in the constitution of the subject through the rediscovery of a sense of historical accountability. He also attacks the universalizing claims of state powers and the nationalist ideologies that invent traditions and claim territories to real or fictional nation-states. Bauman is equally scathing, however, regarding the neotribalism of the many self-appointed prophets who capitalize on nationalism and other forms of cultural essentialism. Instead of such cast-iron convictions on newly reinvented foundations, he calls for a vision of Europe in line with Balibar’s assertion of the need to re-embark critically its own past. The new planetary mission that Europe has to share in entails the criticism of narrow-minded self-interests, intolerance, and rejection of otherness. Symbolic of this closure of the European mind is the fate of migrants, refugees, and asylum-seekers, all of whom bear the brunt of xenophobia in contemporary Europe.

The emphasis on the need to reinvent humanity and planetary values while avoiding the pitfalls of Eurocentrism is central to this project. It entails the ability to learn again from one’s own mistakes, but also from the rest of the world. Europe has mellowed into an acceptance of a renewed Kantian model of perpetual peace, in opposition to the aggressive Hobbesian project pursued by the US. The European Union is thus mature enough for a self-critical planetary role as the ethical and political subject that has already undergone intense self-scrutiny and has therefore elaborated a new form of cosmopolitanism free of ethnic nationalism.

An analogous project has emerged within Paul Gilroy’s work *Against Race* on colonialism and fascism, racism and anti-Semitism. The continuity between

28. Paul Gilroy (1956– ) was born in the East End of London to Guyanese and English parents, graduated in American Literature at Sussex University in 1978, and received his PhD in Sociology at Birmingham University in 1986 with Stuart Hall. He taught at South Bank University, Essex University, and Goldsmiths College before leaving London to take up a tenured post at Yale University, where he was Professor of Sociology and African American Studies. In 2005 he was appointed as the first holder of the Anthony Giddens Professorship in Social Theory at the London School of Economics. In addition to his works cited in this essay,
these atrocious aspects of European history lies at the heart of Gilroy’s case about the coextensivity of European discourses of modernization and racialized discourses and practices of exclusion. Like most postcolonial and race theorists, Gilroy stresses the murderous charge that “difference” has assumed in European history, and hence also the complicity of rationality with domination and terror. Gilroy, however, strikes a radically neohumanist note. He considers colonialism and fascism as a betrayal of the European ideal of the Enlightenment, which he is determined to defend, and thus he holds Europeans accountable for their ethical and political failings. Racism splits common humanity and disengages whites from any ethical sensibility, reducing them to an infra-human moral status. It also reduces nonwhites to a subhuman ontological status that exposes them to murderous violence. Taking a strong stand against the return of fundamentalist appeals to ethnic differences by a variety of white, black, Serbian, Rwandan, Texan, and other nationalists, Gilroy denounces these “micro-fascisms” as the epidemics of our globalized times. He locates the site of the ethical transformation in the critique of each nationalistic category, starting from the Eurocentric ones, not in the assertion of any dominant one. He sets up diasporic mobility and the transcultural interconnections against the forces of nationalism. This is a theory of mixture, hybridity, and cosmopolitanism that is resolutely nonracial. Against the enduring power of nation-states, Gilroy posits instead the affirmative politics of transversal movements, such as antislavery, feminism, Médecins sans Frontières, and the like. He refers to this ideal as “planetary humanism,” defined as a “postracial and post anthropological version of what it means to be human” in the age of biopolitics and genetic power.29

Gilroy’s cosmo-politan neohumanism is a strategic postracial and inclusive neouniversalism. It suggests the possibility of a “distinctive ecology of belonging” that would recompose the relationship between self, territory, individuality, and society through multiple connections.30 Planetary humanism marks a social and also symbolic recomposition of one’s relationship to space, time, and community. It turns hybridity into an ecophilosophical notion. The challenge is not to return to fixed identities, clear boundaries, and an allegedly pure past, but rather to grab the opportunities offered by the cultural intermixture already available within our own postindustrial ethno/gender landscapes, so as to create yet unknown possibilities for bonding and community building.

Non-Western humanists point out the complicity between European enlightened humanism on the one hand and colonial conquest and exploitation on the

---

30. Ibid., 55.
other and call for a more inclusive sense of humanism. For instance, the black feminist theorist Patricia Hill Collins reconnects to the tradition of Ubuntu, or African humanism and African-American spirituality. Drucilla Cornell argues along similar lines. Supported by a dialogical system and informed by the notion of care as a collective responsibility for one’s community, Afro-centric humanism has become a resource for all who want to resist the attrition and devastation of a process of modernization that is hastily assimilated to coercive Europeanization. Another significant development in the same area is the decolonization strand of the “postcontinental philosophy” movement. This refers to critical theories inspired mostly by Fanon and Sartre, which reject the deconstructive approach to race and ethnicity issues and embrace instead a robust expression of the specific forms of subjectivity developed by those who inhabit the margins, interstices, and diasporic spaces of modernity. These dehumanized others are the agents of powerful epistemic, symbolic, and material decolonizations.

VII. THE BECOMING-MINORITARIAN OF EUROPE

Another radical position inspired by Deleuze and Guattari’s political philosophy argues that the new global context provides the ground for a significant relocation of the notion of Europe as a nomadic and nonethnocentric project. Insofar as it unsettles dominant European identity, the European Union marks a process of becoming-minor of the masterful European subject and engenders more inclusive subject-positions.

In this philosophical paradigm, the post-Eurocentric condition combines nomadic subjectivity with flexible citizenship. The starting-point is the rejection of the myth of unitary visions of the subject and essentialized notions of European cultural homogeneity. European history at any point in time provides ample evidence of ethnic hybridity through waves of migration and the continuing presence of Jewish and Muslim citizens, which challenges the identification of Europe with Christianity. Nonetheless, the myth of cultural

homogeneity is crucial to the tale of European nationalism. In our era, these myths are being exposed and exploded into questions related to entitlement and agency. Thus, the European Union is faced with the issue: can one be European and Black or Muslim? Gilroy’s work on black British subjectivity is indicative of the problem of how European citizenship and blackness emerge as contested issues.\textsuperscript{34} However, whiteness is also called into play. Being the norm, whiteness is invisible, as if natural, whereas black, of course, is always marked off as a color. The effect of this structured invisibility is that it masks itself off into a “colorless multicoloredness.” White contains all other colors and reduces them to social and symbolic visibility. Giving a specific location, historical grounding, and accountability to antiracist whites is one of the aims of critical whiteness theory. The process of becoming-minoritarian or nomadic constructs subjects that are in transit within different identity-formations, but, at the same time, sufficiently anchored to a historical legacy to accept responsibility for it.

A multiply located, nonunitary subject-position and a rhizomic politics of relations are also recommended by the Deleuzian philosopher Edouard Glissant.\textsuperscript{35} He develops an effective rhizomatic poetics and politics, taking as point of reference the historical experience and the specific location of Africans and West Indians caught in the transatlantic slave trade. Glissant foregrounds the importance of memory and the productivity of mixity as the centerpieces of his theory of Relation.\textsuperscript{36} He argues that even an experience as devastating as slavery produces specific forms of knowledge and subjectivization that transcend the burden of the negative. Glissant actively expresses the becoming-minoritarian or becoming-rhizomatic of blacks, Creoles, descendants of slaves, and colonized peoples. This is described as a spiritual but also logistical shift in the structure of the subject in the direction of openness toward both self and other.

Glissant’s position includes a sharp critique of Eurocentrism, which is based on the ontology of sameness or the rule of One. This includes a

\textsuperscript{34} Paul Gilroy, \textit{Ain’t no Black in the Union Jack} (London: Hutchinson, 1987).

\textsuperscript{35} Edouard Glissant (1928– ) was born in Sainte-Marie, Martinique and left for Paris in 1946. He studied ethnography, history, and philosophy at the Sorbonne, where he received his doctorate. Together with Paul Niger, he established in 1959 the separatist political party “Front Antillo-Guyanais pour l’Autonomie,” as a result of which he was barred from leaving France between 1961 and 1965. He returned to Martinique in 1965 and founded the Institut Martiniquais d’études, as well as \textit{Acoma}, a social theory journal. He now divides his time between Martinique, Paris, and New York, where he has been visiting professor of French Literature at CUNY since 1995. As a philosopher, writer, poet and literary critic, Glissant is one of the most influential figures in Caribbean thought and cultural theory, the preeminent critic of the Négritude school and father-figure of the Créolité movement, which emphasizes hybridity as the bedrock of identity and a “creolized” approach to textuality.

dualistic relationship with the rest of humanity. There exists a dominant mode of nomadism in Western culture, in the form of epic journeys of discovery, which find their historical apogee in colonialism. The power of sameness in the West is best described in terms of monolinguism, or the illusion of a single cultural and linguistic root. Glissant, in a very Deleuzian mode, plays the rhizome against the root and advocates global polylinguism. This includes the deconstruction of the hubris of European master cultures and the arrogance with which they consider their languages as the voice of humanity. This universalistic pretense is one of the mechanisms supporting colonialism. It also entails the reappraisal of minor languages, dialects, and hybrids, in a phenomenon that Glissant describes as creolization.

Glissant offers a striking example of the poetics of relation in his analysis of how, in the Caribbean colonized territories, the French colonists spoke their own homegrown dialects – Norman or Breton – rather than the high and noble language of the French nation. It is this bastardized language that mingles with that of the local population, creating a crossover between two distinct but analogous forms of linguistic nonpurity. Creolization, therefore, cuts both ways and marks the becoming-minoritarian of the former master languages.

VIII. ON FLEXIBLE EUROPEAN CITIZENSHIP

I want to relate this nomadic sense of identity to the political notion of flexible citizenship. A radical restructuring of European identity as postnationalistic can be concretely translated into a set of “flexible forms of citizenship” that would allow for all “others” – all kinds of hybrid citizens – to acquire legal status in what would otherwise deserve the label “Fortress Europe.” This would involve dismantling the us–them binary in such a way as to account for the undoing of a strong and fixed notion of European citizenship in favor of a functionally differentiated network of affiliations and loyalties. These could materialize and exemplify, for the citizens of the member states of the European Union, the disconnection of the three elements discussed above: ethnicity, nationality, and citizenship. According to Ulrich Preuss, such a European notion of citizenship, disengaged from national foundations, lays the ground for a new kind of civil society, beyond the boundaries of any single nation-state. Because such a notion of “alienage” would become an integral part of citizenship in the European Union, Preuss argues that all European citizens would end up being “privileged foreigners.”\cite{preuss} In other words, they would function together without reference.

\cite{preuss} Ulrich K. Preuss, “Two Challenges to European Citizenship,” *Political Studies* 44 (1996), 551.
to a centralized and homogeneous sphere of political power.\textsuperscript{38} Potentially, this notion of citizenship could therefore lead to a new concept of politics, which would no longer be bound to the nation-state. This is a pragmatic way to develop the progressive potential of the European Union, and also of accounting for the effects of globalization on us all. These effects boil down to one central idea: the end of pure and steady identities, and a consequent emphasis on creolization, hybridization, a multicultural Europe, within which “new” Europeans can take their place alongside their constitutive others.

The project of a nomadic understanding of European citizenship is a historical chance for Europeans to become more situated and more knowledgeable of their own history and hence more self-critical. Nietzsche argued that many Europeans no longer felt at home in Europe.\textsuperscript{39} At the dawn of the third millennium, many want to argue that those who do not identify with the dominant and heroic reading of Europe are ideally suited to the task of reframing Europe. This starts by making it accountable for a history in which fascism, imperialism, and domination have played a central role. Nomadic European subjects can lay the postnationalist foundations for a multilayered and flexible practice of European citizenship in the frame of the new European Union.

IX. CONCLUSION: TOWARD A NEW EUROPEAN SOCIAL IMAGINARY

Communities are also imaginary institutions made of affects and desires. Nations are, to a large extent, imaginary tales, which project a reassuring but nonetheless illusory sense of unity over the disjointed, fragmented, and often incoherent range of internal regional and cultural differences that make up a national identity. The project of developing a range of possible postnationalist, transnational, nomadic subject-positions and equivalent forms of citizenship is related to the process of dis-identification from established, nation-bound identities. Balibar argues that dis-identification is the key to democratic politics in that it implies openness toward the other.\textsuperscript{40} This is one of the key elements of the learning process that can lead to a positive and affirmative relocation of European identities. It is important to stress both the need for an adequate European social imaginary for this kind of subject-position, and the difficulties involved in developing this. There is no denying that such an enterprise involves

\textsuperscript{39} Friedrich Nietzsche, \textit{Beyond Good and Evil} (Cambridge: Cambridge University Press, 2002), pt 8, “Peoples and Fatherlands.”

\textsuperscript{40} Balibar, \textit{We, the People of Europe?}, 68–9.
a large sense of loss and is not without pain; no process of consciousness-raising can ever be without pain.

What is lacking is a social imaginary that adequately reflects the social realities and the lived experience of a postnationalist sense of European identity. Europeans need to develop adequate, positive representations of the new trans-European condition that they inhabit on the continent. This lack of the social imaginary both feeds on and supports the resistance to the European political project. More work is also therefore needed on the role of contemporary global media in both colonizing and stimulating the social imaginary of global cultures. At least some of the difficulty is due to the lack of a specifically European public debate and low involvement by the very intellectuals who represent it, although the lack of vision on the part of European political leaders does not help the situation.

The acknowledgment of a shortage in the collective imaginary of contemporary European social and political philosophy includes humble and sincere accountability for the complex historical aspects of European culture and its problematic legacy. Donna Haraway sums up admirably this mixture of affects:

> Shaped as an insider and an outsider to the hegemonic power and discourses of my European and North American legacies, I remember that anti-Semitism and misogyny intensified in the Renaissance and the Scientific Revolution of early modern Europe, that racism and colonialism flourished in the traveling habits of the cosmopolitan Enlightenment and that the intensified misery of billions of men and women seems organically rooted in the freedoms of transnational capitalism and technoscience. But I also remember the dreams and achievements of contingent freedoms; situated knowledges and relief of suffering that are inextricable from this contaminated triple historical heritage. I remain a child of the Scientific Revolution, the Enlightenment and technoscience.41

The progressive and liberatory potential of this process of situated accountability is equally proportional to the imaginary and political efforts it requires of its participants. The recognition of the new multilayered, transcultural, post-nationalist, and nomadic idea of Europe is also the premise for the collective development of a new relationship with collective memory. It paves the way for multiple and alternative ecologies of belonging. This kind of embodied genealogical accountability is a major contribution to the philosophical discussions

---

about Europe. Through the pain of loss and dis-enchantment, “post-Eurocentric Europeans” on both sides of the transatlantic divide are moving continental philosophy into the global era by finding enough creativity and moral stamina to confront the mixed legacy of their history and work toward becoming “just” Europeans.
POSTCOLONIALISM, POSTORIENTALISM, POSTOCCIDENTALISM: THE PAST THAT NEVER WENT AWAY AND THE FUTURE THAT NEVER ARRIVED

Eduardo Mendieta

One of the central contentions of so-called continental philosophy is that in order to properly philosophize one must do the history of philosophy, or in other words, that to philosophize is to think through the history of philosophy. In turn, to do the history of philosophy requires a philosophical insight into what gives coherence, unity, and rationality to that history. History, for a philosophical analysis of philosophy’s history, is not just the narration of a sequence of personalities and their thinking, but the insight into the necessity and dependence of their thinking as a narrative.¹ To philosophize, in the continental philosophy tradition, demands both a philosophical understanding of history, and an insight into the way in which that history informs and conditions philosophy. The background assumption for such a view is that there is a fundamental interdependence between reason, that is logos, and history, that is human activity in time. This entwinement of reason and history achieved its highest expression in the thinking of Hegel.² Postcolonial, as well as postorientalist and postoccidentalist, theory carries this fundamental insight of continental philosophy to the outer limits of its conceptual reach. Postcolonial, postorientalist, and postoccidentalist thinking are all unequivocally legitimate children of continental thinking, and faithful servants of its most important insights. The contributions

of postcolonial theory are as integral to the unfolding and self-reflection of the tradition as have been the contributions of phenomenology, existentialism, pragmatism, postmodernism, and deconstruction. No exaggeration is committed if it is claimed that continental philosophy is advanced and perpetuated through its challenges by devastating critiques such as those of poststructuralism, postmodernism, and deconstruction. Such critiques were enabled by the tradition itself. The tradition is precisely that ceaseless self-reflexivity, and preservation in critique. Similarly, postcolonialism, postorientalism, and postoccidentalism are part of that relentless self-reflexivity and reverential preservation through critique.

In the following we will provide a synoptic overview of the philosophical contributions and thematics that give coherence to postcolonialism as a form of thinking. We will do this by paying particular attention to the metahistorical innovations introduced by Edward Said, Gayatri Spivak’s incisive and provocative appropriations of Martin Heidegger’s notions of “worlding,” as well as her analysis of Hegel’s epistemograph, and Homi Bhabha’s analysis of the constitutive desiring of the colonizer and colonized as they are implicated in a form of colonial/colonizing governmentality. These philosophical departures, it is claimed, fall under three rubrics: first, the politics of knowledge, or rather the genealogy of the mutual implication of power/knowledge; second, the geography of reason, or the spatializing of temporalizing that always leaves a trace in terms of a territorializing of reason’s materialization in history; and third, the technologies of subjectification that are attentive to the psychic life of domination and colonial desiring. It is thus easy to appreciate the extent to which postcolonial thinking is thoroughly engaged with the central philosophemes of the continental philosophy tradition: the historicity of knowledge, the phenomenology of consciousness, and the genealogy of subjectivity and agency.

We will then relate the conceptual gains of postcolonial theory to those claimed by postoccidentalism. The aim is to unsettle and disturb a certain philosophical complacency and insouciance as it pertains to the philosophical claims of both postcolonialism and postoccidentalism inasmuch as they reflect the recent history of continental philosophy, a history that is perforce viewed through the historical lens of a post-Cold War pax Americana sensibility, for which the collapse of the Soviet bloc has meant the conceptual bankruptcy of historical materialism and the so-called end of history that assured that liberalism and Western-style democracy had won the historical stage. Postcolonial philosophizing discerns and commands the historicizing of histories, the locating of subjectivities, thus allowing the heterogeneity and plurivocity of

*3. Said, Spivak, and Bhabha are also discussed in detail in the essay by Iain Chambers in The History of Continental Philosophy: Volume 7.
the “others” to speak in their many languages and histories. Such philosophical
attitude turns into the imperative that the philosophical subject name, locate,
map, and territorialize his or her locus of enunciation. As subjects, we speak
from a particular place and time. As Fernando Coronil, Enrique Dussel, Walter
Mignolo, and Anibal Quijano have argued, postoccidentalism relocalizes us in
the colonial and imperial histories of the Americas. The project of postcolo-
nialism, therefore, is one-sided, incomplete, colluding and complicit with colo-
nialism so long as it is not territorialized and temporalized through the sobering
criticisms of postoccidentalism. This is the subject of the last part of the essay.

Before we proceed, some terminological clarifications are required. The
“post” in postcolonialism, postorientalism, and postoccidentalism can be taken
as punctuating a temporal marker. Indeed, postcolonialism makes reference to
the time after the end of colonialism, de jure if not de facto colonialism. The
“post” here is a temporal, historical, geopolitical indexicalization. It marks a time
in geopolitical world-time. The time it marks is the time of the end of Western
imperial and colonial domination, and the beginning of a project of decoloni-
zation. But already there in the turning of the hands of the geopolitical world-
time clock, there is an indication of another sense of “post.” This second sense is
a philosophical, conceptual, and weltanschauungliche meaning and indication.
This “post” refers to a way of looking at the world, one that sees not from the
no-place of the pretend universality of the West and Europe, but from the differ-
entiated, particularized, historicized, and marked perspective of the colonized-
in-the-processes-of-decolonization consciousness. This “post,” as a posture and
attitude of self-consciousness and historical reflexivity, traces a different tempo-
rality, namely the temporality of resistance to colonialism. Postcolonial theory
is a relentless engagement with this duality of the “post.” On the one hand, it recog-
nizes the processes of decolonization that are registered in the annals of world
history, and seeks to formalize and explicate philosophically what they say about
formerly colonizer and colonized peoples. On the other hand, postcolonialism
is also a historical phenomenology of the insurrected and contesting conscious-
ness of the subaltern and subjugated, who always resisted the will to dominate
every master. Like Hegel’s historical phenomenology of the “West,” which is
captured in the aporia of constituted and constituting consciousness, postcolonial
theory is also captured in the aporia of a subjugated but always already insurrected
consciousness. Thus, while many commentators hyphenated the “post-colonial”
to indicate the geopolitical world-time clock, in the following we dispense with
the dash, and opt for the unity in tension of the historical and transhistorical,
the constituted and constituting, the subjugated and insurrected. Additionally,
dispensing with the bridging dash (should) allow us to disrupt the temporalizing
imperative to see the colonial as having become past. Indeed, one of the central
philosophemes of postcolonial, as well as postorientalist and postoccidentalist,
thinking is that the colonial has never come to an end, that part of thinking the postcolonial is precisely to think through the enduring effects of the colonial, of course, from another perspective, through and with another archive and another memory. The postcolonial is an engagement with what Bhabha called the “on-going colonial present”\textsuperscript{4} and Quijano named the “coloniality of power.”\textsuperscript{5} The postcolonial present is also the enduring and always already present of the past coloniality. The past is never past, not even when it is forgotten and erased by those who benefited from its crimes and the privileges it granted.

With these hermeneutical indications now in place, we can anticipate that postorientalism and postoccidentalism similarly refer to both temporal and conceptual indications. If postcolonialism announces the end of the epistemic privilege of the fictitious subject of world history – the “West” – then it also announces the beginning of the end of certain indispensable, albeit always invi- dious, inventions, such as the primitive, the savage, the barbarous, the uncivilized and unmodern, in a word, the oriental. Analogously, with the announcement of this process of mental and philosophical decolonization, which is also the decolonization of philosophy, is also announced the end of othering machines, or dispositifs, to use that felicitous construct by Michel Foucault, that allow the invention of unassailable images and constructs of and for the West.\textsuperscript{6} In other words, if in order to invent the “West” as the best, and highest stage in the unfolding of world-historical consciousness, something like the “Orient” had to be invented, the cessation of such inventing and projecting also entails the cessation of the inventing and projecting of the “Occident.” Yet, as much as “Orientalism” and “Occidentalism” are entwined, they have different logic and histories, which have been variously archived and excavated by different philosophical traditions in different loci of epistemic authority and credibility.

Every major philosophical movement and period has been enabled by material conditions of possibility. The Renaissance was enabled by the rise of a wealthy and philanthropic mercantile bourgeoisie; the Enlightenment by the printing press, the emergence of an educated reading public; postmodernism and deconstruction by the information revolution and the globalization of Euro-American media. Postcolonialism similarly names not just a period, but also a movement that was also enabled by certain material conditions. It would be contrary to the spirit of both postcolonialism and postoccidentalism not to properly foreground their enablement by waves of movements and individual

\textsuperscript{4} Homi K. Bhabha, \textit{The Location of Culture} (New York: Routledge, [1994] 2004), 183. Hereafter cited as LC followed by the page number.

\textsuperscript{5} Anibal Quijano, “Colonialidad del poder, cultura y conocimiento en America Latina,” \textit{Anuario Mariateguiano} 9(9) (1997).

agents of history. Thus a lengthy discussion of the sources of postcolonial and postoccidentalist thinking would have to analyze at least three different waves of precursors, actors, and thinkers. In the first wave, one would have to study the works of Aimé Césaire, Mahatma Gandhi, José Carlos Mariátegui, José Martí, Lamine and Léopold Senghor, Mao Zedong, and, as some postcolonial critics have argued, W. E. B. Du Bois and the work of the Harlem Renaissance, which went on to influence the Negritude movement in the 1950s and 1960s in Africa. Most of this work was produced at the height of European imperialism and colonialism. A second wave of thinking emerges during the most intense periods of anticolonial struggles, after the end of the two world wars and the moral and intellectual bankruptcy of Europe and the consolidation of US global power. In this second wave we would include the works of Amilcar Cabral, Enrique Dussel, Frantz Fanon, Ernesto Ché Guevara, Renato Ortiz, Angel Rama, Roberto Fernández Retamar, and Iris M. Zavala. A third wave includes the works by Dipesh Chakrabarty, Partha Chatterjee, Coronil, Edouard Glissant, Lewis Gordon, Ranajit Guha, Achille Mbembe, Mignolo, Quijano, Said, and Spivak. While the first two waves were more directly linked to postcolonial struggles, and their respective thinkers were dispersed throughout the Third World, this third wave is marked by their almost exclusive localization in the US academy, and their attenuated relation to ongoing decolonizing struggles. The work of this third wave also reflects greater theoretical eclecticism and heterogeneity, as well as a growing self-reflexivity in light of new challenges, such as the emergence of neocolonialism under the flag of globalization and Aesopian multiculturalism, a form of ethnoracial tolerance that does not step beyond the shop windows of affluent malls in the gated communities of the Euro-American cities.

I. ORIENTALIZING TO INVENT THE “WEST”

Orientalism, published in 1978, is unquestionably the single most important text to have defined and given an identifiable shape to postcolonial theory. It should be taken as a manifesto of a new philosophical method and attitude. In contrast to Spivak and Bhabha, two of the other most notable postcol-

nial critics, whose work has been far more episodic and essayistic, Said has produced a corpus that has achieved wide readership, crossing over beyond the narrow confines of the academy into a global readership. A paused consideration of this book's central thesis, as well as methodological innovations, is indispensable for an understanding of the claims and contributions of postcolonial theory.

It must be remarked from the outset that *Orientalism* was not an orphan book, a kind of lucky draw. As Said has made explicit in many subsequent texts and interviews, *Orientalism* was followed very shortly by *The Question of Palestine* and *Covering Islam*. These two books, in fact, sought to further exemplify and document what he had so eloquently elaborated in *Orientalism*. Yet, when Said's work is commented on, whether affirmatively or critically, very few commentators discuss the dependence of the more overtly political works on the more theoretical one. This failure leads to the obscuring and diminishing of the engaged, practical dimension of Said's work. It also conceals the way in which Said's work was never simply or merely denunciatory. In addition, overlooking Said's authorial intent to have these three books read as a trilogy conceals the fact that Said did not philosophize from an undisclosed or unthematized location. And, most importantly, it also contributes to obfuscating the ways in which Said's work was about linking past European forms of Orientalism with more recent US versions of Orientalism. Indeed, not reading these works as a trilogy, which is how Said conceived them, if not at the outset, then as he wrote them and researched them, hinders us from recognizing that Said's overarching methodology was both archeological and genealogical. These terms are used advisedly, for they allude to Foucault's work, which deeply influenced Said, as he himself has noted. Said, however, went beyond Foucault, who nonetheless provided him with a language and a host of metaphors, but not the methodological impetus, nor the critical humanistic outlook, nor certainly what Said called the secular and worldly attitude of the engaged intellectual who speaks truth to power. It must be remembered that Said's conceptual and generative

---

11. In an interview Said notes that Foucault ceased to interest him inasmuch as Foucault appeared to him as merely a scribe of power who celebrated the triumph of power but now did not have
heroes were thinkers such as Césaire, Fanon, and C. R. L. James, but also Erich Auerbach and Ernst Robert Curtius, thinkers who stand far afield of structuralist and posthumanist stances. This aside is necessary because a group of scholars has sought to dismiss Said by aligning him with Foucault and thus imputing to him the kind of antihumanism, cynicism, and political nihilism that plagued Foucault’s work. It is also important that we recall the many occasions, both written and spoken, when Said explicitly paid tribute to but also distanced himself from Foucault. Still, even as Said cannot be assimilated to a kind of Foucaultian analytics, it is necessary that we retain the terms “archeology” and “genealogy” to talk about what Said was elaborating in Orientalism, for reasons that will become clear as we proceed.

A careful and attentive reading of the introduction to Orientalism will reveal first, and most importantly, that Said was quite aware that he was breaking new conceptual and methodological ground. The introduction to this now canonical text of twentieth-century critical thought is a dense “meditation on method.” In these pages, Said is at pains to make explicit what it is that he is trying to do, but he is also impatient to get on with the analysis. He is more interested in showing what his method can reveal than in delaying his discoveries with a protracted methodological discussion. In fact, early on in the introduction to Orientalism, Said makes reference to Foucault’s two most methodological works – The Archeology of Knowledge and Discipline and Punish – in order to appropriate Foucault’s analytics of discourse. The reference to these methodological works also announces that Said himself is laying out a methodological work, whose method is best elucidated by what it accomplishes, what it yields, rather than by how comprehensive and exhaustively it renders explicit its modus operandi. A method is what it allows us to discover, uncover, unearth, and elucidate, what the positivism of the evident conceals and buries over with the force of the authority of science and received wisdom. Still, Said unfolds in some densely argued pages what he thinks is generative and innovative, albeit incipient, in his approach.

---

anything to say about how this very power was always under contestation and confrontation. See Said, Power, Politics, and Culture, 214.
14. See, for instance, the pieces on Foucault now collected in Edward W. Said, Reflections on Exile and Other Essays (Cambridge, MA: Harvard University Press, 2000). See also the numerous references, both appreciative and critical, to Foucault in Power, Politics, and Culture.
Said begins by discussing three meanings that he intends to be attached to the term Orientalism. First, it is the collective name for a series of disciplines, and in that sense it refers to the way in which knowledge is both codified and disciplined within a certain epistemological matrix that corresponds to the way in which knowledge is legitimated and authorized within the Western academy. Second, the terms refers to a “corporate institution” that reigns sovereign over an “epistemologically and ontologically” constituted “imaginative geography” that authorizes, augurs, instigates, demands, and interdicts scholarly, literary, legal, aesthetic, geographical pronouncements that make the Orient available, controllable, acquirable. Orientalism, in this sense, is a dispositif, that is, a power–knowledge device that converts cultures and their territories into objects for imperial conquest and consumption. A third sense in which Said wants the term to be understood is in its radical Vichian sense, that is, as a term that in its evident contingency and historical indexicality refers us to the fact that these mythologies disguised as geographical markers are products of human history that, once analyzed as historical formations, reveal to us how much the “Orient” and the “Occident” are implicated and complicit in each other’s fantasies and dreams of domination. Orientalism, in this third sense, then, should evoke the coproductivity and codetermination of East and West. As Said writes: “Therefore as much as the West itself, the Orient is an idea that has a history and a tradition of thought, imagery, and vocabulary that have given it reality and presence in and for the West. The two geographical entities thus support and to an extent reflect each other” (O 5, emphasis added). We cannot think, then, the West without its imagined and abject East; nor can we think the East without thinking how it in turn must fantasize its other, the West. In fact, Said had alluded to this entwinement earlier in the introduction when he wrote: “European culture gained in strength and identity by setting itself off against the Orient as a sort of surrogate and even underground self” (O 3).

Thus far, then, we have said that Orientalism is a disciplinary regime of knowledge production that has very real power effects, power effects that in turn authorize more of its knowledge production and more of its own power gathering and consolidating. At the same time, Orientalism is also, as is quite evident from the two sections quoted, an “identity machine,” a machine that produces and reproduces a certain ontology of the self. Orientalism, as a power–knowledge dispositif, is what one could call an epistemo-onto-logical device that produces “self” and “other” in conflictive, hierarchical, and invidious oppositions in such a way that the self, the I or “we” of the Occident, lives in a predatory and parasitic way off its derogation, abjection, and subalternization of its other. At the same

time that its other is produced, it must produce for itself a fictive, impossible, alienating self. Thus, already within the first five pages of the introduction to *Orientalism*, Said has announced that Orientalism is not just about the production of an other, the Orient, off which the West lives and from which it derives very material benefits. Orientalism must by definition entail the production and productivity of another meta-geohistorical fiction: the West, the Occident. Orientalism is part and parcel of a process of Occidentalization, the production of an imaginary of and about the West. In turn, the more the Occident constitutes itself through this imaginary, the more it Orientalizes its other.

The critique of Orientalism, then, is not just a critique that seeks to disabuse us of the errors and prejudices about this imagined other, the “Orient,” but is also an explicit critique of the errors, prejudices, and fantasies that we have about ourselves, the “I,” the self of the “West.” In fact, if we conceive of Orientalism as an epistemo-onto-logical mechanism that conditions the horizon of possible existence and experience for historical agents, then the critique of Orientalism must proceed by way of a phenomenology of the imperial self. Indeed, this is what Said accomplishes explicitly and magisterially in the sequel to *Orientalism*, namely *Culture and Imperialism*. Still, already in 1978 in the introduction we are discussing, we find the elements of this critical and reverse phenomenology of imperial agency and subjectivity that surveys the world with petulance, contempt, and unimpeded sovereignty.

What has been here called the *phenomenology of imperial self*, which could also be called an *analytics of the imperial Dasein*, is made explicit in Said's further elucidation of his methodological considerations. After discussing the three senses in which he means Orientalism, Said narrows and refines the sense he wants to attribute to the term Orientalism by making explicit three qualifications. First, while Orientalism refers to a system of ideas and texts that configure and contain an ideology, it would be wrong to “conclude that the Orient was *essentially* an idea.” It is more than just an ideology. Second, even as an ideology and a compendium of ideas, these cannot be properly understood without an “analysis of their force and effects, their configurations of power” (O 5). Ideas have power and power produces certain ideas, just as truth has power effects and these power effects produce certain truths, to paraphrase Foucault. Third, the final qualification, the goal is not to engage in a naive act of epistemological cleansing. Even if the truth of Orientalism were told, it would still endure, precisely because Orientalism is less about what is real and more about the kind of truth and power effects it has because of its mythologies about “them” and “us.” As Said put it: “I myself believe that Orientalism is more particularly valuable as a sign of European–Atlantic power over the Orient than it is as a veridic discourse about the Orient” (O 6). It is not that Said is not interested in truth, but that to get to what may be “veridic” we
have to work through the centuries of sedimented fiction, mythology, and misrepresentations that produced their own truths; and, above all, we have to dismantle the power–knowledge dispositif that holds a monopoly on authorizing not just who is to speak but also what can be said about the “other,” regardless of who says it.

With these qualifications in hand, Said then argues that we entirely misunderstand Orientalism if we think of it in terms of a nefarious plot by the “West” or “Europe.” Instead, we must understand Orientalism as “a distribution of geopolitical awareness into aesthetic, scholarly, economic, sociological, historical, and philological texts” (O 12). In other words, it is a way of cognitively mapping the world. Orientalism is also an elaboration of the world in accordance with certain tools and aims. Orientalism, then, is a Gestell, a way of positing the world in a certain way, in accordance with certain Gestalts, figures, and models, which both voice and are the direct expression of a volitional power. Orientalism is the embodiment of, as Said expressed it:

a certain will or intention to understand, in some cases to control, manipulate, even to incorporate, what is a manifestly different (or alternative and novel) world; it is, above all, a discourse that is by no means in direct, corresponding relationship with political power in the raw, but rather is produced and exists in an uneven exchange with various kinds of power, shaped to a degree by the exchange with power political (as with a colonial or imperial establishment), power intellectual (as with reigning sciences like comparative linguistics or anatomy, or any of the modern policy sciences), power cultural (as with orthodoxies and canons of taste, texts, values), power moral (as with ideas about what “we” do and what “they” cannot do or understand as “we” do). Indeed, my real argument is that Orientalism is – and does not simply represent – a considerable dimension of modern political-intellectual culture, and as such has less to do with the Orient than it does with “our” world.

(O 12, emphasis added)

When Said speaks about these different modalities of power – that is, political, cultural, intellectual, and moral – he is refocusing our attention onto the methodological dimension of his analysis of Orientalism. And what he is directing our attention to is that Orientalism is part and parcel of an ontology of selves that are positioned in geographical, social, historical, cultural, moral, political spaces in certain very specific ways: as masters of a world that is to be possessed, controlled, and known sovereignly and indivisibly. The finest and most explicit moment of this brilliant conceptual breakthrough comes toward the end of the introduction when Said writes:
My principal methodological devices for studying authority here are what can be called *strategic location*, which is a way of describing the author’s position in a text with regard to the Oriental material he writes about, and *strategic formation*, which is a way of analyzing the relationship between texts and the way in which group of texts, types of texts, even textual genres, acquire mass, density, and referential power among themselves and thereafter in the culture at large. … Everyone who writes about the Orient must locate himself vis-à-vis the Orient; translated into his text, this location includes the kind of narrative voice he adopts, the type of structure he builds, the kinds of images, themes, motifs that circulate in his text – all of which add up to deliberate ways of addressing the reader, containing the Orient, and finally, representing it or speaking in its behalf … Additionally, each work on the Orient *affiliates* itself with other works, with audiences, with institutions, with the Orient itself. (O 20)

Orientalism, in short, produces a type of knowledge that seems authoritative. As a result, it excludes other types of knowledge and sites of authority (texts as well as other ways of making claims to knowledge) and, ultimately, the moral authority and political agency of others who work outside those privileged hegemonic sites. This privileged site of authority, determined by the *strategic location*, cleared by the *Gestalt* projected by Orientalism, in turn coordinates, maps, agglutinates, orders, and regiments a whole horizon of truths, narratives, images, even genres that cognitively and ontologically grid the world, making it knowable in very specific ways, which again exclude unauthorized cognitive mappings. It must be noted parenthetically that what Said called in 1978 *strategic location* and *strategic formation* is what in *Culture and Imperialism* he is going to refer to with the phrase “structure of attitude and reference.” Here it becomes explicit how Said’s work is both archeological and genealogical in ways that cannot be reduced to Foucault’s type of genealogy. Yet the terms are helpful because they allow us to anticipate the ways in which Said’s analytics and phenomenology of the Imperial and Occidentalist self are a compendium, a catalogue, an inventory, to use the phrase that Said appropriated with gusto from Gramsci, and a genealogy of our contemporary selves. If we properly read *Orientalism* as a genealogy of this Imperial and Occidentalizing and Orientalizing self, then we will discern that Orientalism is a type of discourse that is not just constraining, repressive, but, most importantly, generative, productive, instigating, and prospective. If we discern this, then we can also discern that Said was less interested in gathering a

catalogue for scholastic reasons and aims than in providing us with the critical tools to liberate ourselves from an Imperial ontology, or what was called earlier an epistemo-onto-logical machine that conditions the ways in which we can live out our moral agency and political subjectivity.

II. WORLDING THE "COLONIAL WORLD"

In *Culture and Imperialism*, Said claims that: “Without empire, … there is no European novel as we know it.”18 In fact, “imperialism and the novel fortified each other to such a degree that it is impossible … to read one without in some way dealing with the other.”19 Gayatri Chakravorty Spivak20 has offered profoundly disquieting and incisive readings of major European novels that seek to render explicit this mutual “fortification” of the novel and imperialism. Spivak in fact has offered another, perhaps more philosophical, understanding of what Said called “structures of attitude and reference” by appropriating Heidegger’s notion of “worlding.” For Spivak, to understand how imperialism and the novel are implicated in each other, we have to understand how the novel contributes to the “worlding” of the “Third World” inasmuch as it both projects and conceals the world of the colonized other. This worlding, additionally, entails constituting a horizon of representation and a horizon of expectation, in which subject-positions are allowed and disallowed.21 The point of the kind of “politics of reading” that is advocated by postcolonial theory aims precisely at un-earthing, remembering, and archiving the worlding that gave origin not just to the other of the West, but to the West itself. For in worlding the other, the other as a “Third World,” the West constitutes its own world, a world that is suffused by amnesias, privileges, and subject-positions that are always surveying from above the history of a Subject with capital S, the subject of all world history.22 Spivak’s audacious readings of canonical literary text, such as *Jane Eyre*, *Frankenstein*, *Wide Sargasso Sea*, and many other such texts, aim to

20. Gayatri Chakravorty Spivak (February 24, 1942– ; born in Calcutta, India) was educated at Calcutta University (BA English, 1959), and Cornell University (PhD Comparative Literature, 1967); She has taught at the University of Pittsburgh and, since 1991, Columbia University, where she is now a university professor and Director of the Center for Comparative Literature and Society.
22. Spivak has developed most of her disquieting reading in a series of dense, lengthy, and demanding essays. See *In Other Worlds: Essays in Cultural Politics* (London: Methuen, 1987) and *Outside In the Teaching Machine* (London: Routledge, 1993).
forge a form of self-reflexive literary analysis that reads these texts in tandem with readings of the “archives of imperial governance.”\(^{23}\) Part and parcel of these archives is the production of silences, of absences, and unexpected apparitions that are constitutive of the agency of both readers and agents who live in and through the kind of subject-positions that are commanded by an imperial ethos. For Spivak, however, these transversal readings do not presuppose some unalloyed, pristine, untouched, and archaic “other.” There is no “lost origin,” before colonialism and empire. There is no un-colonized consciousness, or subject that has not been misshapen or misrepresented by a voracious and plenipotent sovereignty and autarkic agency. Just as, for Heidegger and Gadamer, there is no getting out of the hermeneutical circle of interpretation, so for Said and Spivak there is no getting outside the circle of the imperial and colonial worlding that worlds the worlds of both the colonized and the colonizer.

The “politics of reading” entailed by this type of analytics of imperial worlding urged by Spivak remits us to a politics of representation. Spivak has offered one of the most generative readings of what such a politics of representation would entail. In one of her most celebrated essays, as well as one of the most important texts of postcolonial philosophizing, “Can the Subaltern Speak?”\(^{24}\) Spivak engages Foucault and Deleuze’s dialogue on the role of the intellectual in contemporary society as a way to show not only how they both conflate what she calls the macrological with the micrological, but also how in their discussion they also conflate two very distinct notions of “representation.” Spivak proceeds to rescue Marx’s discussion of the two senses of this term in his *The Eighteenth Brumaire of Louis Bonaparte*. There Marx plays the two different German words – *vertreten* (representation within the economy and the state), and *darstellen* (representation within a theory of subjectivity) – off against one another. The former sense refers us to the role of the advocate, or proxy, while the latter refers us to a portrait, representation, putting forth via an image or trope. If the first belongs to the realm of rhetoric, the second belongs to the realm of persuasion. When Foucault and Deleuze fail, according to Spivak, to distinguish between their representation of those represented – their *vertreten* of those they talk about, those *darstellt*, portrayed, and represented – and the represented themselves, this leads them to a position in which, in “representing them [their subalterns], the intellectuals represent themselves as transparent.”\(^{25}\)

Because they fail to see that speaking for others is not the same as representing them (giving an account of their social position, for instance), they collapse their

---

25. Ibid., 275, emphasis added.
borrowed authority into their subjective position in such a way that the subaltern’s own subject-position is eviscerated and silenced. Yet it this “representing themselves as transparent” that is of primary importance to Spivak, as well as for all postcolonial and postoccidentalist critics. The mythically unsituated, universal, transparent intellectual is but a mechanism to render one's forms of “representing” unassailable and transhistorical. Spivak echoes Said, and calls us to the institutional responsibility of the intellectual. Additionally, this enactment of transparency sets the stage for the “need for ‘heroes,’ paternal proxies, agents of power.” By representing the world of the subaltern and colonized subjects through a disavowal of one’s role in that representation, a rhetoric of need and paternalism is also invoked. It is not the interest or subjectivity of the colonial master that stages the world: it is so staged by historical inevitability, the ineluctable iron logic of progress, modernization, and more recently globalization. This “staging of the world in representation” is integral to the worlding of the colonial masters, for through it the proxy of a paternalistic and heroic sovereignty is effaced and occluded behind the grotesque, distorting, haunting, and pitying portrait of the colonized subaltern.

Said described some of his work as a “geographical inquiry into historical experience.” Spivak’s work can be read as attempts to develop a “geographical inquiry into imperial reason.” In her massive and impressive book A Critique of Postcolonial Reason, Spivak undertakes an analysis of the interdependence between a certain reading of universal reason, Hegel’s in particular, and certain geographical projections and representation. In fact, for Hegel, which for Spivak is a world-historical metonym, the becoming self-conscious of Geist must take form through its geographical trajectory across the world and history. Consciousness assumes a geography, and geography in turn becomes the trace of Spirit’s own coming to itself. In Hegel’s philosophy of art, world history, and consciousness, we find not just an epistemology, or rather a phenomenology of consciousness, but an “epistemography.” For Spivak, Hegel's epistemography becomes the alibi for the staging of the world as the struggle for space, over space, but also the staging for the disappearance of that consciousness.

26. Ibid., 279.
that reads its coming into being on the maps of its conquests. If “[t]he task of the Hegelian philosopher of art [but this applies equally to the philosophy of nature, law, history, and the phenomenology of consciousness] is to analyze the cryptonym, decipher the epistemograph, spell the spirit’s paraphe, on its way to Europe’s signature,”\textsuperscript{30} then the task of the postcolonial philosopher is to render explicit the actual and metaphorical production of space onto which putative universal reason writes itself in the name of a civilizing mission, the fulfillment of a fate, a globalizing project. Echoing Henri Lefebvre’s materialist analysis of the social production of space, it can be claimed that Spivak’s materialist, feminist, deconstructionist, and postcolonial critique also offers an analysis of the imperial and colonial production of planetary space by way of epistemographs and ontographs that are accompanied by bellicose mappings of imperial sovereignty.

III. “PERVERSE PALIMPSEST OF COLONIAL IDENTITY”\textsuperscript{31}

In “The Other Question: Stereotype, Discrimination and the Discourse of Colonialism,” Homi Bhabha\textsuperscript{32} takes Edward Said to task on two important registers. First, Bhabha thinks Said misreads, with tremendously deleterious consequences, Foucault’s concept of power–knowledge. For Bhabha the fecundity of Foucault’s genealogical analysis of power–knowledge resides in its rejection of any dichotomous disjunction: essence–appearance, ideology–science, normal–pathological, and so on. “Subjects are always disproportionately placed in opposition or domination through the symbolic decentring of multiple power relations which play the role of support as well as target or adversary” (LC 103). In Said’s work, however, this leads to the problem that it becomes difficult to conceive of the process of subjectification as a placing within Orientalist or colonial discourse for the dominated subject without the dominant being strategically placed within it too. The terms in which Said’s Orientalist is unified – the intentionality and unidirectionality of colonial power – also unify the subject of colonial enunciation.

\textsuperscript{30} Ibid., 41.

\textsuperscript{31} LC 63.

\textsuperscript{32} Homi K. Bhabha (November 1, 1949– ; born in Mumbai, India) was educated at the University of Mumbai (BA), and Christ Church, Oxford University (PhD, English Literature). He has taught in the English Department at the University of Sussex (1978–94), in Humanities at the University of Chicago (1996–2000), and as Professor of English and American Literature and Language at Harvard University (2001– ).
In other words, Said not only homogenizes the Orientalist, making his will to dominate the other both univocal and transparent, but in tandem, owing to the juxtaposition of the mutuality of colonized and colonizer, the other of the Orientalist is similarly homogenized and made univocal and transparent. Said fails to face up to the problems as well as the potentially disruptive effects that introducing the concept of “discourse” entails and evokes. Most of Bhabha’s work is guided by the overriding preoccupation to develop models of subjectification and identification that give more nuanced, and perhaps proper, insight into the tethering of colonial subjectivity to that of the colonialized. Bhabha’s analytics of subjectification are developed through readings of Fanon and Said, but also Freud and Lacan, readings that are so arresting and original that by now they have insinuated themselves within the canon of psychoanalysis and existentialism.

According to Bhabha there are three fundamental conditions that underlie the process of identification: first, identities are called into being with reference to a “phantasmic space of possession” that no subject can occupy separately and continuously. Identification takes place through the reaching out to this space where one is not, and once one is there it is no longer the place to be. This is the place so jealously guarded by the settler, who is haunted by the threat that the natives want to take “their place.” Second, this very place of identification is a “space of slipping” in which to be different from those that are different makes you the same as the putatively self-same, as in “you are a doctor, you are a scholar, you are x, and therefore are different from them and thus you are like us.” This “like us” is predicated on a difference that is marked from the other difference. Here identification happens through a difference that is internal. For Bhabha, this difference that makes the colonizer and colonized the same is one that instigates deferral and displacement.

Identification is not, as is implied by Said, a process of juxtaposing, mirroring onto another what is not oneself; it is rather a process of having to negotiate in between, within one’s own subjectivity, this otherness, the otherness of the self, which is always already different by the way it marks itself off through an identifying sameness. Third, identification is not about affirming a pregiven identity, nor about accomplishing something that was already inchoate. Identity is always achieved in its mis- and re-identification through the assuming of a projected image. Identity is always the staging of misrecognition.
The demand of identification – that is, to be for an Other – entails the representation of the subject in the differentiating order of otherness. Identification … is always the return of an image of identity that bears the mark of splitting in the Other place from which it comes. (LC 64)

There are two distinctive forms these slippings and deferrals take within the discourse of colonialism. The colonial subject is constituted, but also dismantled, through discourses that articulate forms of difference. The central issue for colonial discourses is the “mode of representation of otherness.” One such mode is that of the “stereotypical discourse.” Colonial discourse constitutes the otherness of the subaltern through a stereotypical discourse that projects a fixity, discernibility, legibility, calculability, and already-knowingness of the other. The colonial subject is always already known through the stereotypes. The colonial discourse renders the colonial reality thoroughly known and visible through its stereotypes. But by its very structure as a stereotype, it requires that it be continuously reconfirmed, re-enacted, relived. At the heart of the stereotype there is lack, a horrifying vacuum, namely that it will not be confirmed. This self-cancellation of the stereotype is confirmed through a reading of the stereotype as a fetish. The stereotype acts as a fetish, takes the place of the fetish of colonial subjectivity. “The fetish or stereotype gives access to an ‘identity’ which is predicated as much on mastery and pleasure as it is on anxiety and defense, for it is a form of multiple and contradictory belief in its recognition of difference and disavowal of it” (LC 107).

The other discourse for the constitution of difference that is central to the discourse of colonialism is that of mimicry. At the heart of colonial discourse is the desire for the educated, domesticated, recognizable other that is “a subject of a difference that is almost the same, but not quite” (LC 122). The paternalistic, self-abnegating, and self-sacrificing colonial subject is to be met halfway by a colonized subject who will be just like itself, but not quite. The telos of the colonial discourse is to educate others into its own best image of itself. Mimicry, however, like the stereotypes, is unstable. The mimicry expected of the colonial other, like every iteration, is however liable to be faulty, challenging, mocking, and displacing. While colonial discourse demands this replication, imitation, it also fears it. It is undone by it, in fact.

The effect of mimicry on the authority of colonial discourse is profound and disturbing. It is as if the very emergence of the ‘colonial’ is dependent for its representation upon some strategic limitation or prohibition within the authoritative discourse itself. The success of colonial
appropriation depends on a proliferation of inappropriate objects that ensure its strategic failure, so that mimicry is at once resemblance and menace.

Together, stereotypical and mimetic colonial discourse participate in the constitution of a form of governmentality that “is informed by a productive splitting in its constitution of knowledge and exercise of power” (LC 118). Through its mobilization of stereotypes in the form of racisms with their prejudicial and mystifying ideologies, it sanctions and commands deployment of power, while it disavows its source and necessity. The discourses that represent difference in terms of stereotypes and mimicry underwrite a form of governmentality that foists on its colonial subject both the cause and effect of the excesses of its power. Their own instability, furthermore, demands the vigilance and anarchical or arbitrary enactment of its violence.

What makes Bhabha’s analysis distinctive is precisely the way in which it destabilizes Said’s and Spivak’s sometimes too rigid representation of the identity of the colonizer, and perforce, of the colonized. Bhabha’s work combines productively Lacanian psychoanalysis with Foucaultian genealogy in order to make more nuanced Said’s and Spivak’s analyses of the discourses of imperialism and colonialism. For Bhabha, the ongoing colonial present is not an issue just of the endurance and efficacy of the colonial past, but also of the ways in which forms of identification and subject formation have been constituted in the crucible of colonial domination.

IV. THE WEST’S “OCCIDENT”

Postcolonialism is a form of materialist cultural critique that aims to articulate the interdependence between cultural expressions and their material underpinnings. Imperialism both presupposed and produced the novel. The novel, in turn, gave expression to the kind of subjective positions that enabled and condoned an imperial ethos. Already during the early 1970s Latin American liberation philosopher Enrique Dussel33 had sought to articulate a similar materialist reading of the complicity of Western philosophy with the imperial and colonial practices of the “West.” According to Dussel, the great philosphemes of Western philosophy (such as Descartes’s cogito, Kant’s ich denke, and Hegel’s absolutes Wissen) find

33. Enrique Dussel (December 24, 1934– ; born in La Paz, Argentina) was educated at the National University of Cuyo, Argentina, the Sorbonne, and the Catholic Institute in Paris. From 1968 to 1975 he taught at his alma mater. In 1975, after an assassination attempt, he and his family were exiled in Mexico. He has been teaching since then at the Autonomous Metropolitan University and the Autonomous National University of Mexico, in Mexico City.
their genesis and material condition of possibility in the *ego conquiro* expressed by Hernán Cortés and Francisco Pizarro.\(^\text{34}\) “Before the *ego cogito* there is an *ego conquiro*; ‘I conquer’ is the practical foundation of ‘I think.’”\(^\text{35}\) Like Said and Spivak, Dussel is also supremely conscious of the relationship between philosophy and geography. In fact, his 1975 *Philosophy of Liberation* – a work that summarized over a decade of philosophizing, written in exile in Mexico – opens with a section entitled “Geopolitics and Philosophy.” In his 1992 Frankfurt Lectures, Dussel returns to the relationship between geography and philosophy, but this time to unmask the myth of modernity. Part of the mythology of modernity is to rewrite history and to segregate and marginalize spatially those who are in pursuit of modernity. These lectures were published in English under the title *The Invention of the Americas: Eclipse of “the Other” and the Myth of Modernity.*\(^\text{36}\) At the center of these lectures was a challenge to the then-in-fashion debates about modernity and postmodernity. The challenge issued by Dussel was that Charles Taylor, Jürgen Habermas, Gianni Vattimo, and Richard Rorty, each name standing in for a particular philosophical tradition within these debates, did not properly understand the crisis of modernity because they did not understand its sources. They did not understand modernity’s sources because they had willfully adopted a chronology of modernity that occluded its sixteenth-century origins and its material conditions of possibility in the conquest of the New World. Dussel, in fact, argued that the crisis of modernity was but the crisis of a project that began in the last decades of the fifteenth century, but that only took proper form in the sixteenth century with the expulsion of the Moors and Jews from the Iberian peninsula. Modernity was the mythological name for another project that had a different name in earlier centuries. This early project had the name of evangelization. Later, before the German and French enlightenments, and surely before the ascendancy of Britain to world empire, the Spanish and Portuguese had been the imperial centers of a Christianizing and evangelizing project. Dussel had, in fact, articulated a counter-narrative of modernity, one that recentered the project of modernity within a longer, most encompassing project, the project of the “Occidentalization” or “Westernization” of the world. Implicit in Dussel’s unmasking of the myth of modernity was also a critique of two other philosophical fashions of the later 1980s and early 1990s:

\(^{35}\) Ibid., 3.

postcolonialism and postmodernism. Curiously, Dussel had called his philosophy of liberation a form of “postmodern” philosophy, just as he had also called it “barbarian” philosophy. What he meant partly was that the critiques articulated by these movements have been part of the intellectual and philosophical canon in Latin America already for over a century. In Dussel’s work, however, the issue of the relationship among modernity, globalization, the West, and the Orient had already been articulated as a philosophical problem. As Said’s work became a point of convergence and departure for postcolonial thinkers, so has Dussel’s.37

Fernando Coronil,38 working from within the social sciences, gave a more explicit articulation of the problematic anticipated by Dussel. In a programmatic essay entitled “Beyond Occidentalism: Toward Nonimperial Geohistorical Categories,” Coronil presents one of the clearest analysis of Occidentalism and how it relates to the Orientalist project.39 He finds Said’s analysis in Orientalism indispensable, but also lacking. In fact, according to Coronil, Said presupposes an unthematized understanding of the West, whereas part of the project of a critique of all colonial discourse is to give an account not just of a culture’s misrepresentation of its alleged others, but also of how it conceives itself in such a way that it authorizes itself to view others in a particular light. Coronil does not want to dispense with Said, but rather urges us to redirect our attention.

I wish to take a step in this direction by relating Western representation of “Otherness” to the implicit construction of “Selfhood” that underwrites them. This move entails reorienting our attention from the problematic of “Orientalism,” which focuses on the deficiencies of the West’s representations of the Orient, to that of “Occidentalism,” which refers to the conceptions of the West animating these representations. It entails relating the observed to the observers, products

37. See Linda Martin Alcoff and Eduardo Mendieta (eds), Thinking From the Underside of History: Enrique Dussel’s Philosophy of Liberation (Lanham, MD: Rowman & Littlefield, 2000) and Eduardo Mendieta (ed.), Latin American Philosophy: Currents, Issues, Debates (Bloomington, IN: Indiana University Press, 2002). The debates have been brought home, and now the issue is about the role of Latin Americans in the US. See Ramón Grosfoguel et al. (eds), Latin@s in the World-System: Decolonization Struggles in the 21st Century US Empire (Boulder, CO: Paradigm Publishers, 2005).

38. Fernando Coronil (November 30, 1944– ; born in Caracas, Venezuela), was educated in Venezuela, emigrated to the United States in 1963, and received his BA from Stanford University in 1967, and his PhD from the University of Chicago in 1987. He is Associate Professor of History and Anthropology, and Director of the Latin American and Caribbean Studies Center at the University of Michigan.

39. Another indispensable text in understanding the debates around postoccidentalism is Coronil, “Latin American Postcolonial Studies.”
to production, knowledge to its sites of formation ... This perspective does not involve a reversal of focus from Orient to Occident, from Other to Self. Rather, by guiding our understanding toward the relational nature of representations of human collectivities, it brings out into the open their genesis in asymmetrical relations of power, including the power to obscure their genesis in inequality, to sever their historical connections, and thus to present as the internal and separate attributes of bounded entities what are in fact historical outcomes of connected peoples.

Occidentalism, as I define it here, is thus not the reverse of Orientalism but its condition of possibility, its dark side (as in a mirror). A simple reversal would be possible only in the context of symmetrical relations between “Self” and “Other” – but then who would be the “Other”? 40

Occidentalism, then, is an identity machine that constructs the self-same in terms of how it: (i) separates the world into discretely bounded geopolitical units; (ii) disaggregates and de-links their entwined histories; (iii) turns difference into hierarchies; (iv) naturalizes representations of otherness; and (v) intervenes in the perpetuation of asymmetrical power relations. The Occident, therefore, constitutes itself through the abrogation of the epistemic, political, geographical authority to do this unto others.

Walter Mignolo41 will adopt Coronil’s formulations, but give them greater historical specificity. Linking Coronil’s critiques of Said with Dussel’s critique of the philosophers of the discourses of modernity and postmodernity, Mignolo argues that the key word for understanding the material and historical underpinnings of modernity is in fact Occidentalism. Mignolo notes that in the sixteenth century the Americas were in fact called the “Indias Occidentales.” The Occidentalist project is not one of the juxtaposition of a radical other, as in Orientalism, but rather the incorporation, assimilation, evangelization, and conversion of the “Indians.” In the first stage, the Occidentalist project was one of incorporation and Christianization. Later, the Occidentalist project will become one of civilization and enlightenment; and much later one of modernization and

41. Walter Mignolo (January 5, 1945–; born in Isla Verde, Argentina) was educated in Argentina at the National University of Cordoba, where he received his BA and MA from the Faculty of Letters and Philosophy. He received his Doctorate in 1974 from the École des Hautes Études in Paris, France. He has taught at the Université de Toulouse, Indiana University, and the University of Michigan. Since 1993, he has been the William H. Wannamaker Professor of Literature and Romance Languages at Duke University.
globalization. Each version or stage of the Occidentalist project has been advocated and shouldered by a different imperial power within Europe. Each imperial seat has left its imprint on what it means to be the West, what it means to be European in relationship to the West. For Mignolo, postoccidentalism is the name for the critique of the project of modernity in particular, but also of the bankruptcy of the Occidentalist project in general, from and in Latin America. The crisis of modernity has been expressed in four different “posts”: the “postmodern” project, which was articulated from Europe itself (Arendt, Baudrillard, Lyotard, Vattimo) and the United States (Jameson); the “postcolonial” project, which was articulated in and from India (Bhabha, Guha, Spivak, the Subaltern Studies Group); the “postorientalist” project, which was articulated from the US looking at the Middle East (Said); and the “postoccidentalist” project, articulated in and from Latin America (Dussel, Kusch, Retamar, Silvia Rivera). What these four different “post” projects articulate is the rupture between different cultural areas, traditions, histories, and the locales of the production of knowledge.

When Mignolo articulates the differences, but also relationships among these different post projects, he is also recentering our attention on the central philosophical idea of all forms of postcolonial, postorientalist and postoccidentalist critique and analysis, namely that the layering and interlocking of the politics of knowledge with the politics of reading produce for us a geopolitics of knowledge that is attentive to the locus of enunciation of knowledge and how that claimed knowledge is or is not related to those about whom it speaks and seeks to “represent.” In Foucault’s language, knowledge is always an effect of power and power produces certain knowledges. This is what Quijano called the “coloniality of power,” by which he meant that all social relations, including knowledge relations, cannot but be imbricated with and refracted by the power differentials established, reconstituted, and renewed after the onset of colonial relations.

In a 1985 essay entitled “Orientalism Reconsidered,” Said, referring to all the kinds of philosophical and intellectual projects that shared in the spirit of his own Orientalism, wrote “They are, therefore, planes of activity and praxis, rather than one topography commanded by a geographical and historical vision locatable in

43. Ibid., 42.

a known center of metropolitan power." Said underscores here the decentered topography of knowledge that is not tethered to the commanding leash of an imperial and metropolitan authorizing power. Like Mignolo, he underscores the different and differentiated geopolitical histories of knowledge productions and knowledge–power circuits. The “posts” in postcolonialism, postorientalism, postoccidentalism are not about marking chronologically a moment of crisis and rupture, but rather about announcing an epistemological, hermeneutical, semiotic turning from a form of knowledge production to another that is attentive to local histories. These “posts” announce a past that is never past, and a future that is still to arrive. These “posts” also call us to acknowledge the always disavowed mutuality that makes it impossible to think the West without the Orient, Europe without its others. Postcolonialism, postorientalism, and postoccidentalism are neither anti-Western, nor anti-Occidentalist. This would only perpetuate the kind of amnesia and blindness that the original critiques sought to remedy. At the beginning of the dismantling of the edifice of colonial philosophy and its attendant mentalities is what Chakrabarty calls an “anticolonial spirit of gratitude,” because philosophy conscious of its origins and effects is a gift from all to all.

I. A COMPLEX HISTORY

The history of continental philosophy and the environment brings to the fore some nagging questions: Who counts as a continental philosopher and what is the relationship between geographical location and philosophical approach? Given the embrace of “analytic” philosophy in continental European since the 1970s, philosophy in Europe is now just as divided between “continental” and “analytic” approaches as is philosophy in the English-speaking world. Environmental philosophy in German and French is more likely to engage with English environmental philosophy than with the traditions of French and German philosophy. By far the most productive locale for continentally inspired environmental philosophy is the United States. The situation is further complicated by the fact that continental environmental philosophy has, by and large, developed independently in French, German, and English, so that contributions in one place often remain unnoticed in others. It is the purpose of this essay to present this complicated history, at least in overview. This history has three largely distinct trajectories. English-language continental philosophers have, by and large, sought to show how various European thinkers’ work can be used in addressing environmental issues. Interestingly, with the exception of Martin Heidegger and Félix Guattari, the thinkers chosen have not themselves

1. Pierre-Félix Guattari (March 30, 1930–August 29, 1992; born in Villeneuve-les-Sablons, France; died in Cour-Cheverny, France) studied pharmacy at Bécon-les-Bruyères (1948–49) and philosophy at the Sorbonne (1950–55). He later trained as a psychoanalyst with Jacques Lacan, and worked with Jean Oury at La Borde Psychiatric Clinic from 1955 on. In addition
been particularly interested in environmental issues (and even Heidegger is an interesting case, since his interest seems to run more toward nature; whatever place environment *[Umwelt]* played in his earlier work, he did not have in mind there what we mean by environment when we talk about environmentalism). Simultaneously, and largely unremarked on by English-language continental philosophers, there has been ongoing interest among the French in various environmental issues. A third trajectory can be traced in Germany, where Heidegger and some of early members of the Frankfurt School were exercised by questions having to do with nature, culture, and technology. While, given the relative strength of the Green Party in Germany, one might have expected German philosophers to show an interest in environmentalism, this has not, by and large, been the case. Contemporary German (and, for that matter, Dutch, Belgian, and Italian) contributions have, for the most part, been largely limited to an engagement with environmental ethics as practiced in the English-speaking world. What is distinctive about continental approaches to environmental philosophy, wherever they occur, is a willingness to call into question *all* the relevant terms, in particular “nature” and “humanity.” In distinction, what I am here calling, for lack of a better term, analytic approaches have tended to hold fast their conception of the human being while, at most, being willing to question what nature is, although even this inquiry often does not take place.

While we can find ruminations about nature in the work of Kant, Schiller, Hegel, Nietzsche, and many others, it is really not until Heidegger that thought about nature comes to have what we might term an environmentalist bent. Nevertheless, coming as it does before the events of the 1960s that gave birth to environmentalism, we must characterize Heidegger’s work more as proto-environmentalist. This means that Heidegger’s interest in the environment remains always rather circumspect, requiring the work of interpreters to bring it to the fore.

Interestingly, while Heidegger’s thought has been influential on a number of American interpreters, it has been less clearly influential in the European (and this means primarily French) tradition of environmental philosophy. Here we find an approach to environmental issues that is, in a sense, more radical than anything undertaken in English, whether influenced by the work of nonenvironmentalist continental thinkers or not. What characterizes contemporary French thought about the environment is that, unlike English-language environmental philosophy, it begins not with the assumption of a split between nature and culture, but with the view that nature and culture cannot be thought except in relationship to one another. The reasons for this difference in approach

---

to his works cited here, Guattari authored *Psychanalyse et transversalité: Essais d’analyse institutionnelle, La Révolution moléculaire,* and *L’Inconscient machinique: Essais de schizo-analyse.*
are many, but have largely to do not with the history of European philosophy but with European land-use practices, and developments in fields such as psychoanalysis and anthropology.²

While some well-known continental thinkers have addressed environmental issues, either directly or circumspectly – Michel Serres, Bruno Latour, and Guattari – they have had their environmental work almost entirely ignored by the English-speaking world. Simultaneously, thinkers such as Maurice Merleau-Ponty, Michel Foucault, Gilles Deleuze, and Jacques Derrida, whose work by and large either pays no attention to environmental issues or does so only in passing, have been embraced by English-speaking philosophers. What is unfortunate about this oversight on the part of English-language environmental philosophers is that many of the issues addressed by Serres, Latour, and Guattari – primarily the importance of thinking nature and culture not in opposition but as codeterminants – are only now coming to be recognized as essential to environmental philosophy. However, even in this situation, the groundbreaking work of the French continues to be ignored, which means that English-language environmental philosophers must retread ground that, unbeknown to them, has already been covered.

The following treats the history sketched above in three sections. The first covers Germany (with passing consideration of Belgium, the Netherlands, and Italy); the second addresses English-language developments; the third concerns itself with France.

II. GERMANY AND ELSEWHERE

Much of Heidegger’s later work addresses questions having to do with nature, humanity’s place in the world, and how human practices allow or force nature to show itself one way rather than another. Such themes clearly have an environmental cast to them, even if Heidegger was writing before there was such a thing as environmentalism. For the later Heidegger, humanity’s technological relationship with the world became a central topic of concern. Corollary to this was his interest in what he termed a “new beginning” that would allow human beings to dwell upon the earth, that is, to allow the earth to show itself in a human world in a way shaped not by the terms of science and technology but by the freeing play of poetry. Although such themes in Heidegger’s thought now appear

². For an excellent treatment of this history see Kerry Whiteside, Divided Natures: French Contributions to Political Ecology (Cambridge, MA: MIT Press, 2004). Since Whiteside’s interest is in tracing French political ecology rather than ecological philosophy, he treats not only philosophers but also anthropologists, political theorists, and others.
to have an environmentalist cast to them, this is more due to a change in the times. That is, it is not at all clear that Heidegger conceived of himself as really being engaged in philosophy of nature, never mind environmental philosophy. I return to Heidegger below when I discuss English-language contributions to environmental philosophy.

Several members of the early Frankfurt School are also important here. In *Dialectic of Enlightenment,* Theodor Adorno and Max Horkheimer focus, to a great degree, on enlightenment modernity’s relation to nature. While the project of enlightenment sought to free humanity from nature’s domination by, as it were, turning the tables on nature so that it would now be dominated by us, the end result turned out to be, at the same time, a new form of domination of humanity by itself. Adorno and Horkheimer argue that enlightenment was unable to establish any legitimate goals or purposes to which humanity’s newfound powers could be turned, and, in the absence of such purposes, the tools of domination that so effectively freed humanity from nature’s control were open to being turned to the domination of humanity as well. Enlightenment thus turns out to be a double-edged sword, whose end result is to obtain humanity’s freedom from nature only at the cost of the domination of both nature and humanity by the forces of instrumental reason. For Adorno and Horkheimer it is not only the loss of human freedom that indicts enlightenment but also, if we may put it thus, the loss of nature’s freedom as well. Missing from Adorno and Horkheimer’s work, however, is a response to the situation they analyze.

Unlike Adorno and Horkheimer, whose conclusions are clearly pessimistic, Herbert Marcuse saw in revolutionary politics the possibility to transform technology in such a way that not only humanity, but nature as well, could be freed from the repressive distortions of modernist technological mastery. For Marcuse, it is only through a nondominating technology (a new technology he remains vague in describing) that humanity can recover from the distortions of its nature and nature can become what it always could have been. While Marcuse is clearly optimistic, he does not fulfill his promise with detailed proposals and may, as critics such as Jürgen Habermas have argued, have fallen into an unjustifiable romanticism.

---

*3. Adorno and Horkheimer’s *Dialectic of Enlightenment* is discussed in the essay by Deborah Cook in *The History of Continental Philosophy: Volume 5.*

*6. Habermas’s work is discussed in the essay by Christopher F. Zurn in *The History of Continental Philosophy: Volume 6.*

One might have expected that Germany, with its comparatively powerful Green Party (until 2005 the second player in the governing coalition with the Social Democrats), would have continued to produce continental environmental philosophers. Such, however, has not generally been the case. Perhaps in part because of the revelations about Heidegger’s involvements with National Socialism or because of the turn away from Marxism and the embrace of a revivified Kantian humanism in the thought of Habermas, German philosophers have, by and large, focused their concerns elsewhere. To these speculations should also be added the not inconsiderable fact that philosophers in Germany today are as likely to be interested in Anglo-American analytic philosophy as they are in their homegrown philosophical traditions. Thus, when we look for contemporary German contributions to environmental philosophy (and this is true in the Netherlands and Italy as well), most of what we find are engagements with English-language environmental ethics. We find, for example, investigations of the suitability of utilitarianism as an environmental ethic, a turn to ecology to ground ethics, or various engagements with economic analysis.

That having been said, there have been several recent contributions to environmental philosophy from a continental perspective in Germany (I treat France separately below). Hans Jonas, in the context of his argument for responsibility as the central ethical concept in a technological age, discusses the importance of humanity’s taking responsibility for our use of technology not only for ourselves but for nature’s sake as well. After suggesting this idea, however, Jonas immediately retreats into the position that “responsibility for man” is sufficient, since his view of humanity includes our “worldly home”; that is, we need to care for where we live, broadly conceived, as part of our responsibility to ourselves and to each other. Jonas thus remains not so much an environmental philosopher as a philosopher of technology.

---

More promising is the work of Hans-Martin Schönherr-Mann, who reinvigorates the tradition of Adorno and Horkheimer (now developing it in the direction of a “negative ecology”) by adding to it insights drawn from the work of Nietzsche, Heidegger, and Gianni Vattimo. Writing in the late 1980s, Schönherr-Mann argued that ecological debates in Europe had reached a stalemate between the proponents of technical modernization and those who argued for a “return to nature.” For Schönherr-Mann, this situation requires a metaphysical analysis à la Nietzsche or Heidegger. In other words, what needs to be seen is that both positions are rooted in modernity’s will to master, the former as will to master nature, the latter as will to master that selfsame will to master, that is, a desire for mastery of mastery. Instead of these alternatives, Schönherr-Mann proposes what he calls, following Vattimo, “weak thinking” (often translated “weak theory”), in which thought attempts neither to master the world nor to master itself. Rather, the goal of philosophical engagement is to criticize the ways in which the will to mastery manifests itself so that it can be seen as what it is – a metaphysical position rooted in a particular historical moment with particular ramifications – thus at least opening the way to thinking, and perhaps being, otherwise. That is, weak thinking, rather than offering an alternative conceptualization of the world, endeavors to make evident the contingency of current modes of thought as well as the ways in which they instantiate a will to mastery. This weak thinking risks the same charge of quietism that is often leveled against Heidegger, but constitutes, argues Schönherr-Mann, the only way forward, since all other alternatives simply reinscribe modernity’s will to mastery which, as we saw with Adorno and Horkheimer, leads only to further repression of humanity and nature.

III. THE UNITED STATES

As we saw above, some of Heidegger’s work can be fairly characterized as proto-environmentalist. It was not, however, until recently that those strands in his thought were teased out by some English-language commentators. Early environmentalist commentators on Heidegger focused on Gelassenheit (letting be) as a way of relating to nature and natural beings that Heidegger contrasted with a technical enframing (Ge-stell) that forces the world to appear as what he terms standing reserve (Bestand), that is, as resources that wait to be used.

---

13. Vattimo’s “weak thinking” is discussed in the essay on Italian philosophy by Silvia Benso and Brian Schroeder in The History of Continental Philosophy: Volume 7.
and used up.\textsuperscript{14} What these commentators found in Heidegger was a thinker who took Kant's insight that how nature appeared to us is dependent on our own categories and Hegel's insight that those categories are historically variable, and combined it with Nietzsche's view that such categories could themselves be criticized as either affirming or destructive. For Heidegger, the categories of technical enframing, which force the world to appear as a set of resources—what he termed standing reserve—had pernicious consequences both for nature and for humanity since, as Heidegger saw, such a form of revealing could not but be applied to humanity as well. Thus, the very same set of practices—scientific, technical, philosophical, and so on—that prevent nature from appearing as free also prevent humanity from encountering itself as free. Finally, commentators have found in Heidegger's proposal of a new or other beginning the possibility that we might come to reveal the world (allow the world to reveal itself) not as forced into rigid categories with which it must conform, but as free.\textsuperscript{15} Such revealing for Heidegger will happen, as does technical revealing, primarily in and through linguistic practices. However, freeing revealing will (may) happen through poetizing, in which the poet gives voice to nature itself, so that nature, in a sense, is allowed to show itself to us in language.

Of late there has been a growing tide, led by Michael Zimmerman, one of the earliest proponents of Heidegger as an environmental philosopher, arguing that Heidegger may not be as fruitful a figure as was previously believed.\textsuperscript{16} Zimmerman now argues that Heidegger's involvement with National Socialism is deeply implicated in his philosophy and that, as a result, any Heideggerean environmental philosophy, even one presenting itself as having to do with freedom, runs the risk of finding itself endorsing fascism, which is a risk that Zimmerman is unwilling to take. (Part of this hesitation no doubt stems from the fact that it was under the National Socialists that Germany enacted the world's first far-reaching laws for the protection of nature at a time when they were showing precious little regard for the protection of human beings.\textsuperscript{17}) While

\textsuperscript{14} For example, Laura Westra, “Let It Be: Heidegger and Future Generations,” \textit{Environmental Ethics} 7 (1985).

\textsuperscript{17} For a recent discussion of German environmental policy in the 1930s and 1940s, see F.-J. Brüggemeier, M. Cioc, and T. Keller (eds), \textit{How Green were the Nazis? Nature, Environment, and Nation in the Third Reich} (Athens, OH: Ohio University Press, 2005).
Zimmerman does not believe that there is any surefire antidote to fascism, the one most likely to succeed is a commitment to democracy. The privileged position Heidegger gives to poets, argues Zimmerman, is simply inconsistent with a view that holds that environmental decisions must be made democratically. Still, Heidegger’s insight that we cannot discuss nature without doing so in relation to humanity is one that we will see fruitfully developed later.

Merleau-Ponty’s detailed investigations of human experience, particularly those he developed in his later works, in which he argued that we can make sense of human experience of the world only under the conditions that the world and our bodies are made up of the same “flesh,” have been taken up by some commentators as a fruitful path to making sense of the human place in the environment. While it has long been the case that environmentalists have depended on accounts of our experience of nature, they have often done so in relation to the languages of science or religion (the two great traditional languages for discussing nature).18 Phenomenology, on the other hand, provides the resources for elaborating on experience from out of itself, which makes possible both descriptions and valorizations of that experience in a way that legitimizes them even when they have no grounding in either science or religion.19 Merleau-Ponty’s work thus helps validate the aesthetic component of everyday experience and helps make sense of environmentalist intuitions.

Although Foucault at first blush seems an unlikely candidate to be an environmental philosopher (he famously responded to natural beauty by turning his back on it), if we recall Heidegger’s insights – that nature and culture must be thought together and that human practices shape what nature can be for us – then Foucault seems more plausible. Beginning with Thomas Birch, who argued that wilderness areas are little more than prisons for nature, there has been a steady stream of environmental philosophy drawing on Foucault.20 Éric Darier has argued that three aspects of Foucault’s genealogical period “can be particularly helpful for an environmental critique: ‘governmentality,’ ‘biopower’ and ‘space.’”21 These three concepts, taken together, give the environmental philosopher powerful tools for making sense of government power and its tendencies,

18. This is true, for example, of Aldo Leopold (A Sand County Almanac) and Holmes Rolston III (Earth Ethics: Duties to and Values in the Natural World and Philosophy Gone Wild: Essays in Environmental Ethics).
in particular as that power is deployed on living (for Foucault human) bodies arrayed in space. We can even see, despite Foucault’s protestations to the contrary, a certain sort of environmentalism in his work on biopower, in particular when he turned to issues having to do with public health. For it was here that Foucault showed how the state has sought to control the health of populations by controlling the movement of individuals, foods, substances, and so on; by instituting rules as to appropriate and inappropriate behavior; by setting standards for cleanliness of work places and concerning agriculture; and so on. While such regulations and laws did not concern themselves with nature, they certainly did concern themselves with the human environment, as do many contemporary environmental regulations, such as those addressing agriculture or clean air and water. Foucault’s analyses are useful for they show how the object of such measures is not always so much individual health as it is the health of the social body as disciplined body that must be ready to appear for work or warfare.

Deleuze too, although politically more sympathetic to “green” causes (perhaps because of his connection with Guattari) than was Foucault, was no more engaged with them in his philosophy. Nevertheless, commentators on his work have found rich resources there for thinking through environmental issues. As early as 1997, Patrick Hayden sought to apply Deleuze’s work to environmental issues, arguing that Deleuze’s emphasis on becoming provided resources for thinking about nature as flux rather than as static, a view that Hayden argues is fully compatible with the findings of contemporary ecology. More or less simultaneously with Hayden’s work, I argued that Deleuze and Guattari’s distinction between smooth and striated space could profitably be applied to clarify what we mean by wilderness. In particular, I argued that the idea of wilderness as a place untouched by human activity is incoherent, and that we would be better off distinguishing between spaces that were smoother, that is, had seen less human activity, including even being mapped, and those that were more striated, that is, developed, paved, controlled, and so on. I also argued for a distinction between types of human activity, following Deleuze and Guattari in finding those activities associated with the modern, capitalist state as being of a different

order than those associated with other forms of social organization.24 At this
time, too, Verena A. Conley invoked Deleuze, although more for his interest in
radical democracy and as a coauthor with Guattari than anything else.25

One final development in North America needs to be accounted for: ecofemi-
nism, whose roots are in France. As Trish Glazebrook points out, “It was Simone
de Beauvoir who first saw that in the logic of patriarchy, both women and nature
appear as other. In 1974, Françoise d’Eaubonne coined the term l’éco-féminisme
to point to the necessity for women to bring about ecological revolution.”26
Despite these continental beginnings, most subsequent ecofeminism has been
explicitly hostile to the traditions of continental philosophy, in particular to the
idea of postmodernism. While most ecofeminists argue that there are impor-
tant links between the oppression of women and the exploitation of nature, they
do so in different ways, many of them stressing either women’s greater spiritual
affinity for nature or greater capacity for an environmental ethic. Still others
criticize modern, patriarchal, dualistic thinking for its role in the oppression
of women and nature. While such critiques might have developed using the
resources of continental philosophy, they have largely not done so (although
Glazebrook argues that Heidegger ought to be a resource drawn on by ecofemi-
nists, while D. Bruce Martin does the same for Adorno27). Indeed, many ecofem-
inists, while criticizing dualistic thinking and the androcentrism of Western
philosophy, dismiss what they term “postmodernism” or “deconstructive post-
modernism,” which they see as a dangerous form of social constructivism that
undercuts any attempt to find real differences between men and women, while
also making nature a social rather than a real category of analysis. Mary Mellor
makes this claim most forcefully, writing that “ecofeminism is … incompat-
ible with a radically social constructivist position, whether from a phenomeno-

That having been said, there are several other ecofeminists who are not only sympathetic to, but explicit advocates of, a continental approach (although not always of the same type) including Jim Cheney, Patricia Jagentowicz Mills, and Ariel Salleh. Mills argues that Adorno and Horkheimer can offer an important corrective to much of the ecofeminist literature linking the dominance of women and the domination of nature, since Adorno and Horkheimer do not romanticize nature (or women) the way many contemporary ecofeminists do. Salleh draws more on Marx than on later Marxists to argue that women constitute, if not the revolutionary class that Marx predicted the proletariat would be, at least the central agent for social and environmental change. Finally, Cheney embraces the sort of postmodern philosophical perspective most ecofeminists have eschewed, drawing on Heidegger, Richard Rorty, and Sandra Harding, as well as Biddy Martin and Chandra Mohanty to critique masculinist, totalizing discourse and open up a space for the development of what he terms "bioregional narratives" that are grounded in a place and the practices appropriate thereto.

IV. FRANCE

One way to characterize what we have seen so far is that all of those working in this area have treated nature and humanity as two distinct terms. The question has always been: How ought these two stand in relation to one another? With developments in France, we see the development of a line of thought that rejects the strict dichotomy between humanity and nature and thus paves the way for a philosophy that is far more thoroughgoing in its environmentalism. We might characterize the work of thinkers such as Serres, Guattari, and Latour as being committed to the idea of putting multiple variables in play at once. We will see this type of thinking repeatedly here, albeit in different ways. Before doing so, we should note that the general philosophical climate in France

(and French-speaking Belgium), at least as far as environmental philosophy is concerned, is little different from Germany. The single most visible book of environmental philosophy, Luc Ferry’s *New Ecological Order*, takes as its target not contemporary developments in France (of which Ferry seems largely unaware) but developments abroad, which Ferry characterizes as a threat to French society and democracy. Among French philosophers who have made their names exclusively as environmental thinkers, none has taken a continental approach. Even as recently as 1998, editors of books or special journal issues dedicated to environmental themes (there remains no philosophical journal dedicated to environmental philosophy in French or German; the English-speaking world now has six) have felt the need to include an introductory essay on the terrain of English-language environmental philosophy.

Part of what makes the thought of Serres, Latour, and Guattari stand out is that they begin by thinking of environmental problems not as ethical but as political. That is, they are problems to be addressed through collective rather than individual action. They thus do not engage in what we might term the meta-ethical investigation so common in English-language environmental ethics, where questions as to the moral standing of nature and whether our concern should be directed toward nature as a whole, ecosystems, species, or individual plants and animals, and so on have all been so central. Such investigations assume a fixed pole – that of human beings – who then must decide how they will act. Even those working from a continental perspective in Germany, the UK, Australia, and the US have tended to follow this model, although they have radicalized it to a degree, asking not how we should act toward nature but how we want nature to be. Part of what makes the work of these French thinkers different is that they begin with a very different conception of nature from that of English-language environmental philosophers. Following the tradition of John Muir, American environmental philosophers have historically shown a

great interest in wilderness. With the possible exceptions of the highest peaks of the Alps, there is no wilderness in France and has not been for many centuries. As Latour puts it, “in the ‘geopolitics’ of the philosophy of nature, France benefits from a comparative advantage because the notion of an a-human nature that ought to be protected has never taken root here.” This “advantage,” of course, only gets us so far, since it is certainly possible to conceive of nature as cultural without also taking on the counter-movement that sees culture as (at least partially) natural. That is, while someone such as Steve Vogel argues forcefully for nature as a social construction, he remains committed to humanity’s autonomy from nature. Serres, Latour, and Guattari all agree that such a position is untenable. To see how they arrive at their view, we need to look briefly at the social scientists who influenced their work. I focus here on only one, the social psychologist Serge Moscovici, although one could also mention Denis Duclos, René Dumont, and Edgar Morin, among others.

Moscovici’s 1968 Essai sur l’histoire humaine de la nature (Essay on the human history of nature) seeks to show how changes in science, technology, social organization, and so on have manifested themselves not in new understandings of the same nature, but in changes in nature itself. Such a view is not surprising, at least not from today’s standpoint, when we acknowledge that so much of what we take to be natural is at least as much, if not more, artifactual than natural. This view too is consistent, if not identical, with Heidegger’s view

---

36. See, for example, Michael Nelson and J. Baird Callicott (eds), The Great New Wilderness Debates (Athens, GA: University of Georgia Press, 1998), and Baird Callicott and Nelson (eds), The Wilderness Debate Rages On.

38. Serge Moscovici (1925– ; born in Braila, Romania, into a Jewish family) emigrated to France in 1948, where he began studying psychology at the Sorbonne. Cofounder, in 1975, of the Laboratoire Européen de Psychologie Sociale (European Laboratory of Social Psychology), Moscovici has taught in the US and UK in addition to his position at the École Pratique des Hautes Études.

that changes in human practice necessitate changes in the world.\textsuperscript{40} Moscovici’s view, however, is more radical, for it entails that humanity is both the “creator and subject of nature.”\textsuperscript{41} Thus, we see here already the key insight of French environmental philosophy: it is insufficient to hold one pole (humanity) stable while allowing the other (nature) to evolve. Instead, both poles must be allowed to codetermine each other, and this in a historically mediated fashion. Moscovici conceives of a series of “states of nature”: “organic nature,” the “universe of forces and movements,” and “cybernetic nature.”\textsuperscript{42} The first of these, from late Neolithic times to the dawn of the Renaissance, is characterized by artisans working on materials such as wood, stone, or metal solely with hand tools. Nature here is conceived as a fixed set of materials, each with its own “nature,” that can be complemented by the work of a skilled artisan.\textsuperscript{43} The artisan, then, is the one who follows nature’s lead and seeks not to impose on it, but to work with it. The mechanistic stage conceives of nature as a set of forces and materials that are, by and large, interchangeable. This nature is made up of quantifiable forces and substitutable materials. Moscovici thus finds the origin of Bacon’s and Descartes’s mechanized view of nature in the technology of their day. That is, it is the changes in human practice that lead the way for changes in our conceptualization of the world. But this new nature then makes possible a corresponding shift in humanity, whose skilled artisans are no longer needed, to be replaced by unskilled workers fulfilling tasks set them by engineers and others trained in the ways of the new nature. That is, and here Moscovici’s argument echoes Adorno and Horkheimer, the new mechanized nature gives birth to a new mechanized humanity. The age of cybernetic nature begins when, as Kerry Whiteside puts it, “we see nature as the combination of elements into self-sustaining systems. Knowledge of the properties of these systems allows us to create new forms of matter, not merely to shape or transform what is given.”\textsuperscript{44} The engineer is now displaced by the scientist while the distinction between the natural and the non-natural collapses. Nature’s processes are seen as alterable and, at least at times, in need of human intervention to keep them going.\textsuperscript{45} Here too the changes in

\textsuperscript{41} Moscovici, Essai sur l’histoire humaine de la nature, 21.

\textsuperscript{42} Ibid., 76–119.

\textsuperscript{43} This is Aristotle’s nature.

\textsuperscript{44} Whiteside, Divided Natures, 52.

\textsuperscript{45} We thus find classes in “ecosystem management” and the like.
nature bring about changes in humanity, as those who are empowered to speak and to make decisions shift and as social structures evolve to accommodate the new nature.

While Moscovici’s account is compelling, it is descriptive rather than normative. That is, it describes how things have happened, without taking a stance on how we ought to move forward from here. We thus need to turn to the work of Serres, Latour, and Guattari, who will, each in his own way, seek to develop the thesis of the interrelatedness of nature and humanity into a compelling philosophico-political position. One of the difficulties all three face in crafting a normative position is that there is what we might term a cultural time-lag, so that even while our material practices, science, technology, and so on, have moved forward, thus bringing about transformations in nature and ourselves, we cling to older models of both humanity and nature. Our solutions thus are often inappropriate to the sort of people that we are and to the world in which we live.

If one accepts Moscovici’s thesis that humanity and nature must be conceived of as codeterminants, it follows from this that even if one is concerned only with humanity, one must, ipso facto, also concern oneself with nature. However, in The Natural Contract, Serres argues for a more forceful position: nature must become part of our political structure, not as a set of passive objects or even vibrant systems, but as a partner with humanity. For Serres, humanity has, for most of its history, not thought much about nature. We have been too concerned with our human projects, only noticing nature when it has made itself unavoidable. Today nature has made itself ubiquitous and has done so in response to human actions and conceptions.

Serres reminds us that humanity has a long juridical tradition of reshaping conflicts in order to make them less deadly. Even war has a set of laws and rules governing it; even when we are intent on killing each other, we must follow the rules. War, like other human institutions, is governed by a sort of contract. In the liberal tradition from Hobbes onward, the grandest of all contracts is the so-called social contract, in which we (tacitly) agree to give up some of our rights in exchange for others being bound to respect the remainder. Yet this contract, argues Serres, has always been predicated on our making common cause with our fellow human beings in the project of turning nature into property. The social contract thus brings into being a certain sort of nature. Yet, if this contractually created nature – a nature that can be seen to overlap to some degree Moscovici’s mechanized and cybernetic natures – will not stand passively by as it is turned into products and property, then we need to rethink the human–nature relationship. Such a rethinking, however, is insufficient if

*46. Serres’s work is the focus of the essay by David F. Bell in The History of Continental Philosophy: Volume 6.
it is not accompanied by a reconceptualization of how we relate to our fellow human beings. As Serres puts it, “we must decide on peace among ourselves to protect the world, and peace with the world to protect ourselves.”\textsuperscript{47} For the idea of making peace with the world to make sense, it would seem that the world would have to be capable of “signing” a contract with us, that is, the world must be a subject. Serres writes,

What is nature? First, all the conditions of human nature itself, its global constraints of rebirth or extinction, the hostelry that gives us lodging, heat, and food. But nature also takes them away from us as soon as we abuse them. It influences human nature, which, in turn, influences nature. Nature behaves as a subject.\textsuperscript{48}

We can see here quite clearly Serres’s commitment to the heritage of Moscovici. Yet the idea that nature is a subject is not without its problems. However, Serres reminds us that the intrahuman social contract is already virtual, in that none of us has ever actually consented to it and expect reciprocity from others only in some sort of ideal way. The natural contract too, Serres insists, is also only virtual. That is, we must act as if nature is a party to this contract, even if our motivation for doing so might be purely selfish, which only makes his position more like that of classical contract theorists such as Locke or Hobbes. Just as in classical contract theory, in which my desire for security requires that I respect others in their persons and property, our desire for clean air and water demands that we respect the only “being” capable of furnishing us with those things. Our failure to abide by the natural contract will have negative consequences not only for nature but for us as well.

Latour’s view that in the sciences we need to account for the agency not only of human beings but also of the entities studied can clearly be applied to the domain of environmental thought.\textsuperscript{49} Latour, in works such as \textit{We Have Never Been Modern}, argues that modern thought has so strictly divided the domains of nature (the domain of scientific discovery) and humanity (the realm of politics) that it has blinded us to the various hybrids that have arisen in between the two domains.\textsuperscript{50} When Latour discusses hybrids, he means things such as the hole in

\textsuperscript{48} Serres, \textit{The Natural Contract}, 36; \textit{Le Contrat naturel}, 64.
\textsuperscript{49} Latour is also discussed in the essay by Olkowski in this volume.
the ozone layer over Australia (we might add the world’s climate), which can be described neither as purely natural nor as purely cultural phenomena. Rather, they occupy a middle ground. Politics and science have, since the sixteenth century, been so thoroughly separated from one another that we are either blind to hybrids or do not know what to do with them. Indeed, it is the habit of thought of modernity to insist that there could be no such thing, since the domains of the human and the nonhuman are thought to be distinct and incapable of mixing. Much of Latour’s work has been dedicated to showing how and why these domains cannot be kept distinct, either theoretically or practically.

We need to be careful here, for part of the value of Latour’s work is that it is not “merely” philosophy but also sociology. Thus, while philosophers now generally agree that the fact–value distinction is incoherent, it remains an important part of political and public discourse. Science (with a capital S) takes on the role in this discourse of determining what is true (what is a fact) and what is not. No matter that practitioners of any individual science do not recognize themselves as having such a role or their science(s) as having such a power. The problem for Latour is how to demythologize Science so that we will see that nonhuman things too are players on the political scene and that human beings shape what those things are. That is, just as we saw with Serres, the problem becomes one of conceptualizing how humanity and nature can be codeterminants of one other. Where Latour goes beyond Serres’s position is in his greater emphasis on the relationship between science and politics, thus making the relationship between humanity and nature one that plays itself out not in some abstract realm, but in the very concrete interactions we find in these domains, reconceived, of course, so that they no longer stand in stark opposition to one another.

The grand thrust of Latour’s work is to destabilize the opposition between humanity and nature. This move undercuts, on the one hand, appeals by environmentalists to what is best or right for nature and, on the other, appeals by industrialists or politicians that nature is inconsiderable. Latour, finally, argues that what is needed in order to overcome the modern nature–culture divide is a parliament of things in which human and natural actors and hybrids would all have a say. However, as Whiteside points out, it remains unclear just what deliberations in such a parliament are supposed to look like as well as how it is expected to come to a decision. Nevertheless, the idea that we must attempt to rethink nature and culture in relationship is an important one, as is Latour’s argument that there is neither apolitical science nor ascientific politics.

51. Whiteside, Divided Natures, 139.
Guattari adds a third element that is lacking in both Serres and Latour: human subjectivity. While both Serres and Latour argue for the importance of our reconceptualizing both nature and human society, Guattari argues also for the need to account for human subjectivity, in particular in relation to desire. We thus find in his work a sketch of three ecologies: of nature, of society, and of the subject. As with Serres and Latour, although now developed on three axes, these three ecologies are all seen by Guattari as interrelated. For Guattari, and this is partly due to his earlier involvement with communist politics as well as his later involvements with both green politics and alternative forms of psychiatric practice, modern forms of socioeconomic organization – what he terms “integrated world capitalism” – have had strongly deleterious effects for all three ecologies. Nature has become nothing but a set of resources and pollution sinks, society has become nothing but a guarantor of stability for purposes of assuring economic growth, and subjectivity has become a structure of desire in the service of material consumption.

Guattari’s insight that one must also address questions having to do with subjectivity is important (and remains, to this day, little discussed among environmental philosophers). Subjectivity, for Guattari (and here he is indebted to his work with Deleuze, particularly in the two volumes of Capitalism and Schizophrenia, is always structured out of desire. The problem as he sees it is that our current form of subjectivity is one where the structuration happens in and through the workings of social institutions that are not democratically controlled and whose end is the production of subjects who will be docile, productive, and, most importantly, good consumers. If such is the form of subjectivity with which we (mostly) find ourselves, how might we (i) think subjectivity otherwise and (ii) envision a transition from our current to the alternative form of subjectivity? The second task is no less important than the first since a reorganization of current societal structures without a concomitant reorganization of subjectivity is likely to constitute an unacceptable form of violence to human subjects as we now find them. That is, we Westerners find

53. See on this topic my “Subjectivity, Desire, and the Problem of Consumption,” in Deleuze/Guattari and Ecology, Herzogenrath (ed.).

55. Guattari and Deleuze’s account of desire is discussed in detail in the essay by Rosi Braidotti and Alan D. Schrift in The History of Continental Philosophy: Volume 6.
ourselves with apparently insatiable desires for material things (desires that are—absurdly—presented in political and economic rhetoric as “natural”). These desires will not simply go away, even if we want them to. We must thus work to conceive of ourselves not as free of desire but as having alternatively structured desires. For example, rather than desiring corporate foodstuffs, we might desire knowing who raised our food, so that we could feel ourselves part of a community. To be only of necessity, rather than primarily, a consumer is to desire otherwise, that is, to be otherwise. We must also work to conceive how we can move from how we are now to that other form of subjectivity, lest proposed changes in societal structure be, as they are commonly thought, hardships imposed on individual subjects for the sake of some abstract “nature.”
Continental philosophy has never been reticent about engaging with contemporary political situations. From Kant’s and Hegel’s reflections on the French Revolution, through Sartre’s and Merleau-Ponty’s debates about communism, up to Badiou’s recent reflections on the character of the twentieth century⁴ and Rancière’s critique of antidemocratic currents in Europe,⁵ continental thinkers have addressed themselves to politics, not only in the abstract, but as it has unfolded around them. In contrast to their analytic counterparts, continental thinkers have held situated political reflection to be an intrinsic part of philosophical practice.⁶

Chief among the political parameters of our time that have held the interest of continental thinkers, particularly in recent years, has been the emergence of what might be called globalization. Of course, globalization is a term of common currency. It is a truism to say that we live in an increasingly globalized world. But truisms are where philosophers intervene, either to buttress, to question, or to overturn them. Globalization has been no different. What globalization is, and how to respond to it, have constituted the core of a number of political reflections.

Even the term itself can carry hidden, questionable assumptions. When we refer to globalization, we seem to be referring to the increasing interconnectedness

---

of the world in some fashion or another. Whether it be through increased electronic communications, the spread of transnational capitalism, or the movement of peoples and the breakdown of national borders, the idea of globalization carries with it the decline of the integrity of national entities. But is this true? Is what we are witnessing today a decline of nationality in favor of a more fluid transnationality? Perhaps it is something else altogether. Perhaps, instead of globalization, what we have been witnessing over the past several decades is the rise of a particular national hegemony, that of the United States. From this point of view, our world is less one of globalization than of American imperialism. This imperialism, it is true, is far more economic than political, and in that way differs from the colonialisms of the past two centuries. The US infiltrates other countries with its economic and cultural exports rather than governing them politically (with current exceptions, such as Iraq). Although it might be argued that, at least over the past several years, US hegemony, inasmuch as it did exist, is now on the wane, some might nevertheless argue that it would misdescribe the current global political situation to see it as a new phenomenon of globalization rather than a continuity of the type of national dominations that have long been with us.

Of course, these two explanations are not exclusive. There may be an intertwining of the two. In order to address this issue, however, one must begin to get behind the terms globalization and hegemony and begin to reflect more rigorously on the situation we occupy. Such a reflection would have two related parts: an assessment of the current political character and suggestions for how to intervene in it. In what follows, there is sometimes an emphasis on one or the other of these parts. However, the assessment one provides is not divorced from the kind of responses one sees as appropriate or possible. Conversely, the suggestions one makes for action and intervention depend on what one sees as the salient aspects of the contemporary context.

There have been numerous reflections on what might be called globalization. I will divide these, somewhat arbitrarily, into four categories. My only defense of this division is that it offers a practical categorization. There are, to be sure, transversal lines of influence and similarity: elements of a particular thinker’s approach may be closer to elements of a thinker in another category. If some readers consider that another division better facilitates understanding, they should help themselves to it. The four categories are these:

I Critiques of media and the rise of electronic interaction. Here the primary thinkers are Jean Baudrillard, Paul Virilio, and, to a lesser extent, Slavoj Žižek.

II Conceptions of multitude. In this category fall the work of Michael Hardt and Antonio Negri, as well as Paulo Virno.
III Reconceptualizations of democracy. This would include the work of Jacques Derrida, Ernesto Laclau, and Chantal Mouffe, and part of the recent writings of Judith Butler.

IV Renewal of the anarchist tradition. This is the most recent of the responses, and includes the work primarily of myself and Saul Newman.

I

Reflections on and critiques of the media have a long standing. We might date the background for current approaches to Guy Debord’s classic book *The Society of the Spectacle* (1967). Debord argues, in an update of Marxist thought, that current social relations are no longer mediated by relations of production, but rather through what he calls “the spectacle.” The spectacle consists of the ubiquitous images – in advertising, on television, in the movies, and (postdating Debord’s work) on the internet – through which we relate to ourselves and one another. Debord, though, insists that the spectacle is not simply a matter of the images themselves: “The spectacle is not a collection of images; rather, it is a social relationship between people that is mediated by images.”

The idea that our relationships have been mediated by images is at the core of the thought of Jean Baudrillard. In his early work, Baudrillard, like Debord, shifts the frame of Marxist thought away from its focus on productive relations. For Baudrillard, the proper focus is, instead, on consumption. He argues that we must abandon the focus on productivism and begin to ask about consumption: how it occurs and what codes it follows. Over the course of his career, Baudrillard radicalizes this idea until he argues that, because of the role various media play in constituting our world, we no longer live in a world of reality. Instead, our world is one of hyperreality or simulation.

We might think of the emergence of simulation this way. Human relations have always been mediated to some extent, at least through primitive signs and signals. The rise of language constitutes an important moment in the mediatization of those relationships, as does the appearance of the printing press. However, with the explosion of media through which people interact with one another and their world – television, internet, email – social relationships have become dominated by the media through which they occur. In fact, as media

---

5. Baudrillard’s work is also discussed in the essay on postmodernism by Simon Malpas in *The History of Continental Philosophy: Volume 7*.

begin to replace face-to-face interaction and engagement with the world, the
world as a referent of those relationships and engagement begins to drop out.
It no longer matters whether there is an outside world to which the images and
media refer. Reality shifts, from referent of images to the images themselves.
Images simulate rather than referring to reality. As Baudrillard puts the point,
“To dissimulate is to feign not to have what one has. To simulate is to feign to
have what one hasn’t.”

Simulation is the co-optation of reality by media. Whether or not an event
occurs outside that co-optation is irrelevant. There is an impact on our experi-
ence only inasmuch as something arises within the ambit of the simulated world.
What we encounter is given to us solely through the images that are the ether
of our lives. This means that if an event takes place outside of that ether, it is
as though it did not take place. It will not register; it will not encrust itself into
reality, or at least that hyperreality in and through which we live. Alternatively,
there need be no event that takes place in order for it to be experienced as real. An
event could be entirely fabricated by the press, or arise as a rumor on the internet,
and be experienced with all the reality formerly accorded to the “real” world.

Baudrillard analyzes the attacks of 9/11 in terms of the images that were
disseminated. He does not deny, of course, the horror of the attacks. However,
he finds that the reality that persisted in them was through images as they
unfolded in the media. He argues that the goal of the attackers was to under-
mine the society of the spectacle through an excess of its own spectacularity.
In that sense, the terrorist attacks were played out entirely within hyperreality.

In Baudrillard’s view, then, globalization is the creation of simulation. He
rarely offers anything that could be considered a response to it, for two reasons.
First, Baudrillard is not a nostalgic thinker. He does not seem to miss the real
world that has been left behind. Second, it is not entirely clear he could coher-
ently offer a critique of our simulated world. If it is as encompassing as he claims,
then there seems no place from which critique could occur. All critical posi-
tions have already been absorbed into hyperreality. What might be read as his
only sustained response to simulation is offered in his 1979 book Seduction,
where he paints a picture of politics as an ongoing seduction. This seduction is
never consummated; rather, it is a game of symbolic feints where nothing is ever
captured because there is nothing to be captured. “The law of seduction takes the
form of an uninterrupted ritual exchange where seducer and seduced constantly

7. Jean Baudrillard, Simulations, Paul Foss et al. (trans.) (New York: Semiotext(e), 1983), 5.
raise the stakes in a game that never ends.”\textsuperscript{9} In a world without reality, it is difficult to conceive how else politics might occur.

If Baudrillard’s view of the rise of the media is playful and ironic, Paul Virilio\textsuperscript{10} sees a darker mechanism at work. Like Baudrillard, Virilio focuses his work on the way electronic media have reshaped our world. However, Virilio sees media not only as the creation of a new reality but also as an intervention into our own reality. On the one hand, the rise of electronic media has made us unrecognizably different. On the other hand, we have not entered a hyperreality in which the real world no longer matters. We have become subject to forces that are reshaping us for the worse.

In his early works, Virilio focuses on the emergence of what he calls \textit{speed}, and in particular the military uses of speed. We might think of speed as instantaneousity of communication and intervention, an instantaneity that replaces both space and time. Formerly, military intervention was a matter of controlling space: having more territory, fighting from higher ground, and so on. Then it became a matter of time: who could get where faster. This is signaled by the importance of faster weapons and the development of military airplanes. Now, military intervention is approaching the instantaneous. One no sooner sees the target than one can destroy it. Moreover, this instantaneity is not only a matter of advanced weaponry. It also concerns the control of societies. The rise of electronic communication has created a system in which we can conduct our lives away from public space, but in a space that can be continuously monitored: by cameras, by electronic surveillance, through the monitoring of the computers at which many of us work, by tracking our purchases, and so on.

What this creates is a militarization of society, but in a particular way. It is not that everyone in society is mobilized in a military effort. Rather, there emerges a new class division. No longer is the class rupture between Marx’s capitalists and proletariat. Now the divide runs between the military and the civilians. “The military class is turning into an internal super-police. Moreover, it’s logical. In the strategy of deterrence, military institutions, no longer fighting among themselves, tend to fight only civilian societies – with, of course, a few skirmishes in the Third World.”\textsuperscript{11} This military class should be understood not only as the uniformed military; it also includes political and business leaders and anyone

\textsuperscript{10} Paul Virilio (1932– ; born in Paris) grew up in Brittany, where he experienced and was marked by the German occupation and Allied bombings of Nantes. A cultural theorist and urbanist, he was trained in architecture at the École des Métiers d’Art and also studied philosophy with Vladimir Jankélévitch, Raymond Aron, and Maurice Merleau-Ponty at the Sorbonne. He served as Professor and Director at the École Spéciale d’Architecture in Paris from 1968 to 1998.
\textsuperscript{11} Paul Virilio, \textit{Pure War}, Sylvère Lotringer (trans.) (New York: Semiotext(e), 1997), 94.
else who is aligned with the controlling class, that is, who utilizes speed in order to control part or all of a population.

More recently, Virilio has turned his attention away from the military uses of speed and toward the encrustation of human beings into technology. This encrustation is largely corporeal: the body is monitored, plugged into various technologies, trained to become a relay in the digital infrastructure. Where once the idea of being merely a cog in a machine was a metaphor for alienation, Virilio sees this as becoming a literal truth. Moreover, given the instantaneity of networks of control, our corporeal attachment to technology ensures that we are constantly monitored and manipulated.

The generalized arrival of transmission has taken over from the restricted arrival of transport ... A “freeze frame” whereby the interactive experience of generalized teleaction will soon prolong the life sentence of the expanse of the space-world, to the exclusive advantage of the time-world of the real instant.12

Unlike Baudrillard, Virilio does not see our immersion in technology as benign. He is concerned about its environmental impact, but also about its alienating effects. Where for Baudrillard we are simply becoming something else, for Virilio we have lost what it is to be fully human, and this is to be lamented. Although he calls for resistance to this loss, Virilio does not offer a programmatic response. Rather, he seeks, through the starkness of his descriptions, to recall for us the dangerous technological drift of our current situation.

Although he does not fit neatly into the category of critiques of media and electronic interaction (or, for that matter, into any other category), Slavoj Žižek should at least be mentioned in this regard since his work intersects with the concerns of Baudrillard and Virilio. For Žižek, there is always a Hegelian irony in play, and it occurs in technology as it does elsewhere in the contemporary world. In “Cyberspace, Or, The Unbearable Closure of Being,”13 he argues that we use the internet in order to pretend to ourselves that the desires we fulfill through it or the online personalities we create are merely that: pretend. That is, we project our real desires onto electronic media the more effectively to deny that they are indeed our real desires. More recently, in Welcome to the Desert of the Real, a response to the events of 9/11, Žižek has claimed that the past century, which involved purported attempts to touch the Lacanian Real, has, in that very attempt, found itself more mediatized than ever. He points out the irony of the Islamic fundamentalists who destroyed the World Trade Center in an attempt

to strike at the heart of the modern, Western world, and whose success was had through the media impact of the attacks. This is, he argues, “the fundamental paradox of the ‘passion for the Real’: it culminates in its apparent opposite, in a \textit{theatrical spectacle} – from the Stalinist show trials to spectacular terrorist acts.”\textsuperscript{14} Alternatively, the US, which sees itself as the bastion of democracy, supports undemocratic regimes around the world in the name of the very democracy it forecloses.

II

Turning to the next analysis of and response to globalization, those involving conceptions of the multitude, we should note that there are themes these thinkers share with those we have just discussed. There is no denial of the importance of the role of the media or of electronic communication in the formation of the contemporary scene. However, the emphasis is elsewhere. The accent in this approach is placed on the political and economic rather than on the technological.

The most important and influential book oriented around the multitude is Michael Hardt and Antonio Negri’s \textit{Empire} (2000). The framework of the book is complex, and much of its philosophical background derives from the work of Gilles Deleuze (especially the idea of the multitude as a virtuality, a point we can only gloss here). Regarding globalization, Hardt and Negri argue that we have entered a period characterized not so much by colonialism or imperialism but by the imperial. The imperial is immanent. Instead of a colonial project of taking over another country, entering it from the outside, as it were, the globalized world is, in their view, all inside. There is a single global economic–political order rather than an order of nation-states transcendent to one another. This new order may be conceived as a pyramid in which, at the top or first tier, the US holds a dominant position among a set of nation-states that can engage in economic regulation through such instruments as the G7 and the World Bank. The second tier contains transnational corporations. The third tier consists in various groups, including nongovernmental organizations, which represent the \textit{multitude}, a term we will return to in a moment. In the end, then, the world is not divided simply into nation-states but more importantly into networks of flows of information, production, and so on. There is no transcendent power,

\textsuperscript{14} Slavoj Žižek, \textit{Welcome to the Desert of the Real: Five Essays on September 11 and Related Dates} (London: Verso, 2002), 9. It should perhaps be noted that in \textit{The Century}, Badiou also argues that the twentieth century exhibited a passion for the real. However, Žižek’s Real and Badiou’s real are not exactly the same. For Žižek, the Real is the Lacanian unreachable Real; moreover, he believes that this passion for the Real is ambivalent. For Badiou, in contrast, the real is more diffuse than the Lacanian Real, and those whose passion was for it were not ambivalent.
as in modern sovereignty, but only the power of Empire in the immanence of the networks.

This view has elements in common with that of Baudrillard and Virilio, specifically in its emphasis on networks and on the important role of electronic media in those networks. However, Hardt and Negri’s analysis is more encompassing. The media are part of Empire, but they do not exhaust it. There is a decline of nation-states, but not their disappearance. There can be tensions and resistances, but these resistances are immanent to Empire rather than transcendent. Resistance does not arise from those who are left outside, because there is no outside. Rather, it arises from the creative power that exists within Empire. This is where Hardt and Negri invoke the multitude.

The multitude is not the proletariat, nor is it any other particular identity. In fact, one of the crucial characteristics of the multitude is precisely its lack of such an identity. Because of this, the multitude is not a specific group of people. The multitude is fluid, without strict borders. Essentially, the multitude consists in the creative power of everything that can resist the control of Empire, a virtuality within Empire that has not been caught in the net of its controlling practices and institutions. As they write in their follow-up to Empire, appropriately entitled Multitude (2004), the multitude, like Empire, “too might thus be conceived as a network: an open and expansive network in which all differences can be expressed freely and equally, a network that provides the means of encounter so that we can work and live in common.” Invoking the perspective of Deleuze, the multitude is a network of differences rather than a uniformity of identity.

This conception of the multitude allows for a variety of political alliances. Since those alliances are not predicated on particular identities, there is no question of who can or cannot participate in the struggle. The multitude is beyond identity politics, and is, in Hardt and Negri’s view, the only way to conceive resistance to Empire, that is, to the immanence of power and control in a globalized world.

At around the same time that Hardt and Negri published Empire, the Italian thinker and activist Paolo Virno gave a series of lectures (in 2001) that would eventually be collected in A Grammar of the Multitude. Virno and Negri come from the same background – the Italian autonomia movement – but their conception of the multitude is divergent. If for Hardt and Negri the multitude is a creative virtuality, for Virno it is an empirical product of what he calls “Post-Fordism”: a mode of production that involves not only manual but also intellectual labor. In Virno’s view, the multitude is, as it is for Hardt and Negri, a mass

---

*16. For a discussion of Virno, Negri, and autonomia, see the essay on Italian Philosophy by Silvia Benso and Brian Schroeder in The History of Continental Philosophy: Volume 7.
that is not exactly a class. But, in contrast to their view, for Virno the multitude is not only the basis for social production, but also the product of a particular productive context. The multitude can be revolutionary, but it is not revolutionary in its essence. In his introduction to A Grammar of the Multitude, Sylvère Lotringer sums up this distinction trenchantly when he writes, “Empire involves an original kind of class struggle: a struggle looking for a class. For Virno it would be just the reverse: a class looking for a struggle.”

As Hardt and Negri make clear in Multitude, their conception of the multitude is that of a new democracy. In the context of globalization, the question of democracy has assumed a new importance. There is, on the one hand, the official discourse of democracy, a discourse that arises from the corridors of power in developed countries, and especially in the US. This discourse emphasizes two elements as constitutive of democracy: elections and capitalism. The first ensures political representation; the second free economic activity. However, among many progressive thinkers, the combination of elections and democracy does not seem always to yield a political and economic order that merits the honorific democratic. This is because both elections and capitalism individually, and even more so in their combination, lend themselves to manipulation and control by elites. This point seems an obvious one, but its implications are often missed. Do we really want to label as democratic political and economic orders that work to the benefit of the few, and that, to one extent or another, leave those who are not well placed outside real political and economic participation? Moreover, do such orders not tend toward a stifling homogenization in which certain styles of living and interacting are privileged and anything alternative marginalized? A number of thinkers have argued, as we will see in the next section, that we need to reconceive democracy, particularly in an age where globalization can lend itself to exploitation, oppression, and marginalization on a much greater scale than we have seen previously.

III

Hardt and Negri’s Multitude can be seen as one approach to this reconceptualization. Recent political texts by Derrida, Laclau and Mouffe, and, to a lesser extent, Judith Butler, provide others. Turning first to Derrida, it is perhaps not surprising that he wants to reconceive democracy in terms of the other that is often excluded. Deconstruction has always been a project of thinking the outside, not as outside but as constitutive of the inside. Where the inside (however that

inside is defined) sees itself in contrast to the outside, deconstruction shows that the outside is never entirely outside. The outside is also inside, and the inside is also outside. For our purposes, the political importance of this has to do with Derrida’s project of thinking democracy deconstructively.

In one of his earlier attempts to do so, The Other Heading (1992), Derrida focuses his energies on Europe. This is not surprising, and not only because Derrida lived in France (although he was born in Algeria). For the past twenty years, Europe has been in the throes of integrating non-European populations into national entities that have traditionally seen themselves as culturally homogeneous. As the 2005 riots in France – as well as the increase of racism and xenophobia across Europe – have shown, this process is not going smoothly. Thinking about this situation deconstructively at the time of German reunification, Derrida reflects:

that there is another heading, the heading being not only ours but the other, not only that which we identify, calculate, and decide upon, but the heading of the other, before which we must respond, and which we must remember, of which we must remind ourselves, the heading of the other being perhaps the first condition of an identity or identification that is not an ego-centrism destructive of oneself and the other.

Europe has long seen itself as the exemplar of where the world is “heading.” However, Derrida argues, that exemplarity must itself come into question. Or better, in order for Europe to remain exemplary, its exemplarity must come into question. Europe can no longer think of itself as a unity (or a group of unities) characterized by particular identities. It must instead head in another direction, a direction characterized by the other that it has excluded from its sense of itself. “And what if Europe were this … [a]n opening and a non-exclusion for which Europe would in some way be responsible?” Thus the identity of Europe must be bound to its no longer thinking of itself as resting on particular identities.

This idea, which is carried forward in a series of works, among them The Politics of Friendship (1994), which seeks to undercut the friend–enemy distinction in Carl Schmitt, might be said to culminate in his reflections on democracy in his 2003 book Rogues. In this work, Derrida articulates most fully his concept of democracy-to-come. One way to approach this concept would be through his

---

20. Ibid., 17.
reflections on the other heading. If Europe is to become an opening or a nonexclusion, to what is it supposed to open itself? If we try to categorize that *what*, then we have limited the opening. It becomes no longer an opening, but instead an enclosure for a defined other. And is there not something contradictory about a “defined other”? To be open, then, is to remain receptive to what is to come, without knowing exactly what that might be.

In *Rogues*, Derrida points out the aporia, the gap, necessarily associated with such a thinking of democracy. On the one hand, there must be an openness to an other that cannot be defined. On the other hand, for there to be democracy there must also be a kind of sovereignty, a self-rule, that is necessarily exclusive, since it involves the creation of a legal structure of specific rights that is protected by force. A democracy-to-come must bring together this paradox of sovereignty and openness. Because of this,

> [t]he “to-come” not only points to the promise but suggests that democracy will never exist, in the sense of a present existence: not because it will be deferred but because it will always remain aporetic in its structure (*force without force, incalculable singularity and calculable equality*) …

To endorse a democracy-to-come, however, is not a passive affair. It does not involve waiting. One must act toward a democracy-to-come, embracing both sides of the paradox. Otherwise, the force of sovereignty that is supposed to protect democracy threatens to undercut the very democracy it is designed to protect.

Reconceiving democracy from a different angle, Laclau and Mouffe have followed a thread that is similar to Derrida’s in avoiding closure, but that hews more closely to the radical tradition of Marx and especially the Italian Marxist Antonio Gramsci. In their groundbreaking book from 1985, *Hegemony and Socialist Strategy*, Laclau and Mouffe argue that the problem with the socialist projects of the twentieth century was that they were, in some form or another, reductive. The differences that constitute different classes and segments of those classes were reduced to simple unities. When those simple unities did not appear in reality, steps were taken to force reality into the simplicity of the vision. In short, radical politics became totalitarian.

Since the publication of *Hegemony and Socialist Strategy*, Laclau and Mouffe have followed distinct but related intellectual paths. For Laclau, the thinking of politics has never been far from radical politics. In his 2007 book *On Populist*

---

Reason, Laclau turns to a rethinking of populism to sharpen his view of radical democracy. As he notes, populism, like the radical political projects discussed in Hegemony, often descends into a political reductionism. However, it is not necessary that this be so. Populism often appeals to people at a variety of levels, depending on their different positions within society. The question, then, is one of how to bring unity to these different levels, without forcing them into a narrowly conceived political program.

In order to do this, Laclau proposes the concept of the empty signifier, a signifier that is at once specific and universal. For instance, the central category of populism is the people. However, in populism, under the umbrella of the people is not a homogeneous class, but a variety of classes that are united by their exclusion from a political order or their experience of exploitation or oppression. Specific demands may be made or specific groups identified, but those demands or identities are expressions of a group defined not by its having a particular signification but rather by the “equivalential links” that are drawn from a variety of sources. In this sense, the empty signifier is at once a specific identity or series of demands or opposition that at the same time takes up other identities or demands or oppositions that become “equivalent” to it. So the signifier the people is two-sided: it may refer to specific people in one sense, but in another sense those people lose their specificity since they become representatives of a larger group of which they are not the only members.

In Laclau’s view, globalization requires the construction of a populism of the sort he analyzes, a politics of the empty signifier.

There has been a multiplication of dislocatory effects and a proliferation of new antagonisms, which is why the anti-globalization movement has to operate in an entirely new way: it must advocate the creation of equivalential links between deeply heterogeneous social demands while, at the same time, elaborating a common language.

Thus, while Derrida focuses on a deconstructive play between sovereignty and openness in order to keep a politics of the other alive and avoid political reductionism, Laclau works to a similar end through a particular reading of populist reason.

Mouffe’s more recent work has affinities with that of Laclau, but its theoretical references have more to with the German (and Nazi) theorist Carl Schmitt, who

---

22. For a discussion of radical democracy, see the essay by Lasse Thomassen in The History of Continental Philosophy: Volume 7.
posits a sharp distinction between friend and enemy, us and them. Mouffe wants to introduce a third category, that of adversaries on a common ground, “adversaries being defined in a paradoxical way as ‘friendly enemies,’ that is, persons who are friends because they share a common symbolic space but also enemies because they want to organize this common symbolic space in a different way.” Rather than resolving this tension in terms of friends (as would a consensus model of the kind Habermas advocates) or enemies (which would require war and suppression, in accordance with Schmitt’s thought), Mouffe envisions keeping alive this adversarial space. She does not seek to eliminate further conflict about the character of that shared space. Instead, it must remain open for disagreement about its character and norms. For Mouffe, as for Derrida, democracy is not ever achieved in any final way: “the condition of possibility of a pluralist democracy is at the same time the condition of impossibility of its perfect implementation.”

In thinking about reconceptualizations of democracy, we should note in passing that a recent work by Butler orients such thought around the work of Emmanuel Levinas. Precarious Life, a response to the global situation particularly in the wake of 9/11, argues, as do Mouffe, Laclau, and Derrida, for a nonreductionist view of politics that takes the other into account. And this work, like Derrida’s, emphasizes a vulnerability to the other that must characterize any adequate politics. This is, in Butler’s view, a particularly urgent task in the wake of American belligerence after the attacks of September 2001.

“Precarious Life” approaches the question of a non-violent ethics, one that is based on an understanding of how easily human life is annulled. Emmanuel Levinas offers a conception of ethics that rests upon an apprehension of the precariousness of life … [H]is view is … useful for those cultural analyses that seek to understand how best to depict the human, human grief and suffering, and how best to admit the “faces” of those against whom war is waged into public representation.

What draws these views together as responses to globalization is their common project of thinking diversity without reducing it to a simple identity. This common project, although realized in different ways, might be said to

*25. For a discussion of Schmitt, see the essay by Christopher Thornhill in The History of Continental Philosophy: Volume 5.
27. Ibid., 16.
address a “postnationalist” world, a world in which people are no longer isolated into distinct “nationalities,” be they cultural, linguistic, religious, or national in the traditional sense. The question faced by these thinkers is that of conceiving democracy in a world defined as much by its differences as by its similarities. Although each has its own orientation, all these projects of reconceptualization are characterized by a concern for the integrity of the other in the democratic process.

IV

The final category of response to globalization has been more marginal theoretically than the previous three. However, it has intersected with a growing trend among progressive political activists. Since the fall of the Berlin Wall, Marxism as a framing doctrine for the political Left has been in steady decline. It is not that Marx’s writings are considered irrelevant; rather, they no longer command the power of framing political action. After a century during which the Left could not escape the terms of Marxism in defining itself and its goals, Marx has finally lost his grip on the political framework of the Left. If we can consider another framework to have taken its place, particularly since the World Trade Organization protests in 1999, it would be that of anarchism. With its rejection of the avant-gardism and hierarchical character of Leninism, anarchism emphasizes inclusion, equality, and, to the extent possible, consensus. It has recently made a return to the political scene. This does not mean that anarchism now plays the dominant role that Marxism played during the twentieth century. Far from it. Instead, in the theoretical void of the activist Left that emerged after the fall of the Soviet Union, anarchism has come to be one of the major contenders, perhaps the major contender, for conceiving leftist politics.

However, the world is much changed from the time of the writings of the classical anarchists of the nineteenth and early twentieth centuries: Pierre-Joseph Proudhon, Mikhail Bakunin, and Peter Kropotkin. In particular, the development of French theory in the post-May ‘68 period has offered tools for a rethinking of anarchism that offers a more contemporary approach to anarchist theory and practice. Where classical anarchism was often marked by the

29. This is not to claim that no interesting anarchist theory has occurred for the past hundred years. Although the theoretical tradition has been thin, it has not been utterly bereft. Among those who identify themselves as anarchists, the British thinker Colin Ward (1924–) is particularly noteworthy, especially since his approach anticipates much of the poststructuralist approach discussed here. See, for instance, Colin Ward, *Anarchy in Action* (London: Freedom Press, 1982).

30. For a discussion of Pierre-Joseph Proudhon in the context of French utopian socialism, see the essay by Diane Morgan in *The History of Continental Philosophy: Volume 1*. 

206
Volume 8
humanist optimism and utopianism of the nineteenth century, an incorporation of some of the more sober political viewpoints characteristic of recent continental thinkers opens vistas for a less anachronistic development of anarchist themes. Although work in this area has been as yet sporadic, interest in it, particularly among progressive political activists, continues to grow.

The earliest attempt in this area is my *The Political Philosophy of Post-structuralist Anarchism* (1994). I argue that classical anarchism is characterized by two theoretical commitments: that human nature is inherently good and that power works solely by suppression. These two commitments combine to give rise to the idea that if one eliminates all relations of power, then a utopian society will naturally arise. However, recent thought has abandoned the idea of a benign human nature in favor of the idea that human nature is more plastic. In addition, under the influence of Michel Foucault, the idea that power is creative rather than simply suppressive has gained traction. Therefore, if we combine the egalitarian impulse of anarchism with a recognition of the multiple and irreducible character of power struggles, we arrive at a poststructuralist anarchism, an anarchism that is at once radical and politically supple.

Another project of intersecting recent continental thought with anarchism is Saul Newman’s Lacanian postanarchism. Whereas May orients his thought around Foucault, for Newman, Lacan is the major touchstone. In ways that are similar to the work of Laclau, Newman seeks to avoid the essentialism of traditional political categories by appealing to an emptiness rather than an identity at the center of political resistance. “Lacan’s notion of the lack as a gap, a radical emptiness produced by signification, was used here to theorize a non-essentialist outside to power.”31 Lacan, then, provides a way to combine the anti-authoritarianism characteristic of anarchism with the nonreductive views of the subject of resistance envisioned by recent French thought.

Anarchist thought has been embraced by the Left during the period of globalization in part because its radical egalitarianism provides a way to conceive solidarity across national borders. For those involved in what was called the “anti-globalization” movement, which is really a globalized anti-authoritarian and anti-transnational capitalist movement, the idea of equality allows one to link the struggles of the Malaysian sweatshop worker, the indigenous farmer in Chiapas, and the illegal immigrant in California. The introduction of recent continental thought into anarchist theory furthers this project, allowing it to abandon the anachronistic commitments of its nineteenth-century founders.

We have canvassed a number of analyses of and responses to globalization. Although they diverge in important ways, they share the belief that the globalized

---

world has introduced fundamental changes into both our collective and individual lives, and that these changes require a new conception of where we find ourselves today. Moreover, none of these proposals endorses the idea that what appears to be globalization is really another form of imperialist hegemony, this time under the direction of the US economy. While Hardt and Negri allot the US a place on the first tier of Empire, and while the reconceptualizations of democracy and poststructuralist anarchism do not deny the importance of the US role in the world, the emphasis in all these analyses is on the global character of political, economic, and media change rather than on the domination of a particular national entity. This is perhaps in keeping with the more theoretical character of these approaches. If our world is nothing more than a twenty-first-century repeat of colonialism, with an economic accent rather than a political one and a new country at its center, there is not much to theorize about. However, to the extent that these approaches have theoretical merit, it is because, even if the US does have a dominant role to play in the current geopolitical arena, there are other changes – more important or more lasting – that require our reflection.

Little has been said in this essay about criticisms of these analyses and responses. There are those who might accuse Baudrillard and Virilio of a technological reductionism; others who would likely find the idea of the multitude to be empty or unhelpful; some who may see the reconceptualizations of democracy offered here as too abstract for practical politics; and finally some who may accuse a poststructuralist approach to anarchism of retaining too much utopianism. Moreover, regardless of the criticisms one could make, there remain questions of how to combine elements among the various projects there. What, if any, relation could be drawn between the multitude and anarchist equality? How might Mouffé’s adversarial space fare in the face of the simulated society sketched by Baudrillard? Can one combine Laclau’s politics of the empty signifier with Derrida’s democracy-to-come, or undercut the technological/military dominance that concerns Virilio with a politics of vulnerability of the type Butler endorses?

Much of the work of these thinkers has been coextensive with the rise of globalization itself. They are attempting to understand and to respond to changes through which they – and we – are living. It remains the task of the rest of us, or at least those among us who are concerned with the shape of our world, to think alongside them. We must comprehend and act within and on an increasingly globalized world, in order that we may be subjects of that world and not merely its objects.
