Frege’s criticisms will be familiar to analytic philosophers. The laws of logic are not psychological laws, empirical generalizations describing how individuals actually reason, but are “laws prescribing the way one ought to think”: universal laws of truth concerning what obtains with the utmost generality for all rational thinking. The domain of logic is neither more nor less than objective thought, considered solely with regard to truth and falsity. Descriptions of the mental are to be purged altogether from logic, where “psychological considerations have no more place … than they do in astronomy or geology.” Indeed, logic is sui generis: a request for the justification of a law of logic is either answered by reduction to another law of logic or is not to be answered at all. Frege regarded any attempted justification of logic as inevitably circular, since logical laws and principles are presupposed by all rational inquiries. And this logocentrism is coupled with an objectivist and realist epistemology: knowledge is “an activity that does not create what is known but grasps what is already there,” and, accordingly, “what is true” is “objective and independent of the judging subject.” As the terminology of “grasping” suggests, Frege thus purchases his characterization of knowledge of logical and mathematical objects at the cost of a seeming Platonism about abstract objects, in particular, objective thoughts (Gedanken). Objective thoughts (e.g. the Pythagorean theorem) are not constituents of the stream of consciousness, but propositional bearers of truth-values: timeless objects of belief existing independently of being “grasped” by any subject.9

After Husserl had obtained a PhD in mathematics in Vienna in 1882, his interests turned to philosophy under the influence of Franz Brentano. Inspired by the latter’s concept of intentionality as well as his injunction that philosophy can and must become scientific, Husserl began his philosophical career in earnest pursuit of Brentano’s goal of showing that philosophy and logic are grounded in the laws of an empirical descriptive psychology. This is a principal thesis of his first book, The Philosophy of Arithmetic (1891), dedicated to Brentano. But Husserl’s failure clearly to distinguish between numbers as ideal objects and as ideas or representations (Vorstellungen) in the cognitive acts of counting, collecting, and comparing was subjected to a withering review by Frege in 1894. It has been long and widely believed that Frege’s caustic criticism
converted Husserl from seeking a psychological foundation for logic and that subsequently Husserl joined Frege in a common critique of that program.\textsuperscript{10} Nevertheless, recent studies argue in favor of Husserl’s own later claim that he came independently to the rejection of psychologism in logic for motivations immanent within his own agenda.\textsuperscript{11} One of these motivations, as evidenced by Husserl’s generous references throughout the \textit{Logical Investigations} (1900–1901), was his reading of Bernard Bolzano’s (1781–1848) \textit{Wissenschaftslehre} (1837). In the first two books of this neglected four-volume work (entitled \textit{A Theory of Ideas in Themselves} and \textit{A Theory of Propositions in Themselves}, respectively), Husserl found that “a complete plan of a ‘pure’ logic was already available.”\textsuperscript{12}

Furthermore, and in sharp contrast to Frege, Husserl regards the distinction between the descriptive and the normative as having little to do with the critique of psychologism. Instead, Husserl maintains that all normative sciences depend on theoretical sciences and, in particular, that applied logic, the technique of reasoning for a practical purpose, is itself grounded on a very general theoretical science termed, following Kant, Bolzano, and Lotze, “pure logic” (\textit{reine Logik}). The basic error of psychologism is its conflation of pure and applied logic, resulting in a misinterpretation of the pure laws of logic as empirical laws of psychology. Like Frege, the first volume of the \textit{Logical Investigations}, subtitled \textit{Prolegomena to a Pure Logic} (1900), argues that psychologism in logic inexorably leads to skepticism and relativism. But already in the early 1890s, and perhaps even by 1891, Husserl had acquired the un-Fregean view that the fundamental contrast between logic and psychology lies in the circumstance that logical and mathematical objects are presented or given to the mind in a quite specific

\textsuperscript{10} See Marvin Farber, \textit{The Foundation of Phenomenology: Edmund Husserl and the Quest for a Rigorous Science of Philosophy} (Albany, NY: SUNY Press, 1943), 54–8, and Dagfinn Follesdal, \textit{Husserl und Frege: Ein Beitrag zur Beleuchtung der Entstehung der phänomenologischen Philosophie} (Osl: Aschehoug, 1958). Husserl indeed frankly criticized his earlier psychologism in the first volume (\textit{Prolegomena to a Pure Logic}) of his \textit{Logical Investigations} (1900–1901), but the alleged role of Frege in Husserl’s conversion is puzzlingly not documented there, being limited to a footnote in which Husserl retracted his earlier criticism of Frege’s antipsychologism while warmly commending the reader to the Preface to Frege’s \textit{Grundgesetze} (1893).

fashion that lends them an identity distinct from the various individual psychic acts through which they are given. Thus, on the one hand, Husserl's alternative to Frege's antipsychologism took its first inspiration from Bolzano's conception of logic as the study of “propositions in themselves” (Sätze an sich), having no more relation to psychology than do the propositions of mathematics. And, on the other hand, Husserl regarded “propositions in themselves” as “metaphysical abstrusities (sic)”\(^{13}\) – and so he rejected the Platonism common to both Bolzano and Frege. It was only on reading Lotze that Husserl came to see that reference to such entities was but reference to the “sense” of statements of a pure logic, and that they crucially possessed the property Lotze had termed “validity” (Geltung). In particular, Lotze interpreted the Platonism of earlier writers in the tradition of pure logic (such as Bolzano) in a deontologized fashion, so that the notion of “validity” pertains to the peculiar way in which the systematic forms of thought comprising pure logic are ideal and independent of particular thinkers but not independent of mind as such. In a sense to be further articulated by Husserl, pure logic is formal in that it is regarded as the science of these ideal forms of thought.\(^{14}\)

Husserl's conception of pure logic thereby returns, in part, to Kant's conception of transcendental logic. For we are not concerned solely with abstract “propositions in themselves” (as in Bolzano or Frege) but also, and centrally, with the location or origin of these within the cognitive capacities of a pure or transcendental subject.\(^{15}\) Unlike Kant, however, Husserl has no room for a sharp dichotomy

13. Ibid., 37 n.12.

14. See Husserl in “A Reply to a Critic of My Refutation of Logical Psychologism”: “I saw that under ‘proposition in itself’ is to be understood, then, what is designated in ordinary discourse – which objectifies the ideal – as the ‘sense’ of a statement. It is that which is explained as one and the same where, for example, different persons are said to have asserted the same thing. … And it further became clear to me that this identical sense could be nothing other than the universal, the species, which belongs to a certain moment or phase present in all actual assertions with the same sense, and which makes possible the identification [of sameness] just mentioned. … The proposition [Satz] thus relates to those acts of judgment to which it belongs as their identical intention [Meinung] in the same way as the species redness relates to individuals of ‘the same’ red color. Now with this view of things as a basis, Bolzano’s theory, that propositions are objects which nonetheless have no ‘existence’ [Existenz], comes to have the following quite intelligible signification: They have the ‘ideal’ being [Sein] or validity [Gelten] of objects which are universals [allgemeiner Gegenstände]; and thus that being which is established, for example, in the ‘existence proofs’ of mathematics. But they do not have the real being of things, or of dependent, thing-like moments – of temporal particulars in general. Bolzano himself did not give the faintest intimation that these phenomenological relationships between signification, signification moment, and full act of signifying had been noticed by him” (in Husserl: Shorter Works, Peter McCormick and Frederick Elliston [eds] [Notre Dame, IN: University of Notre Dame Press, 1981], 154).

15. Compare Kant in the Critique of Pure Reason: “[Transcendental logic] would also concern the origin of our cognitions of objects, in so far as it cannot be ascribed to the objects; while general logic, by contrast, has nothing to do with this origin of cognition, but rather considers
between two distinct faculties of the mind, a purely conceptual faculty of understanding and a purely sensible faculty of intuition. On the contrary, all cognition, for Husserl, is necessarily both conceptual and intuitive, insofar as what Husserl calls “essential intuition” (Wesenschau, Wesenserchauung) immediately presents us (in the manner of direct intuition) with a (universal or conceptual) essence. Thus, whereas Bolzano, for example, explicitly opposed Kant on the need for intuition in mathematical analysis in favor of a purely logical, purely conceptual treatment of this subject,16 Husserl rejected the very distinction between intuition and concepts with his doctrine that both logic and mathematical analysis rests on “formal” or “categorial” intuition having no relation (as does geometry) to any particular “material” subject matter given in sense perception.17

As programmatically outlined in the first volume of the Logical Investigations, pure logic is the domain of concepts such as truth, object, sense, proposition, syllogism, ground, and consequence. Inspired by the Leibnizean idea of a mathesis universalis, it considers “pure logico-grammatical forms” without regard to the actual knowing, judging, inferring, representing, and proving of any individual cognizing subject. The laws of pure logic possess “eternal’ validity” (“ewige” representations, whether they are originally given a priori in ourselves or only empirically, merely according to those laws, in accordance with which the understanding brings them in relation to one another when it thinks, and therefore [general logic] deals only with the form of the understanding that can be provided for the representations, wherever they may have originated” (A55–6/B80).

16. As its title intimates, Bolzano’s most significant mathematical work, his proof of the intermediate value theorem (1817), is explicitly a “purely conceptual” result, pointedly eschewing any reliance on spatiotemporal intuition (as in a spatial curve described by “continuous” motion). As such, it is an early precursor of the program of “arithmetization” of analysis subsequently carried out by Augustin-Louis Cauchy, Richard Dedekind, Leopold Kronecker, and Karl Weierstrass. Husserl studied under the latter two in Berlin in the late 1870s and early 1880s, serving as Weierstrass’s assistant in 1883–84, and indeed Husserl would say that it was from Weierstrass that he had acquired “the ethos of my scientific endeavors”; see Karl Schuhmann, Husserl-Kronik (The Hague: Martinus Nijhoff, 1977), 7. While Husserl’s conception of “Philosophy as a Rigorous Science” (1911) took as its model of rigor Weierstrass’s grounding of higher analysis in elementary arithmetic, it is indicative of Husserl’s more philosophically radical approach that he sought, in the Philosophy of Arithmetic, to extend Weierstrass’s critical project by scrutinizing the concept of number itself. As described above, this led, once freed from the psychologism inherent in Brentano’s conception of philosophy, to the development of phenomenology.

17. Husserl holds that, unlike logic and the sciences of number, pure geometry, as a formal conceptual structure, is an idealization of perceived space, which itself is an idealization from the space of actual experience. In the language of Ideen zu einer reinen Phänomenologie und phänomenologischen Philosophie (Ideas Pertaining to a Pure Phenomenology and to a Phenomenological Philosophy; hereafter Ideas) (1913), in Husserliana (hereafter Hua; Dordrecht: Kluwer, 1951– ), vol. 3, §§8–9, geometry is thus a “material,” not a “formal” eidetic science – “the ontological discipline relating to an essential moment of material thinghood, namely, spatial form.” See also note 19 below.
Geltung), a validity guaranteed *a priori* through knowledge of their conceptual essence; and this knowledge, in turn, is obtained from intuition of categorial forms to which nothing perceptual corresponds. For Husserl, the ideality and *a priori* truth characteristic of the propositions of pure logic (and the more abstract parts of mathematics) involve a type of evidence presented only in directed intentional acts of categorial intuition. Unlike intuitions in Kant's sense, therefore, categorial intuitions present us with an “essence” (an abstract object) immediately and directly as an intentional unity of distinct acts of signification, a “givenness” that is inextricably conceptual as well as conceptually determined. In this way, intricate patterns of “validity-foundings” (*Geltungsfundierungen*) can be described, showing how particular ideal meanings are founded on or presuppose others.

By refashioning Lotze's inchoate doctrine of validity into the phenomenological method of essential intuition, Husserl's earlier analyses of the psychological origin of the basic concepts of arithmetic are transformed into descriptive phenomenological analyses of structures of intentionality underlying the ideal validity of the objects of logic and pure mathematics. Thus, whereas Frege (and, following him, Carnap) understood late-nineteenth-century mathematical developments (primarily the “rigorization” and eventual “arithmetization” of analysis) as pointing in the direction of a purely logical foundation for mathematics (arithmetic and analysis) making no reference to intuition whatsoever, Husserl drew from a different, more geometrical strand (involving the *n*-dimensional spaces or “manifolds” of Riemann and Helmholtz, Grassmann's *Ausdehnungslehre*, and Lie's continuous transformation groups) in articulating a foundation in categorial intuition for the basic laws of logic themselves.

18. Bernhard Riemann (1826–66) was a German mathematician whose 1854 *Habilitationsschrift*, “On the Hypotheses which Lie at the Basis of Geometry,” is among the most influential documents of modern mathematics. In it, Riemann extended differential geometry, hitherto applied only on two-dimensional surfaces, to what he termed *n*-dimensional manifolds, positing a differential expression for metrical relations between nearby points. Hermann von Helmholtz (1821–94) was a German physicist, physiologist, and philosopher of science. Helmholtz's (1868) paper “On the Facts Underlying Geometry” is an attempt to derive the Riemannian metrical expression from “facts” regarding the “free mobility” of rigid bodies. However, Helmholtz's condition of free mobility picks out only a restricted class of Riemannian manifolds: those with constant curvature. Sophus Lie (1842–99) was a Norwegian mathematician and founder of the theory of continuous transformation groups. These (so-called “Lie”) groups were originally employed in the theory of differential equations, but Lie subsequently gave them a geometrical application, showing that they describe the set of rigid motions identified by Helmholtz's “free mobility.” Hermann Grassmann (1809–77) was a German linguist and mathematician. Grassmann's major work, his 1844 *Die Lineare Ausdehnungslehre* (Theory of linear extension), formulated an algebraic theory of higher dimensional spaces, essentially *n*-dimensional linear vector spaces.

19. Although Frege sharply opposed Kant's doctrine of the role of pure intuition in arithmetic, looking for a foundation in pure logic for this science (and for the science of analysis), he
According to Husserl, phenomenology was transformed from a purely descriptive psychology to transcendental phenomenology by pursuit of the main themes of the *Logical Investigations*, resulting in the distinctive form of “transcendental phenomenological idealism” articulated in the *Ideen zu einer reichen Phänomenologie und phänomenologischen Philosophie* (Ideas Pertaining to a Pure Phenomenology and to a Phenomenological Philosophy, 1913).\(^{20}\) Whereas the logician is concerned with *a priori* truths of ideal objectivities (just as the number theorist is concerned with numbers and the truths of arithmetic), the thesis of intentionality led to the view that meaning-constituting experiences (if only of an idealized subject) are necessarily correlated with any object of knowledge. Thus, the phenomenological discovery of the meaning-constituting acts of consciousness in the context of mathematical and logical idealities was extended to all objects. Through a step-wise progression of acts of reflection undertaken within inner intuition, each directed toward a normally unthematized particular conscious experience, the character and limitations of each are successively exhibited, together with their possible interconnections to strata more deeply embedded in preconscious experience. The goal is to uncover and bring to full consciousness the multiplicity and structure of the subjective acts through which the intended objects are invested with objective meaning.

For Husserl, therefore, transcendental phenomenology is constitutional analysis: that is, the intentional analysis of how an object is continuously constituted, with respect to its sense and validity, in the interconnections of all acts of consciousness directed towards it. But this is not to say that the object, whose nonetheless followed the Kantian doctrine that the science of geometry, in particular, is based on our pure intuition of space (and is therefore *synthetic a priori*). Like Bolzano, then, Frege operated wholly within the Kantian conception of intuition, but he denied that any such intuition was needed in either arithmetic or analysis. Husserl, by contrast, is breaking with the Kantian conception completely: whereas arithmetic and analysis are based on formal or categorial intuition, the science of geometry is based on a *material* essential intuition having the essences of specifically spatial forms as its object (cf. note 17 above). In the terminology of *Ideas*, therefore, whereas logic, arithmetic, and analysis are completely universal or formal eidetic sciences, geometry is a regional or material eidetic science.

---

\(^{20}\) The characterization of phenomenology as “descriptive psychology” in the first edition of the *Logical Investigations* (“Introduction” to vol. 2, 1901) was later regarded as “misleading” and removed in the second (1913) edition: see “Translator's Note,” in *Logical Investigations*, J. N. Findlay (trans.) (New York: Humanities Press, 1970), vol. 1, 262. Many phenomenologists resisted Husserl's “transcendental turn” away from “the things themselves [*die Sachen selbst*]” toward subjectivity as the ultimate stratum of phenomenological investigation, viewing it as a return to subjective idealism or even psychologism. For the controversy, see Herbert Spiegelberg, *The Phenomenological Movement: A Historical Introduction*, 3rd ed. (The Hague: Martinus Nijhoff, 1982). Husserl's own retrospective (1913) account of this transition – see his "Entwurf einer 'Vorrede' zu den Logischen Untersuchungen" – was not published during his lifetime.
sense may be that of a mind-transcendent object, is produced by consciousness, as subjective idealism absurdly maintains. Rather, constitution is a matter of “sense-bestowal through transcendental subjectivity,” and the task of constitutive analysis is to investigate how objects, exclusively considered as accomplishments of intentional acts, are ongoing unities of “sense formation” arising against the background of previous sense formations. In this sense, transcendental constitution presupposes a purely methodological “bracketing” (epochê) or “phenomenological reduction,” leaving the world of objects of science and everyday life “as is” but suspending or “putting out of action” the usual assumptions regarding the mind-independent existence of these objects. It is the attempt to understand the meaning of “mind-independent” being as arising within an object’s “sedimented” sense-history, a history to be transcendentally reconstructed and clarified as an accumulating achievement within conscious experience in the broadest sense.21

Only in later works did Husserl consider extending the phenomenological reduction, the epochê, “to formal logic and mathesis in its entirety.” By making these objects “essentially evident by observing consciousness itself in its pure immanence,” transcendental phenomenology seeks to discover the “transcendental subjectivity” underlying the objects of logic and mathematics, “the a priori other side of genuine objectivity.”22 As in Kant, it then becomes the task of a transcendental logic to seek “in subjectivity, or more precisely, the correlation between subjectivity and the objective, the ultimate determination of the sense of objectivity, as apprehended in cognition.”23 These correlations of the

21. See Thomas Ryckman, The Reign of Relativity: Philosophy in Physics 1915–1925 (Oxford: Oxford University Press, 2005), for a reconstruction of the mathematician Hermann Weyl’s attempt to implement something like Husserl’s program of transcendental phenomenological constitution in the context of classical field physics (Einstein’s theory of general relativity and Maxwell’s theory of electromagnetism). In 1918, Weyl formulated the first unified field theory of gravitation and electromagnetism; the theory’s epistemological core, heavily indebted to Husserlian transcendental phenomenological idealism, rested on what Weyl termed “the principle of the relativity of magnitude” (Raum–Zeit–Materie: Vorlesungen über allgemeinen Relativitätstheorie. Dritte Auflage [Berlin: J. Springer, 1919], 243), which essentially states that the laws of nature should be invariant under “arbitrary” changes of scale at neighboring space-time points. Although originating in the context of classical fields, Weyl’s principle, when reformulated for quantum mechanics (where it pertains not to a factor of length but to a factor of phase of the wave function, as Weyl himself later showed) is the progenitor of local gauge invariance, currently the unifying principle of the standard model of fundamental interactions, the cornerstone of the present understanding of elementary particles and the forces that act between them. See also Thomas Ryckman, “Hermann Weyl and ‘First Philosophy’: Constituting Gauge Invariance,” in Constituting Objectivity: Transcendental Perspectives on Modern Physics, Michel Bitbol et al. (eds) (Dordrecht: Springer, 2009).

formal objects of logic and mathematics with subjective processes of experiencing are treated schematically in the *Logical Investigations* but elaborated far more extensively in *Formal and Transcendental Logic* (1929) as well as other writings that remained unpublished in Husserl's lifetime. Transcendental logic is “foundational” only in a novel sense: its aim is the clarification of the fundamental concepts of logic and mathematics by showing how the sense of these ideal objectivities arises within “transcendental subjectivity,” through “originary” sense-bestowing acts of pure consciousness. Increasingly prominent in these last writings, the account of the constitution of logical and mathematical objects within transcendental subjectivity ultimately rests on the phenomenological description of the “life-world” (*Lebenswelt*), the world of ordinary activities and beliefs whose prelogical validities act as grounds for the logical ones. Through the phenomenological reduction, these practices, as intentional acts, become the objects of phenomenological reflection, disclosing how their sense formations arise, structuring the experience characteristic of the life-world. In particular, Husserl famously argues that geometry originates within meaning-conferring acts, revealed through phenomenological investigation of the life-world.24

Carnap, as we noted, studied with Frege at the University of Jena in the years 1910–14. After the First World War he first returned to Jena in the years 1919–22, where he completed his doctoral dissertation, *Der Raum* (1921/2), and he then lived in the town of Buchenbach, near Freiburg, from 1922 to 1926. Carnap had already become seriously interested in phenomenology during the years 1919–22, for he makes very significant use of the Husserlian notion of essential intuition in his dissertation. Indeed, not only does he use this latter notion to defend a modified version of the Kantian conception of pure spatial intuition, but Carnap also embraces Husserl’s notion of formal or categorial intuition for the most general laws of formal logic. After completing his dissertation, Carnap then turned in earnest to the project of *Der logische Aufbau der Welt* (hereafter *Aufbau*; 1928) in the years 1922–25, and it was this project, in particular, that then facilitated his introduction to the Philosophical Circle surrounding Moritz Schlick at the University of Vienna in 1925. While working on the *Aufbau,*

---

24. In his late work, *The Crisis of the European Sciences and Transcendental Phenomenology* (1936–37), the English translation of which includes his 1936 paper on “The Origin of Geometry,” Husserl is concerned to exhibit the historical genesis through which the process of geometrical idealization has transpired, from practical activities of measuring and surveying to the triumph of the geometrical method in classical physics, as “a general method of knowing the real.” This illustrates a highly significant shift in emphasis in Husserl’s thought, from considering constitution principally as an achievement of the individual transcendental ego (termed, by later commentators, “static constitution”) to viewing it more generally as an intersubjective achievement, in that the layers of meaning investing and informing a given constituted object may have origins extending back in cultural and historical time (“genetic constitution”).

In particular, the project of the *Aufbau* is also called a “constitutional theory” (*Konstitutionstheorie*), and, more specifically, a “constitutional theory of the objects of cognition.”\footnote{Carnap described the *Aufbau* project this way in his lectures to Schlick’s Philosophical Circle in 1925; see Friedman, *A Parting of the Ways*, 70. It was on the basis of these lectures that Carnap then joined the Circle (soon to be named the Vienna Circle) as Schlick’s assistant in 1926.} Unlike in his doctoral dissertation, however, Carnap has now left all traces of Husserlian essential intuition (and of the Kantian synthetic a priori) entirely behind. In particular, the *Aufbau* presupposes only the theory of logical types of A. N. Whitehead and Russell’s *Principia Mathematica* (1910–13) as the objectifying framework of a theory of constitution, lending the term “constitution” a precise meaning within the language of logic. It articulates the goal of a “rational reconstruction” of the (simply assumed) system of scientific knowledge via an extensional “constitutional system of concepts” wherein each scientific concept is definable in constructive step-by-step fashion from concepts of lower levels, ultimately from primitive concepts pertaining to the subjective sensory data or “elementary experiences” of a single subject. On account of the transitivity of reducibility, the principal thesis of Carnap’s constitutional theory states that any scientific concept can be reduced, via logical chains of definition, to the primitive ones, thus reconstructing each concept in the epistemically privileged terms of first-person experiential content while simultaneously avoiding all (purely subjective) ostensive definitions (*Aufbau* §§1, 13–16). Logical construction thus provides “a rational justification of intuition,” insofar as “intuitive understanding” is now everywhere replaced with “discursive reasoning” (§§54, 100, 143). This automatically excludes any extra-logical justification of logical laws and principles.

Carnap’s *logocentrism* thus points to the vast abyss separating the constitutive approach of the *Aufbau* from transcendental phenomenology. Just as, for Carnap, all talk of “intuition” must be logically reconstructed, all talk of “acts of constitution” executed by a “transcendental subject” must similarly be replaced by purely logical constructions. Whereas all objects are indeed constituted from a “given” basis of first-personal (autopsychological) elementary experiences, it is a central thesis of Carnap’s construction that “the given has no subject” (§65). More generally, whereas we can, if we like, describe Carnapian constitution in terms of the successive operations carried out by a cognitive subject, Carnap is very clear that this mode of speaking is merely a “fiction” whereby we vividly...
represent the true purely logical procedure of step-wise definition (§99). In particular, all it ultimately means to “constitute” an object from “the given” is that we have a chain of logical definitions within the type-theory of *Principia Mathematica* leading from a single basic relation between elementary experiences (remembrance of part-similarity) to the object in question. Formal logic, in this sense, wholly takes the place of transcendent logic.

Heidegger studied at the University of Freiburg in the years 1910–15, completing his habilitation in philosophy under Heinrich Rickert in 1915. Rickert was a neo-Kantian strongly influenced by the “pure logic” tradition; and Heidegger’s earliest writings are largely concerned with this tradition and its ensuing problematic. Heidegger’s first publication, “Neuere Forschungen über Logik” (1912), is a critical review of recent contributions to logic with particular emphasis on the need to overcome psychologism. His doctoral dissertation, *Die Lehre vom Urteil im Psychologismus* (1913), is a much more extended treatment of the same theme, which exposes some of the most popular current theories of judgment as psychologistic and therefore unacceptable. Finally, Heidegger’s habilitation, *Die Kategorien- und Bedeutungslehre des Duns Scotus* (1915), is a reading of the *Grammaticae speculativae* (which was then attributed to Scotus) through the lenses of the contemporary logical investigations of Rickert, Husserl, and Emil Lask.27

Heidegger’s early investigations revolve around the central distinctions between psychological act and logical content, between real thought process and ideal atemporal “sense,” between being (Sein) and validity (Geltung). For, as Lotze in particular has shown, the realm of pure logic has a completely different mode of existence (validity) than that of the realm of actual spatiotemporal entities (being).28 Moreover, as Rickert has shown, the realm of pure logic (the realm of validity) is also distinct from that of mathematics. For, although the latter is equally atemporal and hence ideal, it presupposes the existence of a particular object – the existence of “quantity” or a homogeneous serial order – and therefore lacks the complete generality characteristic of logic. It follows that we must sharply distinguish the realm of pure logic both from the given heterogeneous qualitative continuum of empirical reality and from the homogeneous

27. All three works are reprinted in Martin Heidegger, *Frühe Schriften, Gesamtausgabe* vol. 1 (Frankfurt: Klostermann, 1978), to which we refer in our citations. It is interesting to note that among the logical works Heidegger comments on are some of Frege’s (on which Heidegger comments positively; cf. *Frühe Schriften*, 20) and Russell’s (on which Heidegger comments negatively; cf. *Frühe Schriften*, 42–3, 174). Heidegger seems to see in Frege’s ideas a concern for meaning appropriate to a “philosophical” logic, whereas Russell’s work appears to him to tend in the direction of a mere “calculus,” and is thereby divorced from the genuine problem of judgment. We shall return to the important influence of Lask in §II below.

quantitative continuum of mathematics. In emphasizing these fundamental distinctions, and, above all, in maintaining “the absolute primacy of valid sense [den absoluten Primat des geltenden Sinnes],” Heidegger shows himself indeed to be a faithful follower of Rickert.

It then becomes radically unclear, however, how the purely logical realm of valid sense is connected with the real world of temporal being (Sein): with either the realm of empirical nature where the objects of our (empirical) cognition reside or the realm of psychological happenings where our acts of judgment reside. Rickert himself responds to this problem by appealing to “transcendental psychology.” As he explains in the Preface to the third edition of Der Gegenstand der Erkenntnis (1915), it is precisely the role of the transcendental subject (in Rickert’s own terms, the “cognitive subject” or “theoretical subject”) to bind the realms of being and validity together:

We thus arrive at two worlds, a [world of] being [einer seinden] and a [world of] validity [einer geltenden]. But between them stands the theoretical subject, which binds the two together through its judgments, whose essence only becomes understandable in this way, and without which we could not meaningfully speak of existent [seienden] or real “objects” of cognition.

Unfortunately, however, Rickert is never able to develop in any detail a transcendental psychology that could perform this “binding” role.

Heidegger, for his part, is very sensitive indeed to the difficult position in which Rickert has become entangled, and, accordingly, he also thinks that some version of transcendental psychology is necessary. For Heidegger, however, it is above all the phenomenology of Husserl that offers us a way out of Rickert’s impasse:

[T]he sharp separation of logic from psychology is perhaps not achievable. We must distinguish here. It is one question whether psychology founds logic in principle and secures its validity [Geltungswert], it is another whether it assumes the role of its primary theater of action and basis of operation. And the second is in fact the case; for we are

29. See Heidegger, Frühe Schriften, 214–89; as Heidegger notes, his discussion here is based on Rickert’s “Das Eine, die Einheit und die Eins,” Logos 2 (1911).
30. See Heidegger, Frühe Schriften, 273. The realm of valid sense enjoys this primacy because all realms of existence as such (the natural, the metaphysical–theological, the mathematical, and the logical itself) become objects of our cognition only through the mediation of the logical realm (ibid., 287).
here concerned precisely with the remarkable fact, which perhaps involves problems that can never be completely illuminated, that the logical is embedded in the psychological. But this just determined role of psychology requires to be made more precise. Experimental psychology remains irrelevant for logic. Moreover, even so-called introspective \[selbstbeobachtende\] psychology only becomes relevant from a particular point of view. The investigation concerns the meanings, the sense of the acts and thus becomes theory of meaning, phenomenology of consciousness. Husserl, simultaneously with the critical rejection of psychologism, also theoretically grounded phenomenology in a positive fashion and himself made fruitful contributions to this difficult subject.\[^{32}\]

Whereas Rickert himself had serious doubts whether Husserl's phenomenology can fulfill the function of what he calls “transcendental psychology,” Heidegger is now convinced that only Husserlian phenomenology can possibly play this role.

When, in 1916, Rickert left Freiburg to take Wilhelm Windelband's position at Heidelberg, and Husserl left Göttingen to take Rickert's position at Freiburg, Heidegger became an enthusiastic proponent of the new phenomenology and, in particular, distanced himself further and further from Rickert.\[^{33}\] Nevertheless, in the very same year, in a concluding chapter added to the published version of his habilitation, there also appear rumblings in a new and quite un-Husserlian direction. For Heidegger this suggests that a genuine reconciliation of psychology and logic – here equated with a reconciliation of change and absolute validity, time and eternity – can be effected only through the concept of “living spirit” \(\textit{der lebendige Geist}\) construed as a concrete and essentially historical subject. The “subjective logic” sought by Rickert and Husserl requires a radically new

\[^{33}\] This distance from Rickert becomes quite extreme by 1925–26, when Heidegger was completing \textit{Being and Time}, and can be graphically seen in lectures Heidegger presented at Marburg in the summer semester of 1925 on the concept of time – see Martin Heidegger, \textit{Prolegomena zur Geschichte des Zeitbegriffs} (Gesamtausgabe vol. 20 [Frankfurt: Klostermann, 1979]) – and in the winter semester of 1925–26 on logic – see Heidegger, \textit{Logik: Die Frage nach der Wahrheit} (Gesamtausgabe vol. 21 [Frankfurt: Klostermann, 1976]). Heidegger speaks of Rickert with almost entirely undisguised contempt, whereas Husserl appears as the leader of a new “breakthrough” in philosophy, which, in particular, has definitively overcome neo-Kantianism. Extensive discussion of these lectures, together with Heidegger’s other lecture courses leading up to \textit{Being and Time}, can be found in Theodore Kisiel, \textit{The Genesis of Heidegger’s “Being and Time”} (Berkeley, CA: University of California Press, 1993). See also the essay by Miguel de Beistegui in this volume.
point of view according to which the subject is no merely cognitive (“punctiform”) subject, but rather an actual concrete subject comprehending the entire fullness of its temporal–historical involvements. And such an investigation of the concrete historical subject, according to Heidegger, must now be a “translogical” or “metaphysical” investigation. Thus, Heidegger is here already beginning to come to terms with the historically oriented Lebensphilosophie of Dilthey, an influence that will prove decisive in Being and Time (1927).  

II. THE CATEGORIES OF OBJECTIVE EXPERIENCE: CARNAP, HEIDEGGER, AND THE NEO-KANTIANS

Both Carnap and Heidegger were philosophically trained within a neo-Kantian tradition that dominated the German-speaking world at the end of the nineteenth and beginning of the twentieth centuries. The two most influential movements or “schools” in this tradition were the Marburg School, founded by Hermann Cohen and then continued by Paul Natorp and Ernst Cassirer, and the Southwest School, founded by Windelband and then systematically developed by Rickert. Heidegger, as we noted, studied with Rickert at Freiburg and, in fact, completed his habilitation under Rickert in 1915. Carnap, for his part, studied Kant at Jena with Bruno Bauch (1877–1942) – also a student of Rickert’s from Freiburg – and, in fact, completed his doctoral dissertation (Der Raum) under Bauch in 1921. It is clear, moreover, that Carnap carefully studied several

34. See Heidegger, Frühe Schriften, 341–411. For Heidegger’s assessment of Dilthey’s conception of the subject as “living person with an understanding of active history,” in contrast to Husserl’s more formal conception of the subject, see Heidegger, Prolegomena zur Geschichte des Zeitbegriffs, 161–71. As is well known, in Being and Time Heidegger is quite explicit that the crucial chapter on “Temporality and History” (Division Two, ch. 5, §§72–7) depends fundamentally on Dilthey: “The just completed analysis of the problem of history has arisen out of the appropriation of Dilthey’s work” (§77). The influence of Dilthey is further exhibited in 1916 in Heidegger’s preface to his habilitation, with its call for philosophy to become weltanschaulich, that is, engaged in the concrete historical events of the time; see Heidegger, Frühe Schriften, 191; and cf. 205 n.10. This call contrasts sharply with Husserl’s own arguments (contra Dilthey) that philosophy as a science must be eternally valid and thus essentially ahistorical; see Edmund Husserl, “Philosophie als strenge Wissenschaft” (1911), in Hua, vol. 25, 323–41; “Philosophy as a Rigorous Science,” Quentin Lauer (trans.), in Phenomenology and the Crisis of Philosophy (New York: Harper & Row, 1965), 122–47.

35. At Jena, Bauch was a close colleague and associate of Frege’s. After the First World War, for example, Frege joined Bauch’s conservative Deutsche Philosophische Gesellschaft and published his last three papers (“Logical Investigations”) in the official journal of this society, Beiträge des deutschen Idealismus. For Bauch and his relationship to Frege, see Hans Sluga, Gottlob Frege, and Heidegger’s Crisis: Philosophy and Politics in Nazi Germany (Cambridge, MA: Harvard University Press, 1993). For Carnap’s relationship to Bauch and neo-Kantianism more generally – including discussions of Der Raum – see Alan Richardson, Carnap’s
versions of neo-Kantianism, including, in particular, the writings of Natorp, Cassirer, and Rickert.

Common to both schools of neo-Kantianism is a conception of the object of knowledge or judgment inherited from Kant. Our true judgments should not be construed as representing entities existing independently of them, whether as the “transcendent” objects of the metaphysical realist existing “behind” our sense experience or the raw unconceptualized sense experience itself beloved of the empiricist. In the first case, true judgment would be impossible for us, since, by hypothesis, we have no independent access to such objects by which we could verify the desired relation of representation between them and our judgments. In the second case, true judgment would be equally impossible, for the stream of unconceptualized sense experience is utterly chaotic and intrinsically undifferentiated. Comparing the articulated structure of our judgments to this chaos of sensations therefore makes no sense. How, then, is knowledge or true judgment possible? What does it mean for our judgments to relate to an object? The answer is given by Kant’s “Copernican Revolution.” The object of knowledge does not exist independently of our judgments at all. It is, rather, first “constituted” when the unconceptualized data of sense are organized within the *a priori* logical structures of judgment itself; the initially unconceptualized data are thereby brought under *a priori* “categories” and thus become capable of empirical objectivity.

Yet there is a crucially important difference between this neo-Kantian account of the object of knowledge and Kant’s original account. For Kant, we cannot explain how the object of knowledge becomes possible on the basis of the *a priori* logical structures of judgment alone. We need additional *a priori* structures – the pure forms of sensible intuition – that mediate the pure forms of judgment comprising what Kant calls general (or formal) logic and the unconceptualized manifold of impressions supplied by the senses. The pure logical forms of judgment thus only become *categories* in virtue of the transcendental schematism of the understanding – that is, when pure forms of thought are given a determinate spatiotemporal content in relation to the pure forms of sensible intuition. The pure logical form of a categorical judgment, for example, becomes the category.

---

36. Some of the most important epistemological works of the two traditions are: Cassirer, *Substanzbegriff und Funktionsbegriff: Untersuchungen über die Grundfragen der Erkenntniskritik*; Cohen, *Logik der reinen Erkenntnis*; Natorp, *Die logischen Grundlagen der exakten Wissenschaften*; and Rickert, *Der Gegenstand der Erkenntnis*. Very useful summary presentations of the basic ideas of the two traditions can be found in Heinrich Rickert, “Zwei Wege der Erkenntnistheorie,” *Kant-Studien* 14 (1909), and Paul Natorp, “Kant und die Marburger Schule,” *Kant-Studien* 17 (1912).
of substance when it is schematized in terms of the temporal representation of permanence; the pure logical form of a hypothetical judgment becomes the category of causality when it is schematized in terms of the temporal representation of succession; and so on. For Kant, therefore, pure formal logic must, if it is to play an epistemological role, be supplemented by transcendental logic: an explanation of how logical forms become schematized in terms of pure spatio-temporal representations belonging to the independent faculty of pure intuition. And it is precisely this explanation, in particular, that forms the heart of the “Transcendental Analytic” of the Critique of Pure Reason – the so-called metaphysical and transcendental deductions of the categories.

Nevertheless, both versions of neo-Kantianism entirely reject the idea of an independent faculty of pure intuition. They here follow the tradition of post-Kantian idealism in vigorously opposing the dualistic conception of mind characteristic of Kant’s own position: the radical distinction between a conceptual faculty of pure understanding and an intuitive faculty of pure sensibility. The a priori formal structures in virtue of which the object of knowledge becomes possible must therefore derive solely from the logical faculty of understanding. In particular, since space and time no longer function as independent forms of pure sensibility, the constitution of experience described by transcendental logic must now proceed on the basis of purely conceptual – and thus essentially non-spatiotemporal – a priori structures. And it is this last feature of their conception of epistemology that associates the neo-Kantians with the “pure logic” tradition derived from Bolzano, which had earlier arrived, as we have seen, at a conception of pure thought or pure logic whose subject matter is an essentially nontemporal, and therefore certainly not psychological, realm – an “ideal” (Platonic) realm of timeless formal structures.37

In any case, the “constitution” of experience described by transcendental logic must now proceed on the basis of purely conceptual a priori structures: formal logic must somehow take over the mediating role between a priori intellection and a posteriori sensible experience all by itself. The leading idea of the Marburg School – especially as developed in Cassirer’s Substance and Function

37. As explained in Friedman, A Parting of the Ways, ch. 3, this point needs qualification in the case of the Marburg School, which attempted to avoid such Platonism by embedding formal logic within a transcendental logic depicting all cognitions of the understanding as belonging to a historical developmental process (in accordance with the “genetic” conception of knowledge). As we explained in §1 above, Husserlian phenomenology is also predicated on a rejection of the original Kantian dichotomy between concepts and intuition. In contrast to both neo-Kantian traditions, however, Husserl does not give priority to concepts over intuition in his phenomenological method; on the contrary, he views all cognition, as we said, as a necessary unity of both elements (compare notes 17 and 19 above, together with the corresponding discussion in the main text).
– was to take as our most important “clue” to the fundamental structure of the intellect nineteenth-century developments in mathematics and mathematical physics, and not the traditional Aristotelian theory of the logical forms of judgment. For the modern concepts of function, relation, and series provide us with entirely new insights into our basic forms of concept formation, which we can then use to construct a new picture of the way in which the mind establishes a necessary relation to sense experience: namely, the so-called “genetic” conception of knowledge, wherein empirical knowledge, in particular, is now seen as a never-completed historical sequence of formal abstract structures somehow “converging” on the concrete object of experience as an ideal limit – as a forever unreachable ideal $X$.

The Southwest School, by contrast, decisively rejects this Marburg “mathematization” of formal logic. Formal logic remains Aristotelian syllogistic, so that mathematical thought, in particular, must be sharply distinguished from properly logical thought.\(^{38}\) Hence, the concrete object of experience cannot be viewed as a formally constructed ideal limit (as conceived by the Marburg School), but must rather be viewed as a genuinely independent entity – given, as it was for Kant, in an independent “manifold of sensations” – standing over and against the original forms of thought expressing the purely logical structure of the intellect. Yet, since Kant’s idea of an independent *a priori* faculty of pure intuition (to which the logical forms of thought are related by the transcendental schematism of the imagination) is also rejected, we are left with overwhelming problems in constructing any kind of mediating connection between formal logic on the one side and concrete sensory experience on the other. We are left with overwhelming problems, that is, in effecting a Kantian theory of the categories; and precisely these problems, as we shall see, then initiated the radically new (and explicitly anti-neo-Kantian) conception of the object of knowledge later articulated by Heidegger.

Although Carnap had defended a more orthodox Kantian position in his doctoral dissertation (where he retained an important role for the pure intuition of space), Carnap’s own radical reconceptualization of epistemology in the *Aufbau* can be seen, at least in part, as a further development of the more mathematical “logicization” of experience effected by the Marburg School. In particular, by taking formal logic to be given by the new mathematical logic of Whitehead and Russell’s *Principia Mathematica*, one can now show by logical construction how the initially entirely private and subjective “manifold of sensations” (Carnap’s “elementary experiences”) is successively “objectified” by application of the *a priori* formal structures of logic in a step-wise “constitution of reality.”

\(^{38}\) See Rickert, “Das Eine, die Einheit und die Eins”; cf. note 29 above.
Carnap makes his debt to Cassirer and neo-Kantianism completely explicit here:

Cassirer ([Substanzbegriff und Funktionsbegriff] 292ff.) has shown that a science having the goal of determining the individual through lawful interconnections [Gesetzeszusammenhänge] without its individuality being lost must apply, not class (“species”) concepts, but rather relational concepts; for the latter can lead to the formation of series and thereby to the establishing of order-systems. It hereby also results that relations are necessary as first posits, since one can in fact easily make the transition from relations to classes, whereas the contrary procedure is only possible to a very limited extent.

The merit of having discovered the necessary basis of the constitutional system thereby belongs to two entirely different, and often mutually hostile, philosophical tendencies. Positivism has stressed that the sole material for cognition lies in the undigested [unverarbeitet] experiential given; here is to be sought the basic elements of the constitutional system. Transcendental idealism, however, especially the neo-Kantian tendency (Rickert, Cassirer, Bauch), has rightly emphasized that these elements do not suffice; order-posit [Ordnungssetzungen] must be added, our “basic relations” (Aufbau §75).

That Carnap has the genetic (erzeugende) conception of knowledge characteristic of the Marburg School specifically in mind here becomes especially clear later in the Aufbau, when Carnap describes his position this way:

Constitutional theory and transcendental idealism agree in representing the following position: all objects of cognition are constituted (in idealistic language, are “generated in thought [im Denken erzeugt]”); and, moreover, the constituted objects are only objects of cognition qua logical forms constructed in a determinate way. ($177$

Nevertheless, constitutional theory does not conceive the real individual object of experience as an infinitely distant ideal limit; for, as Carnap emphasizes, all objects of knowledge are defined or “constituted” at definite finite ranks in the hierarchy of Russelian logical types:

According to the conception of the Marburg School (cf. Natorp [Die logischen Grundlagen der exakten Wissenschaften] 18ff.), the object is the eternal X, its determination is an incompletable task. In opposition to this it is to be noted that finitely many determinations suffice
for the constitution of the object – and thus for its univocal description among the objects in general. Once such a description is set up the object is no longer an X, but rather something univocally determined – whose complete description then certainly still remains an incompletatable task.

(§179)

As a result, as Carnap also emphasizes, there is no longer any need for the synthetic (as opposed to the purely logical or analytic) *a priori*. Since an object is always defined or “constituted” at a definite finite rank in the hierarchy of logical types, we can always separate those features of the object comprising its definition from those features that express further information about the object uncovered in the course of properly scientific investigation. Fully determining the latter is indeed an infinite task requiring the entire future progress of empirical science, but establishing the former is simply a matter of stipulation:

After the first task, that of the constitution of the objects, follows as the second the task of investigating the remaining, non-constitutional properties and relations of the objects. The first task is solved through a stipulation, the second, on the other hand, through experience. (According to the conception of constitutional theory there are no other components in cognition than these two – the conventional and the empirical – and thus no synthetic a priori [components].)

(§179)

Carnap thus overcomes even the attenuated version of the synthetic *a priori* characteristic of the Marburg genetic conception of knowledge, and, as we have already suggested, he thereby completely absorbs Kantian transcendental logic within pure formal logic.

We noted above that Heidegger’s earliest writings revolved around the idea of pure logic and its resulting problematic. The most important of these writings, as we also suggested, was Heidegger’s habilitation, *Die Kategorien- und Bedeutungslehre des Duns Scotus*, which examined logical doctrines then attributed to Scotus through the lens of the contemporary logical investigations of Rickert, Husserl, and Lask. What is now most important, from our present point of view, is that the work of Lask, in particular, was especially important for Heidegger’s later development, for it was here that the deep tensions arising for the Southwest School in constructing a mediating connection between formal logic and concrete sensory experience emerged in their sharpest form.39

39. See note 33 above, together with the associated discussion in the main text, for Heidegger’s evolving appreciation of these deep tensions arising within the Southwest School.
Lask was a brilliant student of Rickert’s who held an associate professorship at Heidelberg before he was killed in the First World War in 1915. The basic argument of Lask's most important work, *Die Lehre vom Urteil* (1912), is that, whereas the Kantian philosophy has indeed closed the gap between knowledge and its object, we are nonetheless left with a new gap between what Lask calls “transcendental,” “epistemological,” or “material” logic on the one side and “formal” logic on the other. Formal logic is the subject matter of the theory of judgment: the realm of necessarily valid and timeless “senses,” “objective thoughts,” or “propositions in themselves” familiar under the rubric of pure logic. Transcendental or material logic, by contrast, is the theory of the categories: an explanation of how the concrete object of experience is made possible by the constitutive activity of thought. But, and here is the central point of Lask’s argument, transcendental or material logic is not based on formal logic, and, accordingly, he explicitly rejects Kant’s metaphysical deduction of the categories. For Lask, what is fundamental is the concrete, already categorized, real object of experience. The subject matter of formal logic (which includes all the structures of the traditional logical theory of judgment) only arises subsequently in an artificial process of abstraction, by which the originally unitary categorized object is broken down into form and matter, subject and predicate, and so on. Moreover, since this comes about owing to a fundamental weakness or peculiarity of our human understanding – our inability to grasp the unitary categorized object as a unity – the entire realm of “pure logic,” despite its timeless and necessary character, is, in the end, nothing but an artificially constructed intermediary possessing no explanatory power whatsoever.

The importance of Lask’s work for Heidegger’s later development is clearly evident in a crucial section of *Being and Time* on “Dasein, Disclosedness, and Truth” (§44), where Heidegger explicitly rejects the Kantian “Copernican Revolution” in favor of an apparently “naive realist” conception of truth as direct “agreement with the object” (a view Heidegger associates with Aristotle). After explaining that “[t]he neo-Kantian theory of knowledge of the 19th century frequently characterized this definition of truth as an expression of a methodologically backward naive realism and described it as incompatible with a posing of the question having undergone Kant’s ‘Copernican Revolution,’” Heidegger articulates the “standard” epistemological position he wishes to oppose as follows: “Truth according to the general opinion is cognition. But cognition is judgment. And in the judgment we must distinguish between the judging as real psychical process and the judged as ideal content.” Heidegger then protests vehemently against this latter distinction:

And is not the separation of real execution and ideal content with reference to the “actual” judging of the judged as such unjustified? Is
not the actuality of cognition and judging not broken apart into two
types of being and “levels,” whose piecing-together never touches the
mode of being of knowing? Is not psychologism correct to resist this
separation – even though it itself neither clarifies the mode of being
of the thinking of the thought ontologically, nor even is acquainted
with this as a problem?

Finally, Heidegger formulates his own “naive realist” account of truth:

The meant being itself shows itself so, as it is in itself, i.e., that it
in its self-sameness [Selbigkeit] is so, as how it, being pointed out
in the assertion, is uncovered. Representations are not compared,
either among themselves or in relation to the real thing. In identifi-
cation there is not an agreement between knowing and object and
certainly not between psychical and physical – but also not between
“contents of consciousness” among themselves. In identification
there is only the being-uncoveredness [Entdeckt-sein] of the being
itself, it [itself] in the How of its uncoveredness. This [uncovered-
ness] proves true [bewährts sich] in that what is asserted – that is,
the being itself – shows itself as the same. [Such] proof [Bewährung]
means: the showing itself of the being in its self-sameness.

Heidegger finishes this passage with a footnote that refers us to the Sixth
Investigation of volume two of Husserl’s Logical Investigations (which introduces
the idea of truth as “identification” – a direct relation of identity between the
“intended” meaning and the real object) and to the work of Lask.40

---

40. The footnote warns us against relying exclusively on the first volume of the Logical
Investigations, which may appear merely to represent the traditional theory of the proposi-
tion in itself derived from Bolzano. The relevant sections of volume two (1901, §§36–52), by
contrast, present a conception of truth in which an intention or meaning is directly “identi-
fied” – in immediate intuition – with the very thing that is intended or meant. According to
the theory of truth articulated in these sections of the Logical Investigations, truth in general
is not even propositional. My representation of the table may be immediately compared with
the table, just as my assertion that the table is brown may be immediately compared with
the table’s being brown. Thus, truth in general need involve none of the structures (subject
and predicate, ground and consequent, and so on) studied in traditional formal logic. On
the contrary, such peculiarly logical structures only emerge subsequently in the very special
circumstances of “categorial intuition,” where specifically propositional intentions or mean-
ings are intuitively grasped in their most abstract – and, as it were, secondary and derivative
– formal features. In this sense, Husserl’s conception of the relationship between logical form
and truth in general parallels Lask’s view of the artificiality and subjectivity of logical form. In
neither case can formal logic be in any way foundational or explanatory for truth as a “rela-
tion to an object.” For Heidegger’s assessment of the notion of “categorial intuition” in the
Heidegger is a “naive realist” here insofar as he begins with the idea of “being-in-the-world.” We do not start with a cognitive subject together with its contents of consciousness, but rather with a living practical subject necessarily engaged with its environment. Assertion, as Heidegger explains earlier (§33), is a “derivative mode of interpretation” in which the “hermeneutical ‘as’” of practical understanding of the “ready-to-hand” (where an item “ready-to-hand” is understood “as” suited for a given end or purpose) is transformed into the “apophantical ‘as’” of theoretical understanding of the “present-at-hand” (where an item “present-at-hand” is understood “as” determined by a given predicate). Truth in the traditional (Aristotelian) sense – as a relation of agreement with an object – then emerges (§44) as itself a derivative phenomenon (where an assertion is compared with a “present-at-hand” object it points out in a relation that is itself “present-at-hand”). If we forget this derivative character, however, all the misunderstandings currently prevalent in the (neo-Kantian) “theory of judgment” then arise:

If the phenomenon of the “as” remains hidden, and, above all, if its existential origin in the hermeneutical “as” remains covered over, then Aristotle’s phenomenological approach to the analysis of the logos collapses into a superficial “theory of judgment” according to which judging is a connection and/or separation of representations and concepts. (§33)

In tracing the collapse of the “superficial ‘theory of judgment’” prevalent in the contemporary neo-Kantian tradition to a neglect of the distinction between the “apophantical ‘as’” of theoretical understanding and the “hermeneutical ‘as’” of practical understanding, Heidegger has taken Husserl’s theory of identification and Lask’s emphasis on the primacy of the actual concrete object of experience an important – and absolutely decisive – step further. For Heidegger now conceives the concrete human subject neither as a cognitive or theoretical subject in the sense of Rickert nor as the subject of “pure consciousness” in the sense of Husserl. The concrete human subject (Dasein) is rather primarily and originally oriented towards pragmatic engagements and practical projects necessarily directed towards a temporal future; and it is in precisely this way, for Heidegger, that Dasein is an essentially finite, essentially temporal, being. And for such a being, in particular, the thought of temporal finitude is not simply the representation of an eventual limit or boundary to the sequence of passing phenomena and mental contents; it is rather the thought of the subject’s own death – the

---

context of Husserl and Lask (which Heidegger sees as destroying once and for all the Kantian “mythology” of a synthesis of understanding and sensibility, form and matter) see Heidegger, Prolegomena zur Geschichte des Zeitbegriffs, 63–99.
radical possibility that, at any given moment, one’s ongoing projects and pragmatic engagements may simply cease to be. Whereas, in its everyday understanding of itself, Dasein is completely unaware of its own peculiar character and is simply caught up in its projects and practical involvements, in “being-toward-death” Dasein is revealed to itself for what it is – as what Heidegger calls “thrown being-in-the-world.”

Hence, temporality, for Heidegger, is neither the all-embracing public time within which events are dated and ordered nor the subjective time of “pure consciousness” in which experienced mental contents flow in review past the intentional “now.” Temporality is rather first manifested in the being-towards-the-future of primarily practically oriented Dasein, a being-towards-the-future that necessarily includes being-towards-death and can therefore be either “authentic” or “inauthentic.” Thus, in authentic existence, Dasein’s concernful practical orientation (its “care” [Sorge]) is unified by a “resolute” and thorough-going decision. In inauthentic existence, by contrast, Dasein’s “care” is dispersed and “fallen”: Dasein has, so to speak, lost itself in its world.41 Finally, in authentic existence, Dasein’s practically oriented being-towards-the-future is at the same time a practically oriented (historical) being-towards-the-past. For, at precisely the moment of an authentic decision, Dasein must choose among possibilities that must themselves be already present and available in the historically given situation. Dasein, at the moment of its most authentic freedom, reveals itself as nonetheless dependent on possibilities that have been handed down or inherited. Dasein must thus appropriate its “fate” and is therefore necessarily historical.42

Heidegger’s radical transformation of the neo-Kantianism of the Southwest School thus involves not only the deep influence of Husserlian phenomenology, but also a further appropriation of both the existential spirituality of Søren Kierkegaard and the historically oriented Lebensphilosophie of Dilthey. 43 The

41. See Heidegger, Being and Time: “Dasein can understand itself as understanding from the side of the ‘world’ and the other or from the side of its ownmost possibility-for-being [aus seinem eigensten Seinkönnen]. The last-mentioned possibility means: Dasein discloses itself to itself in and as its ownmost possibility-for-being. This authentic disclosedness shows the phenomenon of the most original truth in the mode of its authenticity. The most original and authentic disclosedness in which Dasein as possibility-for-being can be, is the truth of existence” (§44).

42. The temporality of “authentic” existence is articulated in Division Two, ch. 3 (§§ 61–6), the temporality of everyday “inauthentic” existence in ch. 4 (§§67–71), the temporality of “historicality” in ch. 5 (§§72–7). How the temporality of Dasein is actually the prior ground of the “ordinary conception of time” (viz. the all-embracing public time within which events are dated and ordered) is explained in ch. 6 (§§78–81). Note that the historicality of Dasein means only that the totality of its possible practical involvements is historically determined (and, indeed, by its own interpretation of this history). Dasein’s actual practical involvements are up to its own free choice from among these historically determined possibilities. True authenticity, for Heidegger, rests on the correct understanding of precisely this situation.

43. For the importance of Dilthey, in particular, see note 34 above.
result is a breathtakingly original exploration of the spiritual and philosophical predicament of the early twentieth century; and Heidegger’s decisive rejection of the authority and primacy of formal logic and the exact sciences in the dispute with Carnap over “metaphysical pseudo-sentences” can be properly understood, as we shall see, only against this particular background. Just as Carnap brings the mathematical “logicization” of experience begun by the Marburg School to completion using the new logic of *Principia Mathematica*, Heidegger, for his part, completes the “de-logicization” of experience implicit in the problematic of the Southwest School – which was made explicit, for the first time, in the work of Lask and then incorporated into Heidegger’s own existential–hermeneutic version of phenomenology.

### III. OVERCOMING METAPHYSICS

All four of our protagonists – Frege, Husserl, Carnap, and Heidegger – conceived themselves as making revolutionary breaks with the philosophy of the past through the invention (or discovery) of radically new types of philosophical tools. For Frege, this was the new form of logical language he created – the *Begriffsschrift* (1879) – where, in particular, a purely formal or conceptual treatment of the great mathematical discoveries of the nineteenth century (especially in the foundations of arithmetic and analysis) became completely clear and explicit for the first time.44 This new logical language then constituted the indispensable basis for Frege’s subsequent investigations into the philosophy of logic, language, and mathematics, which are still an essential part of the canon for an education within what we now call the analytic tradition.45 The ambitions of this philosophical tradition to be “scientific” – and to leave behind the irresoluble obscurities of traditional metaphysics – rest squarely on the presumed scientific status of the new philosophical tool Frege created.

For Husserl, by contrast, although he, like Frege, drew very important inspiration from nineteenth-century mathematics, the formal language of modern logic

44. Cf. notes 17 and 19 above. Frege brings the process of showing that arithmetic and analysis are purely conceptual (and thus nonintuitive in Kant’s sense) to a conclusion by finally articulating an explicit conception of purely formal logic adequate to the task.

45. See Gottlob Frege, *Die Grundlagen der Arithmetik: Eine logisch-mathematische Untersuchung über den Begriff der Zahl* (Breslau: Koebner, 1884); “Über Sinn und Bedeutung,” *Zeitschrift für Philosophie und philosophische Kritik* 100 (1892); “Über Begriff und Gegenstand,” *Vierteljahrschrift für wissenschaftliche Philosophie* 18 (1892); and “Der Gedanke: Eine logische Untersuchung,” *Beiträge zur Philosophie der deutschen Idealismus* 1 (1918). The last of these, “Thought” (*Der Gedanke*), is the first of Frege’s final papers published under the title of “Logical Investigations.”
(or any other formal language) was, by itself, quite insufficient to dissolve the obscurities of traditional metaphysics and now launch philosophy on a properly “scientific” path. Thus, as we have seen, Husserl found the modern logical tradition of Bolzano and Frege (and even Carnap) to be philosophically “naive,” insofar as it appeared to give aid and comfort to a Platonistic ontology of timeless abstract objects and thereby render our supposed cognitive “grasp” of logic and mathematics completely obscure. Husserl addressed this difficulty, as we have also seen, by turning to a phenomenological investigation into the “mode of givenness” or “sense” of logical and mathematical objects as they first appear (immanently) to consciousness, while simultaneously “bracketing” all ontological questions as to their “real existence” (transcendently) independent of consciousness. And, more generally, Husserl applied the same method of “phenomenological reduction” to physical objects as well: what matters to phenomenology is again their distinctive “mode of givenness” to consciousness, not the question of their “real existence” independent of consciousness. The new discipline of transcendental phenomenology thereby achieved a distinctively philosophical standpoint that attempted to be entirely neutral with respect to all metaphysical disputes between conflicting “realist” and “idealist” tendencies in the philosophical tradition.

Carnap, in the *Aufbau*, attempted to do something very similar. We observed in §II above that, according to the *Aufbau*, constitutional theory and “transcendental idealism” agree that “all objects of cognition are constituted (in idealistic language, are ‘generated in thought’)” (§177); and, as we also observed, by “transcendental idealism” Carnap has primarily in mind the “logical idealism” of the Marburg School. Nevertheless, in the same section, Carnap also explicitly argues that “[c]onstitution theory and realism do not contradict one another at any point”; and, in an earlier section, he explains the precise sense of this metaphysical neutrality as follows:

Are the constituted structures “generated in thought,” as the Marburg School teaches, or “only recognized” by thought, as realism asserts? Constitutional theory employs a neutral language; according to it the structures are neither “generated” nor “recognized,” but rather “constituted”; and even at this early stage it cannot be too strongly emphasized that this word “constitution” is always meant completely neutrally. From the point of view of constitutional theory the dispute involving “generation” versus “recognition” is therefore an idle linguistic dispute.  

(§5)

In particular, by “constitute,” as we saw in §I, Carnap means only the construction of a sequence of logical definitions from his single autopsychological basic relation within the logic of *Principia Mathematica*, and he explicitly asserts, in
addition, that all talk of “acts” of constitution by a cognitive subject is merely fictional (§99). Thus, although the Aufbau shows very clear signs of the influence of Husserl, it is ultimately modern mathematical logic, for Carnap, rather than transcendental phenomenology, that secures him a metaphysically neutral standpoint.46

Heidegger begins by following Husserl in taking the new phenomenological method decisively to transcend traditional philosophy and place philosophy on the path of a science. In part C of §7 of Being and Time, entitled “The Preliminary Concept of Phenomenology,” Heidegger characterizes phenomenology as a “science of phenomena,” but he then turns in a quite un-Husserlian direction by asserting that, “with respect to its subject matter, phenomenology is the science of the being of beings—or ontology.” In particular, phenomenology, in its Husserlian form, now appears to Heidegger as excessively idealistic, because, as we have seen, he now takes being-in-the-world, rather than pure consciousness, as the subject of characteristically “phenomenological” investigation (within existential–hermeneutic phenomenology rather than Husserlian transcendental phenomenology). To be sure, the resulting “naive realism” still has an important transcendental dimension, insofar as we can pursue “fundamental ontology” only by means of an (existential–hermeneutic) “analytic of Dasein.” It is quite clear, nonetheless, that Heidegger intends to rescue both fundamental ontology and traditional metaphysics, together with the real “being of the world,” from precisely Husserl’s phenomenological reduction.47

---

46. For more on Carnap’s antimetaphysical standpoint in the Aufbau, see Michael Friedman, “Introduction: Carnap’s Revolution in Philosophy,” in Friedman and Creath, The Cambridge Companion to Carnap. Carnap famously uses the Husserlian terminology of the “epoché” when discussing his “autopsychological basis” of “elementary experiences”: “At the beginning of the system the experiences are simply taken in as they are given; the postulations of reality and non-reality in them that are to follow are not yet made, but rather ‘bracketed’; the phenomenological ‘reduction’ (‘epoché’) in the sense of Husserl is thus exerted” (Aufbau §64). Yet Carnap does not intend a reduction to the sphere of pure consciousness (of the transcendental subject), in the sense of Husserl. As he makes perfectly clear in the same section, Carnap simply has in mind the circumstance that all distinctions among “real” and “non-real” objects will be made at later stages (in the hierarchy of logical types of Principia Mathematica) of his purely logical sequence of constitutional definitions: “For the basis no distinction is made between those experiences which are distinguished from one another as perception, hallucination, dream, etc. on the basis of later constitution. This differentiation, and thereby that between actual and non-actual objects, only appears at a rather high constitutional level (cf. §170ff.).”

47. Thus, Husserlian transcendental phenomenology, from Heidegger’s point of view, is still excessively “idealistic.” See Heidegger’s vehement rejection of the idea of a “pure” or “idealized” subject at the conclusion of Being and Time §44: “The ideas of a ‘pure I’ and of a ‘consciousness in general’ so little contain the a priori of the ‘actual’ subject that they either pass over the ontological character of the factuality and the constitution of being of Dasein or they do not see it at all. Rejection of a ‘consciousness in general’ does not mean the negation of the a priori, any more than the positing of an idealized subject guarantees the objectively
In the years following the publication of *Being and Time*, Heidegger embarked on something of a campaign on behalf of metaphysics. His first target was the neo-Kantian conception, especially as defended by the Marburg School, according to which the “return to Kant” they stood for implies that all traditional metaphysics (especially that of post-Kantian German idealism) should now be replaced by “theory of knowledge” (*Erkenntnistheorie*). To this end, Heidegger developed a “metaphysical” interpretation of the *Critique of Pure Reason* itself (still quite influential within German-language Kant scholarship) explicitly opposed to the Marburg School. He first made this interpretation public in a celebrated disputation with Ernst Cassirer at Davos at the end of March and the beginning of April 1929, which Heidegger then wrote up in a few short weeks and published as *Kant and the Problem of Metaphysics* (1929). In that same year, moreover, he took over Husserl's Chair at Freiburg and delivered “What is Metaphysics?” as his inaugural address. It appears, therefore, that Heidegger intended his new defense of metaphysics to represent not only the eclipse of Marburg neo-Kantianism, but also (at least symbolically) that of Husserl's transcendental phenomenology.

Now Carnap's collision with Heidegger over metaphysical pseudo-sentences was directed at precisely Heidegger's inaugural address (where the sentences in question appear). Indeed, Carnap attended the disputation with Cassirer at Davos in 1929, and he came away both impressed and alarmed by Heidegger. Carnap then returned to Vienna and undertook a rather serious study of *Being and Time*. He wrote up and delivered earlier drafts of “Overcoming Metaphysics” directly in the wake of this experience, as he struggled to find a professorship in Europe in the extraordinarily uneasy political climate of the early 1930s. Carnap finally secured a professorship at the German University in Prague (in the Division of Natural Sciences) in 1931, and he published “Overcoming Metaphysics” in *Erkenntnis* (the official journal of the Vienna Circle) in 1932. In December 1935, increasingly distressed by the “stifling political climate” and “danger of war” in Europe, he emigrated to the United States, taking up a position at the University of Chicago. Carnap's radical new attempt at overcoming metaphysics can only be properly understood against this background.
In §5 of “Overcoming Metaphysics,” entitled “Metaphysical Pseudo-Sentences,” Carnap introduces his consideration of examples from Heidegger by remarking that, although “we could just as well have selected passages from any other of the numerous metaphysicians of the present or the past,” Carnap has here chosen to “select a few sentences from that metaphysical doctrine which at present exerts the strongest influence in Germany.”51 There follows a discussion of several of Heidegger’s sentences involving the concept of nothingness (das Nichts), including especially the notorious Das Nichts selbst nichtet.

Carnap’s criticism is more sophisticated and penetrating than one might antecedently expect. For, in the first place, Carnap’s complaint is not that the sentence in question is unverifiable in terms of sense data; nor is the most important problem that the sentence coins a bizarre new word (the verb nichten) and thus violates ordinary usage. The main problem is rather a violation of the logical form of the concept of nothing. Heidegger uses the concept both as a substantive and as a verb, whereas modern logic has shown that it is neither: the logical form of the concept of nothing is constituted solely by existential quantification and negation. In the second place, however, Carnap also clearly recognizes that this kind of criticism would not affect Heidegger himself in the slightest, for the real issue between the two lies in the circumstance that Heidegger denies while Carnap affirms the philosophical centrality of logic and the exact sciences. Carnap accordingly refers explicitly to such Heideggerian passages as the following:

[N]othingness is the source of negation, not vice versa. If the power of the understanding in the field of questions concerning nothingness and being is thus broken, then the fate of the dominion of “logic” within philosophy is also decided therewith. The idea of “logic” itself dissolves in the turbulence of a more original questioning.

especially among the younger philosophers, in the scientific method of philosophy, based on modern logic, and that this interest was growing from year to year” (in The Philosophy of Rudolf Carnap, Paul A. Schilpp [ed.] [La Salle, IL: Open Court, 1963], 34). Compare also his remarks several pages later: “In 1936, when I came to this country, the traditional schools of philosophy did not have nearly the same influence as on the European continent. The movement of German idealism, in particular Hegelianism, which had earlier been quite influential in the United States, had by then almost completely disappeared. Neo-Kantian philosophical conceptions were represented here and there, not in an orthodox form but rather influenced by recent developments in scientific thinking, much like the conceptions of Cassirer in Germany. Phenomenology had a number of adherents mostly in a liberalized form, not in Husserl’s orthodox form, and even less in Heidegger’s version” (ibid., 40).

The supposed soberness and superiority of science becomes ridiculous if it does not take nothingness seriously. Only because nothingness is manifest can science make what is itself into an object of investigation. Only if science takes its existence from metaphysics can it always reclaim anew its essential task, which does not consist in the accumulation and ordering of objects of acquaintance but in the ever to be newly accomplished disclosure of the entire expanse of truth of nature and history.

Therefore no rigor of a science can attain the seriousness of metaphysics. Philosophy can never be measured by the standard of the idea of science.52

Carnap concludes, in his own characteristically sober fashion: “We thus find a good confirmation for our thesis; a metaphysician here arrives himself at the statement that his questions and answers are not consistent with logic and the scientific mode of thinking.”53

The “Postscript” to “What is Metaphysics?”54 considers three types of criticism that have been made of the original lecture. Heidegger reserves his most extensive and militant response for the third criticism, namely, that “the lecture decides against ‘logic.’” The heart of his response is as follows:

The suspicion directed against “logic,” whose conclusive degeneration may be seen in logistic [i.e. modern mathematical logic], arises from the knowledge of that thinking that finds its source in the truth of being, but not in the consideration of the objectivity [Gegenständlichkeit] of what is. Exact thinking is never the most rigorous thinking, if rigor [Strenge] receives its essence otherwise from the mode of strenuousness [Anstrengung] with which knowledge always maintains the relation to what is essential in what is. Exact thinking ties itself down solely in calculation with what is and serves this [end] exclusively.55

It is clear, then, that Heidegger and Carnap are actually in remarkable agreement. Metaphysical thought of the type Heidegger is trying to awaken is possible only on the basis of a prior overthrow of the philosophical authority and primacy of logic and the exact sciences. The difference is that Heidegger eagerly embraces such an overthrow, whereas Carnap is determined to resist it at all costs.

This sheds considerable light, we believe, on the context and force of Carnap’s antimetaphysical attitude. For, by rejecting “metaphysics” as a field of cognitively meaningless pseudo-sentences, Carnap is by no means similarly rejecting all forms of traditional philosophy. He makes this perfectly clear, in fact, in his “Remarks by the Author” appended to the English translation “The Elimination of Metaphysics” in 1957:

To section 1, “metaphysics.” This term is used in this paper, as usually in Europe, for the field of alleged knowledge of the essence of things which transcends the realm of empirically founded, inductive science. Metaphysics in this sense includes systems like those of Fichte, Schelling, Hegel, Bergson, Heidegger. But it does not include endeavors towards a synthesis and generalization of the results of the various sciences.56

In Carnap’s “Replies and Systematic Expositions,” the point is made even more explicitly:

Note that the characterization as pseudo-statements does not refer to all systems or theses in the field of metaphysics. At the time of the Vienna Circle, the characterization was applied mainly to those metaphysical systems which had exerted the greatest influence upon continental philosophy during the last century, viz., the post-Kantian systems of German idealism and, among contemporary ones, those of Bergson and Heidegger. On the basis of later, more cautious analyses, the judgment was not applied to the main theses of those philosophers whose thinking had been in close contact with the science of their times, as in the cases of Aristotle and Kant; the latter’s epistemological theses about the synthetic a priori character of certain judgments were regarded by us as false, not as meaningless.57

57. Rudolf Carnap, “Replies and Systematic Expositions,” in The Philosophy of Ernst Cassirer, Paul A. Schilpp (ed.) (La Salle, IL: Open Court, 1963), 874–5. On the following page Carnap continues: “I think, however, that our [antimetaphysical] principle excludes not only a great number of assertions in systems like those of Hegel and Heidegger, especially since the latter
So Carnap is primarily concerned with “overcoming” a very particular kind of “metaphysics.” The main target is the post-Kantian German idealism Carnap views as currently dominating European thought (in the early 1930s), and he views Heidegger, in particular, as the leading contemporary representative of this trend.

It is noteworthy, therefore, that Heidegger was aware of Carnap’s attack and, indeed, explicitly responded to it – in a draft of his original 1935 lecture course, *Introduction to Metaphysics*, that does not appear in the published version (1953). Heidegger explains how, with the collapse of German idealism in the second half of the nineteenth century, the philosophical understanding of being degenerated into a consideration of the “is” – that is, a logical consideration of the propositional copula. He continues in a memorable paragraph that is worth quoting in full:

> Going further in this direction, which in a certain sense has been marked out since Aristotle, and which determines “being” from the “is” of the proposition and thus finally destroys it, is a tendency of thought that has been assembled in the journal *Erkenntnis*. Here the traditional logic is to be for the first time grounded with scientific rigor through mathematics and the mathematical calculus, in order to construct a “logically correct” language in which the sentences of metaphysics – which are all pseudo-sentences – are to become impossible in the future. Thus, an article in this Journal II (1931 f.), pp. 219 ff. bears the title “Überwindung der Metaphysik durch logische Analyse der Sprache.” Here the most extreme flattening out and uprooting of the traditional theory of judgment is accomplished under the semblance of mathematical science. Here the last consequences of a mode of thinking which began with Descartes are brought to a conclusion: a mode of thinking according to which truth is no longer disclosedness of what is and thus accommodation and grounding of Dasein in the disclosing being, but truth is rather diverted into certainty – to the mere securing of thought, and in fact the securing of mathematical thought against all that is not thinkable by it. The conception of truth as the securing of thought led to the definitive profaning [Entgötterung] of the world.

says explicitly that logic is not applicable to statements in metaphysics, but also in contemporary discussions, e.g., those concerning the reality of space or of time.” Cf.: “It is encouraging to remember that philosophical thinking has made great progress in the course of two thousand years through the work of men like Aristotle, Leibniz, Hume, Kant, Dewey, Russell, and many others, who were basically thinking in a scientific way” (“Intellectual Autobiography,” 42–3).
The supposed “philosophical” tendency of mathematico-physical positivism wishes to supply the grounding of this position. It is no accident that this kind of “philosophy” wishes to supply the foundations of modern physics, in which all relations to nature are in fact destroyed. It is also no accident that this kind of “philosophy” stands in internal and external connection with Russian communism. And it is no accident, moreover, that this kind of thinking celebrates its triumph in America. All of this is only the ultimate consequence of an apparently merely grammatical affair, according to which being is conceived through the “is,” and the “is” is interpreted in accordance with one’s conception of the proposition and of thought.58

Thus Heidegger once again expresses a rather remarkable agreement with Carnap concerning the underlying sources of their opposition – which, as is now clear, embrace both fundamental issues about the philosophical centrality of logic and the exact sciences, and the extremely fraught social and political climate of the late 1920s and early 1930s within which Heidegger’s renewed defense of metaphysics first emerged.

It is even more remarkable, finally, that Carnap’s and Heidegger’s philosophical trajectories exhibited a surprising amount of convergence both before and after their collision over metaphysical pseudo-sentences. In particular, in the final section of “Overcoming Metaphysics,” entitled “Metaphysics as expression of Lebensgefühl,” Carnap refers very favorably to the Lebensphilosophie of Dilthey and his students (by which Carnap himself was considerably influenced during his own student years),59 and he also refers very favorably to

---

58. See Heidegger, *Einführung in die Metaphysik* (Gesamtausgabe vol. 40 [Frankfurt: Klostermann, 1983], 227–8); the unpublished pages were apparently replaced by Heidegger, *Einführung in die Metaphysik* (Tübingen: Niemeyer, 1953), 78–90; *Introduction to Metaphysics* (New York: Doubleday, 1961), 86–99. Otto Pöggeler comments on this (1935) passage as follows: “Heidegger had sufficient taste not to deliver a previous version of his lecture in which Carnap’s emigration to America was put forth as confirmation of the convergence between Russian communism and the ‘type of thinking in America’” (“Heidegger’s Political Self-Understanding,” in *The Heidegger Controversy: A Critical Reader*, Richard Wolin [ed.] [New York: Columbia University Press, 1991], 218–19). Given that Carnap did not emigrate until December 1935, however, whereas Heidegger’s lectures were held in the summer of that year, Heidegger cannot be referring to Carnap’s emigration here. It is more likely, for example, that he is referring to Schlick’s trip to Stanford University in 1929, which is prominently mentioned in the foreword to the Vienna Circle’s manifesto *Wissenschaftliche Weltauffassung* (1929).

Nietzsche’s Also sprach Zarathustra, in which, according to Carnap, the traditional confusion between metaphysics (as a supposed theoretical enterprise) and poetry (as the expression of Lebensgefühl) has been almost entirely avoided. Indeed, it is possible that Carnap took the wording of his title, “Überwindung der Metaphysik,” directly from Also sprach Zarathustra, where the themes of the Überwindung and Selbstüberwindung of man (leading, of course, to the Übermensch) figure very prominently. Moreover, Heidegger, in the mid- to late 1930s (directly following his collision with Carnap), also began using the expression “overcoming metaphysics” to characterize his own philosophical ambitions, in connection with his work on Nietzsche and his increasing concern with technology.60 This period, in particular, marks Heidegger’s attempt to come to terms with the failure of his rectorate at Freiburg (1933–34), and his consequent disenchantment with the Nazi regime over its overwhelmingly technological character.61 It also marks the boundary of Heidegger’s famous Kehre, where he leaves behind the existential–hermeneutic analytic of Dasein once and for all in favor of a new appreciation for the inextricable connection between the type of philosophy he now wants to practice and poetry.62

It is during this same period, as we have seen, that Carnap, for his part, became increasingly distressed by the “stifling political and cultural atmosphere … in Europe,”63 resulting in his emigration to the United States in December 1935. Carnap had just published his last major work written in German, Logische Syntax der Sprache (1934), where he announced a new type of philosophy – or rather what he calls a “replacement” for all traditional philosophy – devoted wholly to Wissenschaftslogik, the logic of science: this new discipline, he says, now “takes the place of the inextricable tangle of problems known as philosophy.”64 Moreover, just before leaving Europe, in September 1935, Carnap participated in the last great international congress devoted to the “scientific philosophy” of logical empiricism that took place before the advent of war. Among other things, Carnap delivered a programmatic paper, “Von der Erkenntnistheorie zur Wissenschaftslogik” (From epistemology to the logic of science), where he asserts that all previous epistemology, including his own earlier epistemology developed in the Aufbau, must now be renounced as an “unclear mixture of

logical and psychological components.”\textsuperscript{65} The purely logical analysis of language – the purely logical analysis of scientific language – must now completely take its place.\textsuperscript{66} Carnap here, and at virtually the same time as Heidegger’s famous \textit{Kehre}, has undergone a parallel \textit{Kehre} of his own: he has not only rejected all of traditional metaphysics, but has also renounced the earlier post-metaphysical philosophies of Husserlian phenomenology, Marburg neo-Kantianism, and his own attempt logically to reconstruct both of these earlier revolutionary traditions in the \textit{Aufbau}.\textsuperscript{67}

We cannot pursue the further development of the (now entirely divergent) analytic and continental traditions beyond this point. Suffice it to say that the final philosophical history of the intricate and multifaceted web of interconnections between logic, intuitive experience, and the time-honored but always questionable enterprise of metaphysics has yet to be written. We believe, however, that it is only possible to make progress here by first adequately understanding how this web itself became “inextricably tangled” – to breaking point – between the two world wars of the twentieth century, and then proceeding (very patiently) to disentangle it.

\textsuperscript{66} For further discussion of Carnap’s mature conception of philosophy as \textit{Wissenschaftslogik}, see Michael Friedman, “‘The \textit{Aufbau} and the Criticism of Metaphysics,” in Friedman and Creath, \textit{The Cambridge Companion to Carnap}.

\textsuperscript{67} Husserl’s late work, \textit{The Crisis of the European Sciences and Transcendental Phenomenology} (1936–37), represents his reaction to this most difficult time – and, in particular, to the now very alarming challenge he sees in Heidegger. Here, in particular, Husserl finally explicitly incorporates a fundamentally \textit{historical} dimension into transcendental phenomenology (cf. note 24 above).
It is possible to reconstruct a story about the development of twentieth-century continental philosophy that includes almost all of its major figures and movements either as extensions of the phenomenological tradition or as a critical response to it. Moreover, even though Edmund Husserl was not, and never claimed to be, the inventor of the philosophical term “phenomenology,” nor even the sole initiator of phenomenology as one the most important philosophical movements in twentieth-century philosophy, it is not an exaggeration to say that during the first few decades of the twentieth century, the term “phenomenology” as a philosophical method and direction of research became so closely associated with the thinking and the works of Husserl that the term “phenomenology” now usually means a kind of philosophizing associated with Husserl, his philosophical allies such as Max Scheler or Alexander Pfänder, and his successors such as Martin Heidegger or Maurice Merleau-Ponty. Hence, the philosophy of Edmund Husserl can legitimately be seen as the beginning of twentieth-century continental philosophy as an identifiable tradition and leading philosophical movement. Prior to Husserl’s work, there may have been differences between some of the dominant tendencies in philosophy in various continental European countries as opposed to the British Isles and the United States, but these were hardly identifiable as a specific movement. But by the middle of the

---

1. Edmund Husserl (April 8, 1859–April 27, 1938; born Proßnitz [now Prostějov], formerly Austro-Hungarian Empire; died in Freiburg, Germany) was educated at the Universities of Leipzig (1876–78), Berlin (1878–81), and Vienna (1881–82) and took his doctoral degree at Vienna in 1882. His influences included Brentano, Cantor, Dilthey, Stumpf, and Windelband, and he held appointments at the Universities of Halle (1887–1901), Göttingen (1901–16), and Freiburg (1916–28).
twentieth century at the latest, those philosophical approaches that had developed as extensions of phenomenology in one way or another had come to be seen as something other than the predominant mode of philosophy in English-speaking countries at the time.

I. EARLY WORKS

Husserl was born in 1859 to a Jewish family that had long been settled in the town of Proßnitz (now Prostějov) in the district of Maehren, which is now part of the Czech Republic and was then part of the Austro-Hungarian Empire. Although many of his contemporaries still attended Jewish schools, Husserl was educated in a secular grade school and later attended and completed Gymnasium in the nearby provincial capital of Olmütz (now Olomouc). In 1876, he enrolled at the University of Leipzig, first studying astronomy and taking courses in mathematics, physics, and philosophy. This is also where he met and became lifelong friends with Thomas Masaryk (1850–1937), who was later to become the first President of Czechoslovakia. In 1878, he switched to the University of Berlin, first studying mathematics under Karl Weierstraß (1815–97) and Leopold Kronecker (1823–91), and philosophy with Friedrich Paulsen (1846–1908). Husserl’s special philosophical interests at this stage centered on investigations into the foundations of mathematics and logic. In 1881, he transferred to Vienna, where he completed his doctoral degree in mathematics under Leo Königsberger (1837–1921) with a dissertation on Contributions to a Theory of Variable Calculus in 1882. It was also in Vienna that Husserl began to work under Franz Brentano (1838–1917), who then recommended Husserl to his former student Carl Stumpf (1848–1936) in Halle. Under Stumpf’s supervision, Husserl enjoyed his first regular academic appointment in philosophy and completed his first major work – Concerning the Concept of Number. Psychological Analyses – as a habilitation in 1887. This work was later revised and published as The Philosophy of Arithmetic: Psychological and Logical Investigations in 1891. During this period Husserl also came to know and be influenced by George Cantor (1845–1918) and his work in set theory. In these early studies, Husserl takes up the question of the foundation of mathematics as an inquiry into its origins. He attempts to show how the science of arithmetic and the concept of number on which it is founded are dependent on certain elementary operations. For example, to form the concept of “one,” a person must abstract from the specific character of what that person experiences and form a notion of “something in general” as the basis for the idea of “unit.” Forming the notion “multiplicity” involves the operation of collectively conjoining such abstract units. At this stage of his thinking, Husserl called this
approach to explaining the origin of arithmetic as a discipline back to such elementary operations as abstraction and conjunction “psychological” analyses. He also argued that symbolic representation is a necessary element in arithmetic since the development of a system of integers for a finite discursive intellect necessarily involves the ability of consciousness to conceive of numbers that it cannot intuitively represent to itself. Hence symbolic representations such as numerals are required to conceive of larger numbers.

Husserl’s general approach here is closely tied to Brentano’s notion of “intentionality,” which posits directedness to objects as an essential feature of all mental states, and thereby also sets the stage for an approach that analyzes objectivity as it presents itself to consciousness in certain mental acts. Thus the promising approach to questions concerning the foundation of mathematics and logic appears to be through an analysis of certain kinds of acts that must be presupposed if certain kinds of conceptions and entities are to be present for consciousness. However, both in substance and in the description of these investigations as “psychological analyses,” there is a danger of confusing questions concerning the origin and status of mathematical entities with the question concerning the origin and status of the possible representation of those entities. The question of the implicit assumptions of certain kinds of simple concepts that are necessarily involved in more complex concepts such as that of a number is different from the question of the operations that are necessary to form those concepts. Moreover, there are important distinctions that would need to be made about what one means here by “operation” or “act,” yet in Husserl’s early work these distinctions are far from clear. One can easily gain the impression that Husserl is trying to suggest that the objects of mathematics and logic are psychological or subjective rather than genuinely objective, ideal entities.

Gottlob Frege was one critic who read Husserl’s early work in this vein and voiced his objections in a well-known review of *The Philosophy of Arithmetic*. He accused Husserl of mixing logic and psychology so as to distort the status of the mathematical entities Husserl purports to analyze, such as “number,” which is not a mental representation. When Husserl opened his next major published work, *The Logical Investigations* (1900), with a “Prolegomena” dedicated to the refutation of “psychologism” – the confusion of mathematical and logical principles with statements about psychological necessities or mental states – there was a common perception that Husserl had adopted as his own Frege’s criticisms of his earlier work. While many assumed that it was in response to Frege’s criticisms that Husserl had achieved a significant breakthrough towards a new approach that does not reduce ideal entities such as meanings or logical principles to mental acts, in fact it is now apparent from letters and minor publications such as book reviews written during the period between 1891 and 1900 that Husserl on his own had become aware of the ambiguities and possible
confusions involved in his earlier work. The Logical Investigations should, therefore, be understood more as an extension and clarification of the general approach taken in his earlier work than a repudiation of it.

II. LOGICAL INVESTIGATIONS

The Logical Investigations was Husserl’s first introduction to a broader philosophical audience. It was published in two volumes – the Prolegomena to a Pure Logic as volume one in 1900, followed a year later by six specific investigations into topics pertaining to the foundation of such a pure logic in volume two. Husserl describes the pure logic it purports to found as a “mathesis universalis” for all individual sciences, that is, as a universal and formal theory of theories in general that could ground a universal system of all knowledge. The investigations thus center around such concepts as meaning, object, truth, and evidence, whose clarification is essential for any theory of science.

Given Frege’s criticisms of Husserl’s earlier position as “psychologism,” it is ironic that it was the extended and devastating criticism of psychologism in volume one of the Logical Investigations that initially attracted the most attention. Here Husserl defines psychologism as the view that pure logic can ultimately be reduced to psychology, that is, that logical principles are at bottom nothing other than assertions about the predominant patterns of human cognition. Included in Husserl’s list of those guilty of the sin of falling prey to this fallacious view is an array of thinkers from John Stuart Mill, Christoph Sigwart, Benno Erdmann, Richard Avenarius, and Hans Cornelius, who were all prominent in the fields of psychology and logical theory at the time. Husserl’s refutation points to the differences in character between a priori logical principles and empirical generalizations about actual human thinking. Empirical laws are necessarily vague (i.e. always include ceteris paribus conditions), merely probable and, as supposed causal principles governing existing things, also have implicit existential import. Logical laws, by contrast, hold unconditionally. They are exact (i.e. are not restricted by ceteris paribus conditions), certain, and do not presuppose actually existing entities. The reality of logical principles is therefore of a fundamentally different kind than that of material or psychological objects. Husserl refers to them as “ideal objects,” in a sense simply as the opposite of “real” objects, whereby their ideality does not make them any less genuine than

physical objects or mental states, although Husserl does not explicitly turn to ontological questions in the *Prolegomena* in order to begin to clarify how such nonphysical and nonmental objectivity might be possible.

In the course of the following investigations, however, Husserl does begin to address such questions. In the First Investigation, for instance, Husserl turns to the question of meaning: since the same expression may mean the same thing when uttered by the same speaker on different occasions, by different speakers, or even when the speaker may be unknown, Husserl again distinguishes the meaning of an expression from the mental state of the person uttering the expression. Thus the function of expressions as bearers of meaning is different from the function that they may play as indicators of the speaker’s beliefs or emotions. Husserl tries to show that the meaning of an expression must also be distinguished from the object that the expression refers to, since different expressions with different meanings may point to different aspects of the same object (e.g. the victor at Jena and the vanquished at Waterloo), and the same meaning (e.g. horse) can be used to refer to different objects. Meanings for Husserl are ways of relating to an object. For instance, one could intend the same object as a horse, a mammal, a quadruped, or – mistakenly perhaps – a mule. Each of these establishes a different intention and would have a different set of conditions that would confirm or refute it. Meanings are not identical to expressions, however, since there may be different expressions within a language or across languages for the same meaning, or different meanings for the same expression. Meanings are an abstract, ideal stratum of expressions, which have both a material and an ideal side, and can be viewed in terms of their function of expressing meaning or of indicating the mental state of the speaker.

Meanings and logical principles are not the only kinds of ideal entities for Husserl in the *Logical Investigations*. In the Second Investigation, he also defends the position that meanings may refer not only to individual physical objects, but also to ideal objects he call “species” or classes of things. “Red,” for instance, is the object referred to by the general concept “red” and is neither itself a red object nor a mental operation. It emerges for a knower through the process of abstraction, but is not itself a mental process, as some empiricist theories might suggest. (This is one step along the way to the clarification of his own earlier positions in which he had not clearly enough distinguished the “meaning” or the concept from the operation through which the concept or meaning is grasped.) The Third Investigation makes clear, however, that Husserl does not view species and other

---

abstract objects as existing independently, but as nonindependent “moments” of concrete wholes in which they actually occur. Moreover, he argues that there are essential laws governing which kinds of meanings (and their corresponding objects) are independent and which kinds are dependent, and he asserts that there are essential laws that even stipulate which specific kinds of independent or concrete meanings and objects provide the foundation for specific kinds of dependent or abstract objects and meanings. The project of a pure phenomenological ontology, then, would be to investigate systematically and lay out these essential relationships. Closely related is the project of a pure grammar, described in the Fourth Investigation. A pure grammar would reflect on essential relationships that govern the kinds of meanings that are compatible with each other and those that are not, and which kinds of simpler meanings must be combined in which ways to result in more complex meanings such as those expressed in sentences.

The Fifth Investigation is particularly significant since it is here that Husserl introduces the notion of intentionality with explicit reference to Brentano and grants it a significant role in explicating the notion of meaning that has been functioning in the previous four investigations. Meanings become connected to intentionality since it is through meanings that a specific mode of directedness towards an object is established. Brentano had reintroduced the Scholastic notion of intentionality in his attempt to distinguish the realm of the mental from that of the nonmental. It is the unique property of mental acts to be about some object toward which they are directed, and Husserl adopts this view when he defines consciousness as intentional experiencing. In the Sixth Investigation Husserl complements this insight with the assertion that all objects for knowledge are at the same time intentional objects, that is, mediated through some meaning that governs the specific way in which they are intended.

Already in the Fifth Investigation, however, Husserl further distinguishes between the content or material and the quality of an intentional act, whereby the material names the particular object and the meaning through which consciousness is directed to it (e.g. an ice cream cone) and the quality of the act concerns the way that consciousness is directed to the object (imagining, desiring, or perceiving the ice cream cone). He also is careful to distinguish the material as the intentional object from the material of sense perception that may serve as the basis for the intention of that object, since from the phenomenological perspective those aspects of a sensibly perceptible object that are given through the senses (such as its specific color or taste) occur for consciousness only as aspects of the object as a whole (in this case, the ice cream cone) and not as independent objects. Thus, by “material” Husserl does not mean something like sense data, but rather intended objects that may include sensibly perceptible moments as part of their complete intention, but these sensibly perceptible moments are not separately intended objects.
Among the various kinds of intentions, Husserl identifies “representations” as the most basic units that are presupposed by others. He follows Brentano’s analysis that it is indeed conceivable that one may represent, for instance, an ice cream cone to oneself without desiring it, but that one cannot desire it without implicitly representing it to oneself, so that there is a one-sided foundational relationship between them, in which representations found all other sorts of intentions.

In the Sixth Investigation, Husserl turns explicitly to the relationship between intentions and intended objects. He begins by focusing on the so-called “objectifying intentions,” that is, those intentions that can be verified or falsified through appropriate intuitions. Thus, the traditional question about the relationship between subject and object, knowing and the object known, is approached in terms of the question of meaning-intentions and their fulfillment. An objectifying intention establishes a relationship to the object such that certain kinds of intuitions count as fulfilling the intention and thus presenting the intended object not merely as intended, but as actually known. The object of knowledge is just that which is given in a fulfilled intention. Hence, corresponding to every intention is an intended object, but in the case of an empty intending, that is, an intending not based on actual sense intuitions, there may or may not be an actual object that corresponds to the intention. In the case of a fulfilled intention, intuition confirms that there is an existent object that indeed corresponds to the intention and that the object is just as it has been intended, so that there is an identity between intended object and the actual object itself. The ideal of a completely fulfilled intention is captured in the notion Evidenz, the experience of an object being evidently given just as it has been intended, so that it is apparent that the actual object coincides precisely with the intention of it. In Husserl’s view, the experience of the evidentness of the object for us as it is in itself lies at the basis of the notion of truth in all of its various manifestations, which all proceed from this notion of evidentness. Taken as a property of the intending or of a judgment expressing a specific intention, truth refers to the ability of an intention to be fulfilled by such an evidential experience. Truth can also be taken to be a property of the intended object or state of affairs, in the sense that something is indeed a true object or a true state of affairs if it can be evidently experienced in the appropriate manner. Moreover, one can further distinguish between truth as the actual experience of the identity between the intention and the intended object by an observer and the claim that such an experience could be had by an ideal observer. But in any case, the claim that a proposition or a state of affairs is a true one ultimately must bear some possible or actual relationship to this experience of evidentness that is the fundamental phenomenon to which any truth claim must be referred.

The Sixth Investigation makes clear that the objects of legitimate intention are not limited to sensible individuals, but may also be states of affairs or other
kinds of objectivities that may be founded in, but are not necessarily reducible to, that which may be directly perceived through the senses. Having articulated the general relationship between intention, fulfillment, and the objects of the intentions that are presented through the fulfillment of an intention in the first half of the Sixth Investigation, Husserl then turns to what he calls “categorial objects” such as states of affairs and the corresponding “categorial intuitions” that fulfill them. Not only does Husserl recognize as legitimate objects those states of affairs that are intended through complex meaningful expressions such as sentences, but he also maintains that there are other meaningful expressions, such as those referring to universals (or “species” as he called them in the Second Investigation), that each have their own appropriate and unique form of fulfillment. Thus, in addition to sense intuition, Husserl proposes that there are other forms of intuition, among them for instance categorial intuition (e.g. seeing that \( a \) is \( b \)) as the fulfillment of the intention of categorial objects (\( a \)’s being \( b \)), each with its own unique structure that is an appropriate topic for phenomenological investigation. Particularly important in this regard is his assertion that there may be kinds of intuitions parallel to categorial intuitions that could fulfill the intention of ideal objects, so that the fulfillment of intentions with regard to mathematical or logical truths would be possible, even though they are not reducible to sense intuitions. Husserl asserts that there is an essential sameness in character in the function that fulfillment plays in all of these forms of intuition in its ability to confirm or disappoint an intention. As a result, the parallel relations between intention, fulfillment, and objectivity make it necessary to recognize each fulfilling act of the confirming self-presentation of an object (even a complex object such as a state of affairs or an ideal object such as a logical principle) as a perception, each fulfilling act in general as an intuition, and its intentional object as an object (Gegenstand). Thus the realm of intuition extends beyond the realm of sense perception and the range of possible objects extends beyond that of mere individual physical objects to any sort of object whatsoever that can be intended and possibly fulfilled through an appropriate form of intuition in this extended sense of the term.

This opens the way for a whole range of investigations into the nature of these various realms or “regions” of objects, into the nature of the kinds of intentions and fulfillments appropriate to them, and into the relationship between the various kinds of objects, intentions, and fulfillments that belong to each of these realms to see how they are essentially related. The sensually perceivable or “real” objects are characterized as objects of the lowest stage of possible intuition; the categorial or ideal objects that are founded on them are by contrast higher-order objectivities. The project of spelling out just how they are related, what the essential structures of each of these regions are, and what essential relations obtain between the intention, fulfillments, and objects of the various regions is
not carried out in the *Logical Investigations*, but the possibility of such a project is outlined and the necessity for it as part of an overall grounding for all of the particular sciences is asserted.

For all of Husserl’s later work, this project will remain at the heart of phenomenology as a systematic field of study. However, a decisive question that remained at this stage of Husserl’s thinking was the proper method for the execution of this project. What guarantees the necessary correlation between intention and object? How is reflection on such essential states of affairs possible and how is it different from the kind of internal observation of one’s own mental states that would amount to nothing other than a new version of psychologism? What is the proper method for studying such essential correlations? Husserl’s turn to transcendental phenomenology during the decade that followed the *Logical Investigations* was meant to answer such questions.

III. THE TURN TO TRANSCENDENTAL PHENOMENOLOGY

Shortly after the appearance of the *Logical Investigations*, Husserl received a professorship in Göttingen, where he would remain until 1916. During this period, he developed phenomenology as an explicit methodology and field of research, and he came to be regarded as the leading figure in phenomenology. It was also during this period that phenomenology became an intellectual movement centered on Husserl and his students in Göttingen (e.g. Winthrop Bell, Theodor Conrad, Hedwig Conrad-Martius, Adolf Grimme, Jean Hering, Dietrich von Hildebrand, Roman Ingarden, Fritz Kaufmann, Hans Lipp, Alfred Reinach, and Edith Stein) and a group of sympathetic scholars in Munich, some of whom were already well established on their own. The latter group had been introduced to Husserl’s work by an independent scholar by the name of Johannes Daubert and included among others Theodor Lipps, Alexander Pfänder, Moritz Geiger, and Max Scheler. In his discussions with these circles as well as in critical yet friendly debates with leading representatives of neo-Kantianism such as Paul Natorp and of the philosophy of life such as Wilhelm Dilthey, Husserl comes to see phenomenology as the study of pure transcendental consciousness – both its intentional acts and the correlative forms of objectivity constituted through these acts. The process of “transcendental phenomenological reduction,” through which all forms of objectivity are traced back to the processes in subjectivity through which they are constituted, was recognized as the key mode of access to the realm of pure phenomenology, which was now seen not as a reflection on the individual mental life of existing subjects within the world, but as an analysis of the realm of “pure transcendental subjectivity.” What does this mean?
From the outset of his work, one of Husserl’s problems had been distinguishing his own analysis of the essential processes through which various forms of objectivity become apparent to consciousness from a study of the mental processes that actually take place in individual subjects. In a polemical essay written for the journal *Logos* in 1911, Husserl described the need for a philosophical method that could make philosophy into a rigorous science, indeed the most rigorous of sciences, since it would presuppose no other. In order to fulfill this task, phenomenological philosophy must avoid the twin dangers of “naturalism,” that is, approaching consciousness only from the standpoint of other natural, ultimately material phenomena, and “historicism,” that is, reducing philosophical issues to matters of historical worldviews. As opposed to either of these ultimately empirical approaches, phenomenological philosophy, if it is to fulfill the task of philosophy as a rigorous science, must be a “pure,” a priori, and hence certain discipline. If it is to study invariant, essential structures and not merely psychological patterns, then phenomenology must find a way to exclude all merely empirical elements from its analysis.

First in working manuscripts composed in 1905, then in lectures presented in 1907 and published posthumously under the title *The Idea of Phenomenology*, Husserl proposed the procedure of phenomenological reduction as the means for accomplishing this goal. The first step is to exclude, bracket out, or put out of play as fallible and thus not the source of genuine evidence those elements in any claim to knowledge that refer not to the processes through which the objects of knowledge are given to consciousness, but to the objects themselves. The technical term Husserl employs to name such suspension of belief on such matters of fact is the Greek term *epochē*, which arose in ancient Stoicism. Accordingly, it is not a phenomenological, but rather an empirical, question whether there actually is a tree outside my window, whether there are such things as magnetic force fields (or phlogiston, for that matter), or whether any particular physical object at all exists. The first step, then, toward moving from the natural or empirical attitude to the phenomenological attitude is to concentrate not on the tree that is seen or the magnetic force field that is proposed as an explanation for certain phenomena, but on the seeing of the tree or the explaining of the phenomena through the proposal of something like a force field, since – following a motif familiar to philosophers at least since Descartes – the seeing or explaining, at least at the moment they are going on, are indubitable occurrences for the subject that is performing the seeing or explaining. But even within this reflective attitude, it turns out that a further kind of reduction or bracketing is necessary to exclude all empirical and thus nonapodictic elements, since mental processes themselves are empirical facts about which one can be mistaken. It is not only possible to be mistaken about whether the tree is such as I perceive it, or even whether there is a tree there at all, but also, at least in principle, equally
open to doubt whether it is I, the empirical person with this or that specific identity, physical or mental traits, and personal history, who is doing the perceiving. At least in principle, I could, for instance in a dream, be thinking of myself as a sixteen-year-old high-school student again talking to my father, who in reality has long since passed away. So in addition to bracketing out all commitments to the truth of the statement about whether the object is such as I perceive it, the phenomenologist must also bracket all empirical psychological claims about the perceiver. What is indubitable is the content and nature of the purported perceiving itself, including beliefs that the perceiver holds about his or her own identity and empirical character. The same holds not just for acts of perception, according to Husserl, but for any mental act whatsoever. The phenomenologist can reflect on those claims without any commitment to their empirical truth at all. Moreover, the phenomenologist can even reflect on what would count as good empirical evidence for those claims and the necessary limitations of such evidence. There can be doubt about whether there is anything that corresponds to these contents of consciousness, and even about the identity of the consciousness that is aware of them, but whenever these contents are present for consciousness there can be no doubt of their presence for the consciousness that is aware of them. Moreover, on reflection, one can also become aware of what would count as experiences that would validate the claims inherent in these beliefs about things like trees, our own identity, or anything else we might intend. Thus, if phenomenology limits itself to an analysis of these “pure” contents, that is the contents apart from all of the empirically dubitable claims attached to them, it has access to a sphere that is beyond doubt, a realm of apodictic certainty for its analyses.

Within this realm of pure self-givenness, Husserl’s interest is and remains the analysis of essential structures and connections within cognition, of its various forms and correlative objectivities. Thus transcendental phenomenological reduction involves a third moment, which one might term eidetic reduction. Phenomenology’s interest pertains to the eidetic, that is, the invariant and thus essential elements that present themselves to pure consciousness. In the Sixth Investigation, Husserl had maintained that such invariant structures or essences can be just as much an object for pure intuitions as an empirical physical object can be given to sense perception. With this reduction to the sphere of pure universal self-givenness, Husserl now believes he can distinguish phenomenology from descriptive psychology, since the investigation no longer concerns the immanent sphere of empirical consciousness, but rather the realm of the purely self-given contents that can be made apodictically evident to phenomenological reflection. Phenomenological reduction thus builds on and presupposes the procedure of imaginative variation through which those things that can conceivably be otherwise than they are may be separated from those that cannot
conceivably change. This procedure, known as “eidetic variation,” is a kind of thought experiment employed by the phenomenologist to distinguish empirical associations and contingent conjunctions from essential structures that cannot conceivably be different from the way they are. Phenomenology is thus a science of “pure possibilities” whose interest is directed to the necessities that underlie any such possibilities and consequently also hold for any conceivable actuality, so that they apply to all possible and actual relationships without implying any commitment to which actual relationships and objects genuinely exist.

Husserl introduced the phenomenological reduction for the first time to a wider audience outside his lecture halls in his major programmatic work, Ideas Pertaining to a Pure Phenomenology and to a Phenomenological Philosophy, First Book, which he described as a general introduction to pure phenomenology (commonly referred to simply as Ideas I). It was published in 1913 as the first volume of the Yearbook for Philosophy and Phenomenological Research, which he cofounded and edited together with Alexander Pfänder, Moritz Geiger, Max Scheler, and Adolf Reinach, and which was to remain the leading venue for phenomenological research until its final volume in 1930. In the general introduction, Husserl describes the sphere of phenomenological research as the “region of pure consciousness,” as the “region of all regions,” since it is within and for that sphere that all other regions are constituted. Transcendental phenomenology is said to be a kind of transcendental idealism, within which the pure or invariant structure of an act of consciousness (the “noesis”), its corresponding intentional object (the “noema”), and the necessary correlation between the two are investigated. It does not purport to replace the individual sciences that operate in the natural attitude and concern themselves with empirical facts. Instead, it seeks to ground all of them as well as formal disciplines such as logic and mathematics by showing how each of them presupposes certain essential structures or essences, whose description and explication can be properly executed only by transcendental phenomenology that brackets out or neutralizes the assumptions made within the natural attitude. The term Husserl now introduces to describe the process by which subjects come to intend objects is “constitution,” through which he seeks to avoid causal terms that would imply a dependency relationship between two existing things such as consciousness and objects, but at the same time stresses the necessary role of specific cognitive operations (noeses) if various kinds of objects are to become present for consciousness (noemata).

In the final section of Ideas I, Husserl turns to the questions of reason and actuality. How does phenomenology fit in with the traditional philosophical project of rational foundation for knowledge and action, and what is the relationship between the eidetic analyses undertaken in phenomenology and actual existence? Husserl describes the two problems as interrelated, for to speak “reasonably” or rationally about objects involves a claim to justification
or possible confirmation through evidence. Thus, under “reason” in this context Husserl understands the inherent directedness of intentions toward fulfillment. There is not only a corresponding noema for each noesis, but also the inherent directedness of objective consciousness toward the confirmation or fulfillment that would establish the relationship toward an actually existent object that would be identical to that noema. However, since there can be different kinds or “regions” of objectivities (such as physical objects, mathematical objects, cultural objects, etc.), there will also be correspondingly different kinds of confirming intuitions that fulfill them. Thus the philosophical project of reason is to lay out what these would be and systematically to delineate the various kinds of essential relationships that hold between them. Again, it is a nonphilosophical question which of these intentions is actually fulfilled, but that does not mean that phenomenology as the science of reason does not address questions of actual existence or actual objects, only that it addresses them exclusively in terms of their “meaning” and their structure. It analyzes the kinds of fulfillment that would be appropriate to these intentions and their corresponding objects, but does not claim to be able to take a stance as a pure science on which of them actually has been or will be fulfilled or not. This means that, for Husserl, the themes of reason, being, and truth are essentially interconnected in a way that presages how Heidegger’s later analyses also attempt to establish an essential interconnection between logos, Being, and truth as αληθεία.

It is during this period that, in addition to intentionality, temporality emerges for Husserl as the second significant essential structure of all consciousness. He demonstrates how consciousness occurs as a flow, so that each event in conscious life has a temporal location with regard to all others. The appearance of any object can necessarily be characterized in terms of a “now,” a “before,” or an “after.” Moreover, Husserl’s further analyses reveal that these distinct modes of past, present, and future are not only mutually related to each other, but also should not be conceived as discrete moments, each separated sharply from the other. Rather, the now appears always with a temporal fringe or horizon. The now taken as a moment around which past and future gather is never strictly an isolated point. Indeed, the very idea of the now as a point is merely a limit concept that is never experienced in itself, since in conscious life every now also involves the consciousness of a having-been that has immediately preceded it and a not-yet that is about to become now. Thus, the “now” for consciousness is always an extended “living presence” that, as the “originary temporal field,” also includes the “no-longer” and the “not-yet.”

One of Husserl’s original contributions to the discussion of temporality, which he had taken up from Brentano, is his distinction between “retention” as that form of the no-longer that is part of the immediate horizon of the now, and “memory,” which involves making present again to consciousness what
was no longer immediately present for consciousness. Retention, along with “protention,” its corresponding form of the not-yet, is a mode of what Husserl calls “impressional consciousness.” Memory, by contrast, is a form of “representational consciousness.” For example, when one hears a melody, a note runs off into the retentional past as it comes to be replaced by a new one, without disappearing from consciousness, since it would otherwise be impossible to hear a melody as such. Similarly, there arises at each moment a new anticipation of a coming note (its “protention”) emanating from the present, which Husserl calls the “primal” impression in order to distinguish the way that it is present for retentive and protentive consciousness. All of these modes of temporal awareness of objects are ultimately grounded for Husserl in the temporality of consciousness itself, that is, in the self-constitution of its own identity throughout its different moments in the flow of consciousness. Another name for transcendental subjectivity is therefore “absolute primordially constituting consciousness” or “absolute primordial temporality,” which has a specific structure that can be the object of phenomenological analysis and forms the horizon against which the constitution of the empirical consciousness of the individual and the objects of consciousness takes place. However, in Ideas I and other works from this period, Husserl does not trace back the constitution of specific kinds of objects to their ultimate temporal foundations, even though it is indeed during this period that the framework for such a project was laid.

IV. THE FREIBURG YEARS (1916–38)

A few years after the appearance of Ideas I, Husserl was named Chair of Philosophy at the University of Freiburg, succeeding Heinrich Rickert, who had accepted an appointment in Heidelberg and recommended Husserl to follow him. Here Husserl remained for the rest of his academic career until his retirement in 1928, and then until the end of his life in 1938. During these years, Husserl concentrated on the completion of phenomenology not just as a methodology, but as a concrete and comprehensive research project. This involved, on the one hand, pursuing a wide range of specific phenomenological constitutional analyses into the relationship between realms of nature and of spirit, or the correlative naturalistic and personalistic attitudes, as well as into the structure of the everyday life-world out of which science emerges; into intersubjectivity and into nature as the correlate of intersubjective intentionality; into the constitution of ideal objects such as numbers or geometrical shapes; into the foundations of sense experience and formal logic; and into the phenomenological foundation for normative sciences such as ethics and value theory. On the other hand, it also involved a deepened understanding of what phenomenological analysis
must entail if it is indeed supposed to trace back the constitution of various kinds of objects to their ultimate origins. Instead of being a static description of various kinds of essential structures and the necessary relationships that obtain between them, if phenomenology is to be a genuine science of absolute origins, it will ultimately have to trace back all forms of objectivity to the structures of consciousness and its basic forms of intentionality and temporality. Constitutive phenomenology thus explicitly evolves into genetic phenomenology, which traces higher-order forms of objectivity back to lower-order forms, and these in turn to the most elementary structures of intentional consciousness that in turn have their ultimate basis in modes of temporality. Accordingly, phenomenology not only must provide a description of the essential relationships governing all of reality, but must also provide an account of the necessary origins of these relationships in and for consciousness in accordance with its most elementary structures. It must not only describe the constitution of the predicative realm and the operations most directly and easily accessible to reflection, but also trace these back to activities at the pre-predicative level that are generally thought of rather as passivities, the passive syntheses that take place at the most basic levels of consciousness as it organizes sense experience into the experience of individual material objects, on the basis of which higher-order objects are constituted.

One guiding theme throughout all of Husserl’s work, and not only in this period, is his opposition to philosophy’s recent attempt to model itself after the natural sciences and to reductionistic tendencies in many other sciences that have also falsely attempted to pattern themselves after that model. This is already a familiar theme developed in Husserl’s earlier refutation of psychologism, where he argued against the attempt to reduce mathematics and logic to natural phenomena in the *Logical Investigations*, and then later again in his critique of naturalism, where he refutes the attempt to reduce all mental phenomena to externally observable physical entities in “Philosophy as a Rigorous Science.” Already during his middle period, Husserl had discovered commonalities in this regard with the philosophy of life as represented by Dilthey, and with philosophers such as Wilhelm Windelband and Rickert, neo-Kantians of the Southwest School who stressed the independence of the cultural sciences from the natural sciences. Whereas the critique of naturalism in the *Logos* essay clearly demonstrated Husserl’s common ground with them, the polemical tone of the critique of historicism offered in the second part of that essay (which exhibits Husserl’s concern with the topic of history and the relationship between philosophy and the cultural sciences) stresses Husserl’s differences from Dilthey and related thinkers instead of their commonalities. Indeed, not until the very last major published work by Husserl, *The Crisis of the European Sciences and Transcendental Phenomenology* (1936), does it become apparent that Husserl shares with the philosophers of life and of culture an appreciation of the cultural and historical
dimensions that are constitutive of everyday human existence, dimensions that provide the background against which abstract disciplines such as the modern natural sciences arise. However, posthumously published writings such as Husserl’s *Ideas II* reveal that Husserl had gained an appreciation for the non-naturalistic attitude that constitutes everyday life much earlier and that he had been decisively influenced in this regard by Dilthey, Windelband, and Rickert.

In *Ideas II*, Husserl contrasts the naturalistic and the personalistic attitudes. Each attitude may be described as a noetic stance, within which specific kinds of entities appear for consciousness. In the naturalistic attitude, everything appears as nature in the sense of modern natural science: what exists is spatially and temporally located, causally determined, and measurable. Husserl analyzes the fundamental concepts or categories that govern this region and shows how anything that does not fit into these categories is dismissed as nonexistent by these standards. However, Husserl makes clear that the naturalistic attitude is only one possible stance toward objects, and that other equally legitimate attitudes can reveal other kinds of equally genuine objects. For instance, in the personalistic attitude, governed by the category not of causality but of motivation, other human beings are encountered as subjects of intentional states who behave in the way they do not because of material causes, but on the basis of motivating mental states such as beliefs and desires. Moreover, even the everyday nonhuman objects that surround us are organized not in terms of the predicates of natural science, but rather in terms of their serviceability to our needs. In contrast to the world of “nature” and its seemingly objective properties, the everyday world in which we live as persons is filled with cultural objects such as tables and chairs and with other human beings who are also persons with beliefs, needs, and desires of their own.

In *Ideas II*, Husserl also examines the essential relationships that hold between the two different regions that emerge in the two different attitudes – that is, the naturalistic and the personalistic – and concludes not only that the personalistic realm is every bit as much a realm of genuine objects as the naturalistic realm, but also that the latter, that is, the scientific realm, is grounded in the former, the realm of everyday life, and not the other way round. Although it is true that the higher-order objects such as cultural objects or persons are founded on natural objects in the sense that each of these more complex, higher-order objects necessarily contains a stratum that can be described simply in naturalistic terms (its weight, spatial location, etc.), Husserl demonstrates that the realm of nature as such arises only through abstraction from the predicates that present themselves to us as genuine predicates of the objects in our everyday, concrete lived existence. The realm of nature or science is an abstraction derived from and therefore dependent on the realm of concrete everyday existence that we encounter in the personalistic attitude. Moreover, in the personalistic world, which Husserl
Edmund Husserl
calls the “Umwelt” (“environment” or literally “surrounding world”) in contrast
to nature, it is apparent that objectivities emerge for us in the way they do,
show up as tables or chairs, in view of certain subjective acts. This realm makes
the subjective role in the constitution of objects more easily apparent than an
approach through the realm of nature, since the latter, in its search for universal
and reliable structures of the objects, constitutes an idea of “objectivity” that is
seemingly independent of any subjective acts or attitudes. Phenomenological
investigation reveals, however, that this very notion of “objectivity” is itself a
subjective construct that can be traced back to certain motivations and inter-
ests of persons. As such it is also subject to critical examination. If it is clear that
the everyday surrounding world shows up the way it does in part as a result of
the activity of a subject or a community of subjects, then critical reflection on
its origins and justification is also possible. Whereas the world of science can
tend to forget or hide its subjective origins and thus seem to remove itself from
the necessity for critical scrutiny, the personalistic attitude is much closer to the
truths that phenomenology reveals, namely that all supposed objectivities are
correlates of subjective activities and attitudes that are amenable to reflective
analysis and criticism.

One important insight developed for the first time in this work is the recog-
nition that, in everyday perception, one is aware not only of the information
provided to us about these objects through our senses, but also of information
about the state and activity of ourselves as embodied agents as well. These
ideas will be especially important for Merleau-Ponty in his Phenomenology
of Perception. Using the notion of kinaesthesis, which in nineteenth-century
psychology was used to describe our immediate sense of our bodies’ own posi-
tions and movements that we can have without necessarily having to see or hear
these movements, Husserl extends the term to refer not only to our awareness of
our own bodily position and movements, but also to the way that we are actu-
ally engaged as embodied agents in the process of perception itself. We might
walk around an object to get a better look at it or be in a better position to hear
something. Moreover, whenever we are trying to make sense of what is going on
in the world, we are constantly in the process of sorting out those changes in the
perceptual field that come from changes in our bodily positioning and those that
are independent of it. For instance, when I shake my head from right to left, what
I see changes, but I attribute those changes not to changes in the objects seen, but
to how my field of vision is changing because of the change in the direction I am
looking. Moreover, in daily perception I am also aware that much of the way the
world looks has to do with me and my own bodily states (where I am looking,
whether I have good or poor eyesight, etc.), but also with the circumstances
under which I perceive things (in a dark or well-illuminated room or in a room
with a red light bulb that makes everything else appear with a reddish hue). In
everyday life, then, the notion or “optimal” or “normal” perceptual conditions plays a constitutive role in our view about how objects “really” are.

Husserl also builds on these insight in the later sections of part one of *Ideas II*, where he shows how a modern notion of objectivity in the scientific sense emerged through an attempt to construct a conceptual framework that would not be contingent on accidental features of the human perceptual apparatus (e.g. the difference between primary and secondary qualities) or other “subjective” factors.

In fact, in Husserl's final works he returned to these themes and developed them further. In a 1935 essay entitled “Philosophy and the Crisis of European Humanity,” he expanded his critique of naturalism into a sweeping indictment of the recent developments of Western culture in general under the heading of “objectivism.” Objectivism, according to Husserl, is the belief that all genuine knowledge is objective knowledge and that objective knowledge is to be gained only by science after the model of modern natural science as it has developed since Galileo. Questions not accessible to the modern mathematical sciences are taken to be outside the realm of the rational; entities that cannot be captured in or reduced to these terms are taken to be nonexistent. Husserl, by contrast, claims that phenomenology realizes the true telos of Western science that was initiated by the Greeks and reawakened at the beginning of the modern age through its quest for absolute rational grounding of the subject and its activities by means of radical self-reflection. Rather than grounding all other sciences, modern mathematically oriented natural science must itself be grounded in a more radical and basic science, that of pure phenomenology.

In *The Crisis of the European Sciences and Transcendental Phenomenology*, Husserl presents an extended and detailed study of precisely how Galilean science emerged against the backdrop of a much broader attempt to capture nature in an all-encompassing rational framework. Husserl traces out how this ideal mathematization arose out of the everyday practice of measuring, then ultimately took on a dynamic of its own so that it came to appear as if nature as the construction of modern natural science bore no inherent relationship at all to human motivations and practices. Modern science involves a kind of subjective self-forgottenness in which human beings have come to take certain tenets about the nature of reality and knowledge for granted that now seem to be exempt from or even nullify the possibility of critical reflection on them. For instance, the assumption that all real knowledge can be or must be empirically verified is not itself an empirical tenet, nor is the modern assumption that all real entities are natural entities. These basic philosophical assumptions arise out of and express a specific worldview that cannot be justified or falsified through the procedures of modern natural science. The name for the ultimate sphere out of which science and all other human practices arise is now termed the “life-world.”
Since it is the source for all other spheres of human activity and cognition, its investigation is the proper object of transcendental phenomenology.

The reference to Galileo and the mathematization of nature in modern science points to another central theme in Husserl’s later work, namely the origin of ideal entities such as logical principles and mathematical entities out of the most basic tendencies in human cognitive life. This topic, the foundation and origin of mathematics and logic, had of course been one of Husserl’s guiding concerns since his earliest work. In the other major published work from Husserl’s later period, *The Formal and Transcendental Logic* (1929), Husserl once again returned to this problem, now not just in regard to arithmetic and its basic operations, nor to certain questions related to the general nature of formal logic, as in the first volume of the *Logical Investigations*; rather, he now tried to show in a very detailed way how the formalization of reason and its operations can result in the discipline of formal logic and its various divisions along with a pure science of manifolds or quantities. He also tried to show how even formal logic, since it necessarily aims at truth, still implicitly refers to and depends on its roots in the life-world out of which it arises. In this work, Husserl also introduces a distinction between apodicticity and adequacy that has far-reaching implications for his own phenomenological project. In his original formulations of the phenomenological method, Husserl had contrasted the apodicticity or certainty of phenomenological analysis under the presupposition of the transcendental reduction with the inherent inadequacy of empirical knowledge about external objects, suggesting that the difference between the two removed any source of uncertainty or error from phenomenological research. However, even nonempirical research such as phenomenological investigations always has absolute universality as part of its very intention, so that the attainment of such apodictic knowledge must at least in principle be reconfirmed over and again by the same researcher at different times and by other members of the community of researchers in order to test its adequacy. This, then, makes phenomenology not only an unending project that must be ever renewed, but also an inherently intersubjective enterprise to be carried out by individuals working in concert with one another, guided by the ideals of truth and self-responsibility.

This brings us to one final predominant theme in Husserl’s later work that also deserves mention. If, on the one hand, phenomenology proceeds through pure reflection on the part of individual subjects, and yet on the other hand, as a genuine science, lays claim to intersubjective validity, then the problem of intersubjectivity and the idea of intersubjective validity will be especially pressing for phenomenology.¹ Husserl’s most extended and best-known treatment of the

167
Volume 3
problem can be found in the fifth of his *Cartesian Meditations*, based on a series of lectures he gave at the Sorbonne in 1929 and published only in French translation during his lifetime. The intention of the Fifth Cartesian Meditation is to show that phenomenology is not a solipsistic enterprise. Consistent with his general project of showing how higher-level, more complicated intentions arise from simpler lower-order intentions, Husserl traces out the constitution of intersubjectivity for subjective consciousness. He begins by isolating that stratum of consciousness that is conceivable without any reference to other subjects. By abstracting from everything that involves a commitment to the existence of other subjects and any elements of consciousness that depend on others, Husserl identifies that stratum of conscious life he terms the “sphere of ownness.” Within this primordial sphere, however, Husserl notes there is still a stratum of the world as the correlate of my isolated but ongoing experience, a stratum he calls “nature within ownness,” that is different from the full notion of intersubjectively constituted nature that we intend in our everyday experience. Within this sphere there is also one unique object, namely one’s own lived body (*Leib*) that is the organ of sense impressions and of movement and activity. Even as an isolated individual – if such a thing were empirically possible – one would thus be capable of recognizing objects within the world, of constituting oneself as a unity of body and soul, and of organizing the world in terms of use and value predicates. However, a subject that had constituted the notion of a lived body as a unity of mental and physical nature in his or her own case would also be capable of recognizing other perceivable entities that resemble his or her body in their appearance and behavior. Husserl calls the attribution of mental states to these other bodies on the basis of the observations of general similarities between my own lived body and theirs “pairing.” The apprehension of these entities as lived bodies involves seeing them and their behavior as an expression (*Ausdruck*) of mental states. He refers to this apprehension as “empathy” (*Einfühlung*), although he admits that this term is easily misleading. He also describes it as an “appresentation,” since the specifically subjective side of the other, the other’s first-person awareness as such, is still never given to one directly. One can indeed have genuine and reliable awareness of at least some of another person’s mental states, but only on the basis of some externally observable deed or statement. The experience of the other is therefore said to be founded on, but not reducible to, the physically observable states of his or her body as a material object in the world. In imputing to the other a subjectivity like mine, I also constitute the idea of a world that is the same for us all in spite of different perspectives, an intersubjective nature, and I can envisage myself as an object for others, as part of that intersubjective world. Moreover, it is also possible to constitute on this basis a world of shared values, a cultural world that could ultimately serve as the norm against which all individual beliefs and actions can be measured. Phenomenology as
the realization of the inherent striving of all agents for rationality in the form of beliefs and norms that can be universally justified is thus necessarily an intersubjective enterprise, toward which Husserl viewed his own work as an important, but merely initial, contribution.

This analysis and most especially the reduction to the “primordial sphere” has been much discussed and criticized in subsequent phenomenological and post-phenomenological work, perhaps most notably by Emmanuel Levinas. Many question whether such a reduction is even possible. Others are concerned about the purported priority it seems to give to an isolated subject who is the source of the being of all other subjects. Can the concept of “pairing” do justice to the irreducible otherness of the other? Are community and language not so fundamentally presupposed for the constitution of any subject as such that the very notion of a primordial sphere as the foundation for intersubjectivity reverses the appropriate foundational order? Much of the answer to these questions will have to do with one’s reading of the nature of Husserl’s project in this brief Meditation.

From its beginnings as a theory in the foundations of logic and mathematics and as a method of reflection on the pure contents of the mental life of individual subjects, Husserl’s phenomenology evolves into an all-encompassing research program that reveals the historical and intersubjective origins of the world in which we live and the objects within it. Husserl himself never rejects the centrality of the method of transcendental reduction, nor does he overlook the important foundational role of the simplest elements of conscious life, for example sense perception and an individual’s direct first-person awareness of his or her own mental states. But Husserl’s analyses demonstrate at the same time that the concrete world – the world in which we all live and which provides the basis from which any specialized scientific research, the world from which even phenomenology itself must proceed – is constituted historically and intersubjectively. Later successors to Husserl’s phenomenological project, notably Heidegger, Eugen Fink,5 Merleau-Ponty, Jacques Derrida, and Levinas, will attempt to go beyond Husserl by purging his approach and his results of what

5. Eugen Fink (1905–75) was Husserl’s research assistant from 1928 until Husserl’s death in 1938. In Husserl’s final years, he collaborated closely with Fink and took steps to insure that Fink, and not Heidegger, would take his place at the center of the phenomenological research community. Fink also played a crucial role in assisting Father Herman Leo van Breda in the transfer of all of Husserl’s manuscripts to Leuven, Belgium in 1938, and he emigrated to Belgium to continue working with the manuscripts in 1939. Following the German invasion of Belgium, Fink returned to Germany; and, after the war, he was instrumental in the establishment of the Husserl-Archiv in Freiburg in 1950, where he worked until 1971. His critical assessment of Husserl’s phenomenology is described in great detail in Ronald Bruzina, *Edmund Husserl and Eugen Fink: Beginnings and Ends in Phenomenology, 1928–1938* (New Haven, CT: Yale University Press, 2004). Fink’s interpretation of Husserl had an important influence on later French readers such as Merleau-Ponty and Derrida.
they perceive as undue Cartesian residues in the emphasis on logic, science, perception, theory, and subjective reflection. They consciously acknowledge their debt to the phenomenological method as developed by Husserl, but attempt to take his insights and develop them into a new way of doing philosophy that moves from the sphere of modern philosophy, in which he still located himself, into a new kind of philosophy that overcomes the modern scientifically oriented philosophy of subjective reflection. On this reading, Husserl represents an important transitional figure in the history of continental philosophy, since he stands as a leading and perhaps the last great representative of classical modern philosophy and a key figure in the transition to a philosophy that goes beyond it.

MAJOR WORKS

I. SCHELER’S LIFE AND WORK

Max Ferdinand Scheler was born in Munich on August 22, 1874, and brought up in an orthodox Jewish household. After completing high school in 1894, he started to study medicine, philosophy, and psychology. He studied with Theodor Lipps in Munich, with Georg Simmel and Wilhelm Dilthey in Berlin, and with Rudolf Eucken in Jena,1 where he received his doctorate in 1897 with a thesis entitled Beiträge zur Feststellung der Beziehungen zwischen den logischen und ethischen Prinzipien (Contributions to an appraisal of the relations between the logical and ethical principles). Two years later this was followed by his habilitation thesis on Die transzendentale und die psychologische Methode.2 In 1902, Scheler met Edmund Husserl for the first time at a reception in Halle given by Hans Vaihinger (1852–1933), the editor of Kant-Studien. Their discussion mainly turned on the relation between intuition and perception.3 It was a meeting that would prove quite decisive for Scheler. As he was subsequently to write in the preface of Der Formalismus in der Ethik und die materiale Wertethik, “I owe the methodological consciousness of the unity and sense of the phenomenological

1. Theodor Lipps (1851–1914) was a prominent philosopher and psychologist known today mainly for his work on empathy. Georg Simmel (1858–1918) was an influential sociologist, and Rudolf Eucken (1846–1926) a philosopher, known mainly for his principle of ethical activism, who won the Nobel Prize for Literature in 1908.
2. Scheler’s influences included Bergson, Dilthey, Eucken, Husserl, Kant, Nietzsche, and Pascal.
attitude to the work of Husserl," but as he then also continues, "I take full responsibility for the manner in which I understand and execute this attitude."\footnote{Max Scheler, \textit{Formalism in Ethics and Non-Formal Ethics of Values: A New Attempt Toward a Foundation of an Ethical Personalism}, Manfred S. Frings and Roger L. Funk (trans.) (Evanston, IL: Northwestern University Press, 1973), xi.}

Scheler is notorious for his rather tumultuous private life. In 1899, he converted to Catholicism and married Amélie von Dewitz-Krebs; it was an unhappy marriage that quickly fell apart, allegedly because of Scheler’s many love affairs. In 1905–6, marital problems led to a public scandal that as a result had Scheler’s wife confined in a psychiatric institution, whereas Scheler was forced to relinquish his teaching position in Jena and move to Munich. One consequence of this move was that Scheler was able to join the Munich Phenomenological Circle. This group consisted of students of Lipps (Theodor Conrad, Johannes Daubert, Moritz Geiger, Dietrich von Hildebrand, and Alexander Pfänder) who had all been devoted to phenomenology since the publication of Husserl’s \textit{Logical Investigations}. In the meantime, Scheler’s unhappy marriage dragged on, and in 1910, as the result of yet another debacle, where his wife publicly accused Scheler of amoral behavior, Scheler lost his position, and had to begin earning his income as a free lecturer, essayist, and publicist. From 1910 to 1911, Scheler lectured in Göttingen, where he met the Göttingen phenomenologists (including Hedwig Conrad-Martius, Jean Hering, Roman Ingarden, Alexandre Koyré, and Adolf Reinach). Edith Stein was at this point one of his students. In 1912 Scheler finally managed to obtain a divorce, and shortly afterwards he married Märit Furtwängler – the sister of the noted conductor – and left for Berlin.\footnote{The work of many of the phenomenologists mentioned in this paragraph is touched on in the essay by Diane Perpich in this volume.}

Scheler had by then managed to establish himself as a phenomenological voice to count on, and in 1913 he was asked by Husserl to become coeditor of the \textit{Jahrbuch für Philosophie und phänomenologische Forschung}, together with Pfänder, Geiger, and Reinach. It was in this venue that both parts of his \textit{Formalismus} were published in 1913 and 1916, respectively. In 1913 he also published the work \textit{Zur Phänomenologie und Theorie der Sympathiegefühle und von Liebe und Hass} (later republished in an extended version in 1923 under the better-known title \textit{Wesen und Formen der Sympathie}).

Scheler’s reputation continued to increase and by the end of the First World War he was considered one of the most influential Catholic thinkers in Germany. After a short interim, during which Scheler joined the German Foreign Office as a diplomat in Geneva and The Hague, he was in 1919 invited by Konrad Adenauer – then mayor in Cologne – to become one of the directors of the newly founded Forschungsinstitut für Sozialwissenschaft and at the same time professor of philosophy in Cologne. Shortly after taking up the position, however, Scheler
publicly distanced himself from the Catholic faith. This alienated him not only from his erstwhile supporters in Cologne, but also from many of his phenomenological colleagues who, owing to his influence, had converted to Catholicism. In the same period, Scheler fell in love with a young student, Maria Scheu. In 1923, he divorced his second wife and married Scheu the following year, a move that did little to improve his popularity in Catholic circles. During these years, Scheler’s reputation as a phenomenologist continued to grow; he was the first of the leading phenomenologists to be invited to visit France, in 1924 and again in 1926, and his 1923 text Wesen und Formen der Sympathie was the first work of phenomenology to appear in French translation, published in 1928 as Nature et formes de la sympathie: Contribution à l’étude des lois de la vie émotionnelle. In 1928 Scheler was offered the Chair in Philosophy and Sociology at the University of Frankfurt. He accepted the position with pleasure, looking forward to future collaboration with thinkers such as Ernst Cassirer, Karl Mannheim, and Rudolf Otto, but on May 19, 1928, he died suddenly of heart failure. In his eulogy, Heidegger would praise him as “the strongest philosophical force in modern Germany, nay, in contemporary Europe and in contemporary philosophy as such.”

When reading Scheler, one is struck by the scope of his references. It is more wide-ranging than what one will find, for instance, in Husserl or Heidegger. The sources he drew on included not only classics from the history of Western philosophy as well as contemporary empirical research, but also works by figures such as Buddha, Freud, Muhammad, Goethe, Lao Tzu, Darwin, and Tagore.

When Scheler died in 1928, many of his writings remained unpublished. The publication of his posthumous writings commenced in 1933, but the enterprise came to a sudden halt with the rise of Nazism, which suppressed and banned Scheler’s work owing to his Jewish background. Their publication resumed in 1954.

II. PHENOMENOLOGY AS EIDETIC ANALYSIS

Scheler worked on a wide variety of topics, and it is impossible to do justice to them all in a short overview such as this. However, in his late text Die Stellung des Menschen in Kosmos, Scheler writes that the question concerning the ontological status of man had been central to him since the beginnings of his philosophical career, and that he had spent more time on this question than on any

7. For an excellent general introduction, see Angelika Sander, Max Scheler zur Einführung (Hamburg: Junius, 2001).
other. Given Scheler’s recognized status as a phenomenologist and as a pioneer of philosophical anthropology, these two domains will constitute the focal points in the following presentation. I shall start with a brief account of Scheler’s phenomenological methodology, and then in turn discuss his concept of person, his description of the nature of sociality, and the in-depth analysis of expression and empathy found in *Wesen und Formen der Sympathie*. This selection, which pays scant attention to his value theory, is motivated by what I take to constitute Scheler’s more enduring contribution, and also reflects the manner in which Scheler was received and discussed by contemporary and subsequent phenomenologists such as Stein, Husserl, Heidegger, Schutz, Sartre, and Merleau-Ponty.

Scheler’s understanding of phenomenology has many affinities with the early reception of Husserl’s writings by the Munich and Göttingen phenomenologists. Scheler took the guiding idea of phenomenology to be the clear distinction between the essential and the existential, between the essence and the fact. He consequently (mis)read Husserl’s phenomenological reduction to be a question of ignoring the *hic et nunc* of objects in order to focus on their essential features. To put it differently, Scheler read Husserl’s phenomenological reduction as an eidetic reduction, thereby disregarding the distinctly transcendental aspects of Husserl’s enterprise. Indeed, rather than seeing phenomenology as a form of transcendental philosophy, Scheler primarily conceived of it as an intuitively based eidetic discipline. For the same reason, Scheler distanced himself from Husserl’s *Ideas I*, which Scheler characterized as a turn toward epistemological idealism and as a curbing of phenomenology to a mere eidetics of consciousness.

Phenomenology is supposed to provide a rigorous intuitive method that will allow for the disclosure of *a priori* structures. This intuitive basis was stressed to such an extent by Scheler that his definition of phenomenology must count as decidedly antithemeneutical. On his account, the aim of phenomenology is to describe the given in as direct, unprejudiced, and pure a manner as possible, thereby allowing for a disclosure of its essence. As he writes in one of his posthumously published writings, phenomenology has achieved its goal when “there is no longer any transcendence and any symbol left.” Indeed, on his view, whereas nonphenomenological experience is experience through or by means of symbols

---

9. To illustrate (but see also the concluding section of this overview), of the six thinkers mentioned, the most extensive discussion of Scheler is found in a paper by Alfred Schutz entitled “Scheler’s Theory of Intersubjectivity and the General Thesis of the Alter Ego.”
12. Ibid., 311.
and hence remains a mediated experience that never gives us the things themselves, phenomenological experience is in principle nonsymbolic. It alone yields facts themselves in an immediate and unmediated fashion. In phenomenological experience nothing is meant that is not given and nothing is given that is not meant: phenomenological experience contains no transcendence.\textsuperscript{14}

Scheler’s strength as a phenomenological thinker is undoubtedly to be found in his concrete analyses – in particular in his analyses of emotional life and sociality – rather than in his methodological considerations. It is for this very reason remarkable that he was quite explicit in his rejection and ridicule of what he termed “picture-book phenomenology,” namely, the view that phenomenology should primarily be concerned with various eidetic analyses, and that any overarching systematization and systematic ambition should be avoided since it inevitably would involve distortions of the phenomena to be investigated.\textsuperscript{15}

III. THE CONCEPT OF PERSON

According to Scheler, the task of philosophical anthropology is to show how all specifically human products, abilities, and activities are rooted in the fundamental ontological structures of man.\textsuperscript{16} What then, on his account, uniquely characterizes human existence?

Scheler accepts the classical distinction between inorganic (or inanimate) being on the one hand and living creatures on the other. Whereas inorganic being lacks any kind of individual unity and interiority (\textit{Innesein}) – it is in no way for-itself (\textit{für-sich}) – all living creatures possess these features; they are more than merely objects for external observers. Scheler ultimately distinguishes three different levels of living creatures. At the bottom, we find plants, which although they possess unity and individuality (if you cut a plant in two, you destroy it), and even a certain interiority and expressivity (plants can appear as languishing, vigorous, etc.), lack both consciousness and self-consciousness. Next we find animals, which possess consciousness but which at the same time are bound to the environment. At the top level, we find human beings, who possess both consciousness and self-consciousness, and who in contrast to animals are not caught up in the world, but rather retain a certain distance from it: a distance that also enables them to objectify entities. To put it differently, in order to apperceive the given as objects, it is necessary to distance oneself somewhat from it. The ability to do so is a distinctive feature of human beings. Thus, on

\begin{itemize}
\item \textsuperscript{14} Scheler, \textit{Formalism in Ethics}, 50–51.
\item \textsuperscript{15} \textit{Ibid.}, xix.
\item \textsuperscript{16} Scheler, \textit{Die Stellung des Menschen im Kosmos}, 86.
\end{itemize}
Scheler’s account, among all creatures human beings alone are able to distance themselves from the world and to objectify the world (and themselves). What provides human beings with this ability? The fact that human beings are spiritual creatures. Indeed, what characterizes human beings as human is precisely the presence of spirit (Geist). It is our spirituality that makes our human life highly independent of drives and independent of the attachment to a specific environment. It is our spirituality that allows us to transform and transcend the closed environment and makes us open to the world (weltoffen). As he puts it at one point, man is “the one who can say ‘no’, the ascetic of life, the eternal protestant against all mere reality.”

Scheler next argues that the center from which human beings are able to perform these objectifying acts cannot be a part of the world, but must rather be appreciated as an aspatial and atemporal dimension. Indeed, for Scheler the spiritual center or source of intentional acts – which he also calls the person – is not only not a substance or thing, but is in its core nonobjectifiable. This holds true not only for our own personal being, but also for other persons. We cannot objectify them without losing them as other persons.

Despite his occasional reference to the Kantian idea of a transcendental subject, however, Scheler’s notion of person differs in certain crucial respects. For Scheler, the person is not some posited supra-individual principle behind or outside the immediately given. Rather, the person is the immediate coexperienced unity of experiencing. The person only exists and lives in the accomplishment or performance of intentional acts. Furthermore, every person is individuated as a person, and not merely by virtue of their bodies, their spatio-temporal locations, and the content of experience. Indeed, for Scheler persons are absolute individuals in the sense that they and they alone are individuated in terms of themselves. So far, Scheler’s concept of person might be different from Kant’s but it seems to retain a high degree of formality. However, Scheler also claims that the possession of a fully sound mind is a prerequisite for being a person. On this account, animals, as well as children, madmen, and slaves (!), are not persons. Your thoughts and actions must be bound by a unity of sense, must constitute parts of one meaningful life, if you are to qualify as a person.

You must be the source of your own decisions, feelings, and thoughts; you must enjoy control and mastery over your own body.24

IV. SCHELER ON EMPATHY

Scheler’s work *Wesen und Formen der Sympathie* (1923) is frequently listed as an example of a phenomenological investigation of emotional life. But in addition to presenting us with careful analyses of various emotional phenomena, the work must also be considered a significant contribution to the phenomenology of sociality and social cognition. It is no coincidence that Scheler at the outset states that the problem of how we understand other minds is a foundational problem for the human sciences. It is one that must be resolved if we are to determine the scientific status of history, psychology, sociology, and so on with any degree of adequacy.25

According to Scheler, sociality is not primarily a theoretical matter; rather, it is an essential aspect of our emotional life. Indeed, a fundamental Pascalian claim of Scheler’s is that our emotions are characterized by an *a priori* content and are subject to *a priori* laws, and that one must recognize an *a priori* “order of the heart” or “logic of the heart.”26 It is in connection with his analysis of this emotional *a priori* that Scheler makes the claim that “all morally relevant acts, experiences, and states, in so far as they contain an intentional reference to other moral persons” (acts such as obligation, responsibility, loving, promising, etc.), “refer, by the very nature of the acts themselves, to other people,” without implying that such others must already have been previously encountered in concrete experience (NS 229). Hence our relation to the other is not some empirical fact; on the contrary, the concrete experience of others presupposes an *a priori* relatedness to one another, and simply represents the unfolding of this possibility.27

Scheler elaborates on this by stating that every finite person is as originally a member of a community as he is an individual. A human being does not live a communal life with other persons “from pure accident”; rather, being a (finite) person as such “is just as originally a matter of being … ‘together’” as it is a matter of being-for-oneself.28 Thus, the experience of belonging to a community

is just as fundamental as self-experience and world-experience, and the intention “in the direction of community” exists completely independently of whether or not it finds fulfillment in a contingent experience of others. Scheler illustrates this idea by speaking of an epistemological Robinson Crusoe. Such a figure would be aware of his relatedness to an intersubjective community even if he had never had a concrete experience of others, and, indeed, would possess such an awareness by virtue of his experience of an emptiness or absence or lack in the fulfillment of intentions such as loving, promising, requesting, obeying, and so on, which can only form an objective unity of sense “in conjunction with the possibility of a social response” (NS 235).

Scheler obviously considers the relation between the individual and the community to be essential. But what kind of justification might we have for positing the real de facto existence of a specific other? How is the other given? To answer this question, we need to take a closer look at Scheler’s analysis of empathy. Let us start by considering two groups of cases discussed by Scheler.

Consider first the situation where you see the face of a crying child, but rather than seeing it as expressing discomfort or distress, you see merely a certain distortion of the facial muscles; that is, you basically do not see it as emotionally expressive. Compare this (pathological case) with the situation where you see the same face as emotionally expressive, but without feeling any compassion, that is, while remaining indifferent. And finally consider the situation where you also feel compassion or concern for the child. For Scheler, the last situation counts as a case of sympathy, which he considers an ethically relevant act. But in order to feel sympathy – in order to feel compassion with, say, somebody’s suffering – you need to realize or recognize that the other is indeed suffering. More basic than sympathy is what Scheler terms Nachfühlen, rendered in the following as empathy.29 In short, whereas empathy has to do with a basic understanding of expressive others, sympathy adds care or concern for the other.

29. Unfortunately, Scheler does not stick to a single term when referring to this basic form of understanding. Rather, he uses terms such as Nachfühlen (reproduction of feeling), Nachleben (reproduction of experience), Nacherleben (visualizing of experience), Verstehen (understanding), and Fremdwahrnehmung (perception of other minds) (NS 9, 238). In some of the cases, the English translation might not be ideal, but Scheler himself must also be blamed for the inevitable confusion. How can Nachfühlen and Fremdwahrnehmung refer to one and the same phenomenon? As we shall see in a moment, Scheler rejects the view that our understanding of the emotional experience of others is based on an imitation or reproduction of the emotion in question, but why does he then himself use a term like Nachfühlen? The fact remains, however, that Scheler is quite unequivocal in his rejection of the view that our understanding of the emotional experiences of others requires us to have the same emotion ourselves (NS 9–10), and one must consequently simply note that his choice of terms left something to be desired. For want of a better term, I have decided to use “empathy” as the best way of capturing what Scheler was referring to when he spoke of a basic experience of others.
Now, apart from stressing the difference between empathy and sympathy, the point of Scheler’s example is also to make it clear that it is possible to empathize with somebody without feeling any sympathy (NS 8–9). Just think of the skilled interrogator or the sadist. Sadistic cruelty does not consist merely in failing to notice the other’s pain, but in empathically enjoying it (NS 14).

Consider now a second group of cases. You might enter a bar and be swept over by the jolly atmosphere. A distinctive feature of what is known as emotional contagion is that you literally catch the emotion in question (NS 15). It is transferred to you. It becomes your own emotion. Indeed you can be infected by the jolly or angry mood of others without even being aware of them as distinct individuals. But this is precisely what makes emotional contagion different from both empathy and sympathy. In empathy and sympathy, the experience you empathically understand or sympathetically care for remains that of the other. In both of the latter cases, the focus is on the other, the distance between self and other is preserved and upheld. Another distinctive feature of emotional contagion is that it concerns the emotional quality rather than the object of the emotion. You can be infected by cheerfulness or hilarity without knowing what it is about. This is what makes emotional contagion different from what Scheler calls emotional sharing. Consider the situation where a father and mother stand next to the corpse of a beloved child. For Scheler, this situation exemplifies the possibility of sharing both an emotion (sorrow or despair) and the object of the emotion. But emotional sharing must on its part still be distinguished from both empathy and sympathy. Consider the situation where a common friend approaches the despairing parents. He can empathize or more likely sympathize with their sorrow, without himself experiencing the despair in question, which is why his state of mind differs qualitatively from either of theirs. Indeed their sorrow and his empathy or sympathy are clearly two distinct states. Their sorrow is the intentional object of his empathy or sympathy (NS 12–13). On Scheler’s account, empathy is not simply a question of an intellectual judgment that somebody else is undergoing a certain experience. It is not the mere thought that this is the case; rather, Scheler clearly defends the view that we are empathically able to experience other minds (NS 9). It is no coincidence that Scheler repeatedly speaks of the perception of others (Fremdwahrnehmung), and even entitles his own theory a perceptual theory of other minds (NS 220).

“Empathy” is usually considered the standard translation of Einfühlung, and it so happens that Scheler himself only used the latter term rather sparingly, and, when he did, frequently rather dismissively. However, Scheler’s reservation was mainly due to his dissatisfaction with Lipp's projective theory of empathy, and it is telling that other contemporary phenomenologists, including Stein, also referred to Scheler’s theory of empathy (Einfühlung); see Edith Stein, On the Problem of Empathy, Waltraut Stein (trans.) (Washington, DC: ICS Publications, 1989), 27.
is a basic, irreducible, form of intentionality that is directed toward the experiences of others. It is a question of understanding other experiencing subjects. But this does not entail that the other’s experience is literally transmitted to us. It does not entail that we share his or her experience, and it does not entail that we ourselves undergo, say, the emotion we observe in the other. It might – as a consequence – but it is not a pre-requisite. We might encounter a furious neighbor and become furious ourselves, but our empathic understanding of our neighbor’s emotion might also elicit a quite different response, namely, the feeling of fear.

To sum up, on Scheler’s account empathy involves neither some kind of analogical inference, nor some kind of projection, simulation, or imitation (NS 12). In fact, Scheler insists that it is necessary to reject the projective theory of empathy in all its forms (NS xlviii), and he is also very dismissive of the attempt to account for the experience of others in terms of some imaginative transformation. In basic empathy, the focus is on the other, on his thoughts and feelings, and not on myself, not on how it would be like for me to be in the shoes of the other (NS 39).

V. ANALOGY AND EXPRESSION

Scheler’s investigation of empathy and social understanding is restricted to the personal level. He is not concerned with the various sub-personal mechanisms that might be involved in interpersonal understanding. His main objection against competing theories seems to be that they are phenomenologically inadequate and that they fail to do justice to our actual experience. On this basis, it might be natural to conclude that his project is exclusively descriptive. It seeks to describe how we experience other minds, but it does not address the normative question concerning the justification or validity of that experience. But this is a mistake. Not only does Scheler provide more systematic arguments against the appeal to analogical inference, but ultimately he also seeks to provide an account of the nature of experience that makes comprehensible how we can experience other minds, and why such an experience can be justified.

According to Scheler, the argument from analogy presupposes that which it is meant to explain. In order for the argument to work, there has to be a similarity between the way in which my own body is given to me, and the way in which the body of the other is given to me. But if I am to see a similarity between, say, my laughing or crying and the laughing or crying of somebody else, I need to understand the bodily gestures and behavior as expressive phenomena, as manifestations of joy or pain, and not simply as physical movements. If such an understanding is required for the argument of analogy to proceed, however, the
argument presupposes that which it is supposed to establish. To put it differently, in some cases we do employ analogical lines of reasoning, but we do so only when we are already convinced that we are facing minded creatures but are simply unsure about precisely how we are to interpret the expressive phenomena in question (NS 240).

In addition, Scheler questions two of the basic presuppositions behind the argument from analogy. First, it assumes that my point of departure is my own consciousness. This is what is at first given to me in a quite direct and unmediated fashion, and it is this purely mental self-experience that is then taken to precede and make possible the recognition of others. One is at home in oneself and one then has to project into the other, whom one does not know, what one already finds in oneself. Incidentally, this implies that one is able to understand only those psychological states in others that one has already experienced in oneself. Second, the argument also assumes that we never have direct access to another person’s mind. We can never experience her thoughts or feelings. We can only infer that they must exist based on that which is actually given to us, namely, her bodily behavior. Although both of these assumptions might seem perfectly obvious, Scheler rejects both. As he points out, as philosophers it is our duty to question the obvious. We should pay attention to what is actually given, rather than letting some theory dictate what can be given (NS 244). On his view, the argument from analogy underestimates the difficulties involved in self-experience and overestimates the difficulties involved in the experience of others (NS 244–6). We should not ignore what can be directly perceived about others and we should not fail to acknowledge the embodied and embedded nature of self-experience. Scheler consequently denies that our initial self-acquaintance is of a purely mental nature, as if it anteceded our experience of our own expressive movements and actions, and as if it took place in isolation from others. He considers such an initial purely internal self-observation a mere fiction.

Scheler also denies that our basic acquaintance with others is inferential in nature. As he argues, there is something highly problematic about claiming that intersubjective understanding is a two-stage process, of which the first stage is the perception of meaningless behavior, and the second an intellectually based attribution of psychological meaning. Scheler argues that in the face-to-face encounter we are neither confronted with a mere body, nor with a pure soul, but with the unity of an embodied mind. He speaks of an “expressive unity” (Ausdruckseinheit), and claims that the notion of behavior is a psychophysically undifferentiated concept. It is only subsequently, through a process of abstraction, that this unity is divided and our interest then proceeds “inwards” toward the merely psychological or “outwards” toward the merely physical (NS 218, 261).
Foreshadowing something that both Sartre and Levinas would later discuss in more detail, Scheler writes that I experience, say, the hostility or love in the expression of another’s gaze long before I can specify the color of his eyes (NS 244). Indeed, on Scheler’s account, our primary knowledge of nature is knowledge of expressive phenomena. He finds this claim corroborated by newborns’ preferential interest for expressive faces and human voices. This knowledge of a living world is taken to precede our knowledge of a dead and mechanical world. So, for Scheler, it is not the case that we first see inanimate objects and then animate them through a subsequent addition of mental components. Rather, at first we see everything as expressive, and then we go through a process of de-animation. Learning is a question of Entseelung (de-animation) rather than Beseelung (animation) (NS 239).

To sum up, Scheler opposed the view according to which our encounter with others is first and foremost an encounter with bodily and behavioral exteriorities devoid of any psychological properties. According to such a view, which has been defended by behaviorists and Cartesians alike, behavior, considered in itself, is neither expressive nor significant. All that is given is physical qualities and their changes. Seeing a radiant face means seeing certain characteristic distortions of the facial muscles. But, as Scheler pointed out, this account presents us with a distorted picture, not only of behavior but also of the mind. It is no coincidence that we use psychological terms to describe behavior and that we would be hard pressed to describe the latter in terms of bare movements. In most cases, it is quite hard (and artificial) to divide a phenomenon neatly into its psychological and behavioral aspect; think, for example, of a groan of pain, a handshake, an embrace, a leisurely stroll. In his view, affective and emotional states are not simply qualities of subjective experience; rather, they are given in expressive phenomena; that is, they are expressed in bodily gestures and actions, and they thereby become visible to others. Instead of attempting to secure an access to the minded life of others through technical detours, he argued that we need a new understanding of the given. If the realm of expressive phenomena is accepted as the primary datum or primitive stratum of perception, the access to the mind of others will no longer present the same kind of problem. What we see is the body of the other as a field expressive of his or her experiences (NS 10). Indeed, on Scheler’s view, expressive phenomena – in particular facial expressions and gestures, but also verbal expressions – can present us with a direct and noninferential experience of the emotional life of others. As he eventually put it:

For we certainly believe ourselves to be directly acquainted with another person’s joy in his laughter, with his sorrow and pain in his tears, with his shame in his blushing, with his entreaty in his outstretched hands, with his love in his look of affection, with his
rage in the gnashing of his teeth, with his threats in the clenching of his fist, and with the tenor of his thoughts in the sound of his words. If anyone tells me that this is not “perception,” for it cannot be so, in view of the fact that a perception is simply a “complex of physical sensations,” and that there is certainly no sensation of another person’s mind nor any stimulus from such a source, I would beg him to turn aside from such questionable theories and address himself to the phenomenal facts. (NS 260)

It should by now be clear that Scheler took a solution to the problem of other minds to require a correct understanding of the relation between mind and body. And of course, the mind–body relation in question is not the mind–brain relation. Scheler was not concerned with the search for the neural correlates of consciousness. Rather, he was interested in the relation between experience and expressive behavior, and he obviously took the connection to be intimate and essential. He claimed that a repression of the emotional expression will necessarily lead to a reduction of the felt quality of the emotion (NS 251), and he even postulated the existence of what he called a universal grammar of expression, one that enables us to understand – to some extent at least – the expressions of other species, be it the gasping fish or the bird with the broken wing (NS 11, 82).

Despite his emphasis on the extent to which the life of the mind of others is visible in their expressions, Scheler insisted however that we should not commit the mistake of claiming that all aspects of the experiential life of an individual are equally accessible to others. Whereas we can in many cases intuit and even share the other’s beliefs and emotions, there are, on Scheler’s account, two limitations. On the one hand, we cannot literally share bodily sensations like a stomach ache (NS 255). I can have a similar stomach ache, but I cannot have the very same pain sensation as somebody else. On the other hand, although Scheler obviouslyconcedes that we can learn something about the other from his automatic and involuntary expressions, he also insisted that there is a limit to how far this will get us. If we wish to grasp what Scheler called the intimate spiritual being of the other, that is the essence of his personhood, we need to rely on language and communication. More specifically, Scheler claimed that there will be aspects of the other that will remain concealed or hidden unless the other decides to reveal and communicate it freely (NS 225). Yet, even then, there will remain something ineffable in the other. There is an absolute intimate sphere of foreign personhood that even the act of free communicative intention cannot disclose (NS 66, 219). On some occasions, though, Scheler suggests that love is what can bring us closest to the essence of foreign individuality. As he would say, drives make blind, whereas love makes seeing (NS 71, 160).
VI. SCHELER’S RECEPTION BY AND INFLUENCE ON OTHER PHENOMENOLOGISTS

An early sustained engagement with Scheler’s theory can be found in Stein’s 1916 dissertation *On the Problem of Empathy*. Not surprisingly, her focus is on Scheler’s account of how we come to understand others. Although she does raise critical points, her overall appraisal of his theory is positive, and she certainly takes it to constitute an improvement compared to Lipps’s projective account of empathy.

After Scheler lost his position in 1910, Husserl wrote him a strong letter of reference, stating that Scheler was no second-rate thinker, but a very sharp, independent and scientifically rigorous scholar.30 In his subsequent private correspondence, however, Husserl repeatedly expressed serious reservations about Scheler’s work. Not surprisingly, his main objection concerned methodological issues. In letters to his friend Adolf Grimme (1889–1963) from 1917 and 1918, Husserl complained about Scheler’s alleged attempt to hijack phenomenology for his own purposes, and even described Scheler as a genius of reproduction and secondary originality.31 Indeed Husserl’s main criticism was precisely that Scheler had misunderstood the sense of phenomenology by confusing the phenomenological reduction with the eidetic reduction, thereby missing its true transcendental character in favor of a philosophically naive anthropology.32 In letters to Ingarden from 1927 and 1931, Husserl disputed that Scheler was a true phenomenologist, and made it clear that Scheler and Heidegger were the main targets of his 1931 lecture “Phenomenology and Anthropology” (although Scheler is mentioned only once by name, and Heidegger not at all).33 In this lecture, Husserl referred very critically to the younger generation of German philosophers, who, inspired by Dilthey’s philosophy of life, had turned toward philosophical anthropology and sought to renew philosophy through a focus on concrete existence.

At the beginning of his analysis of being-with (*Mitsein*) in *Being and Time*, Heidegger referred to Scheler’s *The Nature of Sympathy* in support of his claim that a clarification of being-in-the-world leads us to the insight that a subject is never given in isolation from others.34 But most of Heidegger’s discussion of Scheler concerned the latter’s analysis of personhood, in particular his attempt

---

to stress the nonobjectifi able character of the person.\textsuperscript{35} According to Heidegger, Scheler failed to think the \textit{being} of the person in a sufficiently radical manner. This criticism is more developed in Heidegger’s 1925 lecture course \textit{History of the Concept of Time}. As we have seen above, for Scheler the person exists in the performance of intentional acts. The person is neither a thing nor a substance. But Heidegger asked for a more positive determination of the being of the person, and argued that Scheler remained silent on this and failed to articulate or develop the concept of performance.\textsuperscript{36}

Of the major phenomenologists, Merleau-Ponty was probably the one to appraise Scheler’s work most positively. \textit{Phenomenology of Perception} contains a number of references to Scheler, but Merleau-Ponty’s most extensive reference to Scheler in that book touches on Scheler’s conception of expression and on his criticism of the argument from analogy.\textsuperscript{37} Scheler’s contribution to both of these issues is also taken up in Merleau-Ponty’s lectures on child psychology at the Sorbonne, where Merleau-Ponty, however, added a critical remark. He claimed that Scheler, in order to make the experience of others possible, ended up defending a kind of pan-psychism that led to a denial of the individuation of consciousness and thereby also to a destruction of the very distinction between self and other.\textsuperscript{38} Although Scheler does at one point write that we can take the existence of emotional identifi cation (\textit{Einsfühlung}) – a limit case of emotional contagion – as an indication of the metaphysical unity of all organic life (NS 73–4), Merleau-Ponty’s criticism is nevertheless unjustifi ed, since Scheler is adamant in insisting that the existence of a unity on the level of organic life in no way rules out the \textit{absolute difference} between individual persons (NS 65, 121). Indeed, one of the central fi ndings of Scheler’s analysis of empathy was precisely that it presupposes the difference between self and other.\textsuperscript{39}

\begin{itemize}
\item \textsuperscript{35} Ibid., 44.
\item \textsuperscript{38} Maurice Merleau-Ponty, \textit{Merleau-Ponty à la Sorbonne} (Grenoble: Cynara, 1988), 41–4.
\item \textsuperscript{39} Merleau-Ponty’s criticism is nevertheless interesting since it throws an illuminating light on one of Merleau-Ponty’s own famous claims, found in \textit{Signs}, where he writes: “The solitude from which we emerge to intersubjective life is not that of the monad. It is only the haze of an anonymous life that separates us from being; and the barrier between us and others is impalpable. If there is a break, it is not between me and the other person; it is between a primordial generality we are intermingled in and the precise system, myself–the others. What ‘precedes’ intersubjective life cannot be numerically distinguished from it, precisely because at this level there is neither individuation nor numerical distinction” (\textit{Signs}, Richard C. McCleary [trans.] [Evanston, IL: Northwestern University Press, 1964], 174).
\end{itemize}
Scheler's application of phenomenology to areas such as the emotional and affective domain, sociology, anthropology, and philosophy of religion was instrumental in making phenomenology known and appreciated outside academia. Indeed, in the period between Husserl's Ideas I (1913) and Heidegger's Being and Time (1927) – when neither of these thinkers published any major works – Scheler counted in the public eye as the most prominent phenomenologist.\textsuperscript{40} Although Scheler was not a very systematic thinker, he proved a source of inspiration for many contemporaries, including neurologist Paul Schilder (1886–1940), physician and physiologist Viktor von Weizsäcker (1886–1957), psychiatrists Kurt Schneider (1887–1967), Viktor Frankl (1905–97), Ludwig Binswanger (1881–1966), psychologist F. J. J. Buytendijk (1887–1974), and sociologists Helmuth Plessner (1892–1985) and Arnold Gehlen (1904–76).\textsuperscript{41}

**MAJOR WORKS**

\textsuperscript{40} Wolfgang Henckmann, _Max Scheler_ (Munich: C. H. Beck, 1988), 232.

\textsuperscript{41} Indeed, Gehlen argued that Scheler's _Die Stellung des Menschen im Kosmos_ constituted the point of departure for modern philosophical anthropology; "Rückblick auf die Philosophie Max Schelers," in _Max Scheler im Gegenwartsgegeschichte der Philosophie_, Paul Good (ed.) (Bern: Francke, 1975), 188.
Held by many to be the greatest philosopher of the twentieth century (and by others as an obscure philosopher whose involvement with National Socialism only highlighted the flaws of his philosophy), Martin Heidegger exercised, and continues to exercise, a deep fascination and considerable influence over generations of students and philosophers (Hannah Arendt, Hans-Georg Gadamer, Hans Jonas, Leo Strauss, Max Horkheimer, Herbert Marcuse, Jacques Derrida, and Emmanuel Levinas, to name only a few). His personal and philosophical style was entirely new, and his understanding of the history, the aim, and the nature of philosophy nothing short of revolutionary. To this day, and despite the roughly eighty volumes of his Complete Works already published, it is his third book – Being and Time (1927) – that remains his most famous work. The reason for its success lies in the fact that it was the result of ten years of relentless and groundbreaking philosophical activity, carried out mostly in a series of lecture courses and seminars between 1916 (the year his previous work, in fact his habilitation dissertation, was published) and 1926. This is all the more remarkable in that the work in question was – and remains – incomplete. Its incompleteness was due partly to the sudden pressure under which Heidegger came to publish the results of his research and philosophical questioning in order to obtain a Chair at the University of Freiburg. More fundamentally, though, it was the
sign that the project laid out in the book – and characterized as “fundamental ontology” – however groundbreaking, could not succeed on its own terms, and needed to be revised. This realization, in turn, forced Heidegger’s thought into a new beginning, and triggered an extraordinary burst of philosophical creation in the 1930s and 1940s. By following the itinerary of Heidegger’s thought from his early years as a student to the publication of *Being and Time* and its immediate aftermath, we shall see how he arrived at the following conclusions, which are the central theses of his *magnum opus*: first, that the one and only question that philosophy always presupposes, but is never able to make explicit or answer adequately, is the question of being (*die Seinsfrage*), or the difference between beings (*das Seiende*) and being (*das Sein*) – a difference Heidegger also refers to as the ontico-ontological difference; second, that in order to be addressed properly, and solved, the question of being must be formulated in terms of *time* – time is the key to understanding what it means to be, not just for ourselves, but for all “beings.” It was only by understanding being in terms of *time*, and by transforming classical ontology into onto-chronology, that Heidegger was able to revolutionize philosophy. But this is a revolution that occurred after many years of hard work and a series of breakthroughs.

I. THE STUDENT YEARS (1909–15)

(a) From theology to philosophy

Born in the quiet, rural, and conservative Swabian town of Messkirch, and into a modest, Catholic family, Heidegger gained access to secondary and higher education through the material and financial support of the Catholic Church. He was destined for the priesthood (his father was the sexton of the Church of St. Martin). His Catholicism, and his complex and tormented relation with it, should not be underestimated. He attributes his early interest in philosophy, and in the question that was to guide him through the writing of his *magnum opus*, *Being and Time*, to the reading in 1907 of Franz Brentano’s doctoral thesis, *On the Manifold Senses of Being according to Aristotle* (1862). If, as Aristotle claimed, we can rightly say of all the things that are (of “beings” or *das Seiende*) that they are in different ways, and that what it means for them to be varies in each instance (*to on legethai pollakos*), according to meanings or “categories” that we can list (being as “substance,” “accident,” “truth,” “actuality,” “potentiality,” etc.),

*2. For a discussion of Heidegger’s work following the period covered by this essay, see the essay by Dennis J. Schmidt in *The History of Continental Philosophy: Volume 4*.
might it be possible to go further still and identify a single, unifying meaning of being (Sein) itself? And could this question be the question of philosophy? Also important for Heidegger at that time was the discovery of a book entitled Vom Sein: Abriss der Ontologie (1896) by Carl Braig, a Freiburg theologian who taught Heidegger a few years later. The reading of Brentano and Braig was key in introducing Heidegger to a puzzlement regarding what he later called the “question of being” (die Seinsfrage) and to the problematic of intentionality as a way of addressing it.

Between 1909 and 1911, Heidegger studied theology and philosophy at the Department of Philosophy at the University of Freiburg in preparation for the archdiocesan priesthood. In the winter semester of 1911–12, he withdrew from the Department of Theology and the Theological Seminary for health reasons and abandoned his career plans for the priesthood. He attended classes in mathematics (in analytic geometry of space, differential and integral calculus, algebraic analysis, and advanced algebra), experimental physics and chemistry, but also in logic and epistemology, epistemology, and metaphysics (with the neo-Kantian Heinrich Rickert), the history of philosophy, theology (dogmatic theology, Gospel of John), Hellenic mystery religions, and art history, before deciding to dedicate himself entirely to philosophy. In July 1913, he obtained his doctorate with Die Lehre vom Urteil im Psychologismus (The doctrine of judgment in psychologism). Immediately thereafter (August 1913), he applied to the Freiburg Archdiocesan Chancellery Office for a grant in order “to dedicate himself to the study of Christian philosophy and to pursue an academic career” through work on the habilitation and license to teach in German universities as a lecturer (Privatdozent). He was awarded a scholarship for two years with the expectation that he “would remain true to the spirit of Thomistic philosophy.” In 1915, he submitted his habilitation thesis Die Kategorien- und Bedeutungslehre des Duns Scotus (The doctrine of categories and meaning according to Duns Scotus), directed by Rickert.4

(b) Phenomeno-logical investigations

After his early encounter with the works of Brentano and Braig, and his initial puzzlement concerning the manifold meaning of being, Heidegger seemed to be moving in a different direction. He devoted his initial investigations, written under the influence of Husserl’s Logical Investigations and the neo-Kantian

---

4. Both of Heidegger’s theses are now published in volume one of the collected works, Gesamtausgabe, hereafter cited as GA followed by the volume and page or section number (indicated by §). In cases where an English translation is available, the English page references will follow the German page references.
School of Baden (of Emil Lask, Rickert, and Wilhelm Windelband, in particular), to problems of judgment, categories, and meaning: in short, problems of logic. A closer look at those early works, however, enables one to see how they in fact prepared the way for the type of questioning that eventually led to the publication of Being and Time by focusing on the status and origin of meaning as such. Where is the sphere or layer of meaning to be located? What should we attribute it to? What is it a matter for? Throughout his early period, Heidegger focuses on the question of judgment. Why judgment? Because it is through judgments or propositions that we know, and that the existing world makes sense: meaning is a prerequisite to knowledge. For Heidegger, logic is not the formal, symbolic logic of Frege and Russell – a conception that, in his mind, is too limited – but the study concerning “the conditions of knowing in general.” In other words, logic is the “theory of theory,” the “doctrine of science” (Wissenschaftslehre), or the science of the “primally theoretical” (Urtheoretisches) (GA 1, 23). Today, we would call it epistemology. Inasmuch as they deal with the conditions of knowledge, or truth, judgments constitute the “core” of logic, or its “archetype” (Urgebilde) (GA 1, 268). It is where meaning originates. Later on, as we shall see, Heidegger will reject that idea, and argue that life, not judgment, is the original source of meaning.

It is important to emphasize the fact that, following Husserl’s critique of psychologism in the Prolegomena to Logical Investigations, Heidegger understands judgments not as psychic acts, or subjective representations, but as purely logical acts. Naturally, Heidegger writes, judgments involve a synthesis of representations. As such, they can be seen as psychic acts: the act of judging is a fleeting lived experience (Erlebnis) that comes and goes. Yet what distinguishes judgments from other representations is their reference to the true–untrue distinction (GA 1, 30). Now this distinction is one that we can attribute to neither our representations nor our volitions: if judgments, or propositions, were to be true only so long as the act of judging lasted, then there would be no truth in the first place. If, following Scotus, we can rightly claim that the ens logicum is an ens rationis, or an ens in anima, we cannot reduce it to a psychic reality (GA 1, 277). Translated into Husserlian, phenomenological language, Scotus’s formulation means that the noematic sense or correlate of intentionality obviously cannot be distinguished from consciousness; equally, though, it means that it is not simply contained within consciousness, as a part is contained in a whole (GA 1, 277). What is expressed or intended in the judgment is something independent

of subjective experience. It is what §11 of Husserl’s First Investigation refers to as the meaning (Bedeutung) of the judgment, and what Scotus called its significatio (GA 1, 328).

We must distinguish, therefore, between two aspects of the judgment, which are always intertwined: the judgment as ideal unity, or as Bedeutung; and the real judgment, the actual proposition that we can hear or read. Whereas psychology may have something to say about the latter, it has nothing to say regarding the former, which requires the construction of a “doctrine of meaning” (Bedeutungslehre), or, to use the Scholastic terminology, a tractatus de modi significandi. A “pure” logic only, and not, for example, a psychology, or a metaphysics, as Scotus made amply clear, can fulfill such an aim: insofar as the ens logicum is an ens rationis, it is not an ens naturae, that is, a natural or real thing, whether sensible or supra-sensible. It is autonomous with respect to the subjective (psychological) as well as the objective (real or actual) sphere. “Meaning,” in that sense, refers neither to the psycho-physical act of judging – to the manner, that is, in which the act of knowledge is produced (for that is what psychology does) – nor to something real (das Wirkliche, die Existenz), but to what Husserl called the Sachverhalt (the content) of judgment, that is, its truth or cognitive character. This content, Heidegger goes on to explain, following this time Hermann Lotze, is what “holds” or “values” (gilt) objectively, or with binding “validity” (Geltung): it is an atemporal mode of being that expresses a truth independent of our time-bound existence, our statements and thoughts, and the objects that we usually discuss (GA 1, 22). We need to emphasize, at this point, the sharp distinction that Heidegger draws between “meaning,” “truth,” and “validity” as the object of logic, and “reality,” “existence,” and “actuality” as the object of the empirical sciences, and psychology in particular. The answer to the question regarding the meaning of being will require the convergence of those two opposed realms, and the reconciliation of logos and being in onto-logy.

Heidegger’s habilitation dissertation reveals two traits that will remain decisive for his entire thought. The first, borrowed from Hegel, whom Heidegger quotes at the outset, is that philosophy and the history of philosophy are not two separate disciplines. In fact, the history of philosophy is the only way into

---

6. Rudolf Hermann Lotze (1817–81) made important contributions to the emerging project of neo-Kantian epistemology, especially in connection with the concept of validity. In his Logik, book III, §316, Lotze establishes a key distinction between being (or actuality), becoming (or events), and valuing (which applies to judgments). Propositions are neither actual, existing beings, nor events, but validities. Validities are themselves purely logical entities, as opposed to psycho-physiological acts. As a result, many subsequent philosophers, including Heidegger, credited Lotze with helping to forge one of the earliest criticisms of psychologism.

philosophy itself. While philosophy is something for the present, there is something forever present about great thinkers of the past. The second trait concerns the status of logic, language, and meaning. What Heidegger saw in Scotus, and especially in the “speculative grammar” (*grammatica speculativa*) that, at the time, scholars (wrongly) attributed to Scotus, is an investigation into the conditions of possibility of language and sense in general. In other words, Heidegger read Scotus as a proto-Husserlian who had developed a “theory of the forms of meaning,” or a “logic of sense” very close to Husserl’s “pure logical grammar.” Scotus’s logic is not purely syllogistic, that is, concerned with the art of formal demonstration, as in Aristotle. Rather, it is akin to what Husserl characterizes as a “formal apophantic.” It is the part of logic that deals with the *a priori* laws of sense and that, as such, precedes the art of proof, or the logic of consequence (of reasoning). It is concerned with sense in its opposition to nonsense, and not to counter-sense. With the logic of sense, we arrive at the most primordial layer of logic, already developed by Husserl in his Fourth Investigation.

But before dealing with that logic in the second part of his habilitation, Heidegger deals with the doctrine of categories. In doing so, he comes closer to the question that will eventually shape his *magnum opus*. Toward the very beginning of the first chapter, he remarks that Scotus puts his finger on a decisive feature of our relation to the world in general, as a world made of objects, or things. Of an object in general, irrespective of the categories with which we can describe it, we can say that it is something, or that it *is*. No doubt influenced by Husserl’s Sixth Investigation, and by his account of categorial intuition, Heidegger notes how we have all experienced having before us something, being aware of a presence, before actually knowing whether it is a substance or an accident, before being able to attribute a more precise categorial determination to the thing in question. In other words, before our intellectual gaze has been able to identify what is actually given in experience, something *has been* given. This means that we grasp something intuitively, prior to any determination of a categorial nature, or, better said perhaps, that we have a categorial *intuition* of things. Scotus calls this “primary object” “being” (*Ens*): *Ens*, or being-ness, is what is common to all things (*primum objectum est ens ut commune omnibus*). *Ens*, therefore, characterizes the feature that remains throughout the objective sphere: it is the category of all categories, or the primal category (*Urkategorie*). It precedes even the categories of unity (being-as-one) and veracity (being-as-true), that is, the idea that for something to be, it has to be one, and for it to be truly something, it needs to be an object of knowledge, or a “validity” in the sense spoken of above. Such is the reason, also, why scholasticism, and Scotus himself, refer to *Ens* as the *Transcendens* pure and simple. But can we say anything more of this *Ens*, more, that is, than the fact that it characterizes what is common to everything? Of *Ens*, can we say something other than the fact that it is the most
general, and the most transcendent? Aristotle did not think so, and Scotus seems to agree with him: as soon as we ask something about this Ens, we ascribe to it something else; we understand it as being-ness in the sense of unity, veracity, goodness, and so on. In other words, we associate it with other Transcendentia (Unum, Verum, Bonum, etc.), which can be seen as quasi-properties of Ens, but which are not as originary as Ens itself. We clarify Ens, but we also lose it in its originarity. Even in the case of esse as verum esse, in the case of the copula as the vehicle of truth, the category does not coincide entirely with the object in its primitive or raw givenness. There has to be more to this Ens than meets the eye, and more than what the doctrine of categories has been able to express in its long history. There has to be a sense of Ens, or esse, that is not reducible to the senses of esse expressed in the categories. Yet what that excess might consist of, what that Urkategorie might be, is something that Heidegger is not in a position to discover in 1915.

It is only after engaging systematically and at length with Aristotle in the 1920s that Heidegger became fully aware of the nature of the problem, and came to terms with the metaphysical presuppositions underlying Scotus’s own position. Aristotle was on the right track when he identified ousia, or beingness, as the unifying sense of being. Ousia is the name forged after the present participle of the verb einai, to be; the Latin essentia (from the infinitive esse) translates it literally. In and of itself, this category does not designate much. It is only when it is interpreted further as parousia, or praes-ens, that it becomes meaningful. Presence, Aristotle argues, is the primordial meaning of being: what is first and foremost what is present. To the extent that this solution will influence an entire philosophical tradition, if not the whole of Western thought, Heidegger argues that the metaphysics inherited from Aristotle is a metaphysics of presence. But presence, he adds, is not the ultimate or most fundamental meaning of being. It actually presupposes a more hidden meaning, which it cannot access, namely, time. The meaning of being as presence presupposes the present as the origin of time. But this privileging of the present is precisely what metaphysics cannot think: it is the unthought of metaphysics, that is, its most fundamentally ingrained presupposition. Such is the reason why, in the end, Heidegger calls for the “deconstruction” (Destruktion, Abbau) of metaphysics, and for the reconstruction of philosophy as fundamental ontology. What metaphysics takes to be the origin of time, namely, the present, and the fundamental meaning of being, namely, presence, turns out to be only a secondary and derivative mode of what Heidegger calls the essence, or the temporalizing, of time. Time, in other words, is the key to solving the mystery of being or presence in general, the underlying and unifying phenomenon behind all the senses of being that Aristotle – and the entire philosophical tradition – sought (but failed) to discover in his Metaphysics. Time is the fundamental phenomenon, or the primordial event.
The first murmurs of Heidegger’s own voice, and of what will become his question, can be heard in the conclusion to the book on Scotus. There, he claims that problems of logic must be envisaged within a broader context. In the long term, he writes, philosophy cannot do without what is after all its proper domain, namely, “Metaphysics” (GA 1, 348). Is judgment the ultimate site of meaning and truth, the key to understanding the Aristotelian question regarding the many senses of being, or does philosophy need to develop a metalogic that would reveal the ground of logic itself? In the conclusion to his book, Heidegger hints at what that ground could be when he writes that philosophy is “without force” when it is cut off from “life” and when he calls for a “teleological and metaphysical interpretation of consciousness” (GA 1, 352). It is all quite vague and very programmatic, but the spirit in which those final comments are made will carry Heidegger all the way to the publication of Being and Time.

Between 1915 and 1919, Heidegger did not make much progress with respect to his earlier work. Those were the difficult years of the war. In 1916, Heidegger met Elfride Petri, a Protestant, whom he married in 1917, thus bringing the plans for priesthood to an effective end. In 1916, Husserl had arrived in Freiburg, and began to collaborate with the young philosopher only a year later, despite Heidegger’s eagerness to establish a working relationship with the founding father of phenomenology. That same year, Heidegger was called up for basic training as a reservist and received further training as airman in meteorology. He resumed his teaching in 1919.

II. FROM LOGIC TO ONTOLOGY (1919–23)

In 1919 Heidegger broke with what, in a letter to his friend from the early 1910s, Father Engelbert Krebs, he called “the system of Catholicism.” By that he meant the system of the Scholastics. Instead, he turned toward the more personal and passionate Christianity of Paul, Augustine, Luther, and Kierkegaard. In 1919, too, he became Husserl’s assistant, and began to lecture extensively on phenomenology in connection with questions of value, of intuition and expression; with religion and the religious life; with historical figures such as Descartes, Augustine, and the Neoplatonists or, more importantly still, Husserl himself (Logical Investigations) and Aristotle. It is the teaching on Aristotle that struck the greatest chord with his audience, and gave him a national reputation,

8. The letter in question can be found in Martin Heidegger, Supplements: From the Earliest Essays to “Being and Time” and Beyond, John van Buren (ed.) (Albany, NY: SUNY Press, 2002), 69–70.
which resulted in an appointment as Associate Professor in Philosophy at the University of Marburg in 1923.

Theodore Kisiel, one of the most prominent interpreters of Heidegger, dates Heidegger’s first breakthrough to his topic from 1919, and specifically from the “war-emergency semester” lecture course (GA 56/57). In that lecture course, and very much as a response to claims made by others at the time, Heidegger begins by saying what philosophy is not. Contrary to what Jaspers argues, philosophy is not a worldview. And contrary to what the Marburg neo-Kantians, such as Ernst Cassirer, Herman Cohen, or Paul Natorp, argue, philosophy is not mere Erkenntnistheorie, or epistemology. In fact, the criticism aimed at the latter view is a criticism of Heidegger’s own, earlier position. To the first, Heidegger responds that philosophy is a rigorous science, and the primordial science. To the second, he says that philosophy is the science not of the theoretical, and of the existing theoretical sciences, but of the pretheoretical. As we saw, in his very early work, Heidegger himself began by restricting questions of truth and meaning to the theoretical sphere. He now grants that it is easier and more practical to analyze them in that context, where they are universally valid. Mostly, though, “preference for the theoretical is grounded in the conviction that this is the basic level that grounds all other spheres in a specific way and that is manifested when one speaks, for example, of moral, artistic, or religious ‘truth.’”

It is this assumption he now wants to challenge. The theoretical, it is assumed, colors all other domains of value, and does so all the more easily when it is itself conceived as a value, and the highest value. But, Heidegger claims, “this primacy of the theoretical must be broken, not in order to proclaim the primacy of the practical [in the sense of the ethical] … but because the theoretical itself and as such refers back to something pretheoretical.”

What, then, is this pretheoretical ground on which philosophy needs to focus? How can there be “meaning” at a pretheoretical, precategorial level? And how can that ground be accessed scientifically? Let me begin by addressing the latter question. What allows the discourse of the pretheoretical to be “scientific” is phenomenology. Since the scientificity of philosophy cannot be derived from the exact or natural sciences, or from the theoretical, which presuppose the very object philosophy sets out to analyze, it must be of its own making. Phenomenology, with its attentiveness to the things themselves, its methodological procedures and principle of “intuition,” which are not borrowed from the empirical sciences, or mathematics, is the ideal tool to develop such a science.

10. GA 56/57, 59/50.
11. Ibid.
It gives us eyes (or the conceptual tools) to “see” a lived experience in the very way in which it is lived, or experienced, that is, without adding to or subtracting anything from it, without transforming it in any way. Phenomenology, then, situates itself at the level at which the experience takes place.

As for the first set of questions, Heidegger sketches an answer in just one brief section (GA 56/57, §14) of his lecture course. It is remarkably programmatic, and can be seen as laying the ground for what will eventually become *Being and Time*. In that section, Heidegger no longer opposes “meaning” and “existence.” He now understands being, and the being of beings around us, in terms of meaning, and meaning itself in terms of our own living. It is no coincidence if, in that same lecture course, Heidegger, for the first time, raises the question of the “various senses” in which “there is” something (§13): “being” now refers to the various ways in which “beings” are present or manifest before they are understood theoretically. Heidegger invites his audience to undergo a phenomenological exercise by focusing on what they actually see, or on what he, as a lecturer, actually sees when looking at the lectern in the lecture hall. Do I see, he asks, “brown surfaces, at right angles to one another?” Or do I see “alargish box with another smaller one set upon it?” In fact, he replies, I see neither. What I see is “the lectern at which I am to speak,” and I see it right away, “in one fell swoop, so to speak.” I see it in “a certain orientation, an illumination, a background.” Naturally, he adds, “if a farmer from deep in the Black Forest” were to be led into the lecture room, he would have a different experience of the lectern. But he still would not see it “as a box, an arrangement of boards.” He would see it as the place where the lecturer stands, from which he teaches. In other words – and this is the decisive conclusion – he would see the object as “fraught with meaning.” Even someone culturally alien to the world of European universities, such as “a Negro from Senegal,” would still see the lectern as something meaningful. “Even if he saw the lectern simply as a bare something that is there, it would have a meaning for him, a moment of signification.” He would relate it immediately, and pretheoretically, to what he is familiar with. And even if he could not manage to make any sense of it, this would still testify to the fact that he, like everyone else, is caught up in a meaningful world. And that is the point: everything we see or experience, we see or experience as, or in terms of, something else – our own world, our own lived experience (*Erlebnis*), our own history, and so on. Meaning is first and foremost worldly, and not discursive. This “seeing as” is what, later on,¹² Heidegger will call the “hermeneutical as,” in order to distinguish it from the “apophantical,” or discursive “as,” which is the “as” he had been analyzing up until then in the context of his logical investigations. What is so crucial about it is the fact that it signals a layer of meaning,

and a primordial one, that precedes any judgment or proposition regarding the world. It signals an originary layer of meaning that falls outside the operation of *Geltung* in which he had been considering it hitherto. Meaning turns out to be something much more, and quite literally, mundane: it is a decisive feature of the world as *my* world (*Welt*), or my environment (*Umwelt*). Everything, Heidegger concludes in that section, “signifies.” And he adds, in what constitutes a remarkable revision of the position he held in his first two books: “It is everywhere the case that ‘it worlds’ [es *weltet*], which is something different from ‘it values’ [es *wertet*]” (§14). In other words, meaning is not so much a function of the judgments that we express about the world, and the “validities” they hold, as it is the result of our intimate and pretheoretical understanding of the world. There will be no turning back from that breakthrough.

What Heidegger calls the pretheoretical, therefore, is life (*Leben*) as it is lived and experienced (*Erlebnis*), or life as a meaningful nexus that is also a *world*. In that respect, every theoretical attitude, including that of the various natural and formal sciences, constitutes an abstraction from life and world thus understood. As such, it amounts to a process of de-vitalization, or de-vivication (*Ent-lebnis*) in which what is known is removed (*ent-fernt*), lifted out of the actual experience, and objectified (§15). The “reality” of the theoretical attitude is essentially different from that of philosophy: it is a reality of “mere things” with “thingly” qualities, such as color, hardness, extension, weight, and so on.13 “Thingliness” is precisely what can be abstracted from, or distilled out of, the environment and the world of living “significations.” This is how “significations” are turned into “things,” and how the primordial sphere of the “it worlds” becomes a collection of fixed and de-vitalized qualities (§17). In the face of such a transformation, which has permeated philosophy itself, the task of philosophy becomes one of returning to life in its continuity and unity, and of using phenomenology as a way of being in “absolute sympathy with life,”14 describing its basic features. If the operation of theory is described as a “process,” the life that is to become the theme of philosophy becomes an event (*Ereignis*), both in the sense of something dynamic and something that, because I am closest to it, because I am it, can be appropriated (*er-eignet*), but precisely not as an object (§15). The categories of philosophy must not reflect personal views or opinions about the world, but fundamental structures of existence (“existentials”) and actual, concrete possibilities of life. They are not abstract categories, empty generalities that we would somehow impose on life, or “logical forms” disconnected from the reality of factual life.

---

13. In the 1920s, and in *Being and Time* especially, Heidegger will designate that reality as *Vorhandenheit*, or objective presence.
14. GA 56/57, 110/92.
From then onward, it becomes a question of describing that life, as rigorously and methodically as possible. This is what Heidegger does throughout the 1920s, sometimes directly, but often indirectly, through a series of interpretations of Aristotle, and using the resources of phenomenology and hermeneutics. Heidegger’s views from that period are perhaps most synthetically formulated in a short text from 1922, devoted to his “phenomenological interpretations of Aristotle,” and written at Natorp’s request for his appointment as an associate professor at the University of Marburg. “Phenomenology” and “hermeneutics” are now brought together to secure an access to the problem of life as the very problem of philosophy. To interpret, for Heidegger, is to engage in an activity of exegesis or explication (Auslegung) and comprehension (Vernehmen). The task of the interpreter is to see. And this seeing is directed toward a particular matter (Sache). Heidegger’s concept of hermeneutics is essentially intuitionist, and very close to the ideal formulated by Husserl. “Seeing” or, more generally, “intuition” is the access to the Sache, and the guarantee of its givenness: from a phenomenological perspective, a matter or a phenomenon is “given,” and so manifest as a phenomenon when it is grasped in an intuition. The ideal of intuition, and of hermeneutics, is transparency – not just, and not primarily, of philosophical texts, but of life itself. Following Wilhelm Dilthey, Heidegger claims that the ultimate goal of hermeneutics is to render the interpreter transparent to himself as life, and this means as a temporal, historical reality. Hermeneutics is directed toward the living present, or the “fundamental mobility” of life. The emphasis on seeing, intuition, and the living present means that hermeneutics is phenomenological through and through. Heidegger’s own version and practice of hermeneutics is inseparable from his commitment to phenomenology.

In the very first sentence of the so-called “Natorp Report,” Heidegger describes his investigations as a contribution “to the history of ontology and logic.” Ontology is now explicitly named as the object of philosophy, alongside logic. But the logic in question, Heidegger tells us, is no longer the logic of his early student years: it is now a “logic of the heart,” a “logic of philosophy,” or a “logic of thought” directed toward “pretheoretical and practical” existence. It is, in other words, a logic of concrete, “factual” life (das faktische Leben), or “existence” (Dasein). If ontology designates the nature and object of philosophy (the being of factual life as the source and foundation of knowledge in general), logic designates the concepts or categories with which we can grasp that object in its very vitality and facticity. Philosophy is now understood as fundamental ontology, and more specifically as “the phenomenological hermeneutics of facticity.”

15. Heidegger, Supplements, 111.
16. Ibid., 122.
17. Ibid., 121.
In that respect, Heidegger’s so-called “Natorp Report” can be seen as the first, embryonic version of *Being and Time*.

Factual life points, first of all, to the fact that we are always and from the start ex-posed to, or oriented toward, something (*das Aussein-auf-etwas*). This, according to Heidegger, is the fundamental meaning of intentionality. But because this primordial and irreducible relation is pretheoretical, and because there is no interiority into which it can withdraw, Heidegger no longer calls it “consciousness” (*Bewußtsein*), preferring instead to call it “existence” (*Dasein*). Dasein, Heidegger says in *Being and Time*, is essentially ecstatic: existence designates the essence of who we are (GA 2, 12). That toward which we are oriented or thrown is the “world” (*Welt*). It is only as factual life, or as being-in-the world, that human life can be distinguished from inert, lifeless presence, but also from the rest of biological life: on the one hand, my being is one that I must continue to be, it is an inescapable “having-to-be” (*Zu-sein*); on the other hand, it is a “being-able-to-be.” Whereas the former points to something like the necessity of existence (so long as I am, I must continue to be), the latter points to its freedom (my being is a *Sein-können*, or a “being-able-to-be”). The ecstatic nature of existence, he will go on to say in the 1920s, and in *Being and Time* especially, is revealed in the following fundamental traits, known as “existentials”: first, Dasein has the character of being thrown outside itself and into the world; second, Dasein is always ahead of itself, projecting itself into a world of possibilities, constantly anticipating itself; finally, Dasein is always alongside other beings, including other Dasein, and thus always in a world that is shared. “Thrownness” (*Geworfenheit*), “projection” (*Entwurf*), and “being-alongside” (*Sein bei*) are the three basic existentials.18

Heidegger describes the unity of factual life, or of the three existentials, as “concern,” or “care.” With this word, he wishes to characterize the “fundamental mobility” (*Grundbewegtheit*) of factual life.19 We human beings are in such a way that we are “concerned” about our own being. This amounts to saying that our being is always at issue in the fact and the manner of our own being. We are concerned with ourselves. The concern of life is directed toward life itself. Yet to the extent that life is essentially factual, that is, always open to something, its concern is directed at the world. As a result, the movement of caring is characterized by the fact that factual life goes about its dealings (*Umgang*) with the world. And the world itself is always there, in this or that way, as having been taken up or addressed and claimed (*logos*) in care in one way or another. There are many ways in which factual life can be concerned about the world: it cares about needs, jobs, peace, tranquility, survival, pleasures, practical as

---

18. GA 2, §§12, 29, 31.
well as theoretical knowledge, and so on. Every way of caring about the world amounts to a certain understanding of it: life moves itself in a horizon that is already understood, transmitted, reworked, or reshaped. What Heidegger calls “circumspection” (Umsicht) is the way in which life for the most part “sees” its world: its world is already understood on the basis of perspectives, priorities, aspirations, and specific circumstances. From the start, the world is organized as an Umwelt, an environmental milieu, and not as a theoretical (especially mathematical) “reality” that stands opposed; this is to say, not as “nature” in the modern, scientific sense that we have come to take for granted, and which continues to inform today’s debates around realism and idealism, naturalism, and the philosophy of mind. No doubt the world can be envisaged from the point of view of its “look” (eidos), or “form” (idea), in which case it becomes an object of wonder and curiosity – an object of scientific investigation. At the most primordial level, though, the meaning of the world is pretheoretical: we do not understand and navigate the world as a result of its theoretical representation, but of our pragmatic comportment toward it. Our understanding (Verstehen) of the world is primarily practical.

Yet, precisely to the extent that the movement of caring is a living inclination toward the world, life tends to lose itself in the world, to be sucked into it. It takes the form of a propensity toward becoming absorbed in the world, and “forgetting” its own being (and freedom, as was suggested a moment ago) in this absorption. There is, in other words, a basic factual tendency in life toward falling away from itself (Abfallen), a fall through which life detaches itself from itself and falls into the world. Life is naturally decline (Verfallen) and falling into ruin or self-ruin (Zerfall seiner selbst). Terminologically, Heidegger writes, we can describe this basic characteristic of the movement of caring as “the inclination of factual life toward falling” or, in abbreviated form, simply as “falling into …” (Verfallen an). Verfallen is not a mere occurrence, something that happens occasionally to life. Rather, it is a how of life itself, a basic “intentional” modality, or a fundamental manner in which life is open to the world. In fact, this propensity (Hang) is “the most intimate fate [Verhängnis] that life factically has to endure within itself.” What does this mean? That this characteristic of movement is not an “evil feature of life” appearing from time to time, or structurally there as a result of some primordial sin, which, one day, we could hope to atone. We must resist diabolizing this natural declivity, despite its obvious biblical resonances (which were, most probably, an initial source of inspiration for Heidegger). This state of life does not point to a higher, more perfect “paradisiacal naturality,” whether in the old, biblical sense, or in the more recent, say

---

20. See also GA 2, §§35–8.
Rousseauist, sense of a “natural state” of innocence and goodness among men before the introduction of culture and society. In short, it cannot be a question of eradicating life’s propensity toward falling. What it does mean, though, is that life tends to understand and interpret itself on the basis of its own fallen state, that is, on the basis of its own practical, concernful absorption in the world. This is a natural tendency, and an alienating (entfremdend) one, insofar as it drives life to avoid itself, that is, to pass by its other, more genuine possibilities (which Being and Time describes at length). At the same time, however, this tendency is reassuring and tranquilizing: it allows Dasein to carry on with its life without further questioning or complication. For the most part, life is habit (and in that sense not far from the life of other living beings). 22 Heidegger will want to contrast these circumstances, or this state of affairs (Lage), in which life is somehow lost in its own fallen state, with the situation (Situation) in which life makes itself transparent to itself in its own fallen state, takes a stance with respect to itself, cares about itself in a concrete manner, and takes itself up as a possible counter-movement to its fallen state.

What lies in the inclination toward falling is the fact that factical life, which is in each case the factical life of the individual, is for the most part not lived as such. It is lived, of course, but only as something else, as something other than life in its ownmost and most extreme possibility. It is only an average life. It moves itself within the averageness (Durchschnittlichkeit) that belongs to its caring, its going about its dealings, its circumspection, and its understanding of the world. This averageness is that of the publicness that reigns at any given time. It is the averageness of the entourage, the dominant trends and opinions, the “just like everyone else.” But this “everyone” is at the same time no one in particular, an anonymous “I” that factically lives the life of the individual: everyone is concerned about such and such, everyone sees it, judges it to be so, enjoys it, does it, asks about it, etc. For the most part, factical life is the life that is lived by “no one,” or by what Heidegger calls “the one” (das Man). 23 In this way of being (often considered a way of life), life conceals itself from itself in the world in which it is absorbed and in the averageness in which it goes about its dealings. In the tendency toward falling, Heidegger insists, it is as if life goes out of its way to avoid itself. 24

But what is it that life turns away from, or turns it back to, when it conceals and avoids itself in that way? With that question, Heidegger is on the verge of his major discovery, insofar as answering it will allow him to identify the meaning of the being of factical life, or existence, as well as – later on – the meaning of

22. Ibid., 116.
23. Ibid., 118; GA 2, §27.
24. Heidegger, Supplements, 118.
the being of all beings. With that question, he will finally be able to answer the question that, he claims, was guiding his philosophical curiosity from the start, namely, the question regarding the meaning of being. Let me reformulate the question slightly differently. What is it that Dasein is afraid of, such that it would want, or feel naturally inclined, to flee? We know that it is itself, as factical life – and not some “innerworldly” thing – that Dasein flees, and that this fleeing takes the form of an absorption into worldly concerns. But what does this “itself” consist in? What is Dasein’s ownmost self, the feature that separates it from other beings? Thus far, we have described life only negatively, as it were, as habitual, “fallen” life. We need to understand why Dasein avoids itself in that way, and what it is actually retreating from. Also, we need to find out if there is a distinct possibility for Dasein of grasping and appropriating itself as factical life, a possibility, that is, of becoming transparent to itself. Finally, we need to ask how time emerges as the answer to the question regarding the meaning of being. All those questions are intimately linked, and are given a preliminary, programmatic answer in the Natorp Report, which reveals death as a key phenomenon for accessing the meaning of the being of factical life. This may sound paradoxical, of course, as death is normally opposed to life. If anything, a concern with death is normally associated with a flight from life. Not so for Heidegger, who writes: “The forced absence of worry about death in the caring of life actualizes itself in a flight into worldly concerns and apprehensions.”25 Looking away from death does not mean grasping factical life, but evading what is most distinctive about it. Paradoxically, experiencing the phenomenon of death, and thinking about it, makes life itself “visible” and transparent to itself, and reveals its specific temporality. But what is death, and how does it manifest itself positively to Dasein, outside “fallenness”? This is a question that Heidegger leaves unanswered in 1922, but one to which he returns soon thereafter (GA 20, §§33–4), and thematizes most explicitly in Being and Time, Division Two, chapter one.

III. “BEING” AS “TIME” (1923–27)

It is what is usually referred to as the Marburg period that really marks Heidegger’s philosophical breakthrough, of which the publication of Being and Time in 1927 is the crowning achievement. For it is in that period that Heidegger is able to bring together being and time explicitly, and concretely, by thinking the distinct nature of death for Dasein.

There is indeed something quite distinctive about the death of Dasein. Naturally, there is nothing distinctive about dying as such. All living things die,

25. Ibid., 119.
or rather, perish. They all come to an end. Yet the death of Dasein is different, inasmuch as Dasein relates to its own death, not when it is actually taking place, not at the time of its death, but from the start. Dasein's death is distinctive in that it is not an event, or something that takes place in time, but a possibility, toward which Dasein is constantly projecting itself. Yet death is a possibility unlike other possibilities. First, it is Dasein's ownmost possibility, that is, the possibility that it cannot delegate, and of which it cannot be relieved. Second, it is the ultimate possibility, or the possibility of the impossibility of existence: we have the distinct sense, and even knowledge, that our being (Sein) qua potentiality (Seinkönnen) is not unlimited, and that our openness to the world is not absolute. Somehow, we know that there is a horizon that delimits our world, and therefore limits our possibilities. This limit or horizon is precisely death. Finally, it is a pure possibility, or a possibility that, unlike all other possibilities, can never be actualized (for as soon as it is actualized, Dasein is no longer): death is always “not yet” for Dasein. It testifies to the fact that, so long as Dasein continues to exist, there is something outstanding, something to come. In that respect, death keeps the world open, and allows possibilities to emerge. As such, it is the possibility of all possibilities, or the condition of possibility. By virtue of being “only” a possibility, however, it is not as if death were a remote possibility. On the contrary: Heidegger insists that it is always impending, always there in a way, threatening to bring to an end that which it opens up. Such is the paradox of death: it is both the condition of possibility and impossibility of the world. As the end toward which existence exists, death is at once the possibility of closure of existence and the horizon from which the world opens up and unfolds for Dasein, the limit from which “it worlds.” Such is the reason why Heidegger qualifies further the openness of existence, and the fundamental state of being-in-the-world, as “disclosedness” (Erschlossenheit): the openness and manifestness of the world presuppose a more originary closure.

Remarkably, the word Erschlossenheit is also Heidegger’s translation of the Greek, and especially Aristotelian, alêtheia (“truth”). By investigating the fundamental structure of life, and identifying death as its horizon, Heidegger is able to uncover the hidden and forgotten meaning of truth. It is no longer judgment (logos apophantikos), or even speech (logos semantikos), as he once thought, but existence, which is the place and origin of truth.26 The sense of being as truth (esse as verum esse), which Heidegger had tried to understand in his habilitation

26. This discovery emerges in the context of Heidegger's sustained phenomenological–hermeneutical interpretations of Aristotle. The Natorp Report provides an early, still-tentative version of it: “Hon os alethes [being as being true] is not the authentic being of true judgments and their domain of being or validity but rather beings themselves in the how (os) of their unveiled being-meant [seines unverhüllten Vermeintseins]” (ibid., 132); see also GA 19, §26; GA 2, 32–4.
thesis, and to which he returns time and again in his phenomenological interpretations of Aristotle, is now finally established. It presupposes a move from logic to its ontological, and specifically existential, ground. But it is not just the question regarding the sense of being as truth that is solved; it is also the question regarding the sense of sense, or the meaning of meaning – it is meaning itself that Heidegger now wrests from logic, by understanding it as an ontological a priori. “Meaning” now designates the transcendental x, or the horizon, on the basis of which something (in this instance, “being”) becomes intelligible.

Finally, and more importantly still, it is the meaning of being as time that Heidegger is now in a position to reveal. Traditionally, time was considered to originate in the present. The present was the primordial reality from which the rest of time flowed: the past was understood as what was no longer, and the future as what was not yet. As a result of this present-centrism, and as early as Plato and Aristotle, presence (parousia) defined the underlying meaning of being (ousia): to be always (implicitly) meant to be present. What Aristotle called ousia (essentia) was the fundamental, primordial meaning of being, from which all the other meanings (or “categories”) of being were derived. But, Heidegger claims, this understanding of being as presence stems from an inability to understand our own being as existence, and to draw the temporal consequences of that discovery. With Heidegger, “being” no longer means “presence,” but coming-into-presence (dis-closedness), and coming into presence itself presupposes an originary concealment (lethe), which, for Dasein, is death. As the extreme possibility toward which we find ourselves always oriented, death reveals existence as always ahead of itself, projecting itself in a world of projects and possibilities, anticipating itself. “Project” (Entwurf) and “anticipation” (Vorlauf) are fundamental features of factical life. But what those existentials reveal is the fact that life unfolds from the future, and that the future is its source. What we witness with Heidegger, then, is a decisive shift in the perception of where time originates: the center of gravity of temporality is no longer the present, as was the case in the philosophical tradition, but the future (die Zukunft). The future is the source or the origin from which time flows.

For the most part, though, Heidegger tells us, we do not see time (or ourselves) for what it is: we see the result of the event of time – presence, and not presencing. We see things at the end of the process, as things that we can use (or not), with a view to this or that, always in a certain light, without asking ourselves about the source of that light. As a result, we also tend to understand ourselves, our own being, on the basis of the being of those very things, on the basis, that is, of presence (whether practical or objective). We do that naturally, and the metaphysical conception of being is born of that natural tendency.

27. GA 2, 325.
From a phenomenological perspective, however, the question is one of knowing whether we ever encounter time itself, whether we ever experience ourselves on the basis of our own being. Now Heidegger claims that we do, for example in immediately tangible “moods” or “dispositions” (Stimmungen), such as anxiety, or boredom. In both instances, we experience a total withdrawal of the world, or, better said perhaps, of familiar, ordinary, worldly things. We come face to face with ourselves, with our own worldliness and temporality. In boredom especially, we feel very strongly that all “there is” is time, and that makes us feel uneasy. As a result, we look for a way back into the familiar, practical world in which we feel safe. The question, though, is one of knowing whether there is some kind of experience that could reveal our temporal being and bear witness to the temporal meaning of being in general and that we would not want to flee, but to embrace and sustain. Furthermore, could this experience, this “attunement,” reveal more precisely the way in which time unfolds or temporalizes itself? It is in the phenomenon that Being and Time describes as “anticipatory, resolute disclosedness” (vorlaufende Entschlossenheit) that Dasein is said to understand itself “authentically,” that is, on the basis of its own being-towards-death. This phenomenon reveals a distinct possibility of existence, one in which existence is disclosed to itself as disclosedness, or in its totality (as “care”). In resolute disclosedness, Dasein does not flee its own mortality and finitude, but anticipates it, that is, brings it to bear on its comportment toward the world. This means that Dasein does not look forward to its own death, or, worse still, that it anticipates its own death through suicide. Rather, it means that Dasein lives in the full awareness of its own finitude, and of the fact that time itself is finite. This, in turn, has an effect on the intensity with which it lives its life: possibilities are chosen, decisions are made, on the basis of such an awareness.

Even Dasein’s own past, and not just its present, is modified as a result of its ability to relate positively to its own end. We need to emphasize the point that, although Heidegger locates the source of time in the future, and understands life as projection (Entwurf), he also recognizes that existence is not entirely its own ground, and that it is always thrown (geworfen) into situations that are not of its choosing. This, after all, is what moods and dispositions reveal, namely, the irreducible passivity of life, the fact that thrownness (Geworfenheit) can never be erased. To understand itself as being-towards-death, “authentic” Dasein must also take over its thrownness. Now to take over one’s thrownness means nothing other than to be “authentically” or “properly” what one already was “inauthentically” or “improperly.” What Dasein can be is nothing other than what it already is, nothing other than its having-been (Gewesen). It is only in the anticipation

---

28. On anxiety, see GA 2, §40; “What is Metaphysics?” On boredom, see GA 29/30, part one. 29. GA 2, §62.
of its end that Dasein can correspond to its original condition. Only insofar as Dasein ex-ists, that is, comes toward itself futurally, can it come back (zurückkommen) to itself and what it already is:

Anticipation of one’s ownmost and uttermost possibility is coming back understandingly to one’s ownmost “been.” Only so far as it is futural can Dasein be authentically as having-been. The “having been” [die Gewesenheit, and not die Vergangenheit, the past] arises, in a certain way, from the future.30

This is tantamount to saying that Dasein can be its past only insofar as it comes back to it on the basis of its own future. If the having-been arises from the future, it is because there can be facticity only within the horizon of a can-be (Seinkönnen). So, once again, the future, properly understood, is not a now that is not yet actual, but Dasein’s coming toward its ownmost can-be, which occurs in the anticipation of death. Likewise, because Dasein is not a pregiven entity, an entity present-at-hand, it is not, strictly speaking, “past,” but has always already been and is this very having-been: the “having been” (gewesen sein) is the original phenomenon of what we call the past. Traditionally, the past is what is no longer. But the temporal dimension associated with Dasein’s thrownness is not past in that sense. On the contrary, it is a dimension that persists and insists, although not as something present. Thrownness indicates that Dasein exists in the mode of having-been, a mode that is irreducible to a mere “modification” or variation of the present. What we normally call the present is not the founding moment of time. In fact, it is a derivative mode of time. For presence always arises out of the futurity and pastness of existence. Anticipatory resoluteness, in which existentiality is disclosed as essentially futural, also discloses the present. Indeed, anticipatory resoluteness reveals what Heidegger calls a “situation” by making present an entity. The present as a mode of temporality is originally a making present, or a presencing (ein Gegenwärtigen). Coming back to itself futurally, resoluteness makes present the beings that it encounters environmentally. This is the phenomenon Heidegger designates as temporality (Zeitlichkeit). It has the unity of a future that makes present in having-been (gewesend-gewärtigende Zukunft).

Our present is the effect of the way in which our having-been-ness (Gewesenheit) and our futurity (Zukünftigkeit) come together. Now, the present that is opened up in resolute disclosedness is radically different from that of this or that particular situation. It differs from the kind of present that is linked to a punctual and practical situation; in other words, from the mostly “concerned”

30. GA 2, 326.
and “absorbed” present of our everyday life, the present of needs and ordinary dealings with the world. Furthermore, it is also to be distinguished from the abstract present (the “now”) of the theoretical attitude, which we now unquestioningly consider to be the very form of the present, unaware of the spatial, and specifically linear, understanding of time such an attitude presupposes, the ontologico-existential ground of which we can trace back to the ordinary, fallen nature of our relation to the world in everyday life. Rather, the present that is at issue in the “moment” is the present in which existence is present to itself as the very operation of disclosure, or as the very there of being. In the “moment of vision,” or the Augen-blick, Dasein “brings itself before itself”: it sees itself for the first time for what it is, that is, the originary “clearing” (Lichtung) or the “truth” of being. Thus, the “moment” is not linked to the disclosure of a particular situation, but to the disclosure of situatedness as such: “The moment of vision is nothing other than the look of resolute disclosedness [Blick der Entschlossenheit] in which the full situation of an action opens itself and keeps itself open.”31 Thus, in the moment, Dasein has an eye for action in the most essential sense, insofar as the moment of vision is what makes Dasein possible as Da-sein, there-being. It is to this that the human must resolutely disclose itself. The human must first create “for himself once again a genuine knowing concerning that wherein whatever makes Dasein itself possible consists.”32 Thus, in the moment of vision, existence resolves itself to itself, to itself as Da-sein, thus allowing it to become free for the first time: free not to do this or that, at least not primarily, but free to be its own being, free to be in the most intense and generous sense, that is, free to be for its own freedom or its own ability to be.

Being and Time is the culmination of Heidegger’s early thought, which sets out to construe a fundamental ontology by revealing the unifying meaning of being as time. It corresponds to Heidegger’s first major effort to wrest being from inert substantiality and recover its forgotten origin as pure becoming. “Being and Time” really reads: “Being as Time.” But time itself, pure becoming, must be distinguished from the time of the world and of actuality, the fallen time, as Heidegger puts it, in which things and events seem to succeed one another in what amounts to a merely sequential order. Real time, on the other hand, is not the time of succession, or the linear, actual time in which events replace one another. Nor is it the time of eternity, of the absolute present, which events occupy for a while before vanishing into the past. And the past itself is not what is no-longer-present and held in reserve, waiting to be reactivated or brought back into the present. The present is only an effect of time, not its point of departure. To think time from the present alone, then, is to think abstractly,

32. GA 29/30, 247/165, emphasis added.
for it amounts to taking the effect for the cause, even if no actual cause can be associated with the unfolding, or the temporalizing of time. It also amounts to constructing time as a sequence of instants, which, in turn, can be represented as a line made of points and segments. In doing so, time is spatialized, and denied its own temporal essence. Heidegger’s concept of time, on the other hand, is precisely aimed at despatializing and de-reifying time in order to uncover its eventful or ontological power. Time, he says, “is” not, but temporalizes itself; there is no such thing as time, only a temporalizing, and from out of this primordial and ongoing event, everything takes place and finds its place, possibilities emerge, and a world begins to take shape. So when Heidegger claims that temporality is the meaning of care, we need to understand that only in the self-temporalizing of temporality does Dasein exist according to its own possibilities of being. As Heidegger emphasizes at the beginning of Being and Time §65, by “meaning” we need to understand that wherein the understandability of something lies. The meaning of something, therefore, is that which is necessarily presupposed in that thing for it to become understandable. In other words, it is the condition of possibility of that thing. In that respect, when we say that time is the meaning of care, we say that it is only on the basis of the temporalization of temporality that Dasein’s being as care can come to be understood. How are we to understand the temporalization of temporality? What does Heidegger mean by that? To say that time is essentially a temporalizing is tantamount to saying that time does not constitute the “internal sense” or the “interiority” of a “subject,” but that it is “the ekstatikon pure and simple,” “the original outside-of-itself in and for itself.” Heidegger borrows the term ekstatikon from Aristotle’s Physics, where it designates the nature of change (metabole). It is to be understood in its literal Greek sense as a coming out of oneself, and must hence be related to the notion of existence (or ek-sistence, as Heidegger will later begin to write). By defining the future, the having-been, and the present as the ecstasies of temporality, Heidegger emphasizes the temporalizing of temporality as a movement or an event, and not as the coming out of itself of a hitherto self-contained subject: “Temporality is not, prior to this, a being that first emerges from itself; its essence is a process of temporalizing in the unity of the ecstasies.”33 Thus temporality needs to be understood as an ekstatic unfolding, and not, as thought by the “ordinary understanding,” as a pure sequence of “nows,” without beginning and without end. Ek-sistence, then, as the event of being, is entirely outside: it is not an interiority that externalizes itself, but the outside as such, pure exteriority, pure throwing (pro- and retro-ject). It is only with the characterization of our being in terms of time that Heidegger is able to understand fully the meaning of factual life as being-outside-itself-and-toward-something.

33. GA 2, 329.
By way of summary, we can bring Heidegger’s analysis of originary temporality under four theses: (i) Insofar as time makes possible the constitution of the structure of care, time is the originary temporalizing of temporality. (ii) This implies that temporality does not refer to the interiority of a subject, but that it is essentially ekstatic. (iii) Temporality temporalizes itself primordially on the basis of a priority given to the future. (iv) Such an ekstatic–existential temporality characterizes primordial time as finite time. Time, in short, is horizontal, finite, futural, and ekstatic.

IV. AFTER BEING AND TIME (1928–30)

Despite this considerable achievement, Being and Time goes only so far in establishing time as the meaning of all beings (and not just that of the human being), and wresting philosophy from anthropology once and for all. We must bear in mind that the book contains only one of two parts initially planned, and only two of three divisions. This means that the third division of the first part, which was to reveal time as the meaning of the being of all beings, was never written, or at least not until 1962 (in a conference entitled “Time and Being”). But by then the project had been transformed so radically that it was no longer possible to envisage the lecture as the missing third division of Being and Time. What Being and Time planned to do – this is clearly stated in the Introduction (§8) – was to reveal time as the transcendental horizon for the question of being. In a way, this program is accomplished in the lecture course from 1927 that immediately followed the publication of Being and Time (GA 24). Yet what Heidegger does not manage to achieve, whether in Being and Time or in the lecture course, is to think the time or the temporality of being itself. He finds himself always drawn back into what Division Two of Being and Time had established, namely, “the interpretation of Dasein in terms of temporality” (GA 2, 40). In order to carry out his initial intention, and fulfill the program he had initially defined in the Introduction to Being and Time, namely, to reveal the meaning of being itself (as opposed to that of the human Dasein), Heidegger will have to transform his project radically, and abandon the project of a fundamental ontology rooted in human existence. Soon after the publication of Being and Time, Heidegger’s thought began to shift from a transcendental–horizontal conception of the meaning of being, in which being temporalizes itself in the ekstatic temporality of Dasein, to what we could call an aletheic–ekstatic conception of the truth of being, in which Dasein finds its stance and to which it co-responds. This turning marks the point where being is no longer temporal because it constitutes the horizontal unity of Dasein’s ekstatic temporality, but rather because it is historical in itself. There is a shift from historical time as rooted in the historicity...
of Dasein to history understood as a sending and a destiny that belongs to the truth of being itself. The conference “Time and Being” concludes by saying that instead of “being” and “time” we should now speak of “clearing” (*Lichtung*) and the presencing of “presence” (*Anwesenheit*).

In addition, soon after the publication of *Being and Time*, in a few enigmatic and complex pages devoted to a “Characterization of the Idea and Function of a Fundamental Ontology” (GA 26, 196–202), Heidegger suggests that in redefining the task of philosophy as fundamental ontology, one cannot remain content simply with revealing the sense of being as time. For insofar as this task is carried out as a possibility of Dasein itself, it must itself be submitted to the rigor of the ontological analysis. Thus, in what amounts to the ultimate phase of the project of fundamental ontology, the analysis is to turn back on the way in which the transcendence of Dasein is involved in the very elaboration of that project, back on the way in which this task is made possible and limited at the same time by the very way in which the factical existence of Dasein is folded into it. For what characterizes Dasein in its factical existence is precisely the fact that it is always and from the very start confronted with “nature,” or with the totality of beings. Heidegger introduces this problematic of *das Seiende-im-Ganzen*, or of “beings as a whole,” under the name metontology (*Metontologie*), and the latter constitutes the very heart of his reflection in the years 1929–30.34 It is only with the exposition of the way in which ontology runs back into the metaphysical ontic in which it is caught from the very start that philosophy radicalizes itself and is turned over into meta-ontology. Heidegger announces the programmatic nature of this fully developed concept of metaphysics toward the end of the *Kantbuch*, claiming that “fundamental ontology, however, is only the first level of the metaphysics of Dasein.”35 Whereas the 1928 lecture course still conceived of philosophy as a whole, including its last phase (metontology), under the name “fundamental ontology,” the texts and lecture courses written and delivered immediately thereafter identify fundamental ontology with only the first phase of what came to be characterized as metaphysics. Yet this metaphysics of Dasein, or this metontology, which led to fascinating developments in themselves, was itself abandoned, and replaced by yet another way into the question of being. This shift – known as the “turning” (*die Kehre*) – is apparent in Heidegger’s pivotal lecture course of 1929–30 (GA 29/30). In the first part of the lecture course, entitled “Awakening a Fundamental Attunement [*Grundstimmung*] in our Philosophizing,” Heidegger sets out to unveil the ground or the soil from out of which philosophizing might be possible. In other words, this first part is supposed to bring us to the very threshold of metaphysics.

34. See also “What is Metaphysics?” and “On the Essence of Ground,” and GA 29/30.
35. GA 3, 232.
and of its fundamental concepts by turning to the buried source of a concrete disposition of our existence (this is what Heidegger calls the ontical–existentiell level, which he distinguishes from the structural, or ontological–existential level). Thus, the preliminary task to which Heidegger devotes himself in that lecture course is the awakening within us of a metaphysical disposition that, as existents, is proper to us, and on the basis of which the entry into metaphysics should take place. But things will turn out to be more complicated. Indeed, the analysis of the fundamental disposition that is supposed to take us to the very threshold of metaphysics or, to be more precise, the historical diagnosis to which Heidegger submits this disposition, is introduced at the cost of a tension that the 1929–30 lecture course is not in a position to resolve. The solution to this tension will be found only when Heidegger will reformulate the project of the question concerning the meaning of being and transform it into the question concerning the history of being. In other words – and this constitutes the truly paradoxical nature of Heidegger’s enterprise – the progressively revealed access to the fundamental concepts of metaphysics is eventually inscribed in a context that itself is such as to call into question existence as the primal and originary source of metaphysics. Metaphysics itself will turn out to be grounded not in the transcendence of Dasein, but in history, understood as the history of being: metaphysics itself turns out to be an effect of history, and not just a possibility of Dasein.

Volume 3
I. RENEWAL OF THE QUESTION OF BEING

The question “what Being is” is “the question which was raised of old and is raised now and always, and is always irresolvable.”

(Aristotle, *Metaphysics* 1028b)

Citing this passage from Aristotle’s *Metaphysics*, Jaspers takes up the question of Being as the perennially most fundamental question of philosophy. Coming to terms with its irresolvable nature, Jaspers thinks that the question requires not a radically new departure, but a fresh approach that draws on humanity’s experience of thought about it. Jaspers’s thinking constitutes a renewal of the question of Being, based on a reorientation whereby its possibility is clarified and its significance reconfirmed. The reorientation of the question of Being is the achievement of the first of his two main works, *Philosophy*. On the basis of the reorientation, Jaspers’s later main work, *Von der Wahrheit*, provided the

---

2. Karl Theodor Jaspers (February 23, 1883–February 26, 1969; born in Oldenburg, Germany; died in Basel, Switzerland) was educated at the Humanistic Gymnasium Oldenburg (1892–1901) and universities in Berlin and Göttingen, and took his medical doctorate at the University of Heidelberg (1908). His influences included Husserl, Kant, Kierkegaard, Nietzsche, and Max Weber, and held appointments at Heidelberg Psychiatric Clinic (1909–15) and the University of Heidelberg Department of Psychology (1913–20) and Department of Philosophy (1920–48). He was forced to retire by the Nazi regime in 1937 because his wife was Jewish, and in 1945 was reinstated under US Army auspices. He was honorary University Senator of the University of Basel (1948–), and emeritus (1961).
elaboration in the form of a radical treatment. The two works are not separate departures, but two stages of Jaspers’s renewal of the question. Jaspers speaks mainly of “truth” rather than of “Being.” We do not confront Being per se, but only as it is “for us”: “Truth” is “Being for us.” Thus the question of truth coincides with Being for us. Most thought and action is valid by virtue of a specific truth or kind of truth, for example scientific inference, pragmatic expediency, justification by faith, representation of interest, formal deduction. The fundamental question of truth is distinct: it underlies any and all manner of “special truth,” it is the question of truth in its fundamental unity. The tradition of metaphysics assumed that the underlying fundamental truth has an object, and can be determinately grasped. Yet a system of Being, no matter how inclusive, is, by virtue of its determinate foundation, limited. Since thought is, as such, determinative, truth in its unity, transcending determination, is not present to it as an object. Therein lies the “irresolvability” of truth in its unity.

Yet the question of truth has been “raised of old and always.” In history it has been perennially significant because it concerns the source of meaningfulness of a thoughtful life and of a life of purposive action and endeavor. Hence the philosophical concern over truth that is the truth calls for “operating with this indeterminacy.” Accordingly, Jaspers’s philosophy culminates in the idea of the truth of Being as encompassing man’s temporal perspective.

II. THE FIRST STAGE: REORIENTING THE QUESTION OF BEING

The idea of Being and truth as “encompassing” is adumbrated in Jaspers’s earliest works. The adumbrated motives are taken up in the three volumes of Philosophy (1932). The focus there is on the question of Being. In light of those motives, the

3. See the methodological pluralism in General Psychopathology, J. Hoenig and Marian W. Hamilton (trans.) (Chicago, IL: University of Chicago Press, 1963) and the phenomenology of Weltanschauungen in Psychologie der Weltanschauungen (Berlin: Springer, 1919).
4. Jaspers and Heidegger met at the observance of Husserl’s sixtieth birthday, and soon formed a close philosophical friendship. Jaspers was six years older than Heidegger, and, at that time, had more experience in thinking against the stream. In the 1920s, while writing their first major philosophical works, they met frequently for intense discussions. It is not known what they discussed. Although they went divergent ways, they found their contact challenging and fruitful. The fact that the first volume of Heidegger’s Being and Time was published several years before Jaspers’s complete three volumes of Philosophy does not mean that the latter was written in response to the former, as Heidegger hastily published his volume to qualify for a professorship. Neither knew what the other was writing, and when the respective works came out, neither of them understood nor appreciated that of the other. Both addressed the question of Being. After Being and Time, Heidegger would make attempts to envisage how it would be if “what calls for thinking” is “Being itself.” Jaspers, realizing that “Being itself” transcends man’s thought, would elaborate on the question of “Being for man in time.” Jaspers
“search after Being” is posed from the limited perspective of man’s historicity, that is, of man in his situation and within his temporality. From this perspective, Being ruptures into modes of Being. It is a kind of thinking that steps beyond the multiplicity of beings and kinds of Being, beyond the determinate objectivities of cognitive thought, and beyond the phenomena of which we are conscious. It is the basic operation of philosophical thought; Jaspers calls it “transcending.”

These themes determine the division of Philosophy into the three “books.” We first ask how Being presents itself as “world” within the confines of man’s situation and temporality; second, what are the characteristic phenomena of man, the being that exists thinkingly, such that they determine man’s search after Being; and finally, how man relates to the ground of Being that as such transcends man’s grasp.

**World-orientation**

The Being of the world shows itself to transcending thought not as it is in itself but according to man’s orientation within the world. Among the most prominent modes of world-orientation, Jaspers discusses “purposive action” in the world as well as knowledge about the world, in particular modern scientific thought.

The phenomenon of orientation divides into many modes. World-orientation is not a pursuit designed to lead to a closed and finished structure of the kind envisaged by, for example, idealism or positivism. Especially scientific world-orientation calls for a representation of knowledge achieved at any one time; it is at best an open, ever-changing systematic order, never a system. Systems such as positivism and idealism are the opposite of a systematic order, because they absolutize knowledge gained through a specific kind of world-orientation that, in its specificity, is relative.

**The perspective of man’s temporality**

The second book is a transcendental reflection on the being of man as Existenz. Dealing with its subject matter in a manner different from Heidegger’s fundamental-ontological analysis of Dasein, Jaspers characterizes the prominent phenomena of man’s being-in-time. This can be regarded as the basic text of modern existential philosophy. Its wider significance is determined by the context of the whole mentioned that in working on Von der Wahrheit, he had Heidegger in mind; he was referring to a theme of his later work, namely, that philosophy has political import. To him Heidegger’s (brief) alignment with the Nazi movement was an appalling and telling misstep. See Jaspers’s Notizen zu Martin Heidegger, Hans Saner (ed.) (Munich: Piper, 1978), as well as the posthumously published chapter “Heidegger,” Hans R. Rudnick (trans.), in The Philosophy of Karl Jaspers, rev. 2nd ed., Paul. A. Schilpp (ed.) (La Salle, IL: Open Court, 1974).
Leonard H. Ehrlich

work, according to which the search for Being is thrown back to the question concerning the one who is searching. In this way one can prevent confusing Being with Being-as-it-is-for-man in his historicity. This is the primary concern and main achievement of this part of *Philosophy*, entitled “Illumination of Existenz.”

The modalities of the question of Being become actual and articulated to man, not in his being of and in the world but by existing self-consciously in his temporality. Existenz can be approached by transcendental phenomenology but not cognitively; it can be illumined, not in its actuality as a living person, but only as “possible Existenz.” In order to emphasize this, Jaspers often speaks in polarities reminiscent of Kierkegaard’s Anti-Climacus. This procedure stands in marked contrast to Heidegger’s phenomenology of the structures (*existentialia*) of the being of Dasein in *Being and Time*, written at the same time that Jaspers wrote *Philosophy*.

Accordingly, historicity and communication are the leading themes of Jaspers’s phenomenology of “possible Existenz.” In Jaspers’s conception, historicity refers to whatever becomes historic out of the ground of Being through the agency of thinking man. It refers not only to time, but to man’s temporality. It means not only history (what is realized in public time), but history as the realization of what a person is committed to, and for which he offers his temporality. Man finds himself tied to situations that challenge him to make choices and decisions. This involves the risk of offering up one’s limited temporality, as well as proving oneself with respect to what one regards to be one’s grounding in truth by virtue of fundamental convictions (faith). It entails the assumption of obligation for what is to be actualized, and responsibility for the success or failure of one’s action.

The truth of Being is not realized through action wholly and with finality. Instead, what is true within the bounds of one’s temporality is – not infallibly – decided in one’s original realizations. Moreover, man exists and acts with respect to fellow man; one stands essentially in communication, for one’s truth is not all the truth. Concern over one’s truth means to be engaged in a struggle for the truth with or against fellow man. Jaspers indicates the relevance of communication to realms of human realization that are wider than that of interpersonal transaction, including the political.

Obligation and responsibility call for a discussion of freedom as distinguished from free choice. Freedom cannot be grasped like a knowable object or an observable trait, which would reduce it to conditionality. Freedom is unconditional; it is a capacity drawn from the ground of Being by which man finds

---

*5. For a discussion of Kierkegaard, see the essay by Alastair Hannay in *The History of Continental Philosophy: Volume 2*.***
himself, and, finding himself, participates in the determination of truth for man in time.

The unconditionality of Existenz is at play in Jaspers's conception of other phenomena. Man's coming to be takes place in the context of cultural, biological, social, historical, and everyday situations; as mere Dasein, man's being is tenuous, is “never without struggle and suffering,”6 is inevitably entangled in obligation and guilt, experiences failure and shipwreck, and is confronted with death and having to die. While such limits are conditions of man's being, Jaspers points to their import when they are encountered as limit situations. They are limit situations not by setting limits, but in being confronted. Confronting “limit situations” can direct us to choices on which depend whatever truth can become actual within those limits.

Man does not merely function as the instrument – for example, of the World-Spirit (Hegel) – of actualizing whatever comes about through him, since one’s personal fate and destiny are involved no matter what cause, lord, or god one serves. Where man effects his actualization out of possibilities that are not cognitively derivable but require fundamental commitment and choice, he draws them from the ground in which he is rooted. Jaspers refers to this phenomenon of one's originality as absolute consciousness, in distinction from cognitive consciousness and from Hegel's mediating particularization of the Absolute Universal. Absolute consciousness is to be understood as daring to bring meanings and actualities to bear on the here-and-now that are not native to it. Jaspers recognizes absolute consciousness in the phenomena faith, love, and the creative imagination. By means of the illumination of those phenomena of “possible Existenz,” Jaspers provided the groundwork for reorienting the question of the search for Being by way of the question concerning the one who is searching.

The transcendence of the ground of Being

The question of the truth of Being is the fundamental topic of philosophy; it is therefore with respect to the enterprise of philosophy that Jaspers applies the most radical reorientation effected through the “illumination of Existenz.” While “Metaphysics” is the title of the third book of Philosophy, Jaspers's treatment of the subject is a departure from traditional metaphysics. He rejects metaphysical thought that lays claim to universal validity which, in his view, has been preempted by modern science. The question of the ground of Being must be thought as transcending determinacy – hence its unresolvability. In light of the reorientation, metaphysics is now regarded as the thinking being's relation to the ground of Being, rather than as the forms and traditions of objectification.

Consequently Jaspers’s treatment focuses on the ways of thought about metaphysical topics.

Jaspers raises the question: “Is that which had been the foundation of personalities and of singular creations an aberration. … would it be high time to extirpate it once and for all?” And he poses the opposite question, “is there within us a sense of forlornness and a longing for the retrieval of an experience of authentic Being?” In light of the critical distinction between cognitive–scientific and metaphysical thought, Jaspers says that if the latter is meant to refer to knowable objects, then it is illusory; however, it is actual for Existenz in its relation to the transcendent ground of Being, especially in light of the unconditionality of freedom and the originality of choice. For Existenz, metaphysical thought is historic, that is, actual in the exercise of one’s freedom.

To Jaspers, received testimonies of the relation to transcendence, such as scriptures, myths, theological treatises, texts of philosophy, and, in particular, of metaphysics, are the dry bones of the vital appearance of authentic Being for an Existenz in its freedom. Their significance for us consists in that, by studying them. These testimonies may, by assimilation or by rejection, awaken in us our own historic grounding in the truth of Being.

Jaspers elaborates on this significant aspect of traditional metaphysics under the heading “formal transcending.” On the surface, his is a critical examination of a thinking that has traditionally prevailed in metaphysics and systematic theology. The criticism is aimed at the supposition that formal thought, operating with categories of cognition, can produce valid and cogent knowledge concerning transcendent matters; in this sense Jaspers sees a reason to depart from traditional metaphysics. But his criticism also shows that metaphysical speculation, pursued without the pretense of cognition but with the courage to proceed with clarity of thought and the risk of shipwreck, can be an indicator that the relation to transcendence is actual in the historicity of Existenz. Traditional metaphysics can then gain a new significance.

The centerpiece of Jaspers’s metaphysics is his phenomenology of existential relations to transcendence, that is, what posture Existenz takes as it directs itself to transcendence. Jaspers explores four pairs of such postures. These are not alternatives, but in each case exhibit the tension of polar opposites. It is one of the most original parts of the work, spanning worldwide theological thought; I indicate them in brief.

Defiance and devotion (or piety) are postures taken when merely living one’s existence in the world and in everyday life becomes questionable, as in the

---

8. What Jaspers means by Hingabe is difficult to render in English; “devotion” or “piety,” which I favor, come closer to the intended meaning than Ashton’s translation “surrender.”
confrontation with limit situations. It is the refusal to remain blind with respect to the questions of the meaningfulness, worth, justice, and justification of existence. Jaspers recalls Ivan Karamazov’s defiant protest against a world in which even one innocent child has to suffer. Like Job, Ivan wants to know. The will to know is a primary note of defiance. Devotion is the polar opposite, but not in the sense of surrendering the insistence on understanding what transcends comprehension. Instead, as with Job, it is a knowing piety, born of the knowledge of one's fundamental ignorance, and knowing that, even though one stands by oneself in one's freedom, one, as it were, did not create oneself; one is “not the ultimate.” In its knowing ignorance (as in Cusanus's docta ignorantia), devotion is the chance of accepting one's freedom and one's temporal existence in the world as a gift to be used for the actualization of what can be only through oneself.

The confines of time and temporality determine the second polarity, that of descent and ascent. Within temporality, the relation to transcendence is not a state but an ongoing process of uncertain outcome. It is a matter of invoking ideals of meaningfulness, aspirations, standards of responsible action, causes and purposes to be fulfilled. These are not determinants of our existence, for what we become is subject to our decisions. They function as measures with respect to which we prove ourselves or fail to do so. It is a way of descent to regard the truth to which one ascends as the only truth, without conceding the validity, for the other, of his other truth. Being in process within time, one is never whole; one is torn between the voice of the genius and the voice of the demon, the slide into abject nothingness and the realization of immortal Being.

The existential positions, which Jaspers characterizes with the metaphoric imagery law of day and passion for night, are a fundamental polarity reminiscent of the Greek cosmos and chaos. The position “law of day” obliges us to order, clarity, reason, hence to being loyal and dependable, to “actualization in the world, to building in time, to complete temporal existence on a never-ending path.”9 Thus to Jaspers the light of reason is not extraneous but fundamentally proper to Existenz. Yet “night,” the wholly other, also demands its due, for it is, like Schopenhauer’s cosmic will, a felt actuality that, blind to thought and reason, brings forth and destroys. It affects us in our coming forth out of the darkness of not-being, in this age, at this place on earth, and among these people; in the inevitability of our death and of the eventual ruin of all we have built. Truly a passion for night, it is active in us, most prominently in that “incomprehensible fetter” of eroticism beyond mere sexuality. Night is not evil; the distinction between good and evil prevails in day, and night is beyond good and evil.

The idea of transcendence as the One is the focus of the final pair of existential relations to transcendence, namely the “Wealth of the Many and the

---

One.” Jaspers wonders about the perennial fascination with the One, beginning especially during times that Jaspers later identifies as the “axial times.” He recalls, for example, the idea of the one universal deity of Greek philosophy (Xenophanes, Plato), and of “the God of the Jewish prophets experienced in the soul’s solitude.”

What is at play is oneness as the existential relation to transcendence, which, in the testimony of untold generations, has been thought of as the divinity. Jaspers explains: if we decide by whim, or let ourselves be tossed about by the vicissitudes coming our way, then we fail to be an identity. It is different if we make choices and act out of what is fundamentally important to us, if we know where we stand and are true to ourselves. Yet the transcendent One on which one grounds oneself is in each case one’s own truth. It is not a matter of partaking in what one can know to be an all-embracing ultimate truth. My truth is not everybody’s truth. Even in mutual struggle one has to concede each other’s relation to God. While one’s God is subject to one’s choice and risk, the truly One is beyond one’s limit. “Authentic Existenz will not lose sight of the far God beyond one’s near God.”

_Ciphers of transcendence_

If the relation to transcendence is fundamentally existential, what is the meaning of the articulation of that relation, whether in images, myths, symbols, metaphysical systems, or religious doctrines? Jaspers takes up this question in the last chapter of _Philosophy_, “The Reading of the Cipher-Script.”

The basic thought is as follows: Transcendence to which one relates as one’s ground in Being cannot be encountered as an actuality in the world, nor thought in the manner of a cognitive object. Yet actual objects and determinate thoughts are the unavoidable means of articulating that relation. Thus transcendence is present only as mediated through one’s thoughts or in experienced actualities, and such thoughts or experiences are “ciphers” of transcendence. In ciphers one does not understand or hear but can be addressed by transcendence. Any thought, any experience, can be taken as expressive of that relation, but only to us in our “absolute consciousness,” not in our cognitive understanding. With regard to the inevitable objectification of ciphers, Jaspers distinguishes between the levels of immediate experience, of objective configuration, and of speculative elaboration.

10. _Ibid._, 124.

12. Although an original approach to metaphysics, it is rooted in the experience and history of thought, especially modern thought. Jaspers refers to Paul Tillich and Friedrich T. Vischer; but see also Ernst Cassirer (symbolic forms) and Emmanuel Levinas (Trace).

13. Jaspers speaks of “three languages” rather than levels.
To illustrate: In Golding’s *The Lord of the Flies*, schoolboys stranded on a deserted island kill a pig, sever its head, and triumphantly mount it on a pole. Fascinated by the ugly sight of flies swarming around the decaying head, one of the boys is overwhelmed by the display of what to him is the presence of an awesome and implacable happening beyond comprehension. This is the cipher at the level of existential immediacy. At the next level, immediacy is replaced by objectification, such as institutional religion, mythic imagery, art, doctrine. In such objectification, the cipher does not remain the vehicle of one’s personally exclusive relation to transcendence. It can be regarded by anyone; one can appreciate it without being addressed by it; it can be debated, criticized; it can attract or repel. It is then no more than a symbol; but to the extent that one can be addressed by it, the symbol is a cipher.

In the public domain, a cipher is a determinate object; its meaning can vary with the observer’s standpoint. But insofar as the cipher is expressive of one’s grounding, in freedom, on transcendence, it represents the indeterminacy of transcendence. The meaning it conveys is not verified by interpretation or speculation – the third level – but through one’s commitment and the difference it makes here and now. But personal verification is neither evidential inference nor conceptual finality. Transcendence is as such unfathomable to man thinking determinately and existing in time; the meanings of the cipher are multiple, and transcendence can manifest itself in other ways.

Jaspers’s conception of metaphysical (including theological) thought as the existential reading of the cipher script is the basis of his view of the foundation of religion. This view was challenged by proponents of revealed religion, to whom the tenets of faith are neither myths nor symbols but revealed accounts of mysterious occurrences. Jaspers has met the challenge, whether in the demythologizing controversy with Rudolf Bultmann, or in the confrontation of revealed faith with philosophical faith. In most of his works, we find his interpretations of testimonies of existential relations to transcendence as ciphers, such as religious doctrines, works of literature, myths, works of art, and traditional metaphysics. The last, while rejected as literal, cognitive thought, is seen by Jaspers, especially

---

14. The Protestant theologian Rudolf Bultmann, inspired by Heidegger, proposed to demythologize the Bible by translating the myths of the New Testament into a nonmythical idiom, leaning on modern science. The only exception is the event of salvation, that is, Jesus’s death on the cross and his resurrection; this is to be accepted as literal fact by virtue of the kerygma. Jaspers countered that the truth of myths, symbols, and ciphers is translatable only into other myths, and verified not simply by confessing to it, but by its impact on the conduct of life. See Karl Jaspers and Rudolf Bultmann, *Die Frage der Entmythologisierung* (Munich: Piper, 1954), published in English as *Myth and Christianity: An Inquiry into the Possibility of Religion Without Myth*, Norbert Guterman (trans.) (New York: Noonday Press, 1958). [*] For a discussion of Bultmann, see the essay by Andreas Grossman in *The History of Continental Philosophy: Volume 4*. **
in his *The Great Philosophers*, in its significance as the cipher-like articulation of relations to transcendence.

Personal temporality as the pivotal factor in the reorientation of the question of Being and truth is especially at play where reading the cipher-script ends and culminates in the phenomenon of *shipwreck*. This is neither the deliberate pursuit of foundering, nor the nihilistic resignation from life seen as an exercise in futility. Instead, it is the actual *experience* of the inevitability of shipwreck by one engaged in realizing whatever Being and truth can humanly be realized.\(^{15}\) The ultimate cipher is the one where man, attempting to fathom meaning, runs aground. We cannot find life-giving meaning, for example, in memories lost that are the last repository of what has been achieved, realized, attained by way of Being for man in time. Being as such is the abyss at which thought fails.

The phenomenology of “reading the cipher script” shows that “the question ‘what Being is’ … is unresolvable.” Insofar as Being “calls for man’s thinking,” Being does not provide man with direction by his stepping back and “letting Being be,” as Heidegger suggests. Instead, we are turned to Being as it is for man bringing himself forth in time.

*The triple helix*

By virtue of the reorientation elaborated in *Philosophy*, Jaspers proceeds with the renewal of the question of Being with respect to the *unity of Being and truth*, the basic theme of *Von der Wahrheit*. Several undercurrents motivate Jaspers’s pursuit of the question in *Von der Wahrheit*.

One is the *unresolvability* of the question of Being: “We do not and we shall not possess the one truth, and yet the truth can only be one.”\(^{16}\) The question therefore turns on how the unity of the truth of Being can be regarded through thought determined by man’s temporality.

Another motive is the reference to the *testimony* of humanity’s concern over that question in the history of philosophy as well as in literature and religion. Jaspers’s leaning on this testimony is so programmatic a feature that parallel to his systematic elaboration of the testimony that informed the reorientation, Jaspers devoted much of his later years to a major and original conception of a “world history of philosophy,” which, by its conception, was integral to and intertwined with the philosophic elaboration of the second stage in *Von der Wahrheit*.

Finally, since truth for man in time is historic, there is no truth for man without testimony through choice, action, and responsibility. Authentic philosophy is

\(^{16}\) VdW, 839.
the practice of philosophy. Inasmuch as action affects others, action as testimony of one’s truth is potentially of political import. If we add to that the importance of communication for interpersonal transaction, we find that for Jaspers the question of the unity of truth carries with it a concern over the unity of the human community and of its challenges and tasks past and present, including the unity of the enterprise of research in the university, the meaning of history, and above all, the political motive. The concern over praxis is integral to and intertwined with the substance of the philosophic elaboration of Von der Wahrheit, and is the subject matter of major and minor works of Jaspers’s later years dealing with fundamental political thought, critical studies of current political topics, the criticism of modernity, philosophy of history, the future of scientific research, of the practice of medicine, of education, and the university. Consequent on the earlier reorientation, Jaspers’s thinking in each of the three strands is intertwined with the others, each informing the other. These are: the question of the unity of Being and Truth for man in time; regard for man’s experience with that question; and concern over the active realization of Truth. This triple helix of his thought – fundamental thought, history of testimony, testimony through praxis17 – more or less indicated in Philosophy, is deliberately at play in his later writings.

III. THE SECOND STAGE: BEING FOR MAN IN TIME

Being and its modes: the encompassing

In light of the reorientation we now have to ask how we can speak of Being from the perspective of the historicity of man. For man, Being in its oneness is absolutely transcendent, it surrounds man’s temporality, it is the “Encompassing.” For man, Being ruptures into modes, which are also encompassing as they appear to man. They are encompassing horizons in that they recede no matter how far we progress in realizing what is for man in time.

Pursuing a radical train of thought, Jaspers discloses such horizons, characterizes them, and shows the relations between them. Jaspers calls this a doctrine of the modes of encompassing Being, or “periechontology,”18 in distinction

17. The three strands are displayed in the list of Jaspers’s major works: “Fundamental philosophy”; “Philosophy of faith and religion”; “History of philosophy”; praxis: “Political philosophy,” “Philosophy of modernity and history,” “Psychiatry and psychology”.
18. Jaspers reached back to a similar use of the word in Aristotle’s Metaphysics; Aristotle reports that according to Anaximander the apeiron (the unbounded) cannot be a single thing but encompasses (periechein) single things, and cannot be something that is itself encompassed (periechomenon).
from traditional ontology, that is the doctrine of Being. Jaspers eschews both the constructive thinking (traditional metaphysics) and the antimetaphysical de-constructive phenomenology (Heidegger). Instead, he refers to the testimony of humanity’s hitherto achieved realization of Being and truth, the testimony of philosophy as well as that of language, literature, art, science, praxis, religion, and myth.

Jaspers meant his periechontology to be suited to the contemporary tasks and challenges of peoples meeting in what has irreversibly become one world since it provides an “open horizon” for them to meet in communication. He insists that his periechontology is a personal philosophical perception, not a claim to universal validity. The idea of periechontology is historic, hence open and modifiable. Jaspers does not regard it to be original with him, but at play in all great philosophers, beginning with Plato. It is the open space where people who are divided in their respective fundamental faith can meet in mutual tolerance.

The primary rupture of Being for man is the subject–object dichotomy. Whatever is for us is within this dichotomy. Being-as-such, encompassing both subject and object, is not amenable to being an object for us. Within the primary rupture, Jaspers distinguishes being-object as “Being itself,” and being-subject as “Being that we [human beings] are or can be.”

“Being that we are or can be” divides into several modes: being-there (Dasein), consciousness-as-such, spirit, and Existenz.

**Being-there.**

We are as Dasein, that is, we are there (da-sein means “being-there”) as beings in our environment, in and part of the spatiotemporal world, as life in the biological sense. Whatever else we are, we are actual in the concreteness of our being-there. Being-there is the arena of our actuality. The subject–object dichotomy with respect to being-there consists of the distinction of one’s personal life from one’s surrounding world, one’s environment.

**Consciousness-as-such.**

The term (Bewußtsein überhaupt) stems from Kant. It refers to thought-as-such in the sense that whatever else we human beings may be said to be, we are it thinkingly. Thought, Jaspers says, is a primal phenomenon; it accompanies all other phenomena. Being-thinking includes not only cognition, but also self-consciousness and the inner act of experiencing; hence the designation “consciousness-as-such.” It is by virtue of our being consciousness that Being for us is split into subject and object. Being thinking, we can transcend any being that is for us as object, and, thinking it, we think it in the

---

form of objectivity. No mode of encompassing Being is for us except insofar as we think it. Even the fundamental (“pre-logical”) distinction of the modes of the Encompassing is the work of thought. However, it is cognition that is the proper fulfillment of thought. Hence the nature of thought merits an extensive treatise in Jaspers’s *Von der Wahrheit.*

**Spirit.** Jaspers reintroduces spirit into philosophic discourse as an encompassing mode of the being that we are. In his conception of the spirit, Jaspers, inclining toward Kant’s transcendental idea, stresses the articulation of spirit in the form of ideas. Ideas express transcendental wholenesses and serve as practical or theoretical measures, as motivating aspirations, and as configurations, metaphors, symbols, or ciphers of transcending thought. For example, over the decades Jaspers published three versions of “the idea of the university,” each containing the same core idea, but differing in its application to changing conditions; they are meant not as descriptions of extant universities, but as measures that existing universities might refer to in the realization of the idea. In the form of ideas Jaspers sees encompassing spirit as carrying the formidable weight of humanity’s directing itself to its tasks, to creativity, to investing life and reality with respect to meaning.

**Existenz: self-being.** We do not need to reiterate here Jaspers’s phenomenology of possible Existenz (freedom, historicity, communication, et al.). But Jaspers also speaks of “self-being.” Being oneself means being engaged in an unending task of becoming by virtue of the risk and responsibility of decisions and choices made in confrontation with challenges, choices out of possibilities that are not always at hand but are invoked from the ground of one’s being. It is for this reason that, with respect to man’s temporality, he speaks of self-being as Existenz, that is, as deliberately coming to be in time out of infinite possibility. Existenz is thus more than (transcends) the immanent modes. Jaspers says, “I am not merely there [being-there], not merely the subject of consciousness-as-such, not merely the place of spiritual movement and spiritual creation, but in all of them I can [either] be myself or be lost in them.”

Jaspers discusses the relations and distinctions between Existenz and the immanent modes extensively; we mention only one aspect concerning spirit, namely the question of time and historicity. To Hegel, human actualizations are the particular concretions of the spirit’s universality. But Existenz is not a

---

22. See Jaspers’s early essay on “Kant’s Doctrine of Ideas” appended to his *Psychologie der Weltanschauungen.*
23. VdW, 77. See also Karl Jaspers: Basic Philosophical Writings, 154.
derivative and cannot be subsumed under a universal; Existenz is on its own responsibility, at its own risk. Existenz leans on spirit for its self-articulation; it is not an item of the world spirit’s comprehensive historical universality. For universal spirit, time is the panorama of its timeless wholeness. For Existenz, time is one’s own temporality on which one brings to bear timeless sources of possibility in a never-ending search for wholeness.

How can Existenz be discerned as a mode of man’s being that transcends the immanent modes? One indicator is the motive of immortality among peoples of all kinds, of all times. Jaspers does not mean immortality as “the continuation of life in another form”; he means a sense of being borne by an eternity (transcending temporality) that manifests itself in persistently filling one’s temporality with effective activity. In Jaspers’s words:

> We have but one actuality: here and now. What we miss by our evasion will never return, but we lose Being also if we squander ourselves. Each day is precious: a moment can be everything. We are remiss in our task if we lose ourselves in past or future. The timeless is accessible only by way of present actuality; only by taking hold of time do we get to where all time is extinguished.24

The subject–object dichotomy with respect to Existenz is the polar relation of Existenz to its other, to transcendence, as the “dark ground” and source of our being “out of which I encounter myself in freedom … [and] bring myself forth, yet am given to myself as a gift.”25 In this sense, Jaspers regards faith – as in Philosophy – as an expression of the fundamental certainty of Being.26

“The encompassing that is Being itself” appears as world and is, as transcendence, the ground of Being of Existenz. Jaspers takes a critical stance against the view that there is no indication of Being independently of being for us and radically other than the Being that we are. He takes particular issue with the Nietzschean view that all that is is interpretation originating with us as interpreters. Leaning on Kant, he points out that while we – never adequately, never with finality – bring forth the world and transcendence in their appearance to our thoughtful apprehension, we thereby do not bring forth Being in itself. Against German idealism Jaspers counters Hegel’s dictum: “Whatever might

26. In Philosophy Jaspers mentions faith, love, and creative imagination (Phantasie) as the forms of fundamental certainty. In the writings of the second stage, imagination makes its appearance as the ideas of the spirit by means of which we articulate our faith.
not be known by consciousness would have neither meaning for it nor power over it”:

What does not enter our consciousness is actual power even if unknown … The unknown is effective at the limit of even the most far-reaching consciousness. Without our knowledge it affects us, determines us, overwhelms us; it is discernible … at two limits: every encountered fact indicates Being that we are not and which, in its totality, we call “the world.” [And:] The Encompassing that we are cannot be comprehended out of itself, but indicates an other through which it is …

World. The world is neither an illusory backdrop to what is no more than subject to our interpretation, nor is it Being in itself, independent of man but adequately reflected in our knowledge. Instead, the world in its totality is an idea, cognitively inconceivable. What we do know is always in the world, always a perspective on the world, never the world. And even though we bring forth perspectives on the world in its appearance to our thinking being, we do not bring forth the being of the world. The being of the world, independently of its being known, intimates itself at the limit of our knowledge, in the unyielding givenness of encountered factualities.

What is the relation of world and the modes of being human? As being-there, we too are in and of the world; the expressions of meanings entertained in consciousness are events in the world, the effects of spirit are manifest in the concreteness of the world. Yet no mode of being that we are is reducible to the world; each in its own way is radically originary. There are, then, two aspects of the Encompassing of the world. It means the sheer endlessness of whatever can be an object of our cognition. And, the world is “the Encompassing that we are not, the simply other, that in its core is not present to us as our own essence.”

The world contains the conditions for our being-there, for our being consciousness, for our being spirit. If this were to mean that the being that we are is derived from the world, then man would be a microcosm of the cosmos, and the world, indwelling in us, would not be the unfathomable other. But Jaspers recalls that even Aristotle, who sees man within the natural continuum of living beings, regards nous as coming to man from outside. The world remains extraneous to what we are; encompassing whatever we can cognitively know, it remains a mysterious other. As the condition for our very being, it is that by which we are borne; and it is that which is utterly indifferent to our being.

27. VdW, 84. See also Karl Jaspers: Basic Philosophical Writings, 159.
28. VdW, 87. See also Karl Jaspers: Basic Philosophical Writings, 160.
The conception of the world is not unitary. It is always someone’s world, and every human being has her own world. One’s world is not only one’s physical environment, but differs according to how one acts in it, or makes use of it. It also differs according to how one shapes it, and consists of the different kinds of interpersonal transaction (social, political, etc.). Different still is the world as object of our understanding and cognition, such as history and scientific research. The world ruptures into many worlds; in each, in its own way, we encounter only factualities in the world. Jaspers cautions against absolutizing any one conception.

The realization of the world as encompassing is of weighty political import. Any particular world taken as the true world as such enables one to regard the world as at one’s disposal for ordering it in accordance with one’s vision. Breaking through every limited perspective on the world sheds light on the fathomless ground in which the world is for us and in which we are as beings who, in our historic originality, gain perspective on it. Thus, to Jaspers, our realization of the world as encompassing also points to our freedom in the following three senses:

- “We become free for the world”: that is, we are able to recover from any particular realization, and proceed in our never-ending quest for knowledge of and meaningfulness in the world.
- “We become free for ourselves in the world”: that is, we can discover, beyond our being of the world, the source of our own becoming within ourselves.29
- “We become free for ourselves in relation to transcendence”: that is, we proceed within the world free for our grounding on transcendence. This calls for our testimony in the form of finite cognition, specific actions, or of the difference we make in shaping the world and our lives.30

Transcendence. Existenz in its freedom is central in pointing to the actuality of transcendence. In Jaspers’s words: “Where I am truly myself, I know that I am given to myself [in the manner of a gift]. The more decisively I am conscious of my freedom, the more undisputed also is the transcendence through which I am.” And he adds, including a phrase from Kierkegaard: “I am Existenz only together with knowledge about transcendence as the power through which I am myself.”31 The reason is that only relatedness to transcendence can affirm

Volume 3
one’s independence from the conditionality of world-being, and thus confirm one’s freedom.

The different ways of experiencing the – as such hidden – transcendence remain as characterized by Jaspers in the first stage, namely: formal transcending, the existential relations, the reading of the cipher-script. Now, however, Jaspers refers to some of the many names by which, in the history of man’s experience, transcendence has been referred to.

- **Being.** Within philosophy, Being has long been regarded as transcendence, especially in Scholastic thought. And Jaspers, as well as Heidegger, have renewed the question of Being, each in his own way. To Jaspers, Being is transcendence only for abstract thought. Hence – in keeping with the renewal of the question of Being – Jaspers turns to historically more concrete cipher-imagery.

- **Authentic actuality.** The conception of transcendence in this sense of Wirklichkeit (actuality that brings forth) has a long tradition, rooted in the biblical God as creator, in Plato’s demiourgos, and in Aristotle’s prime mover being pure energeia; it is reflected in the Scholastic idea of God as actus purus, and in later conceptions derived therefrom (Descartes, Leibniz). To Jaspers, transcendence as actuality is perceived as that which touches and involves us, to which we are drawn, which offers guidance.

- **Divinity** is the experience of transcendence as the actuality that governs us, that, surrounding us with its presence, addresses us and makes demands upon us.

- **God** is transcendence as person of concern to us as singular persons; God is experienced as the person-to-person relation to us as individuals. It is the idea of transcendence derived from the Hebrew Bible, determining the fundamental experience of transcendence in the West.

Jaspers traces the historical rise of man’s relation to transcendence. The decisive step is the realization of transcendence as “simply other”; the world is no longer regarded as Being as such, sufficient in itself. Akhenaten’s inspiration of the sun as the one fundamental divinity, although monotheistic, is merely a step in that direction. In the traceable history of humanity, taking that step is a feature in what Jaspers calls the axial times, the period he sees as the axis of history. He

says: “Posing radical questions and confronting the abyss, [man] seeks liberation and salvation. Fully conscious of his limits, he sets himself the highest goals. He experiences unconditionality in the depth of his self-being and in the clarity of transcendence.”

In the Hebrew Bible, Jaspers sees one of the most decisive realizations of transcendence in the axial age. Interpreting the first two of the Ten Commandments as ciphers, Jaspers says,

*The one God*: Polytheism is in keeping with natural man and with all of us. … Man stands in contradiction with himself; by serving some gods he offends others. And then the power of Oneness appears with strange force.

*No image and no symbol*: Transcendence lies beyond all ciphers. Therein lies the truth of all philosophizing.

*Reason: the bond within us of all modes of the Encompassing*. In both stages of Jaspers’s renewal of the question of Being, we noted his perception of the rupture of Being into modes, and of the ruptures within the immanent modes. Jaspers raises the question of unity in connection with the rupture of Being into encompassing modes: “[The] source of the unrelenting urge to unity lies in the Encompassing that we are – not only the internal unity of each Encompassing but that of all modes of the Encompassing, that which we are and that which we encounter: *Unity is through Existenz and reason*.” While the motive of unity may arise as an existential concern over personal integrity, the driving force toward unity is a matter of *reason*.

In Jaspers’s phenomenology, reason is a deliberate bonding force: it is the will of reason to “reclaim whatever there is from … mutual indifference and to return it to a movement of belonging together.” Reason does not have any content specific to it, but by virtue of reason we direct ourselves to the content of the other modes of Being. Through reason we bring what is disparate, other and strange, incompatible and indifferent into relation, not to subdue one to the other, but to recognize and to be concerned that there is otherness that claims to be and to be true.

Jaspers exemplifies the working of reason in the sciences, which, as such, seem to be purely a matter of the understanding. As the motivating force of unity, reason is the impetus of research, a never-ending process of testing and of interim solutions in the form of theoretical constructs. Never satisfied, reason impels us to further questioning and research. The task of reason is, then, not to bond segments of the ruptured wholeness of Being. Instead, it is a decisive force in the history of humanity concerned with the realization of truth, which is never at an end.

Reason is definitive of Jaspers’s conception of the axial age. It is not a coincidence that, together with tragic poetry and scriptural testimonies of man’s hearkening to a transcendent one and singular God who addresses man with demands and guidance, it was the time of the rise of philosophy. For transcending thought, concern over unity and restless questing of truth are the marks of both reason and philosophizing. In modernity, Jaspers sees humanity facing a fundamental challenge second only to that of the axial age. With science having preempted the realm of cogent knowledge, with the irreversible encounter of disparate fundamental truths, differing social norms, conflicting political ideologies, and incompatible cultural values, Jaspers regards reason as the taskmaster of humanity in meeting that challenge – albeit reason in a deliberately communicative mode. We find this at play in all the major aspects of Jaspers’s philosophical work that are the outgrowths of the culmination of his renewal of the question of Being in the philosophy of the Encompassing: the philosophy of modernity and history; the philosophy of science coupled with his idea of the research university; his conception of the statesman as a man of reason, and of politics as grounded in the supra-political; his consideration of the mutual encounter of religious beliefs, and his own encounter with revealed religion; his vision of a world philosophy to come; his project of a world history of philosophy.

IV. TRUTH FOR MAN IN TIME

In light of the reorientation, culminating in the disclosure of Being and its modes as encompassing, Jaspers approaches the question of truth with respect to unity. But truth in its unity, encompassing any human realization, is transcendent. Hence an inquiry into truth with respect to its unity can be only an illumination, with shafts of light that are finite and defined, of the encompassing truth within which we find ourselves.

While traditional theories of truth are valid within respective bounds, they stop short of addressing the question as now defined. In his discussion of the theories of validity of propositions, correspondence, and alētheia (Heidegger), Jaspers finds that they are directed to the rupture of Being. And the Scholastic
principle of *omne ens est verum, unum, bonum*, while addressing unity, eschews the perspective of human temporality.

Another theory of truth that Jaspers discusses is truth as origin and goal. A conception of truth with no recognizable historical precedent, it is proposed by Jaspers in opposition to the relativism of historicism current in the early twentieth century. Truth as origin and goal means that there is no fundamental determinant as to what is truth for man in time, for it encompasses time and temporality:

> Our will to truth is not satisfied with any [realized] truth. … [C]ertain that it is derived from a ground and on the way to a goal … no configuration of truth will satisfy as we are still on the way. … Even though this ultimate goal … is never reached in time, it can guide us … The idea of encompassing truth means … the rejection … of all false anticipation of redemption … We prefer open honesty, whatever its consequences, to a happy sense of security protected by means of blinders … [T]he thought of “being-true” as endless promotes the strength of carrying on the restless search.41

Accordingly, Jaspers sets himself the task of illuminating encompassing truth, and, with reference to the historical experience of thought, he does so in three ways, in a phenomenology spread over 600 pages of *Von der Wahrheit*, to which we cannot do justice in brief. The ways of illumination are distinct and are not derived from a common principle; nor do they function as elements or stages of a coherent construct. They merely intersect.

The first of these ways concerns “Truth and Falsehood.”42 The meaning of “being true” is here illuminated from the perspective that, for man, truth functions as a criterion rather than as an actuality. Measured against the criterion, however conceived, what man realizes is not fully truth but is, in fact, untruth. Truth in its encompassing unity is manifest, as it appears to man, as being less than truth. “Il n'y a point, pour nous, – êtres imparfaits, – de vérité parfaite,”43 Jean Paumen says. Not only are we deceived and deceptive; not only is realized untruth the path in our search for truth; not only is untruth, even lying, a deliberately chosen vehicle of human realization in thought, in action, and in interpersonal relations; but untruth is an indispensable mode of the very being of truth for man.

A familiar instance is the theological function of the symbol. The symbol is a falsehood in a sense in which the sign is not, that is, by representing what is never as such present to our consciousness. If the symbol or the analogy is meant as the presentation of transcendent actuality, it is a deception. The deceptiveness is reduced – not eliminated – by exposing the untruth of the symbol as the vehicle of the irreducible transcendence, for example of the divinity. The phenomenon of shipwreck of thought is, to Jaspers, a prime mode of exposing thought as inadequate to the realization of transcendent truth, thus dependent on the vehicle of untruth.

*Configurations of Truth* is the second way of illumination, as Jaspers turns to the forms in which truth in its unity can be discerned as a phenomenon of the concreteness of truth for man in time. Truth manifest to us is a matter of many truths and modes of truth. As we seek the unity of this multiplicity it becomes more elusive and obscure. The deity, however conceived, that might be posited as the fulfillment of unity, is present within received traditions functioning in the form of institutional structures, established orders, and cultural dispositions. Yet, since these do not only include but exclude, they dismantle the unity vouchsafed by our directedness toward the one God. Thus the very pursuit of the wholeness of truth brings into focus the fragmentation of truth.

We attain truth in time through inquiry or enactment, through the order we live in or try to establish, through the guidance we receive that may pit us against others in their truth. In any of these instances truth in time can be seen as limited and encompassed by truth in its transcendent unity. Truth in time does not take the place of truth in its encompassing unity, but the one truth functions within truth in time by breaking into its confines. Neither derivable nor expectable from the knowledge or power of human realization, it will burst into our lives and into human history, signaling a truth that encompasses man's truth. This can take many forms, but for Jaspers the main concrete configurations by which truth in its unity functions in its breakthrough for man in time are those of *authority* and the *exception*. They are polar opposites, but both are

45. Xavier Tilliette, Professor at the Gregoriana, shows how, in the broad sweep of Jaspers’s theory of truth, what is true for man in time is defined in its limitation over against the transcendence of truth in its oneness. Yet Tilliette looks for some cognitive assurance of the groundedness of man’s limitation in transcendence, which he fails to find in Jaspers. As a way to such assurance he suggests the theological doctrine of analogy. But what pertains to the symbol pertains to the theological use of analogy: the divine actuality that is inferred analogically differs from all other analogically inferred actualities in that it remains an inferred actuality. (With respect to proofs for the existence of God, Jaspers is wont to point out that an inferred God is not God; God in his transcendence is a matter of existential faith or not at all.) See Xavier Tilliette SJ, *Karl Jaspers: Théorie de la vérité, métaphysique des chiffres, foi philosophique* (Paris: Aubier, 1960), esp. 149ff.
indispensable intimations of the unity of truth in the face of the immanent fragmentation, disruption, and limitation of truth. The mark of authority is the sort of universality that, in its intention and potentiality, comprises and concerns all men. But human universality is itself limited, hence truth for man in its encompassing unity requires the challenge of the exception. Even as the truth of authority can become an atrophied caricature of truth unless breached by the exception, so man, in the exception of his truth, will intensify his own limitation unless nourished and challenged by authority.

To Jaspers, the ultimate configurations are not authority and exception but reason and catholicity, each functioning within authority as well as exception. Reason, perennially in search of unity, is not fulfilled in time. The position of the fulfillment of truth in time is the rival of the rule of communicative reason. Jaspers calls this rival – whether appearing in culture, politics, or religion – the position of catholicity. Although the impulse toward unity springs from reason in either case, there is a fundamental difference in executing this impulse, whether oneness of truth is a matter of communicative openness or a matter of realizing a vision of truth deemed to be valid for and binding on all.

The first two illuminations focus on more formal features of the question of truth; in the third illumination Jaspers means to approach the question from the perspective of man’s intimacy with what is true for him. The title of this approach is “Vollendung des Wahrseins” (“The Being of Truth in its Completion”). Radically speaking, the form in which truth is effectively complete is a matter of the singular Existenz; in philosophical abstraction we can only generalize about such forms. The two types of existentially effective completion that Jaspers characterizes are “original intuitions” and “philosophizing.”

He begins the discussion of original intuitions as follows: “It is characteristic of man as man to direct his gaze into the ground of truth. Truth is there for him at all times, and it is within him by means of some language, be it ever so rough or opaque.” Religion, art, and poetry are the ordinary designations of what, for Jaspers, are the intuitions that afford visions of the ground of truth. They are the life-founding completion of truth for man in time, and accomplish this in a manner that is original, that is, not primarily reflective, although their

49. Ibid., 915.

234
Volume 3
expressions and traditions can reach pinnacles of spiritual sophistication in the form of scriptural legacies, mythic traditions, literary creations, iconic art, and so on.

Jaspers exemplifies the manner in which original intuitions have been effective as the completion of truth in time—particularly in light of inevitable limit situations and the phenomenon of foundering—by means of an essay on the tragic and its relation to the idea of redemption. To Jaspers, tragic knowledge is not the perception of the indifferent observer but the cognition of one who is affected at the limit of possibility, in the face of limit situations, where the realization of truth in thought and in deed experiences shipwreck. Jaspers sees Shakespeare's Hamlet as “steadfast in his will to truth …, fully committed to the here-and-now, who does not deny himself to the world but is excluded from it, who fully delivers himself to his destiny and, in his heroism, is devoid of pathos.” Tragic knowledge signals a man's transformation, leading either to rising beyond the tragic in the direction of redemptive grounding in the source of Being, or to a nihilism of aesthetic contemplation, detached, without grounding. Jaspers traces the conception of redemption to the axial times of the millennium before Christianity, when knowledge of the dire state of humanity no longer referred merely to the everyday facts of illness, old age, and death. It was now seen as the fundamental human condition.

Jaspers discusses redemption in Greek tragedy (Aeschylus, Sophocles; absent in Euripides), the dissolution of tragedy in Christian redemptive grace (Dante, Calderón), the philosophical tragedies of Goethe (Faust) and Lessing (Nathan the Wise), the perversion of tragic knowledge in tragic worldviews (Unamuno). Jaspers cautions that the tragic is not absolute, that there are limits to the interpretation of the tragic, that original intuition of the tragic must be maintained lest its significance be lost. In its true historic intuition, the tragic is “questioning and thinking … as well as the overcoming of the tragic, but not through doctrines and revelation, but with respect to order, right, love of fellow man; in trust, in not making final decisions, in the question that has no answer.”

Within philosophic reflection on the encompassing unity of truth, religion, as with the tragic, is identified in its absolute personal significance as the original intuition of the completion of truth in time. This is an additional basis for Jaspers's stand in regard to the demythologizing controversy, his idea of a “philosophic faith,” and the confrontation of revealed religion with faith philosophically conceived.

It is deliberate reflection that is the mark of distinction of the philosophic concern over the completion of truth in time for man. The stress is on

50. Ibid., 942–3.
51. Ibid., 959.
philosophizing – whichever form it takes – as the preeminent existentially effective completion of truth in time. Philosophizing is activity, neither doctrine nor a distinctive way of crafting a doctrine. Hence the key and culmination of Jaspers's exploration of the completion of truth is an essay on reason. Here the completion of truth in its unity is seen as impossible for man in time, but completion of truth in time is turned into the task of self-realization through exercising a will to total communication. And, conversely, communication is seen as the ultimate vehicle of the concretion of truth in time. Truth in time is, then, not something we can realize in its completeness, but its completion is the task of our temporal career. It is by virtue of communicative reason that, for Jaspers, philosophizing is the “ground and completion” of truth. It is that because communicative reason is present wherever there is testimony to one’s own finitude in the face of encompassing truth, testimony that consists in communicative openness to the other, no matter how crude and how far removed from the sophistication of the philosophic craftsman. In Jaspers, the problem of truth for man in time, although informed by the testimony of man’s experience, is turned to the enactments of human life, the everyday life as well as the bigger arenas such as politics, religion, the life of the spirit.

In each of the three illuminations of truth on the way between origin and goal, truth in its unity is seen as exceeding man's capacity, and thereby it is left in its encompassing transcendence. The transcendence of the truth does not reduce either man or man’s truths to insignificance. Through the transcendence of truth, the finitude that is man, in which he finds himself, which he confronts, shapes, and realizes, is the field of truth for man in time. Man is invested with the task of actualizing truth through the capacities given to him, most fundamentally communicative reason, and thereby of gaining the actualization of his freedom. But the measure of the truth of the various pursuits and ways is the unity of truth in its encompassing transcendence, a cipher functioning as a measure: in the first, in the sense of the perfection of truth; in the second, as truth in its wholeness; in the third, as truth in its completion.

Jaspers’s treatment in *Von der Wahrheit* of truth for man in time is a completion of what he began in *Philosophie*. The earlier work reopens the question of

---

52. *Ibid.*, 960. Readers should not be led by this reference to “communicative reason” into thinking that Jaspers’s thought has had an influence on Jürgen Habermas. Habermas’s use of “reason” differs from Jaspers’s; what Habermas means by “reason” is what Jaspers means by the “understanding.” Also, what Habermas means by “communication” differs from Jaspers, as Jaspers’s “communication” falls within the area of what Buber means by “dialogue,” although there are significant differences between them. See “Dialogue and Communication – Buber and Jaspers,” in my *Karl Jaspers: Philosophy as Faith* (Amherst, MA: University of Massachusetts Press, 1975), 77–97.
Being and truth in its unity as an existential exigency, and the later work subjects the question to radical exploration.

Philosophy of modernity and history

Psychiatry and psychology

A full century has passed since Edmund Husserl (1859–1938) published his two-volume *Logical Investigations* (1900/1901), which set in motion the phenomenological movement as we know it. Bertrand Russell proposed to review this “monumental” work for the journal *Mind* in 1917, although the review was never completed and a friend later described the task as being “very much like trying to swallow a whale.”¹ The predicament of the reader one hundred years later has only worsened, since grasping the movement now requires digesting not only one whale but a whole pod – not only Husserl, but also Martin Heidegger (1889–1976), Hans-Georg Gadamer (1900–2002), Jean-Paul Sartre (1905–80), Emmanuel Levinas (1906–95), Maurice Merleau-Ponty (1908–61), Paul Ricoeur (1913–2005), and Jacques Derrida (1930–2004), to name but a few of the most important and prolific – and to follow the philosophical currents set in motion by these thinkers whose intellectual heritage can be traced back to Husserl and phenomenology.

Some fifty years after the publication of the *Logical Investigations*, Merleau-Ponty lamented that the question “What is phenomenology?” had yet to be answered in a definitive way.² Ricoeur, also writing mid-century, suggested that we view Husserl as the knot tying the movement together; but he was also quick to note that what we count as phenomenology must include not only the various formulations of it in Husserl’s own writings, but also the “heresies” of those who

---

¹. The remark comes from Constance Malleson, as reported by Ronald W. Clark in *The Life of Bertrand Russell* (London: Jonathan Cape, 1957), 348. Russell’s review never appeared owing to a delay in the translation of the Sixth Investigation.

came after him. Herbert Spiegelberg, whose treatise on The Phenomenological Movement (1960) remains unsurpassed as an introduction to the thinkers and themes of this tradition, writes that it would be a “misconception” to think “that there is such a thing as a system or school called ‘phenomenology’ with a solid body of teachings.” This is so not because phenomenology has been unable to achieve an adequate level of clarity about its own task, but because it was substantially reinvented and reinvigorated by each successive generation of phenomenologists and, as a result, became one of the richest and most diverse movements in twentieth-century Western thought. This essay provides a historical introduction to the phenomenological movement and to the main developments within it. After considering the history of phenomenology in Germany, the essay traces its reception in France, and ends with a consideration of its status as an international movement and the question of its future.

I. HUSserL AND THE PHENOMENOLOGICAL CIRCLES AT MUNICH AND GÖTTINGEN

Husserl’s earliest writings cannot properly be considered phenomenological, although they were to lead him to problems that put him on the path to phenomenology as he ultimately came to understand it. His first book, The Philosophy of Arithmetic (1891), attempted to derive the fundamental concepts of mathematics by means of a descriptive psychology of acts of mathematical thinking. The attempt was roundly criticized by Gottlieb Frege, although the latter’s target was not Husserl alone but the “widespread philosophical sickness” of employing psychology to answer questions in logic. The planned second volume of Husserl’s

3. Quoted in Herbert Spiegelberg, The Phenomenological Movement: A Historical Introduction, 3rd rev. and enlarged ed. (The Hague: Martinus Nijhoff, 1982), 586. Ricoeur was the French translator of Husserl’s Ideas I and also published a line-by-line analysis of that work. Born in Provence, he was strongly influenced by the philosophy of Gabriel Marcel. Ricoeur had a synthetic turn of mind and a sure grasp of the grand sweep of contemporary philosophy, both European and Anglo-American. He published important works in the philosophy of language and hermeneutics, on metaphor and narrative, on Freud and psychoanalysis, on phenomenology, and in his last works on subjectivity and ethics. [*] His work is discussed in the essay by Wayne J. Froman in The History of Continental Philosophy: Volume 6.

work on arithmetic never appeared and Husserl himself remarked that although the descriptive analyses he had attempted brought a certain clarity to the origin of subjective acts of mathematical thinking, he could discover no way to pass from the subjective connections between ideas to the distinctive objectivity and theoretical unity of mathematics as such. In effect, there was no way to “reconcile the objectivity of mathematics, and of all science in general, with a psychological foundation for logic.”

The first volume of the *Logical Investigations* was subsequently devoted to a thoroughgoing critique of psychologism in logic while the second volume, appearing a year later, contained six studies devoted respectively to expression and meaning, the problem of universals, the theory of parts and wholes, acts of meaning and the idea of a pure grammar, intentional experience, and the elements of a phenomenological account of knowledge.7

The elucidation of the intentional structure of consciousness remains a primary contribution of the *Logical Investigations* and of phenomenology generally. Franz Brentano (1838–1917), from whom Husserl takes the term “intentionality,” argued that all conscious experience is intentional, by which he meant that it is directed toward something: there is no perceiving without something perceived, no imagining without something imagined, no judging without something judged.8 Husserl uses intentionality in largely the same way to indicate that all consciousness is consciousness of something, although he also recognizes that some mental phenomena, such as sensations or sensation complexes, are not themselves intentional. Intentionality, as it is understood by Husserl and Brentano alike, is not to be understood in terms of the relation of a mental act to an extra-mental object or really existing thing. Imagining and hallucinating, for example, are both intentional acts but neither is directed toward objects that exist or are real in our usual sense of the term. In later works, Husserl will seek to clarify the status of the intentional object and to articulate more fully its relation to the intentional act, but what initially interested him was not the act–object relationship but the connections between different intentional acts or between different aspects of a single complex act. For example, the complex intentional act judging that “the cup is white” points back to, or in

---

7. For a detailed discussion of Husserl's *Logical Investigations*, see the essay by Thomas Nenon in this volume.

8. Brentano writes, “Every psychical phenomenon is characterized by what the Scholastics of the Middle Ages called the intentional, (or sometimes the mental) inexistence of an object, and what we should like to call … the directedness (Richtung) toward an object (which in this context is not to be understood as something real)” (*Psychologie vom empirischen Standpunkt I*, Buch II, Kapitel I §5, 125–6, quoted in Spiegelberg, *The Phenomenological Movement*, 36).
Husserl’s terms, is “founded,” in a prior act in which the whiteness of the cup is given in a “fulfilling” perception. This act of perception, in turn, has both complete and incomplete aspects: the back of the cup is only emptily intended in my perception of the front of the cup, although this empty intention can only be filled in by certain kinds of contents and not others. The idea that every act of consciousness – no matter how seemingly simple – is determined as a set of relations between “founded” and unfounded acts, and between “empty” or “merely signative” acts and “fulfilling” or “intuitive” acts becomes evident from a careful reflection on the nature of these acts considered ideally. A full, descriptive account of the structural relations governing the manner in which objects or states of affairs are given in consciousness was the central aim of Husserl’s early phenomenology.

Over the next decade, phenomenological circles inspired by Husserl’s work sprang up in both Munich and Göttingen. The Akademischer Verein für Psychologie, attended by the more advanced students of Theodore Lipps (1851–1914), was already in existence in Munich when the Logical Investigations appeared with Husserl’s extended attack on Lipps’s psychologism. Lipps defended his position before the group with the unexpected result that many of them became confirmed opponents of his position and converted, as it were, to phenomenology. This was the case for both Alexander Pfänder (1871–1941) and Johannes Daubert (1877–1947), who were the leading members of the group at the time. Several members of the Munich Circle went on to work as phenomenologists for the duration of their academic careers. Pfänder became one of Husserl’s collaborators on the Jahrbuch für Philosophie und phänomenologische Forschung, as did Moritz Geiger (1880–1937), Max Scheler (1874–1928), and Adolf Reinach (1883–1917). The Jahrbuch would publish some of the most significant contributions to phenomenology, including the first volume of Husserl’s Ideas Pertaining to a Pure Phenomenology and Phenomenological Philosophy (1913) and the first two divisions of Heidegger’s Being and Time (1927). Pfänder and Geiger made modest but noteworthy contributions to phenomenology during academic careers spent chiefly in Munich (although Geiger fled Germany during the Second World War and spent his last years as a professor at Vassar College in New York). Pfänder’s contribution was primarily in the domain of psychology, his work consisting mainly of descriptive analyses of various acts of willing, and of the structure of other-directed positive and

---

9. An exceptionally clear and succinct discussion of Husserl’s thought, including its early phases, is to be found in Steven Galt Crowell, “Husserlian Phenomenology,” in A Companion to Phenomenology and Existentialism, Hubert L. Dreyfus and Mark A. Wrathall (eds) (Malden, MA: Blackwell, 2006).
negative sentiments (e.g. benevolence, friendliness, ill-will, or hostility). Geiger also made contributions to a phenomenologically based descriptive psychology, focusing like Pfänder on questions of the will, but he was better known for his contributions to a phenomenology of aesthetic acts and attitudes.

Max Scheler was a major figure in phenomenology and in the intellectual life of Germany during his lifetime. Scheler completed both his doctoral dissertation and his habilitation thesis (by the age of twenty-five) under the direction of Jena philosopher Rudolf Eucken (1846–1926). Eucken believed that the philosopher had a special role to play in measuring the practices and attitudes of contemporary society against the unchanging and transcendent moral values that could be discerned by philosophy. Scheler inherited Eucken's commitment to the idea of unchanging values as well as the latter's concern for contemporary life and society; what he sought from phenomenology was a method by which to discern transcendent values and to preserve their status independent of the workings of logic and cognition. By Scheler's own account, he met Husserl at a party in Halle in 1901 and found his ideas about nonsensuous or categorial intuition immediately useful to his own projects. Brilliant and charismatic, Scheler rose to prominence in both the Munich and Göttingen circles, writing major works on the notion of resentment and *The Nature of Sympathy* (1923). His most enduring phenomenological work was his *Formalism in Ethics and Non-Formal Ethics of Value* (1913), although he was better known to the general reading public for

---

10. Pfänder's most significant contributions to phenomenology were still in fragmentary form at the time of his death, but have since been edited and published by his students. Of the works published during his lifetime, *Die Seele des Menschen* (1933) was undoubtedly the most mature expression of his views. A translation of his seminal essay, "Motive and Motivation," and of some of his early work on the will and on logic may be found in *Phenomenology of Willing and Motivation and Other Phaenomenologica*, Herbert Spiegelberg (ed.) (Evanston, IL: Northwestern University Press, 1967).

11. Klaus Berger reports that Geiger's lectures in aesthetics, given in Munich between 1909 and 1922, "were among the more important events at the University" (in Moritz Geiger, *The Significance of Art: A Phenomenological Approach to Aesthetics*, Klaus Berger [ed. and trans.] [Washington, DC: University Press of America, 1986], xvii). Geiger's *Zugange zur Ästhetik* was published in 1928, at which time he also announced plans for a major work in aesthetics. At the time of his death in 1937, an initial section of this book, looking at the foundations of value aesthetics, was fairly well developed although not in final form. A second section on the differentiated structures of various art forms was left in a very fragmentary state. Berger collected the more developed parts of this manuscript together with selections from Geiger's earlier work on aesthetics and published the whole under the title *The Significance of Art*.

12. Eucken lectured widely in Europe and America after the First World War, speaking of the unity of humankind and the need to overcome the self-destructive impulses that had fueled the war. He was awarded the Nobel Prize in Literature in 1908. An overview of Eucken's influence on Scheler's philosophy can be found in H. Bershady, "Introduction," in M. Scheler, *On Feeling, Knowing, and Valuing: Selected Writings*, H. Bershady (ed.) (Chicago, IL: University of Chicago Press, 1992).
an essay that appeared on the eve of the First World War. There in “The Genius of War” he advocated going to war, arguing that a refined German spirit (Geist) could cure Europe of what ailed it, specifically the draining forces of autocracy in Russia, the dry and sterile rationalism of France, and the crude utilitarianism of England.13

Adolf Reinach, the fourth member of the Jahrbuch editorial team, may well be the least known of Husserl's early collaborators but he played a significant role in propagating a realist strain of phenomenology and did as much as anyone in the early years to promote the phenomenological movement. As a Privatdozent in Göttingen during Husserl's tenure there, Reinach14 had a profound influence on members of the Göttingen Circle, including Alexandre Koyré, Roman Ingarden, and Edith Stein.15 Koyré and Stein, for example, both

---

*13. Scheler's work is discussed in more detail elsewhere in this volume.
14. Reinach was part of the "Munich invasion" of 1905, when a number of Lipps's students began coming regularly to Göttingen to attend Husserl's seminars. Daubert was among the first to come, and with him came Reinach. They would be followed by Geiger and Scheler, among others.
15. Koyré (1892–1964) studied with Husserl and the mathematician David Hilbert at the University of Göttingen (1908–11) before coming to Paris, where he followed Bergson's lectures at the Collège de France and studied with Léon Brunschvicg and Étienne Gilson at the Sorbonne (1912–14). After the First World War, he emigrated to Paris, where he taught at the École Pratique des Hautes Études (1922–32, 1950s), Fuad University (later Cairo University) (1932–34, 1935–38, 1940–41), Johns Hopkins University (1950s), and the Princeton Institute for Advanced Study (starting in 1956). Koyré was the first to introduce Bergson's work in Germany in 1911 at the Göttingen Circle and was the first to bring Husserl's phenomenology to France. His emphasis on phenomenology in the interpretation of Hegel was influential for the Hegelianism of Alexandre Kojève and Jean-Paul Sartre. While best known for his work on Descartes and Hegel, Koyré also made important contributions to the history of science. His most important text, Études galiléennes, was published in three volumes in 1939 (Vol. 1: A l’aube de la science classique; Vol. 2: La Loi de la chute des corps: Descartes et Galilée; Vol. 3: Galilée et la loi d’inertie) and was dedicated to Émile Meyerson (1859–1933), whose own work on epistemology played a significant role in Koyré's thinking. Some aspects of Koyré's role in bringing phenomenology to France are noted below. [*] His contribution to French Hegelianism is also discussed in an essay by John Russon in The History of Continental Philosophy: Volume 4.

Ingarden (1893–1970) studied with Husserl from 1912 to 1918 in Göttingen and remained in touch with Husserl by letter until the latter died in 1938. Ingarden is best known for his phenomenological investigations of works of art, including literature, music, and the plastic arts. He pursued painstaking descriptions of the various “strata” that make up the work of art, arguing that even the lowest, most material strata were imbued with cultural constructions. In a move that resonates well with reader-response theory in literature as well as with other contemporary theories of art, Ingarden argued that the work of art was not complete in and of itself and that its meaning emerged as it was concretized by the reader, viewer, or listener. Ingarden was also interested in essential methodological questions concerning the foundation of phenomenology and did not fully embrace Husserl's transcendental turn. His major works in phenomenological aesthetics include Das literarische Kunstwerk (1965; The
report that they learned phenomenology from Reinach rather than Husserl. It is no doubt under Reinach's influence that the group came to see phenomenology not only as a study of the essential structures of consciousness, but even more so as a universal philosophy of essences. And it was during this period that some in Germany began to equate phenomenological intuition with an untenable rebirth of Platonism. Husserl himself was inclined to dismiss some of the discussions of his students during this time as a “picture book phenomenology” overly concerned with the essences of everyday objects, perceptions, and states of affairs. But even as Husserl disavowed his own earlier characterization of phenomenology as a descriptive psychology, Reinach and many in the Göttingen Circle insisted on the legitimacy and fruitfulness of this understanding and of the inquiry into essences arrived at through careful and precise investigation or intuiting with respect to ideal cases. The Göttingen phase of phenomenology ended when Husserl moved to Freiburg in 1916, but there can be no doubt that Reinach's death in action in 1917 also spelled the end of an independent realist phenomenology.

---

18. Schumann and Smith, “Adolf Reinach,” 20. Reinach was the managing editor of the first volume of the Jahrbuch, which appeared in 1913, containing the first part of Husserl’s Ideas as well as contributions by the other coeditors. It is around this time that he began to take his distance from Husserl's thought and its transcendental idealism.

II. HUSSERL’S TRANSCENDENTAL PHENOMENOLOGY

Husserl's journals and personal correspondence from the Göttingen years paint a picture of the philosopher struggling to win clarity on the fundamental issue of the relation of the intentional act to its object.20 In his earlier work, Husserl had already branded the traditional epistemological problem of how subjective thoughts reach a world of external objects a pseudo-problem bred by lack of clarity. However, he remained puzzled by the “enigma” of cognition and particularly by the problem of how the really immanent components of the stream of conscious experience (this perception of whiteness) are related to the nonimmanent or transcendent meanings that make our experience an experience of something (a white cup). The solution to this problem was broached first in a short text on The Idea of Phenomenology (1907) and then in detail in Ideas I (1913). It involved the insight that the relation between transcendence and immanence was itself something that could be immanently given and thus made the object of a pure, phenomenological description. In setting out to develop a pure, presuppositionless critique of cognition, Husserl had to describe the manner in which cognition and its object are bound together, but this description could not use anything that was not self-evidently or intuitively given to consciousness.21 The famous transcendental–phenomenological reductions that make up the phenomenological method were developed precisely to secure the givenness of the phenomenological datum, in this case the relation of the intentional act and its object.

Like much else in Husserlian phenomenology, the reductions are reworked numerous times both in the published texts and in unpublished writings – of which there are forty thousand shorthand pages in Husserl’s Nachlass. A first kind of reduction to essences – an eidetic reduction – was already in use in the Logical Investigations, where Husserl recognized that the experience of an

21. Edmund Husserl, The Idea of Phenomenology, William P. Alston and George Nakhnikian (trans.) (Dordrecht: Kluwer, 1964), 37. Eduard Marbach explains that for the Logical Investigations, “Only intentional acts, given in phenomenological reflection, count as presuppositionless epistemological data. The acts of cognition relevant for the basic epistemological question about truth are intentionally fulfilled acts in which the intended objects comes to intuitional self-givenness. Strictly speaking, nothing can be said about the object of cognition except that it is intended in an act that must be more closely determined. When, from the end of 1906 on, Husserl proceeded to designate as a phenomenologically evident datum not only the act but also the intentional correlate of this act, that is, the intentional object just as it is intended in this act, there followed very decisive consequences for carrying through the phenomenological theory of cognition” (Rudolf Bernet, Iso Kern, and Eduard Marbach, An Introduction to Husserlian Phenomenology [Evanston, IL: Northwestern University Press, 1993], 55–6).
phenomenology at home and abroad

particular object will always be limited by contingent features of the subject's physical situation vis-à-vis the object and by her personal history and any associations she may connect with the object. Phenomenological reflection, in performing an eidetic reduction, abstracts from these contingent features (e.g. the dim light in which the cup is right now seen or the fact that it bears the logo of this particular café) and attends to universal and essential features of the cognizing act. Nor is this reduction limited to phenomenology; it is a standard feature of all kinds of conceptual and mathematical analyses.

The reductions that belong more particularly to the transcendental period of Husserl’s thought are the epochē and the full set of reductions that Husserl simply calls transcendental–phenomenological. The epochē concerns the possibility of suspending or bracketing presuppositions about the object that belong to our everyday or “natural” attitude. In the natural attitude, the subject takes for granted that the chair in which she sits or the paper on which she writes are really there in front of her with just these physical and perceptual properties. Likewise, the subject in the natural attitude takes for granted the results of various sciences and subscribes to various unquestioned beliefs handed down to her by her society or culture. The effect of the epochē and its accompanying transcendental–phenomenological reductions is not so much that the subject comes to doubt these beliefs, as that she suspends them or makes no use of them. The upshot for the critique of cognition is that one no longer worries whether or not the cup being perceived right now “really exists”; the question of existence is put into brackets or put out of play. Similarly bracketed is any account of perception that depends on an acquaintance with theories that come from biology, neuroscience, psychology, or any other science. The epochē is not like radical Cartesian doubt in which I lose the world temporarily in order later to regain my certainty about it. As long as I am engaged in phenomenological reflection, the epochē remains in play. Its function is only to make possible a pure presuppositionless description of the objective correlate of the intentional act as such. The “exclusion of Nature” is “the methodic means for initially making possible the turning of regard to transcendentally pure consciousness.”

The transcendental–phenomenological reductions go on to expose the remaining kinds of transcendencies (that is, those nonimmanent elements of conscious experience) that must be put out of play or bracketed in a phenomenological description. In Ideas I, Husserl writes that “it is immediately understandable” that the suspension of the natural world brings along with it a bracketing of “all sorts of cultural formations, all works of the technical and fine arts, of sciences” and “aesthetic and practical values of every form” including

our ideas of the reality of political states, moral customs, law, and religion.  
Again, the idea is not to doubt the reality of such things but to make no use of beliefs imported from these realms in developing pure descriptions of the operations or essential structures of different types of cognition and conscious experience. While the suspension of the natural and social sciences and all social and cultural values was, for Husserl, an obvious extension of the original reduction, he was less certain about whether (and to what extent) the ego could be reduced, and about whether a suspension of pure logic and of phenomenology itself was possible. Husserl would return to these topics in later writings and his struggles to win a truly presuppositionless starting-point for a critique of cognition would prove to be a lifetime concern. For Husserl, phenomenology was to be a rigorous philosophical science clarifying the epistemological norms governing every region of human consciousness, but the success of this project was directly dependent on whether the phenomenological datum – consciousness and its essential structures – could be given in a pure presuppositionless form.

When Husserl’s thought took its transcendental turn, it cost him many of his former students and thus he arrived in Freiburg in 1916 having to make a fresh start. It was there that he met Heidegger, a junior professor who would become his assistant and whose impact on phenomenology would be at least as important as Husserl’s own, even as it spelled the end of Husserl’s dream of phenomenology as a collectively pursued pure presuppositionless science of conscious experience.

### III. HEIDEGGER AND FUNDAMENTAL ONTOLOGY

To what extent should Heidegger be considered a phenomenologist? Today few doubt his central place in the history of the movement, but it is noteworthy that scholars writing in the 1960s could earnestly debate this question. Early treatments of phenomenology in English, if they mention Heidegger at all, tend to emphasize the differences between Husserl and Heidegger and, depending on the camp, extol the rigor and scientific spirit of the former or the brilliance and originality of the latter. Husserlians, in particular, wanted to distance phenomenology from the seemingly impenetrable language of Heidegger’s philosophy and from its existential overtones. By contrast, Heideggerians were anxious to preserve the independence of the question of the meaning of Being and touted Heidegger’s work, as he did himself, not as phenomenology but as fundamental ontology. French accounts of phenomenology, then as now, were more inclined to see Husserl’s and Heidegger’s work as roughly continuous. Levinas, for

---

Volume 3
example, who studied with both Husserl and Heidegger in Freiburg, thought of Heidegger’s work as “the fruition and flowering of Husserlian phenomenology,” although he readily acknowledges that Heidegger in no way proposed a transcendental phenomenology along the lines of Ideas I.

Although Heidegger seems to have had no early personal contact with Husserl or members of the phenomenological circles, his interest in phenomenology dates to his student days at Freiburg University. In a famous essay – “My Way to Phenomenology” (1963) – Heidegger reports having had Husserl’s Logical Investigations on his desk for two years in the student dormitories and having read it “again and again … without gaining sufficient insight into what fascinated me.” Of course, the other book that Heidegger speaks of as being “the chief help and guide of my first awkward attempt to penetrate into philosophy” was Brentano’s dissertation “On the Manifold Meaning of Being since Aristotle” (1862). The young Heidegger received this book from his high-school teacher and the story of this gift is often told as a reminder that, for Heidegger, prior to phenomenology there was the question of the meaning of Being. Theodore Kisiel convincingly proposes that Heidegger’s two principal influences – Aristotle’s account of the ways in which Being is said (the problem of the “categories”) and phenomenology’s account of the intentional structure of conscious experience – were knit together in an important way by the mediating influence of Emil Lask (1875–1915). Like Heidegger, Lask was a student of the neo-Kantian Heinrich Rickert (1863–1936) and was also deeply influenced by Husserl’s thought. Lask was interested in what Fichte had described as facticity: our brute encounter with the world. But whereas for Fichte the factic is the “irrational par excellence … the ‘matter’ given to thought,” Lask maintained (pace Husserl) that the world is given not only in sensuous intuition but in categorial intuition as well: for Lask, there is “a precognitive moment in which the initial categories or forms first present themselves as simply given in experience before

25. In a lecture course from 1925, Heidegger is especially dismissive of the Munich tradition of phenomenology, saying that although the Logical Investigations influenced Lipps’s Munich students, the book “was regarded simply as an improved descriptive psychology.” Heidegger makes it clear that this is a misinterpretation, although one that Husserl himself briefly labored under. See Martin Heidegger, History of the Concept of Time: Prolegomena, Theodore Kisiel (trans.) (Bloomington, IN: Indiana University Press, 1985), 25.
27. Ibid.
they are known.”29 We “live” in this pretheoretical moment before we explicitly “know” anything of it and it is life in this sense that Lask claims is especially worthy of philosophical investigation: what is philosophically significant is “not brute factic life but rather the sphere of immediate experience replete with value, of life already made worthwhile.”30 This claim resonates with the fundamental task undertaken in Heidegger’s best-known work, Being and Time (1927), where the aim is an analysis of the complex and irreducible relationships that structure our everyday understanding of the world and remain concealed within the apparent immediacy of that understanding.

After writing his thesis on Duns Scotus (which Rickert suggested was more in thrall to Lask’s work than might be desirable), Heidegger joined the Freiburg faculty as a Privatdozent or junior professor. Husserl arrived the following year to fill Rickert’s Chair. Heidegger reports that it was only when he had a chance to work directly with Husserl that he came fully to understand the method of phenomenological “seeing.”31 He also remarks, however, that the better he came to understand phenomenology, the more he saw it as “fruitful for the interpretation of Aristotle’s writing” and the less able he was to separate his own thinking from that of Aristotle and the Greeks.32 As for their personal relationship, Heidegger served as Husserl’s assistant in Freiburg until 1923,33 regularly teaching a “Phenomenological Practicum” for beginners (usually in conjunction with a reading of either Aristotle or Descartes) while Husserl offered a corresponding seminar for more advanced students. In 1923, Heidegger left Freiburg for a position at Marburg and there began the most fruitful period of his career. As before, he taught courses on phenomenology and continued the tradition of

31. Ibid., 78. There were other decisive influences on Heidegger’s work as well as phenomenology and the Greeks. Early encounters with the writings of Nietzsche, Kierkegaard, Schelling, Hegel, Rilke, Trakl, and Dilthey were formative for the questions developed in Being and Time and for Heidegger’s later writings.
32. During the period from 1917 to 1919, Heidegger served for a time in the German military, completing basic training in May 1918 and then serving in the meteorological services until the end of the First World War. There has been some dispute about just when and where he served. Kisiel collects the relevant evidence in The Genesis of Heidegger’s “Being and Time,” 553 n.6. The period from 1917 to 1919 is also noteworthy as the time when Heidegger appears to have set aside his religious convictions. In a letter to Englebert Krebs, he writes of a “transformation of my fundamental standpoint” during this time which “made the system of Catholicism problematic and unacceptable to me” (quoted in ibid., 553 n.6).
33. Being and Time was rushed into publication when Heidegger was recommended by the faculty at Marburg for a full professorship. Husserl was instrumental in having the completed parts published in the Jahrbuch and also in a separate edition by Niemeyer. For Heidegger’s account of the publication history, see Heidegger, “My Way to Phenomenology,” 74–82.
offering a phenomenology “practicum” for beginning and advanced students. It was during the Marburg years that Husserl and Heidegger collaborated (with limited success) on an article on “Phenomenology” for the Encyclopaedia Britannica. It was also during this period that Heidegger wrote the bulk of Being and Time. In 1928, when Husserl retired, he named Heidegger as the only adequate successor to his Chair. Husserl seems to have recommended his younger colleague for this post without having read Being and Time, although he was instrumental in the publication of this work. Had he read Heidegger’s magnum opus, he might have been reluctant to see in his former assistant the successor to his own phenomenological project. Indeed, it is clear from later correspondence that he came to feel that Heidegger’s work neglected the fundamental importance of the phenomenological reductions, with the result that his thought ended up effecting a return to the anthropologism and psychologism Husserl had been at pains to eradicate from philosophy. While there was no formal break between the two men, it is striking that after his first semester back in Freiburg, Heidegger never again offered a course with phenomenology in the title (with the single exception of a seminar on Hegel’s thought).

Heidegger’s most intense engagement with phenomenology thus took place between 1916 and 1929, during which time it is fair to say that he both promoted the philosophical breakthrough achieved by Husserl and significantly reformulated the basic problems of phenomenology. Most importantly, while Heidegger applauded Husserl’s phenomenology for having shown that intentionality is the fundamental structure of all lived, conscious experience, he repeatedly stressed the inadequacy of the phenomenological characterization of intentionality to date. The guiding theme of the 1927 lecture course published as The Basic Problems of Phenomenology is the need to “conceive intentionality itself more radically.” Intentionality is there said to be “founded” in Dasein’s “transcendence” or “transposition” over to things. Transcendence, in turn, is identified with Dasein’s understanding itself “from a world” – the elucidation of the “world-concept” being for Heidegger one of the central problems of philosophy, inattention to which has involved the discipline in “remarkable insoluble aporia.”

37. Ibid., 164.
38. Ibid., 162.
39. Heidegger, Being and Time, §4. Dasein was translated into French as réalité-humaine (“human reality”) and left in the original German in English translations of Heidegger’s work. While neither choice is fully adequate, both are legitimate solutions to the translation problem posed by the unique manner in which Heidegger uses this term.
Time, Heidegger explicitly abandons the term “intentionality” and such corresponding concepts as “consciousness,” “ego,” and “subjectivity.” All, he argues, are inextricably mired in the problematic ontology of modern philosophy where the subject is envisioned as an inner sphere set over against the extant objects of the world. In opposition to this picture, which fails to capture the phenomena of lived conscious existence, Heidegger develops a rich description of what he terms Dasein’s being-in-the-world (In-der-Welt-sein). In German, Dasein is an ordinary word meaning “existence”; in Heidegger’s work, by contrast, it functions as a technical term indicating human existing or that being which each of us is and that has an understanding of being as a definite characteristic of its being.40 This way of designating human subjectivity may seem willfully obscure unless we remember that Heidegger’s aim is to give a description of our factical existing, that is, of the manner in which the world is manifestly there for us and of the way in which we ourselves are in the world understandingly. For Heidegger, central to an adequate understanding of being-in-the-world is the recognition that it is lived and experienced in a unitary fashion. Although being-in-the-world is analyzed in Being and Time in terms of its constituent parts (Dasein, the worldhood of the world, and the mode of Dasein’s being-in), the aim of the work is to elucidate the unitary character of this overarching structure.

Heidegger’s analyses of things as present-to-hand and ready-to-hand, his elaboration of moods, of our average or everyday way of understanding and its dependence on undifferentiated public understandings, of anxiety, death, temporality, and other elements of being-in-the-world had an enormous influence on twentieth-century thought in fields as diverse as literature, sociology, psychology, art, history, and education. Heidegger also produced numerous students, including, most notably, Hannah Arendt and Gadamer, the latter of whom developed an important philosophical hermeneutics on the basis of Heidegger’s work.41 But the most immediate and possibly the most significant impact of Heidegger’s thought came in the form of French existentialism, to which we turn next.

IV. PHENOMENOLOGY IN FRANCE

Phenomenology crossed into France at the Alsatian border. Jean Hering (1889–1966), a professor at the University of Strasbourg, published his Phénoménologie et philosophie religieuse (Phenomenology and religious philosophy) in 1925.

---

40. Gadamer (1900–2002) was born in Marburg and grew up in Breslau (now Poland). He studied with Heidegger in Marburg from 1923 until 1928. [*] For further information, see the essay by Daniel L. Tate in The History of Continental Philosophy: Volume 4, and the essay by Wayne J. Froman in The History of Continental Philosophy: Volume 6.

41. Levinas, Ethics and Infinity, 30.
He also encouraged a young Lithuanian student, Emmanuel Levinas, to travel from Strasbourg to Freiburg to study directly with Husserl. Levinas was initially greatly attracted to Henri Bergson’s account of intuition and when a friend gave him a copy of the *Logical Investigations*, containing Husserl’s account of nonsensuous intuition, he read it with great perseverance and interest but also, as he says himself, “without guide.”  

Levinas reports that the truth of Husserl’s perspective dawned on him slowly but surely and he determined to study directly with the philosopher himself. When Levinas arrived in Freiburg, Husserl had just retired but was still teaching, and Levinas attended his lectures on phenomenological psychology and the constitution of intersubjectivity. Later, Levinas would translate into French (and not altogether to Husserl’s satisfaction) the crucial fifth chapter of the *Cartesian Meditations*: the chapter in which Husserl takes up the problem of how the other person can be constituted as other for consciousness. The real discovery of Levinas’s study year abroad, however, was Heidegger, then even less well known in France than Husserl. In contrast to the “abstract” and “ponderous” approach of Husserl’s phenomenology, Heidegger, in Levinas’s view, “brought the phenomenological method to life and gave it a contemporary style and relevance.” Levinas subsequently wrote his dissertation in 1930 on *La Théorie de l’intuition dans la phénoménologie de Husserl* (*The Theory of Intuition in Husserl’s Phenomenology*), and it would be the first work in French wholly devoted to Husserl’s thought. Levinas’s presentation in this early book is admittedly influenced by Heidegger and criticizes Husserl for a certain “intellectualism,” by which Levinas means that Husserl uncritically maintains that a theoretical or “thetic” positing lies at the basis of all intentional acts. In Heidegger, by contrast, there is an emphasis on the practical and affective dimensions of our involvement in the world and an insistence that these modes of relating to things are not secondary to acts of representation, but primary and disclosive of the world itself.

Having published his book on Husserl, Levinas turned to writing a similarly expository work on Heidegger. He abandoned this project in 1934, however, when he learned that Heidegger had joined the Nazi Party. Those who would argue that it was not possible in the early 1930s to discern the direction National Socialism would take, or who excused Heidegger’s involvement on such grounds, need look no further than Levinas’s 1934 “Reflections on the Philosophy of Hitlerism” to see that sharp eyes and a keen moral compass were

43. Levinas translated only the fifth chapter; the remainder of *Méditations cartésiennes: Introduction à la phénoménologie* was translated by Gabrielle Pfeiffer.
able to expose the racism of National Socialism and to predict that it harbored a threat to “the very humanity” of humankind. Levinas would lose his entire extended family in Lithuania to Nazi violence and was never able to exculpate or forgive Heidegger’s involvement with National Socialism. Nonetheless, Levinas recognized *Being and Time* as among the four or five greatest works of Western philosophy and his own first attempts at developing an original philosophy were recognizably modeled on the existential analytic of *Being and Time*, although they were also meant as a corrective to that account. Specifically, Levinas revisits the ontological difference and inverts the Heideggerian schema that privileges Being over beings or existents. Levinas’s *De l’existence à l’existent* (1947) – whose translated title, *Existence and Existents*, fails to capture this inversion from Being to beings – looks to phenomena such as fatigue, indolence, and insomnia to disclose the suffocating immanence of Being, a horror in existing itself and not only an anxiety about human finitude. Levinas suggests that this immanence cannot be pierced or evaded by the usual forms of transcendence that ultimately rely on a world behind the world, a “place” to which one can flee: after all, such places still are and thus remain within Being. Being, as Levinas presented it in this very early work (and in *Time and the Other*, also published in 1947), is an encumbrance that cannot be shaken off or transcended except in the relation to an Other, l’Autrui, who is absolutely other. Levinas would spend the rest of his career pursuing this line of thought, which is indebted to Heidegger but also determined to “leave the climate of Heidegger’s thought.” Thirty years after his dissertation on Husserl, he published *Totality and Infinity* (1961), the first mature statement of his ethics, and then significantly revised his position in *Otherwise Than Being, or Beyond Essence* (1974). Today, these works are considered among the most significant challenges to Heidegger’s fundamental ontology and are credited with effecting an ethical turn in French philosophy. But, if Levinas played an important (and long unacknowledged) role in the reception of phenomenology and its promotion within the French philosophical tradition, it is a role that unfolded in several distinct phases and over the space of decades rather than years.

Other forces and persons contributed equally to the rise of phenomenology in France during the 1930s. The role of Koyré deserves special mention. A Russian emigré who studied Bergson’s intuitionism in Paris and then phenomenology as a member of the Göttingen Circle, Koyré moved back to Paris from Germany in 1912 and became an important conduit for the transmission of phenomenology

---

*47. For a discussion of the role Levinas played in this ethical turn, see the essay by Robert Eaglestone in *The History of Continental Philosophy: Volume 7*. 

254
Volume 3
to France. In 1931, Koyré founded the journal *Recherches philosophiques*, which regularly devoted space to phenomenological essays and reviews, publishing translations of works by Husserl, Karl Jaspers (1883–1969), and Heidegger, as well as phenomenological studies by budding French phenomenologists. Koyré’s seminar at the École Pratique des Hautes Études (EPHE) also played a role in bringing phenomenology to France, attracting Georges Bataille (1897–1962) and Alexandre Kojève (1902–68), among others. Indeed, Koyré served as a kind of mentor to his Russian countryman Kojève (who was briefly married to Koyré’s former sister-in-law). It was at Koyré’s instigation that Kojève pursued a French doctorate and with Koyré’s recommendation that Kojève succeeded him at the EPHE in 1933. Kojève’s seminar at the EPHE between 1933 and 1939 developed a reading of Hegel that still casts its shadow on French thought.\(^4^8\) Reading Hegel line by line, translating it into French on the spot, Kojève fascinated his audience as he brought Bergson, Husserl, Heidegger, Einstein, and, most significantly, Marx to bear on Hegel’s text (and reciprocally read those figures through a Hegelian lens). The list of those who attended the seminar now reads like a who’s who of French philosophy, and Kojève’s interpretation of Heidegger no doubt had its influence on these thinkers. Bataille and Jacques Lacan (1901–81) were regulars at the seminar, while Raymond Aron (1905–83), André Breton (1896–1966), Levinas, Merleau-Ponty, and Eric Weil (1904–77), among others, were known to have attended at one time or another.\(^4^9\)

In France, the purest continuation of phenomenology may well have come in Merleau-Ponty’s *Phenomenology of Perception* (1945). Like almost everyone else in his generation in France who came under the influence of phenomenology, Merleau-Ponty initially reacted against the rationalism of Léon Brunschvicg (1869–1944) by turning to Bergson’s intuitionism. (He would later accede to Bergson’s Chair at the prestigious Collège de France). Merleau-Ponty was introduced to phenomenology through Georges Gurvitch’s (1894–1965) seminar at the Sorbonne (from 1928 to 1930) and attended Husserl’s lectures at the Sorbonne in 1929 (although, by his own report, he spoke no German at the time). Interested in the relationship between consciousness and nature, Merleau-Ponty proposed to investigate the nature of perception as that which accomplishes our primary relation to the world. Initially he proposed to do this by returning to the insights of Gestalt psychology, although after his discovery of Husserl he saw phenomenology as the principal means by which perception could be described and analyzed, since phenomenology avoids both a

\(^4^8\) Kojève’s reading of Hegel is also discussed in the essay by John Russon in *The History of Continental Philosophy: Volume 4*.

crude naturalism and an overly rationalist intellectualism. Husserl’s influence is evident when Merleau-Ponty writes,

Our task will be … to rediscover phenomena, the layer of living experience through which other people and things are first given to us …; to reawaken perception and foil its trick of allowing us to forget it as a fact and as perception in the interest of the object which it presents to us and of the rational tradition to which it gives rise.⁵⁰

In reawakening an interest in perception as the original modality of consciousness, Merleau-Ponty also developed a rich and persuasive account of the role of the body and embodiment in the structure of experience. The body is neither a mere object in the world, nor the passive instrument of perception, but the unseen pathway or open-ended system by which we are in-the-world. Especially in Merleau-Ponty’s later work, the body is described as an “ensemble” of “routes” that prepare the possibility of consciousness without necessarily being conscious as such.⁵¹ Merleau-Ponty was only fifty-three years old when he died in 1961, but his thought has been exceptionally influential and is employed not only by those who continue the phenomenological tradition, but by philosophers of mind, philosophers of the body, and those interested generally in the philosophy of perception.⁵²

Merleau-Ponty’s schoolmate and sometimes friend Jean-Paul Sartre probably did more than anyone to popularize phenomenology in France. Simone de Beauvoir (1908–86) reports that Sartre became interested in phenomenology after a discussion with Aron in a cafe in 1932. Aron was just back from a year at the Institut français de Berlin where he had carried out research on the philosophy of history and had also read Husserl and Heidegger. Pointing to his drink, Aron announced that phenomenology made it possible to philosophize from the concrete things themselves and convinced Sartre that with phenomenology one could avoid Cartesian dualism while still crediting the irreducible difference between consciousness and the givenness of the world. In then looking for a book on phenomenology, Sartre came across Levinas’s book on Husserl and, deciding to study this new philosophy seriously, Sartre made the necessary arrangements to succeed his friend Aron at the Institut français. It is a puzzling fact about Sartre’s time in Germany that he never went to Freiburg to study directly with either Husserl or Heidegger and met the latter for the first time

Volume 3
only in 1952, by which time both men had moved significantly beyond their phenomenological beginnings and, as Ethan Kleinberg speculates, “had very little to talk about.”

Much like Heidegger, who transformed phenomenology rather than merely transmitting it, Sartre’s engagement with phenomenology was revolutionary. His early work The Transcendence of the Ego (1936/7) largely accepts Husserl’s project of a pure presuppositionless description of lived conscious experience and acknowledges the fundamentally intentional structure of consciousness, but rejects the idea of a transcendental ego remaining after the reductions have been carried out. In the consciousness of an object, the cogito is prereflective, Sartre argues, but the ego itself is constituted in reflection and thus is an object in the world like any other. This view not only dispenses with the threat of solipsism, but, more importantly for Sartre, it returns the ego to the world and subjects it to all the vicissitudes of existence. Phenomenology can be credited with having “plunged man back into the world,” but only if it lets go of the transcendental ego that would once more pull “a part of man out of the world” and set it up as the creator of all that is. For Sartre, intentionality heralds the idea that the world and the self or “me” are contemporaneous. This supposition is enough, says Sartre, to make the “subject–object duality, which is purely logical, definitively disappear from philosophical preoccupations.”

Much like Heidegger, then, Sartre understands phenomenology as tasked with producing a description of our being-in-the-world that does not fall back into the trap of positing the subject over against a world of objects. In his masterwork, Being and Nothingness (1943), Sartre distinguishes being-for-itself (l’être-pour-soi) or consciousness and being-in-itself (l’être-en-soi) or the being of phenomena. Being-in-itself simply is what it is: in itself it is solid and massive. Being-for-itself, by contrast, is “the locus of possibility, negativity, and lack.” Phenomena, in short, are identified with “thingness” while consciousness is fundamentally “nothingness.” Whereas Heidegger defines Dasein as that being for whom its own being is in question, Sartre defines Dasein or réalité-humaine as “a being such that in its Being, the Nothingness of its Being is in question.” To put this

55. Ibid.
58. Ibid.
59. Sartre, Being and Nothingness, 57.
idea in the famous slogan of existentialism, this is just to say that for human being or being-for-itself, existing precedes any essence. A human being is not a particular kind or type of existent object with a specific essence or excellence. Rather, as consciousness, human being or being-for-itself is a spontaneity and freedom through which nothingness comes into the world.\textsuperscript{60}

Sartre’s existentialism was developed on this ontological basis. For Sartre, we are factically existing beings – that is, we live in a situation that is in some respects given – but we have absolute freedom when it comes to how we regard our situation and the actions we undertake within that situation. To think otherwise and to blame one’s choices on the circumstantial constraints is a matter of bad faith. But bad faith is not just a condemnation of cowardice in the face of absolute freedom (and a correspondingly absolute responsibility). It plays the ontologically disclosive role of showing once again that human reality begins with an act of negation. In order to say that I am courageous when I am not, I have to have the power of negation. Similarly, this power is manifested when I deny that my act was courageous and say that I only did what anyone in the circumstances would do. As many have pointed out, in France at the end of the Second World War, when French society was coming to terms both with occupation and collaboration, Sartre’s existentialism showed how it was possible to move forward in hope without denying the moral failings and horror of the recent past.

Kleinberg explains that “Sartre’s use of Heidegger led to the widespread supposition in France that Heidegger was an existential humanist, and Sartre’s own political affiliations with various left-wing political groups led to the vague impression that Heidegger had similar concerns.”\textsuperscript{61} Neither supposition was borne out. As for the second, the intellectual Left in France was stunned when it learned of Heidegger’s involvement with National Socialism, and the debate over whether and to what extent Heidegger’s philosophy is compatible with or contains Nazi sentiments lead to the so-called Heidegger Affair of 1946–47, when the issue was debated in newspapers and through academic journals such as Sartre’s \textit{Les Temps modernes}. The Affair has been revived several times since, both inside and outside France, each time reigniting the furor of the original tempest. As for the first supposition, it is widely known that Heidegger himself eschewed the title “existentialist.” Through a go-between, Heidegger was made aware of the influence of his thought in France and had the opportunity to read the major works of Sartre and Merleau-Ponty. While deeply interested in Sartre’s work in particular, he felt that the young scholar had overemphasized the human agent and his freedom, thus falling prey, as did Husserl, to a repeti-

\textsuperscript{60} Ibid., 60.
\textsuperscript{61} Kleinberg, \textit{Generation Existential}, 153.
tion of Cartesianism. Heidegger’s “Letter on Humanism,” written in response to an invitation by Jean Beaufret (1907–82) to expand his thought in the direction of an ethics, was his most important effort in writing to correct what he felt was the misleading existentialist interpretation of his work in France. The force of this document on French letters and philosophy was exceptional and played an important role in the rise of French antihumanism as seen in the works of Lacan, Michel Foucault (1926–84), and Jacques Derrida.

The philosophical currents begun by these three philosophers enriched and enlivened French philosophy in the second half of the twentieth century. Foucault’s archaeological and genealogical philosophy, Lacan’s revivification of Freudian psychoanalysis, and Derrida’s deconstruction all owe a debt to phenomenology that must be recognized, although it cannot be explored in detail here. Instead, we turn to a final summation of the international status and future of the phenomenological movement.

V. PHENOMENOLOGY AS AN INTERNATIONAL MOVEMENT

Phenomenology has always been an international movement. Many of those who visited Husserl or studied with him came from abroad and were central in the spread of phenomenology. Notably, there was Ingarden from Poland, Koyré from Russia, Aron Gurwitsch from Lithuania, Alfred Schutz from Vienna, Marvin Farber, among others, from the United States, and José Ortega y Gasset from Spain, although the last was never a thoroughgoing phenomenologist.62 Jewish scholars fleeing Germany during the Second World War were also a

62. Gurwitsch (1901–73) spent a year studying with Husserl and Heidegger in the early 1920s and wrote his dissertation under Scheler and then, after Scheler’s death, Moritz Geiger. He was strongly attracted to Gestalt psychology and integrates insights from this tradition with his understanding of transcendental phenomenology. Gurwitsch fled Germany during the Second World War and spent seven years in France before moving to the United States. There he taught at Johns Hopkins University, Brandeis University, and, most famously, from 1959 to 1973 at the New School for Social Research. His major original work was The Field of Consciousness, published originally in French in 1957, then in English in 1964. His Studies in Phenomenology and Psychology contains excellent critical studies of key concepts in phenomenology as well as original essays reflecting his wide interests in philosophy and psychology. Schutz (1899–1959) was a native of Vienna introduced to Husserl by Felix Kaufmann in 1932. Picking up Husserl’s notion of the lifeworld, Schutz developed a phenomenology of the social world with particular attention to the identification of the various sub-worlds that make up the lifeworld and their structural interrelation. Representative works include Der sinnhafte Aufbau der sozialen Welt (The Phenomenology of the Social World).

Farber (1901–80) studied with Husserl in Freiburg in 1923–24 and wrote his dissertation on Husserl’s philosophy. In 1939 he founded the International Phenomenological Society and in 1940 the journal Philosophy and Phenomenological Research. He taught at the University of

259
Volume 3
factor in establishing phenomenology in North America. Arendt as well as Felix Kaufmann, Fritz Kaufmann, Schutz, Gurwitsch, and Moritz Geiger all taught in the United States in the postwar years, many of them at the New School for Social Research in New York. After moving into France in the 1930s, phenomenology was exported worldwide first in the form of existentialism and later in the deconstruction of Derrida. Everywhere it has traveled, geographically and outside the discipline of philosophy, phenomenology has been mixed with local concerns and questions. In Latin America, phenomenology became a resource for liberation theology; in the United States and Canada, it has intersected with and informed the work of feminist philosophers as well as philosophers.

Buffalo and made it a leading center for phenomenological studies in the United States. He published his main work on Husserl, *The Foundation of Phenomenology*, in 1943.

José Ortega y Gasset (1883–1955) was a Spanish philosopher and public intellectual. He received his doctorate from Complutense University in Madrid in 1904 and spent the next few years studying in Germany at a number of different universities. He was appointed to a Chair in Metaphysics at his alma mater in 1909 and became a leading figure in Spanish philosophy and politics. He was not a phenomenologist *per se*, but visited Husserl in Freiburg in 1934 and impressed him greatly. Ortega played a leading role in the translation of contemporary German philosophy, including phenomenology, into Spanish and it was his students who effectively introduced phenomenology into Mexico and Latin America.

Arendt (1906–75) was born in Hanover and studied philosophy in Marburg with Heidegger and then with Jaspers in Heidelberg. She became one of the most influential and important political philosophers of the twentieth century, and both Heidegger, with whom she had a brief love affair, and Jaspers were crucial influences on her thought. Arendt fled Germany when the Nazis came to power in 1933, spending six years in Paris before she was again forced to flee, this time to the United States, where she spent the remainder of her life teaching at prestigious institutions such as the University of California, Berkeley, Princeton University, and finally the New School for Social Research. Major works include *The Human Condition* (1958), *Eichmann in Jerusalem* (1963), *The Origins of Totalitarianism* (1973), and *The Life of the Mind* (1978). [*] Arendt's work is discussed in detail in an essay by Peg Birmingham in *The History of Continental Philosophy: Volume 5*.

Felix Kaufmann (1895–1949) was interested in mathematics and physics as well as law and the social sciences. He visited Husserl repeatedly in Freiburg, after first contacting him by letter in 1922, and kept up a prodigious correspondence with him. In Vienna, Kaufmann was marginally connected with the Vienna Circle and tried to strengthen the relations between phenomenology and logical empiricism. In 1935, he organized a visit with Husserl in Vienna and was instrumental in trying to move the philosopher and his papers to Prague, although the attempt ultimately had to be abandoned. Fleeing to the United States, Kaufmann was the first of Husserl's students to teach at the New School for Social Research, offering courses beginning in 1939.

Fritz Kaufmann (1891–1958), no relation to Felix Kaufmann, began his studies with Husserl and Heidegger in Freiburg in 1919. He wrote his dissertation on "The Picture as Aesthetic Experience," and a book-length study of Thomas Mann. His main work was *Das Reich des Schönen: Bausteine zu einer Philosophie der Kunst* (1960). He fled Nazi Germany during the Second World War and spent twenty years teaching in the United States at Northwestern University and then the University of Buffalo, before returning to Europe at the end of his life.
of mind, and has had an important impact in psychology and sociology. It has
spawned numerous academic organizations worldwide (of which the Society for
Phenomenology and Existential Philosophy in the United States is among the
largest) and has, of course, spawned a veritable industry of smaller conferences,
research circles, translations, publications, and the like. What phenomenology
has not had, however, at least not since the generation of Sartre and Levinas,
is a major reinterpretation based on its dual origin in Husserl and Heidegger.
This suggests perhaps that phenomenology is at risk of becoming a historical
curiosity: retaining its ability to philosophize about the “things themselves”
but failing to speak urgently to the central problems of human existing or of
philosophy in our time. Indeed, already in 1963, Heidegger remarked that the
“age of phenomenology seems to be over. It is already taken as something past
which is only recorded historically along with other schools of philosophy.”64 But
this judgment is as premature now as it was in 1963. Heidegger suggests that
phenomenology is not a technique employed by a certain “school” of philoso-
phers. “It is,” he says, “the possibility of thinking” and even if the name disap-
ppears as such, wherever there is attention paid to what manifests itself and to
how it is given, we are in the vicinity of phenomenology.65 We may add to these
sentiments that we are far from having digested all that is given to be thought in
the works of Husserl, Heidegger, Sartre, Levinas, Merleau-Ponty, Derrida, and
others, and this suggests that the future of the phenomenological movement no
less than that of phenomenology in Heidegger’s sense remains invitingly open,
ready for renewal and reinvention.

64. Heidegger, “My Way to Phenomenology,” 82.
65. Ibid.
During the years leading up to and after 1890–1930, the continental conception of science had a far broader scope than the anglophone notion of science today. Even today, the German term *Wissenschaft* embraces not only the natural and the social sciences, including economics,\(^1\) but also the full panoply of the so-called humanities, including the theoretical study of art and theology, both important in the nineteenth century for, among other things, the formation of the life sciences.\(^2\) Philosophy itself was also counted as a science and was, in its phenomenological articulation, nothing less than the science of scientific origins or “original science” – the “Urwissenschaft” – as Martin Heidegger defined it in 1919,\(^3\) following his own intensive engagement with Edmund Husserl’s *Logical Investigations*.

It is also crucial for any discussion of continental philosophy of science between 1890 and 1930 to emphasize that these were, in Winston Churchill’s words, “precarious times,” times of technological and social change and of revolution, scientific and political. In a positive reflection on the transformations of

---

this period, Heidegger refers, as will Husserl later, to the “crisis of philosophy as science,” noting in 1925 that all “sciences and groups of sciences are undergoing a great revolution of a productive kind that has opened up new modes of questioning, new possibilities, and new horizons.”

These same critical years also saw astonishing industrial innovations, yielding many of the still-familiar achievements of modern technology, from cars (the four-wheeled automobile in 1892), airplanes (1903), and even moving sidewalks (1893); from moving pictures (1895) to public radio broadcasting (in 1922, although Marconi first transmitted a radio signal in 1895) and television broadcasting (1929). Wilhelm Röntgen took the first X-rays in 1895, while the development of modern artillery began in 1897, and Robert Goddard launched the first liquid-fueled rockets in 1926.

Continental philosophy of science has always featured reflection not only on the technologies of scientific investigation but also on human perception and technological circumspection. Louis Basso’s 1925 essay, “Induction technique et science expérimentale” was central to Gaston Bachelard’s 1928 dissertation, *Essai sur la connaissance approchée*, because Basso raised the question of the industrial arts as involving an inherently encompassing coordination of mechanization and technique. Heidegger had already emphasized in 1927 the interaction between theoretical world-disclosure and scientific research equipment, points that continue in Patrick A. Heelan’s (1926– ) reflections on Werner Heisenberg’s (1901–76) physical philosophy and Heelan’s own subsequent elaboration of the phenomenology of perception as a phenomenology of laboratory discovery. A similar focus on the researcher’s art also characterizes Ernst

---

Mach’s (1838–1916) philosophical reflections on science and can be said to drive Ludwik Fleck’s (1896–1961) philosophical sociology of medical science.\(^7\)

For his part, Heidegger’s critical reflections on science anticipate the turn to the history of science and indeed the social and historical studies of technology that increasingly inform science studies.\(^8\) Heidegger’s reflective critique of mathematics and science in his 1927 *Being and Time*, together with the questioning he undertakes with regard to thinking the essence of modern technology, provides the basis for his hermeneutic phenomenology of both scientific theory and practice. As he writes in the later 1930s, using what would turn out to be a timely example taken from the same experimental physics that would herald the development of the atom bomb in the mid-1940s, “Within the complex of machinery that is necessary to physics in order to carry out the smashing of the atom lies the whole of physics.”\(^9\)

Heidegger’s point is echoed in the argument Heelan makes in *Quantum Mechanics and Objectivity* with respect to Heisenberg’s perturbation theory of measurement in his 1925–27 contributions to quantum mechanics.\(^10\) Measurement, as Heelan points out with special emphasis on the technological instruments that are used to obtain such measurements – that is, what Heidegger calls “the complex of machinery” – makes all the difference for the “new scientific spirit” – using Bachelard’s terminology – of physics.\(^11\) For Heidegger, what is at issue is the *constitution* of modern technological and mathematizable (measurable, calculable, model-oriented) science, conceived in both the Husserlian phenomenological sense and the mechanically explicit sense of standardized manufacture and institutional technology.\(^12\) It is thus in this sense that

---

the Heidegger of the 1930s describes the trajectory of modern technology as a “humanism,” much as Friedrich Nietzsche in The Gay Science and in his posthumous notes characterizes mathematics and the sciences in general as what he named, in a Kantian voice, so many modalities of “humanization.”

I. LIMIT-CONCEPTS, METHOD, AND THE TENSIONS OF FRENCH PRAGMATISM

In his address in Paris to the 1900 World Congress of Mathematicians, David Hilbert (1862–1943) adumbrated his famous programmatic plan for mathematics, articulating his positive conviction that “However unapproachable these problems may seem to us and however helpless we stand before them, we have, nevertheless, the firm conviction that their solution must follow by a finite number of purely logical processes.”14 In 1930, Kurt Gödel (1906–78) would announce the results of his own research disproving Hilbert’s program at a congress on the epistemology of the exact sciences in Königsberg at which Hilbert himself gave the culminating public lecture of his life, publicly broadcast on the radio, and proclaiming in conclusion “We must know – we will know.”15 One did not, however, have to wait for Gödel. The crisis in the foundational program is coterminous with Hilbert’s project. It is already present in the neo-Kantianism that dominated continental thinking on science and mathematics in all its modalities from the empirio-criticism or environmental positivism of Richard Avenarius (1843–96) and Mach, in the logical positivism of the Vienna Circle that emerged from this tradition, in Henri Poincaré and Henri Bergson, and in Husserl and Heidegger.

To the question of foundations must be added the question of method. Heinrich Rickert’s The Limits of Concept Formation in Natural Science (1896–1902) distinguishes the different traditions of science as such, and Wilhelm Dilthey (1833–111) extends this reflection to the human sciences. Inaugurating the then-influential turn to what was called Lebensphilosophie,16 Dilthey

---

15. Contending that there is in mathematics no “Ignorabimus,” Hilbert refers to Emil du Bois-Reymond’s (1818–96) claim that there are limits to human knowledge; see Victor Vinnikov, “We Shall Know: Hilbert’s Apology,” Mathematical Intelligencer 21 (1999).
emphasized lived experience as central to the opposition between explanation and understanding. The same focus on method can be read in the reflections of social scientists such as Max Weber (1864–1920), as well as in the Existenzphilosophie of the physician turned philosopher, Karl Jaspers (1883–1969). Even Nietzsche emphasized that “the scientific spirit rests upon insight into method,”\(^\text{17}\) a claim that included classical philology and history as well as the physical sciences.\(^\text{18}\) Yet Nietzsche also argued that “the triumph of science distinguishes our 19th century less than does the triumph of scientific method over science.”\(^\text{19}\)

Although there were clear differences between them, Nietzsche shared Mach’s emphasis on the role of error in scientific rationality along with Mach’s opposition to atomism.\(^\text{20}\) Indeed, one commentator’s introductory assessment of the general reaction to Mach in this context should be compared to common responses to the conjunction of Nietzsche and science: “Mach’s viewpoint provides a basis only for destructive criticism, and tends to discourage the development of hypotheses that may turn out to be fruitful.”\(^\text{21}\)

It is Nietzsche’s critical thinking on the sciences and on logic and mathematics, conjoined with his influence on certain scientists and mathematicians, that constitutes one of the earliest instantiations of continental philosophy of science. During the period under discussion here, Nietzsche’s critical

---

philosophical spirit, including his theory of eternal recurrence,\textsuperscript{22} influences not only literary and artistic traditions but also philosophical discussions of Darwinism, the debate on entropy and thermodynamics,\textsuperscript{23} and the tradition of Victorian relativity antedating Einstein, even if we set aside, for the moment, the impact of Nietzsche’s thinking on Heidegger’s early philosophy of science.

Highlighting Nietzsche’s practical emphases together with his skepticism, the Belgian philosopher René Berthelot in 1911 coordinates American pragmatist and continental philosophy of science, comparing Nietzsche not only to the pragmatism of Charles Sanders Peirce and William James but also to Poincaré.\textsuperscript{24} Linking the American pragmatists in this way with the work of scientists is no fluke. In fact, it is difficult to parse French philosophers of science during this period without referring to Peirce and, especially, to James, who was familiar with and shared a number of interests with Bergson.\textsuperscript{25} Bergson began his intellectual life with a prize essay in mathematics, and in addition to his reflections on evolution he contributed also to the philosophy of mathematics inasmuch as he undertook the critically important step at the turn of the twentieth century of

\begin{itemize}
  \item \textsuperscript{22} For a discussion of Nietzsche’s eternal recurrence, see the essay on Nietzsche by Daniel Conway in \textit{The History of Continental Philosophy: Volume 2}.
  \item \textsuperscript{23} Drawing on Henri Poincaré’s argument that a closed system of atoms must recur, in an infinitesimal approximation, to its initial state, infinitely many times, von Weizsäcker notes that Ernst “Zermelo in 1900 raised objection to the statistical interpretations of the second law of thermodynamics, the so-called Recurrence Objection” (“Nietzsche: Perceptions of Modernity,” 227). This objection against entropy seemed to provide support for Nietzsche’s and other theories of recurrence. For a discussion, including references to Nietzsche and Poincaré, see Stephen Brush, \textit{The Temperature of History: Phases of Science and Culture in the Nineteenth Century} (New York: Bart Franklin, 1978); more recently, Péter Érdi cites the same tradition in \textit{Complexity Explained} (Frankfurt: Springer, 2007). For an overview, including a reference to Nietzsche, see Christopher Herbert on the tradition of relativity before Einstein in \textit{Victorian Relativity: Radical Thought and Scientific Discovery} (Chicago, IL: University of Chicago Press, 2001).
  \item \textsuperscript{24} See René Berthelot, \textit{Un Romantisme utilitaire: Etude sur le mouvement pragmatiste. 1, Le pragmatisme chez Nietzsche et chez Poincaré} (Paris: Félix Alcan, 1911). Peirce, it should be noted, was not pleased with this comparison.
  \item \textsuperscript{25} See Henri Bergson, “On the Pragmatism of William James: Truth and Reality,” Melissa McMahon (trans.), in \textit{Key Writings}, Keith Ansell-Pearson and John Mullarkey (eds) (New York: Continuum, 2002) as well as Émile Boutroux’s \textit{William James}, Archibald Henderson and Barbara Henderson (trans.) (New York: Longman’s, Green, 1912). Horace Kallen’s \textit{William James and Henri Bergson: A Study in Contrasting Theories of Life} (Chicago, IL: University of Chicago Press, 1914) begins by focusing on the perceptual contrast between, and hence affinity of, the artist and the philosopher. It should not be supposed, however, that French philosophers of the turn of the century read the American pragmatists in the way they are read today, a difference still evident, for example, in Paul Ricoeur’s \textit{Freedom and Nature: The Voluntary and the Involuntary}, Erazim Kohak (trans.) (Evanston, IL: Northwestern University Press, 1966), where, in addition to a discussion of James and eidetic phenomenology, Ricoeur also compares James with Bergson and Jaspers.
\end{itemize}
“rereading both Kant’s philosophy and Riemann’s mathematics of the manifold and gave the term *intuition* a central place in his reasoning.”

II. THE MEDIEVAL FOUNDATIONS OF MODERN SCIENCE:
HISTORY OF SCIENCE AND IDEOLOGY

Contemporary analytic philosophy of science rests, implicitly or explicitly, on the crucial idea of the “scientific revolution”. In this same tradition of philosophy of science, it is well known that Pierre Duhem’s famous theoretical underdeterminism was influential for Einstein and Quine. What is less well known is that Duhem also wrote a key account of the story of Catholic (and Islamic and Jewish) science in the Middle Ages – the ten-volume *Le Système du monde* – undermining nothing less threatening to modern science’s conception of itself (in contrast with the medieval and ancient worlds) than the very idea of the scientific revolution. Most historians and philosophers of science are hard pressed to fit the conceptual traditions of medieval science into the developmental tradition of modern science, and ancient science presents an even more difficult task.

On the subject matter of ancient science, and challenging the ongoing presumption that supposes Aristotle incapable of observation, Paul Feyerabend reminds us of the stubbornly acontextual tendencies of the Vienna Circle. In accord with Duhem’s continuationist point vis-à-vis the scientific revolution, Feyerabend argues that the “Vienna Circle shares with the enlightenment an exaggerated faith in the powers of reason and an almost total ignorance concerning past achievements.” Like Nietzsche before him, Feyerabend calls for greater historical sensitivity, a hermeneutic attention to context that would increase the rigor of scientific historiography.

Duhem’s 1903 discovery of themes from Leonardo’s notebooks in a medieval manuscript (of one Jordanus Nemorarius) exemplifies this point. As one scholar notes, so far “from seeing Leonardo as the forerunner of modern science, Duhem fairly rooted him in the then-hitherto unexplored context of late medieval scholastic thought.” Using a metaphor borrowed from Nietzsche to speak of the Greeks’ unique discoveries, Ernst Cassirer has drawn our attention to the detail of Duhem’s account of “how Leonardo received a great number of problems immediately from the hands of Cusanus and how he took them up precisely at the point Cusanus had left them.” As Duhem further details, Domingo de Soto (1494–1570) had described free fall eighty years before Galileo in his 1551 commentary on Aristotle’s *Physics.* Duhem’s approach became the basis for an important change in the history of science. As Jeanne Peiffer explains, “Duhem exploited long-neglected sources and enlarged the body of knowledge concerned with scholastic mathematics and philosophy. He defended the thesis that, through an uninterrupted sequence of barely perceptible improvements, modern science arose from doctrines taught in the medieval schools.”

Together with a focus on interpretation and context, hermeneutic and phenomenological philosophy of science also attends to the kind of historical

31. Here Feyerabend repudiates “the historical illiteracy of most contemporary philosophers and of their low standards of hero worship” (Science in a Free Society, 59).
32. Ibid.
specificity or perspective emphasized by Herbert Butterfield, as does Nietzsche, and later still Foucault and Georges Canguilhem. Mainstream history of science by contrast continues to tend toward “leaving things out,” perhaps in the interest of minimizing complexity, which may be why it prefers the more neutral “presentist” to Butterfield’s “whig” terminology. But the language of “presentism” exemplifies the problem of presentism. Thus Butterfield argues that:

behind the Whig interpretation – the theory that we study the past for the sake of the present – is one that is really introduced for the purpose of facilitating the abridgment of history; and its effect is to provide us with a handy rule of thumb by which we can easily discover what was important in the past, for the simple reason that, by definition, we mean what is important “from our point of view.”

III. BEYOND PHYSICS: EXEMPLARS OF SCIENCE

(i) Grounding physical science: geology and deep time

A relatively new science that developed in the nineteenth century, geology is a science typically neglected in mainstream discussions of the philosophy of science. Like evolution and paleontology, geology counts as a “paleoetiological” science in William Whewell’s language that has had a correspondingly diverse range of influences, not least in the mid-nineteenth century via Charles Lyell’s influence on Darwin. The Scottish physicist William Thomson (1824–1907), who later became Lord Kelvin, challenged the Hutton–Lyell “uniformitarian” theory of geology in the 1860s. Although his challenge to uniformitarian

---

*39. For a discussion of Foucault and Canguilhem in this regard, see the essay by Pierre Cassou-Noguès in *The History of Continental Philosophy: Volume 4*.
44. The uniformitarian theory of geology, as the name suggests, assumes the constancy of the earth’s relative position in the solar system and the stability of the geological features of the earth itself over long periods of time.
theories of the age of the earth was well founded, Lord Kelvin’s own simple or “elegant” mathematical model failed to represent the complex dynamics of the earth’s geological evolution (and indeed its present), and hence his estimate of the age of the earth, for all its mathematical “correctness,” was nonetheless erroneous.\textsuperscript{45} Incorporated in the second law of thermodynamics as expressed in 1865 by Rudolf Clausius (1822–88), Thomson’s challenge, although not itself productive for geology per se, was enormously influential and culminated in the concept of entropy, one of the most profoundly philosophical scientific notions of the nineteenth century. This vision in turn inspired Poincaré’s recurrence theorem, which stated that in a closed or bounded system all events return, infinitely many times, to their initial state, much as Nietzsche also argued with his own theory of the eternal recurrence of the same.\textsuperscript{46} In the spirit of “deep time,” both Poincaré’s and Nietzsche’s articulations highlight an already-consummate past.

Beyond its nineteenth-century preludes and in addition to thermodynamics and evolution, geology saw further important innovations in the polar explorer and geologist Alfred Lothar Wegener’s (1880–1930) 1912 theory of continental drift.\textsuperscript{47} Quintessentially revolutionary, Wegener’s discovery dramatizes some of the difficulties of paradigm change, as it was ridiculed for nearly fifty years (indeed, it was still the object of ridicule by professors of earth science when this author was at university) before being finally accepted as today relevant for the sciences of ecology, evolution, and climate change. Wegener is thus a paradigmatic example for the obstacles faced by any revolutionary theory.\textsuperscript{48} Both for theoretical as well as contextually hermeneutic reasons, including the

\begin{thebibliography}{9}
\bibitem{45} See, for a discussion, in a context attuned to both geology and mathematical modeling in science, Orrin H. Pilkey and Linda Pilkey Jarvis, \textit{Useless Arithmetic: Why Environmental Scientists Can’t Predict the Future} (New York: Columbia University Press, 2007), 27ff.
\bibitem{46} For a discussion of the nineteenth-century context, relevant to Poincaré as well as Nietzsche, see Brush, \textit{The Temperature of History}, as well as Milič Čapek, \textit{The Philosophical Impact of Contemporary Physics} (New York: Van Nostrand-Reinhold, 1961). For a discussion of Poincaré, see the first part of Barry Gower, “Cassirer, Schlick, and ‘Structural’ Realism: The Philosophy of the Exact Sciences in the Background to Early Logical Empiricism,” \textit{British Journal for the History of Philosophy} 8(1) (2000), esp. 80–86, as well as Érdi, \textit{Complexity Explained}. \end{thebibliography}
development of nuclear weapons, but also given new interest in environmental philosophy, geology continues to be relevant for continental philosophy of science to this day.

(ii) Chemistry contra physics

Like the reductionist tendency to translate continental philosophy into analytic philosophy, all other sciences are thought, at least in theory, to be amenable to a translation into the terms of physics. This presupposition is inherently problematic in chemistry, even though chemistry, unlike biology or psychology, can appear to be the most physics-like of the nonphysics natural sciences. This point is exemplified by the writings of a chemist whose work is increasingly relevant in the philosophy of chemistry today, Friedrich Adolf Paneth (1887–1958).

51. See Eric Scerri, The Periodic Table: Its Story and its Significance (Oxford: Oxford University Press, 2006) for a discussion of the conceptual and theoretical implications of Paneth’s work for the philosophy of chemistry. Although the discussion to follow will highlight Paneth’s work, we have already cited several chemists, notably Bachelard but also Duhem and Berthelot. To these names, Bensaud-Vincent adds Émile Meyerson (1859–1933), who began his career as a German trained chemist, and Hélène Metzger (1889–1944) (“Chemistry in the French Tradition,” 634–5). For Bensaud-Vincent, the considerations of feminist philosophy and history of science are indispensable because philosophers and historians of science tend to overlook otherwise significant scientific work owing to a double prejudice against women that extends to those who lack the “prestigious diplomas” and not less (and this is the contrast as Bensaud-Vincent notes with Myerson) the crucial academic appointments that make all the difference for scholarly recognition (ibid., 644). To Metzger’s name in chemistry may be added in physics the name of Mileva Marić or Marity (1875–1948), Albert Einstein’s first wife and his mathematical and scientific collaborator, controversially listed as the coauthor of his 1905 “Zur Elektrodynamik bewegter Körper,” received by the Swiss journal Annalen der Physik on June 30, 1905, signed Einstein–Marity. Alberto Martínez argues the mainstream view contra the significance of Mileva Marity–Einstein, but cites the Russian physicist Abram Joffe’s 1955 account in ”Handling Evidence in History: The Case of Einstein’s Wife,” School Science Review
As a scientist, Paneth is known for his work on isotopes, collaborating in 1921 on the use of radium D as a tracer with the Hungarian chemist George de Hevesy (1885–1966). Paneth is also well known for theorizing the natural scientific limit-concept of the chemical element as such. Paneth underlines the dangers of the reductionist tradition of representing chemistry on the model of physics, writing that “As a rule, chemistry is presented by the philosophers as a science which is well on the way to transforming itself into physics, and to which, therefore, the same considerations will apply in due course.” But where Paneth sought to make these points from the perspective of the philosophy of chemistry in the 1930s, response, as Jaap van Brackel details, has been either utterly absent or glacially slow in mainstream philosophy of science. Indeed, as Joachim Schummer argues, the “one-sided picture of science tailored to physics” has often meant that analytic philosophers of science are unaware of the philosophy of chemistry in terms of the specific differences between chemistry and physics rather than the way they are generally unaware of the philosophy of biology or the philosophy of economics in spite of the important work of continental scientists and theorists such as Friedrich von Hayek and Michael Polanyi.

Duhem, himself a physical chemist, would emphasize the exceptionality of chemistry in the same way, pointing to Kant’s observation that “the theory of bodies can only become a science of nature when mathematics is applied to it.” The point of drawing a parallel with chemistry (like other sciences such as geology, as noted above) has been to underline the fact that analytic philosophers

---

86(316) (March 2005), 51–2. Inasmuch as the original manuscript has vanished, no resolution is in fact possible.

52. Hevesy, an independent researcher, won the Nobel Prize in Chemistry in 1943 for work that grew out of this earlier collaboration with Paneth. Michael Polanyi (1891–1976) was Hevesy’s assistant in Budapest in 1919 before returning to Germany where he had studied physical chemistry.

56. Pierre Duhem, *German Science: Some Reflections on German Science and German Virtues*, J. Lyon (trans.) (La Salle, IL: Open Court, 1991), 31. Duhem goes on to cite Adolphe Wurtz,
of science ignore both chemistry and the philosophy of chemistry rather in the way continental philosophy of science is similarly discounted.

But the parallel runs deeper. Paneth’s own work is itself steeped in the early continental tradition of the philosophy of science. Thus Paneth’s theoretical reflections on the nature of the chemical element cannot be read apart from his engagement with the epistemological reflections of Rickert’s limit-concepts or the philosopher Eduard von Hartmann (1842–1906), or Meyerson’s own chemical insights or Polanyi’s, or of Wilhelm Wundt (1832–1920), the father of experimental psychology so important for cognitive science. Additional influences on Paneth’s thinking include the theoretical insights of Hermann Weyl (1885–1955) and the physicalist and phenomenological reflections of the 1902 Nobel prize-winning chemist Emil Fischer (1852–1919).

In his “On the Epistemological Status of the Chemical Concept of Element,” Paneth repudiates the reduction of chemistry to physics for the very phenomenological and critical reason that the aim of physics is ultimately to reduce “sensory qualities to quantitative determinations.”\(^\text{57}\) Like Duhem, Paneth cites Kant’s mathematical conventionality as justifying the exclusion of chemistry as a science. By contrast, Paneth argues that inasmuch as “chemistry is essentially non-mathematical,”\(^\text{58}\) it was the “chemist, unhampered by mathematics or indeed almost any theory, who discovered the majority of all chemical elements on the basis of the most primitive concept of substance!”\(^\text{59}\) The effectively unchanged basis of chemistry, that is, the basic schema of the periodic table itself in the wake of relativity and quantum theory, offers a corroboration, as Paneth underscores: “already in the seventies of the last century, the elements had been arranged by the chemists into a scheme, the so-called ‘natural system of the elements’”\(^\text{60}\) – a system thus unchanged in its character by the innovations of twentieth-century atomic theory.

\(^\text{Dictionnaire de chimie: Pure et appliquée (Paris: Librairie Hachette, 1874): “Chemistry is a French science.”}\)

\(^\text{57. Paneth, “The Epistemological Status,” 16.}\)

\(^\text{58. Ibid., 118. In a related but ultimately different point, some philosophers of science have argued that the difference between chemists and physicists can be found in the central role of the “thought experiment” in physics just where it is conspicuously absent in chemistry.}\)

\(^\text{60. Scerri notes that the French geologist Alexandre-Émile Béguyer de Chancourtois (1820–86) was the first to propose a periodic arrangement of the elements according to atomic weights. Others include the English chemist John Alexander Reina Newlands (1837–98) and the German chemist Julius Lothar Meyer (1830–95) in addition to Dmitri Mendeleev (1834–1907). Mendeleev is celebrated as the first to use the table to predict elements as yet undiscovered.}\)
Speaking here of substance as either basic (nonobservable, theoretical, or, in some philosophic expressions, constructed) or simple (observable), Paneth seeks to explain the notion of an element as such: “the whole body of chemical theory lies in the assumption that the substances which produce the phenomenon of ‘simple substances’ serve in the quality-less, objectively real sphere of nature as ‘basic substances.”61 Rather than progressing toward a more mathematized chemical science on the model of physics, one would do well to return to the philosophical origins of the concept of the “elemental” (and Paneth means such a return in earnest as he invokes the ancient atomists but also the Epicurean notion of “mixing”), in order to avoid the dangers of equivocation when speaking of either the permanence of substance as such or the signal chemical and even alchemical achievement that is the “creation of a new substance by mixing two known ones.”62

In other words, chemical synthesis generates new compounds, and what we understand by “substance” (here regarded as much philosophically as scientifically) matters for a phenomenological understanding of such new compounds. If Paneth refers to Karl Joel’s 1906 allusion to the “genesis of nature philosophy in the spirit of mysticism,”63 Bensaud-Vincent reminds us that “the challenge posed by chemistry is that its irrationals are incorporated in matter: they are everywhere, in a glass of sugared water or in the kitchen salt that we use every day.”64

62. Paneth, “The Epistemological Status,” 123. Bensaud-Vincent cites Duhem’s discussion of the very idea of a new chemical compound by way of his revival of the Aristotelian term “mixt” and other related concepts contra “the prevailing atomist and mechanistic views” (“Chemistry in the French Tradition,” 637). Thus Duhem, in Le Mixte et la combinaison chimique, argues that in “this mixt, the elements no longer have any actual existence. They exist there only potentially because on destruction the mixt can regenerate them” (cited in Bensaud-Vincent, “Chemistry in the French Tradition,” 637).
64. Bensaud-Vicent, “Chemistry in the French Tradition,” 646. The distinction between physics and chemistry, a political order of rank, seems to have made all the political, theoretical difference for the scientific estimation and investigation of the first reports of cold fusion inasmuch as these reports were made by scientists who happened to be not physicists but chemists. Mainstream philosophy of science continues to regard cold fusion as an example either of pseudo-science or straightforward fraud. See Jean-Paul Biberian, “Condensed Matter Nuclear Science (Cold Fusion): An Update,” International Journal of Nuclear Energy Science and Technology 3(1) (2007).

IV. THE THINGS THEMSELVES: HUSSERL’S
PHENOMENOLOGICAL PHILOSOPHY OF SCIENCE

We have noted that Husserl’s philosophy of science must be set into the wider scope of Hilbert’s foundational program. For Husserl, this is the concern of philosophy as a rigorous science but that is only inasmuch as philosophy is concerned with truth (and not only with what is upheld as what is as good as truth).65 Indeed, Husserl was associated with nearly every key mathematician of the day, from Georg Cantor (1845–1918), Husserl’s friend and colleague at the University of Halle between 1890 and 1910,66 and Gottlob Frege to Hilbert, Weyl, L. E. J. Brouwer, and Gödel.67 For this reason, Husserl’s *Philosophy of Arithmetic*, which first appeared in 1891, is key to the period of continental philosophy of science under discussion.68 Heelan uses both Husserl’s and Heidegger’s reflections to develop a philosophical reflection on objectivity, particularly in Niels Bohr’s and Heisenberg’s theoretical interpretations, thereby suggesting that phenomenology offers an indispensable route to a clarification of quantum mechanics. Others have highlighted Einstein’s role in Husserl’s philosophy of science, while yet others emphasize the coordination of Poincaré with Husserl’s

---

65. See, however, on Husserl and pragmatism, the work of Richard Cobb-Stevens and others.

66. It has been argued that Cantor was an important influence on Husserl; see Clair Ortiz Hill, “Did Georg Cantor Influence Edmund Husserl?” *Synthese* 113 (1997) and David Woodruff Smith, “What is ‘Logical’ in Husserl’s Logical Investigations? The Copenhagen Interpretation,” in *One Hundred Years of Phenomenology: Husserl’s Logical Investigations Revisited*, Dan Zahavi and Frederik Stjernfelt (eds) (Dordrecht: Kluwer, 2002). But see also David Bell, “A Brentanian Philosophy of Arithmetic,” *Brentano Studien: Internationales Jahrbuch der Franz Brentano Forschung* 2 (1989), who argues that Husserl was principally influenced by Brentano. Alain Badiou likewise alludes to this influence with his own claim that Husserl reads Galilean science on a par with (post-Cantor) set theory in *Being and Event*, Oliver Feltham (trans.) (London: Continuum, 2005), 3.

67. Even Einstein is said to have been tempted to name his theory of relativity “*Invariantentheorie*,” in an explicit echo of Husserl’s phenomenological method; see Richard Tieszen, *Phenomenology, Logic, and the Philosophy of Mathematics* (Cambridge: Cambridge University Press, 2005), 87.

68. In addition to Heelan’s *Quantum Mechanics and Objectivity* (The Hague: Martinus Nijhoff, 1965) (which remains important for its emphasis on the crucial role of continental philosophers in their theoretical engagement with scientists, and thereby with Heelan’s analysis of the hermeneutics of natural science within the experimental practice of the sciences themselves), and his *Space-Perception and the Philosophy of Science* (Berkeley, CA: University of California Press, 1983), a book on, among other things, Husserl and the metrics of vision from Luneberg to Marr, see Thomas Ryckman, *The Reign of Relativity: Philosophy in Physics 1915–1925* (Oxford: Oxford University Press, 2005) for an account attuned to the history of science (on Husserl and Weyl as well as Einstein, Schlick, Reichenbach, and Eddington); see also Tieszen, *Phenomenology, Logic, and the Philosophy of Mathematics* (on Husserl and Gödel as well as on Cantor and Brouwer, Heyting and Poincaré).
criticisms of logicism and formalism. Where Ryckman and Clair Ortiz Hill point to the decades Husserl spent in Halle (and the importance of Cantor), Heelan highlights, as do others, the significance of Husserl's tenure in Göttingen during the dynamic years of Hilbert's foundational program in mathematics.

Echoing René Descartes's remark in his *Discourse on Method*, Einstein famously quipped that we should attend to what scientists do, not to what they say. Richard Tieszen thus commends the value of Husserl's "philosophy of mathematics" as it bears witness to the attempt "to do justice to mathematics as it is actually given and practiced." Such a coordinated reference to the history and practice of science exemplifies both phenomenological and hermeneutic approaches to the philosophy of science, and we have seen its relevance for Nietzsche. In this spirit, Ryckman can refer to Husserl's claim to be the "true positivist," a claim that Steven Crowell likewise cites as being "only" slightly ironic.

For Descartes, as for the entire Enlightenment order of philosophizing about cognition and perception, what the mind knows is mind. Thought must be submitted to logical analysis to gain any sure knowledge of it, which leaves the gap between mind and world, thought and object. What Eugene Wigner (1902–95) would describe in a later recollection of this early period, and with patent reference to both Hilbert and Gödel, as the "unreasonable effectiveness" of mathematics in the natural sciences reflects a number of theoretically (if not to be sure "effectively" or "practically") unbridgeable chasms. While this is the traditional issue of objective versus subjective logic for both Husserl and Heidegger, Husserl's account of intentionality sidesteps just this separation insofar as "the

intentional object of a presentation is the same as its actual object. What is known by any intentional act is the intentional object or “noematic” correlate, hence the directive direction of Husserl’s classic cry: “zu den Sachen selbst” (to the things themselves).

Following the error of what Husserl calls “Galilean science” and Rickert had named “positivist” science, the worldview of modern science inaugurates the opposition between pragmaticism and realism that still stands for many as the central problem of the philosophy of science today. Modern science limits or reduces reality to its scientifically measurable, calculable, or quantifiable properties, taking reality here in the common-sense (but still counter-intuitive) meaning of scientific realism. As Husserl saw it, the technological, practical, and theoretical mathematical projects articulating the essence of modern science are fundamentally rather than incidentally opposed to one another. Galilean science (Heidegger’s calculative rationality) substitutes “the mathematically substructed world of identities for the only real world,” and in this way, so Husserl suggests, Galilean science itself comes to stand in the place of the world “that is actually given through perception … [that is,] our everyday life-world.”

The Galilean distinction between primary and secondary properties privileges the measurable as primary, so that what began as a convenience led with Descartes to the division of subjective experience (mind) and objective world (body). And in the end, only the objective or measurable world became the real world, with the subjective and leftover worlds of “meaning” and “value,” “mind” or “spirit,” correspondingly eliminated or “reduced” to the domain of the unreal as mere phenomena. As Husserl writes in The Crisis of European Sciences and Transcendental Phenomenology, the scientific worldview “excluded in principle precisely the questions which man, given over in our unhappy times to the

---

75. In this way, Husserl extended the concept of the life-world beyond its Romantic origins to connect the worlds of science and mathematics to the world we inhabit, a project continued in Heidegger’s philosophical reflections on the worldview of science and technology and further revitalized and ultimately radicalized in Maurice Merleau-Ponty; see Heelan’s discussion of Merleau-Ponty and Husserl in Space-Perception and the Philosophy of Science, and for a discussion of Merleau-Ponty and Derrida with respect to Husserl, see Leonard Lawlor, “The Legacy of Husserl’s ‘Urprung der Geometrie’: The Limits of Phenomenology in Merleau-Ponty and Derrida,” in Merleau-Ponty’s Reading of Husserl, Ted Toadvine and Lester Embree (eds) (Dordrecht: Kluwer, 2003). Florence Caeymaex also traces the connection between Merleau-Ponty and Husserl via Bergson in her Sartre, Merleau-Ponty, Bergson: Les Phénoménologies existentialistes et leur héritage bergsonien (Hildesheim: Olms, 2005).

77. Ibid., 49.
most portentous upheavals, finds the most burning: questions of the meaning or meaninglessness of the whole of this hard existence.”

The greatest threat for Husserl is thus the devaluation of consciousness, the loss of spirit or meaning.

V. HEIDEGGER: HERMENEUTIC PHENOMENOLOGY OF SCIENCE

If, as Theodore Kisiel argues, “the Husserlian approach to science is strikingly evident in the early pages of Being and Time,” Joseph J. Kockelmans (1923–2008) emphasizes that “in most of his publications Heidegger deals explicitly with problems which pertain specifically to the realm of philosophy of science.”

Like Nietzsche, Heidegger argues that beyond theoretical reflection or scientific analysis, philosophy is an explicitly active questioning, especially so in the case of the philosophy of science and modern technology. It is in terms of the importance of reflection in philosophy that Heidegger argues that “all science is perhaps only a servant with respect to philosophy.”

The critical spirit of this early account of the specific difference of philosophical reflection and scientific theorizing finds its most famous expression in the later Heidegger’s provocative dictum “science does not think,” a claim that is already to be heard in his 1927 Being and Time: “ontological inquiry is more primordial or original than the ontic inquiry of the positive sciences.”

Opposing sense-oriented reflection [Besinnung] to the calculative project of Western technologically articulated and advancing science, Heidegger varies but

---

78. Ibid.
he does not alter his early discussion of the relation between science and philosophy in *Being and Time*, writing that “all scientific thought is merely a derived form of philosophical thinking.”84 With this claim, Heidegger maintains that with respect to science, philosophy “is prior in rank.”85 In *Being and Time*, this priority is characterized as a “productive logic”86 that leaps ahead “into some area of Being, discloses it for the first time, in the constitution of its Being, and, after thus arriving at the structures within it, makes these available to the positive sciences as transparent assignments for their inquiry.”87 Heidegger thus opposes the creatively foundational activity of philosophic reflection to the then popular articulations of epistemological investigations into the sciences of his era as the kind of “logic” (Heidegger sets this off in quotes) following after science, “limping along in its wake, investigating the status of [any given] science as it chances to find it in order to discover its ‘method’.”88

“What is decisive” for Heidegger – who here writes in Husserl’s critical foundational spirit – in the development of mathematical physics is “the mathematical project of nature itself” inasmuch as the project “discovers in advance something constantly objectively present (matter) and opens the horizon for the scientific perspective on its quantitatively definable moments (motion, force, location, and time).”89 The “founding” of “factual science” is “possible only because the researcher understood that there are in principle no ‘bare facts,’”90 that, in other words, the material project of nature must be given in advance, a priori. Only then is it possible for a science to be “capable of a crisis in its basic concepts.”91

Heidegger, who remained committed to phenomenology throughout his life, emphasizes that beyond any superficially obvious call “to the things themselves,”92 phenomenology “presupposed life.”93 To understand Heidegger here requires a specific and hermeneutic attention to the biological transformation that was then under way. Including and exceeding Claude Bernard’s *milieu intérieur*, as the evolution beyond Cartesian mechanism, Heidegger’s reference was critically ecological, radically environmental: “Life is that kind of reality which is in the

90. *Ibid*.
world and indeed in such a way that it has a world. Every living creature has its environing world not as something extant next to it but as something that is there [da ist] for it as disclosed, uncovered.”\(^9\) And in 1925, Heidegger emphasized that “for a primitive animal, the world can be very simple,” explaining that we run the risk of missing “the essential thing here if we don’t see that the animal has a world.”\(^9\) Heidegger’s original continuum of complexity and/or simplicity must be added to contemporary readings of Heidegger’s subsequent discussions of the world-poverty of the animal in terms of indigence.

In his 1929–30 lecture course, *The Fundamental Concepts of Metaphysics*, Heidegger alluded to the work of Hans Driesch (1867–1941), who theorized chemical gradients in embryological development.\(^9\) In that same course, Heidegger also invokes the theoretical biologist Jakob von Uexküll’s (1864–1944) 1909 expression of the “*Umwelt*,” citing the Czech biologist Emanuel Rádl (1873–1942) on the significance of animal phototropism\(^9\) in order to emphasize the gulf (Abgrund) between human and animal,\(^9\) but also as a biologicist contrast to the Cartesian tendency of modern scientific biology to define both animals and human beings in mechanistic terms. This tendency remains in modern experimental biology, underlying its reliance on “models,” specifically in animal experimentation.\(^9\) Here Heidegger reprises his hermeneutico-phenomenological case for the interpretive ontology of the human being as an animal bound to world-invention, or what Heidegger called, in an ecological modality, world-making.\(^1\) In this way, Heidegger had earlier cited Nietzsche’s perspectival sense of the human as the “yet to be finished animal.”\(^1\) It is in this projective, that is, yet-unfinished but to-be-finished, sense that “The world that is closest to us is one of practical concern. The environing world [Umwelt] and its objects are in space, but the space of the world is not that of geometry.”\(^1\) Historically, the mechanistic conception of life would return to triumph over the notion of “vital movement” nascent in Driesch (although it is an error to reduce Driesch’s concerns to sheer vitalism, as is evident in his emphasis on

---

94. Ibid., 163.
95. Ibid.
97. Ibid., 242ff., esp. 244.
98. Ibid., 264.
electrochemical gradients), whereas Heidegger explored the living trajectory of life as opposed to its “calculable” course.\footnote{See Keith Ansell-Pearson, Viroid Life: Perspectives on Nietzsche and the Transhuman Condition (London: Routledge, 1997) for an innovative exploration of this theme with reference to Bergson and others.}

Heidegger’s focus on life also recurs in his reference to chemistry in 1929 in order to speak of the biological and organic sciences, to underline how little is said about “the living being” when we “define it in terms of the organic as opposed to the inorganic.”\footnote{Heidegger, The Fundamental Concepts of Metaphysics, 212.} Echoing Nietzsche’s contrastive differentiation of reductively identical kinds in chemistry,\footnote{Nietzsche repudiates the notion that there is “nothing unchanging in chemistry” as “a scholastic prejudice. We have dragged in the unchanging, my physicist friends, deriving it from metaphysics as always. To assert that diamond, graphite, and coal are identical is to read off the facts naively from the surface. Why? Merely because no loss in substance can be shown on the scales?” (KSA, vol. 13, 374).} Heidegger reminds us to consider the example of “organic and inorganic chemistry” precisely inasmuch as “organic chemistry is anything but a science of the organic in the sense of the living being as such. It is called organic chemistry precisely because the organic in the sense of the living being remains inaccessible to it in principle.”\footnote{Heidegger, The Fundamental Concepts of Metaphysics, 212.}

Heidegger began Being and Time with a reference to the crisis in the sciences and arguing for the importance of philosophical reflection. Each particular science articulates its own regional ontology in terms of its basic constitution (Grundverfassung),\footnote{Heidegger, Being and Time, 29.} beginning with the example of the foundational controversy of mathematics in his (and still in our own) day, “between the formalists and the intuitionists.”\footnote{Ibid., 30. Cf. 121–2.} Thus Heidegger adds, in good Husserlian fashion, that what is at stake in this debate turns on “obtaining and securing the primary way of access to what are supposedly the objects”\footnote{Ibid.} of mathematical science. Heidegger articulates the same foundational revolution in physics as he invokes the theory of relativity. This means that science begins with or alongside its own fundamental concepts, and inquiry into these foundations is not then a matter of scientific research, for such research is possible only on the basis of such concepts. Hence philosophical inquiry, or what Heidegger calls “ontological inquiry,” can only be “more primordial, as over against the ontical inquiry of the positive sciences.”\footnote{Ibid., 31. Cf. 91.}

For Heidegger, philosophy is, and can be, in Husserl’s terminology, the science of science not because of a venerable tradition of so regarding philosophy but
because specifically philosophical research must and “can,” as Heidegger claims, “run ahead of the positive sciences.”¹¹¹ Thus, as Heidegger clarifies this point, the contribution of Kant’s Critique of Pure Reason “lies in what it has contributed towards the working out of what belongs to any Nature whatsoever.”¹¹² Rather than epistemology, Kant’s “transcendental logic is an a priori logic for the subject matter of that region of Being called ‘Nature.”¹¹³

In this productive, disclosing sense, which Heidegger also expresses as the constitutional eventuality of aletheic truth as discovery or “uncovering,” the scientist effectively opens up the truth of nature. In the alethic context of such a specifically scientific disclosure, it can be said that before “Newton’s laws were discovered, they were not ‘true.”¹¹⁴ By way of Dasein’s “being in the truth,”¹¹⁵ the laws of Newtonian physics only first “became true.” “Newton’s laws, the principle of contradiction, any truth whatever – these are true only as long as Dasein is.”¹¹⁶ But to say this is also to say that through “Newton the laws became true: and with them entities became accessible in themselves to Dasein. Once entities have been uncovered, they show themselves as the entities which beforehand they already were. Such uncovering is the kind of Being which belongs to ‘truth.’”¹¹⁷

VI. GÖDEL: MATHEMATICS, TIME, AND THE COLLAPSE OF DIALOGUE

At the outset, we noted the importance of Hilbert’s 1900 program to set mathematics on the “completed” path of a science, expressed as Hilbert’s “conviction (which every mathematician shares, but which no one has as yet supported by a proof) that every definite mathematical problem must necessarily be susceptible of an exact settlement.”¹¹⁸ And we have already noted that thirty years later, Hilbert’s conviction would be proven unfounded by a young mathematician who initially thought himself to be taking up Hilbert’s program.¹¹⁹ As is already evident in the title of Gödel’s 1931 first incompleteness theorem, “On Formally Undecidable Propositions of Principia Mathematica and Related Systems, “all consistent formulations of such formal systems as number theory include

¹¹¹. Ibid., 30.

¹¹⁶. Ibid.
¹¹⁷. Ibid., translation modified.
¹¹⁹. Although Gödel and Hilbert never met (this is not surprising given the difference in age and, indeed, prestige), they were not unconnected given Gödel’s friendship with Hilbert’s assistant, Paul Bernays (1888–1977).
undecidable statements (unentscheidbare Sätze).\textsuperscript{120} As such, Gödel’s incompleteness theorem undermines Hilbert’s ideal of axiomatic consummation. The second incompleteness theorem states that the consistency of arithmetic cannot be proved in arithmetic itself or on its own terms, using the methods of first-order predicate calculus. As Jean Cavaillès (1903–44) has articulated Gödel’s second theorem, “noncontradiction of a theory can be demonstrated only within a more powerful theory.”\textsuperscript{121} But this means that consistency can be proven only if the formal system is inconsistent, and insofar as one needs a higher-order or more powerful system in order to prove consistency, this too falls short of the foundationalist ideal of a complete axiomatic system.

The significance of Gödel’s work for mathematics and logic has been widely acknowledged. As Cavaillès\textsuperscript{122} notes, the “result of Gödel’s work is well-known: every theory containing the arithmetic of whole numbers is necessarily non-saturated. A proposition can be asserted within them which is neither the consequence of the axioms nor in contradiction with them.”\textsuperscript{123} Which is to say, no formal system can be both consistent and complete. And beyond his engagement with Hilbert and contributions to mathematics, there is also a case to be made for the relevance of Gödel’s incompleteness theorem for Heisenberg’s quantum mechanics and the most promising discussions look to John von Neumann (1903–57) and his quantum measurement theory.\textsuperscript{124} Yet while Gödel’s contributions are readily acknowledged by many, there is significant debate in the literature regarding Gödel’s philosophical accomplishments in the field of logic, and many scholars like to claim that it is easy to overstate the consequences of Gödel’s incompleteness theorems.\textsuperscript{125}

This is noteworthy because beyond his work in mathematical logic, Gödel’s ambitions were philosophical. As he wrote to the phenomenologically oriented mathematician and philosopher Gian-Carlo Rota (1932–99), “Transcendental

\textsuperscript{125} The one unifying characteristic of both popular and more reconclite books on Gödel seems to be impatience with other treatments of Gödel in philosophical literature, cultural studies, and in other books on Gödel and mathematics.
philosophy … carried through, would be nothing more nor less than Kant’s critique of pure reason transformed into an exact science.”\textsuperscript{126} In particular, Gödel’s interest in time was expressed in the same Kantian spirit, as Gödel believed, in Palle Yourgrau’s paraphrase, that “the attempt to discover what is fundamental about our thinking about time can receive no assistance from physics which, he argued, combines concepts without analyzing them.”\textsuperscript{127} We have instead to “reconstruct the original nature of our thinking.”\textsuperscript{128}

It is regrettable, but unremarkable, given the differences between Anglo-American and continental styles of philosophizing, that throughout his life Gödel himself would be excluded from mainstream debate on the philosophical reflections on the problems of physics and mathematical logic, and especially on the philosophy of time. Yourgrau outlines one such example in detail: Gödel’s contribution to Paul Schilpp’s 1949 \textit{Albert Einstein: Philosopher-Scientist} was judged to be mistaken, a judgment Yourgrau argues as seemingly made “on principle” insofar as the presumption of error was not the \textit{result of} but made in \textit{advance of} debate.\textsuperscript{129} Even in the long course of the more than half century of scholarship to follow, Yourgrau observes, “Gödel’s contribution to the Schilpp volume had almost no impact on the community of philosophers.”\textsuperscript{130} In his view, Gödel was judged to lack the credentials needed to theorize as a philosopher and, as a consequence, Gödel’s reflective efforts were denied a proper reception, a refusal that continues within analytic philosophy to this day.\textsuperscript{131}

The phenomenon of such academic exclusion is the common, all-too-political, academic tendency to refuse what is not expressed in the style of the “profession”: just as Gödel failed to employ the then-current writing style of analytic philosophy, and failed to refer to the “right” names in American analytic philosophy, his own contributions to philosophy were refused access to the conversation. In this sense, Gödel stands as an example, one among many, of the closed nature of certain domains within academic discourse and the unwillingness to allow dissenting voices and voices coming from other traditions to have a share in the conversation of philosophy. Sadly, this has been as true of philosophy of science as it has been in the more “obviously” politicized discourses of social, ethical, and political philosophy.

The nature of men, however various and subject to change, must possess some generic character if it is to be called human at all. This holds … of differences between entire cultures. There is a limit beyond which we can no longer understand what a given creature is at; what kinds of rules it follows in its behavior; what its gestures mean. In such situations, when the possibility of communication breaks down, we speak of derangement, of incomplete humanity.

(Isaiah Berlin, The Crooked Timber of Humanity)

Brilliant, intense, socially inept, and preoccupied with his sins, Wittgenstein continues to nourish our appetite for tales of tortured genius. Likewise, his fragmented, agonistic prose has generated considerable literary interest. Nevertheless, these biographical and stylistic peculiarities are not without philosophical import, for they reflect the awkward terrain of his “long and involved journeyings.” Wittgenstein’s various journeyings have, of course, impacted

2. Ludwig Wittgenstein (April 26, 1889–April 28, 1951; born in Vienna; died in Cambridge) was educated at the Technische Hochschule, Berlin (1906–8), the University of Manchester (1908–11), and the University of Cambridge (1911–13, 1929–30). His influences included Boltzmann, Frege, Hertz, Kierkegaard, Kraus, Loos, Moore, Russell, Schopenhauer, Spengler, Straffa, Tolstoy, and Weininger, and he held appointments at the University of Cambridge (1930–36, 1939–41, 1944–47).
most conspicuously on the development of the analytic philosophical tradi-
tion. But even here his influence has not been unanimously welcomed. Indeed,
Wittgenstein’s later descriptive, therapeutic approach has often been seen as a
lamentable diversion for academic (and now highly professionalized) philosophy.
Although many analytic philosophers continue to appeal to “ordinary language,”
few, if any, think that philosophical questions are really grammatical confusions
waiting to be “dissolved … like a lump of sugar in water.”4 Instead, Wittgenstein’s
writings have been excavated for serviceable arguments and theses. Given that his
later work was never intended for publication, this interpretive methodology has
obvious pedagogical advantages, but only by understating Wittgenstein’s broader
metaphilosophical aims: namely, the dissolution of philosophy itself.

What then about the relation between Wittgenstein and so-called continental
philosophy? This is even less clear. For while he mentions Hegel, Schopenhauer,
Kierkegaard, and Heidegger, these allusions remain tangential; Dostoevsky and
Tolstoy were closer to Wittgenstein’s heart. Moreover, he has received little
sustained attention from continental thinkers. Despite all of this, we are going
to outline a few possible correlations between Wittgenstein and the continental
tradition; specifically, Nietzsche, Schutz, Lyotard, and Levinas. (Obviously, these
correlations are not exhaustive.) Before doing so, however, we shall begin by
laying out some of the basic theses of the Tractatus Logico-Philosophicus that
provide the background for introducing the contrasting set of concepts central
to Wittgenstein’s later philosophy; namely, “language games,” “grammatical
investigation,” “forms of life,” and “family resemblance.”

I. THE TRACTATUS

One way of understanding the profound shift in Wittgenstein’s thought from the
Tractatus to Philosophical Investigations and On Certainty is to see his account of
linguistic meaning as transitioning from the former to the latter notions in the
following series of oppositions: abstract–concrete, general–particular, one–many,
monism–pluralism, theory–practice, necessary–contingent, essence–accident,
individual–social, atomism–holism, logical-analysis–grammatical-description,
and theoretical–therapeutic. That is, if the Tractatus conceives of linguistic
meaning as atomistic, abstract, and general, as necessarily having a monistic
essence expressible in the pure, crystalline (PI §108) formalism of first-
order logic, Philosophical Investigations and On Certainty, by describing the

(eds) (Indianapolis, IN: Hackett, 1993), 183. Hereafter cited as PO followed by the page
number.
multifarious ways in which language is concretely used in the context of purpo-
sive activity, present a pluralist, particular-case-oriented, context-specific, and
practical action-embedded account.

The *Tractatus* was, at least on Wittgenstein’s own reckoning, the culmination
of the project of early analytic philosophy started by Frege and Russell. The basic
assumption of the program is that natural language is a deceptive medium that
conceals the true meaning of its sentences and sub-sentential expressions, and in
so doing is responsible for a host of philosophical problems, such as the mean-
ingfulness of nonreferring singular terms, the possibility of true negative exist-
tential claims, the informativeness of true contingent identity statements, and
so on. What is needed is logical analysis (thus the name “analytic philosophy”),
which involves parsing the sentences of ordinary language into the forms and
expressive resources of first-order quantification theory, the logic that Frege,
Russell, and early Wittgenstein were developing. Doing so reveals their true
underlying logical form, that is, what their correct meaning consists in, and
once this is revealed, the philosophical problems surrounding them evaporate.

A paradigm of such logical analysis was the logical atomism of the *Tractatus*,
in which sentences of ordinary language are analyzable into elementary propo-
sitions that are in turn ultimately analyzable into combinations of simple names
that mean by virtue of picking out simple objects. These simple names come
with their possibilities for combining with other simple names built into them;
such a possible combination of simple names constitutes an elementary propo-
sition and the totality of such combinatorial possibilities of simple names with
each other (the totality of elementary propositions) delimits the expanse of
logical space, that is, of all that can be meaningful (meaningfully true or false).
As possibilities, some may be realized (and become true propositions) while
others may not (and express false propositions); thus false statements can be
meaningful and statements denying the existence of something can be mean-
ingful and true (they say that a certain possible arrangement of simple objects,
which exist, is not actualized). The problem of nonreferring singular terms is
dealt with in a similar way. Such terms are understood to be complex, that is,
composed of simple names that do refer, which ensures their meaningfulness.
It is just that the particular combination of simple names that is the complex
name in question does not pick out anything actual, so the term, while mean-
ingful, is nonreferring. In this way, simple objects referred to by simple names
must exist for such sentences and terms to have any determinate meaning at
all, and logical analysis into simple names corresponding to simple objects (the
true logical form of ordinary names and sentences) solves outstanding phil-
osophical problems. The job of philosophy is clearly demarcated: to furnish
such logical analyses, that is, to map the workings of natural language onto the
abstract, universally applicable formalism of first-order logic.
The notion of a language game and the examples of language games introduced in the early sections of *Philosophical Investigations* (e.g. the builders’ and grocer’s language games) are clearly meant to contrast fundamentally with this earlier model of language.5 As the word “game” brings out, the concept of a language game highlights the fact that for the later Wittgenstein linguistic meaning is inextricably linked with the concrete, practical activities of speakers in their particular natural and social environments. Importantly, with the introduction of language games, the unit of semantic concern is not the declarative sentence but the utterance (e.g. of a desire, “I want five red apples,” or a command, “Bring me a slab”), that is, a social – involving a speaker and hearer – use of language embedded in some practical activity. Thus, the object of investigation is not a symbolic structure excised from its practical context, something whose meaning is then amenable to expression in the abstract formalism of first-order logic; rather, it is a speech act that takes place at a particular time and place, in the context of purposive social activity (buying produce from a vendor, building a structure as part of a work crew), and thus something that involves others and that has a particular practical goal or purpose in view. By foregrounding language’s embeddedness in the practical, social activities of our everyday lives, the focus on language games moves from an approach to meaning that sees it in terms of its ability to be modeled in some abstract logical formalism to one in which the meaning of a speech act is particularized to what is, in the context of the activity in question, the purpose of the speech act. The meaning of “slab” in the language game of the builders is just what someone who understands the term in this context understands by it, as manifested by responding appropriately (in the way established by the language game as correct) to the utterance – which in this example would be bringing a particular shape of stone (a slab rather than a block, beam, or pillar) to a designated place (PI §§2, 8–10, 19–20). It is “what happens before and after” the speech act (PI §35), the whole surrounding context, the pattern of activity within which it is embedded, that determines its meaning. Change this background in certain ways (imagine the workman is not laboring as part of a work crew but is ostensively instructing his child in the names for the various building materials, e.g. pointing to a particular shape of stone and saying “slab”) and the meaning of the utterance will change: for example from a demand for certain building materials to an identifying

---

reference to a particular object, for the language game now being played is one of identifying or ostensively defining masonry items and not constructing a building.

Interestingly, the emphasis on the actual use of ordinary language in practical contexts does not mean that Wittgenstein now believes that the “surface grammar” (PI §664) of natural language provides a transparent medium in which to read off the meaning of natural language expressions. Indeed, a deep commonality in early and late Wittgenstein is the belief in the capacity of ordinary language to disguise through misleading surface similarities the disparate uses of seemingly similar expressions of natural language. What is different in the later work is that the remedy for these confusions is not logical analysis, but in-depth investigation and description of ordinary-language locutions in the contexts of their use. For the later Wittgenstein, then, if ordinary language is the source of confusions, it – and not logical analysis – is also the resource for overcoming them. The confusions created by ordinary language are to be remedied by looking into the detailed workings of the concrete, context-specific, multifarious but indeterminate phenomenon of language-in-use, by attending carefully to how particular words function in particular contexts of use in the everyday lives of speakers engaged in particular practical activities (i.e. language games). One does this by painstakingly describing the range of particular, concrete uses of a word, not by trying to constrain such uses by imposing on them some decontextualized logical form. This kind of context-specific immersion in, and description of, our ordinary uses of language is what Wittgenstein means by a “grammatical investigation” (PI §90). *Philosophical Investigations* and *On Certainty* are thus collections of such grammatical investigations that examine a domain of language that has become the source of philosophical confusion or myth, for example how names, mathematical expressions, and sensation terms get their meaning, or when it does and does not make sense to claim to know something, doubt it, be certain of it, and so on.

In Wittgenstein’s usage, “grammar” is not a syntactic notion that refers to some Chomsky-like innate, universal schema or set of transformational rules, and nor, of course, is it the notion of logical form; rather, it refers to the patterns of the actual uses of particular words in specific practical situations. Attending to these patterns of use involves, *inter alia*: considering how we teach children certain expressions (e.g. arithmetic terms, sensation words, epistemic terms like “know,” “doubt,” “justify”); thinking about how we would teach them to linguistic aliens who had no prior use for them; exploring whether certain of their uses would still occur if certain facts about ourselves and the world were different, and so on. The focus on language games and the technique of grammatical investigation, then, does not aim for a systemization of the determinate set of rules that govern all uses of all words in all
circumstances – as the project of arriving at the logical form of language does – but at laying out the distinctive patterns of use that characterize the actual employment of them. Thus the account of meaning grammatical investigations ushers in is one that replaces the former monism of logical form with the pluralism of patterns of use.

A related notion is “form of life” (PI 226). Like the idea of language games, Wittgenstein’s notion of forms of life contrasts with the Tractarian conception of language as an abstract, formal system of signs. And just as the former notion emphasizes that language is something that is used by speakers in the context of their nonlinguistic activities in the natural and social worlds, so forms of life, which are made up of language games and the nonlinguistic activities that they are embedded in, also view language as something that is enmeshed in the lives of human agents and their significant activities. “Life,” then, is not understood merely as a naturalistic–biological category but also as a cultural one. It refers to the shared set of linguistic and nonlinguistic practices and traditions that determine what is correct and incorrect, what appropriate and inappropriate, in what a historical group of individuals says and does, and in so doing constitutes their culture. To be sure, a form of life is based in biological facts and capacities (PI 230), but insofar as it is structured by normatively rich practices of instruction, evaluation, criticism, correction, and so on, it is not reducible to them but is deeply cultural or meaning laden. In his notion of a form of life, then, Wittgenstein naturalizes the normative without naturalistically reducing it, for a form of life is not independent of natural facts but neither is it thereby identified with such facts. “Form of life” is his term for that nonreductive complex involving natural facts about us and the world we live in as well as the normative practices of language, customs, and traditions that give a community its identity.

The descriptive, particularist, and pluralist character of language games, forms of life, and grammatical investigations dovetails with another important

6. Thus there is a marked similarity between the Wittgensteinian concept of “form of life” and Husserl’s notion of “life-world,” which underwrites the similarity between Schutz and Wittgenstein that we will later discuss. The life-world for Husserl concerns the sociocultural structure of meanings or senses established and inculcated in the linguistic and nonlinguistic practices of a community, which delimits the bounds of comprehensibility for the community. As with a form of life, a life-world may well be based on general natural facts and be founded evolutionarily, but it is importantly a cultural entity: the meaning-laden structures that constitute a community’s worldview, the norms of meaningfulness that condition the way it understands itself, the world and others. Hence it is a life-world that individuals from different communities must to some extent share if it is to be possible for them to understand each other.

7. For more on Wittgenstein’s nonreductive brand of naturalism, see the discussion in the next section as well as the essay by John Fennell in *The History of Continental Philosophy: Volume 8.*
notion of the later Wittgenstein: family resemblance. Wittgenstein initially introduces this notion by considering the language game of the term “game” itself. He argues that if we examine the actual uses of the term “game,” we do not find any single property or set of properties, any common essence, to the activities we rightly call “games.” Some games are amusing and do not necessarily involve any element of competition, of there being a winner or a loser; others are more about competition and less about fun; some others involve skill and not that much luck, while others luck and not that much skill, and in those that require skill there may be very different kinds of skill involved, and so on. The conclusion he draws is that the use of the term “game” does not come with a sharply circumscribed set of individually necessary and jointly sufficient conditions for its correct application, such that the term does not apply if the conditions are lacked, but does if they are satisfied; rather, attending to actual use shows “a complicated network of similarities overlapping and criss-crossing: sometimes overall similarities, sometimes similarities in detail” (PI §66). However, for all that, the term “game” has a perfectly good use, and thus a perfectly serviceable meaning. To be sure, it does not have determinate rules for its correct application, rules that would determine its application in all possible future contexts; but Wittgenstein’s point is that it does not need such universalist, determinate rules to have a use and thus be meaningful. He therefore cautions, “Don’t say: ‘There must be something in common, or they would not be called “games”’ – but look and see whether there is anything common at all” (PI §66). This is a warning not to be tempted, as Wittgenstein himself was in the Tractatus, by the thought that unless there is complete determinacy of meaning there is no meaning at all, which is at the heart of his argument for the necessity of simples. A priori arguments for the necessity of the determinacy of meaning in his early work give way to empirical, “look and see” descriptions of the actual use of terms in specific circumstances in his later work. And what these descriptions show is that in order to have a legitimate use and meaning, terms need not have a strictly determinate meaning-essence. The family resemblances obtaining between uses that emerge from grammatical investigations into the actual uses of words in specific contexts, then, do not issue in conclusions that generalize to the essence of all linguistic meaning; their particularist, context-specific character ensures that any conclusions reached about the meaning of a certain kind of term are highly contingent and provisional: contingent on certain environmental features and social practices of speakers remaining the same, such that if they were to change so might the patterns of use, and thus the grammar (meaning) of the expressions involved. Nevertheless, as long as the range of a term’s applications displays some recognizable continuity, similarity, or family resemblance, however loose this may be, a use is determined for the term, and thus a meaning.
III. RELATIVISM, NATURALISM, AND GRAMMATICAL PROPOSITIONS

Although the notion of family resemblance introduces a certain looseness or anti-essentialism into the later Wittgenstein’s picture of meaning, he does not think that this entails that words have no meaning (meaning indeterminacy) nor that they can mean anything at all, that however we use a word is consonant with its meaning (meaning relativism). Regarding the potential threat of meaning indeterminacy, as we have just seen, all the looseness shows is that absolutely determinate meaning is not necessary for meaning. With regard to the problem of meaning relativism, the later Wittgenstein has two resources at his disposal: his “naturalism,” and the category of grammatical (as opposed to empirical) propositions. We shall explain these notions in turn.

By naturalism, we mean Wittgenstein’s insistence that language games, and the family resemblances among uses of terms that emerge in them, are underpinned by a shared human nature possessed by all human beings and a common natural world that we all live in, no matter what the historical, cultural, and individual differences between us. (As we shall see later, this idea is developed in Zettel and “Remarks on Frazer’s Golden Bough.”) The kind of common nature that Wittgenstein has in mind here consists of very general facts of nature, such as our mortality and biological needs for food and to reproduce, as well as very general facts about our environment, such as that it does not rain gold filigree, that trees do not speak Latin, or that human beings cannot fly or breathe under water unaided. Such general facts of nature to do with us (where “us” here means “us human beings,” not, say, “us early twenty-first-century postmoderns”) and our world act as boundary conditions for what is comprehensible to us, what language games are possible for creatures like us, what uses our words can enter into, and so on. While allowing for some differences between conceptual schemes, such general natural facts do place boundary constraints on the scope of difference. In this way these natural facts permit a plurality of language games, novel extensions of extant language games and differences in the assessment of claims made within them, while at the same time providing a bulwark against an “anything goes” conceptual relativism by placing limits (albeit minimal and general) on what it is possible for us to think, say, and understand. Put another way, they insure that other ways of thinking and using language cannot be completely, radically, other. The radical other must be somewhat familiar, for our nature simply does not allow the truly radically other to be intelligible to us. (We shall return to this later in our discussion of Levinas.) Of course this is a very weak form of naturalism since it does not entail any commitment to reductionism: it is merely the claim that what forms of life and language games are comprehensible to us arise out of general facts of nature, not that they are reducible to them; that such normative practices are not independent of natural facts but nor are they identifiable.
with them. The present point is that although minimal, this form of naturalism still forestalls strong versions of relativism. What it leaves us with is a plurality of language games within certain kinds of boundary conditions; not an “anything goes” relativism but an “a lot of things go” pluralism, where the parameters for what goes and what does not go are not determined a priori by logic but empirically by contingent, general facts of nature. At least this is part of the story.

Not only are there external constraints on the plurality of language games imposed by general facts of nature, but there are internal constraints inside particular language games that limit the intelligibility of claims made within them. These internal constraints on intelligibility are expressed by “grammatical truths” (which are contrasted with empirical claims). This notion is introduced in the discussion of the meter stick (PI §50) and “bedrock” propositions (PI §217), and gets extensive treatment in On Certainty. The idea is that certain statements inside a language game have the special role of acting as conditions for the possibility of other statements in the language game being meaningful. For example, in the language game of measuring objects in meters, the statement that “The standard meter stick is a meter long” does not have the same status as the statement “My desk is a meter long.” The latter is an empirical statement, the former a grammatical one: rather than representing some object as being a certain length in meters, in expressing the standard for what it is to be a meter long, it is what makes all such representations of objects’ lengths in meters possible and so cannot itself be represented in the language game of representing the lengths of objects in meters. To say of the meter stick that it is a meter long in this language game is in effect to say that the meter stick has the same length as the meter stick. That is, it is analogous to an empty tautology, and as with other tautologies – for example “Either it is raining or it is not raining” – which do not describe, represent, or tell us something about the world (it does not say that it is raining, nor does it say that it is not raining), so this does not make an empirical claim about the length of some object but is a condition for other claims doing so. As the repeated reference to the “language game of representing the length of objects in meters” in the foregoing should make clear, its role as a grammatical statement is language-game specific. That it is rather like a tautology or necessary truth in that language game – in other words, that it is a presupposition for other statements to be meaningful in that language game – does not mean that it universally has this status. In another language game, for example the language game of assessing the accuracy of standards of measurement, the statement that the standard meter is a meter long is an empirical claim that attributes a length to a particular object and so stands in need of verification.8

8. Indeed, its being taken as such resulted in its being replaced; at present, the standard is the distance travelled by light through a vacuum in a certain, very small, fraction of a second.
In *On Certainty*, which is discussed in greater depth below, Wittgenstein makes the same point, but this time with regard to the language game of philosophical skepticism and anti-skepticism and the use of the terms “knowledge,” “doubt,” and “certainty.” There Wittgenstein points out that Moorean propositions such as “Here is one hand, here is another,” “My name is LW,” “I have never been far from the surface of the earth,” and so on are grammatical propositions in the language game of ordinary knowledge claims. As such they are statements that have no justification, indeed, they do not need such justification; to think that they do (as the skeptic does) is to misunderstand their grammatical role in the language game (or grammar) of justification – namely, that justification has to end somewhere (with them, as it turns out). Thus, they are epistemic primitives, the justificatory “bedrock” where our epistemic “spade is turned” (PI §217). The important point here is that one cannot be a pluralist about such grammatical propositions and continue to “play” the language game in question: reject them and one is opting out of the specific language game (e.g. moving from the language game of representing the lengths in meters of objects to the language game of assessing standards of measurement, or moving from the language game of ordinary knowledge claims into paranoia or madness⁹). Grammatical propositions “hold fast” (OC §173), at least for the language game in question. Disagreement about them is not possible inside the language game they govern; it bespeaks a misunderstanding, not a different understanding of the concepts involved, and in this way grammatical propositions also act to constrain the possibilities for difference or “otherness.”

**IV. METAPHILOSOPHY**

With this family of concepts (language games, grammatical investigations, forms of life, family resemblance), Wittgenstein is not so much objecting to this or that semantic theory – for example the truth-conditional account of sentential meaning, the referentialist account of names, and so on – with the aim of replacing it with another theory of meaning, namely, the so-called “use theory” of meaning. The use *theory* of meaning often attributed to the later Wittgenstein is a misnomer. His move to looking at how words are actually used in particular social situations given certain natural facts about us and the world is not directed toward installing another, different *philosophical* theory of meaning (the use theory) in place of these other theories. It is better seen as the rejection of

---

the whole “will-to-theorizing” about linguistic meaning characteristic of philosophy; the rejection of the quintessentially philosophical drive to get “behind” or “beneath” actual linguistic usage and arrive at a theory that would explain once and for all what linguistic meaning consists in. In other words, his concentration on actual use is expressive of an antitheory, meta-philosophical attitude. For Wittgenstein, philosophy should consist of piecemeal, particular descriptions of actual concrete uses of language in specific practical situations and under certain natural world conditions. When so practiced, traditional philosophical problems, like the problem of knowledge, the meaningfulness of nonreferring singular terms, the determinacy of the meaning of mathematical expressions, and so on, are not so much answered as do not even arise. Philosophical problems will not be solved but dissolved: they will not even be formable in the first place. Philosophy so practiced will therefore be therapeutic (PI §133); it will not supply the single, unified explanatory theory of how words mean, but will instead cure us of the disease of thinking that we need such a theory.

This conception of philosophy as therapy foregrounds an important aspect of Wittgenstein’s later work, namely, his conception of what philosophy should be. This normative dimension is important because Wittgenstein’s methodological commitment to leave “everything as it is” (PI §124) does not extend to traditional philosophical practice itself. Indeed, he repeatedly characterizes philosophers as idiotic, deranged, and infantile. For Wittgenstein, then, philosophy ought to be therapeutically oriented toward attaining “[t]houghts that are at peace.” He therefore describes philosophical puzzlement as an illness or disease, and his own practice as the requisite treatment (PI §255, §593). This therapeutic analogy is crucial, for just as there is no intrinsic value in medicine, there is no intrinsic value in philosophy; both are valuable relative to their curative capacities. (In this sense, Wittgenstein’s later method might be described as broadly ethical in orientation.) Philosophers should therefore eschew theorizing, as this merely intensifies conceptual suffering. Rather, philosophy’s task lies in “clearing up the ground of language” (PI §118), thereby leaving one “capable of stopping doing philosophy” (PI §133).

Although Wittgenstein is a deeply anti-philosophical thinker, his metaphilosophy is not wholly idiosyncratic. For while he cared little for the history of philosophy, Wittgenstein’s approach has significant resonances with ancient Pyrrhonism, Franz Rosenzweig, and Nietzsche. Indeed, despite his concerns about psychoanalysis, Wittgenstein explicitly aligns himself with Freud to the extent that both are engaged in “persuasion” or “making propaganda for one

style of thinking.” Why? Because what the patient requires is a wholesale perspectival shift: something akin to a conversion.

Beset by dogmatism, superstition, and an impulse to theorize (notably about language), philosophers routinely employ preconceived ideas of that “to which reality must correspond” (PI §131), as Wittgenstein himself had done in the *Tractatus*. All this he offsets in his later work with the “weighing of linguistic facts” and “description alone” (PI §109). So, whenever philosophers talk of “knowledge,” “being,” “object,” “I,” “proposition,” and “name,” and thereby “try to grasp the essence of the thing,” we should ask: “is the word ever actually used in this way in the language game that is its original home?” What Wittgenstein attempts to do then is “bring words back from their metaphysical to their everyday use” (PI §116), for our confusions are generated by surface similarities “between the forms of expression in different regions of language” (PI §90). Philosophy can neither interfere with how language is actually used, nor provide it with a foundation. Rather, philosophers’ task is to “only describe” (PI §124).

Notwithstanding his criticisms of philosophy, Wittgenstein does not think that our conceptual illnesses are created by philosophers. Rather, language itself routinely misleads us (CV 18). For example, because the “verb ‘to be’ … seems to function like ‘to eat’ and ‘to drink’” (because we habitually talk of a “flow of time and an expanse of space,” etc.), we continually “bump up against the same mysterious difficulties” (PO 185–7). Although philosophers certainly exacerbate such confusions, they do not generate them ex nihilo. Our battle is therefore against the seductions of language itself, and not least our “urge to misunderstand” (PI §109). Because it is often as hard to avoid using certain expressions – just as it is hard to “hold back tears, or an outburst of anger” (PO 161) – neither the force of “grammatical illusions” (PI §110) nor the demands of Wittgenstein’s therapy should be underestimated or thought to trivialize philosophy.

At this juncture, we should note Nietzsche’s own warning against the seduction of words. Just as Wittgenstein counters our essentialist urges by introducing language games and family resemblances, Nietzsche similarly cautions that the “unity of the word is no guarantee of the unity of the thing.” Not only are we routinely misled by the “similarity of words and concepts,” but the

---

latter are inherited from more primitive times. Although he would not share Nietzsche’s haughtiness regarding “primitive mankind” (see our later discussion of “Remarks on Frazer’s *Golden Bough*”), Wittgenstein concedes that “our language has remained the same and seduces us into asking the same questions over and over” (PO 185). Likewise, his caution that an “entire mythology is laid down in our language” (PO 199) is prefigured by Nietzsche’s own warning: “A philosophical mythology lies concealed in language.” Illustrating how the deepest philosophical prejudices are already contained within language, Nietzsche thus directs our attention to the supposition that “the subject ‘I’ is the condition of the predicate ‘think,’” for the “inference here is in accordance with the habit of grammar: ‘thinking is an activity, to every activity pertains one who acts, consequently.’” Both Wittgenstein and Nietzsche thus highlight the manifold dangers of getting “tangled up in the snares of grammar.” Indeed, on this point at least, it is hard to know where Nietzsche ends and Wittgenstein begins.

For Wittgenstein, then, ordinary language is both the source of our confusions and where these confusions are remedied. But his later therapeutic method might be arduous for other reasons. Recalling Wittgenstein’s allusion to our “urge” to misunderstand, in *Culture and Value* he conjectures: “It is sometimes said that a man’s philosophy is a matter of temperament, and there is something in this. A preference for certain similes could be called a matter of temperament and it underlies far more disagreements than you might think” (CV 20). Again, this has striking Nietzschean resonances, for Nietzsche similarly describes the tendency of philosophers to cast their rivals as “anarchists, unbelievers, opponents of authority” in terms of those instincts that are “active behind all ... pure theoreticians.” In other words, philosophers have, “under the spell of the instincts, gone fatalistically for something that was ‘truth’ for them ...” As such, the rancor between philosophical systems and “epistemological scruples” is really just a “conflict between quite definite instincts.”

That philosophers rarely ask what instincts motivate them is hardly surprising, for this would undermine their universalist, aprioristic pretensions. But here Nietzsche happily blurs the line between philosophy and autobiography:

---

21. Heller suspects that Wittgenstein’s preoccupation with “everyday” or “natural” language was, in part, due to a “‘Tolstoyan belief in the virtue of the simple life’” (*The Importance of Nietzsche*, 155).
What happens ... is that a prejudice, a notion, an “inspiration,” generally a desire of the heart sifted and made abstract, is defended ... with reasons sought after the event ... It has gradually become clearer to me what every great philosophy has hitherto been: a confession on the part of its author and a kind of involuntary and unconscious memoir ... [a] decisive testimony to who he is ...²⁴

When considering even the philosopher’s most abstract metaphysical claims, we should therefore ask: what “morality” does he or she aim at? Here there is nothing “impersonal”;²⁵ indeed, for Nietzsche, even the laws of logic merely express an empirical human “inability,” and thereby function as “imperative[s] concerning that which should count as true.”²⁶ Although less radical than Nietzsche, Wittgenstein would probably agree that philosophy “creates the world in its own image,”²⁷ and rarely (if ever) for purely rational considerations.

V. THE ORDINARY, KNOWLEDGE, AND TRUST

As will have become clear from our discussion thus far, appeals to the “ordinary” play a crucial methodological role in Wittgenstein’s later work. To dissolve our perplexities and cure philosophical disease, language must be returned “home” from its metaphysical to its everyday usage (PI §116). In short, problems arise “when language goes on holiday” (PI §38). Here Wittgenstein thus seems to polarize two realms: one of safe familiarity, the other of hazardous disorientation. But might one not object that Wittgenstein himself has here been seduced by “forms of expression”; namely, the picture of being-at-home in the “ordinary”? As we have seen, such a conclusion would be hasty insofar as ordinary language is both curse and cure (the “things that are most important” are “hidden because of their simplicity and familiarity” [PI §129]). Still, it is worth exploring other aspects of the ordinary.

In the Investigations, Wittgenstein remarks: “What has to be accepted, the given, is ... forms of life” (PI 226). Precisely what this encompasses remains unclear – not least for Wittgenstein himself – but as we saw above, he uses “forms of life” to refer alternatively to a collection of interwoven language games, to the practical dimension of language games, and even to human life in both its natural–biological and normatively rich aspects. We have referred to “forms

²⁴. Ibid., §§5–6.
²⁵. Ibid., §6.
²⁷. Ibid., §9.
of life” here to highlight two things about the ordinary: (i) When Wittgenstein insists that forms of life are *given*, and thereby must be accepted, he is countering the urge to uncover some esoteric, hidden reality (PI §126). The philosopher’s rightful task is instead to describe how language actually works *in situ*. Moreover, one has to accept *something* as “given.” In philosophy, no less than history, geography, physics and even our prephilosophical life, at some point one’s “spade is turned” (PI §217). What are given are our mundane language games, embedded in more complex forms of life, and expressed by the propositions that are grammatical for them. Thus we are similarly instructed to accept language games “as the *primary* thing” (PI §656), for they require “no justification” (PI 200). In *On Certainty*, then, Wittgenstein claims that the language game is “something unpredictable”; that is to say, it is “not based on grounds. It is not reasonable (or unreasonable). It is there – like our life” (OC §559). (ii) Wittgenstein’s various appeals to the ordinary function as a methodological constraint. He has no aspiration to intrude on other disciplines (e.g. evolutionary theory), for he is doing neither natural science nor natural history. Nevertheless, as noted earlier, his “interest certainly includes the correspondence between concepts and very general facts of nature. (Such facts as mostly do not strike us)” (PI 230). This is important, for Wittgenstein’s orientation (like Nietzsche’s) is deeply naturalistic. As such, his conception of the ordinary cannot be divorced from those general facts of nature only within which human life is truly *human* life. Our language games are therefore to be understood as being “as much a part of our natural history as walking, eating, drinking, playing” (PI §25).

Wittgenstein once claimed that he could imagine philosophy written entirely as jokes. Although “making a joke” is included in his inventory of language games (PI §23), it is not obvious why Wittgenstein thought joking to be *philosophically* important. An answer to this is suggested in the *Investigations*:

> The problems arising through a misinterpretation of our forms of language have the character of *depth*. They are deep disquietudes; their roots are as deep in us as the forms of our language and their significance is as great as the importance of our language. – Let us ask ourselves: why do we feel a grammatical joke to be *deep*? (And that is what the depth of philosophy is.)

(PI §111)

---

28. See OC §§162, 206, 234, 600, 608.
The depth of grammatical jokes (e.g. “I have a pain in my pocket”\textsuperscript{31}) thus corresponds to Wittgenstein’s insistence that confusions arise when language goes “on holiday.” That such jokes might provide therapeutic “reminders” (PI §127) of how language ordinarily works is clear. Nevertheless, we would like to pursue this topic further.

Wittgenstein’s introduction of language games foregrounds that the “speaking of language is part of an activity” (PI §23), a more complex “form of life” that includes nonlinguistic activities. Because the ordinary encompasses typical human behaviors, only of what “resembles (behaves like) a living human being can one say: it has sensations; it sees; is blind; hears; is deaf; is conscious or unconscious” (PI §281). As we will see later, these behaviors are crucial for understanding Wittgenstein’s relevance to ethics. For the moment, we simply need to note that Wittgenstein is not only concerned with everyday ways of speaking, but with how concepts such as “pain” function in the complex “weave of our life” (PI 174). For, as he insists, it is the “common behavior of mankind” that provides the “system of reference” for understanding others – even those of an “unknown country” (PI §206).

According to Wittgenstein, then, if we attend to our actual use of language, what is “hidden” is of “no interest” (PI §126). But in one sense he is interested in something hidden, albeit due to its mundane “familiarity” (PI §129). For what Wittgenstein finds “mysterious” and unable to express is the “background against which whatever I could express has its meaning” (CV §16). Although this may sound distinctly Tractarian, the “background” against which life ordinarily functions is a recurrent theme throughout Wittgenstein’s work. As already noted, the horizon of normal human actions remains elusive because of its extreme proximity. To get a clearer sense of this, let us return to Wittgenstein’s \textit{On Certainty}.

As was pointed out earlier, in these last notebooks Wittgenstein focuses on Moore’s common-sense examples of things he knows to be true\textsuperscript{32} – most famously: “‘Here is one hand, and here is another.’”\textsuperscript{33} What troubles Wittgenstein here is not Moore’s general antiskepticism, but rather his specific claims to knowledge. Why? Because if we attend to how “know” functions in ordinary life, free from philosophers’ “metaphysical emphasis” (OC §482), we find that “I know” entails the possibility of providing further justification, proof, or supporting evidence. In short, “I know” is conditional or “restricted” (OC §554). More specifically, “know” and “doubt” are mutually parasitic, for “I know” implies that “I doubt” \textit{makes sense}. Wittgenstein thus inquires: “How does someone judge

---

\textsuperscript{31} This example is taken from Raimond Gaita, \textit{The Philosopher’s Dog: Friendship with Animals} (New York: Routledge, 2003), 53, 56.

which is his right and which his left hand? How do I know that my judgment
will agree with someone else’s?” and continues: “If I don’t trust *myself* here, why
should I trust anyone else’s judgment? Is there a why? Must I not begin to trust
somewhere? That is to say: somewhere I must begin with not-doubting; and that
is not, so to speak, hasty but excusable: it is part of judging” (OC §150). To the
question “Why don’t you satisfy yourself that you have two feet?” one cannot
provide evidence more certain than what is in doubt; hence Wittgenstein’s own
response: “There is no why. I simply don’t. This is how I act” (OC §148). What
therefore remains interesting about Moore’s propositions is that they neither
require nor permit epistemic bolstering – they are, one might say, more funda-
mental than epistemology. Subsuming these claims under the rubric of “know-
ledge” therefore trivializes them, and even perhaps generates comic incongruity
(OC §§463–4).

It is crucial to note here that Wittgenstein does not simply rebuff Moore. For
although Moore “does not *know* what he asserts he knows,” it nevertheless
“stands fast” (OC §151) for both him and Wittgenstein (not to mention the rest
of us). Indeed, if Moore’s propositions were knowable, and thereby open to criti-
cal interrogation, then “a doubt would … drag everything with it and plunge
it into chaos” (OC §613). Wittgenstein thus undercuts the entire skeptic/anti-
skeptic debate by suggesting that “know” and “doubt” are two sides of the same
conceptual–linguistic coin. But this requires clarification, for he also insists
that the “game of doubting itself presupposes certainty” (OC §115). In short,
while “know” and “doubt” are inextricably connected, the entire knowledge/
doubt language game is underpinned by certainty. So, Wittgenstein is not only
concerned with describing the knowledge/doubt language game, but also inter-
ested in what underpins *all* our language games; hence his allusions to “some-
thing universal” (OC §440), “something animal” (OC §359), and even (rather
oddly) “the human language-game” (OC §554). Wittgenstein patently struggles
to articulate this background certainty without employing the vocabulary of
“knowledge” and “doubt.”34 Because the latter generate “misfiring attempt[s] to
express what can’t be expressed like that” (OC §37), he alludes instead to trust: “I
really want to say that a language-game is only possible if one trusts something.
(I did not say ‘can trust something’)” (OC §509). The parenthetical qualification
here is important, for such trust is not deliberative or hypothetical, but rather
“trust … without any reservation” (OC §337). Such trust is “primitive” in that
it is both unconditional and manifest (shown) in our ordinary linguistic and

34. This shifting vocabulary is most apparent where Wittgenstein discusses learning a whole
“world-picture” (OC §§95, 162, 167) or “system of propositions” (OC §141). It should be
noted that Moore himself struggles to articulate his certitude; see Moore, “A Defense of
nonlinguistic behavior.\textsuperscript{35} Insofar as trust is “anchored in all my questions and answers, so anchored that I cannot touch it” (OC §103), it thus resists explicit articulation. Indeed, even in our most theoretical and/or skeptical moments we do not evade trust, and as such any metadiscourse on trust (Wittgenstein’s included) itself presupposes such trust. This then is why Moore’s “Here is one hand, and here is another” contributes only philosophical confusion to the course of daily life in which hands ordinarily have a role.

Mindful of this, just as Wittgenstein’s conceptual vocabulary shifts throughout On Certainty, we find a similar array of descriptions in Alfred Schutz’s discussions of what is taken for granted in the “everyday life-world.”\textsuperscript{36} Like Wittgenstein, Schutz similarly seems to struggle to articulate this “unquestioned background.”\textsuperscript{37} But, as we shall see shortly, what is especially interesting is how Schutz’s phenomenology of the life-world highlights problems he appears to share with Wittgenstein.

Although Schutz maintains that the pretheoretical attitude of common sense is dominated by the pragmatic know-how involved in pursuing concrete objectives, most of our worldly knowledge is received from our sociocultural heritage. This inherited stock of knowledge is not static, however; “radical surprises”\textsuperscript{38} sometimes occur, which are either subsumed into our existent body of knowledge or undermine our hitherto “unquestioned course of experience.”\textsuperscript{39} At what point such anomalies endanger one’s stock of knowledge is not possible to determine in advance because the latter provides the criteria for what is relevant in one’s “biographically determined situation”\textsuperscript{40} and what counts as a genuine problem. Like Wittgenstein, Schutz thus thinks that the taken-for-granted world constitutes the realm in which doubting and questioning become possible, and as such lies at the “foundation of any possible doubt.”\textsuperscript{41} Moreover, intersubjectivity permeates the life-world. Not only is the taken-for-granted world essentially sociocultural; even one’s pragmatic dealings with objects refer to past, present, and futural activities of human beings. Indeed, while face-to-face encounters

\begin{itemize}

\end{itemize}
are immediate, here one takes for granted not only the bodily reality of one's fellow human beings (including their conscious life and possibility of mutual understanding), but also the interchangeability of our respective standpoints, namely, that “I and my fellow-man would have typically the same experiences of the common world if we changed places.”

However reassuring all this may sound, Schutz's work is haunted by a persistent ambiguity. Like specific passages in On Certainty (especially OC §§162, 167, 608–12), Schutz's life-world often sounds relativistic. A tension thus emerges between “relative-natural world view[s],” on the one hand, and “the fundamental structures of … the life-world” on the other, and likewise between “the life-world” and “our life-world” – where the “our” pertains to a historically and culturally specific community. In a similar vein, Schutz refers to others being so radically different that we do not have “any principles of interpretation”; their world lies “beyond the grasp” of our understanding. (Indeed, he even suggests that not even the “so-called biological needs for food, shelter, and sex” are basic enough to support a “theory of the equality of men grounded on the equal needs of mankind.”) We have begun to see – and will discuss further later – how Wittgenstein's apparent relativism is tempered by his naturalism, but does Schutz have similar resources available? It seems to us that he does. For Wittgenstein, we will recall, the “common behavior of mankind” provides our hermeneutic “system of reference” (PI §206). Only with this background in place can we possibly understand others. As such, this common behavior binds us across history, culture, and our respective stocks of knowledge. Despite the fact that Schutz seems to think that sociocultural groups can be unintelligible to one another, partaking in mutually untranslatable (incommensurable) forms of life, he nevertheless maintains that “Certain features … are common to all social worlds because they are rooted in the human condition.” Every situation is therefore “limited’ through the prior givenness of my body” and the given “ontological structure of the world.” Together these impose a limit on

historical, cultural, and individual difference.\textsuperscript{54} Accordingly, these features are universal; they are “on hand for everyone; they are the same in whatever relativ-natural world view [one is] … socialized.”\textsuperscript{55} As such, the other is “in principle ‘understandable’ to me.”\textsuperscript{56} Putting this in Wittgensteinian terms, then, difference is confined by “very general facts of nature” (PI 230) pertaining to “the natural history of human beings” (PI §415).

VI. ETHICS, THE BODY, AND “OTHERNESS”

Discussing Wittgenstein’s relevance for ethics may seem odd. For when he laments “the harm philosophers do in ethics,”\textsuperscript{57} he is not objecting to specific positions in moral philosophy, but to the philosophical treatment of ethics as such. Wittgenstein thus insists that we should “put an end to all the idle talk about Ethics – whether there be knowledge, whether there be values, whether the Good can be defined, etc.”\textsuperscript{58} In short, our tendency to talk about ethics is ultimately hopeless (PO 44).

Wittgenstein’s broader treatment of ethics seems similarly discouraging. In the Investigations he simply (and unsurprisingly) notes that the word “good” has a “family of meanings” (PI §77) rather than any determinable essence. Elsewhere he suggests that between different moral principles there cannot be “argument and proof,” and that context is all-important when trying to understand moral concepts.\textsuperscript{59} In keeping with these latter suggestions, in On Certainty Wittgenstein imagines encountering another culture. For us the propositions of physics constitute good grounds (OC §608), but how are we to judge those who instead consult an oracle (and for which we “consider them primitive”)? If we think it is wrong or mistaken for their actions to be guided in this way, would we not be merely “using our language-game as a base from which to combat theirs?” (OC §609). Wittgenstein thus proceeds to caution:

Where two principles really do meet which cannot be reconciled with one another, then each man declares the other a fool and heretic

\textsuperscript{54} Ibid., 111.
\textsuperscript{55} Ibid., 109.
\textsuperscript{56} Ibid., 18.
... I said I would “combat” the other man, – but wouldn’t I give him reasons? Certainly; but how far do they go? At the end of reasons comes persuasion. (Think what happens when missionaries convert natives.) (OC §§611–12)

So, if such principles can be radically divergent (and reasons must terminate somewhere [OC §§34, 192, 204, 262]), then noncoercive interaction becomes problematic. Reading Wittgenstein as endorsing a radical incommensurability thesis is doubtless tempting, but as we have begun to see, it is far from unproblematic. Still, we would like to pursue this idea a little further, with reference first to Lyotard, and then to Levinas.

Mindful of the above passages from On Certainty, if there is no site of arbitration outside all language games (no God’s-eye view), then any inter-game judgment will inevitably be framed in the conceptual vocabulary of a specific language game, thereby generating conflict. These broadly Wittgensteinian concerns preoccupy Lyotard insofar as he thinks that the multiplicity of language games (e.g. those governing “science, literature and the arts”60) are irreducible and heterogeneous. Simply put, “we have no common measure”61 here, and the resultant incredulity toward metanarratives (i.e. “narrations with a legitimating function”62) constitutes our postmodern condition. If metanarrative legitimation is problematic, then the emancipatory quest for consensus itself becomes ethically and politically questionable. After all, why assume that it is “always better to play together”?63

Clearly, Lyotard’s use of “language game” is rather different from Wittgenstein’s.64 For while the former extends its application to cover complex sociocultural phenomena, Wittgenstein’s own examples in the Investigations (e.g. “Giving orders, and obeying them … Reporting an event … Forming and testing a hypothesis … Translating from one language into another … Asking, thanking, cursing, greeting, praying” [PI §§23–5]) are significantly more mundane, and thereby cut across science, religion, art, and so on. Lyotard’s extension of “language game” thus enables him – rightly or otherwise – to draw explicit ethico-political conclusions; specifically that the imposition of one

63. Jean-François Lyotard, Postmodern Fables, Georges Van Den Abbeele (trans.) (Minneapolis, MN: University of Minnesota Press, 1997), 144.
64. The striking exception to this is OC §§608–12.
set of rules across the social field “entails a certain level of terror”; a more-or-less tacit injunction: “be operational (… commensurable) or disappear.” To translate conflicting parties, even for the sake of consensual harmony, violates the given heterogeneity of (Lyotardian) language games. Because different language games have their own operational criteria for how to move, and cannot be externally justified (i.e. their rules are local), the tension between language games cuts deep. However, such tension is not due to a problem of mere litigation or disagreement about the application of a shared rule. Rather, what interests Lyotard is what he calls the “differend,” where even the criteria for playing differ between subjects or collections thereof. Such conflict constitutes a differend because “the success (or the validation) proper to one genre is not the one proper to others.”

Although bolstered by his philosophy of language and appeal to a quasi-Kantian sublime, the political implications of Lyotard’s incommensurability thesis are pretty clear. He therefore advocates a “pagan” attitude of celebration and multiplication of differences – even a “war on totality.” Privileging one language game would be as absurd as claiming that chess or poker was the only true game. The pagan recognizes that there is no such privilege, for one can play numerous games each of which is “interesting in itself.” Conversely, a sure indication that people are insufficiently pagan is that “they think that they are in the true.” The flourishing of difference, nourished by an experimental attitude, is therefore what Lyotard thinks we postmoderns should desire, not least because questions of justice cannot be solved by models or rules. The alternative to this “pagan” attitude is the sort of dogmatism that, ultimately, leads to imperialism and genocide. Lyotard’s avowed openness to “difference” may sound cozy, but for him dissensus is the cost of recognizing the heterogeneous nature of language games. Although agonistic, Lyotard is

66. Although even within a language game there is no necessity to “move” one way rather than another; see Jean-François Lyotard, *The Differend: Phrases in Dispute*, Georges Van Den Abbeele (trans.) (Minneapolis, MN: University of Minnesota Press, 2002), 66, 80–81.
68. Lyotard, *The Postmodern Condition*, 82.
70. Avant-garde art is the paradigm case here, for its only “rule” is to search for (and question) its own rules; see Lyotard, *The Differend*, 139, and *The Postmodern Explained to Children*, 24.
73. Lyotard’s shifting vocabulary of language games, little narratives, phrases, and so on similarly bears witness to his agonistic desire to avoid totalizing discourse. The agonism of the phrase amounts to this: to phrase is inescapable; it is given, but how to phrase remains open (see Lyotard, *The Differend*, 66; *The Postmodern Explained to Children*, 54). Owing to the multiplicity of possible linkages, there is a corresponding multiplicity of possible disputes about
not therefore despairing, for politics is simply inseparable from the “threat of the differend.”  

These concerns seem in keeping with Wittgenstein’s insistence that all we can ultimately say is “this language-game is played” (PI §654), for at some point justification is exhausted (PI §217). Indeed, as noted earlier, the language game is “something unpredictable … it is not based on grounds. It is not reasonable (or unreasonable). It is there – like our life” (OC §559). Thus, when Lyotard writes “All we can do is gaze in wonderment at the diversity of discursive species,”75 we might well hear an echo of Wittgenstein’s own amazement at the given multiplicity of language games and forms of life (PI 226). On a Lyotardian reading, then, Wittgenstein’s anti-essentialism bears witness to “what the postmodern world is all about”; namely, the delegitimation of homogenizing metanarratives.76

While there are some striking correlations between Lyotard and Wittgenstein – especially the latter’s remarks in §§608–12 of On Certainty quoted earlier – we would now like to shift focus from Lyotard’s differend (and associated themes77) to Levinas – one of the most prominent continental philosophers of “difference.”78 Like Lyotard’s, Levinas’s work resists easy summary. As such, we will concentrate on a couple of themes that relate most conspicuously to Wittgenstein’s later thinking.

Levinas’s central preoccupation throughout his work is with the singularity of the “other” – specifically, other human beings.79 In this he draws on our prephilosophical experience of others, placing special emphasis on face-to-face encounters. According to Levinas, traditional philosophy has tended to characterize the other as essentially a member of a common species, an instance of humanity, or to use philosophical jargon, a token of a type. Typically, the other here figures as a source of epistemological concern – hence the problem of other minds and associated puzzles. But this way of construing our relation to others misses something much more fundamental; namely, that I am routinely faced by concrete, singular, vulnerable others – each with their own distinct

---

78. For more on the relation between Wittgenstein and Levinas, see Bob Plant, Wittgenstein and Levinas: Ethical and Religious Thought (London: Routledge, 2005).
79. For Levinas’s views on other animals, see especially “The Paradox of Morality: An Interview with Emmanuel Levinas,” A. Benjamin and T. Wright (trans.), in The Provocation of Levinas: Rethinking the Other, Robert Bernasconi and David Wood (eds) (New York: Routledge, 1988).
life-narratives, needs, desires, etc.80 (We might say, borrowing Wittgensteinian terms, that Levinas is here reminding us of something mundane we nevertheless tend to overlook due to its “familiarity” [PI §129].)

Much of Levinas’s work thus focuses on what it means to be faced by a finite, vulnerable, embodied other. The general claim he makes here is that “access to the face is straightaway ethical.”81 In other words, my “access” to the other is not dependent on any analogical inference or chain of reasoning on my part; rather, it is immediate. As Levinas remarks, what the face expresses

is not just a thought which animates the other; it is also the other present in that thought … [for the] expression does not speak about someone, is not information about a coexistence, does not invoke an attitude in addition to knowledge … Expression is … the archetype of direct relationship.82

Levinas goes further, however, for the face is not merely a collection of discernible features to be recognized, deciphered, or comprehended.83 Rather, the face has an active ethical dimension, for I am faced by the other’s face, not merely presented with one more worldly object for cool contemplation. Here, then, Levinas maintains that the other’s face embodies three things: first, the biblical command “Thou shalt not kill”;84 second, the appeal “Do not kill me” (and even “Do not abandon me”85); and third, the face accuses me of already having killed, of being an (albeit unwitting) accomplice in others’ deaths.86 So, the other’s face simultaneously commands, appeals, and accuses. Combined, the moral claim made on me here is inescapable.87 Thus, when Levinas says that the “face speaks,”88 the point is not merely physiological. Rather, the face provides the

LUDWIG WITTGENSTEIN

ethical conditions of possibility for discourse. For it is from the (vulnerable) authority of the other’s face that the silent demand that I justify myself first comes, and toward the (authoritative) vulnerability of the face that my response is ultimately addressed. It is in this sense that responsibility is “not a simple attribute of subjectivity”; rather, I am “initially for another.”

That being faced by the other demands that I justify myself is one of Levinas’s most persistent themes, for he repeatedly insists that the face “calls me into question.” The natural “egoism” of the self – what Levinas sees as its instinctive prioritization of its own welfare, needs, and desires over others’ – is therefore undermined in the face-to-face encounter. For here I am (albeit silently) required to justify to the other my very “right to be.” Why? Because my simply being here constitutes a “usurpation of someone’s place.” This then helps to explain why Levinas insists that “bad conscience … comes to me from the face of the other.”

The command of the face “Thou shalt not kill” is therefore an impossible injunction, for I have already sacrificed others, and continue to do so. For no matter how sensitive and generous I might be toward this other, I thereby neglect all the other others who are just as singular and needy.

It is in this sense then that responsibility is, strictly speaking, “infinite.” For what Levinas rules out is the good conscience involved in thinking that one’s responsibilities have been accomplished. (This latter theme plays a central role in Derrida’s ethical and political writings on hospitality, forgiveness, and the gift.)

These, in brief, are some of the central motifs of Levinas’s work. Mindful of all this, it is striking that Wittgenstein also draws our attention to the human face. In a sense this is unsurprising, for face-to-face encounters clearly play a central role in our everyday dealings with others. But Wittgenstein’s remarks on the human face (and the body more generally) have more notable Levinasian resonances. For he too wants to undermine the general philosophical view that others are essentially another species of object to be known. Like Levinas, Wittgenstein insists that the meaningful presence of the other is immediate. For example, one sees consciousness, and even a “particular shade of consciousness,” in the other’s face. When encountering others one does not first look into oneself and then “make inferences … to joy, grief, boredom” (Z §225) concerning them.

(This is why a facial expression cannot adequately be described in terms of “the

89. Ibid., 96.
92. Levinas, Entre Nous, 148.
distribution of matter in space” [CV 82].) Rather, we normally “describe a face immediately as sad, radiant, bored” (Z §225); its meaning “is there as clearly as in your own breast” (Z §220). The face, one might therefore say, manifests joy, grief, boredom, suffering, and so on. It is not incidental then that some recent Wittgensteinians describe embodiment, and specifically the human face, as a “moral space,” for the face is “the locus of the possibility of all those expressions that are at the basis of moral life.”

Despite all of this, we should not overstate the similarities between Levinas and Wittgenstein. For while Levinas constantly stresses the radical “otherness” of the other (although he gives this a distinctly ethical twist), Wittgenstein repeatedly emphasizes the regularities and commonalities of human behavior (PI §206). For example, he remarks: “If a man’s bodily expression of sorrow and of joy alternated, say with the ticking of a clock, here we should not have the characteristic formation of the pattern of sorrow or of the pattern of joy” (PI 174). In a similar vein, elsewhere Wittgenstein writes:

Isn’t it as if one were trying to imagine a facial expression not susceptible of alterations which were gradual and difficult to catch hold of, but which had, say, just five positions; when it changed it would snap straight from one to another. Now would this fixed smile, for example, really be a smile? And why not? (Z §527)

Such a face or body would signal, not radical “otherness,” but rather abnormality, dysfunction, or someone acting or making a joke. Wittgenstein thus asks us to imagine meeting people whose facial features were identical. Here, he suggests, this “would be enough for us not to know where we are with them” (CV 75) – just as we would falter if we were to encounter others whose linguistic and nonlinguistic behavior was completely predictable.

Given Wittgenstein’s preoccupation with human embodiment, his occasional references to the “soul” may seem rather surprising. But what interests Wittgenstein here is, predictably enough, how this term actually functions in our ordinary intercourse. If we “look and see,” rather than impose preconceived ideas of what “soul” means, we find that the term does not name some mysterious inner substance. Saying that someone “has a soul” is manifested, not in one’s hypothetical beliefs about their metaphysical constitution, but rather through one’s practical orientation toward them. In other words, to “believe that men have souls” lies in the application of this “picture” (PI §422), and this

96. Bergson’s Laughter is in large part an extended meditation on this point.
is why, regarding concrete others facing me, I have “an attitude towards a soul. I am not of the opinion that he has a soul” (PI 178). Given this very practical characterization of “attitude,” it becomes clear why such a picture is central to our sense of ethical concern for finite, embodied, vulnerable others. There is something primordially significant about the human form, so much so that it determines the limits of to what or whom the concepts pain, consciousness, soul (etc.) can be meaningfully attributed. It is in this sense then that caution is needed when speaking of the intractable or radical “otherness” of the other. For while other human beings may not be transparent to us (hardly something we should bemoan), that does not mean that they are inherently mysterious or that an unfathomable gulf separates us. Certainly the lives of others are singular; each of us has our own physical, psychological, emotional, and cognitive peculiarities, not to mention our own distinct life-narratives. In this sense we are unique and irreplaceable. But it is misleading to suggest that our uniqueness betokens some radical difference between us. For this ignores the mundane fact that, simply in virtue of being human, we share a considerable amount. Indeed, as suggested earlier, if others were truly radically “other,” how could we possibly be cognizant of this fact? Surely they would not even register on our cognitive, affective, and empathic radar.97

Both Wittgenstein and Levinas insist on the immediacy of our intersubjective encounters; our responsiveness to others is not essentially deliberative, nor does it result from our reasoning by analogy (Z §537). But here is where Wittgenstein and Levinas part company in the most significant way. As noted above, Levinas conceives of the face-to-face as undermining the natural “egoism of the I.”98 That is to say, for Levinas ethics is fundamentally “against nature because it forbids the murderousness of my natural will to put my own existence first.”99 This markedly bleak vision of the natural is crucially at odds with Wittgenstein’s naturalism, and specifically his insistence that “it is a primitive reaction to tend, to treat, the part that hurts when someone else is in pain; and not merely when oneself is.” By “primitive,” Wittgenstein does not mean anything derogatory, but rather that such responses are “pre-linguistic: that a language-game is based on it, that it is the prototype of a way of thinking and not the result of thought” (Z §541). (“‘Putting the cart before the horse’ may be said of an explanation like the following: we tend someone else because by analogy with our own case we believe that he is experiencing pain too” [Z §§540–42].) Thus:

98. Levinas, Basic Philosophical Writings, 54.
Being sure that someone is in pain, doubting whether he is, and so on, are so many natural, instinctive, kinds of behavior towards other human beings, and our language is merely an auxiliary to, and further extension of, this relation. Our language-game is an extension of primitive behavior. (Z §545)

Of course, there are times when the meaning and sincerity of others’ behavior is far from obvious. But Wittgenstein’s point is that, in the ordinary course of our lives, “I can only believe that someone else is in pain, but I know it if I am” is only to say that “one can make the decision to say ‘I believe he is in pain’ instead of ‘He is in pain’. But that is all … Just try – in a real case – to doubt someone else’s fear or pain” (PI §303). Put slightly differently, in such circumstances one needs “reasons for leaving a familiar track,” for “[d]oubt is a moment of hesitation and is, essentially, an exception to the rule” (PO 379). In an especially striking passage, Wittgenstein proceeds:

The game doesn’t begin with doubting whether someone has a toothache, because that doesn’t – as it were – fit the game’s biological function in our life. In its most primitive form it is a reaction to somebody’s cries and gestures, a reaction of sympathy or something of the sort. We comfort him, try to help him. (PO 381)

The important point here is that if, as Wittgenstein maintains, language is an extension, refinement, or replacement of primitive reactions (Z §545; CV 31; PI §244), then moral deliberation concerning when, how and to whom we should attend is ultimately rooted in prelinguistic natural or “primitive” reactions toward others. This is not to contest the obvious anthropological fact that the manner in which different cultures organize and implement their moral values may vary considerably. (Nor is it to contest the existence of sociopaths and moral blindness.) What it does suggest, however, is that the depth of such cultural diversity is not unfathomable, but rather circumscribed both by prelinguistic behaviors and given natural facts about human beings – not least their finitude and vulnerability. This then is why Wittgenstein insists:

The concept of pain is characterized by its particular function in our life.

Pain has this position in our life; has these connexions; (That is to say: we only call “pain” what has this position, these connexions).

Only surrounded by certain normal manifestations of life, is there such a thing as an expression of pain. Only surrounded by an even more far-reaching particular manifestation of life, such a thing as the expression of sorrow or affection. And so on. (Z §§532–4)
Moral problems force themselves on us insofar as they arise from the “common life between men and do not presuppose any particular forms of activity in which men engage together.” Thus, for example, what constitutes suffering is not primarily an epistemic or hypothetical matter; it is central to the natural life of human beings. The other’s suffering commands us to help (whether or not we actually do); his misery “calls for action: his wounds must be tended.” As such, the various trajectories taken in the course of historical and cultural practice and rational ethical and political deliberation are only possible on the grounds of a much more natural responsiveness toward others. Unlike Levinas’s ethics of radical otherness, then, what Wittgenstein is reminding us of in all this is the natural backdrop our lives share; our “agreement … in form of life” (PI §241).

In the previous discussion we have been stressing Wittgenstein’s (albeit minimal) naturalism, and how this figures in thinking about the relevance of his later work for ethics. Before concluding, however, it is worth saying something about “Remarks on Frazer’s Golden Bough,” for here Wittgenstein’s naturalism plays an even more tangible role. In these notes, Frazer is taken to task for portraying the magical and religious views of humankind as pseudo-scientific “errors” or “pieces of stupidity” (RFGB 61). According to Wittgenstein, however, religious beliefs can be erroneous only to the extent that they offer a theory or opinion. But “[n]o opinion serves as the foundation for a religious symbol” (RFGB 64); indeed, the “characteristic feature of primitive man is that he does not act from opinions” (RFGB 71). Frazer’s assessment is driven by his desire to explain religious practices. True to form, Wittgenstein opposes this by insisting that one must “only describe and say: this is what human life is like” (RFGB 63). Under these methodological constraints, then, “all one can say is: where that practice and these views occur together, the practice does not spring from the view, but they are both just there” (RFGB 62). These sentiments are therefore in keeping with Wittgenstein’s remarks in On Certainty that he wants to “regard man here as an animal … a primitive being to which one grants instinct but not ratiocination.” After all, “[a]ny logic good enough for a primitive means of communication needs no apology from us. Language did not emerge from some kind of ratiocination” (OC §475). For Wittgenstein, neither religious practices nor language itself are founded on reason; rather, the “origin and the primitive form of the language game is a reaction; only from this can more complicated forms develop” (CV 31). In short, Wittgenstein’s focus in “Remarks on Frazer’s Golden Bough” is not on (allegedly) “primitive” human beings, but rather on the “primitive” within human beings.

Wittgenstein thus provides a continuity thesis regarding primitive behaviors and language games. Indeed, this is why he suggests that “one could begin a book on anthropology by saying: When one examines the life and behavior of mankind throughout the world, one sees that … [human beings] perform actions which bear a characteristic peculiar to themselves, and these could be called ritualistic actions” (RFGB 67). Not only does Wittgenstein narrow the apparent rift between Frazer’s “savages” and us postmoderns, but this underlying commonality is something Frazer himself presupposes. For if his explanations did not already appeal to a natural tendency in us, then they would have little explanatory force. What Wittgenstein is stressing is the kinship between the behavior of Frazer’s “savages” and “any genuinely religious action of today” (RFGB 64). Because these various practices show a “common spirit” (RFGB 80), were one to invent a religious ritual, it would either perish or be “modified in such a manner that it corresponds to a general inclination of the people” (RFGB 78). (Indeed, we should remember our own ritualistic behaviors, such as kicking the ground in anger or kissing the photograph or name of a loved one.) Moreover, on closer inspection, Frazer’s “savages” understand perfectly the natural boundaries of their rituals, for the “same savage, who stabs the picture of his enemy apparently in order to kill him, really builds his hut out of wood and carves his arrow skillfully and not in effigy” (RFGB 64). Hence, Wittgenstein concludes that if they were to document their knowledge of nature, it “would not differ fundamentally from ours” (RFGB 74). Judging the religious practices of Frazer’s “savages” by our scientific criteria is misguided, perhaps also unjust, but not because of some radical differend or unfathomable “otherness.” Rather, the injustice here lies in Frazer’s underestimating our natural commonality. It is therefore unsurprising that “in relation to man, the phenomena of death, birth, and sexual life, in short, everything we observe around us year in and year out … will play a part in his thinking … and in his practices” (RFGB 66–7).  

102. In the same vein, Winch maintains: “[T]he very conception of human life involves certain fundamental notions – which I shall call ‘limiting notions’ – which have an obvious ethical dimension, and which indeed in a sense determine the ‘ethical space’, within which the possibilities of good and evil in human life can be exercised … [specifically] birth, death, sexual relationships. Their significance here is that they are inescapably involved in the life of all known human societies in a way which gives us a clue where to look, if we are puzzled about the point of an alien system of institutions … In trying to understand the life of an alien society, then, it will be of the utmost importance to be clear about the way in which these notions enter into it … [T]he very notion of human life is limited by these conceptions” (“Understanding a Primitive Society,” American Philosophical Quarterly 1[4] [October 1964], 322). Passages such as these undermine the common view that Winch is some sort of cultural relativist.
Wittgenstein introduces the concept “language game” (and associated terms) to shake us from our grammar-induced urge to think that language functions in one way. Rejecting such essentialism thus leads him to embrace a contextual, descriptive–therapeutic (rather than aprioristic, speculative–theoretical) approach. The early part of our discussion focused on this aspect of Wittgenstein’s work. What is of broader significance, however, is that while he emphasizes sensitivity toward the “multiplicity of language-games” (PI §24), he does not think that the horizon of human life is radically open. While we must be attuned to diversity in the social, historical, and cultural realm, insofar as language games emerge from shared “primitive behavior” (Z §545), it is misleading to interpret Wittgenstein as having “developed the theory of the irreducible plurality of language games,” and who thereby “sought to resolve the difficult question of values in terms of plurality.”103 It is even more misleading to think that Wittgenstein faced intractable problems “surmounting the heterogeneity of language games and the corresponding forms of life.”104 While specific passages in his later work (not only in On Certainty105) lend themselves to this sort of interpretation, Wittgenstein’s naturalism situates him at least as close to “common-sense” philosophy as to Lyotard’s postmodernism or Levinas’s ethics of radical otherness.

Inevitably in an essay of this sort it is impossible to provide a comprehensive analysis of a given philosopher. As such, we have doubtless presented Wittgenstein in a partial light, foregrounding what we considered to be the most interesting and salient facets of his work. Specifically, we have emphasized his naturalism and tried to explain how this bears on a number of issues – not least those of a broadly ethical sort. But, one might reasonably ask, where does this leave us? What is the relationship between Wittgenstein and so-called “continental philosophy”? The answer to this question, it seems to us, remains contentious. Or rather, if we expect a neat answer to this question, then we will likely be disappointed, for Wittgenstein’s is not the sort of work to permit such an unequivocal answer. To borrow a good Wittgensteinian metaphor, Wittgenstein’s own work is held together by a network of “family resemblances”: a “complicated network of similarities overlapping and crisscrossing: sometimes overall similarities, sometimes similarities in detail” (PI §66). But this should not be cause for despair, among continental philosophers or anyone else. For Wittgenstein's

104. Ibid., 58.
105. See, for example, Wittgenstein’s remarks on religious believers and nonbelievers being “on an entirely different plane” (L&C 53; cf. 56, 59–60) insofar as they “think entirely differently” (L&C 55). As such, he suggests, there is no “contradiction” between them (L&C 53, 55).
work requires reconstruction. What we have provided here is just part of that much larger – albeit disparate – ongoing project. Ours has been a cautionary tale, specifically against reading Wittgenstein as a champion of unbounded radical difference and otherness. Such a reading, we think, misses an important, although often neglected, aspect of his work: namely, his minimal naturalism. But other commentators – for example, Simon Glendinning, Stephen Mulhall, Chris Lawn, and Søren Overgaard\textsuperscript{106} – have traced other points of contact between Wittgenstein and continental philosophy. During the twenty-first century, no doubt, there will be other similarly insightful and challenging reconstructions of Wittgenstein’s work. In this sense at least, the future for thinking about Wittgenstein in relation to continental philosophy remains open.

**MAJOR WORKS**

I. INTRODUCTION: THE FREUDIAN DIFFERENCE IN CONTINENTAL PHILOSOPHY – THE DISCOVERY OF THE UNCONSCIOUS

Sigmund Freud\(^1\) is a momentously important figure not only in relation to the history of the continental philosophical tradition; he casts a prominent long shadow over the entirety of the past century.\(^2\) In addition to informing certain varieties of therapy linked to specific theoretical models of the mind, Freud’s invention of psychoanalysis has exerted (and continues to exert) enormous influence on Western culture and the history of ideas, even transforming the very manners in which people think and speak about themselves at an everyday level. Who does not occasionally suspect that he or she and others are moved by obscure or hidden mental forces, that the reasons for observed behavior are not always what they superficially seem? And few thinkers from one hundred years ago continue to provoke controversy in the here-and-now. Freud’s writings, rather than being highly specialized psychological texts focusing on sexuality and family life, are incredibly rich and wide-ranging reflections on numerous aspects of the human condition, such as the workings of memory,

---

2. Freud’s influence is discussed in the essay on “Psychoanalysis and Desire” by Rosi Braidotti and Alan D. Schrift in *The History of Continental Philosophy: Volume 6*. 
the relationship between mind and body, the meaning of literature and art, the nature of the emotions, the function of religion, and the structure of social groups. In several senses, for one to understand oneself today requires understanding Freud.

Thanks to his formidable erudition and amazing breadth of interests, Freud’s texts have something to say about nearly every issue and topic of concern to philosophers (as well as to anyone who pauses to ponder the mysteries of being human). However, whereas Anglo-American philosophical orientations generally have, with a few exceptions, skirted around serious engagement with the implications of Freudian psychoanalysis for accounts of mind and subjective agency, every significant philosophical movement forming part of the history of thought in twentieth-century Europe has, at a minimum, felt obligated to rise to the challenge of reconsidering the multifaceted enigmas of existence and subjectivity in response to Freud. It would be no exaggeration to assert that what is designated nowadays by the phrase “continental philosophy” involves, almost by definition at the current historical juncture, various relations with Freudian psychoanalysis and its diverse offshoots.

Along with Karl Marx and Friedrich Nietzsche, Freud is an essential, unavoidable point of reference for those continental philosophers working in his wake (with Marx, Nietzsche, and Freud functioning as a sort of foundational triumvirate for continental philosophy from the twentieth century through the present). Likewise, for all who seek to comprehend these philosophers, a certain comprehension of Freud’s key concepts and claims is mandatory. At the most basic and fundamental of levels, what Marx, Nietzsche, and Freud have in common is an emphasis on the subtle and insidious ways in which people remain opaque to themselves, operating under the influence of forces and factors foreign to their self-images and yet, at the same time, absolutely constitutive of and integral to their very being. One might be tempted here to invoke the French psychoanalyst Jacques Lacan’s\(^3\) neologism “extimacy,” a neologism referring to that which is simultaneously intimate and exterior, the core of a subject’s structure, which the conscious self of this same subject nonetheless cannot directly identify with and make its own. Along these lines, economic class struggles (Marx), historical power relations (Nietzsche), and fraught past experiences (Freud) are all posited as central determinants of the human condition usually misrepresented and/or obfuscated by mechanisms that conspire to keep such unsettling truths from being openly acknowledged and addressed – these mechanisms being ideology according to Marx, morality according to Nietzsche, and repression according to Freud.

\(^{3}\) For a discussion of Lacan, see the essay by Ed Pluth in *The History of Continental Philosophy: Volume 5*.

Volume 3
However, one might already be wondering: What sets Freud apart from Marx, Nietzsche, and other thinkers in the continental philosophical tradition with whom he shares some overlapping conceptual ground? What is distinctive about Freudian psychoanalysis with respect to post-Kantian European philosophy? There are many fashions in which one could go about answering such questions. In fact, considering both the sizable intellectual scope of Freud's own voluminous writings as well as the veritable mountain of literature by clinicians, philosophers, and many others dealing with Freud, a small library's worth of books could be written on the differences Freudian ideas make in the history of nineteenth- and twentieth-century continental philosophy.

What is more, Freud analyzes many matters of direct concern to philosophers of various stripes: temporality, embodiment, subjectivity, inter-subjectivity, affectivity, and countless other objects and phenomena. So, given that the present discussion is constrained by the length limitations of a single essay, difficult decisions must be made about what will be focused on here (as Spinoza remarks, “all determination is negation”). Despite these difficulties, one notion clearly thrusts itself forward as the leading candidate for the status of being Freud's crucial and unique contribution to the history of ideas, including the history of continental European philosophy: the unconscious (das Unbewusste). Psychoanalysis is born with the discovery of the unconscious in the late 1890s. It thereafter remains the defining object of inquiry for analysis as a particular discipline unto itself.

As Freud himself admits, he does not invent the unconscious ex nihilo, instead arriving at this notion through a combination of clinical experience with patients (including himself as the analysand of his in-depth self-analysis) and extensive reading across a range of material. He readily concedes that quite a few poets, artists, and philosophers before him discerned significant aspects and contours of these nuanced shades of mental life. Additionally, against a nineteenth-century intellectual background colored by the concepts of F. W. J. von Schelling, G. W. F. Hegel, Søren Kierkegaard, Marx, Schopenhauer, and Nietzsche, among others, it initially appears to be the case that much of what seems original in Freud involves, in actuality, modifications, inflections, and embellishments added to ideas that were already, as it were, “in the air” before he invents psychoanalysis at the turn of the century.

But this initial appearance is misleading. Although Freud's elaborations of psychoanalysis (as centered on the unconscious) over the decades of his mature career draw much inspiration from a whole series of other thinkers and disciplines, one must not lose sight of those characteristics and features of the specifically Freudian unconscious that make it an absolutely unprecedented idea distinct from its historical precursors. Lacan laments that Freud chose to designate what he discovered with a word bearing a negative prefix (i.e. “un-”). His
“return to Freud” endeavors to undo the damage done to the picture of Freud by misunderstandings generated, at least in part, by the proliferation of false renditions of the unconscious flourishing in the vagueness and indeterminacy opened up by a concept-term superficially appealing to everything that is simply not conscious; a brief moment of consideration ought to lead one to conclude that the unconscious of psychoanalysis, as a set of components and operations at play in the human psyche, cannot be the mere equivalent of the indefinite number of things that could be said to be “not conscious.” Following Lacan’s lead, only a correct positive conception of the unconscious (as more than just the negation of consciousness) will suffice in order to situate Freud properly vis-à-vis both his predecessors and successors in the history of continental philosophy. Lacan (sometimes referred to as “the French Freud”) is arguably the most important interpreter of the philosophical import of Freudian psychoanalysis for continental Europe, and the approach to Freud adopted here is unashamedly guided in certain ways by his teachings.

What follows is organized into two parts. In the first part, the peculiar features of the unconscious as the object of Freudian psychoanalysis will be outlined, with an eye to highlighting those of its traits that identify it as a unique contribution to the history of ideas. This task of outlining will be structured by the six sorts of questions one can ask about a thing (i.e. Who? What? Where? When? Why? and How? – of course, each of these questions will require further specification to become precise enough to guide a fruitful discussion of Freud). Then, in the second part, this thus-established delineation of the unconscious will be used to situate Freudian psychoanalysis in its relations to some of the major European philosophical orientations of the past two centuries. This latter half of the essay will strive to bring into view the convergences and divergences between Freud and those surrounding him in nineteenth- and twentieth-century continental philosophy.

II. THE UNCONSCIOUS – THE OBJECT OF FREUDIAN PSYCHOANALYSIS

Who? – the subject of the unconscious

Although Freud does not explicitly employ the terms “subject” and “subjectivity” as found throughout the bodies of literature constituting continental philosophy – more than anyone else, Lacan is responsible for putting such philosophical language into circulation within Freudian discourse – what these terms refer to is constantly at stake throughout the entire span of his psychoanalytic theorizations. However, even granting this, one might nevertheless wonder whether Freud’s descriptions of the unconscious are the appropriate places to
go looking for a Freudian account of subjectivity; surely his musings and speculations about the conscious dimensions of the ego, for instance, are more likely to furnish a depiction of the subject relevant to the concerns of philosophical orientations situated in a tradition rooted in Kantian and post-Kantian German idealism (these being conceptual frameworks evidently centered on consciousness and self-consciousness). Is the unconscious not something nonsubjective? Would images of it along the lines of either an utterly asubjective roiling mass of impulses and urges and/or a static storehouse of inert, frozen tableaus of episodic memories not be more fitting?

The unconscious posited by Freud is reducible to neither a seething sea of irreducible instinctual energies nor an accumulated jumble of snapshots of the childhood past. Rather, the unconscious of Freudian psychoanalysis is a thing that thinks (albeit in modes intimately connected to libidinal and mnemic factors). What is most revolutionary about Freud’s “Copernican Revolution” – Freud himself compares his mental decentering of the psyche to the shift from geo-centrism to helio-centrism – is the implication that one can think without knowing that one thinks, that one can know without knowing that one knows. Much of Western philosophy assumes that the mental and the conscious are synonymous and coextensive (this assumed equivalence has been empirically falsified by a wealth of psychological and neuroscientific research apart from the critiques to which psychoanalysis has submitted it). Consequently, many philosophers have presupposed (and some still persist in presupposing) that thinking and knowing exemplify and are inextricably bound up with the reflexive structures of a consciousness transparent to itself (i.e. to think is to think that one thinks, to know is to know that one knows). What Freud uncovers in his clinical work with patients and his examinations of sociocultural materials are the traces of sophisticated and complex processes of mentation (i.e. highly elaborate and clever mental maneuverings often involving intricate constellations of words and symbols) foreign to and disowned by the very authors of the evidence exhibiting these traces.

From the perspective opened up by Freud’s analytic ears, a far-from-mindless “it,” akin to an alien other of equal (yet utterly different-in-kind) intelligence to the familiar self-conscious “I,” appears to dwell within psyches whose forms of consciousness tend to ignore or deny the muffled presence of this it. Mentioning Lacan’s twin twists on René Descartes’s famous “Cogito, ergo sum” is perhaps helpful here: “I think where I am not” – that is, the unconscious involves a thinking that the “I” of conscious selfhood does not believe or suspect is happening – and “I am not where I think” – that is, the true kernel of one’s subjectivity resides not in the ego of one’s self-awareness, but, instead, in this thinking that circumscribed conscious awareness does not think is thinking. The Freudian unconscious is, first and foremost, an ensemble of nonreflexive
mental dynamics, a thinking that one \((qua\) conscious ego) does not reflectively think while (it is) thinking.

\textit{What? – the substance of the unconscious}

Although the unconscious is a style of thinking, a set of distinctive modes of mentation, it is not this exclusively. Of course, for anyone even minimally familiar with Freud, the unconscious also can be conceived of as both a particular place in the mind (i.e. a specific sector of the psyche topographically distinct from consciousness and the preconscious) and certain sorts of ideational materials (such as painful memories, inadmissible intentions, threatening desires, and the like). The knowing involved with this aspect of mental life is closely related to such materials as a kind of knowledge that one knows without knowing that one knows, relegated to mental regions resistant to self-conscious reflective assessment.

Hence, insofar as the unconscious is not pure form without content, a philosopher, especially one situated in the continental tradition, is likely to ask: What is the ontological status of the unconscious? Of what sort of “stuff” does it consist? What types of being(s) are involved with it? Freud himself does not address such queries directly, in part owing to his aversion to philosophy as he views it. His craving for scientific legitimacy in the eyes of the natural scientific positivism of his time, coupled with his bad impressions of highly speculative varieties of philosophizing inspired by the German idealists, lead him to be generally quite dismissive and disparaging of philosophy as a discipline, despite the obvious wealth of philosophical consequences entailed by his psychoanalytic theories. Nonetheless, whole books could be written in response to the preceding questions.

In terms of the ontological–material essence of the Freudian unconscious, several key points must be made. To begin with, the young Freud embarks on his path as a medical student researching matters neurological; as evinced by the posthumously published \textit{Project for a Scientific Psychology} (1895), this training (under the direct influence of Brücke and the indirect influence of Gustav Fechner and Hermann von Helmholtz) remains a pervasive influence shaping his metapsychological reflections across the entire span of his intellectual itinerary. However, he soon comes to realize the limitations of the neurology of his day. Freud awaits an eventual biological articulation of psychoanalytic metapsychology, but starts laying the theoretical foundations of analysis without it. Whether the insights he thereby arrives at can and should be put back into relation with the natural sciences has been and continues to be the focus of much lively debate both within and outside of philosophical circles.

\textit{Contra} a plethora of popular misrepresentations, Freud is not the vulgar biological materialist that he too frequently is portrayed as being, namely, a
scientistic reductionist in the mold of eighteenth-century French monistic materialism. The psyche, including the unconscious, is admittedly not without its relations to the body. But, in addition to defying a complete and exhaustive reduction to corporeal being alone, the body with which the psychical apparatus maintains a rapport is not just mechanistic matter moved solely by efficient causes (i.e. the matter at stake in crude science-inspired materialisms). The (sexualized) body-image, as the ideational representations (Vorstellungen) of the body, is a crucial mediating matrix conjoining, as Freud puts it, soma and psyche. In this vein, through his concept of drive (Trieb) – this concept is another of Freud's major contributions to the history of ideas, one as unprecedented with respect to the philosophical tradition as the unconscious – Freud depicts human being as taking shape at the complex, tangled intersection of body and mind, nature and nurture.

Furthermore, as is particularly apparent in the early founding texts of psychoanalysis (such as, most notably, The Interpretation of Dreams, The Psychopathology of Everyday Life, and Jokes and Their Relation to the Unconscious), much of the “stuff” of the unconscious consists of elaborate webs of images, words, symbols, and concepts (i.e. Vorstellungen, themselves accumulating over the course of the individual’s ontogenetic life history, chained together in incredibly sophisticated networks by the thinking activity of unconscious mental processes). Succinctly stated, the Freudian unconscious is not the familiar bastardized version of his later notion of the id (das Es). In other words, it is far from being simply a bubbling cauldron of primitive animalistic instincts held in check by nothing more than external social prohibitions and their psychical internalizations. Nor, by contrast with the Jungian unconscious and its archetypes, is the Freudian unconscious determined from the beginning by any innate meaningful contents wired into the foundations of the psyche.

Where? – the place of the unconscious

In addition to the form and content of the unconscious, there is the matter of the place of the unconscious. In continental European psychoanalytic circles, the 1923 publication of The Ego and the Id marks a transition from the “first topography” (i.e. the fundamental map of the mind as divided into conscious, preconscious, and unconscious domains) to the “second topography” (i.e. the id, ego, and super-ego trinity). Anglo-American psychoanalysts refer to this pivotal shift in Freud's metapsychology as the replacement of the “topographic model” with the “structural model.” Additionally, one should note that, for the later Freud, the terms “conscious,” “preconscious,” and “unconscious” are not straightforwardly supplanted by (or correspond in any direct one-to-one manner with) the terms “id” (das Es), “ego” (das Ich), and “super-ego” (das Über-Ich). Instead,
“conscious,” “preconscious,” and “unconscious” change from being nouns in the first topography (i.e. names for places in the psyche) to being adjectives in the second topography, adjectives modifying the nouns “id,” “ego,” and “super-ego” (e.g. in Freud’s later work, there are unconscious portions of the ego and super-ego, hidden dimensions of selfhood and conscience of which one normally is unaware). Moreover, the latter terminological triad, as with other of Freud’s German terms (such as \textit{Trieb} or \textit{Schicksal}), poses serious questions of translation on which hinge fundamental psychoanalytic issues with clinical and practical as well as theoretical and philosophical implications. For instance, whether every occurrence of “\textit{das Es}” or “\textit{das Ich}” should be translated with the technical terms “id” and “ego” respectively, rather than the words “It” and “I,” makes a genuine difference to one’s understanding of Freud’s writings about analysis from 1923 onwards. Lacan’s disputes with American ego psychology come out quite clearly through the differences between how he exegetically translates Freud’s German versus the fashions in which his English-speaking adversaries read \textit{The Ego and the Id} (like the German, the French terms for the three psychical entities of the second topography [“ça,” “moi,” and “surmoi”] preserve the same ambiguity between the technical and the nontechnical).

These difficulties aside, attention ought to be paid to the obvious here: Freud speaks of a psychical “topography,” namely, a (metaphorically) spatial depiction of the mental apparatus. The first association one might have in response to this, especially those who buy the image of him as a naturalizing biological reductionist, is the idea of the project of anatomical localization. However, Freud, painfully aware of the limitations of even the most cutting-edge of what was then-contemporary neurology, warns against efforts to pin down the “places” of the psyche in relation to the anatomy of the central nervous system (with a hindsight informed by today’s neurosciences, this decision against the project of localization was the right move insofar as the vast majority of complex mental dynamics, including ones operative in the Freudian unconscious, are nonlocalized \textit{qua} widely distributed across bodily systems and environs).

Another association people often make as regards visual metaphors for the unconscious as a mental space is to the motifs of so-called “depth psychology,” to imaginings of the unconscious as the concealed corners and recesses of the mind, as a psychical container for unpleasant things shrouded from view by the veil of repression. This conception of it as a deep, overshadowed repository is incredibly problematic (Lacan’s recourse to mathematical topology is driven, in part, by the struggle to purge metapsychological theorizing of any reliance on a misleading picture-thinking tethered to the spontaneous, intuitive Euclidian geometrical register of macro-level sensory-perceptual experience). Unconscious phenomena frequently are on display out in the open (as instances of “the psychopathology of everyday life”), transpiring on the very surface of
quotidian reality in publicly visible words and deeds – and yet, of course, usually somehow going unnoticed nonetheless. Furthermore, insofar as, on the Freudian account, consciousness itself is shaped by the unconscious, the latter is woven into the fabric of the former (rather than consciousness standing over and above the depths of the unconscious). Finally, certain dimensions of the unconscious even could be said to be distributed across individual psyches, situated in the intersubjective and trans-subjective structures arising between human beings via exchanges occurring within a diverse array of sociosymbolic milieus.

**When? – the temporality of the unconscious**

Freudian psychoanalysis, along with such roughly contemporaneous continental philosophical movements as both transcendental and existential phenomenology, takes significant strides in the direction of reconsidering the nature of being human in light of reflections on time. The temporal dynamics organizing psychical life are absolutely essential components of Freud’s analytic theories. And yet, not only does Freud himself fail to realize the full extent of the contributions his work makes to a new philosophical conceptualization of temporality – this is related to his insistence on the “timelessness” of the unconscious – but popular consciousness comes to consider the discipline he founds as, so to speak, a science of the past. That is to say, owing to a combination of some of Freud’s own remarks with impressions circulating among the general public, the unconscious phenomena of the psyche are at risk of being envisioned as either impervious to the passage of time and/or restricted to the effects of a limited number of repressed episodic memories from childhood. These misleading notions regarding the relevance (or, more accurately, irrelevance) of time to Freudian psychoanalysis obscure from view its many far-reaching ramifications for theories of temporality in philosophy.

Admittedly, the past is indeed very important in Freud’s account of mental life, as evinced through such things as infantile sexuality, the return of the repressed, repetition compulsion, transference, and so on. But, beginning with his earliest proto-psychoanalytic texts of the 1890s, Freud indicates that the past at stake in the psychical facets with which he is concerned is a past dialectically intertwined with a present continually unfurling itself off into the uncharted terrain of the future, a future filled with an indefinite multitude of unpredictable contingencies. Such phenomena as deferred action (*Studies on Hysteria*), mnemic re-transcription (“Letter 52” to Fliess), screen memories (“Screen Memories”), day-dreams (“Creative Writers and Day-Dreaming”), and, most notably, the interaction between “infantile wishes” and “day-residues” in the formation of the “manifest texts” of dreams via the “dream-work” (*The Interpretation of Dreams*) all reveal that what the unconscious retains of the past in the form of
encoded ideational representations is subjected to repeated retroactive alterations in connection with the ongoing lived history of ontogenesis. As a result of this dialectical oscillation between past and present, the unconscious past exerts its influence over the present only insofar as the present provides associative catalysts for the reactivation of this past, a past then modified by these same reactivations. Consequently, in psychoanalysis, a pure, undiluted repetition of or regression to a past “as it was” is impossible for several metapsychological reasons. This is a far cry from the image of the unconscious as a repository of fixed memories, a closed album of unchanging snapshots of early life events.

Additionally, the formations of the unconscious tend to orbit around enigmas pertaining to the temporal character of the human condition. More precisely, the entanglement of sexuality with the topics of birth and death is revealed through both the symptoms of certain neurotics and the fundamental fantasies situated at the core of each and every psyche. Many of the mysterious questions of existence that these fantasies attempt to answer bear on matters of mortality (and an unconscious that is allegedly ignorant of chronological time and logical negation struggles to comprehend such matters).

Lastly, although Freudian psychoanalysis could be identified as deploying developmental models of the mind, its developmentalism is not that of developmental psychology as it is commonly understood. To be more specific, when Freud insists on the timelessness of the unconscious, what he means is that prior phases of development (i.e. past periods of psychical experience and structure) are not eliminated and replaced by subsequent phases of development. Instead, the effects of the passage of time on the psyche involve the cumulative sedimentation of interacting layers (interactions in which layers of the long ago can and do continue to bend and warp current processes), rather than successive demolitions of the old by the new.

**Why? – the reasoning of the unconscious**

One of the more common misconceptions of the Freudian unconscious depicts it as a homunculus-like mind-within-the-mind, a sort of second mind as a lustful and violent Doppelganger of the conscious mind familiar to the first-person self. Freud takes great care to argue against such notions. By contrast with, for instance, the depth psychology of Pierre Janet (1859–1947; one of Freud’s contemporaries who posits a “subconscious” qua a split-off double of consciousness), the unconscious of Freudian psychoanalysis does not think in the manners and modes of the thinking with which consciousness is acquainted. Unconscious mentation works quite differently than conscious mentation – so differently, in fact, that traces of the former, often writ large out in the open, easily and usually go unrecognized by the latter. The strange, unfamiliar thinking
of the unconscious is not bound by the same logical and chronological laws and patterns as conscious cognition. In outlining elements of his metapsychology, Freud highlights the peculiarity of the unconscious in noting that it has no cognizance of either negation (including the law of noncontradiction foundational to the bivalent logic relied on by forms of conscious rationality) or time (in terms of the linear ordering of phenomena through the skeletal schema of past, present, and future). The Freudian distinction between “primary processes” (associated with the unconscious) and “secondary processes” (associated with consciousness) emphasizes precisely this: the rules and procedures of unconscious mentation are different in kind from those of conscious thinking. Hence, primary-process-style cognition is not to be conceived of along the lines of secondary-process-style cognition. In other words, the unconscious cannot be thought of as a duplicate of consciousness, a second consciousness operating apart from, yet in ways similar to, the first consciousness of the experiencing “I.”

Some of the philosophically crucial upshots of Freud’s insistence on the thinking (of the) unconscious as radically other in relation to conscious thought have to do with the statuses of reason and meaning in human existence. The unconscious is not “irrational” in the sense of being an inner primitive animality of crude instinctual whims and caprices, an opaque maelstrom of murky energies alien to more sophisticated, higher-order conceptual and linguistic reasoning. Nonetheless, the unconscious also is not “rational” relative to standards for rationality related to consciousness and self-consciousness. It does not pursue ends, weigh means, calculate outcomes, and ponder consequences as the conscious mind constantly does. The unconscious does not even recognize a firm, black-and-white line of demarcation between reality and fantasy, between fact and fiction. Freud, in connection with his later theories centered on the death drive, the super-ego, and masochism, goes so far as to hypothesize that the psyche even sometimes deviates from the rudimentary rationality embodied in the self-interested aiming at well-being, sabotaging its own pleasurable pursuits and inflicting pain and suffering on itself.

Likewise, although the formations of the unconscious are far from meaningless, they cannot be interpreted according to criteria of meaning derived from the recognizably meaningful phenomena of conscious life as experienced by the self of the ego. For example, the primary-process mentation characteristic of the unconscious, a style of thinking reflected in the dreams and free associations focused on by analysts, pays no heed to whether its manipulations of words, ideas, and images “mean something” according to the standards for meaning upheld by grammar, syntax, logic, and chronology. Unconscious cognition chains together ideational representations according to looser, more liberal principles of association, forging links between fragments of mental content that consciousness would never think to link. Consequently, psychoanalysis à
Freud is not (exclusively) a hermeneutic endeavor in search of deep meaning insofar as it necessarily involves paying attention to how facets of consciousness are configured and constrained by (sometimes quite elaborate and intricate) forms of nonsense and meaninglessness (nonsensical and meaningless from the perspective of mundane conscious contemplation).

How? – the manifestations of the unconscious

What evidence is there revealing the operations of the unconscious supposedly at play within the psyche? Asked differently, how does this un-thought thinking related but irreducible to libidinal economies manifest itself in analytically interpretable manners? Some of the first pieces of evidence prompting Freud to propose the revolutionary thesis that not all of what is mental is conscious come from his attempts to address hysteria therapeutically. This particular variety of neurosis involves psychosomatic conversion symptoms and/or affective reactions of a seemingly exaggerated and inappropriate degree of intensity in response to their apparent experiential stimuli. As regards the medically mysterious bodily ailments of hysterics, Freud’s 1890s writings on hysterical patients and phenomena postulate, below the threshold of explicit conscious thematization and awareness, a psychical (rather than strictly physical) body cobbled together out of images, words, and concepts. This more-than-physiological body, a body of Vorstellungen, is identified as being responsible for the distribution of conversion symptoms across the body (i.e. symptoms that convert painful psychical conflicts into a decipherable “language” of physical pain). And, as regards the apparently irrational emotional outbursts of hysterics, Freud surmises that there invariably is, as it were, method to the madness. If there is a glaring discrepancy between a circumstance and someone’s affective response to it, then, hidden behind (but associatively linked to) the circumstance, there must be another circumstance (a repressed idea or memory) as the unconscious determinant in relation to which the response is indeed justified and understandable. That which at first glance appears to be simply irrational turns out to be complexly structured by an idiosyncratic (quasi-)rationality, namely, the peculiar logics of mental processes typically unrecognizable to conscious cognition.

In the years that follow (especially 1900–1905), Freud proceeds to divulge a plethora of examples buttressing his axiomatic insistence that the mental and the conscious are anything but equivalent to or synonymous with each other. This deluge of evidence allegedly speaking in favor of the hypothesis of there being unconscious dimensions and dynamics in the mind comes in the forms of dreams, lapses of memory, slips of the tongue, and bungled actions, among other phenomena constituting the psychopathology of everyday life. Whereas the symptoms of hysteria are not experienced by all people, everyone is acquainted
with these sorts of instances regularly occurring in the course of quotidian existence. Freud's interpretive gamble here is to wager that, contrary to widespread presumptions that nocturnal imaginings and accidental blunderings are obviously without any real significance, these seemingly unimportant occurrences are, in fact, of great import. Such occurrences, Freud contends, are encoded manifestations of another type of thinking able to be thoroughly decoded only through analytic interpretation. Given the pervasive ordering and organization of mentally mediated life, Freud considers it unreasonable simply to write off puzzling dreams and perplexing behaviors as merely meaningless, as marginal and disconnected in relation to the intricate linguistic–conceptual webs woven throughout the fabric of human being.

But perhaps the strongest evidence in favor of the Freudian case for the unconscious comes from people's amorous and sexual lives. Starting with his groundbreaking 1905 text *Three Essays on the Theory of Sexuality*, Freud brings to light a range of features of this prominent portion of human existence for which explanatory strategies based on the assumptions that the sexual is instinctually dictated by biological nature alone and/or that love is either self-evident or entirely inexplicable quickly prove to be inadequate and unsatisfactory. Individuals do not just fall in love with whoever comes along who happens to be a fitting partner for the animal–organic endeavor of reproduction. Nor do they confine their pleasures to heterosexual genital copulation; sometimes they do not take pleasure in this, but fancy other things instead. People often cannot articulate a cogent account for who they become enamored with or why they enjoy what they enjoy sexually. Through his conceptions of and reflections on infantile sexuality, homosexuality, drives, the Oedipus complex, transference, perversions, fetishism, gender identity, and sexual difference, Freud re-examines love and sexuality as blossoming at the tangled intersections of soma and psyche. Moreover, the powerful influences helping to configure these amorous and sexual phenomena usually remain opaque to ordinary conscious reflection. And yet, despite appearing to be illogically devoid of any rhyme or reason, love and sexuality, from the Freudian perspective, are not without their reasons, however rational or irrational, however visible or invisible.

III. FREUD AND … – THE RELATIONS OF PSYCHOANALYSIS TO EUROPEAN PHILOSOPHICAL ORIENTATIONS

German idealism

Freud directly and indirectly refers to Immanuel Kant on several occasions. Most of these references occur in the context of discussions dealing with the super-ego
and moral masochism. Kant’s metaphysics of morals, his ethics of pure practical reason, is clearly what Freud has in mind when he talks about the merciless harshness of super-egoistic morality as a “pure culture of the death drive.” On Freud’s anti-Kantian account, seemingly disinterested rational conscience often serves as the disguised conduit for the nonrational interests of the sadistic id, with the id’s sadism inwardly discharged, via the super-ego, against the ego as its brutalized object. The ego’s consciously baffling guilt is a price paid for the satisfaction of the vicious id. One could say that, from a Freudian perspective, ethical renunciations and sacrifices, contrary to superficial appearances, are not without pathological enjoyment (qua the satiating of aggressive impulses).

Freud rarely mentions the German idealists. J. G. Fichte does not appear even once in the index of names occurring in the Standard Edition. The one citation of Hegel is a reference, in The Interpretation of Dreams, to someone else quoting Hegel. Schelling is explicitly invoked somewhat more frequently, most notably in the 1919 essay “The Uncanny.” However, based on his acquaintance with certain nineteenth-century intellectual currents inspired by German idealism, Freud tends to dismiss this late-modern philosophical orientation as pseudoscientific obscurantism, as unsubstantiated spiritualist silliness unworthy of serious consideration.

However, Freud’s dismissive poor estimation of German idealist Naturphilosophie (philosophy of nature) is based more on its use and abuse by subsequent figures than on a careful assessment of the writings of Schelling and Hegel. Had he looked more closely at these two philosophers, Freud might have discerned in them precursors of and resources for his metapsychological model of the human psyche. Freudian psychoanalysis posits conflict, in various forms and on multiple levels, as a pervasive (even ubiquitous) power conditioning the ontogenetic emergence of full-fledged subjectivity and thereafter continuing to shape subjects. Freud’s later speculations lead him to propose that psychical conflict, as grounded in the antagonisms and tensions reigning between Eros and the Todestrieb (death drive), goes right down to the bare bones and raw flesh of the biological body; human corporeality, rather than being harmoniously self-integrated and internally synthesized, is shot through with discord. In terms of this hypothesized fundamental strife between the forces of life and death, Freud credits the pre-Socratic thinker Empedocles with being an early predecessor in relation to his dual-drive theory of 1920 and after. But, in greater historical proximity to Freud, Schelling and Hegel conceive of material nature as saturated by proto-subjective negativity. The substance of German idealist Naturphilosophie, like the conflict-ridden somatic underpinnings of psychical life theorized by Freud, is at war with itself, permeated by the violence of clashing forces and the agitating disturbances of unsettling affects.
Moreover, thanks to Lacan putting Freud into dialogue with Hegel, one can perceive retroactively important precedents for Freud’s specifically psychoanalytic conception of the unconscious in Hegel’s philosophy (the 1930s rudiments of Lacan’s own theoretical framework emerge at the intersection of Freudian psychoanalysis and Kojève’s Hegelianism). Some of these precedents include the dialectical self-subverting structure of the figures of consciousness in the 1807 *Phenomenology of Spirit*, the insistence on the thoroughly all-encompassing conceptual and linguistic mediation of human being in the 1812 *Science of Logic*, and the invocations of an unconscious entangled with sociohistorical forms of existence in the 1821 *Philosophy of Right*, to name a few psychoanalytically resonant lines of thought in the Hegelian philosophical apparatus. Like Freud, Hegel insists that the hidden dimensions of human subjectivity are not to be conceived of simply as the dark depths of a brute, bestial nature. Hegel and Freud concur on a point of great significance: the unconscious side of the subject is traversed by and enmeshed with intersubjective and trans-subjective configurations of great complexity and sophistication, networks of elaborately organized words, images, and ideas.

**Materialism**

The brand of materialism with which Freud obviously entertains a relationship is that of such nineteenth-century materialists as Fechner and Helmholtz, namely, a scientism inspired by physics and chemistry. In particular, Freud’s metapsychological theories, from his 1895 *Project for a Scientific Psychology* through some of his final writings of the 1930s, display evidence of the influence on his thinking of so-called “psycho-physics.” Psycho-physics is a nineteenth-century version of a quite well-known type of (speciously) scientific materialism, a materialism that believes it is both possible and desirable to reduce mental life and everything with which such life is bound up to corporeal substance (i.e. matter as physical particles mechanically interacting with each other according to the laws of efficient causality). Simply put, the psycho-physicists known to Freud strove to construct a psychology in which the psychical is investigated and described in the same fashion in which the natural sciences of the time handled material objects.

The influence of naturalistic, science-inspired materialism on Freud is glaringly manifest through several features of his corpus. First of all, Freud’s earliest metapsychological formulations borrow images and ideas from the neurology in which Freud had been trained, speaking of the psyche (at least metaphorically if not literally) as a system of interconnected neurons through which circulate the excitations and stimuli of quotas of energy (both endogenous and exogenous). These neurology-derived metaphors persist, disguised and
undisguised, throughout the entire subsequent span of Freud’s intellectual itinerary. Additionally, Freud repeatedly appeals to the natural sciences; in particular, he forecasts future biological confirmations of his controversial hypotheses regarding human sexuality. More generally, the mechanistic language with which Freud depicts the dynamics of the psyche sometimes strongly resembles the discourse of psycho-physics, making mental processes sound like the workings of an asubjective, inhuman mechanical contraption.

But there are several very good reasons for rejecting the notion that Freud himself remains a committed psycho-physicist. And some of these reasons disclose resonances between psychoanalysis and the materialism(s) developed by and after Marx and Friedrich Engels. Although Freud makes no overt proclamations about historical and/or dialectical materialism (apropos Marxism, he briefly comments on the Russian Revolution of 1917 in *Civilization and Its Discontents*), his theoretical framework, like that of Marx and Engels, would not allow for unreservedly embracing any sort of mechanistic materialism. Stated much too succinctly, the relation between body and mind in Freudian psychoanalysis is a dialectical one. More precisely, soma participates in giving rise to psyche; but, thereafter, the psyche thus generated can and does exert reciprocal transformative powers over its libidinal–material sources in the body. Hence, by contrast with the mechanistic materialism of, for instance, psycho-physics, the treatment of mental life in analysis does not reduce it to an epiphenomenal status vis-à-vis the physical body.

Finally, as regards Marx’s historical materialism, Freud’s later work leads him implicitly to break with certain Enlightenment principles and biases presupposed by Marx (and, like Marx, Freud too is deeply marked by the beliefs and ideals of the Enlightenment). The traditional Marxist vision of history involves assuming that, at least in the long run, people are inclined to think and act in accordance with their own best interests (as exemplified by Marx’s prediction that, eventually, the oppressed proletarian masses will awaken from their ideological slumber and revolutionarily smash their capitalist shackles so as to create a radically egalitarian socioeconomic arrangement in which true justice reigns). This is to attribute a minimal underlying rationality to human beings, one postulating that if somebody fully and genuinely knows what is “better” for himself or herself, then he or she will desire this good and behave so as to obtain it (an old article of faith going back to Socrates). Through such concepts as the death drive and “disavowal” (*Verleugnung*), the later Freud indicates not only that human beings can and do become libidinally invested in self-defeating and self-destructive projects, but they also are able openly to acknowledge things (say, that given values and institutions are based on bankrupt ideological foundations) while, regardless, continuing to live in ways unaltered by these acknowledgments. Knowing the truth is not automatically and inevitably
liberating. Marxist critiques of ideology, as motivated by revolutionary political pursuits, are faced with some additional daunting difficulties by certain of Freud’s insights into the contradictions and inconsistencies of desiring subjectivity and its defense mechanisms.

**Existentialism**

Although the label “existentialism” originates in the first half of the twentieth century as a term of journalistic convenience used with reference to Jean-Paul Sartre in particular, it has come to designate a movement beginning with the later Schelling (of the 1809 *Freiheitschrift* and after) and running through Kierkegaard, Fyodor Dostoevsky, Nietzsche, Franz Kafka, Martin Heidegger, Sartre, Albert Camus, and Samuel Beckett, among others. The existentialists’ focus on the affective lives of human beings, especially their emphases on the relative frailty of reason *vis-à-vis* the emotions and the disturbing details of the gloomier side of negative affects, seems to be strikingly similar to what is involved with some of the concerns central to Freud’s analytic perspective. And, if Nietzsche is deemed to be an existentialist, then, as a chorus of authors engaged in an academic sub-industry unto itself never tire of claiming, Freud is profoundly indebted to existentialism. Admittedly, Nietzsche is almost certainly one of the figures Freud has in mind when, in a moment of modesty, he portrays psychoanalysis as a theoretical systematization and practical instrumentalization of the insights and discoveries of various key predecessors. However, this momentary modesty aside, it would be utterly unjustifiable to maintain that Freudian analysis is simply a clinical recapitulation of Nietzschean philosophy. Apart from there being much in Freud’s *oeuvre* that is not to be found in any developed or explicit form in Nietzsche’s writings, there are many important differences between these two thinkers even at the level of overlapping concepts (such as the unconscious, drives, and so on). Moreover, whether any of the versions of the libidinal economy hypothesized by Freud are seamlessly compatible with the infamous “will to power” posited by Nietzsche is quite doubtful.

Countless comparisons and contrasts could be elaborated here as regards looking at Freud alongside the existentialist tradition. One could spell out a Freudian problematization of the possibility of reasonless action represented by the character Meursault in Camus’s novel *The Stranger*. One could weave together Heidegger’s treatment of temporality in his analytic of Dasein with the delineation of the temporal structures of the psyche sketched by Freud. Numerous other things could be said as well. Incidentally, along these lines, it is worth noting that Freud showed little interest in the bridge-building efforts of “existential psychoanalysts” such as Ludwig Binswanger and Medard
Reciprocally, Heidegger was blithely dismissive of psychoanalysis and Sartre was highly critical of it. Both Heidegger and Sartre viewed Freud’s vision of the human condition as too mechanistic and determinist to capture what is most essential in being human.

Despite their disagreements, Heidegger and Sartre share a picture of Freud as pursuing a fundamentally reductive project, as seeking to collapse the being of human beings into the law-governed workings of ultimately bio-material forces. This vulgar, commonplace portrayal of Freudian psychoanalysis is terribly mistaken. On the one hand, it is indeed true that Freud’s notions of intrapsychical defense mechanisms and the overdetermination of states of consciousness undermine certain standard, quotidian senses of oneself as being an autonomous self, a free agent. But, on the other hand, psychoanalysis is anything but a straightforward discourse of determinism, a set of narratives about how people are nothing more than inherently ignorant puppets dancing on the end of strings held by an invisible master called “the unconscious.” For Freud, not only are individuals usually unaware of the degree to which their seemingly self-determined words and deeds actually are determined by influences operating below the level of conscious cognizance; they are also, at the same time, heavily invested in avoiding any direct realizations of the frightening extent to which their modes of life and styles of being are not imposed and held in place by the authority of an extra-mental external reality such as fate, God, society, and/or childhood. In other words, behind the veil of repression lurk not only the heteronomous determining matrices and machinations of the unconscious, but also an often obfuscated “abyss of freedom,” that is, an unsettling autonomy as the groundless ground beneath all constructed and constraining fashions of living. This freedom is normally just as unconscious as the hidden powers of psychical overdetermination.

**Phenomenology**

Freud shares with his contemporary Edmund Husserl, the founder of phenomenology, a debt to the teachings of Brentano. More precisely, Freud and Husserl appropriate, each in his own way, Brentano’s “intentionality thesis” according to which the mental is distinct from the physical insofar as the former involves

---

4. Binswanger (1881–1966) and Boss (1903–90) were both mental health practitioners who sought to integrate clinical and theoretical psychoanalysis with phenomenology and existentialism, in particular the existential phenomenology of Heidegger. In philosophical circles, Binswanger today is perhaps best known for his essay “Dream and Existence,” thanks to Foucault’s translation of it (a translation accompanied by an introduction longer than the essay itself). Boss, advocate of “Daseinanalysis,” is responsible for prompting Heidegger to give his *Zollikon Seminars* addressing philosophy and psychological matters.
an intentional directedness. Additionally, this directedness requires psychical “presentations” forming the (mental) objects with which the acts and operations of the mind concern themselves. Apart from influencing certain of Freud’s metapsychological models having to do with Vorstellungen and their roles apropos reality (as psychical reality, the reality principle, etc.), Brentano’s notion of intentionality informs the so-called “fundamental rule” of clinical analytic practice, namely, free association on the part of the analysand. When a patient in analysis says that he or she has “nothing” to say or “nothing” on his or her mind, this is never taken as literally true by the analyst. Due to the abiding, inherent “aboutness” of mental life (i.e. its intentional structure), there always and necessarily are things occurring to the analysand lying on the couch. Hence, his or her protests that he or she cannot think of anything to talk about should be interpreted, in nearly all instances, as resistance to associating freely.

However, despite having Brentano in common as a source of early inspiration, Freudian psychoanalysis and Husserlian phenomenology part company when it comes to the topic of the unconscious. Bluntly put, transcendental phenomenology à la Husserl contains no equivalent to the specifically analytic unconscious. When Husserl and his followers address aspects of mental subjectivity apart from the domain of conscious awareness, what they usually refer to are features of the mind that Freud would qualify as either preconscious (i.e. features that can become conscious on deliberate, focused reflection) or nonconscious (i.e. features that simply cannot be rendered within the parameters of possible representation holding for first-person conscious mentation). Unlike what is preconscious or nonconscious, what is unconscious is kept outside of the circumscribed sphere of (self-)consciousness thanks to the workings of defense mechanisms (i.e. repression and other intrapsychical defenses). The contents of the unconscious, although in most cases capable of being brought to light through an analytic process (by contrast with the nonconscious), cannot easily be called to mind at will (by contrast with the preconscious). Husserlian phenomenology lacks a proper unconscious insofar as it does not posit anything resembling the defense mechanisms so central to the Freudian understanding of mental life.

Whereas transcendental phenomenology shows little interest in psychoanalysis qua theory of the unconscious, existential phenomenology proves to be a much more promising philosophical partner for analysis. Although Heidegger turns a blind eye to Freud on the basis of ill-informed opinions of the latter’s ideas, Binswanger and Boss, as well as many others, are not without their good reasons for sensing some potential points of theoretical co-augmentation between a metapsychological model of the psyche and an existential analytic of Dasein. One of the tragedies of the missed encounter between Freud and Heidegger is that the two twentieth-century figures carrying out the most radical
reconsiderations of the human condition in light of temporality did not end up collaborating.

With respect to psychoanalysis, Maurice Merleau-Ponty is the most sympathetic and engaged of the great thinkers of the phenomenological orientation. Not only does he explicitly take up Freud’s concepts and the ontogenetic schemas contained in analytic metapsychology – he also draws on Kleinian object-relations theory and certain ideas formulated by his friend Lacan. In particular, the Merleau-Pontian account of embodiment, involving a distinction between the exogenously mediated “lived body” and the corporeality at stake in the natural sciences, is quite relevant to Freudian analysis. But, at the same time, the images and themes of harmony, integration, and fusion permeating Merleau-Ponty’s philosophical discourse are at odds with the psychoanalytic stress on both pervasive antagonism and conflict as well as the psychical subject’s insurmountable out-of-joint-ness with its surrounding environs.

Critical theory

Although Freud himself does not engage with Marx, several twentieth-century figures and movements in the Marxist tradition see in Freudian psychoanalysis a set of useful theoretical tools for political analysis and critique (and this despite Freud’s bourgeois sensibilities as well as the suspicions that analysis is a form of “class therapy” excluding those not sufficiently blessed with spare time and disposable income). The most notable and well-known instance of this is the selective appropriation of Freud’s ideas by members of the Frankfurt School of critical theory. Theodor Adorno’s famous 1950 study The Authoritarian Personality attempts to sketch a psychoanalytically informed portrait of a purported type of individual character structure allegedly susceptible to fascist-style authoritarianism. As regards Adorno, it also should be mentioned here that his criticisms of scientism in the social sciences, with this scientism’s insistence on quantitative and statistical methods of study, dovetails with the position of Freudian and post-Freudian psychoanalysis vis-à-vis those psychologies

---

5. Melanie Klein (1882–1960) is the founder of object-relations theory, a post-Freudian psychoanalytic approach that, as its name suggests, emphasizes the centrality of fantasy-mediated relationships with objects and others as the driving motor mechanisms of psychical development. Relations, rather than endogenous libidinal forces and factors, are identified as the formative fundaments of the psyche, fundaments allegedly established starting in very early infancy. Along with ego psychology (an outgrowth of Anna Freud’s analytic doctrines, with the 1940s split between Anna Freud and Klein having had a decisive impact on the subsequent history of psychoanalysis, especially in the English-speaking world) and Lacanianism and its permutations, object-relations theory is one of the three major orientations shaping psychoanalysis over the course of the past several decades.
basing themselves on the numerical parsing of data from large test-subject sample pools. Freud does not shy away from offering evidence for his metapsychological claims about the organization and operation of the psyche: quite the contrary. But, nonetheless, analyses are always-unique experiences taking shape between singular subjects in intimate circumstances, circumstances whose private and unrepeatable qualities make them ill suited for a methodology based on replicable experiments open to public scrutiny. For practical as well as philosophical reasons, psychoanalysis cannot survive reduction to a “scientific psychology” according to the standards of the sort of scientism argued against by Adorno.

However, the key manifesto of Frankfurt School Freudo-Marxism in its most robust incarnation is Herbert Marcuse’s 1955 book *Eros and Civilization*. In this text and elsewhere, Marcuse, through his particular manner of combining Freud with Marx, contends that psychoanalysis both falls prey to aspects of the ideology of capitalism’s “repressive society” and, simultaneously, also harbors the conceptual resources for seeing through this same ideology. In Marcuse’s eyes, Freud erroneously treats as ahistorical constants of human psychology facets of psychical life shaped by the temporary historical features of capitalism as a particular socioeconomic system. More specifically, Marcuse maintains that the material conditions peculiar to Freud’s era – these conditions ostensibly require renunciations and sacrifices (i.e. “repressions” as per Marcuse’s rather loose construal of Freudian vocabulary) on the part of individuals as cogs in a collective machine involving “alienated labor” and artificial scarcity – mislead Freud into positing extreme libidinal inhibition as an inherent, contextually invariant symptom afflicting every (discontent) individual ensconced within “civilization” (defined as any group order in which the price of membership is submission to restrictive rules). Along Marxist lines, Marcuse imagines a new ensemble of historico-material conditions yet to come in which the pointless toiling of commodity-propelled capitalism and the curbs on satisfaction it demands are eliminated; and, with this revolutionary change, neurosis-inducing repression as conceived of by Freud supposedly is eliminated too. While criticizing Freud in this fashion, Marcuse avowedly continues to rely on Freudian psychoanalysis, especially its theories of the libidinal economy, to explain the psychological and subjective workings of capitalism as well as to articulate his vision of a future society beyond repression. But Marcuse’s political deployment of Freud’s ideas arguably is based on some far-from-insignificant misunderstandings of these ideas. In a nutshell, Marcuse tends to equivocate illegitimately between instinctual needs and psychical drives as well as between intrapsychical repression and external social suppression. A better metapsychological appreciation of drive dynamics in relation to their enveloping milieus problematizes Marcuse’s picture, calling into question whether
the revolutionary liberation he anticipates can or would ever occur as envisioned by him.\footnote{6}{For a detailed discussion of Marcuse, see the essay by John Abromeit in \textit{The History of Continental Philosophy: Volume 5}.}

Blending psychoanalysis with Marxism is not the sole prerogative of the Frankfurt School. Starting in the 1960s, Lacan attracts an audience outside clinical analytic circles, an audience containing leftists of various stripes (including Maoist students of Louis Althusser, himself committed to a careful Marxist consideration of psychoanalysis, such as Jacques-Alain Miller and Alain Badiou\footnote{7}{Miller and Badiou are discussed in detail in the essay by Patrice Maniglier in \textit{The History of Continental Philosophy: Volume 7}, while Badiou is the focus of an essay by Bruno Bosteels in \textit{The History of Continental Philosophy: Volume 8}.}). Claude Lefort, Cornelius Castoriadis, and Slavoj Žižek, to name several of the most prominent representatives of continental political thought as inflected by psychoanalysis, draw on analytic concepts in their reflections on democracy and capitalism.

\textit{Feminism}

The feminist reception of Freud, even when limited to those varieties of feminism forming part of the continental philosophical tradition, cannot be summarized easily or adequately given its sophistication and complexity. Needless to say, Freudian psychoanalysis has sparked a range of reactions from feminist thinkers, spanning a spectrum running from outright rejection to enthusiastic appropriation. What follows are a few highly selective remarks about a topic (i.e. Freud and feminism) around which has formed a sizable mass of diverse texts and debates.

Before mentioning some of the most noteworthy continental feminists concerned with Freudian psychoanalysis, a couple of claims ought briefly to be made against a certain feminist tendency to dismiss Freud as a misogynistic turn-of-the-century Viennese male whose views reflect those of his sexist culture and time. To begin with, Freud’s female analysands are themselves products of a sexist culture and time. As such, their psyches are marked by the effects of a phallocratic system; through analysis, Freud reveals just how deeply ingrained are the imprints of patriarchy. But there is a world of difference between description and prescription, with Freud describing the sexualities and libidinal subjectivities of his patients without thereby aiming to endorse in a normative mode what he describes. Furthermore, despite moments when Freud admittedly does seem to fall back into aspects of the misogyny of his era, his sustained examination of sexual difference and gender identities, itself a deviation from his predecessors’
and contemporaries’ general tight-lipped silence apropos such matters, arguably opens up a whole horizon of new possibilities for considering the multifarious relationships between sexuality and subjectivity.

Along related lines, Freud launches his clinical analytic career by being one of the first people to start genuinely listening to suffering women. He treats female hysterics not as irrational creatures of emotion buffeted about by a crazy vortex of feelings and sensations (perhaps discombobulated by a “wandering womb”), but as proper human beings with rich mental lives that, even when riddled with psycho-neurotic symptoms, exhibit the rhyme and reason of the psychical logics uncovered by analysis. Additionally, Freud is not the simple-minded biological determinist that many, including many feminist critics, make him out to be on the basis of flawed partial interpretations of his writings. For him, human physiology, with “the anatomical distinction between the sexes,” indeed crucially contributes to shaping the contours and characteristics of people’s subjectivities. But these bio-material factors do not predestine someone in the direction of a single subjective telos; nor do they enjoy a final determining authority over who and what (sexed) individuals are or become.

French feminism and those feminist thinkers drawing from this particular strain of feminism are the most favorably disposed toward Freud and his legacy (especially his legacy in France as influenced by Lacan). While being critical of Freudian psychoanalysis in her classic 1949 book *The Second Sex*, Simone de Beauvoir’s discussions of femininity therein are prefigured by Freud’s groundbreaking de-essentialization of gender identity and his revelatory analytic dismantling of the sociopsychical constructions contributing to configurations of a denaturalized sexual difference. In Beauvoir’s wake (and continuing up through the present), others tackle the issues of sex and gender in fashions that openly employ psychoanalytic concepts. Judith Butler, Hélène Cixous, Catherine Clément, Luce Irigaray, and Julia Kristeva, to list just a handful of theorists of diverse outlooks, maintain a nuanced, multifaceted dialogue with Freud, simultaneously pointing to limitations plaguing his conceptions of femininity while also deploying his ideas in projects striving to reconceptualize the status of sexual difference (these two endeavors sometimes come together as an immanent critique, namely, a critique of Freud’s account of sexual subjectivity relying on Freud’s own notions). Admittedly, even for those feminists drawing on Freud, there is much in his corpus (such as versions of the Oedipus complex and the notorious conjecture about penis envy in women) that must be reworked or discarded in light of feminist critical insights. Some of the most far-reaching explorations of the places of embodiment and inter-subjectivity in Freudian psychoanalysis are due to feminist interventions in the analytic field.
Of course, when one considers the link between psychoanalysis and structuralism, the primary association that immediately comes to mind is Lacan's return to Freud. During the first six years of his annual seminar (1953–59) and in contemporaneous writings, Lacan endeavors to re-read Freud through the lens of Saussurian structuralism (his version of Ferdinand de Saussure is heavily reliant on that of the structural linguist Roman Jakobson). Paying close attention to both the role of language in Freud's theories and the linguistic–conceptual details of Freud's texts, Lacan asserts that Freud unknowingly already was a proto-structuralist of a Saussurian sort. Much of his evidence for this assertion comes from the prevalence of elaborate word-plays in the numerous examples of dreams, jokes, and parapraxes analyzed by Freud, especially in his early writings. Lacan insists that interpreting Freud's works in this fashion is crucial for avoiding the deviations from the essential tenets of Freudian psychoanalysis of which Lacan thinks Anglo-American psychoanalytic orientations are guilty. Lacan's quasi-structuralist return to Freud is a sustained effort to combat the image of Freudian psychoanalysis marketed by the American ego psychology of the 1950s in particular.

Claude Lévi-Strauss, a structural anthropologist who epitomizes what is referred to as classical French structuralism, also significantly informs how Lacan understands Saussure and his successors in connection with psychoanalysis. What is more, Lévi-Strauss, taken on his own apart from Lacan's references to him, champions a conception of “structure” audibly resonating with the Freudian notion of the unconscious in manners echoing the resonances between Hegel and Freud. To be more precise, in his 1949 *Elementary Structures of Kinship* and similar studies, Lévi-Strauss claims to uncover the workings of formally expressible laws and patterns organizing and underpinning identity, status, and familial–social relations in given human groups. For the most part, the members of these groups are not directly or explicitly aware of these laws and patterns, although their thoughts and actions testify to the rule of these orders of nonconscious structures. Like the Freudian unconscious, Lévi-Straussian structures, rather than being sets of nonconscious instinctual tendencies, are networks of sophisticated codes and algorithms palpably molding individuals’ existences without, for all that, these networks being self-reflexively grasped as such by those caught in their grip.

*9. For a detailed discussion of Lévi-Strauss, see the essay by Brian C. J. Singer in *The History of Continental Philosophy: Volume 5.*
According to the conventions of certain philosophical journalists and intellectual historians, Michel Foucault (at least in his youth) and Roland Barthes both also qualify, along with Lévi-Strauss and Lacan, as structuralists. In some of his first and some of his final works (in such texts as 1961’s *History of Madness* [early] and 1976’s initial volume of *The History of Sexuality* [late]), Foucault situates Freud historically, using this historical framing to call into question Freud’s seemingly revolutionary, unprecedented status. From these critical Foucaultian perspectives, Freud appears to be surprisingly complicit with longstanding prior psychiatric traditions as well as part of a growing Western cultural tendency toward valorizing sexuality as the supposed secret truth of who and what one is. However, in between the early and late phases of his *oeuvre*, Foucault, near the end of *The Order of Things* (1966), approvingly speaks of psychoanalysis as participating in “the erasure of the figure of man,” that is, the dawn of a new antihumanist thought (although Foucault does not mention him by name here, he undoubtedly is appealing to Lacan’s structuralist version of analysis).

Carrying out a project called for by Saussure himself, Barthes develops semiotics as a “science of signs” beyond linguistics proper (i.e. a theory of sign-systems encompassing not only the signs of natural languages, but the signifying elements functioning in cuisine, fashion, art, etc.). Kristeva, perhaps Barthes’ most prominent student, weaves together semiotics and Freudian–Lacanian psychoanalysis. The semiotic sensitivity to the multiple dimensions of signifying materials and practices – neither semiotics nor psychoanalysis limits signs and signifiers to meaningful instances of communicative language – meshes well with analytic approaches to the symbolically shaped texture of psychical subjectivity and its contexts.

**Poststructuralism**

Lacan’s seventh seminar of 1959–60 (*The Ethics of Psychoanalysis*) justifiably could be identified as the first poststructuralist (albeit *avant la lettre*) treatment of Freudian psychoanalysis. Therein, Lacan enacts what is often described as a sort of turn in his thinking, a shift of emphasis in his foundational “register theory” from the Imaginary and the Symbolic to the Real. Whereas previously he focuses on the effects of images and signifiers in the structuring of the speaking subject, at the end of the 1950s he turns his attention to things (for instance, *das Ding*, *jouissance*, *der Nebenmensch*, and so on – in short, Things of the Real) that impact the Imaginary–Symbolic structures of reality without themselves being captured by or reducible to such structures. The signifier-supported scaffoldings of desiring subjectivity in its relations with intersubjective and trans-subjective constellations are no longer, in and after the seventh seminar, the sole foci of...
analytic metapsychology. Succinctly stated, for the later Lacan, structure is (in his own parlance) “not all.”

However, the inaccurate picture of Lacan as a classical Lévi-Straussian structuralist, a picture based on his teachings from the years prior to the seventh seminar, informs a poststructuralist rebellion against the Lacanian return to Freud. This rebellion is intertwined with the events of May 1968 in Paris. In the climate of France in the late 1960s, Gilles Deleuze and Félix Guattari mount their anti-Oedipal critique of psychoanalysis, a critique portraying Freud and Lacan as insidious normalizers of desire, as representatives of an effort to codify an anarchic, nomadic, impersonal, and machine-like libidinal economy within the constraining coordinates of narratives centered on the nuclear family and its familiar anthropomorphic actors.10 Deleuze and Guattari manage powerfully to channel and express the sociopolitical concerns of many of their contemporaries. But, under the influence of these turbulent times, this anti-Oedipal duo indulge in the tactics both of representing the Oedipus complex as the be all and end all of Freudian psychoanalysis (itself a debatable, dubitable representation) as well as of depicting Lacan as fundamentally a structuralist advocate of the utterly Oedipal Freud (this too is questionable and problematic).

In fashions more sympathetic to psychoanalysis, other poststructuralist discontents of Lacanianism play Freud off against Lacan. Arguably animated by a vaguely Bergsonian conceptual and theoretical aesthetic, André Green, Jean Laplanche, Paul Ricoeur, and others (such as Kristeva) appeal to Freudian energetics (supposedly encompassing the concepts of libido, drive, affect, and similar notions) contra the purported dominance of bloodless formal structures in the Lacanian model of psychical subjectivity. This poststructuralist strain of psychoanalytic theory is primarily responsible for the now-familiar allegations that Lacan—the-analyst indefensibly neglects body and emotion (themselves said to be sidelined by him in tandem with his ostensibly lopsided privileging of signifiers as conceived of via such disciplines as linguistics and mathematics). As with Deleuze and Guattari, these sorts of readings of Freud and Lacan are contentious and contestable.

Lastly, there are multiple connections between, on the one hand, psychoanalysis à la Freud, and, on the other hand, Jacques Derrida and the “deconstructionism” associated with his name. Derrida repeatedly addresses Freud and Lacan.11 Moreover, his novel methods and techniques of philosophical exegesis are avowedly indebted to psychoanalytic practices of listening and reading.

Nonetheless, Derrida shares many of his fellow poststructuralists’ concerns and reservations apropos Freudian and Lacanian analysis. Additionally, from a certain angle one can perceive deconstruction and psychoanalysis as mirror-image inversions of each other: whereas the former tends to discern a chaotic, nonsystematic heterogeneity behind a textual façade of ordered, systematic homogeneity, the latter tends to discern the opposite, namely, an ordered homogeneity behind a textual façade of chaotic heterogeneity (for example, the apparently fragmented and disjointed free associations of analysands are, in actuality, governed by an integrated, coherent order of unconscious formations). The texts interpreted by deconstructionists and analysts often differ, and, appropriately, so too do their interpretive procedures.

Declarations of Freud’s death have become a journalistic cliché in an age dominated by the alliance between insurance companies and the pharmaceutical–industrial complex. However, although no longer enjoying the anomalous, strange success of its mid-twentieth-century years as the preferred psychological treatment of celebrities and the privileged theoretical framework governing psychiatry departments, psychoanalysis is far from perishing and disappearing. Part of what has been crucial to keeping Freud and his followers alive is continental philosophy’s lively interest in psychoanalytic ideas (not to mention the creative applications of these ideas carried out by various sectors of the humanities and social sciences influenced by European philosophical currents). Today, philosophers and theorists rooted in the philosophies of continental Europe continue to appropriate, modify, and refine concepts from the Freudian tradition, using psychoanalysis to interrogate a range of contemporary cultural, political, religious, and scientific issues. Considering his continuing relevance to how people understand themselves and their world, Freud is anything but dead.

MAJOR WORKS

All references to the English translations refer to The Standard Edition of the Complete Psychological Works of Sigmund Freud (24 vols), edited and translated by James Strachey, in collaboration with Anna Freud, assisted by Alix Strachey and Alan Tyson (London: The Institute of Psycho-Analysis, 1953–74); hereafter abbreviated SE, followed by the volume number and, if a given text is one of two or more in a single volume, the inclusive page numbers. The dates in parentheses mark the dates of publication of the original German texts; those in brackets, when they occur, mark the dates of composition if these differ from the dates of publication.

*Studien über Hysterie* (with Josef Breuer) (1893–95). Published in English as *Studies on Hysteria*. SE 2.

*Die Traumdeutung* (1900). Published in English as *The Interpretation of Dreams*. SE 4–5.
Der Witz und Seine Beziehung zum Unbewussten (1905). Published in English as Jokes and Their Relation to the Unconscious. SE 8.
Jenseits des Lustprinzips (1920). Published in English as Beyond the Pleasure Principle. SE 18: 1–64.
Das Ich und das Es (1923). Published in English as The Ego and the Id. SE 19: 1–66.
Hemmung, Symptom und Angst (1926). Published in English as Inhibitions, Symptoms and Anxiety. SE 20: 75–175.

Apart from the books listed above, many of Freud's most important texts are article-length essays as well as novella-length case studies. The most important of these would include (but not be limited to): the Fliess correspondence, the five famous case studies (Dora, Little Hans, the Rat Man, Schreber, and the Wolf Man), the writings on psychoanalytic technique, the papers on metapsychology, the later pieces on sexuality and gender identity, as well as numerous analyses of social, cultural, and political phenomena. The reader interested in these texts should turn to The Standard Edition.

RESPONSES TO EVOLUTION: SPENCER’S EVOLUTIONISM, BERGSONISM, AND CONTEMPORARY BIOLOGY
Keith Ansell-Pearson, Paul-Antoine Miquel, and Michael Vaughan

Darwin’s *On the Origin of Species* was published towards the end of 1859 and although its influence on the intellectual life of the second half of the nineteenth century was immense and dramatic, it alone did not generate the rise of interest in questions about evolution. As one commentator has noted, most nineteenth-century evolutionists were Lamarckians or Spencerians rather than Darwinians: Jean-Baptiste Lamarck (1744–1829) had published his theory of progressive evolution in *Philosophie zoologique* in 1809 and Herbert Spencer (1820–1903) had developed an evolutionary theory of mind and behavior in his *Principles of Psychology* of 1855.¹ It is often assumed that Spencer and Darwin adhere to the same theory of evolution, but this is not the case; and it is Spencer who, at least for philosophers, was the major intellectual figure of the period. Some of philosophy’s most original minds, such as Charles Sanders Peirce (1839–1914) and Henri Bergson (1859–1941), took note of the Darwinian revolution and the rise of philosophical evolutionism and sought to respond to them.² Bergson captures the mood well when he writes in his great text of 1907, *Creative Evolution*, that “the language of transformism forces itself now upon all philosophy, as the dogmatic affirmation of transformism forces itself upon science.”³ Let us note at the outset that Darwin’s aim in the *Origin of Species* was not to promote the concept of evolution – the word appears only at the very end of the

book⁴ – but rather to do away with the notion of supernatural intelligence, that is, the view that the universe is the result of an idea or plan. As one commentator has noted,⁵ what is radical about Darwin’s book is not its evolutionism but its materialism: species evolve according to processes that are entirely natural, chance-generated, and blind. Indeed, Darwin’s choice of the word “selection” may be unfortunate since it suggests an intention at work in nature, while the process of evolution is a blind one: “The selection of favorable characteristics is therefore neither designed nor progressive. No intelligence, divine or otherwise, determines in advance the relative value of individual variations.”⁶ There is, then, no ideal type or essence of a species toward which adaptive changes are leading.

In his *The Variation of Plants and Animals under Domestication* (1868), Darwin makes it clear that the process by which living things evolve can be explained without making use of any theory of design.

In this essay, we focus attention on Bergson’s *Creative Evolution*, since this is without doubt the most important text on evolution by a continental philosopher. It contains an important critique of Spencer’s evolutionism; it is intellectually ambitious and rich in showing how philosophy and science can reach a new rapport concerning questions of life; and it has inspired major developments in both postwar philosophy (notably the work of Gilles Deleuze) and recent biology (notably in applications of complexity theory and nonlinear thermodynamics to the study of living systems).

I. HERBERT SPENCER AND EVOLUTIONISM

Spencer’s ideas on evolution are primarily contained in his *First Principles* (1862) and his two-volume work, *The Principles of Biology* (1864, 1867). In the first work, he sets himself two main tasks: first, to come up with an adequate definition of the aims and scope of philosophy; and, second, to provide an adequate conception of evolution. Spencer accepts that philosophy has limits of knowledge and affirms the idea that philosophy is unable to formulate “Being” in

---

⁴ The idea of evolution is presented at the end of the *Origin of Species* in a way that permits one to speak of a kind of Darwinian sublime: “Thus, from the war of nature, from famine and death, the most exalted object which we are capable of conceiving, namely, the production of the higher animals, directly follows. There is grandeur in this view of life, with its several powers, having been originally breathed into a few forms or into one; and that, whilst this planet has gone cycling on according to the fixed law of gravity, from so simple a beginning endless forms most beautiful and most wonderful have been, and are being, evolved” (*The Origin of Species* [Harmondsworth: Penguin, 1985], 459–60).

distinction from “Appearance.” In short, philosophy is not an ontology. But what is its character once these limits have been acknowledged? Spencer considers the rivalry between German and English philosophy in which “the English criticism” repudiates everything regarded as absolute knowledge. What they share, however, he notes, is a commitment to philosophy as the discipline that is concerned with systematized knowledge. What is needed is a useful contrast between philosophy and science. Spencer proposes that science “means merely the family of Sciences” and consists of “truths more or less separated”; by contrast philosophy stands for truths that have been integrated (FP 37). He writes:

How, then, is Philosophy constituted? … So long as these truths are known only apart and regarded as independent, even the most general of them cannot without laxity of speech be called philosophical. But when, having been severally reduced to a mechanical axiom, a principle of molecular physics, and a law of social action, they are contemplated together as corollaries of some ultimate truth, then we rise to the kind of knowledge which constitutes Philosophy proper. (Ibid.)

Philosophy’s job is to “comprehend and consolidate the widest generalizations of Science” (ibid.). If science is partially unified knowledge, philosophy is completely unified knowledge. Knowledge begins with crude and isolated observations; it then seeks to establish propositions of a broad scope that are separate from particular cases; and finally, it culminates in the articulation of universal propositions. It is important to note that Spencer is placing the stress not simply on knowledge as a process but rather on philosophy being able to express definite pieces and truths of knowledge; that is, his concern is not with the validity of the act of knowing but with the actual product of knowledge, such as an ultimate proposition that “includes and consolidates all the results of experience” (FP 42). For example, philosophy shows that we always think in terms of “relations” and their elements, such as likenesses and differences. Our thought enjoys a status of “relativity” and is thus forever debarred from “knowing or conceiving Absolute Being” (FP 47).

In the case of “evolution” the concern is with specifying its most general laws, for example, showing that “in its primary aspect” it denotes a change “from a less coherent to a more coherent form consequent on the dissipation of motion and integration of matter.” Spencer takes this to be a universal process, that is, one through which “sensible existences,” both individually and as a whole, pass

---

during the “ascending halves of their histories” (FP 115). He contends that this holds for both the earliest changes in the visible universe and the changes that can be traced in societies and the products of social life, including science itself. Spencer is thus identifying a law of development that can be applied to all things that undergo evolution, be it a solar system, a planet, an organism, or a nation: “From the lowest living forms upwards, the degree of development is marked by the degree in which the several parts constitute a co-operative assemblage – are integrated into a group of organs that live for and by one another” (ibid.). Spencer is seeking again the most general and comprehensive principles by which the phenomenon of “Life” (a word he comes to be suspicious of8) can be understood, for example, “integration” and “differentiation.” His central and most well-known claim is that in evolution there is a change from the homogeneous to the heterogeneous. We see this, he contends, in the case of the human animal, in the progress of every tribe and nation as well as every civilization (FP 122). The initial definition of “evolution” can now be finessed, then, as a change from an indefinite, incoherent homogeneity to a definite, coherent heterogeneity (FP 127, 138).

Spencer’s *The Principles of Biology* takes the form of a theoretical inquiry into the meaning of life and not a contribution to the growth of any particular biological science.9 His specific aim was to combat the “continental” tradition of inquiry and deny that living things possessed meaning on account of their being directed by an internal force or power. He was keen to avoid any probing into what may lie beneath surface shapes and instead seeks to restrict knowledge, in true empiricist fashion, to what is causally visible; in short, knowledge is “superficial” and, as such, uncovers rational and functional laws.10 Spencer places himself in opposition to two continental currents of thought: on the one hand, the philosophical idealism associated with the likes of Lorenz Oken (1779–1851) and Goethe; and, on the other hand, a materialistic current stemming from Comtean positivism. Any appeal to transcendentalism (such as a vital principle of life) was to be avoided, along with innate principles and teleological perfection. At the same time, a crude positivism that held life to be meaningless was also to be avoided. There is “meaning” in life but this will be discovered only in the detailed interpretation of the functions and structures of life, such as plants and animals, and in the examination of their relations with an environment.11 Life is not a separate force and the science of biology will demonstrate that living things are all subject to the same laws as the rest

9. Ibid., 211.
10. Ibid.
11. Ibid., 212.
of the physical universe: “Nothing would be hidden; for Spencer the meaning of life was plainly visible in the forms and structures of the material world.” Where Spencer is radical is in his denial that classifications of living forms correspond to anything natural in the world; systems of classification are an artificial means for organizing our knowledge. The further we carry the analysis of things, he holds, the more obvious it becomes that divisions and classifications are essentially human inventions and scientific artifices by which we limit and arrange the matter under investigation and as a way of facilitating human inquiry.

The issue that intrigues Spencer in *The Principles of Biology* is not the natural selection of species but species’ self-persistence and perpetuation; in short, their continuation over time. This means, therefore, focusing on the “static” aspect of life. He explains the exhibition of species’ stability by recourse to a vital impulse, which he calls the protoplasm, but this impulse is not progressive, that is, it is an agent not of change but of stasis. For him what causes change is not the inner life force but some harsh novelty caused in the environment that serves to jerk a species out of equilibrium. Evolution, then, exhibits no drive towards perfection. On this issue he takes his inspiration from Darwin: evolution does not work toward specific goals. Moreover, “Spencer’s biological evolution had become a matter of responses to physical forces that shaped or formed organic entities in the same way they did inorganic ones.” Curiously though, he holds to the view that the evolutionary destiny of human beings is separate from the rest of nature. His hope is that in time evolution will move beyond its “red in tooth and claw” character and result in the general abolition of “evil,” or life beyond the cruelty, competition, pain, and fear that characterize nature.

**II. BERGSTON’ S CREATIVE EVOLUTION**

Bergson began his intellectual life as a follower of Spencer but soon broke with him on core philosophical issues. In *Creative Evolution*, while acknowledging the powerful attraction Spencerian evolutionism has exerted on contemporary thought, he goes so far as to contend that this evolutionism deals in fact neither with becoming nor with evolution (CE 232). We shall return to his criticism of Spencer later in the next section. First, it will be helpful to provide insight into some of the main arguments of Bergson’s great text, the text that turned him into a philosophical sensation in his own time and which various biologists of

our own time, such as Steven Rose, Brian Goodwin, and Mae-Wan Ho, refer to as containing rich resources for understanding the evolution life as an open, dynamical system.

Bergson may well be the most important philosopher of life in the twentieth century, the one most seriously committed to it for philosophical ends. *Creative Evolution* was an audacious work when it was first published in 1907, and it remains so today. Here we encounter a continental philosopher taking seriously the insights of modern evolutionary theory and biology, attempting to assess their implication for matters of concern to philosophy, and seeking to demonstrate how philosophy can illuminate and clarify our thinking of life in its evolutionary aspects. Bergson is not afraid to speculate. However, for him “speculation” should be neither abstract nor idle, but grounded in facts that are empirically intelligible and testable. In *Creative Evolution*, Bergson attempts to show that the problem of knowledge, the problem of accounting for the faculties of intellect (intelligence) and intuition, is one with the metaphysical problem of gaining access to the real: the two form a circle, the center of which is “the empirical study of evolution.” The double form of consciousness (intuition and intellect) is shown to reveal “the double form of the real” itself (dynamic and static). For Bergson, intellect reveals only the static aspect of reality, but through intuition we may gain access to the dynamic reality that intellect misses. The attempt to demonstrate this constitutes what we might call the Bergsonian Revolution. It is an effort to enter “into life’s own domain,” conceived as “reciprocal interpenetration, indefinitely continued creation” (CE 115). Life is to be approached as a “current of creative energy … precipitated into matter” that endeavors “to wrest from it [matter] what it can” (CE 209).

The significance of the science of the nineteenth century for Bergson is that it places at the center of its inquiry the “study of living beings.” He concedes that even here science may still be governed by mechanics, but what we are dealing with is a mechanics of transformation, which is a mechanics that cannot be developed by relying on geometrical and spatialized schemas of thought. Change, transformation, and evolution are bound up with living and open systems, and the features of novelty that characterize such systems will always elude a mathematical treatment. A major critical point that Bergson makes in *Creative Evolution* concerns the way in which an exclusively physico-chemical study of organisms cannot grasp the real growth and change that are essential to life, because it treats its object of study – be it a single cell or a whole organism – mathematically, that is to say, as a constant, isolable, and self-identical unit. For Bergson, the physical sciences become merely symbolic when they treat life, which displays dynamic properties, within this static framework. Further, if science claims that it is justified in doing so because life is essentially mathematical, it ceases to be descriptive and becomes hypothetical. Through his studies of
cytology, embryology, and paleontology, Bergson is well aware that the evidence suggests the contrary, that life is not essentially mathematical. In Bergson’s terms, treating life within a static mathematical framework is dogmatic, and betrays a metaphysics that haunts science.

In an unorganized body or material object, Bergson accepts that change may be only a displacement of the ultimate parts of which an object is made, parts that themselves do not change, meaning there is no real growth, no history, nothing to prevent the object returning to its previous state (CE 5). What biology reveals, for Bergson, is that living organisms do not change through a mere rearrangement of parts, but that each part itself changes by splitting in an unpredictable way. Hence “the distinctive feature of the organized body is that it grows and changes without ceasing” (CE 9) because this growth or change “does not proceed by the association and addition of elements but by dissociation and division” (CE 58). This means that unlike unorganized matter, change in living systems cannot be charted and predicted as a rearrangement of parts because the parts themselves do not remain unchanged throughout the process. Indeed, they do not even remain self-identical, as it is their nature to multiply: “because there are several individuals now, it does not follow that there was not a single individual just before … it was one in the first instance and afterwards many” (CE 9). For Bergson, this is not a hypothesis: it is observable fact, evident in cell division, in the development of the embryo, and in the evolutionary process of speciation. In each case we see that what was once one is now literally two (or four, or eight, etc.). Thus, the very language of ultimate parts with a constant numerical value, which is the basis of a mathematical treatment, cannot express this process in which the parts that we identify continually multiply, and what is more, multiply in an unpredictable way.15

In contesting a purely mathematical treatment of life Bergson does not, as has been widely supposed, espouse a naive vitalism. Vitalism entails an appeal to some mysterious vital stuff that is then held to be the transcendent motor or agent of evolution, while Bergson explicitly eschews any appeal to a vital force or principle. He notes that when the mind considers the infinity of infinitesimal elements and causes that come together in the genesis of a living being, in which the absence or deviation of any one of them would ruin everything, its first impulse is to take “this army of little workers as watched over by a skilled foreman, the ‘vital principle,’ which is forever repairing faults, correcting effects of neglect or absentmindedness, putting things back in place” (CE 145). For

15. We should note that mathematics has found new applications since Bergson’s time, and that within complexity theory in particular it is now used to model the behavior of systems that are held to be in principle dynamic and unpredictable, while in fact giving rise to patterns of regularity – a view that is very close to Bergson’s own, but which the mathematics of his day did not entertain.
Bergson, however, there is no such foreman; nor are there any workers that need such supervision. Furthermore, “the position of vitalism is rendered very difficult by the fact that, in nature, there is neither purely internal finality nor absolutely distinct individuality” (CE 27).

Bergson claims that time has not been taken seriously in previous science. He contends that both common sense and science deal with isolated systems, which are systems that realize themselves in the course of time. Time is reduced to a process of realization on account of the fact that mechanical explanation treats both the past and the future as calculable functions of the present. As a result, time is deprived of efficacy and, in effect, reduced to nothing, having just as much reality for a living being as an hourglass. This is true of both mechanism and finalism for Bergson. Indeed, he contends that finalism is merely an inverted mechanism, substituting the attraction of the future for the compulsion of the past and conceiving the order of nature on the model of a realization of a plan. Bergson claims that both mechanism and finalism are, ultimately, attempts to conceive evolution along the lines of the workings of the human mind (for good reasons did Emmanuel Levinas locate in Bergson's text a source for Heidegger's question concerning technology). He thus claims, somewhat radically, that mechanism's reproach against finalism – that it is anthropomorphic – can also be applied to mechanism itself. Both conceive of nature working like a human being in bringing parts together and proceeding via association and the addition of elements. Bergson suggests that a glance at the development of an embryo will readily show that life works in a very different manner, namely, via dissociation and division (self-differentiation).

Bergson's conception of life draws heavily on his notion of a virtual multiplicity made up of heterogeneous elements, in which the relations between them are ones of fusion and interpenetration. Considered in terms of its contact with matter, life can be likened to an impetus or an impulsion that in itself “is an immensity of potentiality [virtualité], a mutual encroachment of thousands and thousands of tendencies,” which are such only when spatialized (CE 165–6). It is matter that carries out in actuality the division of this virtual multiplicity, and individuation is to be treated as in part the work of matter and in part the result of the inclination of life. In the opening part of Creative Evolution, Bergson states that there is no universal biological law that applies “precisely and automatically to every living being.” Rather, “there are only directions in which life throws out species in general” (CE 10–11). This seemingly innocuous statement provides the key to understanding Bergson's attempt to stage an encounter between the

discoveries of modern biology and an enlarged perception of the “whole” of life and evolution, one that endeavors to go beyond the uncritical assumptions of “evolutionist philosophy” (the reference is to Spencer).

What challenge to thought did Bergson think the new biology presented? First, and most obviously, there is the rejection of Aristotle’s thinking. In his discussion of the development of animal life in chapter two of Creative Evolution, he says that the cardinal error that has vitiated almost all philosophies of nature from Aristotle onward lies in seeing in vegetative, instinctive, and rational life successive degrees in the development of one and the same tendency. In fact, they are “divergent directions of an activity that has split up as it grew” (CE 88).

This is in accord with one crucial aspect of his conception of “life,” namely that it proceeds not by the association and addition of elements but by dissociation and division. Bergson argues that one of the clearest results of modern biology is to have shown that evolution has taken place along divergent lines (CE 113). This means that it is no longer possible to uphold the biology of Aristotle in which the series of living beings is regarded as unilinear.

The second challenge to thought raised by the new biology was located in the modern doctrine of “transformism,” a doctrine that Bergson says he accepts “as a sufficiently exact and precise expression of the facts actually known” (CE 15). On the one hand, it shows us that the highest forms of life – highest in terms of complexity – emerge from a very elementary form of life, thus “the most complex has been able to issue from the most simple by way of evolution.” On the other hand, it shows that life can no longer be treated as an abstraction. Life can now be described in terms of the continuity of genetic energy that cuts across the bodies “it has organized one after another, passing from generation to generation, [and that] has become divided among species and distributed amongst individuals without losing anything of its force, rather intensifying in proportion to its advance” (CE 17).

Bergson insists that we need to display a readiness to be taken by surprise in the study of nature and life and learn to appreciate that there might be a difference between human logic and the logic of nature. We cannot approach nature with any a priori conceptions of parts and wholes or any a priori conception of what constitutes life, including how we delimit the boundaries of an organism and hence define it. We must resist the temptation to place or hold nature within our own ideas or shrink reality to the measure of them. We should not allow our need for a unity of knowledge to impose itself on the multiplicity of nature. Life challenges the essential categories of thought: unity, multiplicity, mechanical causality, intelligent finality all fall short. A consideration of life in its evolutionary aspects makes it virtually impossible to say where individuality begins and ends, whether the living being is one or many, whether it is the cells that associate themselves into an organism or the organism that dissociates itself.
into cells. Unity and multiplicity, or the one and the many, are categories of inert matter; the vital impetus can be conceived as neither pure unity nor pure multiplicity.

The need for a new thinking of life arises for Bergson, in particular, out of the deficiency of the intellect and its inability to think duration.

The more duration marks the living being with its imprint, the more the organism differs from a mere mechanism, over which duration glides without penetrating. And the demonstration has most force when it applies to the evolution of life as a whole ... inasmuch as this evolution constitutes, through the unity and continuity of the animated matter which supports it, a single indivisible history.

(CE 24)

Time is written and engrafted – it is inscription: “Wherever anything lives, there is, open somewhere, a register in which time is being inscribed” (CE 11). Bergson insists that this is no metaphor; rather, it is of the essence of mechanism to consider as metaphorical every effort to ascribe positive attributes to time. For mechanism, change is reducible to an arrangement or rearrangement of parts, while the irreversibility of time is depicted as an appearance relative to our ignorance. But if there is no direction of time for physics, this cannot be the case for biology. On every level we care to examine it, be it embryology, morphology, or the process of evolution itself, time is the indicator of life and of individuated living systems. This inscription and recording of time is, in fact, the time and place of the vital:

[W]hat is properly vital in growing old is the insensible, infinitely graduated, continuance of the change of form ... The evolution of the living being, like that of the embryo, implies a continual recording of duration, a persistence of the past in the present, and so an appearance, at least, of organic memory. (CE 13)

III. BERGSON ON SPENCER’S EVOLUTIONISM

Bergson opposes his conception of evolution to the Spencerian one, arguing that Spencer’s method consists in reconstructing evolution with fragments of the evolved (CE 232). In short, Bergson’s argument is that Spencer is unable to think genuine evolution since he lacks a principle of genesis and instead supposes that we can posit at the beginning what can only be the result of an actual evolution:
Already, in the field of physics itself, the scientists who are pushing the study of their science furthest incline to believe that we cannot reason about the parts as we reason about the whole; that the same principles are not applicable to the origin and to the end of a progress; that neither creation nor annihilation, for instance, is inadmissible when we are concerned with the constituent corpuscles of the atom. Thereby, they tend to place themselves in the concrete duration, in which alone there is true generation and not only a composition of parts.

(CE 235)

For Bergson, the illusion is generated when we define the evolution of life as a passage from the homogeneous to the heterogeneous. In effect, he is criticizing a specific variety of finalism, what Stephen Jay Gould and Richard C. Lewontin baptized “the Panglossian paradigm” or “adaptationist program”:

We call it the adaptationist programme, or the Panglossian paradigm [which] is rooted in a notion popularized by A. R. Wallace and A. Weismann, (but not, as we shall see, by Darwin) toward the end of the nineteenth century … This programme regards natural selection as so powerful and the constraints upon it so few that direct production of adaptation through its operation becomes the primary cause of nearly all organic form, function, and behavior.”

However, Bergson is not being completely fair to Spencer since the principle of the passage from the homogeneous to the heterogeneous does not, in fact, specify the evolution of life but is to be applied to the physical universe. It is not the simplistic idea Bergson takes it to be, since before the invention of statistical mechanics it was not possible to understand life, or the formation of the solar system in our galaxy, except as a simple growth of entropy or of homogeneity in a closed system. Life needs an open structure to evolve, and this means for Spencer that evolution cannot be a closed system. For example, living organisms, which are made of “crystalloids” and “colloids,” integrate nitrogenous compounds to which, through the absorption of heat, they add more motion. In short, they are not simple monatomic closed gas systems but are open systems. This means that “living aggregates” are not simply to be thought as “associated facts.” By

this process a variety of heterogeneous elements and of heterogeneous functions in the same organism come to be diversely proportioned in diverse places and rendered more complex by evolution.

The details of Spencer’s account of the evolution of life cannot be traced here. Bergson takes issue with it for a specific reason: the concepts that Spencer utilizes to account for evolution in the direction of the heterogeneous, such as integration, equilibrium, and maximization, and which come from the integral calculus, suggest that the process of evolution can be explained and predicted by natural laws (which are not laws of fate). Darwin, it needs to be noted, does not conceive of evolution in these terms. Although he admits the existence of natural laws, and endeavors to come up with a theoretical explanation concerning the origin of new species, he does not connect this explanation with a possible prediction of evolution. Darwin does not accept the idea of an intelligent design, such as an omniscient Creator who could have foreseen every consequence resulting from the laws he imposes.¹⁹ He thus takes issue with the idea that evolution could have been intentionally ordered. Had this been the case, natural selection would not be the law or mechanism by which the Creator achieves his design because natural selection would not have been foreseen at the beginning.²⁰ Of course, Darwin did not hold this position from the start of his intellectual inquiries but came to it gradually as a result of intense and searching reflection. His mature stance is that the good of each being depends on the way by which this good is selected. Moreover, different ways of selection give different meanings to the concept of goodness, so that good and bad, fitting and ill-fitting, are emergent properties. This means that the substrate is not neutral. Rather, it can change in different circumstances.

What, then, as Daniel Dennett puts it, is Darwin’s most dangerous idea? Is it that natural selection acts only through and for the good of each being, or for the good of a species, but without any intention? If so, we can then conclude, as does Dennett, that natural selection acts as a mindless and mechanical meta-engine that modifies biological engines, which in turn generate the growth in complexity and adaptability.²¹ Dennett advances his idea of the accumulation

²⁰. Ibid., 428.
²¹. Dennett writes: “Here, then, is Darwin’s dangerous idea: the algorithmic level is the level that best accounts for the speed of the antelope, the wing of the eagle, the shape of the orchid, the diversity of species, and all the other occasions for wonder in the world of nature. … No matter how impressive the products of an algorithm, the underlying process always consists of nothing but a set of individually mindless steps succeeding each other without the help of any intelligent supervision; they are ‘automatic’ by definition: the workings of an automaton” (Darwin’s Dangerous Idea: Evolution and the Meanings of Life [London: Allen Lane, 1995], 59). According to Dennett, the key lesson to be learned from Darwin’s revolution is this: Paley
of design based on a mindless algorithm in contraposition to the conception of
a creative order that produces novelty from nothing that he attributes to Gould.
In Dennett’s view, natural selection is a crane and not a skyhook, and this means
that natural selection is just a functional property that is not directly connected
with its material structure. Like different clocks that can all keep good time,
natural selection can be realized by different natural substrates. This is the argu-
ment of “substrate neutrality.”

However, one of Bergson’s main arguments is that time is acting in biology
and so we need to pay attention to what natural selection is doing in each specific
set of circumstances: evolution is never ready-made but always making itself.
The Darwinian tree of evolution is full of singularities; it does not lead to a
state in which all possible events are equiprobable. New “possibles” for life are
invented. To conceive this, we need only think about genes that are not eternally
conserved but can be modified; or let us think about how the world of RNA has
been changed in the world of DNA. Bergson’s insight into “creative evolution,”
then, is that constraints in biology do not have the same meaning they have in
classical physics because they are flexible.

The reduction of real complexity to mathematical computation is one that
Bergson locates in both nineteenth-century physics and biology. He quotes
the following passage from Emil Du Bois-Reymond’s Über die Grenzen des
Naturerkennens of 1892:

We can imagine the knowledge of nature arrived at a point where
the universal process of the world might be represented by a single
mathematical formula, by one immense system of differential equa-
tions, from which could be deduced, for each moment, the position,
direction, and velocity of every atom of the world. (CE 25)

Life cannot be understood simply in terms of a mechanical realization of
preexisting goals or problems. Rather, the problems of life are general ones,
evolving within a virtual field that is responded to in terms of specific solu-
tions.22 Bergson’s main argument, then, is that to adequately conceive of life we

---

22. An example to illustrate this would be cases of convergent evolution, such as the eye, repre-
senting solutions to general problems that are common to different phylogenetic lineages, in
this case that of light and the tendency “to see,” or vision, and which involve a heterogeneity
in the mechanisms actually involved.

was right in holding Design to be not only a wonderful thing but also to involve intelligence.
Darwin’s contribution was to show that this intelligence could be broken up into “bits so tiny
and stupid that they didn’t count as intelligence at all, and then distributed through space and
time in a gigantic, connected network of algorithmic process” (ibid., 133).
need to appeal to a duration in which novelty is constantly springing forth and in which evolution is genuinely creative.

IV. ON THE SIGNIFICANCE OF EVOLUTION

At the end of chapter three of *Creative Evolution*, Bergson turns his attention to a consideration of the question of the “significance” (*signification*) of evolution, and the way in which this is revealed in “man.” This should not be taken to reintroduce teleology or anthropomorphism into evolution, for Bergson states that it is in a “quite special sense that man is the ‘term’ and ‘end’ of evolution.” How, then, is this “special sense” to be understood? He is not, of course, claiming that the phenomenon of human consciousness mysteriously lies at the very beginning of the evolution of life as some kind of concealed destiny. His point is that the key characteristics of consciousness – indetermination, hesitation, delay, the quantity of choice with respect to a field of action, and so on – are also tendencies or potentialities of life itself (life as a current of “creative” energy). It is in this specific sense that Bergson argues that consciousness – and what he calls “supra-consciousness” (*supraconscience*) – lie at the very origin of life. This expanded notion of consciousness means before all else an “exigency of creation” that can become manifest to itself only where creation is possible: “It lies dormant when life is condemned to automatism; it wakens as soon as the possibility of a choice is restored” (CE 261). Bergson is not suggesting that the evolution of life miraculously transcends the domain of contingency and accident in order for consciousness to realize itself. Evolution remains contingent in every aspect, and Bergson is not reintroducing teleology when he locates man as the “end” of evolution. Rather, he maintains that with the human being the “life” of consciousness reaches, at least potentially, its highest state of emancipation from the restrictions imposed on it by matter. He accepts that “there has not, properly speaking, been any project or plan” (CE 265), and that the evolution of life “takes directions without aiming at ends” (CE 102). Indeed, it is a crucial aspect of his conception of a creative evolution, be it a question of a work of nature or a work of art, that forms are created without an end in view, and Bergson works out his account of the significance of man in the context of a treatment of the part played by contingency in evolution, which he takes to be enormous and extends as far as life assuming a carbonic form and being developed and concentrated in organisms.

In his book *Wonderful Life*, Gould suggests that the fossils of the Burgess Shale challenge the traditional frameworks of progress and predictability for interpreting evolutionary history, revealing instead that the nature of that history is essentially contingent. The reason these fossils demand a new explanatory
framework is because they show that the diversity of life during the “Cambrian explosion” – the earliest known proliferation of multicellular organisms – was much greater than it is today. Today, there are thought to be twenty to thirty different phyla (basic anatomical designs) within the animal kingdom. What the Burgess fossils reveal is that at the very origin of the animal kingdom there were at least fifteen to twenty additional phyla. On the basis of this evidence, Gould rejects what he calls “the ladder of progress” and “the cone of increasing diversity” as models of evolutionary change and develops a new explanatory framework in which diversification (of species) follows only from a prior decimation (of phyla). He states that it was a lottery as to which phyla survived and does not shy away from the implications this has for our understanding of ourselves as human beings and our place in evolution:

Invariant laws of nature impact on the general forms and functions of organisms; they set the channels in which organic life must evolve. … But the physical channels do not specify arthropods, annelids, mollusks and vertebrates, but, at most, bilaterally symmetrical organisms based on repeated parts. The boundaries of the channels retreat even further into the distance when we ask the essential questions about our own origin: Why did mammals evolve among vertebrates? Why did primates take to the trees? Why did the tiny twig that produced Homo sapiens arise and survive in Africa? When we set our focus upon the level of detail that regulates most common questions about the history of life, contingency dominates and the predictability of general form recedes to an irrelevant background.

Gould’s account of the decimation of phyla, among which humanity’s distant ancestors must have survived, coupled with the contingency of our subsequent

23. More specifically, the number of phyla, or basic anatomical designs, was much greater during the Cambrian explosion, while today there are thought to be a greater number of species based on fewer phyla. See Stephen Jay Gould, Wonderful Life: The Burgess Shale and the Nature of History (London: Century Hutchinson, 1989), 98–100.

24. Bergson himself explicitly rejected the ladder of progress and the cone of diversity as images of evolutionary development in Creative Evolution: “the impression derived [from the study of organisms] is not always that of an increasing complexity … Nor does it suggest the idea of steps up a ladder” (CE 110).

25. As Gould says, “We do not know for sure that the Burgess decimation was a lottery, but we have no evidence that the winners enjoyed adaptive superiority,” nor is there evidence that the survivors could have been predicted on the basis of any prior characteristic: “twentieth-century paleontology portrays the Burgess losers as adequately specialized and eminently capable” (Wonderful Life, 239, emphasis added).

26. Ibid., 289–90.
evolution, leads him to take seriously the contingency of the human mind itself: “wind back the tape of life to the early days of the Burgess Shale; let it play again from an identical starting point, and the chance becomes vanishingly small that anything like human intelligence would grace the replay.” Gould does not develop a positive account of the alternatives except to infer rightly from the extinct members among the Burgess fossils that they would be forms of life radically different from the vertebrates, mollusks, arthropods, and so on that are familiar to us today.

How is it, then, that if Bergson acknowledges the tremendous role played by contingency and accidents in evolution, which make it entirely conceivable that we could have evolved in ways that would make us physically and morally different from what, in fact, we are, he can also claim that man is the highest achievement of life, and as such reveals its nature most clearly? The brilliance of Bergson’s account of the significance of the human is that from a comprehensive analysis of the variety of contingent evolutionary forms, he is able to discern certain functions that he sees as universal, and the expression of which is what marks out man as the most significant of its products. Hence, the empirical details of evolution constitute the factual basis not only for an understanding of the actual form of the human, but also for any speculation regarding its evolutionary significance.

Whereas it is the examination (in paleontology and comparative anatomy) of material forms that revealed contingency, it is the examination of organisms in terms of their function, and specifically their relation to energy, that allows Bergson to attribute significance to the human in particular. As Bergson says, “life as a whole, whether we envisage it at the start or at the end of its evolution, is a double labor of slow accumulation and sudden discharge” of energy. It is along these lines that Bergson distinguishes plant and animal life, which “develop two tendencies which at first were fused in one” (CE 76). The accumulation and release of energy “at first completed each other so well that they coalesced,” but in the history of evolution we see that “the animal evolved … toward a freer and freer expenditure of discontinuous energy” while “the plant perfected rather its system of accumulation” (ibid.). Their tendency to emphasize different aspects of energy flow leads to the development of different modes of feeding, of movement, and ultimately of consciousness in the plant and the animal. However, his characterization of the evolution of animal life in terms of an increasing ability to use energy leads Bergson into a direct confrontation with the second law of thermodynamics, which states that all energy tends to degrade into heat, which is distributed throughout matter in a uniform manner. Bergson considers this to be “the most metaphysical of the laws of physics” because it attempts to
describe the very direction of existence (CE 156). While it may apply within a closed material system – which Bergson describes as “a thing unmaking itself” (CE 157) – it does not apply to life, in which we find an effort to remount the incline that matter descends and that in its creative passage through matter is “a reality which is making itself in a reality which is unmaking itself” (CE 159).28

Is Bergson here, for once, in direct contradiction to empirical evidence? His is an extreme claim, and demands some kind of support. This can be provided, however, by Mae-Wan Ho, one of the few biologists to adopt Bergson’s work as a valid resource within science. In The Rainbow and the Worm, Ho develops an account of living systems in terms of nonequilibrium thermodynamics. Like Bergson, she claims that living organisms are “irreconcilable with the statistical nature of the laws of thermodynamics,” hence those laws cannot be applied to life without some reformulation, which Ho develops under the name “a thermodynamics of organized complexity.”29 The difference for Ho is this: whereas in material systems, energy tends toward undifferentiated distribution or “equilibrium” as stated by the second law of thermodynamics, living systems are highly differentiated as a consequence of the way “energy flow organizes and structures the system in such a way as to reinforce the energy flow.”30 For this to work, an organism’s ability to store energy is key. Hence, in Ho’s definition, an organism is a coherent structure maintained far from thermodynamic equilibrium by the ability to store energy, and then release it in a way that magnifies its effect well beyond any potential it would have had in a purely material context. Bergson’s description of animal life as a counter-entropic movement can be refined, through Ho’s work, into an account of life as a local magnification of potential energy resulting through the differentiation of storage and release.

The excess of energy that the animal has at its disposal is, then, the condition for the development of human freedom as much as the brain itself. That is to say, human consciousness is not to be explained with reference only to its material conditions, but also to the contingent conditions of its evolutionary history. Gould too has noted this: “We shall then finally understand that the answer to such questions as ‘Why can humans reason?’ lies as much (and as deeply) in the quirky pathways of contingent history as in the physiology of neurons.”31

Hence Bergson is not being materialistic, or providing an emergent account of the mind when he argues, for example, that the difference between animal consciousness and human consciousness lies in the number and range of motor

---

28. For Bergson’s discussion of Boltzmann’s interpretation of the second law of thermodynamics, see CE 157.
30. Ibid.
mechanisms that have been set up in the human brain, which serve to give an almost unlimited field of choice in their release. Thus, from the fact that the brains of human and ape are alike, “we cannot conclude that consciousnesses are comparable or commensurable” (CE 263), because from the limited to the unlimited there is all the distance between the closed and the open (in fact, what we have here is a difference of kind and not merely degree). Unlike the case of the animal, the powers of invention within the human are not simply variations on the theme of routine. Rather, we have a machine that has the potential to triumph over mechanism and closure. The human is not a captive of the mechanisms its brain has set up. It is as a complex, open machine, therefore, that the human can be said to be the “interesting” animal. Bergson then duly notes the importance of the role played by language, social life, and technics in the creation of this “exceptional life” of the human animal (elsewhere Bergson calls man “the sporting animal” and conceives the brain as an organ of sport).32

The complication of the brain, for Bergson, is an effect of evolutionary freedom as much as a condition of human freedom. The development of the brain itself is contingent on the excess of energy that allows the development of free action along the animal line of evolution. The brain is not an originary material base that allows consciousness to emerge. Rather, it is material so organized by evolutionary “consciousness”33 as to allow it to re-emerge in the human:

Things have happened just as though an immense current of consciousness, interpenetrated with potentialities of every kind, had traversed matter to draw it towards organization and make it, notwithstanding that it is necessity itself, an instrument of freedom. But consciousness has had a narrow escape from being itself ensnared. Matter, enfolding it, bends it to its own automatism, lulls it to sleep in its own unconsciousness. … So, from the highest rung of the ladder of life, freedom is riveted in a chain which at most it succeeds in stretching. With man alone a sudden bound is made; the chain is broken.34

The human form, then, is not prefigured in the evolutionary movement and cannot be said to be the outcome of the whole of evolution since this has been accomplished on several divergent lines, and the human species is simply at the

33. Again, this is not to anthropomorphize evolution: consciousness here means freedom, contingency, creation, and so on.
end of one of them: “[man] does not draw along with him all that life carries in itself” (CE 266). Nevertheless, for Bergson man is more significant than the species that occupy the other lines of vegetable and animal evolution because he is the being in whom the vital movement of life reaches its highest expression, and hence the being in whose freedom the creative nature of evolution is made most evident. This point is worth stressing so that Bergson is not misheard when he advances these kinds of insights. There is nothing anthropomorphic in Bergson’s claim that man reveals the significance of evolution, primarily because it is not the specific form of man but his function as a free and creative being that constitutes his significance. It is as if “a vague and formless being” (un être indécis et flou) – call it, Bergson says, man or superman – had sought to realize itself but could succeed in this effort only by abandoning parts of itself in the process (such losses are represented by the animal and vegetable worlds and what is positive in them).

In subsequent essays and texts, Bergson does think outside the restrictions he himself had placed on speculation in Creative Evolution, speaking of the appearance of the human – “or of some being of the same essence” – as the “raison d’être of life on our planet.” However, we should not suppose that the metaphysician in Bergson has simply got the better of him and now overrides the stress he had previously placed on the empirical study of evolution. He still maintains that “experience is the only source of knowledge,” and he seeks to develop his insights on the basis of a synthesis of an intellectual cognition of facts and the accumulation of probabilities. With the word “experience” Bergson means something rich and varied, but the objects of experience we refer to must be ones that can become objects of scientific inquiry and research. Bergson’s thinking of life and of creative evolution culminates in a conception of “creative emotion” and the claim that philosophical certainty, which admits of degrees, requires the extension of intuition – supported by science – by “mystical intuition.” He ends his final book, The Two Sources of Morality and Religion (1932), by describing the universe as a machine for the production of gods and declaring that the task now facing human beings is whether they wish to go on living or not. In order to address the tremendous social, political, and international problems of the planet, we need to refine the “spirit of invention” that to date has been cultivated largely on the basis of mechanism. It is not more and more reserves of potential physico-chemical energy that need releasing but those of a moral energy: “the body, now larger, calls for a bigger soul” and “mechanism should mean mysticism.”

37. Ibid., 310.
It is perhaps this kind of reflection on the meaning of evolution that has generated some of the more far-out speculations we encounter in work on evolution in the twentieth century, such as the writings of Pierre Teilhard de Chardin (1881–1955), as well as in positions advanced in our own time that propose that we are currently witnessing on earth a takeover of mindless Darwinian evolution by controlled and self-directed evolution. De Chardin, a priest and paleontologist, claimed to have been inspired in part by Bergson’s *Creative Evolution* as well as by Nietzsche’s conception of the superhuman. What concerns him most is not that there is evolution, a fact he considers indisputable, but whether evolution is directed or not. In *The Phenomenon of Man*, he holds that evolution does have a precise orientation as well as a privileged axis, and he thinks that he can show this while “leaving aside all anthropocentrism and anthropomorphism.” In his attempt to establish his case, he resurrects almost all the notions that Darwin’s revolution had cast into intellectual oblivion: “The impetus of the world, glimpsed in the great drive of consciousness, can only have its ultimate source in some inner principle, which alone could explain its irreversible advance towards higher psychisms.” In short, for de Chardin the meaning of evolution comes from it having a definite direction and this is a psychic one centered on man or, rather, consciousness and the fact that the story of life on earth is to be understood as the spreading of “spirit” around it. The future of evolution for de Chardin consists in the attainment of what he calls “super-life,” which is a “superior form of existence” beyond mere survival and an opening “onto limitless psychic spaces” in the universe. He explicitly uses the word “superhuman” to depict this future and speaks of it in terms of a “spiritual renovation of the earth.” In an attempt to add intellectual substance to his ill-defined concerns, de Chardin comes up with an armory of strange new terms,

38. In a statement that takes one’s breath away on account of its reckless personification of evolution, Kevin Kelly writes: “My larger point is that the advantages of Lamarckian evolution are so great that nature has found ways to make it happen,” and adds, “Evolution daily scrutinizes the world not just to find fitter organisms but to find ways to increase its own ability. … Evolution searches the surface of the planet to find ways to speed itself up … not because it is anthropomorphic, but because the speeding up of adaptation is the runaway circuit it rides on. … What evolution eventually found in the human brain was the complexity needed to peer ahead in anticipation and direct evolution’s course” (*Out of Control: The New Biology of Machines* [London: Fourth Estate, 1995], 361). He goes on: “What evolution really wants – that is, where it is headed – is to uncover (or create) a mechanism that will most quickly uncover (or create) possible forms, things, ideas, processes in the universe” (ibid., 363).

such as the noosphere and the Omega Point, and together they are meant to support his claim that evolution can be interpreted as the story of the ascent of consciousness and spirit that culminates in an era of “hyper-personalization” – or, one might say, Hegel meets biology and evolution: “There can be no doubt about it,” he claims after stating that modern totalitarianism is the distorted truth of something magnificent, “the great human machine is designed to work and must work – by producing a super-abundance of mind.”

De Chardin’s appreciation lacks the subtlety of Bergson’s speculations about the significance of evolution and the possible “meaning” within it of the appearance of the human. Moreover, he fundamentally distorts the sense of Nietzsche’s “superhuman” figure. For Nietzsche, of course, the emphasis is to be placed on the body, not on consciousness or spirit, and he was keen to separate his idea from association with evolutionary thought, insisting that the question to be posed was not what should now replace or succeed humanity in the order of being, but rather what kind or type of human should now be willed and bred as having greater value and being more certain of a future.

V. DELLEUZE AND BERSONISM

The influence of Bergson on Deleuze cannot be overestimated. Indeed, Alain Badiou calls Bergson Deleuze’s “real master, far more than Spinoza, or perhaps even Nietzsche.” He further insightfully notes that it was Deleuze’s immense

43. By “noosphere,” de Chardin means a new era in evolution centered on the emergence of the “thinking layer” or the “soul” of the Earth and achieved through hominization: “outside and above the biosphere there is the noosphere” (ibid., 202). The “Omega Point” names the centered point around which the noosphere revolves, namely, consciousness as “hyper-personalization”: “Because it contains and engenders consciousness, space-time is necessarily of a convergent nature. Accordingly its enormous layers, followed in the right direction, must somewhere ahead become involuted to a point which we might call Omega, which fuses and consumes them integrally in itself” (ibid., 285). In short, de Chardin is claiming that the more the “sphere” of the world expands and grows in consciousness, the richer and deeper it becomes and is concentrated at a point that allows us to speak of “the volume of being.”

44. Ibid., 284–5.

45. Ibid., 82.

46. In a note of 1883–84, Nietzsche writes: “we are in the phase of the modesty of consciousness … Put briefly: perhaps the entire evolution of the spirit is a question of the body … The organic is rising to yet higher levels. Our lust for knowledge of nature is a means through which the body desires to perfect itself … In the long run, it is not a question of man at all: he is to be overcome” (Nietzsche, The Will to Power, §676).

merit to have “modernized the Bergsonian filiation.” He did this by extricating Bergson from what he had laid himself open to:

a recuperation of the injunctions of the Open [an important category in Bergson’s The Two Sources of Morality and Religion] by Christian spiritualism and an adjustment of his cosmic vision to a certain global teleology of which Father Teilhard de Chardin was for a time the herald.49

According to Badiou, then, Deleuze’s appropriation of Bergson is of great significance since it “secularizes” him and in so doing connects his concepts “to the creations at the forefront of our time.”50

Deleuze identifies a number of philosophical innovations in Bergson’s project and he accords a special importance to the accomplishment of Creative Evolution, locating in it the seeds of a new thinking of difference and the prospect of thinking beyond the human condition (beyond, that is, our spatialized habits of representation). There are a number of places in his writings where Bergson explicitly approaches philosophy as the discipline that “raises us above the human condition” (la philosophie nous aura élevés au-dessus de la condition humaine) and makes the effort to “surpass” (dépasser) the human condition.51 In Creative Evolution, Bergson conceives philosophy as “an effort to dissolve again into the Whole.” Moreover: “Intelligence reabsorbed into its principle, may thus live back again in its genesis” (CE 123). Such a method of thinking has to work against the most inveterate habits of the mind and consists in an interchange of insights that correct and add to each other. For Bergson, as Deleuze notes, such an enterprise ends by expanding the humanity within us and so allows humanity to surpass itself by reinserting itself in the Whole.52 This is accomplished through philosophy, for it is philosophy that provides us with the means (methods) for reversing the normal directions of the mind (instrumental, utilitarian), so upsetting its habits. Deleuze stresses that for Bergson this makes philosophy’s task a modest one. If we suppose that philosophy is an affair of perception, then it cannot simply be a matter of correcting perception but only of extending it. There is nothing at fault with the human condition, and its fundamental errors and habits do not require correction. Rather, the task is to extend the human present, which is the aspect of time in which the human necessarily dwells, a necessity to be explained through the dictates of evolution.

49. Ibid., 99.
50. Ibid.
such as adaptation: “The human condition is the maximum of duration concentrated in the present, but there is no co-exclusivity to being, that is to say that there is not only the present.”

For Deleuze, Bergson’s philosophy contains a new thinking of difference: “The notion of difference must throw a certain light on Bergson’s philosophy, but inversely Bergsonism must bring the greatest contribution to a philosophy of difference.” It is a quasi-phenomenological venture since the aim, Deleuze declares, is to “return” to things themselves. The promise, if this is got right, is nothing less than one of difference delivering Being to us. A careful consideration of the differences of nature will lead us to the nature of difference. Hitherto, thinking has confused two kinds of difference and covered one with the other: differences of degree over differences of kind or nature. The task of philosophy is to grasp the thing itself in its positivity, and this requires a notion of internal difference. Deleuze fully appreciates that a certain strand of modern philosophy finds such a notion of difference to be absurd. In the Hegelian schema of difference, a thing differs from itself only because it differs in the first place from all that it is not. Difference is, therefore, said to be constituted at the point of contradiction and negation. The novel modernity of Bergsonism lies, for Deleuze, in its critique of metaphysics and of a science that has forgotten the durational character of life and imposed on it an abstract mechanics. It rests on a schema that homogenizes difference by selecting only differences of degree through a spatialized representation of the real. General ideas simply present for our reflection completely different givens that get collected in utilitarian groupings. The task for Deleuze is one of breaking out of a merely “external state of reflection,” so that philosophy no longer has a merely negative and generic relation with things in which it remains entirely in the element of generality.

For Deleuze the ultimate aim is to reconnect human thought and existence to, as he puts it, the “universal consciousness” of the Whole (le Tout). If Nietzsche’s philosophy rests on an inversion of Platonism and a parody of metaphysics, the Bergsonian has found a different path, one that is able to articulate a philosophy of becoming that enables us to reverse the normal directions of thinking and its spatial habits. As Deleuze points out, for Bergson metaphysics begins not with Plato but with Zeno.

55. “Metaphysics dates from the day when Zeno of Elea pointed out the inherent contradictions of movement and change, as our intellect represents them” (Bergson, The Creative Mind, 17); and, “Metaphysics … was born of the arguments of Zeno of Elea on the subject of change and movement. It was Zeno who, by drawing attention to the absurdity of what he called
for philosophy. In his 1960 lecture course on *Creative Evolution*, Deleuze indicates precisely where Bergson’s importance lies, namely in the effort to radicalize the post-Kantian project commenced by Solomon Maimon and J. G. Fichte: the need to pass from a transcendental philosophy to a genetic one. Exposing the “myth of the given” has, of course, been a preoccupation of much of twentieth-century philosophy and with respect to both analytical and continental sources of thought. Deleuze focuses attention in large measure on the nature of Bergson’s singular contribution to this project. Neither the intellect nor matter can be taken as given (today the polarity is cashed out as one of “mind” and “world’); rather, there is a need for a double genesis. It is this conception of genesis that constitutes such an essential aspect of the Bergsonian revolution. If successful, it means that we will be able to enter into the Whole, or what Deleuze calls the universal consciousness of life. Deleuze stresses that the Whole enjoys neither interiority nor totality; individuated forms of life have a tendency toward closure but this is never accomplished on account of life. As Bergson puts in *Creative Evolution*, “finality is external or it is nothing at all” (CE 27). That the Whole is not given should fill us with delight since it is only our habitual confusion of time with space, and the assimilation of time into space, that makes us think the Whole is given, if only in the eyes of God.

Informing Deleuze’s Bergsonism is a philosophical critique of the order of need, action, and society that predetermines us to retain a relationship with things only to the extent that they satisfy our interest, and of the order of general ideas that prevent us from acquiring a superior human nature. This “ethical” impulse of Bergsonism has been taken up, as we shall now see, within contemporary biology.

VI. “CREATIVE EVOLUTION” TODAY: BERGSON AND CONTEMPORARY BIOLOGY

A major innovation of Bergson’s work on biology is the shift away from a focus on parts and toward the view that it is the whole that is important. This is not...
to say that the analytic study of the parts of organisms, or of organisms as parts
of evolution, is unimportant to Bergson, but that such research must itself take
its direction from the whole context within which the parts find their sense.
In Creative Evolution this move is evident in Bergson's definition of life as a
whole that splits up into parts through dissociation rather than a whole that is
constructed through the association of parts. This has several consequences:
first of all, it rules out mechanism as a complete account of life because the focus
on ultimate parts means it cannot think life except as constructed from matter;
and second, it rules out vitalism as an account of life because the focus on an
immortal life-force means it cannot think its relation to matter except as a
mysterious kind of animation. We might say, then, that while mechanism lacks
an adequate philosophy of life as a whole, vitalism lacks an adequate physics of
particular living organisms.

In Creative Evolution, Bergson presents a third way of approaching the
problem that avoids the dogmatic stand-off between mechanism and vitalism
by providing an account of life in expanded material terms: as dissociation, as
the freeing up of energy, as an unpredictable and ultimately creative evolution.
Bergson eschews dogmatic theorizing and retains of mechanism and vitalism
only what is based on experience: from mechanism, this is the analytic study of
organisms (the forms of which now are understood as contingent rather than
determined), and from vitalism, the idea of life (which is now understood as
immanent rather than transcendent to the forms of organisms). In Creative
Evolution, Bergson was working with an expanded understanding of matter that
was not widely recognized at the time, and this, as well as his choice of the term
élan vital, led to him being broadly categorized as a vitalist. Today, however,
there are no longer the same mechanistic limitations on our understanding of
matter, and Bergson's dynamic account finds corroboration in many areas of
contemporary biology (although we can still, of course, find the same dogmatic
mechanism that Bergson opposed). What we can also find is that in place of
vitalism (which is now largely consigned to history) are a number of models for
thinking life as an open, dynamic system and for thinking through the implica-
tions of this for scientific practice itself.

How, then, do we locate Creative Evolution in the context of biology today?
We do not want to limit our treatment of Creative Evolution to its reinstate-
ment in a revisionist history of biology that, in the light of recent alternatives,
would seek to expand the story of twentieth-century biology beyond that of the
development of a mechanistic science leading from neo-Darwinism to modern
genetics, but nor can we claim that Creative Evolution was a canonical text for
the development of those alternatives. More than anything, it is the failure of
the human genome project to “explain” life in mechanical terms (its greatest
discovery was that there are not enough genes to do this, hence raising new
questions rather than answering old ones) that necessitated a change of approach from determinism to a consideration of nonlinear causality, feedback mechanisms, and context-dependent behavior. What *Creative Evolution* can offer is a model for thinking through these kinds of problems in biology, and, what is more, a model that relates these problems in biological research practices both to a more general epistemology (an engagement with which runs through all Bergson's work, and *Creative Evolution* in particular) and to their broader social and historical context (something that Bergson develops in *The Two Sources of Morality and Religion*, particularly in its fourth and final chapter).

Biologist Steven Rose has stated the need for resources exactly like this in the preface to *Lifelines*, where he describes how his attempt to establish a perspective on biology that transcends genetic reductionism made it necessary to “draw upon those powerful alternative traditions in biology which have refused to be swept along by the ultra-Darwinist tide into accepting that living processes can be reduced to mere assemblages of molecules driven by the selfish urges of the genes to make copies of themselves.” For Rose, Bergson (along with Georges Cuvier, Etienne Geoffroy Saint-Hilaire, and Hans Dreisch) is part of “an alternative, almost underground nonreductionist tradition in biology [whose] voices were and still are drowned out by an almost universal reductionist consensus which insists that, whatever the theoretical critique, reductionism works.” And we should note here that Dreisch, Bergson, and others are no longer described as vitalists but as “nonreductionists,” signifying an important shift in the intellectual landscape: we no longer have vitalism as a metaphysical hypothesis opposed to “scientific” mechanism, but nonreductionism as a valid position within science that is opposed to what is now recognized as the metaphysical hypothesis of reductionism.

59. “The lesson that has emerged with blinding clarity from the whole genome project is the error of regarding an organism as a kind of supermolecular machine whose parts are written in the genetic code” (Brian Goodwin, *Nature’s Due: Healing Our Fragmented Culture* [Edinburgh: Floris Books, 2007], 89). “No amount of information on genes and protein interactions will ever add up to the complex, entangled whole that is the organism” (Mae-Wan Ho, “Human Genome: The Biggest Sell-Out in Human History,” International Society for Science in Society report (2000). www.i-sis.org.uk/humangenome.php [accessed January 2010]).

62. Indeed, in *Creative Evolution* Bergson had described the mechanistic treatment of life according to mathematical principles as “a certain new scholasticism that has grown up during the latter half of the nineteenth century around the physics of Galileo” (CE 236; cf. 13). Brian Goodwin also suggests that the modern science for which Galileo, Bacon, and Descartes laid the groundwork has now reached its limit as our primary way of knowing and relating to the world (*Nature’s Due*, 11).
The reductionistic or mechanistic focus on parts that Bergson criticized in neo-Darwinism is today most clearly evident in genetics, and is subjected to a similar criticism by a number of biologists. For example, Brian Goodwin writes:

Organisms have been replaced by genes and their products as the basic elements of biological reality. … There is no lack of highly persuasive books whose objective is to demonstrate why organisms are not what they seem to be – integrated entities with lives and natures of their own – but complex molecular machines controlled by the genes carried within them. … It is the absence of any theory of organisms as distinctive entities in their own right, with a characteristic type of dynamic order and organization, that has resulted in their disappearance from the basic conceptual structure of modern biology.63

For Goodwin, evolution is not the realization of a genetic program, but a dynamic process of emergent order (morphogenesis) “in which genes play a significant but limited role.”64 It is an approach that, like Bergson’s, reintegrates the quantifiable facts of scientific analysis in a broader appreciation of the qualitative process that is their true context. As Goodwin expresses it:

in an extended view of the living process, the focus shifts from inheritance and natural selection to creative emergence as the central quality of the evolutionary process. … Inheritance and natural selection continue to play significant roles in this expanded biology, but they become parts of a more comprehensive dynamical theory of life which is focused on the dynamics of emergent processes.65

63. Brian Goodwin, *How the Leopard Changed its Spots: The Evolution of Complexity* (London: Phoenix, 1994), ix–x. It is worth noting here that while Goodwin’s statement might call to mind Richard Dawkins’s *Selfish Gene*, Dawkins cannot straightforwardly be assimilated to a reductionist position. True, organisms are vehicles for the survival of atomistic genes in Dawkins’s work, but only in the sense that it is the genes, and not the whole organism, that are the true subject of natural selection. In other respects, the organism is an “integrated and coherent” unit in which “genes may interact and even blend” in their effects on the organism. Dawkins’s point as regards selection is that “they do not blend when it comes to being passed on to future generations” (*The Extended Phenotype* [Oxford: Oxford University Press, 1982], 114). While the reduction of inheritance to the passing on of genes is itself highly questionable, Dawkins does not reduce properties of organisms to the action of their genes, remaining sensitive to the environmental and social factors that affect gene expression.

Denis Noble is another biologist whose work foregrounds the necessity of placing genes in their wider context. Whereas Goodwin uses a language of emergence derived from complexity theory, Noble develops what he calls “systems biology” as an alternative to the view that the instructions for the development of an organism lie in its genes: “there is no such program and there is no privileged level of causality in biological systems.” Noble denies any metaphors that would attribute causal agency exclusively to genes, as if they “control,” “determine,” “code for,” or “contain” organic events in advance of their realization:

From the systems biology viewpoint the genome is not understandable as “the book of life” until it is “read” through its “translation” into physiological function. My contention is that this functionality does not reside at the level of genes. It can’t because, strictly speaking, the genes are “blind” to what they do, as indeed are proteins and higher structures such as cells, tissues and organs.

There is a complex interaction between genes and their environment – both the cellular environment and the wider environment of the organisms in which they exist. The organisms in turn have a relationship with their environment, and this also will have an impact on gene expression.

Moreover, this environment crucially determines which genes are expressed and to what degree. The passage of information is not simply one way, from genes to function. There is two-way interaction.

However, despite the theoretical sophistication of the nonreductionist thinking of life, the shift toward this perspective within biology remains a mere stirring when compared to the landslide that its interpretive success might lead us to expect. To understand why this is the case, let us highlight another

67. Ibid., 34.
68. Ibid., 33. Here and in the next extract, Noble is specifically referring to the cellular environment, although, in his view, what he says is also true of wider environments.
69. Ibid., 35.
70. Both Goodwin and Noble, for example, have demonstrated the value of emergence and nonlinear causality as strategies for understanding the heart organ. See Goodwin, Nature’s Due, ch. 2, in which he also discusses cancer as an emergent property of cells, and Noble, The Music of Life, ch. 5.
important point in the passage we cited from Rose: *whatever the theoretical critique, reductionism works.*

Who cares if the behavior of a gene is context dependent if we can isolate that context and show that within it the gene behaves in a predictable way? Or if we can isolate the aspects of a gene that are independent of a particular context and on this basis predict how it will behave when transplanted to a different one? Who cares about context dependence *in principle* when we can ignore it *in fact*? Well, philosophers such as Bergson do, and biologists such as Rose, Goodwin, Ho, and Noble do. But why do they? And what practical alternatives do they offer to the genetic technologies we are alluding to? In order to answer this, let us turn Rose’s statement that “reductionism works” into a question, or rather a series of questions: *how does reductionism work, what does it work on, and with what results?*

In their critical assessment of mechanistic practices in science, writers such as Rose, Goodwin, Noble, and Ho raise many of the same points as Bergson, emphasizing the utilitarian bent of the intellect toward fabrication, the historical contingency of scientific methods and principles, and the way mechanistic approaches actualize only a small part of a potentially far richer relationship to nature. However, they also emphasize two key issues that have developed only since Bergson’s time: that research projects today are largely dictated by the requirements of technological and corporate interests, and that scientific practices constitute a significant intervention into natural processes – so much so that they are considered to make a significant contribution to the current environmental crisis. Now, in the terms of the mechanistic hypothesis, the intellectual reduction of nature to its fundamental parts is a process of discovery; but from a critical perspective, such an activity is not one of discovery but of intervention. If nature is a holistic process, then the isolation and manipulation of certain natural processes constitute a fundamental alteration of nature itself.

In *Creative Evolution*, Bergson's account of life as an integral whole was accompanied by an extensive critique of the intellect as that which resolves life into parts, describing it as an instrument of useful action rather than of disinterested speculation. Its main characteristic is the fabrication of instruments from matter, and when it turns to consider life it cannot help but do so from its utilitarian perspective: “it makes us consider every actual form of things, even the form of natural things, as artificial and provisional; it makes our thought efface from the object perceived, even though organized and living, the lines that outwardly mark its inward structure” (CE 101). This ability to regard living form

---

71. The word alternative is not entirely appropriate here; the issue is not about abandoning mechanistic science, but delimiting for it an appropriate field of application and complementing its method with others that may be more appropriate to different areas.
as provisional – to literally see in life only raw material for our use – gives us “an unlimited power of decomposing according to any law and of recomposing into any system” (ibid.). In Creative Evolution, this remains an epistemological point, and Bergson is primarily concerned with accounting for the “bewilderment” of an intellect designed to organize matter “when it turns to the living and is confronted with organization” itself, but the problem today is a different one: the “recompositions” that the intellect organizes are at odds with the “inward structure” or “organization” of organisms or ecosystems, and actually disrupts those systems (CE 104).72

Goodwin has demonstrated very clearly that the presuppositions of genetic reductionism “make it legitimate to shunt genes around from any one species to any other species.”73 If the gene is ultimately the only biological reality, then “species don’t have natures” and “we can manipulate them in any way.”74 Life itself loses all significance in such a view, and nature becomes “a set of parts, commodities that can be shifted around.”75 As Goodwin notes, the rhetoric that goes along with biotechnology is totally at variance with the reality: genes are not stable bits of information, they are defined by context, and if you change the context you change the activity of the gene, leading to unexpected modifications and transgenic transference between species.76 For Goodwin, contemporary genetic technologies mark the highest point of a “science of quantities” that was formally introduced by Galileo and has, during its relatively short history, enabled an exceptional rate of technological development. He suggests that the advancement of scientific knowledge, which now suggests that life is not made up of parts, and the worsening environmental crisis, which results from treating life as if it is made up of parts, both indicate the necessity of a fundamental shift toward what he calls “a science of qualities” that would take into account the properties of living systems as a whole.77 In his most recent work he has argued

72. In The Two Sources of Morality and Religion, Bergson suggests that “the spirit of invention has not always operated in the best interests of humanity” and that we should “allot to the machine its proper place, I mean the place where it can best serve humanity,” although his beef is largely with the social implications of technology, which fosters an artificial need for luxury and widens the gap between capital and labor, rather than with the environmental implications that would be revealed only years later. See Bergson, The Two Sources of Morality and Religion, 305–7.
74. Ibid.

76. Ibid.
that living systems have qualities such as health that are in no sense “secondary” to those usually observed by science. They are properties that pertain to the whole system and cannot be explained in terms of the properties or interaction of its parts.78

In the *Origin of Species* Darwin introduced his new concept of natural selection by using an analogy between variation under domestication and variation under nature. The work of contemporary biologists, no less than that of Bergson, suggests that it is time to move beyond this analogy. The effects of the contemporary techno-scientific “domestication” of nature are so much more powerful than the selective breeding that Darwin considered that they defy comparison (after Bergson, we could say that this is a difference of degree that is so great it amounts to a difference in kind). Rather than suggesting an analogy with nature, the evidence today indicates that “domestication” suggests the opposite: the technological manipulation and control of nature is the most short-sighted and destructive line of action we could have taken, disrupting nature and inhibiting creative evolution. Alongside her laboratory practice, Ho has also developed an extensive critique of mechanism, characterizing it as an adolescent phase in the development of the life sciences and claiming that the application of methods and principles drawn from the mathematical and physical sciences is inadequate to an understanding of life: in order to reach maturity, biology must adopt a more holistic perspective, using an intuitive as well as intellectual approach. She emphasizes a view of life as symbiotic, with humans as participants in a creative – we could say, a healthy – evolution. Such participation cannot be grounded in an intellectual – that is to say, an instrumental – disposition toward nature: a disposition that makes us alienated from nature and from ourselves.79

Life is holistic, and the manipulation of parts has effects on the whole that cannot, in principle, be predicted. Reductionists may well object that, given a complete knowledge of the parts, prediction is possible, but what Bergson originally revealed was that analytic knowledge alone is by definition inadequate, because it reveals not what life is, but only what we can do to it. In this context, a concept such as “conservation” can find a new application, no longer as simply the preservation of life as it is, but rather as the preservation of the dynamism of life so that it can continue to evolve creatively. As the Bergson scholar and environmentalist Pete Gunter has pointed out, Bergson’s focus on the whole of

78. See Goodwin, *Nature’s Due*, ch. 3. Another example of reductionism at work on a larger scale is the industrial farming practice of monoculture: “This monoculture mentality arises directly out of a reductionist science of quantities that looks at species in terms of specific traits that can be maximized to give high yields of particular products” (Goodwin, *How the Leopard Changed its Spots*, 211). The Bergson scholar and environmentalist Pete Gunter also investigates the effects of monocultural farming in North Texas in his book *The Big Thicket*.

79. This is a central theme of Goodwin’s *Nature’s Due*. 

Volume 3
evolution “locates man squarely in nature and stresses man's kinship to all living creatures.” Bergson's model of evolution as the differentiation of a common impetus clearly emphasizes the importance of studying the evolution of ecosystems as well as individual species. The concept of divergent tendencies within a single evolutionary process means that all evolution, in principle, is symbiotic, and places ecology at the very heart of biology.

A biology of organisms that is not complemented by an ecology of the whole context within which they evolve is incapable of supporting an adequate concept of creative participation in life, leaving the scientist unable to comprehend life, able only to make use of it. Farming practices based on genetic technologies such as the annual use of neutered and patented seeds, or based on industrial technologies such as clearcutting and monoculture, effectively abolish the dynamic conditions of a creative evolution. Indeed, when Goodwin describes the way in which “mechanism works,” he uses an analogy with drug addiction: “farmers become enslaved to ‘scientific’ methods of production that are intrinsically unsustainable, and new technological ‘fixes’ are needed to sort out new problems.” We cannot solve the problems that techno-science has created through further interventions. Indeed, this line of thinking has more in common with indigenous knowledge than it does with European epistemology, but it is important to note (as against readings that would suggest Bergson is an “irrationalist” and “anti-science”) that this is not essentially at odds with science – only with the intellectual and industrial appropriation of science. What is required is – in Bergson’s terms as well as those of contemporary biologists – intuition of the self and sympathy with life; only in this way can “humanity … set about simplifying its existence with as much frenzy as it devoted to complicating it.”

Creative Evolution is only now receiving the attention it deserves. More than any other work in the philosophy of life, this text is predominantly understood in light of what came after it. This is not to say merely that we interpret it in retrospect, but that the philosophical community has had a century to acclimatize itself to the scientific worldview that Bergson recognized at its inception. It stands as a lesson in how philosophy can accompany rather than follow science, and how both disciplines gain from this partnership. Dynamic theories of biology and evolution can operate only through the recognition of the temporal character of living systems, ecological theories can operate only through the recognition of sympathy between organisms, and both these approaches were developed by Bergson at a time when biological science on the

whole operated by treating organisms as raw material. Our thinking of life today is moving away from control and toward participation, away from exploitation and toward sustainability, and only now is scientific thought embarking on the path that Bergson pointed out a century ago, a path that he had seen indicated in the evolutionary biology of the late nineteenth and early twentieth centuries. Bergson's visionary ideas are not of course the only resource for this project, but they surely merit being placed at the center of any serious philosophical response to questions of life and evolution.

83. Mention should be made of Uexküll's Umwelt research, which sought to show the extent to which the "environment" is structured and mediated by the specific Umwelt of the organism and which has been taken up by continental philosophers such as Heidegger (The Fundamental Concepts of Metaphysics), Merleau-Ponty (In Praise of Philosophy and Other Essays), and Deleuze & Guattari (A Thousand Plateaus).

Bibliography 287
Index 305
“Continental philosophy” is itself a contested concept. For some, it is understood to be any philosophy after 1780 originating on the European continent (Germany, France, Italy, etc.). Such an understanding would make Georg von Wright or Rudolf Carnap – respectively, a Finnish-born philosopher of language and a German-born logician who taught for many years in the US – a “continental philosopher,” an interpretation neither they nor their followers would easily accept. For others, “continental philosophy” refers to a style of philosophizing, one more attentive to the world of experience and less focused on a rigorous analysis of concepts or linguistic usage. In this and the accompanying seven volumes in this series, “continental philosophy” will be understood historically as a tradition that has its roots in several different ways of approaching and responding to Immanuel Kant's critical philosophy, a tradition that takes its definitive form at the beginning of the twentieth century as the phenomenological tradition, with its modern roots in the work of Edmund Husserl. As such, continental philosophy emerges as a tradition distinct from the tradition that has identified itself as “analytic” or “Anglo-American,” and that locates its own origins in the logical analyses and philosophy of language of Gottlob Frege. Whether or not there is in fact a sharp divergence between the work of Husserl and Frege is itself a contested question, but what cannot be contested is that two distinct historical traditions emerged early in the twentieth century from these traditions’ respective interpretations of Husserl (and Heidegger) and Frege (and Russell). The aim of this history of continental philosophy is to trace the developments in one of these traditions from its roots in Kant and his contemporaries through to its most recent manifestations. Together, these volumes present a coherent and comprehensive account of the continental philosophical tradition
that offers readers a unique resource for understanding this tradition’s complex and interconnected history.

Because history does not unfold in a perfectly linear fashion, telling the history of continental philosophy cannot simply take the form of a chronologically organized series of “great thinker” essays. And because continental philosophy has not developed in a vacuum, telling its history must attend to the impact of figures and developments outside philosophy (in the sciences, social sciences, mathematics, art, politics, and culture more generally) as well as to the work of some philosophers not usually associated with continental philosophy. Such a series also must attend to significant philosophical movements and schools of thought and to the extended influence of certain philosophers within this history, either because their careers spanned a period during which they engaged with a range of different theorists and theoretical positions or because their work has been appropriated and reinterpreted by subsequent thinkers. For these reasons, the volumes have been organized with an eye toward chronological development but, in so far as the years covered in each volume overlap those covered in the subsequent volume, they have been organized as well with the aim of coordinating certain philosophical developments that intersect in a fashion that is not always strictly chronological.

Volume 1 begins with the origins of continental philosophy in Kant and the earliest responses to his critical philosophy, and presents an overview of German idealism, the major movement in philosophy from the late eighteenth to the middle of the nineteenth century. In addition to Kant, the period covered in the first volume was dominated by Fichte, Schelling, and Hegel, and together their work influenced not just philosophy, but also art, theology, and politics. This volume thus covers Kant’s younger contemporary Herder, and his readers Schiller and Schlegel – who shaped much of the subsequent reception of Kant in art, literature, and aesthetics; the “Young Hegelians” – including Bruno Bauer, Ludwig Feuerbach, and David Friedrich Strauss – whose writings would influence Engels and Marx; and the tradition of French utopian thinking in such figures as Saint-Simon, Fourier, and Proudhon. In addition to Kant’s early critics – Jacobi, Reinhold, and Maimon – significant attention is also paid to the later critic of German idealism Arthur Schopenhauer, whose appropriation and criticism of theories of cognition later had a decisive influence on Friedrich Nietzsche.

Volume 2 addresses the second half of the nineteenth century, in part as a response to the dominance of Hegelian philosophy. These years saw revolutionary developments in both European politics and philosophy, and five great critics dominated the European intellectual scene: Feuerbach, Marx, Søren Kierkegaard, Fyodor Dostoevsky, and Nietzsche. Responding in various ways to Hegelian philosophy and to the shifting political landscape of Europe and
the United States, these thinkers brought to philosophy two guiding orientations—materialism and existentialism—that introduced themes that would continue to play out throughout the twentieth century. The second half of the nineteenth century also saw the emergence of new schools of thought and new disciplinary thinking, including the birth of sociology and the social sciences, the development of French spiritualism, the beginning of American pragmatism, radical developments in science and mathematics, and the development of hermeneutics beyond the domains of theology and philology into an approach to understanding all varieties of human endeavor.

Volume 3 covers the period between the 1890s and 1930s, a period that witnessed revolutions in the arts, science, and society that set the agenda for the twentieth century. In philosophy, these years saw the beginnings of what would grow into two distinct approaches to doing philosophy: analytic and continental. It also saw the emergence of phenomenology as a new rigorous science, the birth of Freudian psychoanalysis, and the maturing of the discipline of sociology. Volume 3 thus examines the most influential work of a remarkable series of thinkers who reviewed, evaluated, and transformed nineteenth-century thought, among them Henri Bergson, Émile Durkheim, Sigmund Freud, Martin Heidegger, Edmund Husserl, Karl Jaspers, Max Scheler, and Ludwig Wittgenstein. It also initiated an approach to philosophizing that saw philosophy move from the lecture hall or the private study into an active engagement with the world, an approach that would continue to mark continental philosophy’s subsequent history.

The developments and responses to phenomenology after Husserl are the focus of the essays in Volume 4. An ambiguity inherent in phenomenology—between conscious experience and structural conditions—lent itself to a range of interpretations. While some existentialists focused on applying phenomenology to the concrete data of human experience, others developed phenomenology as conscious experience in order to analyze ethics and religion. Still other phenomenologists developed notions of structural conditions to explore questions of science, mathematics, and conceptualization. Volume 4 covers all the major innovators in phenomenology—notably Sartre, Merleau-Ponty, and the later Heidegger—as well as its extension into religion, ethics, aesthetics, hermeneutics, and science.

Volume 5 concentrates on philosophical developments in political theory and the social sciences between 1920 and 1968, as European thinkers responded to the difficult and world-transforming events of the time. While some of the significant figures and movements of this period drew on phenomenology, many went back further into the continental tradition, looking to Kant or Hegel, Marx or Nietzsche, for philosophical inspiration. Key figures and movements discussed in this volume include Adorno, Horkheimer, and the Frankfurt School.
Schmitt, Marcuse, Benjamin, Arendt, Bataille, black existentialism, French Marxism, Saussure, and structuralism. These individuals and schools of thought responded to the “crisis of modernity” in different ways, but largely focused on what they perceived to be liberal democracy’s betrayal of its own rationalist ideals of freedom, equality, and fraternity. One other point about the period covered in this volume is worthy of note: it is during these years that we see the initial spread of continental philosophy beyond the European continent. This happens largely because of the emigration of European Jewish intellectuals to the US and UK in the 1930s and 1940s, be it the temporary emigration of figures such as Adorno, Horkheimer, Lévi-Strauss, and Jakobson or the permanent emigration of Marcuse, Arendt, and Gurwitsch. As the succeeding volumes will attest, this becomes a central feature of continental philosophy’s subsequent history.

Volume 6 examines the major figures associated with poststructuralism and the second generation of critical theory, the two dominant movements that emerged in the 1960s, which together brought continental philosophy to the forefront of scholarship in a variety of humanities and social science disciplines and set the agenda for philosophical thought on the continent and elsewhere from the 1960s to the present. In addition to essays that discuss the work of such influential thinkers as Althusser, Foucault, Deleuze, Derrida, Lyotard, Irigaray, Habermas, Serres, Bourdieu, and Rorty, Volume 6 also includes thematic essays on issues including the Nietzschean legacy, the linguistic turn in continental thinking, the phenomenological inheritance of Gadamer and Ricoeur, the influence of psychoanalysis, the emergence of feminist thought and a philosophy of sexual difference, and the importation of continental philosophy into literary theory.

Before turning to Volume 7, a few words on the institutional history of continental philosophy in the United States are in order, in part because the developments addressed in Volumes 6–8 cannot be fully appreciated without recognizing some of the events that conditioned their North American and anglophone reception. As has been mentioned, phenomenologists such as Alfred Schutz and Aron Gurwitsch, and other European continental philosophers such as Herbert Marcuse and Hannah Arendt, began relocating to the United States in the 1930s and 1940s. Many of these philosophers began their work in the United States at the University in Exile, established in 1933 as a graduate division of the New School for Social Research for displaced European intellectuals. While some continental philosophy was taught elsewhere around the United States (at Harvard University, Yale University, the University at Buffalo, and elsewhere), and while the journal Philosophy and Phenomenological Research began publishing in 1939, continental philosophy first truly began to become an institutional presence in the United States in the 1960s. In 1961, John Wild (1902–72) left Harvard to become Chair of the Department of Philosophy at Northwestern University. With a commitment from the provost of the university
and the Northwestern University Press to enable him to launch the Northwestern Series in Phenomenology and Existential Philosophy. Wild joined William Earle and James Edie, thus making Northwestern a center for the study of continental philosophy. Wild set up an organizational committee including himself, Earle, Edie, George Schrader of Yale, and Calvin Schrag (a former student of Wild’s at Harvard, who was teaching at Northwestern and had recently accepted an appointment at Purdue University), to establish a professional society devoted to the examination of recent continental philosophy. That organization, the Society for Phenomenology and Existential Philosophy (SPEP), held its first meeting at Northwestern in 1962, with Wild and Gurwitsch as the dominant figures arguing for an existential phenomenology or a more strictly Husserlian phenomenology, respectively. Others attending the small meeting included Erwin Straus, as well as Northwestern graduate students Edward Casey and Robert Scharff, and today SPEP has grown into the second largest society of philosophers in the United States. Since those early days, many smaller societies (Heidegger Circle, Husserl Circle, Nietzsche Society, etc.) have formed and many journals and graduate programs devoted to continental philosophy have appeared. In addition, many of the important continental philosophers who first became known in the 1960s – including Gadamer, Ricoeur, Foucault, Derrida, Lyotard, and Habermas – came to hold continuing appointments at major American universities (although, it must be mentioned, not always housed in departments of philosophy) and, since the 1960s, much of the transmission of continental philosophy has come directly through teaching as well as through publications.

The transatlantic migration of continental philosophy plays a central role in Volume 7, which looks at developments in continental philosophy between 1980 and 1995, a time of great upheaval and profound social change that saw the fruits of the continental works of the 1960s beginning to shift the center of gravity of continental philosophizing from the European continent to the anglophone philosophical world and, in particular, to North America. During these years, the pace of translation into English of French and German philosophical works from the early twentieth century as well as the very recent past increased tremendously, and it was not uncommon to find essays or lectures from significant European philosophers appearing first in English and then subsequently being published in French or German. In addition, the period covered in this volume also saw the spread of continental philosophy beyond the confines of philosophy departments, as students and faculty in centers of humanities and departments of comparative literature, communication studies, rhetoric, and other interdisciplinary fields increasingly drew on the work of recent continental philosophers. Volume 7 ranges across several developments during these years – the birth of postmodernism, the differing philosophical traditions of France, Germany, and Italy, the third generation of critical theory, and the so-called
“ethical turn” – while also examining the extension of philosophy into questions of radical democracy, postcolonial theory, feminism, religion, and the rise of performativity and post-analytic philosophy. Fueled by an intense ethical and political desire to reflect changing social and political conditions, the philosophical work of this period reveals how continental thinkers responded to the changing world and to the key issues of the time, notably globalization, technology, and ethnicity.

The eighth and final volume in this series attempts to chart the most recent trends in continental philosophy, which has now developed into an approach to thinking that is present throughout the world and engaged with classical philosophical problems as well as current concerns. The essays in this volume focus more on thematic developments than individual figures as they explore how contemporary philosophers are drawing on the resources of the traditions surveyed in the preceding seven volumes to address issues relating to gender, race, politics, art, the environment, science, citizenship, and globalization. While by no means claiming to have the last word, this volume makes clear the dynamic and engaged quality of continental philosophy as it confronts some of the most pressing issues of the contemporary world.

As a designation, “continental philosophy” can be traced back at least as far as John Stuart Mill’s *On Bentham and Coleridge* (1840), where he uses it to distinguish the British empiricism of Bentham from a tradition on the continent in which he sees the influence of Kant. Since that time, and especially since the early twentieth century, the term has been used to designate philosophies from a particular geographical region, or with a particular style (poetic or dialectical, rather than logical or scientistic). For some, it has been appropriated as an honorific, while for others it has been used more pejoratively or dismissively. Rather than enter into these polemics, what the volumes in this series have sought to do is make clear that one way to understand “continental philosophy” is as an approach to philosophy that is deeply engaged in reflecting on its own history, and that, as a consequence, it is important to understand the history of continental philosophy.

While each of the volumes in this series was organized by its respective editor as a volume that could stand alone, the eight volumes have been coordinated in order to highlight various points of contact, influence, or debate across the historical period that they collectively survey. To facilitate these connections across the eight volumes, cross-referencing footnotes have been added to many of the essays by the General Editor. To distinguish these footnotes from those of the authors, they are indicated by an asterisk (*).

Alan D. Schrift, General Editor
Mauro Carbone is Professor of Aesthetics in the Faculty of Philosophy at the Université “Jean-Moulin” Lyon 3, France. He taught contemporary aesthetics for many years at the State University of Milan, Italy. His books include: *La Visibilité de l’invisible: Merleau-Ponty entre Cézanne et Proust* (2001); *The Thinking of the Sensible: Merleau-Ponty’s A-Philosophy* (2004); and *Una deformazione senza precedenti: Marcel Proust e le idee sensibili* (An unprecedented deformation: Marcel Proust and the sensible ideas; 2004), revised and enlarged in French as *Proust et les idées sensibles* (2008), and published in English as *An Unprecedented Deformation* (2010). He is the founder and a coeditor of the journal *Chiasmi International: Trilingual Studies concerning Merleau-Ponty’s Thought*.

Pierre Cassou-Noguès is a tenured researcher at the Centre Nationale de Recherche Scientifique, Paris. His work concerns the tradition of epistemology in France in the twentieth century and, in a more speculative perspective, the relationship between reason and imagination. His books include *De l’expérience mathématique: Essai sur la philosophie des sciences de Jean Cavaillé* (2001) and *Les Démons de Gödel* (2007). He has also coedited a volume on the opposition between concept and consciousness in French philosophy: *Le concept, le sujet et la science* (with Pascale Gillot; 2008).

Andreas Grossmann is Research Fellow at Leuphana University Lüneburg, Germany. He is the author of *Spur zum Heiligen: Kunst und Geschichte im Widerspruch zwischen Hegel und Heidegger* (1996) and *Heidegger-Lektüren: Über Kunst, Religion und Politik* (2005), coeditor of the correspondence between Martin Heidegger and Rudolf Bultmann, *Rudolf Bultmann/Martin Heidegger: Briefwechsel*
1925–1975 (with Christof Landmesser; 2009), and the author of numerous articles on practical philosophy, philosophy of religion, and hermeneutics.

Galen A. Johnson is Honors Professor of Philosophy at the University of Rhode Island and Director of the URI Center for the Humanities. He is currently General Secretary of the International Merleau-Ponty Circle. In addition to large numbers of articles in continental and American philosophy, he is the author of Earth and Sky, History and Philosophy (1989) and The Retrieval of the Beautiful: Thinking Through Merleau-Ponty’s Aesthetics (2010), editor of The Merleau-Ponty Aesthetics Reader: Philosophy and Painting (1998) and coeditor of Ontology and Alterity in Merleau-Ponty (with Michael B. Smith; 1990).

Samuel J. Julian is Limited-Term Assistant Professor of Interdisciplinary Studies at Georgia College and State University. His interests include recent continental philosophy and contemporary ethical, social, and political issues.

S. K. Keltner is Assistant Professor of Philosophy at Kennesaw State University in Georgia. Her primary research interests are in social and political philosophy in the continental tradition and gender studies. She is coeditor of Psychoanalysis, Aesthetics, and Politics in the Work of Kristeva (with Kelly Oliver; 2009) and is finalizing a manuscript entitled Julia Kristeva: Thresholds.

Leonard Lawlor is Edwin Erle Sparks Professor of Philosophy at Pennsylvania State University. He has written several books, including The Implications of Immanence: Towards a New Concept of Life (2006) and This is not Sufficient: An Essay on Animality and Human Nature in Derrida (2007), and is one of the coeditors of Chiasmi International: Trilingual Studies Concerning the Thought of Merleau-Ponty.

William L. McBride is Arthur G. Hansen Distinguished Professor of Philosophy at Purdue University and President of the International Federation of Philosophical Societies (FISP). In addition to French philosophy, especially Sartre’s, his research interests include social and political philosophy and philosophy in Eastern Europe. He was cofounder and first director of the North American Sartre Society and is immediate past President of the North American Society for Social Philosophy. In addition to well over a hundred book chapters, articles, and critical reviews, he has authored, edited, and coedited twenty books, most recently Philosophical Reflections on the Changes in Eastern Europe (1999), From Yugoslav Praxis to Global Pathos (2001), Calvin O. Schrag and the Task of Philosophy after Postmodernity (2002), and Social and Political Philosophy, Volume 2 of the Istanbul World Congress Proceedings (2006).
**Contributors**

**Dermot Moran** is Professor of Philosophy (Metaphysics and Logic) at University College Dublin and a Member of the Royal Irish Academy. He is a member of the Board of Directors of the Center for Advanced Research in Phenomenology (CARP), and a member of the Steering Committee of the International Federation of Philosophical Societies (FISP). His books include: *The Philosophy of John Scottus Eriugena* (1989), *Introduction to Phenomenology* (2000), *Edmund Husserl: Founder of Phenomenology* (2005), and, as editor, *The Routledge Companion to Twentieth Century Philosophy* (2008). He is founding editor of *The International Journal of Philosophical Studies*, and coeditor of the Contributions to Phenomenology book series.

**Felix Ó Murchadha** is Senior Lecturer in Philosophy at the National University of Ireland, Galway. In addition to the philosophy of religion, his research interests include all areas of phenomenology (especially Heidegger, Husserl, and Merleau-Ponty), and issues in the philosophy of violence and conflict. He is the author of *Zeit des Handelns und Möglichkeit der Verwandlung* (1999) and the editor of *Violence, Victims, Justifications* (2006), and has published some thirty book chapters, articles, and critical reviews.

**John Russon** is Professor of Philosophy at the University of Guelph, Canada. He is the author of two books on Hegel, *The Self and Its Body in Hegel’s Phenomenology of Spirit* (1997) and *Reading Hegel’s Phenomenology* (2004), and two books of original philosophy, *Human Experience* (2003) and *Bearing Witness to Epiphany* (2009).

**Dennis J. Schmidt** is Liberal Arts Research Professor of Philosophy, Comparative Literature, and German at Pennsylvania State University. He is the author of *The Ubiquity of the Finite: Hegel, Heidegger, and the Entitlements of Philosophy* (1988), *On Germans and Other Greeks: Tragedy and Ethical Life* (2000), and *Lyrical and Ethical Subjects: Essays on the Periphery of the Word, Freedom, and History* (2005), and the coeditor of *The Difficulties of Ethical Life* (with Shannon Sullivan; 2008) and *Hermeneutische Wege* (with Günter Figal; 2000). He is also the editor of the SUNY Press Series in Continental Philosophy.

**Daniel L. Tate** is Associate Professor of Philosophy at St. Bonaventure. His publications have focused principally on hermeneutics and aesthetics. He is currently working on a manuscript on Gadamer’s philosophy of art.
INTRODUCTION
Leonard Lawlor

In the three decades covered by this volume, Husserl’s rallying cry for phenomenology – “to the things themselves” – takes on new meaning. It must. This is the period that sees the rise of Nazi Germany, which results not only in the devastation of the Second World War, but also in the Cold War opposition between the United States and the Soviet Union. History forces philosophers to require that the things themselves be concrete. No longer is it possible for phenomenological descriptions to be concerned with the abstractions of logic, no longer with idealities, no longer with a subject removed from situations. Now, they must be oriented toward the real problems of existence. In his 1945 *Phenomenology of Perception*, Maurice Merleau-Ponty expresses this shift best: “Husserl’s originality lies beyond the notion of intentionality; it is to be found … in the discovery, beneath the intentionality of representations, of a deeper intentionality, which others have called existence.”1 Hence it is the movement of existentialism that dominates this period. Of course, along with Merleau-Ponty, the central figures of existentialism are Jean-Paul Sartre and Martin Heidegger. All three develop “ontologies,” that is, attempts to define what it means to exist. In the process of developing an answer to the question of the meaning of being, the tasks of philosophy and literature, especially in France, come to coincide. As we see in Sartre’s novels and plays, both philosophy and literature are able to express existence. The identification of the tasks of philosophy and literature leads to a transformation of aesthetics. Instead of being a limited field of philosophical investigation, aesthetics refers us to a

primary experience – the experience of art – through which we are able to gain access to existence. Here Merleau-Ponty’s “Eye and Mind” and Heidegger’s “The Origin of the Work of Art” take on particular importance. As we see in these two texts, artworks are events in which a “world” (Heidegger’s terminology) is “instituted” (Merleau-Ponty’s terminology). Because of the artwork’s event character, it turns out that what most defines existence for Heidegger and Merleau-Ponty is history. The fact that human existence is fundamentally historical leads Heidegger in particular (and already in his 1927 *Being and Time*) to appropriate the nineteenth-century theories of interpretation called “hermeneutics.” Therefore, just as aesthetics no longer refers simply to a field of investigation, hermeneutics no longer refers to the interpretation of ancient texts. Hermeneutics becomes philosophical.

By themselves, however, Heidegger, Merleau-Ponty, and Sartre do not define this period. Throughout the 1930s, 1940s, and 1950s, other movements are fueled by and run parallel to these three great thinkers. Both Sartre’s and Heidegger’s philosophies assert atheism. This assertion results not only in a kind of “existential theology,” but also in a reconsideration of religion (both Christian and Jewish religion). While the drive for the concrete calls forth strong political statements from Sartre and Merleau-Ponty, we find nothing like an ethics in their works (at least in their published works) nor in the works of Heidegger. A figure working in relative obscurity over this thirty year period, Emmanuel Levinas, therefore criticizes Heidegger for having overlooked the fundamental status of ethics. Also stemming from Husserl’s work, in particular his work in the phenomenology of mathematics, and bypassing Sartre, Merleau-Ponty, and Heidegger, the philosophy of the concept develops during the same years when existentialism first comes on the scene. Although we cannot deny the abstractness of this philosophy, it falls under the category of concreteness because it wants to conceive not the static forms of mathematics, but the way mathematics develops or becomes. As the near coincidence of philosophy and literature indicates, problems of expression accompany the experiences of the concrete. Logical positivism and neo-Kantianism, the seeds of what today we call “analytic philosophy,” bring these problems of expression to the fore. As we can see already, the period from 1930 to 1960 has focal points, but around these focal points there are diverse trajectories. And all of them emanate from the drive to concreteness. The new meaning for the phenomenological slogan is indeed announced by the title of Jean Wahl’s 1932 book, *Vers le concret* (Toward the concrete). But it is also important to recall that Wahl was among the first to introduce Hegel’s thought into France.
Prior to this period, there was little interest in Hegel's thought in France. It was dominated by Bergsonism and neo-Kantianism. But as German phenomenology – Husserl and Heidegger – started to dominate, French philosophers looked to another great phenomenologist of an earlier German tradition. From the 1930s to the end of the 1950s we are in the period of the “three H’s”: Hegel, Husserl, and Heidegger. To French thinkers, Hegel appeared to anticipate ideas found in Husserl and Heidegger. Although Husserl had developed his phenomenological slogan in opposition to metaphysical speculation such as it is found in German idealism, Hegel had already tried to turn philosophy strictly to the things themselves. Merleau-Ponty, for instance, recognizes the principal idea of Hegel's phenomenology: the sense of things must not be determined by an external and static faculty of reason; the sense of things must emerge from the things' own dynamism. But the French philosophers of this period also recognized that Hegel's thought provides an alternative to Husserlian and Heideggerian phenomenology. Especially in Husserl's idealist version of trans-cendental subjectivity, one could not find the struggle through which existence, human existence, became meaningful. For Wahl however, Hegel's thought is completely concerned with overcoming “unhappy consciousness,” that is, the consciousness of the difference between what one is and what one wants to be, the difference, for instance, between one's desire for freedom and the fact that one is enslaved. Through this interpretation of Hegel’s thought, Wahl opened the way for history to be conceived as the search for meaning. While Wahl focuses on the “Unhappy Consciousness” section of Hegel's Phenomenology of Spirit, Alexandre Kojève focuses on the “Lordship and Bondage” section. Indeed, the dialectic presented here (which resonated with Heidegger's descriptions of “being-with” in Being and Time) powerfully influenced French philosophy of the 1940s. Through Kojève's famous lectures, it appeared to Sartre and Merleau-Ponty that human life consists in an interpersonal struggle; self-consciousness is the desire that the other recognize one's freedom. However as the 1940s came to a close, another Hegel commentator appeared, Jean Hyppolite. Hyppolite tries to show that Hegel's thought was not existential in the popular sense and especially not anthropological, as Kojève had believed. Like the later Merleau-Ponty, whose philosophy started to resemble Heidegger's more and more, Hyppolite shows that Hegel's thought is concerned with the meaning of being, with a foundation below

---

and beyond human existence. The impact of Hyppolite’s reading of Hegel would not really appear until the 1960s, when existentialism would start to fade with the advent of structuralism. Stressing Hegel’s concept of difference, Hyppolite’s Logic and Existence would resonate with the main idea that drives structuralism, Ferdinand de Saussure’s view of language as a system of differences, to which we will return below when discussing his influence on the later Merleau-Ponty.

In the 1940s, however, existentialism dominates the French scene. Although there are many figures associated with the movement, Sartre is its center. Sartrean existentialism is at once indebted to Husserlian phenomenology and breaks with it. On the one hand, as with the slogan of “to the things themselves,” the phenomenological method of description calls for concrete descriptions; on the other, phenomenology seems bound up with vestiges of Cartesian thought. It is in his 1936–37 essay The Transcendence of the Ego, that Sartre attempts to show that anything like a Cartesian ego is unnecessary. For Sartre, the ego must be transcended since the “I” that thinks is unsubstantial and spontaneous. The elimination of anything like a substantial ego, as some sort of fixed entity, sets up the dualism that animates Sartre’s major work Being and Nothingness (1943). As the title indicates, there is being, meaning brute reality that does not have the capacity to negate itself and thereby become self-aware; simply being is, and it remains in itself; it is full positivity. But, in contrast to “being-in-itself,” there is consciousness, which has the capacity to negate, and to negate even its own determinations, by means of which it becomes conscious of itself and therefore “for-itself.” Having the capacity to negate any determination of itself, human consciousness is, for Sartre, nothingness. From this dualism, many famous and interesting analyses unfold, including the structure of bad faith and the description of concrete relations with others with its poles of sadism and masochism. But what is most famous and controversial in Being and Nothingness – and what is most indicative of this moment of continental philosophy – is the notion of absolute freedom. A notion already anticipated in The Transcendence of the Ego, absolute freedom refers to the spontaneous movement of the “for-itself.” For Sartre, the evidence for absolute freedom of the “for-itself” or self-consciousness lies in the fact that we ask questions. Questions essentially contain the possibility of a negative reply. As Sartre says in Being and Nothingness, “It is essential therefore that the questioner have the permanent possibility of dissociating himself from the causal series.” But this dissociation has a further implication for Sartre. Alluding to Husserl’s epoché (the “putting out of circuit” or suspension in the belief in the natural determinations of things), he says:

5. Ibid., 58.
For man to put a particular existent out of circuit is to put himself out of circuit in relation to the existent. In this case he is not subject to it; he is out of reach; it cannot act on him, for he has retired beyond a nothingness. Descartes … has given a name to this possibility which human reality has to secrete a nothingness which isolates it – it is freedom.  

This “ontological freedom” (not political freedom) implies therefore that there is no determinism, like the natural causation of actions. But it also implies that I am not, my being is not, any of the natural properties I seem to have. If there is no determinism and how I find myself is not what I am, then I am totally responsible for myself, for my actions, and for the world conditioned by my actions. Total responsibility is a crushing experience, which Sartre expresses by saying that human reality is “condemned to be free.” It is this condemnation and the anxiety of total responsibility that we see portrayed in Sartre’s many literary works. Although a philosophical movement, the immense popularity of existentialism undoubtedly stemmed from its literature. If existentialism is generally defined by the concern to describe concrete experience as it is lived, and not the abstract idealization of science and traditional philosophy, then literature must portray this project. Here Camus’s novels are exemplary. There is no question that in his 1942 novel The Stranger, Camus portrays a universe “divested of illusions and lights.” Without such illusions, human reality experiences itself as “an alien, a stranger.” Although Merleau-Ponty, unlike Sartre, Beauvoir, and Camus, never wrote a literary text, he sums up this close association between philosophy and literature when he says, “From now on, the tasks of literature and philosophy can no longer be separated.” This association between philosophy and literature led to a transformation of the field of aesthetics.

II. AESTHETICS AND HERMENEUTICS: MERLEAU-PONTY AND HEIDEGGER

It is important to hear the double sense of the word “aesthetics.” On the one hand, it refers to the investigation of artworks, of the history of art (painting, poetry, literature); on the other, taking the word in a more literal sense (aisthesis:  

6. Ibid., 60.  
sensation), it refers to experience. During this period then, aesthetics is no longer a limited field of philosophical investigation distinguished, say, from metaphysics or ethics. Instead, it becomes “ontological.” In other words, the experience of the artwork becomes the fundamental means of access to the meaning of being. The experience of the artwork takes on this role because in it one experiences a thing not as relative to human use; one experiences it as something still to be determined, in a word, as something new. As we just mentioned, the existentialist movement is inseparable from a literary movement. However, one of the many debates Merleau-Ponty had with Sartre concerned the very function of literature. Through this debate, we can see the transformation of aesthetics more precisely.

Although cofounders – along with Simone de Beauvoir – of the journal *Les Temps modernes* and at times close friends, the relationship between Sartre and Merleau-Ponty was not tranquil. Already in the 1945 *Phenomenology of Perception*, Merleau-Ponty had criticized Sartre’s concept of freedom. But the 1947 publication of *What is Literature* brought Sartre into conflict with Merleau-Ponty’s views on art and language. For Sartre, the center of literature is the writer who in the clarity of thought uses language as a means for communication. In his prose writing, the writer informs readers of the conditions of the world so that the readers become responsible and committed to political action. Importantly, Sartre classifies poetry with painting as arts that do not produce meanings, which therefore do not communicate. Even more he subordinates silence to words. In contrast, for Merleau-Ponty, whose 1951 “Indirect Language and the Voices of Silence” (his last publication in *Les Temps modernes*) is a kind of response to Sartre, the center of literature is not the conscious author who has clear intentions to communicate. Always for Merleau-Ponty, consciousness is not spontaneous; it is based on a thick past that continues to have effects in the present. Merleau-Ponty understands this past in a variety of ways. Having been the first of many French philosophers to appropriate Saussure’s linguistics, Merleau-Ponty sees that a system of language is based on a series of diacritical differences (the differences between phonemes for example). Any act of speaking (or of writing) is able to function and produce meaningful effects only through these differences. These differences, however, are themselves never spoken. There is no other conclusion than the fact that speaking or writing is based on silences. These silences that have never been spoken give language a latency that the artist is able to express. Hence the title of Merleau-Ponty’s essay. The language of poetry and literature is “indirect,” pointing to that which has never been spoken; the artist’s voice is “the voice of silence.” Although Merleau-Ponty writes about literature, his real interest seems to lie in painting.10 Merleau-

10. See Maurice Merleau-Ponty, “Metaphysics and the Novel” and “A Scandalous Author,” in *Sense and Non-Sense*, 26–40 and 41–47. “Metaphysics and the Novel” extensively describes
Ponty is a philosopher of perception, and painting concerns nothing but vision. As he says, and this comment is in direct contrast to Sartre:

Art and especially painting draw from this pool of brute sense, about which activism wants to know nothing. Art and painting alone do this in full innocence. From the writer and the philosopher, we want opinions and advice. ... Only the painter is entitled to gaze upon everything without being obliged to appraise what he sees.  

We just quoted from Merleau-Ponty’s key text in aesthetics, “Eye and Mind.” In it, Merleau-Ponty claims that painting is an expression of vision, not the vision that sets up an object over there, nor the vision that classifies and divides; painting expresses the vision that participates in world. What is the nature of this participation? Merleau-Ponty realizes that since vision is always vision from the eyes, since it is carnal vision or even fleshy vision, vision is made of the same “stuff” as what is seen. Made of the same stuff, vision sees itself: the eyes that see can also be seen. Thus there is a sort of mirroring relation in this vision. On the one hand, the mirroring relation means that there is no subject–object separation here. On the other hand, and more importantly, the mirroring relation means that just as there is an interior to my vision, that is, there is a kind of invisibility in me that you cannot see (and vice versa, an interior life in you that I cannot see), likewise there is a kind of interiority or invisibility to all visible things. Hence the mirroring relation implies the title of Merleau-Ponty’s last and unfinished work, The Visible and the Invisible. Painting continues the work of vision’s attempt to bring this invisibility into the visible. Insofar as it continues this work of vision, painting is a kind of institution. It institutes a tradition, in which each painting stands as one of the attempts to bring the latency, the shadows, and the textures of things to visibility. Each painting therefore says something new, which itself institutes more possibilities for expressing the invisible. For Merleau-Ponty, the tradition of painting is never done. These are the final words of “Eye and Mind”:

For if we cannot establish a hierarchy of civilizations or speak of progress – neither in painting nor even elsewhere – it is not because some fate impedes us; it is, rather, that in a sense the very first

---

Beauvoir’s novel She Came to Stay (L’Invitée), while “A Scandalous Author” defends Sartre’s literary writings. It is important to recognize, however, that this volume opens with a text on painting, “Cézanne’s Doubt.”

painting went to the farthest reach of the future. If no painting completes painting, if no work even is itself absolutely completed, each creation changes, alters, clarifies, deepens, confirms, exalts, re-creates, or creates in advance all the others. If creations are not acquisitions, it is not just that, like all things, they pass away; it is also that they have almost their entire lives before them.12

Hermeneutics – the nineteenth-century approach to interpreting ancient texts – had already recognized that artworks “have almost their entire lives before them.” But with Heidegger, just as aesthetics becomes ontological, hermeneutics becomes philosophical. Indeed, more than the thought of Sartre and Merleau-Ponty, it is Heidegger’s thought that defines this period for the continental tradition. His influence cannot be measured, even today. In Being and Time, Heidegger had announced that phenomenology must become hermeneutical. With this announcement, Heidegger meant that the very concept of the phenomenon had to be rethought. It could not be conceived as something simply present before my gaze. Instead, going back to the ancient Greek word for truth, “a-lētheia,” Heidegger defines the phenomenon as un-concealment. For Heidegger, the hyphen in the literal meaning of “alētheia” implies that phenomena in general tend to conceal and hide themselves. Therefore, since the phenomenon is not simply given, it requires a process of making manifest. This process of bringing to light is interpretation (hermeneuein). In Being and Time, interpretation is based on understanding. For Heidegger, understanding is our basic relation to the world; no knowledge, not even philosophy, is possible without understanding. Yet, unlike Husserl’s desire to make phenomenology a “rigorous science,” Heidegger sees that understanding can never be presuppositionless. Understanding always involves what he calls a “fore-structure,” that is, a structure set up earlier, before. In other words, human existence (Dasein13) always finds itself already with, and is always already using, a set of concepts and projects through which it deals with the world. In short, human existence always finds itself with prejudices. Finding ourselves with preset ways of understanding

12. Ibid., 378.
13. The term “Dasein” is highly charged in Heidegger’s writings. Normally the term would be translated into English as “existence.” But frequently Heidegger hyphenates the term as “Da-Sein” to show that existence always finds itself with a dis-position, positioned in a “Da” (in a “there”); the hyphen is always supposed to indicate that existence is where (again “Da”) Being (“Sein”) happens, the un-concealment that occurs with understanding. Finally, while Heidegger stresses that Dasein cannot be conceived biologically or anthropologically and therefore seems to be distinguished from the human, the only example Heidegger gives of Dasein is human Dasein. That the human is the sole example explains why I have used here the phrase “human existence” to render “Dasein.” I have also done this in order to remove some of the mystery from the German word “Dasein.”
the world, our expectations about the world always seem to be confirmed. We seem to find what we already knew, as if our understanding were moving in a circle. Heidegger calls this confirmation “the hermeneutic circle.” But here both prejudices and the hermeneutic circle – this claim will become explicit in Gadamer’s 1960 *Truth and Method* – do not have a negative value. The “prejudices” provide a framework within which to interpret. But, more importantly, the interpretation must be a “working out” of the prejudices. That is, the interpretation makes the prejudices explicit, so that we can decide if they cover over the things or allow them to be unconcealed. Over the course of *Being and Time*, we learn that the fore-structure refers ultimately to the fact that human existence finds itself always and necessarily constituted historically. The historicity of human existence becomes more apparent for Heidegger in the artwork.

Like Merleau-Ponty, Heidegger has one key aesthetical text, his 1935 “The Origin of the Work of Art.” This is a complicated text to which Heidegger would return several times over his career. In “The Origin of the Work of Art,” Heidegger approaches the artwork by means of its “thingly” character. Such an approach is intended to make us think of the artwork not as an object, that is, not as something formal with a determinate set of attributes. Instead, to call the artwork a thing is intended to make us focus on what it does, focus on it as something at work. In order to bring the work character of the artwork to light, Heidegger famously interprets a Van Gogh painting of peasant shoes. His interpretation of the painting draws our attention to what the shoes do, their essence as something used, that is, as equipment. Of course, we know what shoes do; they are for protecting the feet. But, do we really understand the reliability in which the shoes consist? This is Heidegger’s interpretation, which is, undoubtedly, quite moving. Indeed, Heidegger’s words take us somewhere other than what we commonly and obviously know about shoes:

> And yet – From the dark opening of the worn insides of the shoes the toilsome tread of the worker stares forth. In the stiffly rugged heaviness of the shoes there is the accumulated tenacity of her slow trudge through the far-spreading and ever-uniform furrows of the field swept by a raw wind. On the leather lie the dampness and richness of the soil. Under the soles slides the loneliness of the field-path as evening falls. In the shoes vibrates the silent call of the earth, its quiet gift of the ripening grain and its unexplained self-refusal in the fallow desolation of the wintry field. This equipment is pervaded by the uncomplaining anxiety as to the certainty of bread, the wordless joy of having once more withstood want, and trembling before the impending childbed and shivering at the surrounding menace of death. This equipment belongs to the *earth*, and it is protected in the
world of the peasant woman. From out of this protected belonging 
the equipment itself rises to its resting-within-itself.14

Through this long quote, we see that the work the artwork does is to bring forth what the shoes really are. In their being or essence, the shoes are the point of a gathering of the world and earth. The world is the set of meaningful relations that a people sets up. In contrast, the earth is that upon which a world is set up; it is a ground, but that ground shelters and conceals. As Heidegger says, “Earth thus shatters every attempt to penetrate into it. It causes every merely calculating importunity upon it to turn into a destruction.”15 Thus what the artwork brings forth is the strife between the needs of the world and the refusal of the earth. That the artwork brings forth the being of the shoes as a gathering-strife is an event. The event character of the artwork means that the artwork is historical: it brings forth “a being such as never was before and will never come to be again.”16 The artwork then is an event of truth. As we have already seen, Heidegger appropriates the ancient Greek word for truth, “alētheia.” This appropriation means that, for Heidegger, truth is not correctness, not the adequate relation between a proposition and a state of affairs. Rather, truth is un-concealment, in which something comes to presence but in which, as well, something else remains concealed. Earlier I said that Heidegger’s description of the peasant shoes presented in Van Gogh’s painting takes us elsewhere. Now we can really see where. The description takes us away from the world of technology in which all things are determined through calculation. The earth and the world in their striving bring forth things not as objects, but truly as things, incalculable and uncertain. As his career develops from this point (1935), Heidegger relentlessly criticizes the increasing technologization of the world. He criticizes technology not in order to make us give up our devices, but in order to remind us that the things we possess are gifts. Insofar as they are gifts, they come forth to us mortals (the peasant woman “shivers at the surrounding menace of death”17), through the striving of earth and world, from the holy.

At this point, we are able to be more precise about the differences among the three great thinkers of this period. Sartre is the thinker of freedom and responsibility. But his requirement for freedom and responsibility is spontaneity. Spontaneity in Sartre seems to imply that a decision and the responsibility for that decision must be based in a present that is able to separate itself from the

15. Ibid., 45–6.
16. Ibid., 60.
17. Ibid., 33.
past (and then project itself into the future).\textsuperscript{18} In contrast, for Merleau-Ponty and Heidegger, the present is set upon a past within which other possibilities remain concealed. The artwork brings these latencies forth as an event, which means that the artwork, like human existence in general, must be conceived historically. But there is one more difference besides the thickness of the past and the slender present of the instant, between essential historicity and irreducible spontaneity. In “Eye and Mind,” Merleau-Ponty calls objectifying vision “profane vision.” However, he never provides us with a name for the more originary and participatory vision.\textsuperscript{19} Perhaps this vision of the flesh is “sacred.” In this way we could say, echoing Heidegger, that for Merleau-Ponty the thinker says being, while the poet and the painter name the holy.\textsuperscript{20}

\section*{III. God, Concept, and Logic}

The relation between Heidegger and religious thought is complicated. One thing, however, seems clear. With the technologization of the world, the dimension of the holy has come to be closed.\textsuperscript{21} Such a closure is even, Heidegger says, “the sole malignancy” of our times. Nevertheless, by means of his characterization of human existence as “being-in-the-world,” and by means of his association to Sartre’s existentialism, Heidegger seemed to many readers of his works to be an atheist. Moreover, at this point few people knew of Heidegger’s early investigations of the Christian tradition, and how Christian life functioned as a model for his characterizations in \textit{Being and Time} of human existence. Consequently, the movement of existential theology arose as a kind of reaction against atheistic existentialism even as it received its primary impetus from the thought of existence. The impetus is seen most clearly in Rudolf Bultmann’s “existen-

\textsuperscript{19} Merleau-Ponty, “Eye and Mind,” in \textit{The Merleau-Ponty Reader}, 357.

tial interpretations” of biblical texts. His “demythologization” was intended to show how the Revelation is not about a transcendent and distant God; rather, the Revelation is about an occurrence in existence. Similarly, Paul Tillich wrote out of the experience of the “death of God” (an expression taken both from Heidegger and Nietzsche). But the doubt implied by the death of God, for Tillich, is supposed to make us find the courage to have faith. Reacting against atheistic existentialism, Gabriel Marcel rejected the label “existentialism”; but then, indirectly exhibiting a similarity to Heidegger, Marcel criticizes modern individualism and subjectivism because they render the religious question obsolete. For this movement, the religious question is always a question of what the person is. The fundamental experience of the person, according to Emmanuel Mounier, is the experience of being spoken to. This second-person experience is at the heart of the “I–Thou” relation, as we find it in Martin Buber. The “Thou” refers to each other human other, but within each other there is the eternal Thou, which is God. As Levinas notes, Buber is the “pioneer” of the thought of alterity. The thought of alterity always attempts to escape from the immanence of consciousness. Therefore, for Levinas, the thought of the other is the thought of transcendence. And as his thought develops, Levinas calls the thought of transcendence “ethics.”

Although not using the word “transcendence,” the philosophy of the concept shares with existential theology the project of an escape from consciousness. Even more, as it develops through Gaston Bachelard and Georges Canguilhem, and into Michel Foucault, the philosophy of the concept understands itself as moving in the reverse direction from phenomenology. While phenomenology tried to show that the subject constitutes structures, meanings, and science, the philosophy of the concept (especially as Foucault appropriated it) tried to show that structures outside and independent from the subject constitute the subject, turning the subject into a kind of epiphenomenon. At its beginning, however, the philosophy of the concept has a more intimate relation to phenomenology. The phrase “the philosophy of the concept” originates in “On Logic and the Theory of Science,” a posthumously published text written by Jean Cavaillès, a war hero from the French Resistance who was executed by the Gestapo in 1944. In “On Logic and the Theory of Science”, Cavaillès is seeking a philosophy that is faithful to mathematics, in particular, faithful to the becoming of mathematics. For Cavaillès, mathematics is not tautological. If it were, all the discoveries of mathematics that have occurred throughout its long history would have been logically contained in its basic axioms. In other words, if mathematics were tautological, then its discoveries would not be real discoveries. Mathematics, in Cavaillès’ eyes, is genuinely creative, genuinely historical. We can see here how the historicity of human existence (at first illuminated for us through the artwork) is still functioning in the background of Cavaillès’ thought of mathematics. It is precisely this interest in the history of mathematics that leads
Cavaillès to Husserl, in particular to Husserl’s late writings on history, such as his “The Origin of Geometry.” What Cavaillès finds in these late texts is that Husserl thinks that, through a process of “reactivation,” a thinking back into the original activities of the first geometer, one is able to discover the original meaning of geometrical concepts. Yet, Husserlian reactivation, Cavaillès realizes, does not require the concrete study of the history of geometry. What Cavaillès then objects to is that the history of mathematics never contains discoveries that actually change the meaning of mathematics. In Husserl, the current developments are continuous with the past; they do not erase the past. According to Cavaillès, however, when a new theory is invented, the new theory in fact radically modifies the concepts of the former theory. The becoming of mathematics, for Cavaillès, consists in the deepening and eradication of concepts. Therefore Cavaillès famously concludes “On Logic and the Theory of Science” by saying, “It is not a philosophy of consciousness but a philosophy of the concept that can give a theory of science. The generating necessity is not the necessity of an activity but the necessity of a dialectic.”

Like the philosophy of the concept, what was called “logical analysis” and what is now called “analytic philosophy” arises from reflections on scientific knowledge. Also, like the philosophy of the concept (at least if we restrict ourselves to Cavaillès), logical analysis has an intimate relation to phenomenology. The first criticisms of phenomenology arise not in the anglophone world but in the Germanic world, from philosophers deeply aware of Husserl’s writings. At this point, in the 1930s, a rift does not exist between phenomenology and logical analysis. There is no question that the first criticisms took phenomenology seriously. The criticisms of phenomenology (which also target Bergsonism and all life philosophy) coming from logical analysis (and from logical positivism and neo-Kantianism) seem to focus on one relation: the relation of intuition to conceptualization (or experience to linguistic expression). Starting from this relation, the criticisms then seem to go in two directions. Either phenomenology concerns experience without conceptualization or it provides linguistic expressions without experience. The first side of the disjunction applies mainly to Husserl, since according to Husserl the phenomenological method is fundamentally intuitive. So, for instance, Moritz Schlick argued that knowledge could not be reduced to any kind of intuition, the pure content of intuition being inexpressible. The result of such criticisms was that phenomenology was seen as an irrational, nonconceptual intuitionism. Passing from the first side of the disjunction

---

*23. For a detailed discussion of these early reactions to phenomenology, see the essay by Michael Friedman and Thomas Ryckman in *The History of Continental Philosophy: Volume 3.*
(intuitions without concepts), we come to the second side, which applies to Heidegger. Rudolf Carnap’s 1931 essay, “The Overcoming of Metaphysics Through the Logical Analysis of Language,” targeted nonsensical philosophical sentences. Although Carnap presents several examples of such nonsense, what he says about Heidegger’s 1929 address called “What is Metaphysics?” became famous. The criticism is simple. In “What is Metaphysics?” Heidegger writes this sentence: “The nothing nothings.” It is grammatically correct and it resembles sentences such as “the rain rains.” However, what Carnap stresses is that Heidegger has made a logical mistake of using “nothing” as a noun. One can meaningfully say “the rain is outside,” since the word “rain” is a noun or a name. And one can say that “nothing is outside,” but here the word “nothing” is not a noun or a name. The sentence consists in a negative existential. It must therefore be reformulated as “There is nothing (nothing exists) which is outside.” The sentence “the nothing nothings” is nonsense according to Carnap, not only because the word “nothing” is being used incorrectly, but also because Heidegger has introduced a word “which never had a meaning in the first place.” Moreover, not being a noun or a name, “the nothing” in Heidegger’s sentence refers to no object. Not referring to an object, it is not possible to verify the sentence. The sentence then must count as metaphysical speculation in the worst sense. It is not clear whether these criticisms hold or not. Questions could be raised, questions Heidegger himself later raises: Is experience restricted to the experience of objects? Is language restricted to logical form? Nevertheless, these criticisms have had their effects. Even today, these criticisms have the result of making phenomenology (and more broadly continental philosophy) constantly defend itself against the charge of obscurantism.

IV. CONCLUSION: “TO THE THINGS THEMSELVES”

With these three last topics (God, concept, and logic), we have started to move beyond the chronological period of this volume. Thanks to Derrida’s 1964 essay, “Violence and Metaphysics: An Essay on the Thought of Emmanuel Levinas,” Levinas’s thought becomes increasingly important. Levinas’s emphasis on alterity, on the wholly other, will produce what has come to be called “a theological turn” in phenomenology. In the early 1960s, Foucault’s archeological

25. For a discussion of this “theological turn,” see the essay by Bruce Ellis Benson in The History of Continental Philosophy: Volume 7. Levinas’s work is a focus of Robert Eaglestone’s essay in the same volume.
studies take up the banner of the philosophy of the concept. These early Foucault studies are emblematic of the structuralist movement. But “structuralism’s” attempt to displace the subject and therefore its attempt to displace phenomenology leads to the entire development of the great French thought of the 1960s: not only Foucault, but also Derrida and Deleuze.26 Structuralism turns into post-structuralism, and the development of French poststructuralism (and postmodernism) occurs at the same moment that anglophone analytic philosophy comes to dominate departments of philosophy in the English-speaking world. In the second half of the twentieth century, the divide between what we now call “continental philosophy” and “analytic philosophy” becomes more severe. Yet, as the century comes to a close, what we see is a powerful resurgence of phenomenology. The call “to the things themselves” therefore seems to have an inexhaustible vitality. 27

*26. For a discussion of these and other figures of French poststructuralism, see the essays in *The History of Continental Philosophy: Volume 6.*

27. I am very grateful to all the authors for their effort and cooperation. Alan Schrift’s direction of this volume in particular and the entire series was invaluable. My thanks as well to Kate Williams at Acumen for her copyediting and to David Agler at Penn State for composing the index.
I. HEGEL IN FRANCE

There have been a number of times in history when the (re)discovery of something from the past by a culture or a community has had a remarkably stimulating and revitalizing effect on the work of that community. The discovery of Aristotle’s texts in the Christian West in the thirteenth century led to a sort of philosophical revolution in the works of Albertus Magnus and Thomas Aquinas. The works of Plato provided a seemingly inexhaustible source of nourishment and inspiration for the cultural imagination of the Italian Renaissance. Although never lost, St. Paul’s writings from the New Testament were in a sense “rediscovered” by Martin Luther, leading to a revolutionary reformation of the Christian church. Johann Joachim Winckelmann’s experience of the art of the Hellenistic and Hellenic world led to an explosive “classicism” in German writers. The unearthing of the works in Lascaux, and related “discoveries” of “primitive” art around the world led to a revolution in twentieth-century European art. In each of these cases, the revolutionary developments are new; yet, nonetheless, there is an important sense in which they are – and are seen to be – a kind of belated reception of the force of those “original” works. There is a profound sense in which the rediscovered works motivate and shape the original and revolutionary cultural developments, even as those developments themselves give new life and new meaning to those older documents or artifacts.
Something similar could be said about the role of the texts of Hegel in French intellectual culture of the 1930s and 1940s. In particular, Hegel’s *Phenomenology of Spirit* of 1807 demonstrated some of its incredible potency through the huge impact it had on original work in many different areas of intellectual culture. Prior to the late 1920s, Hegel’s philosophy was known almost exclusively through his *Encyclopaedia of the Philosophical Sciences*. The *Encyclopaedia*, although vast and rich in its content, is opaque and schematic, written by Hegel as a handbook to accompany his lectures. Careful reading of the *Encyclopaedia*, especially by those highly conversant with his central works – the *Phenomenology of Spirit* and the *Science of Logic* – reveals it to be a powerful and exciting work of philosophy; when it was read in isolation from his other texts and without a strong understanding of the principles of Hegel’s philosophy, however, the work appeared dry and, indeed, machine-like in its attempt to categorize systematically the full range of reality. The introduction of Hegel’s *Phenomenology* to French readers – especially through the work of Jean Wahl and Alexandre Koyré – suddenly presented a new Hegel, vibrant, provocative, and revolutionary. Initially through these writers, and subsequently through a multiyear seminar on Hegel’s *Phenomenology* led by Alexandre Kojève from 1933 to 1939, a new Hegel was discovered who spoke powerfully to the existential contradic-

---

2. Jean Wahl (May 15, 1888–June 22, 1974; born in Marseille, France; died in France) was educated at the École Normale Supérieure (1907–10), and received a doctorate from the Sorbonne in 1920. His influences were James, Kierkegaard, Marcel, Nietzsche, and Whitehead, and he held appointments at the University of Besançon (1918), University of Nancy (1920), University of Lyon (1923), Sorbonne (1927–36), Mount Holyoke College (1942–45), Smith College (1944–45), and the Sorbonne (1945–60s).

Alexandre Koyré (August 29, 1892–April 28, 1964; born in Taganrog, Russia; died in Paris, France) was educated at the University of Göttingen (1908–11) and the Sorbonne (1912–14). His influences were Brunschvicg, Husserl, and Meyerson, and he held appointments at the École Pratique des Hautes Études (1922–32, 1950s), Fuad University (later Cairo University) (1932–34, 1936–38, 1940–41), Johns Hopkins University (1950s), and the Princeton Institute for Advanced Study (from 1956).
tions of personal and interpersonal life, to the motor and meaning of historical and political development, to the stifling and alienating conditions of modern social life, to the transformative power of artistic creation, to the dynamism and life of the mind, and to the “irrationality” of reason. In Hegel’s text, vital new resources were discovered for engaging with many of the most pressing concerns of contemporary life.

The reception of Hegel flowed down many different channels. Wahl, Koyré, Kojève, and Jean Hyppolite were engaged in the scholarly interpretation of Hegel. In Jacques Lacan, Hegel’s ideas intersected with the tradition of psychoanalysis. Hegel’s philosophy had a significant impact on the artistic world through André Breton and the surrealists, a trajectory that, in the work of Georges Bataille, also intersects with the work of Claude Lévi-Strauss and structuralist anthropology. Indeed, this line of structuralism, with its roots in the structural linguistics of Ferdinand de Saussure, also intersects with Lacan and the psychoanalytic stream, and later flows into the deconstruction of Jacques Derrida. Hegel’s work had a direct and powerful impact on existentialism, through Jean-Paul Sartre and Simone de Beauvoir, a trajectory itself interwoven, in the works of Maurice Merleau-Ponty and Jacques Derrida, with the mainstream trajectory of phenomenology that had been developing through the works of Edmund Husserl and Martin Heidegger. Many of these thinkers, too, can also be understood to be continuing the tradition of Marxism, and, through the work of Beauvoir, Hegel’s text was involved in some of the most influential work in the founding of contemporary feminism. The explosive influence of Hegel’s thought and texts is thus implicated in, and significantly contributed to, the interweaving of surrealism, existentialism, Marxism, structural linguistics, structural anthropology, psychoanalysis, feminism, phenomenology, deconstruction and the discipline of the history of philosophy. Indeed, as Merleau-Ponty rightly says, “all the great philosophical ideas of the last century – the philosophies of Marx and Nietzsche, phenomenology, German existentialism,

3. Alexandre Kojève (1902–68; born in Moscow, Russia; died in Brussels, Belgium) was educated at the University of Heidelberg (1920–22, 1924–26). His influences included Hegel, Heidegger, Koyré, and Marx and he held appointments at the École Pratique des Hautes Études (1930s).

4. Jean Hyppolite (January 8, 1907–October 27, 1968; born in Jonzac, France; died in Paris) was educated at the École Normale Supérieure (1925–28). His influences included Bergson, Hegel, Heidegger, and Husserl, and he held appointments at the Lycée Louis-le-Grand (1939–41), Lycée Henri-IV (1941–45), University of Strasbourg (1945–49), Sorbonne (1949–54), École Normale Supérieure (1954–63), and Collège de France (1963–68).

Eric Weil (1904–66; born in Mecklenberg, Germany; died in Nice, France) held appointments at the École Pratique des Hautes Études, Centre National de Recherche Scientifique, and the University of Lille (1955–68).

5. Lacan, Bataille, and Lévi-Strauss are each the focus of an essay in The History of Continental Philosophy: Volume 5.
and psychoanalysis – had their beginnings in Hegel,” and “there would be no paradox involved in saying that interpreting Hegel means taking a stand on all the philosophical, political, and religious problems of our century.”

Like Hellenistic sculpture, the works of Aristotle and the epistles of St. Paul, Hegel’s *Phenomenology* offers inexhaustible resources. The critical appropriations of this philosophy, however, typically also involved various expressions of critical dissatisfaction. These critical appropriations were interwoven with interpretations of Hegel that ranged from sensitive but imperfect to highly incompetent, and along with a recognition of many of his great insights came a legacy of outrageous misrepresentations that have themselves influentially colored the subsequent developments in French philosophy. The “meaning” of a text or a philosophy – Hegel’s or any other – will always be open-ended, for its meaning will always be its significance as defined by the living parameters of the world in which it is apprehended, and thus the “reading” of Hegel’s text is not simply a matter of reconstituting an already fully accomplished sense but will always be interpretation, will always be transformative. This undecidability of the authoritative meaning of the text does not, however, change the fact that Hegel’s text is itself very determinate, and the text itself thus still offers itself as a standard for judging the adequacy of any “reading,” and the history of the reception of Hegel in French philosophy must be recognized to be as much a history of misrepresentation, (significantly because of the incredible difficulty of Hegel’s text) as it is the *Wirkungsgeschichte* of that text, which defines retroactively what it was able to mean. Nonetheless, through the embrace of Hegelian ideas in response to and within the phenomenological movement, the reading of Hegel grew progressively more substantial and more rigorous, reaching a kind of culmination in the works of Merleau-Ponty and Derrida from the late 1940s through the early 1960s. In what follows, I will address the reception of Hegel as a response to the phenomenological philosophy that had been developing in the works of Husserl and Heidegger. My primary orientation will not be toward the claims about Hegel made by the various figures involved, but toward how they can be seen to be deploying Hegelian themes as those are understood by the best contemporary scholarship on Hegel.

---

7. As Merleau-Ponty says, “A man cannot receive a heritage of ideas without transforming it by the very fact that he comes to know it, without injecting his own and always different way of being into it” (“Man and Adversity,” in *Signs*, Richard C. McCleary [trans.] [Evanston, IL: Northwestern University Press, 1964], 224).

8. The quality of scholarship on Hegel underwent a great qualitative improvement in the 1960s and 1970s, largely in tandem with the publication of high-quality research in the journal *Hegel-Studien*. Since the 1970s, many outstanding interpreters have distinguished themselves,
Hegel’s philosophy is the project of being rigorously committed to allowing *whatever appears* to show itself on its own terms, and philosophy is thus a project of bearing witness to the dynamism by which the phenomenon transforms itself for its own reasons. This is what Hegel calls “phenomenology” or “the science of the experience of consciousness.”9 Hegel’s philosophy was revolutionary in the history of philosophy for introducing this new method of philosophy: the method of adopting a stance of descriptive receptivity to the self-motion of the object. Hegel’s philosophy is unique – at least prior to parallel developments in twentieth-century phenomenology – in being rigorously and by definition without a thesis or an author. Hegel’s philosophy is true exactly insofar as it does not present views attributable to the author “Hegel,” but instead is only a site for the self-presentation of the phenomenon itself according to its own standards. This rigorous demand that the philosopher not import a point of view of his or her own equally means that the process of description cannot presume in advance to know what rules to follow or what principles to use in interpretation. Hegel’s method, in other words, is the abrogation of method, and his bearing witness to the *sense* of the phenomenon itself – which Hegel calls variously *die Vernunft, der Geist* or *der Begriff*, that is, in English, reason, spirit, or concept – is precisely a renunciation of all conceptions of an independent reason that could define in advance the terms of meaningfulness. It is the phenomena themselves, in their own self-manifestation, that must be the very *Darstellung* (presentation) of sense, or rationality.

That the sense of things must emerge from their own dynamism, and cannot be measured by some alien, predefined, static “reason,” is probably the single most salient idea in Hegel’s phenomenology. Merleau-Ponty writes:

It was [Hegel] who started the attempt to explore the irrational and integrate it into an expanded reason that remains the task of our century. He is the inventor of that Reason, broader than the understanding, which can respect the variety and singularity of individual consciousnesses, civilizations, ways of thinking, and historical contingency but which nevertheless does not give up the attempt to master them in order to guide them to their own truths.\(^\text{10}\)

Hegel’s *Phenomenology* studies violent struggles for personal recognition and glory, slavery, religious ecstasy, Hellenic funerary practices, the Roman emperor, sun worship and Dionysiac processions. Hegel’s philosophy teaches one not to look “up” to universal principles, but to look “into” the specificities and singularities of determinate realities, and to find sense within things, events, and practices that are pointedly nonuniversal. This conception of reason as immanent sense leads to the prominence of the theme of the philosophical interpretation of history as the phenomenon of freedom realizing itself; as thus self-creative, history is a process that actually accomplishes meaning rather than being a vehicle for an already established sense. This notion is paralleled by Hegel’s emphasis on the primacy of the practical in general, seen especially in his analysis of the distinctive form of self-consciousness – namely, the consciousness of oneself as a competent agent and a participant in the real – that is accomplished through the experience of work.\(^\text{11}\) These aspects of the Hegelian conception of meaning resonated with a number of emerging cultural movements in France in the 1920s.

The Hegelian themes of the inherent meaningfulness of history and work characterize the writings of Marx that self-consciously drew on these Hegelian ideas and that made their own explosive entry into French culture at roughly the same time as the discovery of Hegel, through the discovery of the *Economic and Philosophic Manuscripts of 1844*, and many of Hegel’s ideas were thus obviously significant to the intellectual and political traditions of French Marxism. The demand of Hegel’s “method” that one find an immanent sense within phenomena rather than defining them in terms of a pre-established standard of rationality or normalcy also had a natural affinity with psychoanalysis and its recognition of “illness” as autonomously meaningful. And Hegel’s notion of sense as something that is not established in advance and held in reserve but is

11. The discussion of work is in *Phenomenology of Spirit*, paras 194–6. For contemporary interpretations of these passages, see Harris, *Hegel’s Ladder*, vol. I, 363–70, and my *Reading Hegel’s Phenomenology* (Bloomington, IN: Indiana University Press, 2004), ch. 6. Themes pertinent to history are found in Chapter 6 of the *Phenomenology of Spirit*, entitled “Spirit”; these claims are more directly found in the introduction to Hegel’s *Lectures on the Philosophy of World History*, Hugh Barr Nisbet (trans.) (Cambridge: Cambridge University Press, 1981).
realized in giving oneself over to the self-defining life of the particular is what appealed to the surrealists in their enthusiasm for Hegel in the early 1930s.

The surrealist movement aligned itself with the Communist Party, and thus was already in the political ambit of Marx and Hegel, but the connection with Hegel was more significant and more explicit in the definitive “method” of surrealism. André Breton (1896–1966), in his “Surrealist Manifestos” called for a commitment to a vibrant pursuit of meaning through the rejection of the rule of alien reason. Along with an invocation, in the First Manifesto (1925), of Freud as a pathbreaker for “recovering the rights” of imagination against convention and conformity, Hegel’s dialectical method was imagined, in the Second Manifesto (1929), to offer a resource for overcoming the strictures of a bureaucratizing and normalizing “rationality.” In the First Manifesto’s definition of surrealism as an “automatism … by which one proposes to express … the actual functioning of thought … in the absence of any control exercised by reason,” Breton’s words clearly do resonate with Hegel’s “method” of abandoning oneself to the immanent rationality of what appears. A similar resonance is apparent in Breton’s notion of “objective chance,” according to which one gives oneself over in desire to what unexpectedly arrives through the unpredictable development of the object of desire. Finally, the surrealist notion of the generation of novel “syntheses” through the conjoining of seeming aliens clearly drew on a notion of synthesis that was seen to be at work in Hegel’s dialectic. Although his relation with the surrealists was always strained, Bataille’s thought in the 1930s and 1940s is strongly resonant with this movement. Perhaps the strongest connection between Bataille and the surrealists, and also his strongest connection with Hegel, is found in his idea that the regularized relations of normal social life (which he later called a “restricted economy”) do not present the original or ultimate form of meaning, but rather depend on a more fundamental flow of energy (“general economy”) that does not itself answer to the terms of normalized life. This Hegelian idea of a more basic sens that is both the condition of and the source for the undermining of the conformist rationality of social systems was subsequently highly influential on Derrida, Lacan, and others for shaping their own engagement with phenomenology.

Breton and Bataille were not Hegel scholars, but the contemporaneous commentaries on Hegel’s philosophy written by Wahl and Koyré are straightforward works of Hegel scholarship. Wahl, who was Professor at the Sorbonne from 1936 to 1967 (except for a period during the Second World War, when he fled to the United States after escaping from a German prison camp), was highly influenced by the philosophical ideas of Henri Bergson and William James. He was himself highly influential on both Sartre and Levinas, and on French philosophy in general, especially through his early works on Hegel and Kierkegaard. The work on Hegel was a self-conscious attempt to introduce French readers to the perspective of the young Hegel, whose works had been published by Wilhelm Dilthey and Herman Nohl in Germany in 1905 and 1907. What distinguished Wahl’s work on Hegel was its emphasis on the existential concreteness behind the logical forms of Hegel’s *Phenomenology*. Wahl, strongly influenced by Kierkegaard, showed Hegel to be of compelling existential importance by rightly recognizing the centrality for Hegel’s philosophy of the figure Hegel calls “the Unhappy Consciousness.” “The Unhappy Consciousness” is Hegel’s name for the ultimate condition of self-consciousness, which is, namely, that we are never fully self-possessed but are always at a distance from our own selves, waiting to receive our own sense of meaning and identity. As Wahl puts it, “consciousness is too small for itself, because greater than itself.” Wahl found in Hegel’s study of unhappy consciousness the “tragic, religious, and romantic” context of meaning – the “fear and trembling” – that so prominently shapes Kierkegaard’s thought. Unhappy consciousness is the experience of a self torn between its being embedded in the finite, and its being drawn to an infinite beyond: it both is and is not itself, is and is not its object, such that its unity is its dismemberment, its duplicity its unity. Philosophy, religion, and the search for meaning that is the motor of human history all begin in the affectivity of this divided consciousness, and Wahl understands Hegel’s *Phenomenology* to be the history of the attempts by unhappy consciousness to fill its inner void, its inability ever to fully “be” itself. Wahl’s interpretation of Hegel is distinguished primarily by this idea that the dialectic of the *Phenomenology* is to be understood as the

working through of this existential situation, an interpretation that privileges affectivity and existentiality over abstract rationality or systematicity. Wahl, (who took himself ultimately to disagree with Hegel), construed the ultimate force of this insight to be the need to reinvest the contingent with the force of the infinite, the initial experience of transcendence being thus folded back into immanence. Wahl’s insight into Hegel’s figure of the “Unhappy Consciousness” – which must also be in a stance of waiting for ourselves – fit well with Koyré’s writings on Hegel’s understanding of time. Koyré, himself explicitly operating in the phenomenological tradition of Husserl and Heidegger, correctly recognized (pace Heidegger) that Hegel’s philosophy operates with a conception of temporality that is defined by the primacy of the future.

These two interpretations of Hegel, like the work of the surrealists and Bataille, draw from Hegel the notion of the openness of sense, and, correspondingly, of the way in which our existential condition is one of being necessarily both excluded from participation in a fully established rational system and responsible for engaging with the issue of meaning. These themes obviously resonate powerfully with the existential movement in French philosophy in the 1940s, and the Hegel-inspired works of these intellectuals had a direct influence on that movement. In fact, though, because of the work of Kojève, the Hegel-interpretation begun in Wahl and Koyré was temporarily eclipsed by the less competent and much more influential Hegel-interpretation of Kojève, a situation that was not corrected until the work of Jean Hyppolite.

III. EXISTENTIALISM AND PHENOMENOLOGY IN THE 1940S: SENSE AND THE OTHER

The most manifest impact of Hegel on French philosophy is found in the writings of the existentialist philosophers of the 1940s. In 1927, Heidegger, in Being and Time, launched an “existential analytic of Dasein.” This study argued that we are always already “in-the-world” and that experience could not be understood as a “product” of a preexistent and independently defined transcendental meaning-giving power. Whether the transcendental ego, as that is understood by Husserl, ultimately is such a detached, autonomous meaning-giving power is by no means obvious, but the effect of Heidegger’s work was to inaugurate an “existential” approach to phenomenology that challenged such a “transcendental”

phenomenology that was identified with Husserl. The existentialist philosophers, in advancing this “antitrascendental” orientation, found Hegel’s phenomenology a welcome ally, partially because of the Hegelian–Marxist focus on engagement, but especially because of Hegel’s emphasis on the experience of others and the “dialectic of recognition.”

Hegel’s phenomenology aims to describe accurately the various forms experience takes, and one of its central studies is the description of the experience of self-consciousness. In the sections of Hegel’s *Phenomenology* entitled “The Struggle to the Death” and “Lordship and Bondage,” Hegel shows that the definitive desire of explicitly self-conscious beings is a “desire of the other,” that is, we desire to be the object of the other’s desire, and we are inherently responsive to the experience of being subjected to the gaze of other explicitly self-conscious beings. His description captures the various strategies we live out in response to this experience that run from (i) trying to obliterate our “outside” as embodied in the perspective of the other upon us so as to maintain an experience of total self-possession (the struggle to the death), through (ii) trying to subordinate and control that outside/other (lordship and bondage), to (iii) embracing the shared intersubjectivity of our self-identity (the reciprocal recognition of “spirit,” the “I that is We and We that is I”). These latter two developments are interpersonal relations that are only possible through a kind of institutionalization, which means they are relations that are inherently mediated by law and language. The half dozen pages of the *Phenomenology* in which Hegel describes this dialectical development were perhaps the most influential pages for French philosophy of the 1940s.

These pages made their entry into French thought primarily through Kojève’s seminar on Hegel’s *Phenomenology* at the École Pratique des Hautes Études from 1933 to 1939. Kojève worked through the entirety of Hegel’s text with seminar participants who included Raymond Queneau, Georges Bataille, Jacques Lacan, Aron Gurwitsch, Eric Weil, and Maurice Merleau-Ponty. As Wahl before him had seen the power of Hegel’s figure of the “Unhappy Consciousness” for

---

22. This opposition of Husserl and Heidegger is expressly discussed in Trân Duc Thao, “Existentialisme et matérialisme dialectique,” *Revue de métaphysique et de morale* 54 (1949), according to which Husserl’s *epoché* puts the transcendental ego “outside the world,” whereas Heidegger recognizes that there must be “a concrete and temporal self”; Trân Duc Thao rejects Hegelianism, but nonetheless draws substantially on Marx and on notions derived from Hegel.

24. Hegel defines spirit (Geist) as the “I that is We and We that is I” in *Phenomenology of Spirit*, para. 177.

25. These lectures were published as *Introduction à la lecture de Hegel* in 1947, selections translated in *Introduction to the Reading of Hegel* in 1969.
interpreting a wide range of human affairs, so Kojève found in the figures of “The Struggle to the Death” and “Lordship and Bondage” a powerful key for unlocking the significance of the whole range of human experience. Through Kojève's direct or indirect influence, an entire generation of French intellectuals saw the importance of the idea that self-consciousness is the desire of the other and that this definitive structure naturally ushers in a dialectic of interpersonal struggle that weaves together the psychological and the political, and that situates law and language at the heart of human identity.

Sartre apparently did not himself attend Kojève's seminar, but his Being and Nothingness (1943) is nonetheless highly alive to these ideas from Hegel that were popularized by Kojève. Sartre argues that all experience must be characterized by a prereflective cogito, a tacit awareness of oneself as an experiencing subject that must be constitutive of any experience, and he makes a parallel argument for what he describes as a sort of “cogito of the other.” Just as I always necessarily experience myself tacitly as an “I” or subject, I also tacitly experience myself as a “me,” that is an object for another. “The look” of the other to which I am subjected is also a constitutive feature of all experience, and my self-consciousness is thus (irremediably) divided between a sense that I am what I take myself to be and a sense that I am what others take me to be. What I am, in other words, is from the start not in my possession but is determined by others, and thus “the original meaning of being-with-others is conflict” because my own reality is inherently a site of contestation between the definitive authority of myself and that of others. In a manner highly reminiscent of Hegel's discussion of “Lordship and Bondage,” Sartre argues that we are always trapped in unsuccessful strategies for embracing our own subjectivity in a way that also embraces the subjectivity of others, for our strategies all result in some form of relationship of domination and subordination.

In these sections of Being and Nothingness, Sartre draws on Heidegger's discussion in Being and Time of the constitutive being-with-others that characterizes our being-in-the-world, and the discussion of the experience of the alter-ego in the fifth of Husserl's Cartesian Meditations, but uses the resources of Hegel's phenomenology of self-consciousness to bring to this theme a richness and a dynamism unexplored in these other texts. His deploying of this Hegelian theme of “the Other” is especially powerful for challenging what critics imagined to be the excessively “immanentist” theme of Husserl's transcendental phenomenology. One of the main perceived problems of the “transcendental” approach to phenomenology is that Husserl's conception of a “sense-giving” transcendental

27. Ibid., 475.
ego that is a “constituting power” is the conception of an agent that is actually constructing experience that, in one form or another, ends up making experience into a kind of representation of the other. If there can be sense only within the purview of the transcendental ego, then both the forms of meaning brought to experiential material and the very materials with which the forming power works must be within the domain of that transcendental ego, so in a profound way the “I” will only ever deal with itself. Transcendental phenomenology is thus accused of being ultimately solipsistic, and providing only a model for a self-absorbed subjectivity. Heidegger’s existential analytic, Levinas’s writings on phenomenology throughout the 1930s and 1940s (which seem to have been highly influential on Sartre), and Sartre’s existentialism all emphasize a primary realm of sense that cannot be understood on the “representational” model of a self-absorbed subject. Ek-sistent or ek-static *Dasein* (in Heidegger’s language) is outside itself, engaged with what is other. *Dasein* is not “consciousness” but engagement, being-in-the-world. Sartre’s emphasis on the experience of the other underscores the essentiality of this point. For it to count as experience of the other, that experience must necessarily not be immanent, must not be a representation, but must be precisely what cannot be found within the internal horizons of my ego. The experience of the other is precisely, on Sartre’s account, the

28. This basic orientation is captured in these remarks by Paul Ricoeur: “Thus Husserl … conceives of phenomenology not only as a method of description … but also as a radical self-grounding. …

[But] in its effective practice phenomenology already displays its distance from rather than its realization of the dream of such a radical grounding in the transparence of the subject to itself. …

It is because we find ourselves first of all in a world to which we belong in which we cannot help but participate, that we are then able, in a second movement, to set up objects … that we claim to constitute. … The subject-object relation – on which Husserl continues to depend – is thus subordinated to the testimony of an ontological link more basic than any relation of knowledge” (“On Interpretation,” in *Philosophy in France Today*, Alan Montefiore [ed.], Kathleen McLaughlin [trans.], 175–97 [New York: Cambridge University Press, 1983], 188–90). Basically, this “transcendental I,” this constituting power, is a position that “I,” as an engaged, perspectival being-in-the-world, can never occupy. In the 1930s, in *The Transcendence of the Ego* (1936) and “Husserl’s Central Idea” (1939), Sartre himself defends Husserl against a “representational” view, which he attributes to Descartes and neo-Kantianism, although he does criticize Husserl for an analogous problem of reifying reflecting consciousness.

29. Sartre also emphasizes the practical and situated character of the self, both in *Being and Nothingness* and in his later *Critique of Dialectical Reason*. Like the emphasis on the experience of the gaze of the other, this notion of the engaged subject brings out the way that subjectivity is something in-the-world rather than in consciousness. Hegel’s and Marx’s analyses of work are highly influential on Sartre’s notions of situatedness, action, and history. In “*Merleau-Ponty vivant,*” in *The Debate between Sartre and Merleau-Ponty*, Sartre credits Merleau-Ponty with teaching him about the importance of this theme of the “action that since Marx and Hegel has been called praxis” (*The Debate Between Sartre and Merleau-Ponty*, Jon Stewart
experience of the insufficiency of “my own” constitutive powers to be adequate to the sense of world in which I find myself. Here, then, Sartre draws on a powerful Hegelian insight in order to highlight the way in which phenomenology must always recognize an unclosable gap in the experience of meaning.

Closely related developments are found in the works of Simone de Beauvoir. In both The Ethics of Ambiguity (1947) and The Second Sex (1949), the influence of Hegel is prominent and explicit. In studying the inherently situated character of freedom, Beauvoir brings together explicitly the rich themes of being-with-others developed by Sartre and his notion of “bad faith,” and she develops what is roughly a systematic model of the forms of intersubjective bad faith. Sartre in his notion of “bad faith” and Heidegger before him in his notion of the “das Man” had both emphasized the way in which our freedom (in Sartre's vocabulary) can be lived authentically or inauthentically, that is, we can live in a way that owns up to our free nature (authenticity) or in such a way that the image we present of our nature through our actions contradicts the freedom that is the true condition of those actions (bad faith). This idea that a form of behavior can be at odds with itself such that its manifest character contradicts its inherent nature is one of the primary characteristics of the dialectical self-transformations of experience as described by Hegel. Sartre had already begun to make manifest something like this link between bad faith and intersubjectivity inasmuch as he demonstrated the ways in which our attitudes toward our being-with-others contradict themselves and transform themselves in accordance with those contradictions. This structure is at the core of Beauvoir's Ethics of Ambiguity, the second chapter of which shows both how our attitudes are rooted in the dynamic development of free self-consciousness from childhood and how the different adult attitudes we adopt can themselves each be understood to respond to tensions generated by the contradictions in other attitudes. The attitudes Beauvoir addresses are all one-sided in actively or passively embracing the inherent duality of freedom that is both transcendence (i.e. we are always faced with defining anew the significance of what we have done) and facticity (i.e. through the choices we make we are always defining who we are). Beauvoir portrays this work as significantly

[ed.] [Evanston, IL: Northwestern University Press, 1998], 582). These themes of engagement and history in Sartre's philosophy are helpfully discussed in Baugh, French Hegel, 101–17. For other thinkers as well, Hegel and Marx also provided the basis for a philosophy of nature and history that seemed missing in Husserl’s phenomenology. See Trần Đức Thảo: “Marxism imposed itself on us as the only conceivable solution to the problems posed by phenomenology itself” (Phénoménologie et matérialisme dialectique [Paris: Éditions Minh-Tân, 1951], 5). Compare also Jay Lampert, “Husserl and Hegel on the Logic of Subjectivity,” Man and World 21(4) (October 1988).

31. This is the subject of chapter 2 of Beauvoir, The Ethics of Ambiguity.
Hegelian, and it is strongly Hegelian in its emphasis on our essential intersubjectivity, on its emphasis of the dynamism within and between attitudes, and, in general, in its emphasis on the self-contradictory character of forms of behavior. *The Second Sex* is even more direct in its appropriation of Hegel because of its wholesale taking over of Hegel’s dialectic of the relationship of lordship and bondage to explain the formation of women’s and men’s identities in Western culture.32

Although neither *The Second Sex* nor *The Ethics of Ambiguity* presented itself expressly as a response to phenomenology, they both operate within the tradition of the existentialist appropriation of phenomenological philosophy so prominently and powerfully introduced by Sartre, and demonstrate the importance of the reception of Hegelian ideas to the history and vicissitudes of the phenomenological tradition. Just as we have already noted that the reception of Hegel ran along many avenues that coalesced and intersected with each other in various ways, so here do we see in Beauvoir’s work how the Hegelianized existential phenomenology itself grew into a cultural significance far beyond the exclusive field of official, intradisciplinary philosophical discourse. *The Second Sex* in particular stands out not only for its impact in a larger field but indeed for its virtual inauguration of the field of contemporary feminism. In the roughly contemporary work of Lacan, we can also see the impact of Hegel outside intradisciplinary philosophical discourse.

We noted above a certain natural affinity between the project of psychoanalysis and the results of Hegel’s phenomenological inquiry into human experience. This connection was powerfully developed by Lacan, who used the parameters of the development of self-consciousness mapped out by Hegel (and interpreted by Kojève) as the model for understanding the child’s psychological development through the Oedipus Complex that Freud had outlined. Freud’s own psychological writings certainly presumed the important place of the experience of the other in psychological development, but they never justified the idea that desire is inherently motivated to care about the other as a self-consciousness;33 Lacan’s insight was to see that Hegel’s description of the desire of self-consciousness as the desire of the other supplied the understanding of desire that would complete the Freudian model. And, following Hegel, Lacan, too, saw that the dialectic of self-consciousness depends on the mediation of desire through the estab-

32. This is the subject of the concluding section of *The Second Sex*.
lishing of law and language.34 Because desire defines itself through the other, growing up into the world requires social integration, which is the insertion of oneself into a system of normalizing relations ("the law of the father") that effectively constitute a universal language. This very system of universal interpretation, however, draws its resources for meaning from the originary propulsion of desire, which will itself never be fully assimilated by or adequately articulated in the terms of this universal order. Through and behind the regularized, "literal" language of culture, desire – the unconscious – speaks in its own language of metaphor/condensation and metonymy/displacement. The interest in an imminent "reason" beneath the surface of regularized rationality that initially defined the common terrain of Hegel, psychoanalysis, and surrealism is hereby shown by Lacan to be translatable into a matter of signs, with the result that the central existential and humanistic questions of meaning are displaced into the domain of linguistics and semiology.35 Lacan's early work was initially influential among the surrealists, but it was in the 1950s that the trajectory of these developments intersected with the main development of phenomenological philosophy in the work of Merleau-Ponty and Derrida.

IV. FROM EXISTENTIALISM TO DECONSTRUCTION THROUGH THE 1950S: METHOD AND DIFFERENCE

The central place of Hegel's dialectic of recognition in the existentialism of Sartre and Beauvoir is reproduced in Merleau-Ponty's Phenomenology of Perception (1945), especially in his discussions of the "metaphysical" dimension of sexuality and the role of expression as "confirmation."36 Merleau-Ponty's engagement with Hegel, however, goes far deeper than this. The first and most obvious

“Hegelianism” of the *Phenomenology of Perception* is found in its structure and method.

Like Hegel’s *Phenomenology of Spirit*, which describes the dialectical development of experience from its most immediate form (“Sense-Certainty”) to its most developed form (“Absolute Knowing”), the *Phenomenology of Perception* is a phenomenological description of experience that runs from its most immediate form (“The Sensation as a Unit of Experience”) to its richest development (“Freedom”). Merleau-Ponty’s work is also organized around a triadic structure of subject (Part I: “The Body”), object (Part II: “The World as Perceived”), and their relation (Part III: “Being-for-itself and Being-in-the-World”). In these respects, there is a strong mirroring of Hegel’s work in Merleau-Ponty’s own.

The most striking and important parallel, however, is in the method Merleau-Ponty follows in his phenomenological description. Merleau-Ponty’s manner of proceeding in his description and analysis of each successive topic in his work is not to assert and defend the position he advocates, but rather to take up familiar approaches to the phenomenon in question and, through careful attention to their responsiveness to the phenomenon they purport to explain, to allow them to demonstrate their own insufficiencies. More or less with respect to each topic, Merleau-Ponty first describes an empiricist interpretation (i.e. one that interprets the subject as inherently passive), which description typically reveals an insufficient account of agency, and then turns to a rationalist interpretation (i.e. one that interprets the subject as inherently active) as an alternative, which description typically reveals an insufficient account of passivity. The positive characteristics of the phenomenon revealed through these accounts, together with their mutual insufficiencies, are then shown to point to the need for a third form of accounting for the phenomenon that reveals the subject (and *mutatis mutandis* the object) to be being-in-the-world, a condition that, indeed, necessarily underlies and makes possible the sorts of attitudes that empiricism and rationalism presume to be primary. Although somewhat more formulaic than Hegel’s approach in the *Phenomenology of Spirit* (indeed, in external form it resembles more closely the method of Bergson in *Matter and Memory* in particular, which work is organized around the idea that neither idealism [rationalism] nor realism [empiricism] can adequately account for experience, and which proceeds, like Merleau-Ponty, by considering in turn the errors of each method in order to make possible the articulation of Bergson’s own account), this method of allowing one-sided accounts (i) separately to demonstrate their own need for supplementation by what they exclude as opposite, and (ii) mutually to demonstrate their reliance on a more basic form of experience that is not itself defined in terms of the antithesis that characterizes the two opposites, is very much the method of dialectical observation demanded by Hegel. The *Phenomenology of Perception* can, therefore, with equal legitimacy,
be called a book of Hegelian or Husserlian (or, for that matter, Heideggerean) phenomenology.

Merleau-Ponty thus represents the strongest version of the reception of Hegel’s phenomenology as a response to Husserl’s phenomenology inasmuch as his work is effectively an argument for the identity of those two phenomenologies. Merleau-Ponty, too, reproduces the comprehensiveness of Hegel’s philosophy – which is a call to openness – inasmuch as he similarly calls for an identification of phenomenology with linguistics, psychoanalysis, and art. Indeed, all the streams of “Hegel-interpretation” that we identified in French culture themselves come together explicitly in Merleau-Ponty’s work. The very openness of phenomenology – its very comprehensiveness – ultimately erases its unique and distinctive status as an exclusive discipline.

Merleau-Ponty’s writings from the 1940s resemble very much the writings of Sartre and Beauvoir in that they are occupied with the “human drama” of existence. Like Heidegger, however, Merleau-Ponty’s emphasis on experience is not “anthropological” or “humanistic,” but rather provides an opening for engaging with the “question of being,” and Merleau-Ponty’s writings of the 1950s and early 1960s explicitly emphasize this “ontological” dimension. If, as Merleau-Ponty and Heidegger argue, we are essentially being-in-the-world and if, therefore, the very opposition of “self and world” is a meaning that occurs within being-in-the-world, then the terms of that opposition cannot explain the source of meaning – indeed, they cannot explain themselves. Just as the oppositions of rationalism and empiricism are shown in the Phenomenology of Perception to point to a more fundamental source from which they derive their meaning but that they cannot explain, so does this “ultimate” opposition of self and world point to a more basic source that gives it meaning and that it is inadequate to explain. Like Heidegger’s, Merleau-Ponty’s philosophy ultimately points to something like being as the ultimate sense-giver.

This development within the French existential response to phenomenology from a focus on human experience as the site of meaning to a focus on the human as responsive to being is paralleled in the development in Hegel interpretation manifest in Hyppolite’s Logic and Existence (1952). Hyppolite was important in the tradition of French Hegelianism initially because of his translation of Hegel’s Phenomenology of Spirit into French in 1939 and 1941, and subsequently because of his commentary on the same book, Genesis and Structure of Hegel’s Phenomenology of Spirit (1946). This book was particularly notable because of its continuation of the line of interpretation developed by Wahl, which rightly recognized the figure of “the Unhappy Consciousness” as the essential form of self-consciousness in Hegel’s understanding. In this respect, Hyppolite’s book was an important corrective to the exciting and provocative, but substantially misrepresentative interpretation developed by Kojève in his lectures (which
Hyppolite avoided). Kojève drew powerful lessons from the analysis of Hegel’s description of the relation of lordship and bondage, but he failed to understand the logic and organization of Hegel’s argument in his description of self-consciousness, and wrongly presented the relationship of lordship and bondage as the completed form of self-consciousness.

In *Genesis and Structure*, Hyppolite continues Wahl’s emphasis on the tragedy and division that inherently characterize human experience, and he understands the movements of the dialectic as our attempts to deal with the questions of meaning within this context, drawing this especially from the analysis of “unhappy consciousness.” This book, which is primarily a careful and detailed commentary on Hegel’s text, emphasizes the permanent dilemmas that characterize our human situation, rather than finding in the text a fundamental drive toward “systematization” or the “overcoming” of tensions. Elsewhere Hyppolite writes, “Hegel maintains the tension of opposition within the heart of mediation, [with the result that] … he would reject the possible disappearance of the ‘tragedy of the human situation.’ … It is in the existential tragedy of history that Hegel apprehended the Idea.” It is this tragedy that points to the essentiality of forgiveness for human life, and Hyppolite’s work stands out from Hegel’s *Phenomenology* for its emphasis on this topic: the violence and the tensions of human life are not erased, but we become reconciled with them and, through this, we become reconciled with each other. Finally, the figure of “Unhappy Consciousness” points, as the ultimate goal of our existence, and hence of Hegel’s philosophy, to a reconciliation between the here and now and the beyond; such a reconciliation, however, must neither deny our permanent experience of self-division nor reduce either side of the opposition to the other. Because there is no “other world” beyond human history, history is the domain invested with ultimate meaning; at the same time, history itself – the empirical reality of humanity – is not a self-defining realm of meaning (as Kojève might ultimately have it), but is itself the site for the revelation of God (in the language of religion) or of

---

39. Like Hyppolite, Eric Weil also rejected Kojève’s claim that the end of history had arrived, instead arguing that our world has reached a point where in principle the goal of history can be articulated, but it has not been accomplished (*Hegel et l’état* [Paris: Vrin, 1950], 77–9, 102). In *Hegel et l’état*, Weil also challenged the view that Hegel was a defender of the Prussian state, seeing, on the contrary, ways in which Hegel’s philosophy was precisely a critique of that state, a point ultimately made most powerfully by Jacques d’Hondt in *Hegel en son temps* (Paris: Éditions Sociales, 1968).
the self-showing of the absolute (in the language of philosophy). Hyppolite thus interprets Hegel’s philosophy as a site for uniting existentialist themes of meaningfulness with the Marxist theme of the dialectic of history, and, ultimately, with the Heideggerian theme of Being.

*Genesis and Structure* was an important corrective to Kojève, but it was with *Logic and Existence* that Hyppolite developed the interpretation of Hegel’s philosophy that showed how it could contribute to the “ontological” approach to phenomenology developing in the works of Merleau-Ponty and Heidegger. The strength of Hyppolite’s analysis in *Logic and Existence* is that it argues for the essentiality of the *Science of Logic* and its engagement with the problematic of “being” for Hegel’s philosophy, as a corrective to the “humanistic” views that saw the *Phenomenology of Spirit* as the definitive work and as a work whose value was found in separating it from the *Science of Logic*. Whereas earlier interpreters had made of *Science of Logic* an otherworldly importation of reason, Hyppolite rightly recognized that what Hegel calls the concept (*der Begriff*) is the immanent *sense* of whatever is. Hyppolite argues, in *Logic and Existence*, that the *Logic* and the *Phenomenology* form a pair, each of which presupposes the other, and neither of which can be reduced to the other. Against the “anthropological” approach of Kojève, Hyppolite’s argument is that the human experience that is the subject of the *Phenomenology* is not itself “the absolute,” but is rather the site for the self-showing of the absolute (i.e. being). In this way, humanity is not the ultimate subject of history; rather, history, language, and human practice are the contingent, determinate modes of articulation through which this self-showing of being accomplishes itself. In this interpretation of Hegel, Hyppolite is clearly drawing on Heidegger’s discussion of language as “the house of being” in his “Letter on Humanism,” itself recognized as an important gesture of distanc ing phenomenology from anthropology and humanism. While it is not at all clear that it is correct to call the existentialism of the 1940s “anthropological,” it is certainly correct to describe Kojève, and his interpretation of Hegel, in this way. In addition to his (misrepresentative) emphasis on the dialectic of lordship and bondage, Kojève’s interpretation of Hegel was also especially significant for its interpretation of Hegel’s notion of the “end of history” from Hegel’s lectures on the philosophy of history. Kojève presented Hegel as maintaining that history had reached an end, meaning there was fundamentally nothing further to be accomplished politically. Hyppolite’s much more accurate interpretation of Hegel

41. See Jean Hyppolite: “Man is the house of the Logos, of the being which reflects on itself and thinks itself” (*Logic and Existence*, Leonard Lawlor and Amit Sen [trans.] [Albany, NY: SUNY Press, 1997], 74); and “Through this freedom, which Hegel say is the absolute Idea of history … man does not conquer himself as man, but becomes the house of the Universal, of the Logos of Being, and becomes capable of Truth” (*ibid.*, 187).
comes closer to recognizing that Hegel’s references to the “closure” of history are precisely a demand for infinite openness, and that, far from claiming the accomplishment of human happiness, it is the condition of “unhappy consciousness” that is the permanent and final condition of humanity. The openness of “the Concept” and, likewise, the “unhappiness” of self-consciousness are both situations of an unclosable divide between reality and its own meaning, the permanent condition of a humanity defined as a site for the self-disclosure of being and a reality, as Koyré noted two decades earlier, defined as inherently futural. Hyppolite’s interpretation is important in the tradition of the French reception of Hegel primarily because it begins to come to terms with Hegel’s understanding of being as an originary self-differing, a notion very similar to what Merleau-Ponty had been developing in his own “ontological” writings of the 1950s under such headings as “interrogation,” “flesh” and “écart.”

Hyppolite’s Logic and Existence strongly influenced the development of French philosophy in the 1960s. Inasmuch as this work (like his Genesis and Structure) is a massive improvement over the interpretation offered by Kojève, this influence had a salutary effect on the reception of Hegel. But insofar as engagement with Hyppolite’s interpretation seems often to have functioned as a substitute for the actual engagement with Hegel (much as engagement with Kojève played such a role for an earlier generation of French intellectuals), Hyppolite, who is by no means the best modern interpreter of Hegel, is also responsible for the perpetuation of many unfortunate misrepresentations of Hegel’s philosophy. Much of the focus on language in such writers from the 1960s as Jacques Derrida, Gilles Deleuze, and Michel Foucault (all of whom were students of Hyppolite⁴²) seems directly inspired by their studies of and with Hyppolite, and this is perhaps even truer of the focus on difference. The recognition of the notion of constitutive and irreducible differing discussed above marked a significant advance in the interpretation of Hegel’s Science of Logic and of Hegel’s philosophy in general. Hyppolite, however, also put his authority behind the perpetuation of more familiar cartoons of Hegel’s engagement with the themes of dialectic, synthesis, and contradiction, with the result that Hegel’s own profound reflections on the relationship between difference, opposition, and contradiction have largely been lost on a generation of philosophers who made a point of distancing themselves

⁴². Deleuze dedicated his first book, Empiricism and Subjectivity (1953), to Hyppolite; and Foucault, who succeeded him at the Collège de France, acknowledged his importance on several occasions, including at his memorial at the École Normale Supérieure, where, noting Hyppolite’s influence as a teacher, he said: “All the problems which are ours – we his former students or his students of today – all these problems are ones that he has established for us” (“Jean Hyppolite: 1907–1968,” in Dits et écrits, Daniel Defert and François Ewald [eds] [Paris: Gallimard NRF, 1994], vol. I, 785).
from a notion of difference-as-contradiction that they attributed to Hegel but that has very little connection with anything in Hegel's actual philosophy.

Derrida, in his “deconstruction,” is obviously and explicitly influenced by Hegel in many ways. Although Derrida at a number of points avows a distancing of himself from Hegel, it is to his actual works that one must turn to determine the relationship of deconstruction and Hegel's dialectical phenomenology. It is particularly in Glæs (1974) that Derrida demonstrates most effectively his appreciation of Hegel's philosophy, but the Hegelianism of Derrida's thinking is already manifest in his writings on phenomenology from the 1950s and early 1960s. Most definitively he, like Merleau-Ponty, embraces Hegel's method, and the ontology of difference.

Hyppolite's discussion of Hegel rightly showed that “the absolute” both can never appear as such and yet nevertheless must always be appearing in and as something or other. This is the relation between the ontological and the anthropological, between the “origin” and the site that conditions the origination of that origin. This description conforms almost exactly to the notion of différance that Derrida introduced in his discussion of Husserl in Speech and Phenomena in 1967, and these notions were already present in his writings on Husserl between 1954 and 1962. Especially in The Problem of Genesis in Husserl's Phenomenology (1954), and Edmund Husserl's Origin of Geometry (1962), Derrida grapples with this theme of the emergence of the ontological within the phenomenological, or of the ideal within the historical.

In The Problem of Genesis in Husserl's Phenomenology, Derrida looks at Husserl's works from the Philosophy of Arithmetic through The Crisis of the European Sciences to note the abiding tension between, on the one hand, the ideal value of universal and necessary truths (mathematics), “transcendental”

44. Excellent treatments of these texts are Leonard Lawlor, Derrida and Husserl: The Basic Problem of Phenomenology (Indianapolis, IN: Indiana University Press, 2002), and Joshua Kates, Essential History: Jacques Derrida and the Development of Deconstruction (Evanston, IL: Northwestern University Press, 2005).

45. See also Jacques Derrida, ““Genèse et structure’ et la phénoménologie,” in Entretiens sur les notions de genèse et de structure, Maurice de Gandillac (ed.) (Paris: Mouton, 1965); revised and published in English as “‘Genesis and Structure’ and Phenomenology,” in Writing and Difference, 154–68.
ideas such as “the thing in general,” and essences, and, on the other hand, the empirical genesis of meaning within experience. Derrida’s argument is analogous to Merleau-Ponty’s in the *Phenomenology of Perception*, which sees each philosophical *topos* as motivating both a rationalist account that begins from the necessary pre-givenness of ideal truths (in order to account for the apodicticity) and an empiricist account that begins from the necessary historical accomplishment of meanings (in order to account for the relevance to experience).

Following Husserl’s own analyses of the origin of sense, Derrida shows that this “original“ must *already* be characterized by an irreducible alterity. In his working through of Husserl’s *Lectures on Internal Time-Consciousness*, Derrida shows that, in Husserl, the “original” “absolute” must be an engagement with the real that is a temporally thick moment, a duration, which means that the experience of meaning is already characterized by a relationship to – a retaining of – the past (and future), and thus, by its own terms, is already not first: it is itself delayed with respect to itself, self-differing. Husserl’s own search for an entirely immanent, self-constituting/constituted meaning thus completes itself in the discovery of a moment that transcends itself; an immanence that is already inherently characterized on its own terms as a relation to outside.46 Sense is thus irreducibly characterized by what Derrida came to refer to as “*diff érance,*” here understood through the irreducible temporality of sense.47

In the “Introduction” of 1962, these same themes are replayed with special attention to the nature of writing (a theme introduced in Husserl’s text on the origin of geometry), and this provides the occasion for Derrida to develop a further understanding of this notion of *diff érance* through the irreducible role of signs in sense. Basically, any “moment” of sense can function only by being determinate – having a meaning of its own – and by serving as a pointer to other sense – having its meaning outside itself. Determinacy is thus a sign inasmuch as it embeds itself/is embedded in a contextualizing system of reference. A sign is a mark, a contingent, historical, empirical specificity that, by invoking a transcending meaning, inaugurates the engagement with an inexhaustible sense that can be universally repeated. Meaning is thus founded in the sign, always second to a graphic difference (as Saussure argued) which itself has its character of sign only on condition of its revelation of an inexhaustible sense.48

---

47. In some respects this work, like that of Trân Đức Thao, may be functioning primarily to establish the necessity to reinterpret Husserl’s transcendental ego in terms of Heidegger’s being-in-the-world, thus reflecting more the emphasis of the “humanist” appropriations of phenomenology from the 1940s.

and the determinate, the ideal and the empirical, are thus intertwined, each the origin of the other, irreducibly different but mutually implicated: “contaminated.” The “original” is always already delayed, a meaning always interpreted by the very sense it inaugurates, always thus a “representation” of an infinitely repeatable sense that exceeds this trace, and thus always already available to others, and thus always inherently in dispute.

The phenomenological tradition, which began with Husserl as the imperative to describe what presents itself thus concludes, in Derrida, with the recognition that “what presents itself” is the unpresentable, that is, appearing is always the disappearing of the writing that is its condition (a theme that was seen to intersect with Lacan’s psychoanalysis, and the notion of an originate desire always disappearing behind that normalizing language that mediates its presence, its “presentability”). Descriptive phenomenology will never be present at the origin of meaning, but will always be instead the revelation of its own condition in a givenness for which it can never account but to which it must respond and from which it is given its resources.

Derrida’s taking up of Husserl in these early works is highly influenced by Hegel. The Problem of Genesis in Husserl’s Phenomenology and “‘Genesis and Structure’ and Phenomenology” (1959) both draw explicitly on Hegel, although the sense of Hegel that Derrida deploys is not highly refined. In the “Introduction to Husserl’s Origin of Geometry,” however, Derrida’s relationship to Hegel is significantly more refined, apparently through the direct influence of Hyppolite. In this work, Derrida remarks that Logic and Existence “lets the profound convergence of Hegelian and Husserlian thought appear.”

We saw above that Hegel’s notion of an originary differing – the core of Derrida’s notion of différence – is a prominent theme in Logic and Existence, and the importance of this for the development of Derrida’s appropriation of phenomenology is made clear in a note in his 1964 “Violence and Metaphysics”: “Hegel’s critique of the concept of pure difference is for us here, doubtless, the most uncircumventable theme. Hegel thought absolute difference, and showed that it can be pure only by being impure.” Presumably through the direct influence of Hyppolite, Derrida was able to recognize in Hegel the very terms of his own most central philosophical (non)concept.

These early works of Derrida from the 1950s and 1960s parallel very closely in time and in content the work done by Merleau-Ponty himself on the theme of the origin of geometry, both in the “Cogito” chapter of the Phenomenology of Perception and in his lecture course on Husserl’s “The Origin of Geometry” from

49. Ibid., 67 n.62.
1959–60, entitled “Husserl at the Limits of Phenomenology.” In these works of Derrida, as in the work of Merleau-Ponty generally, the philosophy that emerges is not a criticism of Husserlian phenomenology but rather stays with Husserl to the point that phenomenology shows its own limits, shows its own reliance on what exceeds it. This method of staying with the phenomenon and allowing it to demonstrate its own nature without external imposition is, of course, the method called for by Hegel, and, indeed, with both philosophers, their resulting philosophy can with equal legitimacy be called Hegelian or Husserlian, although both of these philosophers rhetorically identify themselves more primarily with Husserl.

But although Derrida and Merleau-Ponty are remarkably similar in their philosophical projects (and, indeed, are remarkably close to Hegel), the works ultimately have a rather different style. In his earlier works especially, (less so in late works such as Aporias, for example), Derrida uses the fundamental insights about writing as a motivation to work from the themes of language and to focus on the character of written texts (in the familiar sense of that designation), whereas Merleau-Ponty works much more from the phenomena of human engagement. The result of this is that Derrida’s work links him much more with the traditions and trajectories of structural linguistics and literary criticism, while Merleau-Ponty’s work intersects more obviously with “humanist” phenomenology and existentialism and with psychology. Structuralism in linguistics had already been embraced as a response to “humanism,” as a way to displace the human subject’s centrality by showing the embeddedness of meaning in “inhuman” systems (a tradition for which the Hegelianized psychoanalysis of Lacan was already significant). While Merleau-Ponty, in “Indirect Language and the Voices of Silence,” had already established a connection with Saussure’s linguistics, it was much more the work of Derrida that had the transformative force of allowing the seemingly more humanistic tradition of existential phenomenology to be displaced from the center of French thought by the tradition of structural linguistics in the later 1960s.51

Throughout each of the stages of its development from the 1920s to the 1960s, French philosophy took powerful and productive inspiration from Hegel’s philosophy. This intellectual world also produced, in Jean Wahl, Alexandre Koyré, and Jean Hyppolite, three of the most sympathetic and insightful of Hegel’s interpreters. The engagement with Hegel was hearty: it was enthusiastic and polemical, and it was rooted in a real sense of the power of Hegel as an interlocutor, and of the importance of grappling with the specifics of his text. The generation of French thinkers that followed this period, however, seem in many cases to have accepted a “received” Hegel, which carries on the misrepresentations and

inadequacies of these earlier Hegel interpreters as much as it carries on their insights. It seems unfortunate that the work of Hegel, which was so consistently essential to this history of the development of French philosophy, now suffers misrepresentation at the hands of later French thinkers who consistently adopt a received anti-Hegelian rhetoric in their philosophizing, rather than generating their own, reinvigorated Hegel. It is worth remembering that Wahl, Koyré, and Hyppolite produced their Hegel-interpretations in large measure to correct existing misrepresentations, and it is this spirit, rather than the imperfect letter of their interpretations, that should be carried on.

I. THE ORIGINS OF EXISTENTIALISM IN PREWAR FRANCE

Today, “existentialism” broadly construed refers to the lives and works of a number of nineteenth- and twentieth-century literary and philosophical figures. Fyodor Dostoevsky, Søren Kierkegaard, and Friedrich Nietzsche¹ are commonly regarded as the predecessors of a diverse set of twentieth-century thinkers, including Martin Heidegger and Karl Jaspers (Germany);² Simone de Beauvoir, Albert Camus, Emmanuel Levinas, Gabriel Marcel, Maurice Merleau-Ponty, and Jean-Paul Sartre (France);³ José Ortega y Gasset, Miguel de Unamuno, and Xavier Zubiri (Spain).⁴

¹ Dostoevsky, Kierkegaard, and Nietzsche are discussed in detail in essays in *The History of Continental Philosophy: Volume 2*.
² Jaspers and Heidegger’s early works are discussed in essays in *The History of Continental Philosophy: Volume 3*.
³ Simone de Beauvoir (January 9, 1908–April 14, 1986; born and died in Paris, France) was educated at the Sorbonne (1926–29). Her influences included Heidegger, Husserl, Merleau-Ponty, and Sartre, and she held appointments at the Lycée Janson-de-Sailly, Paris (1929), and several lycées in Marseille, Rouen, and Paris (1930–43).
⁴ Albert Camus (November 7, 1913–January 4, 1960; born in Mondovi, Algeria; died in Villeblevin, France) was educated at the University of Algiers (1930–33). His influences included Heidegger, Husserl, Kierkegaard, and Nietzsche.
⁵ For more on Marcel, see the essay by Andreas Grossmann in this volume.
⁶ The focus of this essay on existentialism in France has made it impossible to integrate the Spanish existentialists into the following account. But their work is too important to pass over without comment. For that reason, readers will find a brief introduction to the work of Unamuno, Ortega y Gasset, and Zubiri in the Appendix to this essay.
and Frantz Fanon (Martinique). Although Sartre and Beauvoir are the figures most readily identified with existentialism, generally speaking what unites existentialists, or philosophers of existence, in the twentieth century is the analysis of “concrete” or “lived experience” – “existence” broadly construed – as opposed to a second-order reflection on the sciences. The existentialists coupled the rejection of scientific reflection with the rejection of ideal reflection, especially a reflection directed toward ideal values.

The term “existentialism” gained immense popularity in France in the 1940s; however, it was not immediately embraced by anyone to whom it was applied and was ultimately rejected by most. Beauvoir recounts her embarrassment at not even understanding “the meaning of the word ‘existentialist’” as late as 1943. Nevertheless, Beauvoir and Sartre’s lives and works became inescapably linked to the term. By the end of the 1940s, Sartre and Beauvoir were not only forced to adopt the label “existentialist,” but were also expected to define and defend “existentialism.” While Sartre’s 1945 lecture “Existentialism is a Humanism” is the most famous of these explanations/apologies, Beauvoir also wrote several popular defenses of existentialism in the immediate postwar period, and her own philosophical works were published next to Sartre’s under the same banner. Others were less willing to accept the label mainly because of its association with Sartre. After Marcel first applied the term to a “resistant Sartre” in 1945, he ironically found himself having to distinguish his own version of “existentialism” from that of Sartre – even though he preferred the term “neo-Socratic” for himself. Other members of the previous generation who directly influenced Sartre also found themselves having to distinguish their work from his: Jaspers rejected the term as only partially representative of his work because the anal-

5. Frantz Fanon (July 20, 1925–December 6, 1961; born in Martinique, French Antilles; died in Washington, DC) studied medicine at the University of Lyon (1947–51). His influences included Césaire, Freud, Hegel, Merleau-Ponty, and Sartre and he held appointments in the psychiatry department, at Blida-Joinville Hospital, Algeria (1953–56).

ysis of existence makes up only one of three main parts of his philosophy;\textsuperscript{10} Heidegger regarded the analysis of human existence as merely a means to the understanding of Being and so preferred the term “ontology.”

The application of the term existentialism was problematic for Sartre’s own generation as well. Sartre applied the label to Camus, who he claimed inaugurated a new “existentialist literature”;\textsuperscript{11} but later, both Camus and Sartre distinguished the latter’s “existentialism” from the former’s “absurdism.”\textsuperscript{12} Merleau-Ponty preferred the term “philosophy of existence,” but later even rejected that description of his work. Although Levinas has come to represent “the philosophy of the Other,” his early work in fact focused on the relationship between existents and existence; indeed, he was the only member of the generation to include the term “existence” in the title of his major early work (\textit{Existence and Existents}). Thus, both Sartre’s immediate predecessors and contemporaries had to situate their work in relationship to his. The same is largely true for the next generation of thinkers educated in France. Fanon, one of the most significant social and political theorists of the next generation who has subsequently come to be known as the father of black existentialism,\textsuperscript{13} also situated his work explicitly in relation to Sartrean existentialism. This chapter will focus on French (or francophone) existentialism as it emerged in response to Husserlian phenomenology and Heideggerean ontology. It is organized primarily around Sartre, who occupies a privileged place in the history of existential phenomenology as the dominant figure to whom everyone (including those who influenced him) was required, in some way, to respond.

The origins of existentialism as a twentieth-century philosophical movement, to a great extent, can be traced back to an influx of German philosophy in France, primarily the works of Nietzsche, Husserl, Scheler, Scheler, and

Heidegger, and secondarily those of Hegel, Marx, and Kierkegaard, in the late 1920s and early 1930s. With respect to phenomenology, the late 1920s witnessed the first book-length study of phenomenology in France; translations of key phenomenological works; Husserl’s Parisian lectures; and the Heidegger–Cassirer disputation in Davos, Switzerland, attended by young intellectuals from both sides of the Rhine.\(^{14}\) The early 1930s added two more book-length studies of the phenomenological movement (one by Georges Gurvitch and another by Levinas\(^{15}\)), and saw the publication in 1932 of Jean Wahl’s Vers le concret, very much informed by Wahl’s reading of Being and Time,\(^{16}\) and French translations of Husserl’s Cartesian Meditations and two essays by Heidegger.\(^{17}\) This largely receptive phase of the phenomenological movement in France was followed by a wave of original works.\(^{18}\) While phenomenology exercised some influence on established thinkers such as Gabriel Marcel and Eugene Minkowski,\(^{19}\) the first great series of original phenomenological studies was produced by Sartre, including The Imagination: A Psychological Critique (1936), The Transcendence of the Ego (1937), Nausea (1938), The Emotions: Outline of a Theory (1939), and The Imaginary (1940). Today, two essays by Levinas – “Reflections on the Philosophy of Hitlerism” (1934) and On Escape (1935) – also stand out from this early period owing to recent interest in political phenomenology. The decade

\(^{14}\) The first book-length study was Jean Hering’s Phénoménologie et Philosophie religieuse. Max Scheler’s The Nature of Sympathy was the first work by a phenomenologist translated into French and was followed by Karl Jaspers’s General Psychopathology, which was proofread by Sartre and Nizan. See The Writings of Jean-Paul Sartre, Volume 1: A Bibliographical Life (Evaston, IL: Northwestern University Press, 1974). The Heidegger–Cassirer disputation was attended by, for example, Eugen Fink, on the German side, and Levinas and Jean Cavaillès, on the French side.

\(^{16}\) In Search for a Method, Sartre mentions Wahl’s text as enjoying a “great success” among his generation (Search for a Method, Hazel E. Barnes [trans.] [New York: Knopf, 1963], 19).

\(^{17}\) Heidegger, “What is Metaphysics?” and “On the Essence of Ground,” both in Pathmarks, William McNeill (ed.) (New York: Cambridge University Press, 1998), 82–96 and 97–135, respectively. “What is Metaphysics?” was originally published in Bifur 8 (1931); Sartre’s “Légend de la vérité” was also published in the same issue.

\(^{18}\) For the characterization of the first phase of the phenomenological movement as primarily a receptive phase, to be distinguished from the next productive phase of the movement, beginning with Sartre, see Herbert Spiegelberg, The Phenomenological Movement: A Historical Introduction, 3rd rev. and enl. ed. (The Hague: Martinus Nijhoff, 1984), 425–47.

\(^{19}\) See, for example, the essays published in Recherches philosophiques, including Marcel’s “Esquisse d’une phénoménologie de l’avoir” (vol. 3, 1933/34) and “Aperçus phénoménologiques sur l’être en situation” (vol. 6, 1936/37); Minkowski’s “Esquisses phénoménologiques” (vol. 4, 1934/35) and “Le problème du temps vécu” (vol. 5, 1935/36).
immediately preceding the Second World War thus marked, as Merleau-Ponty recounts in “The Philosophy of Existence” (1959), “the moment of [his generation’s] great initiation into the philosophy of existence.”

At the time of his death in 1938, Husserl’s main published works could have given the impression of reducing the whole of conscious life to theoretically “pure” (or representational) acts. Yet, prior to Husserl’s death, both Sartre and Levinas also saw what the latter called “the very wide extension of the Husserlian notion of intentionality” (TIH 44). For each, the fecundity of the Husserlian notion of intentionality depended on freeing it from the restrictions imposed by Husserl’s concerns for the foundations of the formal sciences (logic, arithmetic, and geometry). Following Scheler and Heidegger’s lead, both Sartre and Levinas sketched the structures of intentionality in affective and practical life. For them, being is irreducible to its mode of appearance to “pure” consciousness: the world itself is essentially a wanted or a hated world – beautiful or ugly, alluring or repulsive, charming or horrifying. Again, following Heidegger, Sartre and Levinas saw in Husserl the possibility of getting beneath traditional subject–object dualism and, so, beyond the impasse between idealism and realism. In The Theory of Intuition in Husserl’s Phenomenology (1930), the work that introduced Sartre to phenomenology, Levinas argues that “[t]he precise function of intentionality [in Husserlian phenomenology] is to characterize consciousness as a primary and original phenomenon, from which the subject and the object of traditional philosophy are only abstractions” (TIH 48). Sartre’s The Transcendence of the Ego: An Existentialist Theory of Consciousness also denied the primacy of the “I think.” By distinguishing between a prereflective, spontaneous consciousness and reflexive consciousness and by describing how the act of reflection constitutes an empirical ego, he shows how the subject–object correlation depends on the existence of an “absolute, impersonal consciousness” (TE 106). Later, in the Phenomenology of Perception, Merleau-Ponty would note that “Husserl’s originality lies beyond the notion of intentionality; it is to be found in the elaboration of this notion and in the discovery, beneath the intentionality of representations, of a deeper intentionality, which others have called existence.”

“consciousness of…” thus opened the possibility of an analysis of concrete life beyond its representational function.

French existential phenomenologists also emphasized not serene reflection but “limit-situations” (an idea inherited from Jaspers and employed effectively by Heidegger in *Being and Time*) as providing concrete access to the level of existence, which remains hidden to theoretical life. Beauvoir aptly describes the significance of the limit-situation thus: “[I]t is in these privileged cases that man discloses and manifests his essence in a way that is more pure and necessary than in daily life.”23 While in *Being and Time* Heidegger had presented anxiety as a privileged mode of access, interestingly, in the 1930s both Sartre and Levinas, each apparently without knowledge of the other, presented nausea as a revelatory experience. In *Nausea*, Sartre describes how in the experience of nausea existence loses its status as an abstract philosophical category and appears as “the very paste of things.”24 Nausea reveals existence to be contingent, without reason, absurd – superfluous, yet also impossible to abandon: “Every existing thing is born without reason, prolongs itself out of weakness and dies by chance. … Existence is a fullness which man can never abandon.”25 In *On Escape*, Levinas similarly presents nausea as an experience that shows existence to be a fact from which it is impossible to escape. Nausea is a desperate “effort to get out [of] the fact of being riveted” to oneself: “We are there, and there is nothing more to be done, or anything to add to this fact that we have been entirely delivered up, that everything is consumed.”26 For Levinas, then, “The experience that reveals to us the presence of being as such, the pure existence of being, is an experience of its powerlessness, the source of all need” (OE 69). The profound link between Sartre’s and Levinas’s early works and the major works of existential phenomenology in the 1940s is a shared concern for and manner of approaching the common theme of “existence” inspired by, if not entirely faithful to the letter of Husserlian phenomenology. Merleau-Ponty’s utilization of abnormal psychology (for example, Minkowski’s analysis of the schizophrenic’s lived experience of space) functions in the same way as these first-person descriptions in Sartre’s and Levinas’s early works. Conversely, for Beauvoir and Fanon, the significance of being a woman or having black skin in a white man’s world, respectively, is concretely revealed from the start by the shock of not being able to escape the surveillance of another – which marks the end of all naïveté.

Against the background of war, existentialism emerged as a major cultural phenomenon in the 1940s largely because of popular literary and political writings by Sartre, Beauvoir, Merleau-Ponty, and Camus, including the publication of the newspapers *Les Temps modernes*, edited by Sartre, Merleau-Ponty, and Beauvoir, and *Combat*, edited by Camus. The war’s end also brought with it a major wave of criticisms from the general public as well as from intellectuals on the political Left and Right, directed particularly against Sartrean existentialism. Sartre famously catalogues some of the criticisms from both the Marxist Left and the Catholic Right in the opening pages of “Existentialism is a Humanism.”\(^\text{27}\) Beauvoir succinctly summarizes the charges against existentialism in *The Ethics of Ambiguity*: “[I]t is … claimed that existentialism is a philosophy of the absurd and of despair. It encloses man in a sterile anguish, in an empty subjectivity. It is incapable of furnishing him with any principle for making choices.”\(^\text{28}\) The more philosophically significant objections were aimed at Sartre’s presentation of his ontology in *Being and Nothingness* (1943). *Being and Nothingness* thus serves as an essential point of departure for approaching a series of foundational texts of French existential phenomenology, especially those by his contemporaries and closest associates: Merleau-Ponty’s *Phenomenology of Perception* and Beauvoir’s *The Ethics of Ambiguity*.

Camus’s thesis of absurdism was an important point of reference in the reception of existentialism. Although Sartre and Camus were one in their insistence on the meaninglessness of the world, Camus’s absurdism was largely born of his reading of nineteenth-century philosophical and literary texts, especially those of Dostoevsky, Nietzsche, and Kierkegaard. In his 1942 *The Myth of Sisyphus*, Camus describes the feeling of absurdity as “born of the confrontation between the human call and the unreasonable silence of the world.”\(^\text{29}\) The feeling of the absurd arises in the human being’s confrontation, for example, with mortality or the baselessness of absolute ideals. Consciousness of the absurd, however, does not simply destine the human being to meaninglessness, which could be used to justify crime, oppression, and murder. Instead, for Camus, “the man of the absurd” may also be a “man of revolt” who transforms values. Camus’s philosophy of revolt would not be developed until later, in *The Rebel* (1951), but

\(^{27}\) Sartre, *Existentialism is a Humanism*, 17–18.

already in the early 1940s one hears the emergence of an ethics of the absurd that orients human beings to a concern for injustice in the world. Although Camus’s absurdism was formulated independently of Sartrean ontology, its moral and political meaning would be subsequently deepened in relation to Sartre’s own attempts to work out the implications of existentialism.30

Sartre opens Being and Nothingness by making a distinction between two irreducible regions of being characteristic of inert objects, on the one hand, and consciousness, on the other, which also make up two aspects of the self: being-in-itself and being-for-itself. For Sartre, things simply are: “being in-itself is what it is.”31 This is not to say that things are in the sense that their meaning is forever fixed and unchangeable. Things are, rather, determinations of being whose meaning is disclosed by the for-itself. Being-for-itself, to the contrary, is not simply what it is: being-for-itself is “being what it is not and not being what it is” (BN 28). Sartre’s contradictory formulation is meant to express the essential noncoincidence of human reality.32 To be human is to exist in such a way that one is not simply present to oneself in the manner of things. Being-for-itself is a negation of being and a desire for being – a lack of being, nothingness, or negating activity (“nihilation”), which at the same time discloses the meaning of being-in-itself in this very act of negation.

Sartre further describes human reality in terms of a tension between transcendence and facticity. Negatively, transcendence refers to the capacity of consciousness to escape being-in-itself; positively, the desire “to be” transcends being-in-itself by projecting possibilities into the future – possibilities that it is not, but that it has to be. Positively, the desire to be such-and-such aims to accomplish the kind of identity that is specific to the being of things, but which is essentially impossible for conscious beings. Conversely, facticity refers to the way in which transcendence is essentially bound up with already given facts, for example, my place, my past, my environment, my fellowmen, and my death. The characterization of human reality as a tension between transcendence and facticity was meant to reveal a central point: that the meaning of being is not simply given, but is constantly negotiated through the projection of possibilities. The for-itself constantly escapes being-in-itself by projecting itself toward a yet to be determined or possible future; however, this escape can never be total, since it is always bound to given material, social, and historical conditions. The impossibility of realizing the desire to be what one is, that is, of attaining

30. See section III of this essay.
32. “La réalité humaine” was the French translation of Heidegger’s term for existence, Dasein.
the identity of being-for-itself and being-in-itself, is what leads Sartre to define "man" as a "useless passion" (BN 615).

The refusal to accept what one is (facticity) or the affirmation that one is simply what one is not (transcendence) is at the root of the phenomenon of bad faith: “The condition of the possibility for bad faith is that human reality, in its most immediate being, in the intra-structure of the prereflective cogito, must be what it is not and not be what it is” (BN 112). In bad faith, one treats oneself as an object. Temporally speaking, one identifies with either one's past (facticity) or one's future (transcendence). The fact that the transcendence of the for-itself is essentially tied to past, or to the world within which one finds oneself always already entangled with things and others, implies that human reality is essentially being-in-situation. For Sartre, being in a situation is, at once, being-there and being-beyond (BN 703). The idea that consciousness projects itself toward the future and thereby escapes its given condition, unlike the being of things, was inspired by Heidegger's conception of the thrown-project in Being and Time. The circle of selfhod (ipseity) – the tension between transcendence and facticity, or what is not yet and what already is and has been – thus articulates the temporal structure of human reality.

"To exist" in this sense is not to be alone among inert things within the world, but to be in relation to others; being-for-others is an essential fact of human reality. Furthermore, since each individual aims to re-create the given world in its own image, Sartre saw intersubjective conflict as the fundamental relation to others. Sartre utilizes Hegel’s master–slave dialectic, in which each participant desires the death of the other, as his point of departure for his descriptions of concrete relations to others. To aim at the “death” of the other for Sartre is first and foremost to attempt to subordinate the other’s freedom to one’s own. Sartre develops this struggle to the death through an analysis of “the gaze” or “the look” (le regard). The Other, he maintains, “is on principle the one who looks at me” (BN 345). The fact of being affected by the look of the Other introduces essential modifications into the structure of human reality. To exist is also to be an object within another’s world. The meaning of my existence is not solely determined by me. In the phenomenon of shame, for example, I experience myself as I am seen by the Other. The gaze of another reduces me to the status of a thing: “Shame reveals to me that I am this being” (BN 351).

The linchpin of Being and Nothingness – its various analyses of concrete experience and the basic structures of being they are meant to disclose – is what Sartre refers to as his “ontological understanding of freedom” (BN 612). More fundamental than political freedom, ontological freedom is the originary spontaneous movement of the for-itself, which tends beyond given facts toward possibilities projected into the future. To be “absolutely” free, however, is not the capacity to do what can be conceived without contradiction, nor is it the ability
to satisfy one’s desires or to achieve one’s goals. Ontological freedom is an origin-
ary relation to the given world; in other words, freedom is essentially situated: “the
situation … is an ambiguous phenomenon in which it is impossible for the
for-itself to distinguish the contribution of freedom from that of brute existence” (BN 627). A corollary of the thesis of absolute freedom is total responsibility. If
I am never wholly determined by the givens of my situation, then I am totally
responsible for myself and for the world conditioned by my acts, whether these
acts are due to explicit, reflective decisions or prereflective, spontaneous choices.
To choose not to act, as in, for example, the phenomenon of apathy, is still a
choice for which I am responsible. Sartrean freedom even renders one respon-
sible for that which one seemingly could not have even chosen: the very shape
of the social and historical world into which one is born. To be free is not to be
determined to be or to do this or that by “the facts”; it is to be unable to escape
the fact that I am absolutely responsible for everyone and everything – human
reality is irrevocably “condemned to be free.”

Sartrean ontology – including its apparent dualism between the in-itself and
the for-itself, his conflictual model of human relations or being-for-others, as
well as his de-emphasis of the constraints of facticity in his hyperbolic formul-
ations of freedom – was the subject of controversy from the start. Perhaps the
most significant critique of *Being and Nothingness* was leveled by Merleau-
Ponty in his *Phenomenology of Perception*. Indeed, Merleau-Ponty’s magnum
opus can be conceived as offering an alternate ontology in light of what he takes
to be the defects of Sartre’s ontology. Merleau-Ponty criticizes Sartre for main-
taining an untenable dualism between being-for-itself and being-in-itself and,
hence, for his conception of the subject as self-transparent and absolutely free.
Merleau-Ponty, therefore, draws more attention (than Sartre) to the funda-
mental ambiguity inherent to human existence. By making the body the middle
term between consciousness and being, on the one hand, and that by which
one participates in a common existence with others in a shared world, on the
other, he emphasizes the opacity and weight of being – the obscure, anonymous
background of existence. He thus highlights the limits of self-consciousness and
freedom:

Our freedom, it is said, is either total or non-existent. … If indeed we
place ourselves within being, it must necessarily be the case that our
actions must have their origin outside us, and if we revert to consti-
tuting consciousness, they must originate within. But we have learnt
precisely to recognize the order of phenomena. We are involved in
the world and with others in an inextricable tangle. The idea of situ-
ation rules out absolute freedom at the source of our commitments,
and equally, indeed, at their terminus. (PP 454)
These and other, often implicit, points of contention between Merleau-Ponty and Sartre would become more explicit in their political debates throughout the 1940s and 1950 (see section III, below).

Beauvoir’s position vis-à-vis the opposition between Sartre and Merleau-Ponty is an ambiguous one. On the one hand, Beauvoir might be thought to have launched an implicit defense of Sartrean ontology against Merleau-Ponty’s criticisms, when she developed the concept of ambiguity – a term exploited by both Sartre and Merleau-Ponty – in *The Ethics of Ambiguity*. There, Sartre’s work takes pride of place, but remarkably she never mentions Merleau-Ponty, despite the fact that she had favorably reviewed the *Phenomenology of Perception* in 1945. On the other hand, in *The Prime of Life* she recounts having arguments at this time with Sartre about the situation. Additionally, her review of the *Phenomenology of Perception* might be read as indicating that she found Merleau-Ponty to offer a richer ontological framework. Nevertheless, Beauvoir’s philosophical development was not merely parasitical on the debates between Sartre and Merleau-Ponty. In her first philosophical essay, “Pyrrhus and Cineas” (1944), she began to develop her own original analyses of concrete existence, subsequently deepened in *The Ethics of Ambiguity*. In opposition to the absurdity and despair that characterized the mood of the period and colored the reception of existentialism, she identified the spontaneous creation of meaning through the project as “the joy of existing” and characterized the world as “a source of joy” (EA 41). Further, she emphasized the weight of the situation and the difficulties it posed for the oppressed, an insight that would reveal its larger significance in *The Second Sex*. Finally, while Beauvoir presented conflict with others as necessary, this conflict was counterbalanced, if not underwritten, by an ethical relation, which she characterized as being one of concern, responsibility, and generosity. This authentic relation would function as the measure and signify the proper end of action – even of conflict.

Beauvoir’s analyses of intersubjectivity (or being-for-others) were perhaps her most significant philosophical achievements at the time. In them she maintains that the individual is both separated from and connected to others. For Beauvoir, my existence as a free project fundamentally appeals to the existence of others. In particular, without the Other, my own freedom would harden into “the absurdity of facticity” (EA 17). Beauvoir thus describes this ambiguous relation as a conflict between two freedoms, and she further develops it within an ethical register. Because I am the Other’s facticity, and thereby the condition of the Other’s situation, the Other’s freedom concerns me:

I am there, and for him, I am confused with the outrageous existence of all that is not him. I am the facticity of his situation. The other is free based on that, totally free based only on that, but free facing this and not that, facing me. The fate that weighs on the other is always us.35

When, in *The Ethics of Ambiguity*, Beauvoir contends that to will one's own freedom is, simultaneously, to will the freedom of all, she may appear to be merely reiterating Sartre's formulation of this idea from his 1945 “Existentialism is a Humanism,” but she had already begun to prepare the ground for this claim in “Pyrrhus and Cineas”.

While the works of Sartre, Camus, Merleau-Ponty, and Beauvoir attracted the attention of intellectuals and the wider public in postwar France (and indeed around the world), Levinas's first major work, *Existence and Existents*, was largely ignored at the time. The book, begun before the war and mostly written while interned in a German prisoner of war camp for French soldiers, includes an apology “for the absence of any consideration of those philosophical works published, with so much impact, between 1940 and 1945.”36 The reference is presumably to Sartre's *Being and Nothingness* and Merleau-Ponty's *Phenomenology of Perception*. Instead of directly addressing the works of his contemporaries, Levinas presents his analyses primarily in opposition to Husserl and Heidegger, with whom he had studied in 1928–29: “[W]here the continual play of our relations with the world is interrupted, we find neither death [Heidegger] nor the 'pure ego' [Husserl], but the anonymous fact of existing” (EE 8).37 The centerpiece of *Existence and Existents* is accordingly an analysis of horror as the concrete mode of access to impersonal or anonymous existence (being-in-general), or what Levinas calls the “there is” (*il y a*). Horror reveals a more fundamental dimension of existence than personal existence within the world, a condition that Levinas regarded as not simply given. Freedom in this situation outside of the world is merely a *thought*: “The concept or the hope of freedom explains the despair which marks the engagement in existence in the present” (EE 90). Limited for the most part to the analysis of the relationship between an existent and its existence, the book nevertheless provides a first sketch of an analysis of “the relationship to the Other, as a movement toward the Good” (EE xxvii), which Levinas presents as an asymmetrical, face-to-face,

35. Simone de Beauvoir, “Pyrrhus and Cineas,” in *Simone de Beauvoir: Philosophical Writings*, 126.
37. Henri Bergson also served as an important point of reference for Levinas in his early works, although not to the same extent as Husserl and Heidegger.
I–thou relation, contrary to Heidegger’s description of being-with-others in *Being and Time*. Levinas thus shares with Sartre the rejection of Heidegger’s being-with as the primordial relation to others. He first characterized existence as toward others in *Existence and Existents*, but shortly thereafter as being for others – where the “for” has an ethical sense.

Although Levinas did not have a personal relationship with Sartre, like others in the immediate postwar period, he found Sartrean existentialism an unavoidable point of reference. Chief among the works published during this period that address Sartre is “Time and the Other,” a series of four lectures delivered in 1946/47 and published in 1948, which reframes and extends the analyses of *Existence and Existents* in terms of the antinomy between Marxism and existentialism. In this context, Levinas’s critique of Sartre is twofold. On the one hand, Sartre does not fully take account of the limitation imposed on freedom by the materiality of existence: “In Sartre’s philosophy there is some sort of angelic present. The whole weight of the past, the freedom of the present is already situated above matter” (TO 62). On the other hand, Sartre mistakenly conceives of intersubjectivity as a fundamental relation between two opposing freedoms: “[T]he relationship with the Other is entirely different from what the existentialists propose as it is from what the Marxists propose” (TO 79). To a large extent, this entails challenging the primacy of the master–slave dialectic common to both Marxism and existentialism. Levinas’s analysis of intersubjectivity, particularly the relation to “the feminine” in “Time and the Other,” was subsequently attacked by Beauvoir in *The Second Sex* (1949). That same year, Levinas employed Sartrean language to express the core idea of his philosophy: “the primary fact of existence is neither the *in itself*, nor the *for itself*, but the ‘for the other.’” Here, as alluded to above, we find for the first time an ethical significance attached to the “for.”

---

38. Levinas explicitly connects this relation to the dialogical philosophy of Martin Buber.
40. Simone de Beauvoir, *The Second Sex*, H. M. Parshley (trans.) (New York: Alfred A. Knopf, 1952), xxii; hereafter cited as SS followed by the page number. When Beauvoir criticizes Levinas’s description of the relation to the feminine, she fails to note that Levinas’s account took place within a critique of Sartre’s ontology.
Whereas the interwar period may be characterized in terms of the political opposition between French liberalism and German National Socialism, the postwar political situation in France may with some right be characterized in terms of the opposition between the United States and the USSR, or liberalism and communism, with France and, in particular, existentialism somehow caught in the middle. The formation of the broadly leftist *Les Temps modernes* in 1945 by Sartre, Merleau-Ponty, Beauvoir, and others was in fact initially conceived as an alternative venue for addressing social and political issues. The review marked the fruitful collaboration between Sartre and Merleau-Ponty, but it also instigated an eventual, hostile break, which saw the two develop in different political directions. With the onset of the Korean War, Merleau-Ponty became increasingly withdrawn from politics and repudiated his earlier sympathies with Marxism. Although Sartre’s last interviews would ultimately suggest a break with Marxism, during the 1940s and 1950s Sartre became more committed to politics and more immersed in Marxist thought,ironically in large part owing to his association with Merleau-Ponty. Sartre’s relationship with Camus would likewise suffer as a result of Sartre’s increasing sympathies for Marxism. The postwar political situation thus provided the context for the further development of existential social and political theory. These developments were not limited to the Marxist framework, within which the debate between Sartre and Merleau-Ponty and that between Sartre and Camus were largely played out. First, Levinas and Beauvoir, and then Fanon also made significant contributions, particularly with regard to the complexities of the lived experiences of identity politics.

Sartre’s leftist sympathies provided the ground for the public and hostile break between Sartre and Camus. Both Sartre and Camus equated communism and violence, but whereas Camus rejected communism as rationally justified murder, Sartre embraced revolutionary violence. Camus’s *The Rebel*, published in 1951, presented a notion of “revolt” inspired by Sartre’s “for-itself” but distinguished his sense of revolt from the revolutionary violence that Sartre defended. He identified an originary impulse of freedom beneath historical revolt, the latter of which he claimed transformed revolt into murder in an attempt to overcome the absurdity of human existence. Communism was simply the modern form of this attempt. In the final chapter of *The Rebel*, and without mentioning Sartre or his works by name, Camus distinguished himself from “the existentialists” by

attacking Sartre’s play *The Devil and the Good Lord* for its justification of revolutionary violence. Sartre promised to review the book in *Les Temp Modernes*, but continually delayed his response owing to their friendship. Sartre eventually allowed Francis Jeanson,⁴³ his younger colleague and defender, to review it. Jeanson, like most others on the Left, vehemently opposed and criticized it. The publication of *The Rebel*, and the (silent) debate between Sartre and Camus that took place surrounding it, marked the end of their friendship and solidified their own opposing political positions. While Camus favored a “revolt” that would lead to reform and solidarity, Sartre favored a “revolution” that acknowledged the material needs and experience of the oppressed.⁴⁴

The major criticism of Sartre from the Marxist Left was that his ontology represented the most recent expression of bourgeois individualism and, more generally, that it was incapable of addressing (if not unconcerned with) the pressing ethical, social, and political issues of the time. In this context, Sartre presented his most widely read and controversial essay, “Existentialism is a Humanism.” There, Sartre defines existentialism by the principle according to which “existence precedes essence.” The formulation was at the center of Heidegger’s critique of Sartre in “Letter on ‘Humanism,’” where Heidegger accuses Sartre of simply reversing metaphysics, which had traditionally privileged essence over existence. Sartre later stated that he deeply regretted the over-simplification of the formulation and explained that his formula was meant to be heard within the context of phenomenological analysis in which concrete experience discloses and articulates the essential structures of existence. When Sartre claimed that “existence precedes essence,” he did not intend these terms to be heard in their traditional metaphysical sense, as Heidegger heard them. Sartre’s claim, in fact, was meant to reiterate Heidegger’s own formulation in *Being and Time*: “The essence of Dasein lies in its existence.”⁴⁵ Similarly, in the opening lines of the *Phenomenology of Perception*, Merleau-Ponty highlights this point as phenomenology’s attempt “to put essences back into existence” (PP vii); and Beauvoir, for her part, distinguished existential phenomenology from a philosophy “separating essence from existence.”⁴⁶

---

⁴³. Francis Jeanson (1922–2009) was, in addition to being on the editorial board of *Les Temps modernes*, the author of over twenty works, including several on Sartre, Beauvoir, and Algeria. He is perhaps best known for his underground activities in support of the National Liberation Front (FLN) in Algeria, for which he was sentenced in absentia in 1960 to ten years in prison (pardoned in 1966).
meant to express his agreement with Heidegger’s critique of metaphysics, the point he drew from the claim was an emphasis on freedom and responsibility:

[T]he first effect of existentialism is to make every man conscious of what he is, and to make him solely responsible for his own existence. And when we say that man is responsible for himself, we do not mean that he is responsible only for his own individuality, but that he is responsible for all men.47

“Existentialism is a Humanism” is significant because it contains Sartre’s initial attempt to work out the ethical and political implications of his ontology.

Prior to the 1945 essay, Sartre had only gestured at the ethical and political import of existentialism. At the end of The Transcendence of the Ego, for instance, he claimed that the existential theory of consciousness sketched there provided the ground of an ethics and a politics that would be “absolutely positive” (TE 106). Similarly, in Being and Nothingness, Sartre gestured twice toward an ethics that would be consistent with his thought.48 But Sartre explicitly formulates the relationship between his “ontological understanding of freedom” and political freedom for the first time in “Existentialism is a Humanism.” There he claims that to will one’s own freedom is simultaneously to will the freedom of all, a formulation, again, that Beauvoir too would favor. In defining human reality in terms of freedom, Sartre expressed the idea that within one’s conscious act is projected a future in which all of humanity is free. The choice that defines the existent’s project is simultaneously the choice of a specific shape of the world in which the freedom of all is realized. Sartre’s emphasis on freedom seems to create an unbridgeable gap between existentialism and Marxism since, according to Marx’s famous formulation, “being determines consciousness,” whereas it would seem that for Sartre “consciousness determines being.” Sartre’s formulation of existentialism as a humanism, however, should not be confused with classical, Western humanism, of which Sartre himself was a staunch critic as early as Nausea. Rather, Sartre meant to establish a new humanism on existentialist principles; that is, on an analysis of sociohistorical struggle based on an open future, but guided by the idea of freedom.

Sartre’s first major attempt at a synthesis of Marxism and existentialism appears in several essays initially published in Les Temps modernes in the early 1950s and later gathered under the title The Communists and Peace. (His first extended critique of contemporary Marxism took shape in “Materialism and

47. Sartre, Existentialism is a Humanism, 23.
48. In a footnote to the section on bad faith, Sartre promised an ethics to come (BN 116), and he concluded Being and Nothingness with some preliminary reflections on ethics.
Revolution” in 1946.) Merleau-Ponty in turn wrote several essays collected in Adventures of the Dialectic in 1955. The book concluded with a chapter entitled “Sartre and Ultrabolshevism,” where Merleau-Ponty argued that Sartre’s extreme subjectivism made his ontology irreconcilable with dialectical materialism. In “Merleau-Ponty and Pseudo-Sartreanism,” Beauvoir explicitly defended the early Sartre against Merleau-Ponty’s charges and showed how Sartre’s thought had developed between Being and Nothingness and The Communists and Peace. Nonetheless, Sartre’s Critique of Dialectical Reason may still in great respects be seen to respond to Merleau-Ponty’s criticisms in his synthesis of existentialism and Marxism. In Search for a Method, Sartre states that he “accepts without reservation the thesis set forth by Engels in his letter to Marx”: “Men themselves make their history but in a given environment which conditions them.” In the Critique of Dialectical Reason, he uses a quote from Marx’s The Eighteenth Brumaire of Louis Bonaparte to make the same point: “Men make their own History … but under circumstances … given and transmitted from the past.” As he would write, regarding Paul Valéry: “Valéry is a petit bourgeois intellectual, no doubt about it. But not every petit bourgeois intellectual is Valéry. The heuristic inadequacy of contemporary Marxism is contained in these two sentences” (CDR 56). Sartre thus opposes the determinism of orthodox Marxism at the time in favor of “the permanent and dialectical unity of freedom and necessity” (CDR 35). With regard to material existence, the thrown project remains fundamental, but he concretizes it by grounding the project in material needs and the practical field defined by scarcity. With respect to intersubjectivity, Sartre maintained his analysis of “the look,” but he redescribed its significance in terms of a social situation of alienation produced by a process of serialization. The possibility of the formation of practical groups thus required transcending this alienated condition.

In The Second Sex and Black Skin, White Masks (1952), Beauvoir and Fanon demonstrate the positive value of Sartre’s account of the look in their respective analyses of gender and racial oppression. Phenomena such as race and gender

50. Sartre, Search for a Method, 85.
52. Interestingly, whereas Merleau-Ponty had initially criticized Sartre’s existential Marxism for its distance from Marxism proper, Fanon criticizes Sartre for his proximity to Marxism. This is not to say that Fanon did not recognize the significance of socioeconomic conditions, but rather that its sole focus on class was inadequate for understanding racial colonialism. Fanon’s criticism of Sartre’s subordination of the Négritude movement to a larger socioeconomic dialectic took place in response to Sartre’s “Black Orpheus,” an introduction to an anthology of
may be said to exist not as the result of essential determinations, nor as the mere reflection of group solidarity, but rather as the effect of a lived reality of oppression. Fanon says, for example, “the black soul is a white man's artifact” (BSWM 14). In his account of the colonialism of the Malagasy, he writes, “the Malagasy alone no longer exists … the Malagasy exists with the European … something new had come into being on that island” (BSWM 97). In this sense, it is the white man who gives identity to the black man. Analogously, Beauvoir claimed “man defines woman not in herself but relative to him” (SS xxii). In perhaps the most famous and oft-cited formulation in the history of feminist theory, Beauvoir claims, “One is not born, but rather becomes, a woman” (SS 267), a formulation of the lived experience of social oppression that came to represent the revolutionary claim that sex and gender are distinct. Sartrean existentialism thus opened the possibility of accounting for the reality of social identities without falling into essentialism by means of an analysis of racial and gendered experience within determinate social and historical situations. Beauvoir and Fanon, however, were not merely disciples of Sartre. Fanon, for example, was deeply influenced by Merleau-Ponty’s account of the “corporeal schema,” the Négritude movement, and psychoanalysis. Beauvoir’s work actively engaged the histories of philosophy and literature, as well as that of the natural and social sciences. Fanon and Beauvoir offer some of the most provocative and creative analyses of social identity to date.

A number of shorter pieces, including “Some Reflections on the Philosophy of Hitlerism,” show Levinas already addressing the question of Jewish existence prior to the war. After the war, Levinas continued to develop this line of thought, but now primarily in relation to Sartrean existentialism in general and Sartre’s Anti-Semite and Jew in particular. Anti-Semite and Jew provoked harsh criticisms, and Sartre himself admitted many years later that he did not properly treat the subject matter. His most controversial claim was that the anti-Semite makes the Jew. For Sartre, in other words, the sociohistorical conditions of anti-Semitism, rather than the past or a futural purpose, is what makes the Jew a Jew. While Levinas admitted that “Sartre’s notion that Jewish destiny is determined in function of anti-Semitism can be most disappointing,” he also highlighted the positive significance of Sartre’s attempt to criticize anti-Semitism using existentialist principles: “The most striking feature of Sartre’s struggle lies less in his victory than

---

[1] For further discussion of Fanon, see the essay by Lewis R. Gordon in The History of Continental Philosophy: Volume 5.
in the arms he employs. They are absolutely new. He attacks anti-Semitism with existentialist arguments.” 53 Much later, in “A Language Familiar to Us” (1980), Levinas also came to Sartre’s defense, not on the grounds of his account of the Jew, but on the grounds of his account of freedom, which, Levinas says, offered a “fundamental lesson of freedom” or “a message of hope” for a generation for which it had been lost – “regardless of all he might have thought and said” about the Jews (UH 92). In the meantime, Levinas spent much of the 1950s developing the Judaic dimension of his thought, including the notions of “Jewish humanism” and “holiness.” 54 Humanism of the Other (1972), which opens with an essay on Merleau-Ponty, shows, moreover, that the ongoing French debate over humanism and antihumanism provided the cultural context for the publication of Levinas’s last major work, Otherwise than Being or Beyond Essence (1974).

IV. THE INVESTMENT OF FREEDOM: THE 1960S AND BEYOND

By the end of the 1960s, Foucault, Derrida, and Deleuze would emerge as major voices of a new generation of French philosophers who sought to get out from under the immense shadow cast by existential phenomenology. But neither the birth of a new generation, the deaths of Camus in 1960 and Merleau-Ponty and Fanon in 1961, nor the passage to old age spelled the downfall of existential phenomenology. In fact, the 1960s and 1970s brought forth a second and third wave of major works: beginning with the first volume of Sartre’s Critique of Dialectical Reason (1960), Merleau-Ponty’s Signs (1960), Fanon’s Wretched of the Earth (1961), and Levinas’s Totality and Infinity (1961). These works would be followed by Sartre’s multivolume work on Flaubert, The Family Idiot (1971–72), Levinas’s Otherwise than Being or Beyond Essence, and Beauvoir’s The Coming of Age (1970), while Beauvoir’s The Second Sex became a major inspiration for feminism’s second wave. As the debate concerning humanism and antihumanism came to the fore, Levinas’s critique of Heideggerian ontology came to be seen in terms of the same debate. In this context, the possibility of an ethics on existential-phenomenological grounds remained a central concern, that – despite their differences – served to unite Sartre and Levinas in opposition to those who would dissolve the subject into the situation (or reduce consciousness to being). The relationship between the existential phenomenology of Sartre and Levinas thus represents one of the major issues of the later period.

53. Emmanuel Levinas, Unforeseen History, Nidra Poller (trans.) (Chicago, IL: University of Illinois Press, 2004), 73. Hereafter cited as UH followed by the page number.
54. Many of Levinas’s essays on Judaism were later collected in Difficult Freedom, Seán Hand (trans.) (Baltimore, MD: Johns Hopkins University Press, [1963] 1997).
Contrary to the Sartrean conception of freedom as an originary spontaneity, in *Totality and Infinity*, Levinas refers freedom back to a more fundamental passivity, that is, to a preoriginary alterity that incessantly troubles the identity of the same. Nevertheless, in referring freedom back to an originary passivity, Levinas employs Sartrean language against Sartre:

> Existence is not in reality condemned to freedom, but is *invested* as freedom. Freedom is not bare. To philosophize is to trace freedom back to what lies before it, to disclose the investiture that liberates freedom from the arbitrary. Knowledge as critique, as a tracing back to what precedes freedom, can arise only in a being that has an origin prior to its origin – that is created.55

Contrary to Sartre’s originary spontaneity, Levinas presents the identity of the same as always already troubled by the demands of the Other:

> The subject is “for itself” – it represents itself and knows itself as long as it is. But in knowing or representing itself it possesses itself, dominates itself, extends its identity to what of itself comes to refute this identity. This imperialism of the same is the whole essence of freedom … the Other imposes himself as an exigency that dominates this freedom, and hence as more primordial than everything that takes place in me.56

In his last major work, *Otherwise than Being*, Levinas similarly characterizes responsibility for the other, or the-one-for-the-other, as prior to “committed” (or “engaged”) subjectivity.57

From this perspective, Sartre and Levinas may be seen to defend radically opposed conceptions of subjectivity. However, toward the end of his life, in a series of controversial conversations posthumously published as *Hope Now*, Sartre began to conceive of ethics as foundational to consciousness:

> By “ethics” I mean that every consciousness, no matter whose, has a dimension that I didn’t study in my philosophical works and that few people have studied, for that matter: the dimension of obligation.

---

... In my opinion, each consciousness has this ethical dimension; no one ever analyzes it, and I should like us to.58

Sartre formulates a notion of freedom that simultaneously carries “the nature of a requisition” (HN 70) from the thought of ethics in his prior work:

I was looking for ethics in a consciousness that had no reciprocal, no other (I prefer other to reciprocal). Today I think everything that takes place for a consciousness at any given moment is necessarily linked to, and often is even engendered by, the presence of another … To put it differently, each consciousness seems to me now simultaneously to constitute itself as a consciousness and, at the same time, as the consciousness of the other and for the other. It is this reality … that I call ethical consciousness. (HN 71)

The proximity of Sartre’s later thought to Levinas’s was pointed out by Levinas himself in a later interview, where he links his use of the term “for others” to Sartre’s use in Hope Now: “Existing for others does not mean appearing to others but being devoted to others. This position is very close to my idea of both ethics and the general role of the category of ‘for the other’ in the very position of the ego or rather in the deposition of the ‘ego’” (UH 98). Interestingly, in “Meaning and Sense,” an essay (included in Humanism of the Other) in which Levinas frames his thought in relation to Merleau-Ponty’s theory of meaning, Levinas appeals to Sartre’s “striking observation that the Other is a pure hole in the world.”59

These interviews with Sartre were criticized by Beauvoir and others for distorting Sartre’s thought. Indeed, Beauvoir’s own Adieux: A Farewell to Sartre, which included her own interviews with Sartre, largely sought to discredit Hope Now, describing Benny Lévy as having taking advantage of an old man. Others, like Jean-Pierre Boulé, defended the interviews against Beauvoir, insisting that the interviews represented a new stage in Sartre’s thought. Ronald Aronson has suggested that most reactions to Hope Now may be read as various forms of ageism and that a more balanced and responsible approach to the text would be to locate Sartre’s own intention within “several fields of tension,” including the complex relationship with Lévy.60 Sartre was careful to insist that his rethinking of ethics as requisitioned freedom was not foreign to his earlier thought. Indeed,

he claims to have never conceived of the subject as a closed whole: “I really did envisage something that needed to be developed … the dependence of each individual on all other individuals,” where “dependence” does not signal nonfreedom, but rather a constraint that keeps intact free choice (HN 71–2). He thus regarded this “later phase” neither as a break with his earlier thought nor as a distortion of that thought. Rather, he identified an essential moment implicit in his work that needed to be deepened and explored. He refers this moment back to Being and Nothingness and suggests that “requisitioned freedom” as an ethical, “inner constraint” at the foundation of consciousness – that is, a self engendered by otherness in an ethical signification – can be found throughout his writings.

If Sartre gives to us a further determination of the ethical investment of freedom, Levinas’s thought might represent the sustained interrogation of this moment left implicit within Sartre’s philosophical works. For both Sartre and Levinas the ethical demand that “requisitions” or “invests” freedom means that freedom is not arbitrary but ethically elected. Contrary to the traditional opposition between the self-sufficient ego and the self as a mere moment within a general structure or historical movement, both Sartre and Levinas delineate a more primordial relation to others – an ethical demand at the root of political commitments. Indeed, both can be seen as negotiating the sense of responsible freedom within history – a sense given by the needs of others and articulated in terms of one’s response to them.

APPENDIX: EXISTENTIALISM IN SPAIN

The three most important Spanish existentialist philosophers were arguably Miguel de Unamuno, José Ortega y Gasset, and Xavier Zubiri. Unamuno (September 29, 1864–December 31, 1936; born in Bilboa, Spain; died in Salamanca, Spain) was educated at the University of Madrid (BA 1883, doctorate, 1884). His influences included James and Kierkegaard, and he held appointments as Rector at the University of Salamanca (1900–1924, 1930–36). He was a novelist, essayist, poet, playwright, philosopher, philologist, and political figure. The existentialist elements in Unamuno’s works can be found in his two most philosophical works: The Life of Don Quixote and Sancho (1905) and The Tragic Sense of Life in Men and Nations (1913). Both present the two pillars of Unamuno’s thought: (i) the battle between faith and reason, and (ii) the longing

---

62. The authors wish to thank Marianna Alessandri for providing this appendix on the Spanish existentialists.
for immortality. The tragic sense of life, for Unamuno, consists in a universal fear of death and longing for immortality, and is something that reason alone cannot alleviate or eradicate. As a self-proclaimed “irrationalist,” Unamuno rejected systematic philosophy and turned to a philosophy of the whole human being, or the “man of flesh and bone.” His thought thus emphasizes not just reason but also imagination, illusion, desire, fear, love, faith, and so on.

Nineteen years Unamuno’s junior, and a philosophical rival, José Ortega y Gasset (May 9, 1883–October 18, 1955; born and died in Madrid, Spain) was educated at the University of Deusto, Bilbao (1897–98), Complutense University of Madrid (1898–1904; doctorate, 1904) and University of Marburg. He was influenced by German neo-Kantianism (Cohen, Natorp) and phenomenology, and he held appointments at the Complutense University of Madrid (1910–36). Ortega was a philosopher, essayist, and literary critic, a student of Hermann Cohen, and an intellectual descendent of Dilthey, Husserl, and Heidegger. For Ortega, philosophy’s strength is its capacity for conceptual transparency, intelligibility, and clarity. José Ferrater Mora helpfully classified Ortega’s work into three phases: Objectivism, Perspectivism, and Ratio-Vitalism. Ortega’s first phase expressed a preference for abstract, rational ideas above all else, while the second considered the relationships between things to be crucial to understanding any idea. Famously repeating the phrase “I am myself and my circumstance,” Ortega claimed that distinguishing between an individual and her surroundings perpetuates a mistaken description of the world. Ortega’s third phase was his most existential in proclaiming reason as a product of living: “I think because I live.” His main philosophical works are Meditations on Quixote (1914), Invertebrate Spain (1921), and The Revolt of the Masses (1930).

As a student of Ortega, Xavier Zubiri (December 4, 1898–September 21, 1983; born in San Sebastián, died in Madrid) was educated at the University of Madrid (doctorate, 1921) and held appointments at the University of Madrid (1926–36), Institut Catholique, Paris (1936–39), and the University of Barcelona (1940–42), before returning to Madrid where he delivered private cursos (seminars) to a large group of dedicated followers. Zubiri argued for the importance of historical and existential context of thoughts and ideas. He also attempted to combine Aristotelian thought with the phenomenological tradition by claiming that the foundation for thought is not life, but the perception of reality. Like Ortega, Zubiri rejected the portrait of the subject presented in the history of philosophy as somehow detached from life. Instead, he posited that human beings possess “sentient intelligence,” so that what we apprehend is real, although this reality has not been adequately accounted for in the history of metaphysics. His main works include Nature, History, God (1942), On Essence (1962), and the three-volume work, Sentient Intelligence (1980–83).
Jean-Paul Sartre’s fateful encounter with Husserlian phenomenology was the result, in part, of a casual meeting with his erstwhile École Normale Supérieure classmate Raymond Aron, at which the latter, just returned from a fellowship year at the French cultural center in Berlin, waxed enthusiastic about this new approach to philosophy and urged Sartre to apply to do the same thing as he had done. Aron’s main point was that phenomenology, unlike the broadly idealist approach that was still dominating the French intellectual landscape in the early 1930s, opened the way for philosophers to give concrete descriptions even of everyday objects. Sartre applied, and was awarded the grant, which he utilized during the academic year 1933–34.

During this period Sartre did indeed study a number of Husserl’s principal works and wrote a short expository article, “Une idée fondamentale de la phénoménologie de Husserl: l’intentionnalité,” which was first published in

1. Raymond Aron (1905–83) was Professor of Sociology at the Sorbonne (1957–68) and held the Chair in Sociology at the Collège de France (1970–83). A close friend of Sartre and Beauvoir during the 1920s–30s, their relationship was strained after the Second World War, as Aron’s politics turned toward classical liberalism. A prolific writer, Aron published over thirty books of philosophy, sociology, history, and political analysis, including *Introduction à la philosophie de l’histoire* (Introduction to the Philosophy of History: An Essay on the Limits of Historical Objectivity), *La Sociologie allemande contemporaine* (German Sociology), and *L’Opium des intellectuels* (The Opium of the Intellectuals).
2. Jean-Paul Sartre (June 21, 1905–April 15, 1980; born and died in Paris, France) was educated at the École Normale Supérieure (1924–29). His influences included Heidegger, Husserl, Marx, and Nietzsche, and he held appointments at the Lycée du Havre (1931–33, 1934–36), Lycée de Laon (1936–37), Lycée Pasteur, Paris (1937–39, 1941), and Lycée Condorcet, Paris (1941–44).
the *Nouvelle revue française* in January 1939, in other words five years later, but which Sartre’s bibliographers Michel Contat and Michel Rybalka characterize as extremely important because it marked a major development in his thought and the beginning of a more original philosophical perspective on his part. Far from being esoteric, it stresses the distance of Husserlian phenomenology from the fixation – common, according to Sartre, to both the idealisms and the realisms of the past century – on knowledge as all-absorbing and on subjectivity and the inner life rather than a robust appreciation of things in the world. In short, this essay treated Husserl as a realist, but a realist of an entirely new sort: Aron had been right.

Another product of Sartre’s Berlin year, one that was longer and philosophically more original than “Une idée fondamentale,” was “La Transcendance de l’ego: Esquisse d’une description phénoménologique.” It first appeared as a long article in the journal *Recherches Philosophiques* (1936–37), and was only re-edited and published as a small separate volume in French in 1965. Meanwhile, however, in 1957, an English translation (by Forrest Williams and Robert Kirkpatrick) had been published in book form and was widely read and studied by Sartre scholars in the anglophone world. *The Transcendence of the Ego* expresses Sartre’s disappointment with Husserl’s introduction into his thought of the notion of a transcendental ego, which occurred in his Sorbonne lectures of early 1929, *Einleitung in die transzendentale Phänomenologie*, and had first been published in an expanded version in French translation (by Gabrielle Peiffer and Emmanuel Levinas) in 1931: in other words, two years before Sartre was to become aware of phenomenology. Against these *Cartesian Meditations*, the title by which everyone now knows this work, Sartre argues that the hypothesis of a transcendental ego is unnecessary and misleading, since the “I” that thinks is best understood as unsubstantial and spontaneous, not a fixed entity of any kind, whereas the conception of myself and of others as having such-and-such qualities is always a construction, and a corrigible one at that, which is best characterized by using the pronoun-object, that is, “le Moi” or, in English, “the Me.” This work clearly anticipates, in a number of basic respects, the ontological position that Sartre was to spell out in such detail in his *chef d’œuvre*, *Being and Nothingness*, although in the earlier work Sartre had still not developed the systematic terminology (in particular, the three regions of being: in-itself, for-itself, and for-others or for-another) for which the later work is so well known, and he strongly insists there on the impersonality of consciousness in a manner that readers previously familiar only with *Being and Nothingness* usually find

---

surprising. The Transcendence of the Ego concludes, in its final paragraph, with a ringing defense of phenomenology against charges that it is ultimately a version of idealism; rather, Sartre contends, phenomenology is the most realistic philosophical movement “in centuries,” opening the way for philosophers to be critical of the world’s many evils (suffering, hunger, war) and hence quite sympathetic with historical materialism without, for all that, subscribing to the “absurdity” of metaphysical materialism. This interesting anticipation of Sartre’s later engagement with Marxism is the only such reference in the essay, but it furnishes valuable evidence against the claim, once quite commonly voiced by some critics, that that engagement constituted a radical break, on Sartre’s part, with the phenomenological tradition as he understood it.

Back in France in the fall of 1934, teaching at a secondary school in Le Havre, Sartre returned to a set of topics that had interested him well before his introduction to Husserl and had, in fact, been the theme of the thesis that he wrote for his diplôme d’études supérieures in 1927: images and the imagination. The first portion of what he completed, intended as an introduction to the full work, was published separately in 1936 under the title L’Imagination; the title of the later English translation is the same, The Imagination. Since it is primarily a historical survey of various earlier theories (associationism, Bergson, the Würzburg School, etc.), one can readily see how Sartre was able to rely primarily on adaptations of his earlier research for much of its content. Only in the brief final chapter does he present Husserl’s phenomenology as the gateway to truly understanding what an image is. But at the same time he is not uncritical, suggesting that, while for the most part Husserl seems to observe the distinction, crucial for Sartre at this point, between imagining and perceiving, he does not provide a full account of what the hyle of an image is, and suggests that there may be a need to go beyond eidetic description (although this must remain the starting-point) to experimentation in order to complete the account. In the final sentence of this book, Sartre promises to undertake a future work containing a phenomenological description of the image structure.

In fact, this work was already largely completed; it had been the decision of the publishing house (Félix Alcan), to publish only the portion that we know as L’Imagination. But the remainder eventually appeared in print in 1940, that is, four years later, under the title L’Imaginaire, psychologie phénoménologique de l’imagination. (To make the bibliographer’s task just a bit more confusing, an early English translation of this was given the title The Psychology of the Imagination, whereas a recent [2004] and much better translation restores

the spirit and letter of the French title: *The Imaginary: A Phenomenological Psychology of the Imagination.*) Here, Sartre explores many different forms of image and image-related phenomena, from symbols to dreams, referring to many other writers in addition to Husserl, and concludes with a discussion of art and the aesthetic attitude. Throughout, he remains firmly wedded to the idea that imagination, as that type of consciousness that evokes the “irreal,” is a form of consciousness distinct from such other forms of consciousness as perception, which focuses on the real. As a whole, the work is probably Sartre’s most sustained effort consistently to carry out phenomenological description, and little else, within the framework of Husserlian methodology as he has adapted and reinterpreted it, and in certain ways, in style and range of content, it is anticipatorily reminiscent of Merleau-Ponty’s later and much longer *Phenomenology of Perception*, where this Sartrean study will in fact be cited from time to time.

The next several years saw Sartre involved in various literary efforts, the most important being the ongoing revision of the manuscript of his most famous novel, *Nausea*, and at the same time continuing his secondary school teaching, the venue of which changed from Le Havre to Laon for one year, and then to the Lycée Pasteur in Paris in the fall of 1937. It was then that he undertook, as he explains in his posthumously published *Carnets de la drôle de guerre* (*The War Diaries*),5 to write a long treatise, still in the Husserlian tradition while maintaining a distance from the letter of Husserl’s philosophy, to be entitled *La Psyché*. If we are to believe him (and why not, given the absolutely prodigious quantity of those of his writings with which we are acquainted?), he wrote 400 pages of it in three months, then stopped in order to complete editorial work on his book of short stories (*Le Mur*), and never returned to it. One small portion of it, and only one, was published as a short monograph in 1938: *Esquisse d’une théorie des émotions* (*The Emotions: Outline of a Theory*). This work – self-contained, clear, and rather original – analyzes emotions as kinds of “magic” responses that we adopt as ways of coping with new situations, without ever fully succeeding in identifying ourselves with any of our emotions (e.g. never becoming entirely saturated with the anger that we display). It anticipates, in a very interesting way, Sartre’s much more complex critique of traditional views of the human person as consisting of certain fixed qualities, traits of “character,” and so on that will be one of the central messages of *Being and Nothingness*.

Just how does Sartre explain his abandonment of *The Psyche*? Above all, he says, it had to do with his increasing discomfort with what he saw as idealist tendencies in Husserl and his increasing dissatisfaction (of which he only became fully aware in retrospect), during that time, with at least two fundamental issues

---

that he found it impossible really to resolve within the Husserlian framework as he had inherited it: the issue, previously mentioned, of the “passive matter” in consciousness to which Husserl had given the name *hyle*, and the question of how to assure oneself that other minds do indeed perceive the same world as I do. At the same time, the gathering war clouds contributed to his distraction from his more austere methodological concerns of the past and motivated him to take seriously, for the first time, the work of Heidegger, which he had previously dismissed as somewhat barbaric. There exists no complete, sustained, systematic Sartrean account of exactly how this first in-depth reading of Heidegger, especially of *Being and Time*, reshaped his own thinking to such an extent as to play a major role in inducing him so quickly to conceive and compose *Being and Nothingness*: we have only some occasional, scattered references to this development in the *Diaries* and in his contemporaneous letters to Simone de Beauvoir. Some scholars have even voiced the suspicion that the systematic ontology elaborated over several hundred pages in *Being and Nothingness* is derivative, not so much from Heidegger despite the numerous texts in which Sartre engages with and critically discusses the latter, but rather from the mind of Beauvoir, who was his closest companion and the prepublication reader of all, or almost all, of his manuscripts (as he was of hers). This suspicion has been further fueled by the relatively recent discovery of diaries that Beauvoir wrote when an adolescent, parts of which evince greater background knowledge of philosophy and greater philosophical creativity during those early years than had previously been attributed to her, as well as by a new awareness that Sartre had read, at an earlier stage than had previously been believed, a draft of her novel, *L’Invitée (She Came to Stay)*, which contains numerous philosophical reflections reminiscent of some basic ideas (particularly concerning relations with others) contained in *Being and Nothingness*. “Thus,” comments a leading Beauvoir scholar, “Beauvoir’s novel, long assumed to be an application of Sartre’s philosophy in his essay, was instead discovered to be one of its sources.”\(^6\) There should be no doubt that Beauvoir was a stronger and more original philosophical thinker than she, partly out of deference to her companion with respect to the domain of philosophy, ever acknowledged. Indeed, her *The Second Sex*, while remaining indebted in some basic ways to Husserlian phenomenology, plows new conceptual furrows that neither Sartre nor any of her other contemporaries came close to exploring in such depth. Nor should there be doubt that she exerted a considerable influence on his thinking. But so did he on hers. Continuing research on the details of exactly how each influenced the other will almost certainly prove valuable, but

---

engaging in polemics with a view to disparaging one or the other is unproductive. It is time now to call a (temporary) halt to my chronological narrative and to confront directly the landmark phenomenon that is *Being and Nothingness*.

It is very important, for understanding the evolution of philosophy in the twentieth century, not to forget that the subtitle Sartre gave this work was “Essay in [literally, “of”] Phenomenological Ontology” (*Essai d’ontologie phénoméno-logique*). Ontology had not been a central preoccupation of Husserl’s, although he had left the door open for it as a possibility within the framework of his grand research project. For Heidegger, on the other hand, no aspect of philosophy was of greater importance, even though he gradually came to eschew the word, “ontology,” itself, because of what he came to regard as its deeply misleading connotations. *Being and Nothingness* begins with a somewhat forbidding introductory chapter that purports to establish, giving due credit especially to Husserl and Descartes, that, if we are to overcome the dualism of appearance and being as well as most of the other dualisms (such as realism and idealism) that have long dominated philosophical thought, there must be a “region” of being that is “transphenomenal,” that is, not exhausted in any or all appearances, and yet at the same time is not of a different order of reality from the appearances (in other words, is not some hidden “noumenon”). He calls this region (the term, “region,” is derived from Husserl) “being-in-itself” and concludes that all that we can validly say about it is that it is, that it is what it is, and that it is in itself. In the course of this same analysis he makes reference to consciousness, accepting Husserl’s famous statement that every consciousness is a consciousness-of, and determines that consciousness must belong to a different region of being, which he denominates “being-for-itself.” It would not be a great oversimplification to say that all the rest of this long book is an extended analysis of the interrelationships and interactions between these two regions of being, although almost halfway through Sartre will introduce yet a third “mode of existence” that he will insist is as fundamental as being-for-itself and that he will call “being-for-others” (*pour autrui*, more literally “being for another”).

Sartre proceeds to approach his exploration of the nature of the *pour-soi*, the for-itself, by first examining some familiar experiences of negation and negativity (for which he coins the general term “néagtités”), such as that, dear to the hearts of Kierkegaard and Heidegger before him, of anguish or dread, or that of vertigo, or the discovery that someone whom one is expecting is not present as expected, and so on. The inference that he draws from these analyses is that the for-itself is literally nothing (“nothingness,” *le néant*), in itself. Contrary to

7. As is, alas, all too often the case, the generally trustworthy, although of course not impeccable, English translation by Hazel Barnes bears a slightly, but importantly, misleading subtitle: *A Phenomenological Essay on Ontology*.
Descartes’s conception of the cogito as an immaterial but substantial mind that thinks, consciousness for Sartre is insubstantial but active, spontaneous, free; in his deliberately paradoxical formula, it is the being “that is what it is not and is not what it is.” It is in this early context of elaborating on our experiences of negation that Sartre introduces, as a particular instance to be explored in greater detail, his analysis of “bad faith,” a lie that one tells to oneself, which has since become perhaps the book’s single best-known chapter. Faith itself, he concludes, is what he calls a “metastable” phenomenon.

Sartre’s for-itself can never, as it were by definition, exist apart from the in-itself. Hence, the idea of “facticity,” already proposed by Heidegger, is of crucial importance to him: I always exist, to employ another favorite Sartrean expression (one that gave the title to his ten-volume series of shorter essays, Situations), in situation. As examples of facticity he selects, and analyzes in some detail, my place, my past, my environment, my fellowman, and my death (while assigning to this last a much less central role than it plays in Heidegger’s thought) – in addition to a long discussion of the body as facticity, about which Sartre writes more interestingly and in a more nuanced way than brief summaries of his work usually acknowledge. Although one cannot hope to do more here than skim the surface of the themes developed by him, and then only in a highly selective way, I may note a few more highlights that have attracted particular attention and helped shape a large body of philosophical discussion that was generated in the book’s wake. One is his treatment of values as constructed rather than “given” or “natural”; his famous remark, already adumbrated in The Transcendence of the Ego if not even earlier, to the effect that there is no such thing as a fixed “human nature” epitomizes this. Another highlight is his lengthy treatment of temporality, drawing in some ways on both Husserl and Heidegger and sharing in their critiques of the often taken-for-granted idea of the priority of physical time, but placing in a rather original perspective all three temporal dimensions of past, present, and future. (For Sartre, the past is certainly a part of facticity, as already noted, and yet through our free choices we can and often do alter the meaning of the past, or of any portion thereof; the present takes a certain priority over the other two dimensions; and our “projects” toward the future are fundamental to explaining what it means to act.) Yet a third highlight is Sartre’s proposed solution to the problem of “the Other,” which is to focus on the common experience of being looked at, and hence objectified, by another – an experience that, without involving deductive reasoning or any other type of logical inference, establishes with undeniable certainty that I live in a world with other selves; this notion of the “look” (or “gaze” – le regard) of the Other as a defining characteristic of human experience has been of great influence over a wide range of later thinkers, especially in France. (It is not unreasonable to regard this aspect of Sartre’s philosophy as his response to the dissatisfaction
that he had felt with Husserl’s treatment of intersubjectivity.) A fourth highlight is his chapter on “concrete relations with others,” in which he deals with various possible attitudes and behaviors, particularly of a sexual nature (such as desire, love, sadism, and masochism), starting with the premise that conflict – not always actual, of course, but always potential, given the inevitability of mutual objectification disclosed in the analysis of “the look” – is fundamental to all such relations. Not nearly so unremittingly gloomy as a bare, abstract summary of its topics and themes is likely to make it sound, this series of descriptions of certain concrete human relations is a rather bold venture into territory left mostly unexplored by other philosophers; at the same time, it represents a kind of response to Freud. (This fact is made clearer in parts of the final regular chapter of Being and Nothingness, where Sartre proposes, as a suggestion for others to implement, the development of what he calls “existential psychoanalysis,” to be rooted in his unswerving assumption of the priority of human freedom both as an ontological truth and as basic to the explanation of all human behavior, as opposed to Freudian, or other, determinisms.)

As even this very short condensation of just a few of the principal themes of Being and Nothingness should have made abundantly evident, its atmosphere, if not so clearly in the introductory chapter then certainly thereafter, is light years away from the dominant atmosphere of Husserl’s writings, with their strong emphasis on developing a rigorous methodology. Sartre still makes considerable use, throughout the book, of techniques of phenomenological description – his famous illustrations of “bad faith” beginning with the too-perfect cafe waiter are good examples of this – but most usually at the level of everyday experiences and without observing some systematic protocols that Husserl would have considered necessary. The very centrality for Sartre of the enterprise of ontology, mentioned earlier, is in itself a significant departure from Husserl’s concerns, much closer to Heidegger’s, but also differing considerably from the latter by virtue of the basic contrast between Heidegger’s orientation toward Being and Sartre’s anthropocentrism. (One has only to read and compare Heidegger’s “Letter on Humanism” with Sartre’s later-published lecture, “Existentialism is a Humanism,” to see this contrast. While it is true that the lecture is a popularization that makes no mention of the distinction between two or more different kinds of “humanism” that is to be found elsewhere in Sartre’s writings, and while it is also true that Heidegger emphatically denies that his rejection of the “humanism” that he takes Sartre to be endorsing there makes his own position antihuman, the root differences of philosophical perspective are clear.) In addition, Being and Nothingness is suffused with numerous hints, although often they are little more than that, concerning various aspects of value theory: something conspicuously absent from most of Husserl’s work, at least until his final years. Besides the previously mentioned section on “the For-Itself and the Being of Value,” one may cite as
examples Sartre’s famous footnote at the end of his chapter on bad faith that holds out the possibility of a radical escape from bad faith in the form of “authenticity” – a discussion of which, however, he says has no place there; his dismissal of the hypothesis of a God as being the impossible pure confluence of in-itself and for-itself, and his concomitant view of the ultimate human project as that, again an impossibility, of becoming God; and, most important, his promise in the book’s final paragraph to write a book on ethical issues in the future. In short, Being and Nothingness played a key role in opening up an exciting new philosophical and, more generally, intellectual world, one that was to resonate with the spirit of the time that began in France, with the Liberation of Paris in late summer 1944, a little over a year after its publication, and gradually and to some extent came to prevail in much of the rest of the West. Cautious philosophers might refer to the rise of “existential phenomenology” or even of “phenomenological existentialism,” but to the broader public it was simply the vogue of “existentialism.”

Although, of course, Sartre’s more strictly literary works commanded a wider early audience than his long and somewhat difficult philosophical treatise, it would be an error to think, as some have claimed, that Being and Nothingness remained virtually unknown and unappreciated during its first years in print. A survey of early reviews of it reveals a few that were written (e.g. Gabriel Marcel’s first review, published somewhat later but dated “November 1943”8) and others that were already published before or close to the time of the Liberation (e.g. one by an anonymous reviewer for the Revue de métaphysique et de morale and another by Alexandre Astruc, from 19449), a time at which any such activity was necessarily rather difficult. Thereafter, beginning in 1945 (Izard in the Argentine journal Sur, A. J. Ayer in Great Britain, A. de Waelhens in Belgium, P. Godet in Switzerland, and R. M. Albérès, F. Alquié, J. Beaufret, R. Campbell, M. de Gandillac, C.-E. Magny, J. Mercier, and R. Troisfontaines in France), and continuing from early 1946 (H. Arendt, W. Barrett, I. Lepp, J. Wahl, et al.) onward, one finds quite an array of reviewers and their reviews in various publications both in France and elsewhere, with a considerable majority concurring in recognizing the great importance of the new philosophy that it contained – even including those, such as Ayer and Barrett, who for one reason or another did not like it.10 The case of Marcel, at the time probably the best-known original

philosopher among the names I have just mentioned, is especially instructive and interesting in this regard. Although he had invited the young Sartre to present a paper at one of his regular, popular prewar at-home receptions and had encouraged him to expand on the idea of a psychoanalysis of things that had been his theme in that paper, Marcel later developed an ever-increasing bitterness with regard to Sartre’s thought, identifying it with atheism, immorality, and the younger generation; nevertheless, or perhaps in part just for this reason, Marcel did not attempt to deny Sartre’s significance and influence. By 1945, Sartre had achieved the celebrity status that he continued to have for the next decade or so, and it was his philosophy, as much as and probably more than his dramas, his prose fiction, or his rapidly expanding work as an essayist and editor identified with the new journal, *Les Temps modernes*, that gave him this status.

Given the principal theme of the present volume, which is three crucial mid-century decades of responses to phenomenology, I think it would be a mistake to devote space in this essay to Sartre’s extensive work between 1943 and 1960 in the other genres that I have just mentioned (with the partial exception of a couple of the essays). On the other hand, 1960 is the perfect cut-off year for a presentation of Sartre’s historical role as a philosopher, because it was in 1960 that Volume One of the *Critique of Dialectical Reason*, the only part of that work to appear during his lifetime, was published. 11 However, although for many years few Sartre scholars were aware of this, Sartre devoted considerable effort during the immediate postwar years to writing what was to have been his promised work on ethics, only to decide eventually to abandon it. Despite this decision, he did not discard the abandoned manuscript, and it finally appeared posthumously in print in 1983, edited by Sartre’s adopted daughter and literary heiress Arlette Elkaïm-Sartre, under the title *Cahiers pour une morale* (*Notebooks for an Ethics*). It is a mélange, composed of two notebooks totaling more than 650 pages, plus two brief appendices: one on “the good,” dated from a time in December 1945 when he was taking a long sea voyage to the United States; the other on oppression, focusing on the American slave experience. It is filled with interesting insights and details, but it is by no means a finished effort. Since, moreover, it obviously had no impact on the philosophical world at large prior to 1983, and has had relatively little impact even since then, it does not merit extended attention here. But I will first pick out for mention, in passing, a few of its interesting aspects, then consider possible broader implications of Sartre’s decision not to edit it or publish it.

It is clear from the earliest pages of the first notebook that history has begun to play a much more central role for Sartre than in his earlier work.

---

*11. Sartre’s *Critique of Dialectical Reason* is discussed in detail below and in my essay in *The History of Continental Philosophy: Volume 5*.†
He is beginning to believe that an acceptable ontology must be fundamentally historical, and he gives numerous indications of the influence that his careful reading of Alexandre Kojève’s work on Hegel is exerting on him. At the same time, especially since Kojève is notorious for insisting on the close connection between Hegel and Marx but also no doubt in light of the enormous importance being accorded to Marx and to Marxism within the French intellectual climate, Sartre in the Cahiers shows much greater interest than before in such notions as class struggle, labor, alienation, and, of course, dialectics, as well as in the meaning of history. While critical of the Communist Party for its prevarications and inclined to consider Hegel a better philosopher than Marx and the atomic bomb as of greater importance than the Russian Revolution, Sartre now takes very seriously the idea of the “end of history,” which he sometimes equates with the idea, already mentioned occasionally in Being and Nothingness, of a “radical conversion,” but now treated, often implicitly and sometimes explicitly, as a social, even global, rather than merely individual, future possibility. From this point of view, Sartre sometimes treats his earlier work dismissively, as at best a description of “the hell of the passions”\textsuperscript{12} rather than of the full range of human capabilities, and recognizes (quite rightly, in my opinion) the inadequacy of its treatment of the “we,” of humanity as collective. He now sees “revolutionary socialism” as the ideal, although perhaps only a regulative ideal, and fluctuates between critiquing traditional ethics as a study in the \textit{status quo} and looking for a new Ethics beyond traditional ethics that would seek to overcome oppression and realize true equality and freedom. Within this general context he engages in fascinating, quite original phenomenological (in the broad sense) descriptions exploring such diverse themes as the basis of law in violence; prayer (or pleading), threats, and demands (or requirements); failure, ignorance, and stupidity; the relations of parents to children; and the oppression of women.

Another, albeit mostly implicit, influence on Sartre in the Cahiers is the much-discussed little book on “the gift” written by the anthropologist Marcel Mauss.\textsuperscript{13} Sartre connects this concept with the virtue of generosity, which at some points he seems to treat as the capstone of a value hierarchy in the sought-for new ethics. (A deep irony that he may not have fully appreciated is that this same phenomenon, generosity, was accorded a sort of capstone role by Descartes in his Passions of the Soul.) This may go further than any of the other proposed explanations (such as that noted by Beauvoir, in her autobiography of the period, to the effect that Sartre became firmly convinced that ethics was

\textsuperscript{12} “The hell of the passions” (Jean-Paul Sartre, \textit{Notebooks for an Ethics}, David Pellauer [trans.] [Chicago, IL: University of Chicago Press, 1992], 499).

\textsuperscript{13} Mauss is discussed in the essay by Mike Gane in \textit{The History of Continental Philosophy: Volume 3}. 

Volume 4
simply a manipulative bourgeois trick designed to help us live with a world filled with oppression) by way of accounting for Sartre’s eventual abandonment of the entire project embodied in the extant *Cahiers*: he was simply unable satisfactorily to bring together so many disparate strands of thinking. For example, it is difficult if not impossible to envisage a future ethic that would be in some sense axiological (a hierarchy of values) without putting into serious doubt the radical critique of traditional notions of value that characterizes his treatment of that theme in *Being and Nothingness* and even of some other texts in the *Cahiers*. Sartre also came to realize that the latter exhibits certain obvious elements of idealism, which he had always attempted to shun, and decided that this work was a failure. In several important senses he was right, although its variety of rich insights makes it worth reading nonetheless.

Of course, Sartre’s concern with ethical issues never really “went away.” It is arguable that his long, probing biography of the playwright, Jean Genet, entitled *Saint Genet, comédien et martyr* (1952), in which Genet’s having been branded a thief when still a child is hypothesized as helping to explain many aspects of his later, conflict-filled life, is among other things a masterly study around the fundamental moral question of the meaning of good and evil. His 1964 Gramsci Institute paper on “Ethics and Society,” the background manuscript for which has yet to be published in its entirety, constitutes a serious although sketchy effort at developing a socialist ethic, aimed at bringing about a genuine human society for the first time (*faire l’humain*), and influenced as much by the Algerian struggle for independence as by anything in classical Marxism. (This institute, in Rome, was among other things a gathering-place for Italian communist intellectuals, with whom Sartre, who vacationed frequently in Rome, felt more at home than with most of their more rigid and dogmatic French counterparts.) Of equal interest are the notes that Sartre sketched for presentation in lecture form at Cornell University but never gave because he felt obliged to cancel his planned visit (in 1965) in protest against the United States government’s escalation of its war against Vietnam; in them, as well, through the exploration of themes as diverse as the decision of a group of Belgian mothers to have their infants aborted when it was discovered that they had become severely deformed through the mothers’ having been prescribed the drug thalidomide, and the Kennedy–Humphrey Presidential primary contest in West Virginia, in which Kennedy’s Catholicism was a central issue, Sartre focused primarily on ethical issues. It could even be argued, as some have attempted to do, that there are the germs of yet a new Sartrean ethic in the three published dialogues, given the collective title *L’Espoir, maintenant* (*Hope Now*), that Sartre had with his secretary and confidant, Benny Lévy, at a time that proved to be the eve of his death (1980). And it can also be argued, quite plausibly, that the later Sartrean work with the most extensive ethical implications,
even if they must be inferred obliquely, is the *Critique of Dialectical Reason*, to which I will turn shortly.

One quite short essay that Sartre wrote after having set aside the *Cahiers* and that he also failed to publish occupies a special niche: it is *Vérité et existence* (*Truth and Existence*), written in 1948 and finally published in 1989. In her introduction to it, Arlette Elkaïm asserts that it is, to her knowledge, the only posthumously published mature work of his that gives the appearance of being a finished piece.¹⁴ If one were to try succinctly to characterize its single central theme, a task made difficult by its excessively grandiose and sweeping title, it would be that of the so-called “meaning [or truth] of history,” one of the principal issues that were to come into play in Sartre’s 1952 quarrel and rupture with Camus. In *Truth and Existence*, Sartre attempts to occupy a middle ground between the relativist view that there is no such thing as a truth of history and its absolutist opposite, that there is a single such truth. He is very clear that truth must be anchored in intersubjectivity, and hence that the understanding of the past is bound up with the changing perceptions of successive generations of human beings. Thus, there can be no final truth of history, even if (and when) humanity ceases to exist, since even at that point there will be no one and no outside entity to close humanity’s eyes. Meanwhile, a certain degree of ignorance will and must always accompany our historical projects, whatever they may be: if we could foresee our “destiny” with certainty, we would no longer be free. The idea of a universal truth is a pure abstraction, he says, yet to acknowledge this is by no means equivalent to denying that there are historical truths, based on the availability of evidence. This little essay is one of the most important keys, in my opinion, to understanding the connection between the so-called “early” (ontologically oriented) and “later” (more historically oriented) Sartre, showing with great clarity that there was a process of intellectual evolution rather than a truly “radical conversion.” Indeed, as he himself points out in the essay’s first paragraph, every conversion doctrine runs the risk of being ahistorical.

History certainly played a commanding role in Sartre’s life and thought during the tumultuous Cold War years between 1945 and 1960. One of his most discussed and influential monographs/essays of that period was *What Is Literature?*, first published in segments in six successive monthly issues (in 1947) of *Les Temps modernes*, which probes above all the question of whom one writes for and concludes that, given the nature of the writer’s contemporary readership and of the times in which they were living, the only acceptable type of prose literature would have to be one of commitment (or “engagement”: littérature engagée). Writers could no longer remain “above the battle.” But in the context of that

---

period particularly in France, and in fact to some extent worldwide, one could not avoid taking some stance with respect to Marxism as part of that engagement. Less well known but of comparable importance in understanding Sartre’s evolution is a shorter essay from mid-1946, “Materialism and Revolution,” in which Sartre had endeavored to delineate just such a stance for himself. Its message is one of solidarity with the revolutionary ideal that was espoused by the so-called “orthodox Marxists” who dominated the then quite powerful French Communist Party, of an understanding of the value of that Party’s crude historical materialist ideology in helping to rally workers to the cause (because materialism implies a fundamental equality among all human beings, undercutting any claims to superiority on the part of some privileged individuals), but of an ultimate rejection of such materialism as a myth because its dogmatic determinism seeks to deny the reality of human freedom. In this essay, Sartre calls for the creation of a philosophy of freedom that would be dedicated to the same revolutionary ideal without needing to rely on the materialist myth. Sartre’s later essays of the same early postwar period, during a portion of which (in the early to mid-1950s) his practical efforts at collaborating as much as feasible with the communists while not joining the Party or giving up his intellectual independence reached their height, are heavily oriented toward political issues: the struggle against the remnants of colonialism, especially in Africa; the cruel and hopeless French war in Indochina; the prosecution of a young French sailor, Henri Martin, for distributing leaflets opposing that war; the outbreak of the Korean War and his somewhat related, somewhat disconnected break with his increasingly anticommunist colleague Merleau-Ponty; and so on. The appearance in mid-1955 of Merleau-Ponty’s Les Aventures de la dialectique, the long final chapter of which famously accuses Sartre of “ultra-Bolshevism,” must have intensified Sartre’s desire to meet the challenge of creating a new, freedom-based revolutionary philosophy that he had himself posed in “Materialism and Revolution.”

In early 1956, one of history’s predictably unpredictable watershed events occurred, to wit, Nikita Khrushchev’s denunciation, meant to be kept secret but soon made available to the world, of the many crimes and excesses of his predecessor, Stalin. This ushered in the period of the so-called “Thaw” in the Cold War, which incidentally provided the opportunity for Sartre to move beyond occasional political essays to serious, systematic social and political philosophy, culminating in the Critique of Dialectical Reason. The mechanism for this was a Polish intellectual journal, Twórczość, the editors of which decided to profit from the relatively greater intellectual freedom permitted under the new dispensation to prepare a special issue (in 1957) on contemporary thinking in France and invited Sartre to be one of the contributors. He accepted, and the resulting essay, published separately in English translation under the title Search for a Method but appearing in French as the preliminary essay, “Questions de
méthode,” in the same volume as Volume One of the Critique proper, constitutes a major statement of Sartre’s view of the then-current situation of philosophy. It begins with the outline of what amounts in fact to a rather simplistic conception of the history of philosophy, according to which every major period is defined above all by one or at most a couple of great systematic thinkers: Descartes, Kant, Hegel, and so on. Our period, says Sartre, is the period defined by Marx, and so every other contemporary philosophical position must be understood as either somehow dependent on or reactive against his thought. From this perspective, existentialism must be seen as an “ideology” (Sartre’s use of this word here is unclear and out of step with most recognized usages) that is subordinate to Marxism, but is nevertheless a needed corrective to the course taken by mainstream Marxism proper, which has effectively come to a halt and grown out of touch, in certain important ways, with reality. What existentialism most emphasizes, while recent Marxism has neglected it, is the individual human being with his or her particular characteristics and the freedom to choose his or her individual projects, albeit within the framework of larger sociohistorical structures. Today’s Marxists, Sartre remarks at one point, speak as if a person comes into existence only on beginning his or her first job, as if he or she had had no childhood. Freidians certainly acknowledge and even emphasize childhood, but fail to recognize other aspects of complete human existence. Behavioral social scientists neglect the dimensions both of freedom and of history. To explain why an individual turns out in one way rather than in any other possible way, Sartre argues, a new method is needed that would involve first undertaking a kind of “archeology” (to employ Foucault’s term anachronistically), uncovering the social and historical layers underpinning that individual’s environment, and then a reconstruction of his or her personality as it develops and manifests itself through that person’s life. Sartre borrows the term “progressive-regressive [more accurately, regressive-progressive] method” from an article written by his Marxist contemporary, the sociologist/philosopher Henri Lefebvre, as the best available label for this sought-for approach to anthropology (in the broad, European sense of that word); he accordingly describes his task as being that of developing “a structural and historical anthropology” and calls the Critique proper a “prolegomenon to any future anthropology,” and his lengthy, much later study of Gustave Flaubert (who is used frequently as an example in Search for a Method), The Family Idiot, will be identified at the outset as a detailed attempt to carry out this very approach.

Sartre began writing the Critique in late 1957 and was able to hand the manuscript of Volume One, subtitled “Théorie des ensembles pratiques” (Theory of practical wholes), to Gallimard for publication in early 1960. It was an enormous effort, undertaken under great stress brought on by both personal and political factors (this period was the height of France’s extremely self-destructive
effort to preserve its hegemony in Algeria), and its often verbose, unedited style reflects this. Volume One is, in effect, a detailed manual of the regressive part of Sartre’s “method;” Volume Two, which, although long, is obviously unfinished and would ideally have ranged over much wider territory than its posthumously published version actually contains, is nevertheless an illustration of the progressive part of the method, as its subtitle, “The Intelligibility of History,” suggests. The focus of the largest part of Volume Two is Stalin’s Soviet Union during a period in the 1930s; while it is quite interesting in a number of respects, I will not try to summarize it here, since its very belated publication and the fact that it is still studied only quite infrequently by philosophers, even by comparison with Volume One, makes it of marginal relevance to the overall presentation of Sartre’s thought between 1930 and 1960 that I have been attempting. It is true, to be sure, that Volume One itself has been much less frequently commented on than its earlier counterpart, Being and Nothingness, but it deserves somewhat greater attention here than its sequel both for its content, which is philosophically quite challenging, and because of its role, as I believe we can now see in retrospect, as the embodiment of the end of an era.

The overall scheme and structure of this often highly complex work are themselves fairly simple to recount. After a long introductory section that pursues the methodological concerns raised in Search for a Method but at a much higher level of both systematicity and abstraction, Sartre introduces an imaginative structural picture of the individual human being working on inert matter (e.g. as a peasant farmer) under conditions of material scarcity in order to produce enough to satisfy his basic needs and stay alive. The human being, in this account, is characterized above all by “praxis,” the more action-oriented, less purely intellectual term, taken from the early Marx, that serves the same basic function as did “for-itself” in Being and Nothingness. (Inert matter is the counterpart of “in-itself,” as Sartre himself affirms in a long footnote well into the text that involves one of the very few cross-references to his early work to be found in the Critique.) This necessity-driven activity creates a domain that Sartre denominates the “practico-inert,” a domain in which there comes to be an appearance of role reversal, with the free being of praxis, the human being, becoming objectified in the struggle against recalcitrant matter. This is the point at which Sartre introduces the element of collectivity, of intersubjectivity, that will be his principal concern in the Critique: human beings in such a passive, dominated condition are forced to work together – basically, again, in order just to survive – in social structures that Sartre denominates “series,” their common condition being given the designation of “seriality.” Sartre offers many concrete illustrations, in the form of (loosely) phenomenological descriptions, some of them rather unforgettable. Examples are the actions of the Chinese peasantry succeeding, over generations, in cutting down the trees along the banks of the
Yangtze for such uses as firewood, thus inadvertently contributing, through erosion, to the devastating annual floods (an especially good illustration of the historical phenomenon that Sartre calls “counter-finality”); or, in a less sinister vein, the commuters queuing for a bus at a stop in Paris, each remaining as oblivious as possible of the identities of the others; or the broadcast of propaganda over a government-controlled radio station to thousands of listeners who are impotent to respond; and so on. After much detailed analysis of such serial conditions, Sartre moves to the book’s climax, in which we are confronted with the possibility of an alternative form of social formation, a manifestation, at least in its initial phases, of human freedom expressed collectively, which he calls “the group.” The group formation that he famously chooses as his principal illustration is the taking of the Bastille by residents of one incipient working-class district of Paris who felt themselves to be under threat of being massacred by government forces and who somehow conceived the idea of seizing and occupying this large fortress-prison that loomed over the only route of access to the neighborhood. These individuals engage in a genuinely free common *praxis*, which, however, as Sartre insists, is always constituted rather than constitutive and can never become a single “organism.” Initial success, however, if there is such, soon gives way to the need to begin to develop some forms of organization – for instance, in this historical case, the need to assign hours of standing guard to warn against any possible attempt by the authorities to regain control – and this process will ultimately lead to the taking of some sort of pledge, or oath, of solidarity, and eventually to much more advanced forms of institutionalization and finally of bureaucratization. And so the circle will be closed, so to speak, and something closely resembling the original condition of seriality, but far more complex, will return.

Despite the apparent pessimism of this scheme, to say nothing of Sartre’s depiction of human beings under primitive conditions of scarcity as cruel and destructive, he insists throughout that the dialectical progression being sketched is at every point reversible and by no means necessary. He keeps his commitment to the reality of freedom even while obviously admitting to far more elements of determinism in the world than the reading of *Being and Nothingness* would have led us to expect, and there are even a few isolated passages in which, while they do not contain the old language of “radical conversion,” seem to hold out the possibility of a world, or at least of isolated milieux, in which free group *praxis* could be sustained indefinitely. The last principal section of the volume is entitled “From the Group to History,” and, while including a number of references to the concept of class and related notions and allusions to recent history, is intended above all to pave the way for reflections on the history of our increasingly “one World” (Sartre prefers to use this English-language expression, something that is quite unusual for him) as ultimately a single “totalization”
– his word for ongoing and indefinite forward progress (although certainly not necessarily in the Enlightenment sense of “progress!”) across time – which he consistently contrasts with “totality,” the view of a society or a segment of history from the outside, as frozen.

This, then, to paraphrase Hegel near the end of his own Philosophy of History, is the point to which Sartre’s consciousness had attained by 1960: the completion of the first volume of a new magnum opus, one that is far richer and more varied than can possibly be conveyed in a brief summary, but one that never became the succès fou that Being and Nothingness had been. Soon, the voices of other philosophers – Althusser, Foucault, Derrida – would begin to be listened to more attentively than Sartre’s, at least in his own country. It may well be, of course, that eventually the Critique of Dialectical Reason as well as some of his even later work will achieve greater recognition from the learned philosophical public, while some or all of these then-new vedettes will fade from consciousness: that remains to be seen, since history is open. As for Marxism, Sartre in his last years lost faith in it, concluding that it was not, after all, reconcilable with his views of freedom nor with some of his other intellectual interests. He first made this clear, as far as I know, in a long interview that he gave to three interlocutors acting on behalf of the editor of the American series, Library of Living Philosophers. Since he had by then become too blind to be able to read the critical articles written by contributors to the volume that had been prepared on his philosophy, much less to write responses to them as is the usual practice, these interlocutors summarized some points from the articles as well as from questions drawn up separately for this purpose by the contributors. Responding to a question that I had requested that he be asked and to which others had also alluded, to wit, whether he still considered himself to be a phenomenologist – “Have you ever left phenomenology?” posed by Susan Gruenheck – he answered: “Never. I continue to think in those terms. I have never thought as a Marxist, not even in the Critique de la raison dialectique.”15 Although, as far as I can see, the entire Critique contains only one, rather casual and incidental reference, near the beginning, to Husserl, it is obvious that the latter’s long shadow continued to fall across the philosophical landscape of the twentieth century well past the year 1960.

MAJOR WORKS

The phrase “continental aesthetics” is itself a surprise. For one thing, continental philosophy during the middle of the twentieth century has been engaged in a critique of the Cartesian theory of perception and the subject as origin of philosophy, and whereas one meaning of the “aesthetic” is perception or sense experience (aisthesis), there is something of a paradox in conjoining “continental” with “aesthetics.” The other meaning of “aesthetic” having to do with philosophy of art or philosophy of fine art, common only since the time of Alexander Baumgarten and Kant’s Critique of Judgment, shows this bias toward subjectivism clearly in its dominant terms of taste, pure feeling, imagination, and genius. For another thing, “continental aesthetics” is far from a unified field of study. No one has made this clearer than Theodor Adorno, whose Aesthetic Theory, published in German posthumously in 1970 and still the most recent attempt to develop something like a comprehensive aesthetic theory on the European continent, found that “the unusual situation of aesthetics is discouraging.”

Like a weather vane it is blown about by every philosophical, cultural, and scientific gust; at one moment it is metaphysical and in the next empirical; now normative, then descriptive, now defined by artists, then by connoisseurs, one day art is supposedly the center of aesthetics and natural beauty merely preliminary, the next day art beauty is merely second-hand natural beauty. (AT 332)

Therefore, rather than a unified field of study we find a pluralism of meanings. The situation is complicated further with the introduction of phenomenology, for, on the one hand, there are those responses that take up phenomenology and develop various forms of a “phenomenological aesthetics” – these would include most prominently Martin Heidegger, Jean-Paul Sartre, Maurice Merleau-Ponty, Mikel Dufrenne, and Hans-Georg Gadamer – and, on the other, there are those instances of continental aesthetics that develop based on explicitly antiphenomenological premises and themes – these would include Adorno himself, as well as Walter Benjamin, Michel Foucault, and, from some points of view, Jean-François Lyotard (whose first book, in 1954, was a critical introduction to phenomenology).²

Thus, it will be up to us to sketch out what we will mean by “continental aesthetics” as we find it in the mid twentieth century. It is true to say that aesthetics are “continental” because they are written in a language other than English, principally French and German. However, beyond such a linguistic and geographic qualifier, there seem to be a number of features of the figures of this period that distinguish the period from earlier aesthetic thinking, particularly from the aesthetics of giants such as Kant and Hegel. These will be more or less pronounced from one figure to another. One feature we have already mentioned: these philosophers – Heidegger, Merleau-Ponty, and so on – develop their aesthetic thinking in opposition to philosophies of subjective perception and philosophical categories such as taste and pure feeling. This means, second, that they understand art and the aesthetic as the disclosure of Being, and this means the work of art is exemplary of the meaning and truth of experience. The artwork and aesthetic experience give us the outline and architecture of an ontology similar to the way natural science, especially mathematical physics, functioned in the thinking of Renaissance and Enlightenment philosophers, or the way religion dominated the philosophies of the medieval period. This is why, third, aesthetics turns, for the first time, away from abstract philosophical categories such as the imagination, and toward the study and comprehension of specific artworks. In a very direct sentence in his “Draft Introduction” that Adorno may well have modified if he had lived to work on its revision, he wrote that “Hegel and Kant were the last who, to put it bluntly, were able to write major aesthetics without understanding anything about art” (AT 334). From Heidegger through Sartre to Merleau-Ponty and Dufrenne, we find the study of specific artists and artworks: Hölderlin and Rilke, Calder and Giacometti, Velásquez and Magritte, Beethoven and Mozart. Even here, we note again another pluralism with respect to which of the arts comes in for attention, whether poetry, sculpture, painting, or music. Two painters stand out, Paul Cézanne and Paul Klee,

for they influenced the aesthetic thinking of nearly every one of our continental philosophers, most prominently Heidegger and Merleau-Ponty, but Adorno, Gadamer, Benjamin, and Foucault as well. A fourth feature might be that aesthetics becomes central in philosophy in an unprecedented way. The ontology of art comes to be taken as an opening, as an analogy, for understanding broader domains of human experience such as language, history, and politics. We find, ranging from Sartre to Foucault, the injunction to “make of our life a work of art,” as well as Merleau-Ponty’s statement that “we would undoubtedly recover the concept of history in the true sense of the term if we were to get used to modeling it after the example of the arts and language.”

We thus rough out a beginning and a way for our thinking of “continental aesthetics” to proceed. Within “phenomenological aesthetics,” the ontology of art is so central that our beginning will be with Heidegger. Then we will move to Merleau-Ponty. This brings us to Sartre by way of his dispute with Merleau-Ponty, as well as Roland Barthes, over the meaning of art and “engaged” literature. We will pause to give some consideration to the variations on the ontology of art introduced by Ingarden, Dufrenne, and Gadamer. Then we will consider an objection from Levinas. Prominent among the “antiphenomenological” reactions, the work of Adorno and Benjamin must be considered before arriving at Foucault’s commentary on Velásquez’s Las Meninas (The Maids of Honor) in The Order of Things. Throughout, owing to limitations of space, we will be forced to be more cryptic and less nuanced than I would prefer. The recent, valuable Continental Aesthetics Reader (2000) runs to some 618 pages, just to give some sense of the scope of what is involved and the reduction that is necessitated here.

I. HEIDEGGER ON THE ORIGIN OF ART

The key work by Heidegger bearing on continental aesthetics is “The Origin of the Work of Art,” originally given as a lecture in Freiburg in 1935, then repeated in Zurich in early 1936 and subsequently reworked as three public lectures in Frankfurt in late 1936. It was eventually published in the 1950 volume entitled Holzwege. Also of considerable import are four lecture courses that Heidegger taught at the University of Freiburg-im-Breisgau from 1936 to 1940 on Nietzsche, the first two of which take up the theme of “The Will to Power as Art.” “The

Origin of the Work of Art” has three sections: “Thing and Work,” “Work and Truth,” and “Truth and Art,” and as this structure suggests, Heidegger’s aim was to establish a close relationship between the artwork as “thing” and truth as “unconcealment.”

The question of the “origin” of the work of art is not to be understood in a historical or even genealogical sense, but rather as the question of the “essence” of the artwork (OWA 143). Heidegger approaches this question by considering the “thingly” character of the artwork and the three traditional interpretations of the “thing” stemming from ancient ontology: (i) the thing as a substance with accidents or properties, or as a subject with certain predicates; (ii) the thing as the unity within the mind of a manifold of sense-impressions; and (iii) the thing as matter invested with form. Although all three interpretations distort the essence of the artwork, Heidegger argues, the interpretation in terms of matter and form has gained a special dominance, which Heidegger believes is due to its derivation from the familiar mixture of matter and form we find in tools or equipment. Here we come in “The Origin of the Work of Art” to the much discussed text about a common sort of equipment, a pair of peasant shoes, and Van Gogh’s several paintings of them. Heidegger’s text deploys the equipmental character of the shoes as serviceable and reliable to introduce the two most central concepts for his understanding of the essence of the artwork, “world” and “earth:” “In the shoes vibrates the silent call of the earth. … This equipment belongs to the earth, and it is protected in the world of the peasant woman” (OWA 159).

The “world” of the peasant woman that is rural and agricultural might seem to suggest an individual horizon or context for her work in the plowed fields, but Heidegger’s equally famous narrative about a Greek temple as artwork makes it clear that “world” is a historical and cultural setting for life that belongs to a people (OWA 167). Every human being is born into a fundamental horizon of disclosure that Heidegger calls “world,” the background and usually unnoticed understanding that determines for a historical people what, for them, fundamentally there is. Thus, “world” in “The Origin of the Work of Art” is continuous with Being and Time, in which Heidegger identifies it as an “ontological structure” that emerges from the ready-to-hand.5 Heidegger’s essay seems to suggest two somewhat different understandings of the relationship between the artist/artwork and world: first, a role of making manifest or revealing a world that is already present; second, what has been called a Promethean view that art creates world. In the temple passage we find both in close proximity. The first reading that emphasizes revealing, making manifest, and preserving is far more politically neutral than the much stronger Promethean reading that, in

the 1930s historical context of “The Origin of the Work of Art,” has been taken by some as an implicit reference to a new world established by the agenda of National Socialism, its art and architecture, and the Nuremberg rally. Another complication is that there is a discrepancy between Heidegger’s interpretations of the Van Gogh painting and the Greek temple, for it is really not the painting per se that opens up a world, nor the painting that evinces equipmentality, but the subject in the painting, those shoes, whereas the Greek temple itself is reliable and serviceable in the world of the Greek people as a place that “lets the god himself be present” (OW A 168). The narrative of the Van Gogh painting is also at odds with Heidegger’s own rejection of the institutional view of the artwork, that it is the “art industry” of museum boards, directors, and curators who specify the nature of art (OW A 166).

Whereas the meaning of “world” and of the artwork as “truth setting itself to work” is only moderately troubled, the meaning of “earth” is much more difficult in Heidegger’s essay. Heidegger himself rules out a literal reading of “earth” or the native “ground” either as a mass of matter deposited somewhere or as the idea of a planet in the solar system (OW A 168). Rather, the meaning of earth circulates between two thoughts in the essay: the thought of sheltering and stability, that earth has more solidity and durability than either world or artwork and thus offers them shelter and protection; and the thought of concealment, even ineffability in the work of art, that leads in the direction of Heidegger’s

7. In the early versions of “The Origin” from Heidegger’s Freiburg and Zurich lectures, Heidegger does not discuss Van Gogh’s shoes painting. Cf. Hugh J. Silverman, Textualities: Between Hermeneutics and Deconstruction (New York: Routledge, 1994), ch, 13, “The Autobiographical Textuality of Heidegger’s Shoes,” 250 n.5. Another fascinating aspect of Heidegger’s reading of the Van Gogh painting is a correspondence that occurred between Heidegger and Columbia University art historian Meyer Shapiro much later in the 1960s, about which Shapiro published “The Still Life as a Personal Object” in 1968. Shapiro effectively demonstrated that Van Gogh had not painted a pair of peasant’s shoes at all but, indeed, his own shoes. These would have been the shoes of a poor artist struggling to exist and even afford paints through the winters of 1886 and 1887 living in Paris, in Montmartre – boots really, in one of which the overturned shoe reveals the distinctive white of extending nails. Derrida, in The Truth in Painting, Geoff Bennington and Ian McLeod (trans.) (Chicago, IL: University of Chicago Press, 1987), has further compounded the discussion between Shapiro and Heidegger by questioning whether the paintings even show us a “pair” of left and right matched shoes and whether they are the shoes of a man or of a woman. Part of the trouble that generates these questions is that Heidegger does not name the specific Van Gogh painting that he is narrating, and Van Gogh made several – five, in fact – different paintings of shoes during the years of 1886–88, at least one of which Heidegger would have seen at a 1930 exhibition in Amsterdam. Cf. Silverman, “The Autobiographical Textuality of Heidegger’s Shoes,” 137.
language of the sacred and the “holy.” Just as in Heidegger’s thinking of the essence of truth, every revealing is also a concealing, so this notion that artist/artwork disclose a world must be given its other side of darkness, unfathom-ability, depth, and mystery. Being also “withdraws,” “closes,” and “conceals itself,” and this thought is part of the meaning of “earth” (OWA 172).

In world and earth we can also hear an echo of Nietzsche’s aesthetic theory of Apollo and Dionysus.8 We find Heidegger engaged explicitly with the interpretation of the Apollonian and Dionysian in the chapter entitled “Rapture as Aesthetic State” in Nietzsche, Volume I. In the last analysis, Heidegger refers the meaning of these terms to the German poet Hölderlin, who draws the contrast as one between “holy pathos” and the Occidental “sobriety of representational skill.”9 “The Origin of the Work of Art” often speaks of earth as site of the “holy,” leading us to believe that Hölderlin’s terms provide the best reading for interpreting the meaning of earth and world.

Heidegger describes the relationship between world and earth as “strife” (Urstreit), “conflict,” and even “warfare” between the forces of disclosure and those of concealment. “The conflict is not a rift [Riss] as a mere cleft is ripped open; rather, it is the intimacy with which opponents belong to each other” (OWA 188). Heidegger imported the notion of strife rather directly from Heraclitus, Fragment 53, to mark the conjunction of dualities that “earth” conveys as contradictory tendencies: “what is holy and unholy, what great and what small, what brave and what cowardly, what lofty and what flighty, what master and what slave” (OWA 169). Thus, truth in the work of art does not just “happen,” but must be won. Heidegger himself later came to see that the language of strife in “The Origin of the Work of Art” was a mischaracterization of the happening of truth in the work and he replaced it by the idea of Ereignis, which we should not attempt to summarize here, but in rough outline is the meaning of advent, also of an irruption, a happening or “event” that introduces discontinuity and alters the course of things.10

At the time of “The Origin of the Work of Art,” Heidegger was very clear that the great work of art brings together a living community and gives to a people their outlook upon themselves (OWA 202), and what does this, above all, is poetry (poiesis), for only in it, much more so than in painting, music, or

---

10. Young’s systematic study of Heidegger’s philosophy of art states: “after the transition to ‘Ereignis-thinking’ in 1936–38, it [Urstreit] makes no further appearance either in connection with art or with anything else” (Heidegger’s Philosophy of Art, 64).
architecture, do we find the clearest articulation of truth and world that gather a people and a people’s history. This gives us essentially a Greek template, or medieval template, for understanding the essence of art. After seeing the paintings of Cézanne and the artwork of Klee in Basel in the late 1940s, Heidegger came to realize that under what we might call the heroic-historical requirements of “The Origin of the Work of Art,” these artworks could not be great art and realized his philosophy of art needed a broader, more pluralistic cast. We have only Heidegger’s conversations with Heinrich Petzet during the 1940s and 1950s to hint at the shape of such a rethinking.11

II. MERLEAU-PONTY ON ART AND THE ONTOLOGY OF THE INVISIBLE

Merleau-Ponty’s signature contribution to aesthetics is “Eye and Mind” (1961) and, like Heidegger, he finds in art the germ of an ontology that he would further develop in The Visible and the Invisible, published posthumously (1964). Unlike Heidegger, however, Cézanne had been central to Merleau-Ponty’s thinking from his earliest works, The Structure of Behavior (1939) and Phenomenology of Perception (1945). Also unlike Heidegger, Merleau-Ponty works from quite specific artists and artworks by name, photographs of eight of which are included in “Eye and Mind”: Giacometti, Cézanne, de Staël, Matisse, Klee, Richier, Rodin, and the unknown Alain de la Bourdonnaye. The number of artists upon whom Merleau-Ponty draws in the essay includes a dozen more and is remarkable in spite of his own humble comment that he is a “layman” who lacks “both competence and space”12 to draw upon art history properly. The dominant new artistic voices in “Eye and Mind” are Auguste Rodin, especially Rodin’s conversations in Art: Conversations with Paul Gsell,13 and, above all, Klee. The multiple references in “Eye and Mind” to Klee’s notebooks, journals, and nature studies indicate that Klee had become the most influential artist for Merleau-Ponty’s philosophy of vision and Being. Part IV ends with Merleau-Ponty’s own transliteration of Klee’s words written at age thirty-seven and inscribed on his tomb: “I cannot be grasped in immanence” (Je suis insaisissable dans l’immanence).14

13. The Rodin text was originally published in 1911.
14. The German inscription found on Klee’s tomb is: “Diesseitig bin ich gar nicht fassbar, denn ich wohne grad so gut bei den Toten wie bei den Ungeborenen.” Merleau-Ponty was working
Structurally, “Eye and Mind” has five parts. Part III, the hinge between the philosophy of vision of Parts I and II and the ontology of Parts IV and V, contains the philosopher’s critique of the philosophy of vision and metaphysics in Descartes’s *Optics*. Cartesian rationalism, Merleau-Ponty argues, was unable to grasp the central artistic dimension of depth, either bringing the world too close to the eye by reducing vision to thought or shifting to the divine perspective of God in which the world is surveyed from above (*survol*). When one is too close or too far, Being is flattened and Merleau-Ponty argues that this is why Descartes favored drawings and etchings over painting and sculpture. This argument pertaining to vision and depth is supplemented by a metaphysical-epistemological argument against Cartesianism: as flattened, the visible world is reduced to mere representations or icons for the mind to know as ideas or thoughts, rendering problematical the relation of mental representations and things. For Descartes, perception is a form of thinking in which mental ideas represent things, separating the mind from body and the world. “It is the mind that sees, not the eye,” Descartes had famously written in the *Optics*. Finally, Merleau-Ponty argues that Cartesianism mistakenly takes for granted the perspectival techniques of the Renaissance as yielding an “exact and infallible art of painting” (MPAR 135), while Leonardo da Vinci’s own studies of linear perspective themselves involve competing and sometimes contradictory claims. This tripartite critique and rejection of rationalism enabled Merleau-Ponty to overcome Cartesianism and move toward a new ontology with depth as the central problem, and Flesh (*la chair*), Merleau-Ponty’s innovative ontological notion, is introduced in Parts II and IV. This envelopment, generality, and anonymity named Flesh (*la chair*) is comparable to the Greek idea of element, which is not substance, nor mind, nor matter. The world and the painter are the inverse and obverse of one sole Power that breaks open in an unending generosity of creation and expression. This ontology of Flesh and reversibility both preserves the gaps (*écarts*), strife, and differences among colors and things and between self and world, and prioritizes genesis and process over substance. Verbs and adverbs replace nominatives. The incarnate principle of Flesh imbues life and the world with a longing (*désir*) for unity that is deferred, but a deferral that keeps open the genesis and metamorphosis of expression.

The gains for aesthetic theory offered by Merleau-Ponty’s “Eye and Mind” are multiple, for the work includes discussions of color, iconography, etchings,
sculpture, mirrors, self-portraits, motion, depth, voluminosity, line, and abstraction. His discussion of line emphasizes the flexuous line and cites Klee’s ability to “let a line dream” (laissé rêver une ligne), as well as Henri Michaux’s phrase “to go line” (aller ligne). The reflections on line and abstraction, as well as on color as a dimension, indicate that Merleau-Ponty’s aesthetic ontology is not limited to artists and works at the beginning of the twentieth century and in the mid century he himself knew so well, but extend to the more abstract and experimental artistic works of contemporary times, amenable particularly to abstract expressionism such as we find in Newman, Rothko, and Pollack.15

III. SARTRE VS. MERLEAU-PONTY (WITH INGARDEN, DUFRENNE, AND BARTHES): “ENGAGED” LITERATURE AND ITS CRITIQUE

Articulating his theory of engaged literature, Sartre’s 1947 *What is Literature?* brought him into eventual direct dispute with Merleau-Ponty’s aesthetic and ontology. Originally published in the journal *Les Temps modernes*, which the philosophers coedited together with Simone de Beauvoir from its founding in 1945 until Merleau-Ponty’s resignation in 1952, the essay subsequently appeared in a slightly revised version in *Situations II*. Sartre’s aesthetic thinking was very much broader than this particular work. It included his own literary art in the novel *Nausea* (1938) and the trilogy of novels together titled *Roads to Freedom* (*Les Chemins de la liberté*) about the Second World War and the Nazi occupation beginning from *The Age of Reason* (1945), a series of plays including the best-known *No Exit* (1943–44), short stories such as *The Wall* (*La Mur*: 1939), and his autobiography, *Words* (*Les Mots*: 1964). He also published substantial essays of criticism on topics and figures ranging from the paintings of the Renaissance Venetian Jacopo, to Lapoujade and Giacometti of modern times, the mobiles of Calder and sculpture of Giacometti, as well as the literature of Baudelaire and Flaubert. Amid this massive breadth of creativity, production, and interest, we will take Sartre’s theory of engaged literature as our focus here.

In Merleau-Ponty’s *Sense and Non-Sense* (1948), which opens with “Cézanne’s Doubt,” we find the essay “A Scandalous Author,” in which Merleau-Ponty defended Sartre as a person – “What makes the man winning makes the author

scandalous … it is good that from time to time there is a free man”\(^{16}\) – and also defended Sartre’s literary philosophizing of the bestial, ugly, and horrible in human life. He attributes to Sartre the “violence of the sublime” rather than obedience to a “religion of the beautiful” (SNS 43). At the time, Merleau-Ponty believed that he had found in Sartre and Beauvoir (particularly her novel, *L’Invitée [She Came to Stay]*) that marriage of philosophical and literary expression he himself advocated: “From now on the tasks of literature and philosophy can no longer be separated” (SNS 28). The seeds of the break between Sartre’s existentialist aesthetic and Merleau-Ponty had already been planted in Merleau-Ponty’s *Phenomenology of Perception* (1945), particularly in its critique of Sartre’s philosophies of time and freedom. However, Merleau-Ponty’s reply to Sartre’s theory of engaged literature, “Indirect Language and the Voices of Silence” (1951), would be his last essay published in *Les Temps modernes* prior to his resignation from the editorial board.

It is important to realize that prior to this dispute and rupture, Sartre had long been at work on the topic of the imagination and Merleau-Ponty had been deeply influenced by his work. Sartre had written two works on imagination, *Imagination* (1936) and *L’Imaginaire* (1940), the latter translated as *The Psychology of Imagination*. Sartre’s theory of the imagination was intent on defeating the portrayal of the image as an immanent mental content, rather explicating imagination as an intentional act that refers to a transcendent object. It differs from perception, nevertheless, for imagination is an awareness of something as not being, as absent, elsewhere, or as pure possibility. Thus, imagination’s distinguishing characteristic is freedom and spontaneity, which Sartre calls the “magical” quality of imagination, and renders it the only type of conscious act that is wholly spontaneous and unmotivated, not bound to body, place, time, or circumstance. Merleau-Ponty’s response to this theory is found in a 1936 review of Sartre’s *Imagination*, as well as in *Phenomenology of Perception*. In the review, Merleau-Ponty takes Sartre’s account as evidence for assigning an impoverished and reduced significance to imagination in comparison with perception and, in *Phenomenology of Perception*, he wrote that “the imaginary has no depth.”\(^{17}\) With the appearance of Sartre’s *What is Literature?* in 1947, Merleau-Ponty could see explicitly the latent implications in Sartre’s dualisms of perception and imagination, real and unreal, and he realized that his own philosophy of perception and depth would need a much greater and revised role for imagination right within perception itself. Painting “scrambles all our categories” (MPAR 130), he would

\(^{16}\) Maurice Merleau-Ponty, *Sense and Non-Sense*, Hubert L. Dreyfus and Patricia Allen Dreyfus (trans.) (Evanston, IL: Northwestern University Press, 1964), 47; hereafter cited as SNS followed by the page number.

write in “Eye and Mind,” essence and existence, real and imaginary, activity and passivity. These can no longer be thought as binaries or dualities but as intertwinings or interlacings (entrelacs).

In *What is Literature?*, Sartre contests that committed writing does not also imply committed painting, sculpture, or music because there is no parallelism among all art forms. The plastic or musical artist makes a thing such as notes, colors, and forms that are not signs and that express the emotions and motives of the artist or composer. The “painter is mute,” in Sartre’s judgment, for one does not paint meanings and Picasso’s *Guernica* “won no one over to the Spanish cause.”  

Further, within the arts of writing there is a clear distinction between prose and poetry. Prose is the “empire of signs,” while poetry is on the side of painting, sculpture, and music in producing words as things similar to colors and notes. Poets refuse to utilize language whereas prose is explicitly utilitarian, seeking to use words as actions taking up the responsibility of commitment. “The function of the writer is to act in such a way that nobody can be ignorant of the world and that nobody may say that he is innocent of what it’s all about” (WL 38). Silence is subordinate to words because it is the refusal to speak, “therefore to keep on speaking” (WL 38). The engaged writer is thus projected out of Sartre’s existentialism, the person of action who regards writing as an enterprise, who may be right or may be wrong but nevertheless refuses to be an abject passivity and commits to an authentic course of action.

It is worthwhile to compare Sartre’s theory of engaged literature with the most prolonged phenomenological consideration of the literary work of art, that of Roman Ingarden’s *The Literary Work of Art* (1931). For one thing, the distance of this work from Sartre is seen immediately, for Ingarden was not interested in questions of engagement, action, or politics but of the ontology of the artwork. Ingarden rejected Husserl’s late transcendental idealism and argued that the literary work of art is neither exclusively an ideal nor a real object, but partakes of both real and ideal features. On the one hand, a character such as Hamlet came into existence at a particular moment in history like a real object, but on the other, the character is constructed by purely ideal elements, namely word meanings. Thus, Ingarden concluded that the identity of the literary work of art, *Hamlet*, is an intentional being in Husserl’s sense, constituted in the cognitive relation between the author and work and between the reader and the work.

---

19. Roman Witold Ingarden (February 5, 1893–June 14, 1970; born and died in Krakow, Poland) was educated at the University of Göttingen (1912–16) and University of Freiburg (1916–21). His influences included Heidegger and Husserl, and he held appointments at Jan Kazimierz University, Lwów (1933–41) and Jagiellonian University, Kraków (1946–49; 1957–63).
work of art is “heteronomous,” depending on consciousness for its animation and concretion. Thus, for a second point in comparison with Sartre’s theory of literature, we find a concordance, for Sartre also argues that the literary object is a mixture of immanence and transcendence. On the one hand, the substance of a character is formed by the reader’s subjectivity: “Raskolnikov’s waiting is my waiting which I lend him. Without this impatience of the reader he would remain only a collection of signs” (WL 45). On the other hand, the words are there “like traps to arouse our feelings and to reflect them toward us. Each word is a path of transcendence” (WL 45).

Mikel Dufrenne, in *The Phenomenology of Aesthetic Experience* (1953), has criticized both Ingarden’s and Sartre’s conceptions of the literary work of art. In reading a poem or a novel, one is not dealing with an unreal world known through the image and imaginary knowing, as Sartre characterizes the situation, nor does one go straight to the significations through the words, as Ingarden would have it, for the words have the quality of the perceptible and, Dufrenne argues, “to read is to perceive.” Words have a peculiar physiognomy of gravity or of brightness, not the clarity and precision of an algorithm, and their meaning receives stability only through their sensuousness. The signification obtains from the word a type of insistence and density that is far from imaginary but is a presence, and this presence expands into a world. The fruits and flowers of Verlaine are concrete because they introduce us to a certain atmosphere, which is the world of the text (PAE 211). For Dufrenne, there is a difference between the artwork and the aesthetic object. The artwork is the object the artist makes and that hangs on the wall in the museum, while the aesthetic object is the artwork so far as it is perceived. The aesthetic object derives its structure and content from the artwork and the artwork derives its truth from the aesthetic object. “The work itself calls for a type of perception which discovers in it (or realizes through it) the aesthetic object, so that the very analysis of the work continually refers, at least implicitly, to this perception” (PAE 223). In the notion of “world,” Dufrenne extends the Heideggerian understanding of the essence of the artwork, but in the notion of the aesthetic object, he joins with Merleau-Ponty’s phenomenology of perception that insists on the presence of meaning in the world as primordially given in embodied sensuousness.

---

20. Mikel Dufrenne (1910–95; born in Clermont, France; died in Paris) was educated at the École Normale Supérieure (1929–32). His influences included Jaspers and phenomenology, and he held appointments at the University of Poitiers (1953–63) and University of Nanterre (later Paris X) (1963–74).

Merleau-Ponty also undertook his critique of Sartre’s philosophy of the word and writing from the perspective of the phenomenology of language. Under the influence of Saussure’s linguistics, Merleau-Ponty had undertaken a systematic study of the differences and relations among speech, writing, and the language system. Fundamentally, he wanted to think more systematically about the relationships between writing and the visual arts, especially painting, that Sartre had bifurcated so sharply. Regarding artworks, Merleau-Ponty contended that the work is not an opaque thing, and although the relation of a painting to the world is not one of univocal resemblance or representation, yet the relation is one of revealing or disclosing a world with its latent, hidden hollows, “rendering the invisible visible,” to cite the famous words of Klee’s *Creative Credo*. Merleau-Ponty often wrote about how “painting speaks” and said that Cézanne “writes in paint” and “thinks in paint.” Regarding linguistic signs, he argued that these are filled with multiple meanings that lend them their fullness and richness. Within both speaking and writing, silence is not a negative phenomenon but is the “voice of the spirit” that dwells in the pauses and spaces between signs, in what the author omits to say, and silence is also the style of an artist’s work. In short, in Merleau-Ponty’s famous conclusion, “the voices of painting are the voices of silence,”22 very far removed from Sartre’s analysis that treats artworks as mute or “silenced” forms without expression.

Although Roland Barthes does not explicitly mention Sartre’s *What is Literature?* in his 1953 *Writing Degree Zero*, it is commonly understood that Barthes had that work in mind. His argument is an attempt at assessing and partly refuting what he thought to be Sartre’s very strong and somewhat over-simplified view of the nature of language, writing, and the ethical and political responsibilities of the writer.23 Sartre had supported his thesis that the responsible writer’s end or function is to communicate an ethical and political stance by differentiating between language and style, the latter of which means individual expression and may be prominent in the arts and poetry, but is least significant in prose writing. In prose, the language or content is what matters. Barthes drew up a different analysis of writing. The subtle shift in his French title compared with Sartre’s first chapter title is telling. Sartre had used the straightforward French verb “écrire” (to write) whereas Barthes used the much more complex French noun “écriture,” which he made into a technical term. To Sartre’s dyad of language and style, Barthes added this third term, “écriture,” which stands between them as a middle ground and means something like “form” that is

neither purely objective nor purely personal. The writer makes choices with respect to form that are directed toward society but are also directed toward what literature itself has been and what it will become through the work at hand. Thus, there is indeed an ethical responsibility of the writer, but this is never wholly free and spontaneous but somewhat hemmed in by the history and tradition within which the writer stands. As Barthes himself put it in his “Introduction”:

What we hope to do here is to sketch this connection; to affirm the existence of a formal reality independent of language and style; to try to show that this third dimension of Form equally, and not without an additional tragic implication, binds the writer to his society; finally to convey that fact that there is no Literature without an Ethic of language. (WDZ 5–6)

The “zero degree of writing” of which Barthes speaks represents what he thinks of as the last episode of a “passion of writing” that has dismantled bourgeois consciousness and includes “colorless writing” such as that of Camus, Blanchot, or Queneau. Barthes’s notion of écriture in Writing Degree Zero laid the groundwork for a structuralist theory of literature that he went on to develop in his later work such as his truly original and now classic essay, “The Death of the Author,” published in Image – Music – Text (1977).  

IV. LEVINAS’S ANTAGAESTHETIC, GADAMER’S HERMENEUTICS, AND THE “RELIGION OF THE BEAUTIFUL”

When Merleau-Ponty made reference to a certain “religion of the beautiful” in relation to Sartre’s critics, he was speaking specifically of classical art and art theory that emphasized harmony, proportion, and rationality “wherein lies the beauty of the Greek god” (SNS 42). Although Merleau-Ponty thus criticized a certain religion of the beautiful that characterized the classical age, Emmanuel Levinas detected in his own age a kind of philosophical worship or adoration of the artwork and aesthetic experience that he believed impedes or even blocks altogether our contact with reality. This countervailing antiaesthetic demurral was also first published in Les Temps modernes in the year following Sartre’s What is Literature? under the title, “Reality and Its Shadow” (1948), and it also took

*24. For further discussion of Barthes, see the essay by Claire Colebrook in The History of Continental Philosophy: Volume 6.
its bearings from within what the author calls a “phenomenological analysis.”

The commonly held belief is that an artwork goes beyond common perception, and a poem or a painting speaks with metaphysical intuition, “thus an artwork is more real than reality” (RS 117). To put it in theological terms, Levinas says, art belongs neither to the order of revelation nor that of creation (RS 118). Agreeing more with Sartre than Heidegger or Merleau-Ponty, Levinas argues that art is not on the side of cognition and knowledge but rather on that of the image; art consists in substituting for the object its image, not its concept, thus in substituting an image for being. Therefore, art is “the very event of obscuring, a descent of the night, an invasion of shadow” (ibid.). Levinas reinvokes the shadows of Plato’s cave and builds his argument through a phenomenology of the image, rhythm, and “the meanwhile.” Although rhythm certainly has its privileged locus in music, there is a certain musicality of every image inasmuch as each one has its temporal pulse or beat that creates a certain hold on us, the subject is caught up and carried away by it. This is a function of rhythm quite like the automatic character of a walk or a dance in which the image imposes itself on us without our consent and holds us in its present. There is no longer a self but a passage from oneself to anonymity, which is the captivation or magical incantation of poetry and music. In this sense, every image and every artwork is an idol, for what it produces is time’s delay. Art brings about this “duration in the interval” in which the future as a promise of a new future is refused. This eternal duration of the interval “differs radically from the eternity of a concept; it is the meanwhile, never finished, still enduring – something inhuman and monstrous” (RS 125). Aesthetic enjoyment is thus a form of irresponsibility. It replaces the world to be built by its shadow, which is art, and replaces it with moments of charm, lightness, and grace, which is aesthetic experience, sheer sensation. “There is something wicked and egoist and cowardly in artistic enjoyment. There are times when one can be ashamed of it, as of feasting during a plague” (RS 126). Art is a “dimension of evasion” in which we become preoccupied with it rather than our responsibilities to the world and, above all, to the Other (RS 127). Levinas argues that only a new kind of art criticism, the “philosophical exegesis of art,” would be able to separate shadow from reality by speaking of art “frankly, through concepts, which are like the muscles of the mind” (ibid.).

The critique of the “religion of the beautiful” is approached from an entirely different angle by Gadamer because Gadamer, following Heidegger, seeks to know the essence of art, but seeks to know it in such a way that would show the commonality between the older, classical “fine arts” of the beautiful with their

“quasi-religious” function and modern art with its irreligious impulse toward provocation and to “destroy beauty,” as Rimbaud, Barnett Newman, and others have put it. Gadamer’s best-known work, *Truth and Method* (1960) opens with its entire First Part on “The Question of Truth as it Emerges in the Experience of Art.” Nevertheless, Gadamer subordinated his examination of art and the aesthetic in that work to the questions of truth, understanding, and interpretation and did not produce a comprehensive aesthetic theory. In its place, we have the collection of aesthetic essays titled *The Relevance of the Beautiful and Other Essays* (1967, 1977). There, in a number of ways, Gadamer draws the language of aesthetic experience and religious experience into close relationship. A late essay in the book takes up explicitly the theme of “Aesthetic and Religious Experience” and considers the integration of poetic and scriptural texts. Unlike Levinas, Gadamer argues that the work of art “signifies an increase in being”26 because we find in the artwork the same sort of self-movement that Aristotle found to be the most fundamental characteristic of living beings, organic aliveness that has the “basic character of excess striving to express itself” (RB 23). Gadamer’s word here for “excess” is *Überfluss*, which also means “superabundance.” In contrast with the everyday passage of time within which appears the possibility of boredom, Gadamer contends that “the essence of the temporal experience of art is in learning how to tarry. … And perhaps it is the only way that is granted to us finite beings to relate to what we call eternity” (RB 45). The experience of the beautiful “is the invocation of a potentially whole and holy order of things” (RB 32).

Three main concepts organize Gadamer’s interpretation of aesthetic experience: play, symbol, and festival. He creates his account drawing from the aesthetic thinking of Plato, Kant, and Hegel, above all a reading of Kant’s *Critique of Judgment*, and in these three concepts, Gadamer believes he has found a way to link the older arts of the beautiful with modern art. Play is the fundamental excess of being alive and is meant to express the repetition of “to and fro” movement as in the “play of light” and the “play of the waves.” Gadamer introduces the expression “aesthetic nondifferentiation” to bring out the deep structure of the kind of perception that is at work in being addressed by an artwork and constitutes the cooperative play between imagination and understanding. In the work of aesthetic nondifferentiation, the artwork becomes a symbol, not in the sense of representing and standing in for something other than itself, but in Heidegger’s sense of resting on an intricate interplay between showing and concealing. The symbol is that “fragment that has always been sought in order

to complete and make whole our own fragmentary life” (RB 32). Thus, the work
of art becomes something unique, precious, and irreplaceable, which Gadamer
likens to what Walter Benjamin called the “aura” of the work of art. This is why
destruction of a work of art “always has something of the feeling of religious
sacrilege about it” (RB 34). Gadamer introduces the unusual concept of the
festival, drawn explicitly from the theological context of holidays and the full-
ness of time, to designate the communicative and participatory dimension of
the artwork. Festive time is “autonomous time” in which there is no tedium but
a tarrying that allows us to enhance our feeling for life. This tarrying with the
work provides an opportunity through which finite beings may gain a feeling
for eternity.

V. ANTIPHENOMENOLOGIES: THEODOR ADORNO
AND WALTER BENJAMIN

Although originally working within the phenomenological tradition in what is
known as his “transcendental phase,” Adorno’s turn away from phenomenology
and toward critical theory in the 1930s occurred as a criticism of what Adorno
interpreted as Husserl’s idealism, essentialism, and above all, a-historicity.
These criticisms are detailed in Adorno’s “Husserl and the Problem of Idealism”
(1940). In Husserl’s effort to go “back to the things themselves” as immediate
data of consciousness, Adorno argued that he inevitably remained too faithful
to the idealism he was seeking to overcome. Phenomenological claims of direct
access to immediate data fail to recognize the extent to which perception is
overlap with its social and historical epoch, which means, for Adorno, with the
values and ideology of bourgeois capitalist economy. Art and aesthetic experi-
ence have become a mass culture under the control and influence of the culture
industry, thus the whole effort toward a phenomenology of aesthetic experience
and of the art object is compromised and mediated by culture and history from
the outset. It was in the context of Adorno’s negative dialectics and the work of
the Frankfurt Institute that Walter Benjamin wrote his influential essay “The
Work of Art in the Age of Mechanical Reproduction” (1936), in which he made
a start toward what he thought of as revolutionary “politics of art.”27 In the long
run, Adorno would find many points with which to disagree with Benjamin’s
essay, perhaps above all Benjamin’s treatment of the artwork as an element of

27. Walter Benjamin, “The Work of Art in the Age of Mechanical Reproduction,” in Illuminations:
Essays and Reflections, Harry Zohn (trans.) (New York: Schocken Books, 1968), 218; hereafter
cited in the text as WAMR. [*] Benjamin and this essay are discussed in the essay by James
the superstructure in its own right, with its own history and its own processes of technological development necessitating separate analysis. Adorno could never agree with Benjamin’s idea that the mechanical reproduction of art, especially in the recently emergent medium of film, is progressive, even revolutionary. How could film become anything other than entertainment under conditions of mass culture? Nevertheless, what Adorno shared with Benjamin and found lacking in phenomenology was the thoroughgoing commitment to historical thinking about aesthetics and the arts. Benjamin even distinguished such historical thinking from Heidegger’s meditations on origins and “historicality,” finding them too sweeping and abstract with little specific and concrete nuance.

After the preface, Benjamin’s essay is divided into fifteen sections followed by its famous epilogue on the “aestheticization of the political.” Benjamin argues that especially photography and film have introduced a profound change in the reproduction of artworks that previously was possible in only limited ways through older techniques such as the woodcut, printing, lithography, and forgery. The camera creates the possibility of such rapid and multiple reproductions that the whole concept of the “original” or “authentic” work loses its meaning. Benjamin here introduces the pivotal concept in the essay, that of the “aura,” which refers to the unique existence of the authentic original, and argues that our age is experiencing the withering or “decay of the aura.” This decay brings with it an alteration in human perception itself, and one of the points Benjamin wants to stress is that “human sense perception is determined not only by nature but by historical circumstances as well” (WAMR 222). Photography and film have altered the way we “see.” This alteration is illustrated by comparing the perception of a natural object such as a mountain with perception of pictures created by the camera. In the former, there is an aura defined as “the unique phenomenon of distance” (ibid.), that is, the mountain remains at a distance on the horizon displaying its uniqueness and commanding its proper respect. The camera, on the other hand, has the capacity to bring everything closer. Whereas uniqueness and permanence characterize perception previously, transitoriness and reproducibility mark the photograph and film. One can see this collapse of distance and aura very clearly with respect to the screen actor whose presentation on-screen is subject not only to a director but to the cameraman, camera angles, close-ups, and the film editor. In film, “the audience’s identification with the actor is really an identification with the camera” (WAMR 228). The decay of the aura as the collapse of distance replaces the “cult value” of the artwork with its “exhibition value,” and the total function of art experiences a

reversal. Instead of being based on the cult of beauty, the museum, and ritual, the function of art begins to be based on politics. No longer being a preserve of a religious or, more recently, moneyed elite, art, through its mechanical reproduction, becomes something available to and subject to “the masses.” There are a number of effects. The reactionary attitude toward a Picasso painting changes into the progressive reaction toward a Chaplin film; in general, the conventional is uncritically enjoyed and the truly new is criticized with aversion. With close-ups of hidden details of familiar objects, an unconsciously penetrated space is substituted for a space consciously explored; thus “the camera introduces us to unconscious optics as does psychoanalysis to unconscious impulses” (WAMR 237). The movie frame also replaces the contemplation of the spectator before a painting with the bullet speed of an optical ballistics; thoughts are replaced by moving images; perception becomes “reception in a constant state of distraction” (WAMR 240) and it becomes “absent-minded” (WAMR 241).

Benjamin’s famous epilogue focuses on the consequences of the role of art and aesthetics in the increasing formation of humanity into masses. He argues that fascism seeks to give masses of humanity not their rights but their expression and enjoyment: “the logical result of Fascism is the introduction of aesthetics into politics,” and indeed, “all efforts to render politics aesthetic culminate in one thing: war” (ibid.). Benjamin cites Italian poet Filippo Marinetti’s “Futurist Manifesto” (1909), in which Marinetti contended that “war is beautiful” with its gas masks, metalization of the human body, fiery orchids of machine guns and cannonades, geometric formation flights, and smoke spirals from burning villages. Benjamin bitterly concludes that in fascism and Marinetti’s futurism, mankind’s “self-alienation has reached such a degree that it can experience its own destruction as an aesthetic pleasure of the first order” (WAMR 242). Whereas in the body of the essay Benjamin found in photography and film a progressive development that erodes the power of the elites, in the epilogue he makes it clear that the concomitant formation of mankind into masses endangers our humanity with the aestheticization of the political.

Although focusing on Benjamin’s influential contribution to the debate surrounding technology, art, and politics, we need to note the much broader scope of his aesthetic thinking, which ranged over critical essays on Kafka, Baudelaire, Proust, and theater. Among these rich contributions, we single out two writings, the first being Benjamin’s Origin of German Tragic Drama (1925), which focuses on German seventeenth-century baroque theater. Although the work is complex and demands serious engagement, it has become recognized as one of the most original books of literary and philosophical criticism of the twentieth century. Benjamin orient his thinking in relation to two great preceding landmarks in the theory of tragedy, Hegel’s Phenomenology of Spirit – with its interpretation of the meaning of tragedy, especially the art of
Sophocles in *Antigone* – and Nietzsche’s *The Birth of Tragedy*. There are also Jewish facets of the work pertaining to the Jewish past and messianic future, as well as Kabbalistic overtones of the hidden word and a mystery in the word. This latter brings forward affinities with Kafka reflected in Benjamin’s two later essays on Kafka, translated in *Illuminations*. A second writing of aesthetic significance is Benjamin’s commentary on Klee found in section IX of “Theses on Philosophy of History.” From among Klee’s angel drawings, in 1921 Benjamin had purchased *Angelus Novus* (1920) and included comments about it in this text. Klee had made numerous angel pictures for twenty-five years since 1915 and these multiplied near the end of his life from 1938 to 1940. Klee invented angels of a mixed type that dwelt between this world and the next, such as an angel applicant that seems it might be a dog, a poor angel, a forgetful one, and many others, including the final *Angel Still Ugly* which appears as part of the composition in the final canvas Klee left on his easel at the time of his death, *Last Still Life* (1940). *Angelus Novus* presents us with a young, novice angel, wings upraised in what might be taken as a stop sign amid a storm of dust. Benjamin saw in it the angel of history, but a history that “piles wreckage upon wreckage” that the angel is unable to prevent because “a storm is blowing from Paradise” (WAMR 257).

VI. FOUCAL: BEYOND PHENOMENOLOGY TO THE POSTMODERN

Like Adorno and Benjamin, Foucault’s writings on art are antiphenomenological, but perhaps he is also the beginning of what has come to be called the “postmodern.” We see this antiphenomenological approach to aesthetics in two sources. *This is Not a Pipe* (1973) took its premise from the series of paintings created by the Belgian surrealist, Rene Magritte, and undertook reconsideration of the relation of words to images in the history of painting. Foucault sought to undermine the two most fundamental assumptions supporting the representational theory of art. The first asserts the separation between the plastic representation and the linguistic reference of the title always placed outside the frame; the second affirms a representative bond with the object through the fact of resemblance. The paintings of Magritte (as well as Kandinsky and Klee) challenge both assumptions by placing words into the paintings themselves inside

the frame and with the pointed assertion that the image is not the object (that
is, the image of the pipe is, indeed, not a pipe). Magritte further played with the
word–image boundary by frequently mismatching words and objects, such as
painting the image of a horse and labeling it “the door” or labeling the image
of a pitcher “the bird,” and so forth. Foucault’s rather playful and paradoxical
challenge to the representational theory of art by way of Magritte had been
preceded by the more rigorous and systematic dismantling of that theory in
the opening chapter of The Order of Things (Les Mots et les choses; 1966), titled
for the painting by Velásquez, Las Meninas. Foucault’s foreword to the English
dition of that work makes his antiphenomenological stance and its reasons
crystal clear. He states that the one philosophical approach that he rejects is
the phenomenological approach “which gives absolute priority to the subject,
which attributes a constituent role to an act, which places its own point of
view at the origin of all historicity – which, in short, leads to a transcendental
consciousness.”

Although the relationship between Foucault and critical theo-
rists such as Adorno and Benjamin is complex and involves the tenuous rela-
tions of each to Marx, they both distance themselves from what they perceive as
phenomenology’s a-historicity. Foucault offers us an extremely close reading
of Spanish painter Diego Velásquez’s 1656 Las Meninas, which pictures the artist
at work on a large canvas, only the back of which is visible to us as viewers.
Princess Margarita and her maids occupy the center and to the right of them
appears a dwarf with a dog in the foreground. The faces of the king and queen,
King Philip IV and Queen Mariana, appear in a mirror in the background. We
see only their reflected images and they themselves are not visible to us. They
thus seem to occupy a place outside the canvas and in front of it, precisely where
we as viewers are now placed. In the right background appears a shadowy figure
about to enter or exit from the room.

A number of things occupy Foucault’s attention about this work. One is the
reciprocity of looking, the way in which we are looking at the painting and yet
the painting looks back at us. Another is the uncertainties in visual represen-
tation that the painting creates, and creates these uncertainties precisely at the
moment in history at the opening of the “classical age” in which that very repre-
sentational theory of the mind–world relation had been created by Descartes.
Las Meninas was a very early critique of the power of representation to express
an objective order of reality visually. Foucault argues that the center of the
painting is what is symbolically sovereign, the reflected images of the king and
the queen, but this center fulfills a “triple function.” “In it there occurs an exact
superimposition of the model’s gaze as it is being painted, of the spectator’s as

32. Michel Foucault, The Order of Things: An Archaeology of the Human Sciences (New York:
Vintage, 1970), xiv; hereafter cited as OT followed by the page number.
he contemplates the painting, and of the painter’s as he is composing his picture” (OT 14–15). In the space of the mirror in which the reflections of the king and his wife appear, “there could also appear – there ought to appear – the anonymous face of the passer-by and that of Velázquez” (OT 15). Thus, rather than being the complete or perfect representation that renders everything visible, the painting is incomplete, afflicted with invisibles and gaps. Foucault concludes: “in this picture, as in all the representations of which it is, as it were, the manifest essence, the profound invisibility of what one sees is inseparable from the invisibility of the person seeing – despite all mirrors, reflections, imitations, and portraits” (OT 16). Thus, *Las Meninas* is the opening to everything that interests Foucault about the varying ways of ordering reality throughout history, the varying *epistēmēs* through which reality is constructed. As the ground of the classical age crumbled at the end of the eighteenth century and gave way to the modern age with its recent invention of “man” – and by this Foucault means transcendental ego or transcendental consciousness from Kant through Husserl – “then one can certainly wager that man would be erased, like a face drawn in sand at the edge of the sea” (OT 387).

This last line of *The Order of Things* brings into view a postmodern aesthetics that would be inaugurated by Jean-François Lyotard’s *Discours, Figure* (1971). Postmodern aesthetics would stress the blending of the discursive and the figural, desire and the optical unconscious, and above all the *differend*, which means, according to Lyotard, the unstable state wherein something, some suffering or some wrong, “must be able to be put into phrases but cannot yet be.” Lyotard contends that “what is at stake in a literature, in a philosophy, in a politics perhaps, is to bear witness to differends by finding idioms for them.” The *differend* and Heidegger’s *Ereignis* are also at stake in Lyotard’s work on the abstract expressionism of Newman and a postmodern sublime. In “Philosophy and Painting in the Age of Their Experimentation: Contribution to an Idea of Postmodernity,” Lyotard has written succinctly: “What do we want from art today? Well, for it to experiment, to stop being only modern” (MPAR 335). But this is another story, equally long but equally fascinating, that has been foreshadowed along the way by much that we have seen in Heidegger, Merleau-Ponty, and Foucault, to name just these three.

Throughout the epoch in continental aesthetics that we have examined, we have seen the centrality our philosophers have afforded art and the aesthetic as the fecund nucleus from which other domains of their philosophical thought

---

*33. For a discussion of *Discours, Figure*, and Lyotard more generally, see the essay by James Williams in *The History of Continental Philosophy: Volume 6*.
grow. The work of art is not only exemplary for the limited domain of philosophical aesthetics but is exemplary of meaning and truth and, indeed, give us the outline and architecture of various approaches to the ontology of Being. In recent continental philosophy, aesthetics has become central in philosophy in an unprecedented way as an opening, an analogy, for understanding broader domains of human experience including language, history, politics, and religion. While analytic philosophies have tended to isolate and marginalize aesthetics and philosophy of art as a discrete discipline with its technical problems and vocabulary, the continental philosophers of the twentieth century have integrated aesthetics into the center of philosophical thinking.

**MAJOR WORKS**

**Roman Ingarden**

**Mikel Dufrenne**

There is a Rembrandt painting that can perhaps help us to understand not only how philosophical reflection but, more widely, how Western culture has traditionally conceived our most common experience of the sensible world, that is, our experience of vision. The painting is *The Philosopher in Meditation* (1631), which depicts a philosopher in his room, sitting before a window at which, however, he does not direct his gaze, his eyes being cast downward while his forehead seems burdened with thoughts. Through the window only an oblique and faded light filters into the room, while the world is shut out. The original model for such a philosophical attitude was given by Réné Descartes. In fact, in the lecture “The Film and New Psychology,” presented in 1945 at the Institut des Hautes Études Cinématographiques in Paris, Maurice Merleau-Ponty\(^1\) recalls for us that:

> in a famous passage from the *Méditations* [i.e. *Meditations on First Philosophy*, originally published in 1641, only ten years after Rembrandt’s painting], Descartes wrote, “I say that I see men going by in the street, but what exactly do I really see? All I see are hats and coats which might equally well be covering dolls that only move by

---

\(^1\) Maurice Merleau-Ponty (March 14, 1908–May 3, 1961; born in Rochefort-sur-Mer, France; died in Paris) was educated at the École Normale Supérieure (1926–30). His influences included Bergson, Descartes, Heidegger, and Husserl, and he held appointments at the Lycée de Beauvais (1931–33), Lycée de Chartes (1934–35), École Normale Supérieure (1935–39), Lycée Carnot, Paris (1940–44), Lycée Condorcet, Paris (1944–45), Université de Lyon (1945–48), Sorbonne (1949–51), and the Collège de France (1952–61).
springs, and if I say that I see men, it is because I apprehend through an inspection of the mind what I thought I beheld with my eyes.”

Thus, Descartes would have certainly gazed upon the world with an attitude like that of Rembrandt’s philosopher. For, by distrusting anything his eyes threw before him, he remained generally suspicious of vision. He would have thus shut the window, gone back to his desk, and closed his eyes. The ideal mental position for Descartes was in fact to withdraw from experience and have recourse strictly to his own consciousness, since consciousness seems to be the only thing that could guarantee the truth of what actual vision could merely make us believe. This is the attitude that ultimately supports the philosophical approach where the philosopher, having first contemplated the world from a window, gathers it up within the seclusion of his room. In this way, he safely keeps his distance from the mistakes of his visual experience, which ultimately is sensuous vision grounded in the body. Descartes seems to trust in the ability to reach, through an inspection of the mind, an intellectual and therefore disincarnated vision, which, as such, has to be conceived as a “pan-oramic” (literally, an “all-seeing” vision), developing therefore in reflection (which etymologically means “bending backward”) all that was prereflectively implied in sense experience. Thus, the philosopher presupposes that he is not involved in what he sees, suggesting, therefore, that his vision is pure.

On closer scrutiny, this Cartesian attitude is not relevant only to the philosopher depicted in the painting. The portrait itself seems to be Cartesian insofar as it is a representation in which a portion of the world appears in front of us, so that we become mere disembodied spectators of the external scene. This kind of representation would be directly related to the conceptions of the so-called “planimetric perspective,” which has prevailed over any other kind of perspective since the beginning of the Italian Renaissance. At stake, then, is not merely the attitude of a certain type of philosophy, Cartesianism. More generally, at stake here is a whole cultural disposition embedded in our concept of space – space as uniform and positive extension – and in our concept of vision – vision as an aerial view of Being. In other words, at stake is precisely the metaphysics of a disincarnated vision, which describes the way we relate to the world in terms of a frontal relation between subject and object. This is why at the end of his career, in “Eye and Mind,” Merleau-Ponty stresses that every theory of painting

---

actually implies a metaphysics. This widely embedded metaphysics is why his reflections on painting are so important. They indicate the obstacles to the ideas he is trying to develop and thus they drive his thinking forward.

Apart from numerous passing reflections on painting across his corpus, Merleau-Ponty produced three essays completely devoted to this topic. Each essay moreover chronologically represents one of the three periods in which his thought can be subdivided. More importantly, each summarizes the essential characteristics of the period in which it appears. Listed chronologically, the essays are: “Cézanne’s Doubt,” published in 1945, the same year of the *Phenomenology of Perception*, his most important complete work; “Indirect Language and the Voices of Silence,” published in 1952, where, typical of his early 1950s work, he paid particular attention to language; and finally the last essay, mentioned above already, “Eye and Mind,” written in 1960 but published in 1961, just before his sudden death. Merleau-Ponty composed “Eye and Mind” at the same time that he was writing *The Visible and the Invisible* (posthumously published in 1964), in which he aimed to present a “new ontology.” We do not really know what this final ontology would have looked like. But if we follow his three main texts on painting, we can get a sense of it. So, contextualizing each essay within the period of Merleau-Ponty’s thought in which it falls, we will first focus our attention on “Cézanne’s Doubt”; then on “Indirect Language and the Voices of Silence”; and finally on “Eye and Mind.” As the title of this essay suggests, my aim here will be to show how painting, for Merleau-Ponty, at once brings forward great phenomenological truths but also leads his philosophy of the visible to the limits of phenomenology taken in the strict sense as a philosophy of consciousness.

I. CÉZANNE AND PHENOMENOLOGY

In 1942, when Merleau-Ponty writes the essay “Cézanne’s Doubt,” his understanding of Cézanne is certainly not limited to Joachim Gasquet’s 1921 book, even though Merleau-Ponty carefully quotes passages from Gasquet’s account of his meetings and conversations with Cézanne. Nor did Merleau-Ponty know just the reports of Cézanne’s dialogues with Émile Bernard, about which he openly counsels caution. Actually, it is hard to believe that Merleau-Ponty was not familiar with two crucial texts about Cézanne with which – it is important

4. See, for instance, Merleau-Ponty, “Cezanne’s Doubt,” in MPAR, 63; hereafter cited as CD followed by the page number in MPAR.
to note – his interpretations naturally converge: Ranier Maria Rilke’s letters, and the 1929 “Introduction” that D. H. Lawrence wrote for an exhibition of his own paintings. In 1907, Rilke, who at that time lived in Paris, described his encounter with the way Cézanne’s paintings revealed “objectivity.” These descriptions seem to find an echo in Merleau-Ponty’s essay not only in the passage in which he states that “Cézanne wished to return to the object” (CD 62), but, even more, in the passage in which Merleau-Ponty points out that “it was the objects and the faces themselves as he saw them that demanded to be painted in that way, and Cézanne simply expressed what they wanted to say” (CD 71, translation modified). Moreover, the reasons why Lawrence regarded Cézanne as “the only really interesting character” of modern art also seem to find an echo in Merleau-Ponty’s essay. Just like Lawrence, Merleau-Ponty himself describes Cézanne’s obstinate attempt to give back to things the physicality that Western humanity had denied them. This Western humanity would be the humanity of Descartes’s rationality, which removed corporeality from rationality and which thereby imprisoned itself along with things within the immaterial clichés that its mentalistic consciousness had made.

But it is not his knowledge of what others had said about Cézanne that is decisive here. I would like to show the traces of more crucial influences: those of Edmund Husserl, Erwin Panofsky, and Marcel Proust.

As for the first, when Merleau-Ponty writes his essay about Cézanne, he had already visited the Husserl Archives in Leuven. Merleau-Ponty was the first scholar outside the Leuven circle to consult some of Husserl’s unpublished texts housed there. We know that the texts he read concerned primarily the “primordial constitution” (Urkonstitution) of the sensible world, which Husserl calls the Lebenswelt (lifeworld). For Husserl, the lifeworld is the world of our primordial experience, which, even though it always underlies the constructions of Galilean–Cartesian science, still remains an obvious and yet forgotten “presupposition” to such science. This forgetfulness produces the crisis that Husserl had identified, a crisis felt both in that model of science and in the European–Western culture that had given birth to it. Moreover, Merleau-Ponty seems to unify Cézanne’s enter-

---

6. As is well known, the Husserl Archives were founded in 1939 shortly after Edmund Husserl’s death. Because Husserl and his wife were of Jewish descent, his manuscripts were in great danger in Nazi-ruled Germany. The Franciscan father H. L. Van Breda succeeded in bringing Mrs. Husserl, the manuscripts, the extensive philosophical library, and the correspondence of Husserl to Leuven.

prise with that of Husserl when he writes, in “Cézanne's Doubt,” that “we see things; we agree about them; we are anchored in them; and it is with ‘nature’ as our base that we construct our sciences. Cézanne wanted to paint this primordial world” (CD 64). Therefore, for Merleau-Ponty, the most disturbing novelty of Cézanne’s painting lies in his effort to express the bewilderment our bodies feel when we find ourselves in a world that is not yet organized according to the Copernican scientific order. Having read at Leuven a fragmentary text Husserl wrote on our primordial experience of space (usually referred to as “The Earth does not Move”), Merleau-Ponty saw in Cézanne’s painting an attempt to express precisely that kind of experience, according to which the earth does not move.8

In this primordial experience, the earth maintains a sort of otherness, suggesting that in fact it does not belong to humanity. In relation to this otherness, Merleau-Ponty’s comments on Cézanne’s Le Lac d’Annecy (1896) are exemplary:

| There is no wind in the landscape, no movement on the Lac d’Annecy; the frozen objects hesitate as at the beginning of the world. It is an unfamiliar world in which one is uncomfortable and which forbids all human effusiveness. If one looks at the work of other painters after seeing Cézanne’s paintings, one feels somehow relaxed, just as conversations resumed after a period of mourning mask the absolute change and restore to the survivors their solidity. (CD 66–7) |

Thus, leaving aside Rilke’s letters, we see that what Merleau-Ponty is really thinking about when he emphasizes that “Cézanne wished to return to the object” (CD 62) is the famous Husserlian task of returning to “the things themselves.” We hear in the background a sentence from Husserl’s Cartesian Meditations – one of Merleau-Ponty’s favorites – when he writes that Cézanne “has returned to the source of silent and solitary experience on which culture and the exchange of ideas have been built” (CD 69, emphasis added).9

9. Here is Husserl’s sentence: “It is the experience ... still mute which we are concerned with leading to the pure expression of its own meaning” (Cartesian Meditations, Dorion Cairns [trans.] [New York: Springer, 1977], 38–9). As for the recurrence of this sentence in...
As for Panofsky’s influence on “Cézanne’s Doubt,” we have no explicit reference as we have with the other sources. Nevertheless, it seems plausible to speculate that a reading of Panofsky’s *Perspective as Symbolic Form* may have been behind the writing of Merleau-Ponty’s text. In *Perspective as Symbolic Form*, Panofsky highlights how the birth of Renaissance “perspective construction” is connected to a rationalization of our visual perception. Both the psychophysiological characteristics of our vision (the binocularity of vision, the constant movement of the eyes, and the spherical configuration of the retina) as well as the “psychological” interpretation of vision come to be rationalized. The rationalization ends up asserting a mathematically inspired model of perceptual vision itself. In fact, the perspective construction of the Renaissance “reproduces the vision of one sole immobile eye that is supposed to be placed at a constant distance from the plane of representation.”

One hears echoes of Panofsky’s remarks when Merleau-Ponty writes about a portrait depicted by Cézanne in 1895: “The work table in his portrait of Gustave Geffroy stretches, contrary to the laws of perspective, into the lower part of the picture” (CD 63). Therefore, Merleau-Ponty argues that “by remaining faithful to the phenomena in his investigations of perspective, Cézanne discovered what recent psychologists have come to formulate: the lived perspective, that which we actually perceive, is not a geometric or photographic one” (CD 64).

As for Proust’s influence on “Cézanne’s Doubt,” it is certain that, when Merleau-Ponty writes it, he is profoundly acquainted with the Proustian novel *Remembrance of Things Past*, which he had already quoted in his first work, *The Structure of Behavior* (which dates from 1938, although it was published in 1942). We can then suppose that the knowledge of Proust’s novel influences also some aspects of Merleau-Ponty’s idea of painting that we see emerging in “Cézanne’s Doubt.” When Merleau-Ponty writes that “The painter recaptures...

11. Speaking of “recent psychologists,” this quotation alludes to *Gestalt* theorists. The German word *Gestalt* has no direct translation in English, but refers to the way in which we experience the world, that is to say, the way in which we know the world through our perception. *Gestalt* theorists state that perception of the “whole” in comparison with that of the parts of it is original, primordial, and that the whole is greater than the sum of its parts. In other words, the whole carries a different and altogether greater meaning than its individual components.
and converts into visible objects what would, without him, remain walled up in the separate life of each consciousness” (CD 68), this echoes perfectly with what Proust writes in *Time Regained* (the last volume of *Remembrance of Things Past*):

> Through art alone we are able to emerge from ourselves, to know what another person sees of a universe which is not the same as our own and of which, without art, the landscapes would remain as unknown to us as those that may exist in the moon. Thanks to art, instead of seeing one world only, our own, we make that world multiply itself.13

Indeed, the nonfictional painter to whom Merleau-Ponty devotes this essay, Cézanne, seems, in certain respects, to have been modeled on Proust’s imaginary painter named Elstir. When Proust describes, in *Within a Budding Grove* (the second volume of *Remembrance*), “the effort [Elstir] made … to strip himself, when face to face with reality, of every intellectual concept,”14 with the aim of “reproduc[ing] things not as he knew them to be, but according to the optical illusions of which our first sight of them is composed,”15 Elstir’s aim converges with our primordial encounter with the world studied by Husserl and with the lived perspective evoked by Panofsky.

Now, I have chosen to point out these three influences in particular because in my opinion they intersect in one of the two poles between which this phase of Merleau-Ponty’s philosophy seems to be oscillating: that is, the pole according to which Merleau-Ponty tends to consider Cézanne’s painting as the exemplary attempt to paint our primordial perceptual experience. Moving toward this first pole, in the contemporaneous *Phenomenology of Perception*, Merleau-Ponty assigns to phenomenological philosophy, and therefore to his own thinking, “the ambition to make reflection equal to the unreflective life of consciousness.”16 In other words, according to the first pole, in the oscillation we find, in Merleau-Ponty’s philosophy immediately after the Second World War, that both pictorial reflection and philosophical reflection are supposed to be able to “translate,” without any residue, “the text”17 written by the experience that Husserl defined as “silent and solitary experience.” Nevertheless, in this phase of Merleau-Ponty’s thought, this pole lives together with another one that, later, will prevail and will lead his thought to its ontological developments. According to this second pole, Merleau-Ponty writes in “Cézanne’s Doubt” that “the meaning of what

---

17. As for the terms between quotes, see *ibid.*, xviii.
the artist is going to say does not exist anywhere – not in things, which as yet have no meaning, nor in the artist himself, in his unformulated life” (CD 69). Thus, the second pole suggests a relationship between the unreflective life and its expression that, in the Phenomenology of Perception, is shaped precisely by the example of art; Merleau-Ponty says, “Philosophy is not the reflection of a pre-existing truth, but, like art, the realization of a truth.”

As I said, the second pole will prevail in the further development of Merleau-Ponty’s thought, along with a more profound reflection on the “status” of the sensible that will push Merleau-Ponty toward its “ontological rehabilitation.”

II. SPEAKING LANGUAGE AND TACIT LANGUAGE

In the early 1950s, Merleau-Ponty’s philosophy was influenced in a decisive way by Saussure’s linguistics. Indeed, while Saussure’s Course in General Linguistics would become decisive for the so-called “structuralist movement” of the 1960s, Merleau-Ponty was in fact the first person to study Saussure from a philosophical perspective. Like the structuralists, Merleau-Ponty takes up Saussure’s definition of the “sign” as “diacritical, oppositional, and negative”:

What we have learned from Saussure is that, taken singly, signs do not signify anything, and that each one of them does not so much express a meaning as mark a divergence [écart] of meaning between itself and other signs. Since the same can be said for all other signs, we may conclude that language is made of differences without terms; or more exactly, that the terms of language are engendered only by the differences which appear among them.

The “écart” (divergence) mentioned here, which could also be rendered in English as “hiatus” or “gap,” refers both to space and differentiation, to the

18. Ibid., xx, translation modified.
19. For an extended discussion of Saussure and structural linguistics, see the essay by Thomas F. Broden in History of Continental Philosophy: Volume 5.
21. The écart is “the gap, the separation, the differentiation between the touching and the touched, the seeing and the seen, mind and world, self and others; it is the fissure that language tries to bridge and that the philosophical methods of reflection, dialectic and intuition have
space in between the signs and to the process that differentiates one sign from another. From this point on, the word “écart” will play a major role in Merleau-Ponty’s thought (as it will as well in that of Deleuze, Derrida, and Foucault). On the basis of this écart among the signs, Merleau-Ponty argues that language “in the making” – which he calls “speaking language” (langage parlant) – signifies in an oblique, indirect way, that is, through the inextinguishable vibration crossing differences between signs. It is in this way that “speaking language” reorganizes “spoken language” (langage parlé), that is, reorganizes sedimented signs and meanings, and thereby establishes new meanings, as every creative use of language does.

Saussure’s notion of “sign” is precisely Merleau-Ponty’s starting-point in “Indirect Language and the Voices of Silence.” Here, Merleau-Ponty’s purpose consists in a “reduction” of the speaking language of literature and philosophy to the tacit language of painting, in order to bring to light the similarities and differences of these two kinds of languages. “Reduction” is, of course, one of the key points of Husserl’s phenomenological method. This method requires that one avoid all abstraction, all theorizing, all generalization, in short, all knowledge that is usually assumed to be obvious, bracketing it and reducing the world to a phenomenon, that is, to the way it appears to us in our primordial experience. On the basis of this kind of reduction, Merleau-Ponty writes in “Indirect Language and the Voices of Silence” that:

If we want to understand language as an originating operation, we must pretend never to have spoken, submit language to a reduction without which it would once more escape us by referring us to what it signifies for us, look at it as deaf people look at those who are speaking, compare the art of language to other arts of expression, and try to see it as one of these mute arts. It is possible that the meaning of language has a decisive privilege, but it is in trying out the parallel that we will perceive what may in the end make that parallel impossible.

(ILVS 84)

This passage highlights that Merleau-Ponty’s interest in linguistics, which characterizes this phase of his thought, is not separable from his reflection on art and literature. In fact, if linguistics can illuminate the phenomenon of expression, art and literature practice expression in a privileged way. Modern art and

________________________________________
historically attempted to close through their respective theories of meaning, only to ignore thereby how this ‘un-tamable,’ at once secretly nourishes and undermines the habits of thought and experience that they sought to establish” (Patrick Burke, “Listening at the Abyss,” in Ontology and Alterity in Merleau-Ponty, Galen A. Johnson and Michael B. Smith [eds] [Evanston, IL: Northwestern University Press, 1990], 84).
literature, in particular, according to Merleau-Ponty in “Indirect Language and the Voices of Silence,” put the phenomenon of expression into question insofar as it has been understood through the “objectivist’ prejudice.” Through this prejudice art and literature had been conceived mimetically as representations of nature (see ILVS 84). On this point Merleau-Ponty explicitly refers to André Malraux’s trilogy entitled The Psychology of Art (written between 1947 and 1949), and Merleau-Ponty’s title explicitly evokes Malraux’s subsequent 1951 book on art and art history called The Voices of Silence.\(^{22}\) Merleau-Ponty, however, does not agree with Malraux’s thesis in The Psychology of Art, which states that the peculiarity of modern painting consists in the transition from objectivity to (individual) subjectivity, that is, from painting understood as a mimetic representation of nature based on the law of “planimetric perspective” to painting as the expression of an individual point of view about the world that breaks with any law of reproduction. Criticizing this thesis, Merleau-Ponty states that:

Modern painting presents a problem completely different from that of the return to the individual: the problem of knowing how one can communicate without the help of a pre-established Nature which all men's senses open upon, the problem of knowing how we are grafted to the universal by that which is most our own. (ILVS 89)

In fact, according to Merleau-Ponty’s opinion, in the first half of the twentieth century, painting, as well as literature and more generally culture – as he specifies in the contemporaneous essay “Man and Adversity” – focus on the experience of incarnate existence:

Our century has wiped out the dividing line between “body” and “mind” and sees human life as through and through mental and corporeal, always based upon the body and always (even in its most carnal modes) interested in relationships between persons. … The twentieth century has restored and deepened the notion of flesh, that is, of animate body.\(^{23}\)

\(^{22}\) André Malraux (1901–76) was a French author and dominant figure in French culture and politics from the 1930s to the 1970s, serving as Minister of Information (1945–46, 1958) and Minister of State for Cultural Affairs (1959–69). His major works include La Condition humaine (Man’s Fate) and Les Voix du silence (The Voices of Silence).

\(^{23}\) Merleau-Ponty, Signs, 226–7. This essay is the text of a lecture that Merleau-Ponty gave in Geneva, Switzerland, in 1951. It was published for the first time in 1952, and later collected in Signs.
Merleau-Ponty thinks that the investigation of incarnate existence characterizes all twentieth-century thought. But in particular such an investigation must grant to painting (especially owing to its singular proximity to the perceptual experience) the ability to reveal and even emphasize the primordial ability to express that is at work in our bodily relationship with the world: “it is the expressive operation of the body, begun by the least perception, that develops into painting and art” (ILVS 106–7). In this sense, despite the modifications that emerge in this phase of Merleau-Ponty’s thought, the fundamental reasons supporting his interest in painting have not changed from those supporting this same interest during the earlier period of his philosophy, as exemplified in “Cézanne’s Doubt.”

Nevertheless – even though Merleau-Ponty continues to investigate painting as a singular way to develop the expressive operation begun by perception – now, when he engages in a description of perception itself, he grants a central role to the notion of style. “Perception already stylizes,” Merleau-Ponty asserts; style defines “our original relation to the world.”24 Already appearing in the Phenomenology of Perception, the Merleau-Pontean notion of style comes from Husserl, but here in “Indirect Language,” it is filtered through Malraux’s characterization of style as “the coherent deformation [of] the data of the world” (ILVS 91). For Merleau-Ponty, style is meant as a “system of equivalences” furnishing “the emblems of a certain relationship with being” (ibid.). In other words, style is entirely unified with the meaning things have for a person, but that meaning must, recalling Merleau-Ponty’s comments on Saussure’s notion of “sign,” in turn be understood diacritically as écart, that is, as differentiation. In perception, for Merleau-Ponty, there are differences between things, not just laterally in the perceptual field but also temporally or historically. These differences usually reside in the background of perception allowing the usual forms of things to appear. But one’s style deforms the usual form by drawing certain differences out and leaving others hidden – so that, when I for instance see a red hat, it signifies not only as not blue (it signifies its usual color form) but also as not fashionable (a deformation that is specific to me). Or when I look at a landscape, I see, according to my perceptual style, the shifting movements of birds, while others see the outline of the mountains. All of these meanings are hidden in what I see, but potentially visible. Thanks to the diacritical differences functioning in perception, our encounter with sensible being is therefore able to “sketch” a latent meaning. And it is the latent perceptual meaning that both the painter and the writer will later stylize once more in their works. In other words, that latent meaning will be retaken and recreated according to a movement, that is,

at the same time, archaeological and teleological, in order to become expressed and accessible in their work, whether pictorial or literary. Therefore, not in a way different from that of a painter, the style of a writer looks like a “coherent deformation imposed upon the visible” (ILVS 115), and the painting, no less than the work of writing, can be characterized as a “system of equivalences” that run across the traced signs. In fact, in both these cases, the expressive operation can be characterized in diacritical terms, because first of all their perceptual source can be characterized by difference.

The concept of diacriticity gained through the investigation on language actually shines its light on the description of perception, illuminating this domain as well through the notion of a differentiation that excludes any positive term. This notion allows Merleau-Ponty to abandon the tendency toward conceiving the unreflective and silent life of consciousness as a positive foundation of meaning as it seemed to be in the earlier phase of his thought. Thus, in the summary for his 1952–53 course devoted to “The Sensible World and the World of Expression,” Merleau-Ponty states that “[T]he meaning of a perceived object when picked out from all others still does not stand isolated from the constellation in which it appears; it is articulated only as a certain gap [écart] in relation to the order of space, time, motion, and signification in general in which we are established.”25 This comment is in stark contrast to what we see in “Cézanne’s Doubt,” where the artist is described as someone who has “returned to the source of silent and solitary experience on which culture and the exchange of ideas have been built” (CD 69). Here unreflective life seems to be something like a positive foundation of meaning (as if the meanings were there already made); it does not seem to be a system of gaps or differences that in themselves are meaningless. In contrast to that pole of the oscillation we traced in the period of “Cézanne’s Doubt,” in the period of “The Indirect Language and the Voices of Silence,” Merleau-Ponty states that style – meant in a diacritical way – “is thus not shut up in the depths of the mute individual but diffused throughout all he sees” (ILVS 90). Moreover, if the Phenomenology of Perception definition of operative intentionality as a “text” suggests the same tendency toward conceiving the unreflective life as the presence of a positive layer of sense, in “Indirect Language and the Voice of Silence” Merleau-Ponty insists on excluding the idea of an “original text” that is supposed to precede and guide the effort of expressing (ILVS 80). Therefore, when he discusses the time-lapse film of Matisse’s act of painting that allows us to see Matisse’s hesitations, choices, and reconsiderations, Merleau-Ponty points out that that act was motivated only by “the intention of executing

that particular painting which did not yet exist” (ILVS 83). On the same page, he specifies that speaking-language works in a similar way: “It gropes around a significative intention which is not guided by any text, and which is precisely in the process of writing the text” (ibid.). In fact, in the contemporaneous “On the Phenomenology of Language”26 (despite the title, what Merleau-Ponty says here about the problem of language may be made to refer to every other expressive form), he explains that the intention of meaning “is at the moment no more than a determinate gap to be filled by words.”27 In other words, the intention of meaning is a “mute aspiration” that precedes and provokes the expressive operation but as well an aspiration that comes to know itself only through the expressive operation.

Therefore, the expressive operation cannot measure itself against any preliminary text, for the unreflective and silent life of conscience appears as a “determinate gap” and not as a positive foundation that the expression would need only to translate. For this reason, it is in the mutual diacritical configuration of silent experience and linguistic expression that the transition from the former to the latter can now be understood. In this way, we seem to have very nearly overcome the difficulties associated with the conception of the unreflective and silent life of consciousness as a positive foundation of meaning. Surely, here we do not yet find the reversibility between silence and speech that Merleau-Ponty will thematize when he subsequently attains the ontological perspective. However, the basis of the idea of reversibility seems to be present already since both perception and language share the same power of differentiation, which means that both express meaning in an indirect way. In this perspective, subjectivity gradually loses the characterization of being “full and positive,” which the Phenomenology of Perception seemed to give it. Subjectivity gradually finds a more precise status through the characteristics designated with the French terms “fissures” and “lacunes,” terms rendered in English as “fissures and gaps.”28

III. THE ONTOLOGY OF VISION AND FLESH

Now we are going to focus our attention on the finished but posthumously published essay entitled “Eye and Mind.” Appearing in the first issue of the journal Art de France, “Eye and Mind” included images of some artworks that Merleau-Ponty had selected; he apparently selected them because these

26. Text of Merleau-Ponty’s contribution to the First International Conference on Phenomenology (Brussels, Belgium, 1951). It was published for the first time in 1952, then collected in Signs.
27. Merleau-Ponty, Signs, 89.
images highlighted the ideas he was developing. By itself, this small “imaginary museum” indicates that in “Eye and Mind” Cézanne is no longer, as he was in “Cézanne's Doubt,” the exclusive reference point; now, more generally, Merleau-Ponty refers to what he calls “modern painting.” However it is important to point out that in “Eye and Mind,” Merleau-Ponty emphasizes that “from Lascaux to our time, pure or impure, figurative or not, painting celebrates no other enigma but that of visibility” (EM 127). In fact, here for Merleau-Ponty, each kind of painting manifests what he calls “a polymorphous Being, which justifies all of them without being fully expressed by any” (EM 134).

In “Eye and Mind,” we find again Merleau-Ponty’s previous rejection of the concept of art as mimesis. Also, we find again the idea of artistic creation as a visible disclosure of what otherwise would remain trapped in one’s own individual universe. But in “Eye and Mind,” Merleau-Ponty focuses on painting primarily because, as he explains in the second section of this essay, painting interrogates the enigma of vision. For him, the enigma of vision forms one sole thing with that of the body as the seen and seer together. The phenomenon of vision is ignited in relation to this enigmatic peculiarity of the body. Therefore here, the body is defined as “an intertwining of vision and movement,” between which, Merleau-Ponty explains, there is an “extraordinary overlapping” (EM 124). “Intertwining” (a term appearing in the title of the most innovative chapter of The Visible and the Invisible29) and “overlapping” (a term translating the French word “empiétement”) are recurring terms in the last phase of Merleau-Ponty’s thinking. Elements that are mutually intertwining and overlapping imply reversibility. And it is reversibility, for Merleau-Ponty, that animates sensible being. The idea that the primary characteristic of sensible being is reversibility has its roots in the human body being an “intertwining of vision and movement”: movement implies vision, vision implies movement. Because of this mutual overlapping, it is a mistake to conceive vision and movement, respectively, as an “operation of thought” and a “decision made by the mind” taking place in front of a world understood as “in itself, or matter” (ibid.). It is thus a mistake to view the world as utterly heterogeneous with respect to vision and movement, which is really what the philosophical tradition and common sense springing from Cartesian thought would hold. In fact, as we saw at the beginning in relation to Rembrandt’s painting, the philosophical tradition and common sense are habituated to consider the world as a thing extended in space (res extensa) in front of the subject. Merleau-Ponty objects that, thanks to the mutual

overlapping, vision is not “a representation of the world,” but a real and actual opening to it, while our movement is not a displacement in geometrical space as it would be in the case of a thing. Instead, movement is a tending toward, a self-transcending, and hence it is an aspect that decisively contributes to the definition of our body. Unlike a thing about which we say “it is moved,” in the case of our body, we say that it “moves itself.”

Thus, vision and movement – which open us to the world – are decisive factors in establishing the reversible structure of the human body, which is its very enigma. In fact, in “Eye and Mind,” Merleau-Ponty explains that “the enigma derives from the fact that my body simultaneously sees and is seen” (ibid.). Therefore, one cannot say that the seer stands before the world. But, as well, one cannot say that the seer is placed in the world while remaining distinguished from the world itself. The seer is part of the world in so far as, being a body, the seer is visible just as the world is. Here Merleau-Ponty is thinking of the experience of the mirror. In order to have this experience, one must be not only a thing that sees but also a thing that is seen. Thus the seer’s body must be made of the same stuff as the world: the visible. At the same time, it is the visible that can see – the visible. Therefore it is that particular visible in which all of the visible can see itself. It is as if the visible were a single organism that, in order to see itself, gathers itself around that visible which is also the seeing, and therefore, in this respect, “it is its consciousness,” as Cézanne said (see CD 67).

In “Eye and Mind,” the paradoxical consequence of the fact that my body is at same time seer and seen is found in the following statement: “Visible and mobile, my body is a thing among things; it is one of them. It is caught in the fabric of the world, and its cohesion is that of a thing. But because it moves itself and sees, it holds things in a circle around itself …; the world is made of the very stuff of the body” (EM 124–5). The reversible structure of the human body, being at the same time sentient and sensible, shows how this body is fleshly akin to the sensible world that therefore shares the same ontological status. In this sense, in his 1959 “The Philosopher and his Shadow,” an essay dedicated to Husserl’s “unthought,” Merleau-Ponty recognized the need for “an ontological rehabilitation of the sensible. For from now on we may literally say that space itself is known through my body.” On such a basis, rather than the mere relationship between the percipient subject and the perceived world indicated in the Phenomenology of Perception, Merleau-Ponty asserts that the sentient and the sensible belong together to the same “flesh.” This flesh interweaves our own body, the other’s body, and the things of the world, wrapping them all up within

30. This essay was published for the first time in 1959, then collected in Signs. As for the expression “unthought-of element,” see Merleau-Ponty, Signs, 60.
a horizon of “brute” or “wild being.” In this wild being, the subject and object are yet not constituted as such, and therefore perception accomplishes itself in the indistinguishability of perceiving and being perceived, in the indision of activity or passivity, and finally in the reversibility between seeing and being seen, of which Merleau-Ponty finds painting to be a telling example.

Thus, Merleau-Ponty is the first in the twentieth century to explicitly claim a philosophical value for the notion of “flesh,” saying that he uses it to illustrate a type of being, which “has no name in any philosophy” (VI 147). “Flesh” names neither matter nor mind nor substance (VI 139, 145, 147); it names a unitary texture where each body and each thing manifests itself only as difference (as écart) from other bodies and other things. In other words, for Merleau-Ponty, the notion of “flesh” designates the common horizon where all beings belong. In that sense, such a notion may even sound “older” than the specific Christian use of it. Indeed, Merleau-Ponty defines it by resorting to the Presocratic term “element” (VI 139, 147) or to a Presocratic expression, attributed by Aristotle to Anaxagoras, “omou hn panta” (all was together) (VI 217). On the other hand, Merleau-Ponty tries to make us see that the flesh is not an origin, but something “originating.” Older than anything that has counted as an origin, older than all things that have originated, the originating, Merleau-Ponty warns, “is not all behind us” (VI 124); it is still present and in perennial explosion. It is indeed enough to repeat, Merleau-Ponty suggests, the experience of the hand that goes from touched to touching, as described by Husserl in Ideas Pertaining to a Pure Phenomenology and to a Phenomenological Philosophy – Second Book: Studies in the Phenomenology of Constitution (§36), in order to encounter the phenomenon of reversibility. It must be noticed however that this is “a reversibility always imminent and never realized in fact” (VI 147).

Thus, Merleau-Ponty comes to the notion of “flesh” by thinking of our relationship with the world in the direction showed by what he called the “shadow” of Husserl’s thought. At the same time, though, he is inclined to think that the danger of just overturning the metaphysical relationship between sensible and spiritual lurks in the idea, advocated by Husserl, of a stratification of experience – the truth of which would be directly proportional to its deepness. Merleau-Ponty comes therefore to criticize the goal, in stratification, of “unraveling” of ‘disentangling’ what is entangled” (VI 268), that is, the disentangling of the flesh itself.

In this light, the definition of painting as the interrogation of the enigma of vision demands now to be recognized in all its importance. During the last

32. About this expression, see Aristotle, Physics, I, 4, 187a30.
33. See Merleau-Ponty, The Visible and the Invisible, 124, and even more clearly the following passage taken from a working note in the same text: “for me it is no longer a question of origins, nor limits, nor of a series of events going to a first cause, but one sole explosion of Being which is forever” (VI 265).
phase of his thought, in which the dimension of subjectivity is inscribed as a fissure or a hollow in the dimension of Being, Merleau-Ponty tends to see in the operation of painting – rather than in the creative prolongation of the painter’s perceptual experience, as described in “Cézanne’s Doubt” and in “Indirect Language and the Voice of Silence” – the expression of a “Visibility” (a word that Merleau-Ponty uses as a synonym of “flesh”) understood with all its ontological implications. This does not mean that Merleau-Ponty gives painting a privilege with respect to other arts or cultural expressions. In reality, in the preparatory notes to the 1958–59 “Philosophy Today” course, Merleau-Ponty lists painting as just one of the “cultural symptoms” “that attest to [one] same crisis situation, i.e., at once peril and possibility for the rebirth of philosophy: example, in our Western ideology: poetry, music, painting, and psychoanalysis.”

Nevertheless, painting understood in its ontological significance is, according to Merleau-Ponty, “a central operation contributing to the definition of our access to Being” (EM 132), since it is precisely this carnal Being “that itself comes to show forth its own meaning” in vision (EM 147).

On the one hand, by virtue of one’s own body as seeing-visible, the one who looks in fact participates in the world he sees, and on this basis Merleau-Ponty conceives vision as the expression of a “fundamental narcissism” – the narcissism of the Ego – since “the seer is caught up in what he sees, it is still himself he sees” (VI 139). On the other hand, in the involvement of the seer in what he sees, Merleau-Ponty also identifies “the second and more profound sense of the narcissism,” because such an involvement suggests the imminent reversibility between seeing things and being seen by them. This “second and more profound sense of the narcissism” is the ontological sense, which Merleau-Ponty traces both in the aesthetical dimension (the reciprocity of vision is witnessed by many painters who felt their glance was reciprocated by the things they were looking at) as well as in the sphere of desire: “to be seduced, captivated, alienated by the phantom” of one’s own image (ibid.).

Thus, the ontological sense of narcissism could be defined as the desire of the carnal Being for its own vision, which elicits its dehiscence in the seer and in the visible, both of which – as they spring forth from the same flesh – hold a mutual reciprocity and can therefore reverse their roles. But painting does not show only the reversibility between the seer and the seen, according to Merleau-Ponty. He writes, “Essence and existence, imaginary and real, visible and invisible – painting scrambles all our categories, spreading out before us its oneric universe of carnal essences, actualized resemblances, mute meanings” (EM 130). In other words, painting also shows that, in the horizon of the flesh, perception takes

place in the steadfast intertwining with the imaginary, which “renders present to us what is absent” (EM 132). Thus, painting contributes to reveal vision as the capability to see the invisible in the visible. An example of this invisible in the visible can be found in the “carnal essences” mentioned a moment ago, essences that in the final pages of The Visible and the Invisible he calls “sensible ideas” (VI 151). These essences are nonconceptual generalities that, according to the peculiar logic of the aesthetical world, are inseparable from their particular, sensible presentation.

Thus, it is in this logic of the aesthetical world that Merleau-Ponty saw a new, nondualistic ontology at work. He was hoping to give this nondualistic ontology a full philosophical formulation by refounding the very idea of philosophy in what he began to call “a-philosophy.” A-philosophy: this means a thinking that is finally able to establish and to maintain a close connection with the aesthetical world that the philosophical tradition, in contrast, devalued. “This philosophy, which is yet to be elaborated, is what animates the painter” (EM 138). At the time of his sudden death, it was this ontological perspective that Merleau-Ponty was stressing, going as far as the very limits of phenomenology.

### MAJOR WORKS

35. This is the reason why, in the quoted passage, Merleau-Ponty characterizes vision through the French term “voyance,” which literally indicates “clairvoyance,” the “gift of double sight.” For more about this notion in Merleau-Ponty’s last reflection, see my *The Thinking of the Sensible: Merleau-Ponty’s A-Philosophy* (Evanston, IL: Northwestern University Press, 2004), 31ff.

Volume 4

The intersection of phenomenology and hermeneutics in the twentieth century creates a new trajectory within contemporary continental philosophy. But although we speak of the departure of hermeneutics from phenomenology, we must recognize the phenomenological impulse of hermeneutics as well. During the 1920s, Martin Heidegger redirects Husserl’s phenomenology toward a “hermeneutics of facticity” that examines the concrete, historical life of human being rather than the eidetic structures of transcendental consciousness. This hermeneutic transformation of phenomenology comes to fruition in the existential-ontological analysis of Dasein in Division I of Being and Time. The radicality of this hermeneutic thrust is most pronounced where Heidegger articulates his ontological conception of understanding in relation to the “hermeneutic circle.” Moreover, the hermeneutic implications of this analysis carry deep into Division II of that work, where Heidegger uncovers the temporality of Being—there as “Care” and the “historicity” of authentic existence. Hans-Georg Gadamer takes up the banner of hermeneutics later abandoned by his mentor. By drawing out the implications of Heidegger’s ontology of understanding for the human sciences, Gadamer lays out the basic traits of philosophical hermeneutics in Truth and Method. Pursuing further Heidegger’s emphasis on the historicity of human being, Gadamer places a new emphasis on the belonging of understanding to tradition. This insight challenges the concept of historical
understanding as the acquisition of objective knowledge. Conceived instead as a mode of historical being, understanding is more deeply characterized by its participation in tradition as an event of transmission. Influenced by Heidegger’s later linguistic turn, Gadamer stresses the import of language as the medium of tradition and its transmission and thereby completes the “ontological shift” of hermeneutics expressed in his formula “Being that can be understood is language.”3 This survey of the hermeneutic development of phenomenology concludes with a brief review of Gadamer’s exchanges with his contemporaries (Betti, Habermas, Ricoeur, and Derrida) highlighting the key points of contention in these debates.

I. HERMENEUTIC RADICALIZATION OF PHENOMENOLOGY: HEIDEGGER

Heidegger’s transformation of phenomenology

Heidegger frequently acknowledges his debt to Husserl’s phenomenology for providing an essential insight into the “genuine method” of philosophical thinking conceived not as a new technique, but as “a path toward the disclosure of objects.”4 For Heidegger, phenomenology is a way of “seeing” that refuses the self-evidence of accepted theory or prevailing opinion in order to attend solely to beings and the manner in which they disclose themselves. In this respect, he joins Husserl’s recourse to “the things themselves” (die Sachen selbst) as the abiding concern of phenomenology. But Heidegger is careful to take his distance from the “transcendental” conception debuted in Husserl’s lectures on The Idea of Phenomenology (1907) and the “idealist” tenor of its full statement in Ideas Pertaining to a Pure Phenomenology and to a Phenomenological Philosophy – First Book: General Introduction to a Pure Phenomenology (1913), preferring to develop his own appropriation of phenomenology from Husserl’s Logical Investigations (1900).5 From the outset, Heidegger is unreceptive to Husserl’s claim that transcendental phenomenology fulfills the ideal of philosophy as a rigorous science. While Husserl holds that the transcendental reduction allows the intentional life of consciousness to be described without metaphysical presupposition, Heidegger maintains that Husserl’s project is bound by onto-

5. For a detailed discussion of Husserl’s phenomenology, see the essay by Thomas Nenon in The History of Continental Philosophy: Volume 3.
logical commitments inherited uncritically from the metaphysical tradition. He also rejects Husserl’s discovery of a domain of “transcendental subjectivity” as a “sphere of immanence” secured by the reduction. Where Husserl claims that the intentional object is constituted within its intentional relation to consciousness, Heidegger insists that the “directedness toward” characteristic of intentionality marks a fundamental openness to the world that transcends any enclosure within consciousness. Heidegger also refuses the priority that Husserl’s emphasis on evidence grants to theoretical knowledge over practical engagement. When Husserl asserts that phenomenology offers no constructions or speculations but grounds its claims solely on the object as given in intuition, Heidegger sees the persistence of the paradigm of knowledge as the pure beholding of a present object.

Heidegger instead appeals to ancient Greek thought for a more originary understanding of phenomenology than he finds in Husserl. In his recollection “My Way to Phenomenology,” Heidegger remarks: “What occurs for the phenomenology of the acts of consciousness as the self-manifestation of phenomena is thought more originally by Aristotle and all Greek thinking and existence as alētheia, as the unconcealedness of what is present, its being revealed, its showing itself.”6 Indeed, when he defines phenomenology in Being and Time (1927), it is not to Husserl that he turns, but to Aristotle. Above all, it is Aristotle’s stress on the unconcealment achieved in speech that guides Heidegger’s conception in section 7. There his definition of phenomenology proceeds from the Greek words phainomenon and logos. Phainomenon, derived from the Greek verb phainesthai (to show itself), means “that which shows itself in itself; the manifest [das Offenbare].”7 Although typically translated as “word,” “concept,” or “reason,” Heidegger renders logos as “discourse” (Rede) in order to stress its etymological connection to legein (“to bind together,” “to gather up,” and “to let something be seen”). This serves to underscore that the self-manifestation of phenomena is realized in discourse. The logos of the phainomenon is such that it brings the matter out into the open, lets it be seen, or makes it manifest. “Thus ‘phenomenology’ means apophainesthai ta phainomena – to let that which shows itself be seen from itself as it shows itself by itself.”8 In this definition lies Heidegger’s radicalization of phenomenology that displaces the center of gravity from the intentional life of transcendental subjectivity to the ontological event of an entity’s self-presentation. Despite Husserl’s influence, it is the emphasis in Greek thought on the emergence of the being from

---

8. Ibid., 30.
absence into presence that becomes decisive for Heidegger’s appropriation of phenomenology.

Heidegger conceives an entity’s self-presentation as the unfolding of presence from absence. Hence an element of absence, of hiddenness, belongs to the ontological structure of such self-presentation; self-manifestation is inseparable from self-concealment. Heidegger’s recourse to Aristotle and Greek thought thus signals a renewal of “the question of Being” (die Seinsfrage) that profoundly affects his appropriation of phenomenology. This is apparent in Heidegger’s appeal to the Greek concept of truth as alētheia as the movement of an entity into the unconcealedness of its presence. Stressing the alpha-privative in the word’s grammatical structure, he maintains that phenomenological dis-closure or un-concealing requires making something manifest that otherwise tends to hide itself.9 Phenomenology is now wedded to an ontological problematic that demands a hermeneutic reorientation of phenomenology. In fact, he is quite explicit about it:

Our investigation will show that the meaning of phenomenological description as a method lies in interpretation. The logos of the phenomenology of Dasein lies in the character of hermeneuein, through which the authentic meaning of Being, and also the basic structures of Being which Dasein itself possesses are made known to Dasein’s understanding of Being.10

Because the Being of Dasein tends to conceal itself, phenomenological description must be supplanted by interpretation. Heidegger therefore broaches the question of Being through a hermeneutic investigation that brings Dasein to present itself by means of a self-interpretation that wrests Being-there from its own tendency to cover itself up. Yet Heidegger’s interpretation remains genuinely phenomenological because it approaches the phenomenon as it initially presents itself. Accordingly, the “Existential Analytic” begins with an interpretation of Dasein’s “average everydayness” as a manner of Being-there that is immersed in the world, preoccupied with the things of pressing concern, and pervaded by the prevailing outlook sanctioned by the “They.” The “average everydayness” of Dasein only comes to appear inauthentic by comparison to the authentic manner of Being-there that pulls itself out of its absorption in the world by seizing on those possibilities that are genuinely its own. The self-presentation of Dasein therefore requires the hermeneutic transformation of phenomenology.

9. Ibid., 29.
10. Ibid., 33.
For only a hermeneutical approach can fulfill the phenomenological demand to let beings show themselves from themselves.

*Heidegger’s hermeneutics of facticity*

Heidegger’s transformation of phenomenology is also inspired by his renewed interest in the hermeneutic tradition—especially the work of Wilhelm Dilthey, which marks a crucial, if problematic, advance. By situating the issue of understanding within the sphere of historical life, Dilthey succeeds in opening the scope of hermeneutics; but he also confines it within an epistemological project that seeks the conditions for the possibility of historical knowledge. Hermeneutics provides him with a method for the human sciences that supports a claim to objectivity for understanding comparable to the method of explanation in the natural sciences. Although psychology maintains its foundational function for Dilthey, hermeneutics assumes a more significant role later where he finds that what is understood is not really psychological but rather “forms of spirit” in which historical life achieves expression. For Heidegger, however, the appeal to psychology and the insistence on method misconstrues both hermeneutics and historicity. Yet Heidegger is still drawn toward Dilthey’s late work where the goal that emerges is, he says, “to understand life philosophically and to secure for this understanding a hermeneutical foundation in terms of ‘life itself.’” But where understanding belongs to the hermeneutical structure of historical life, it is necessary to transcend the methodological contrast of the natural and human sciences in order to retrieve the unique reality of history. It is necessary, that is, to remove understanding from the limits of its epistemological and psychological conception in order to appropriate it anew as an ontological structure of historical being.

This radical reevaluation of hermeneutics emerges from Heidegger’s reflections on the historical experience of “factual life” that he finds exemplified in primordial Christian faith. His early lectures on the phenomenology of religion focus on the letters of Paul expressing the hope of Christ’s return on which the life of Christian faith is based. Attending to the “time of decision” (kairos) with its indefinite expectation of the coming event, Heidegger confirms the futural orientation of genuinely historical life that finds fulfillment in concrete performance. He calls this “factual life,” by which he means to emphasize the concrete, contingent, and individual character of historical existence. Although Paul and other Christian writers (Augustine, Luther) achieve an “ontic” comprehension

*11. For a discussion of the hermeneutic tradition, with a focus on Dilthey and Schleiermacher, see the essay by Eric Sean Nelson in The History of Continental Philosophy: Volume 2.*

*12. Ibid., 363.*
of the temporality that belongs to such performance, none of them develops an adequate understanding of the ontological structure of factical life.\(^{13}\) Heidegger first provides this in the lectures on *Ontology – The Hermeneutics of Facticity* (1923), where he conceives hermeneutics as the self-interpretation of factical life. “Hermeneutics” now means making Dasein understandable to itself as a being to which a state of having-been-interpreted belongs; “facticity” designates the “temporal particularity” of “this” Dasein in its Being-there “for a while” which is always situated in the “today.”\(^{14}\) This means that factical life is historical and that Dasein always understands itself historically. The specific task of hermeneutics is thus to interpret the Being of Dasein with respect to its facticity. For Heidegger, then, hermeneutics is not restricted to the domain of the human sciences, but incorporates the whole of human existence as a historical phenomenon.

**Heidegger’s ontology of understanding**

Heidegger’s ontological conception of understanding (*Verstehen*) is decisive for his hermeneutic phenomenology. According to this conception, understanding is a mode of Dasein’s Being: existentially, understanding belongs to Dasein as potentiality-for-Being (*Seinskönnen*, literally, to-be-able-to-be); ontologically, it is a primordial mode disclosure. Rather than a theoretical cognition, Heidegger views understanding as a practical capacity, a “being-able to” that assumes familiarity with the world where Dasein’s involvements are oriented by its “concern” (*Besorge*). He emphasizes that the initial encounter with things is determined by our practical interests in accordance with which they become available to us for this or that purpose. Consequently, the disclosure of things in their initial availability as being “ready-to-hand” (*Zuhandensein*) occurs through the “circum-spective concern” by which we engage the surrounding world.Understanding is then essentially anticipatory; it casts forth the horizon within which beings

---

14. In the lecture course cited above, Heidegger exposes the inadequacy of the current self-understanding of Dasein by showing the “fore-having” operative in historical consciousness (and in contemporary philosophy) as one that understands itself and human being in an objective manner. But such an approach cannot do justice to the temporality of factical existence and the historicality of its performance. As long as Dasein interprets itself in objective terms, its self-understanding falls short and remains in the orbit of a metaphysical conceptionality that conceives Being as a constant presence. See Martin Heidegger, *Ontology – The Hermeneutics of Facticity*, John van Buren (trans.) (Bloomington, IN: Indiana State University, 1999), 40–52.
disclose themselves to Dasein’s circumspective concern. Understanding therefore exhibits the ontological structure of “projection” (Entwurf). As a potential-to-be, Dasein understands by projecting upon possibility whereby it discloses both the world and itself. More specifically, understanding discloses beings by projecting upon the world and thereby understands itself as Being-in-the-world; at the same time, Dasein discloses itself and understands its own Being as a potentiality-for-Being. Dasein does not project upon free-floating possibilities, but rather upon those possibilities available in the factical situation to which it has been delivered over. This means that facticity modifies Dasein’s understanding. This modification refers back to “disposition” (Befindlichkeit, literally, the situation in which Dasein finds itself) as a mode of disclosedness by virtue of which Dasein finds itself in the midst of the world without whence or whither, a condition that he calls “thrownness” (Geworfenheit).

Dasein’s understanding therefore has the character of “thrown projection,” which consists in a threefold “fore-structure” (Vor- struktur) that guides any interpretation by delineating in advance the Being of what is understood. “Fore-having” (Vorhabe) lays hold of the being as a whole; “fore-sight” (Vorsicht) projects an initial view of the kind of Being that belongs to that being; and “fore-grasping” (Vorgriff) sets forth the basic concepts by which to grasp it. A hammer, for instance, presents itself to our circumspective concern in regard to the work to be done within a context – in this case, a “work-world” – that provides a set of references or assignments that determine its meaning. To “understand” the hammer is to “have” the hammer as a whole “in advance” by locating it within the referential totality of the work-world from which it first appears. It is also to have “seen” how the hammer appears from out of this context in its Being as “ready-to-hand.” Finally, we “grasp” the hammer “in advance” by means of a set of concepts (such as those deployed above) that enables one to conceptually articulate the Being of the hammer precisely as it appears. To understand the meaning of the hammer (or anything else) is thus to project its Being upon the horizon to which it belongs – that is, the horizon set forth by this complex of fore-structures.

The “fore-structure” of understanding thus comprises the “hermeneutic situation” within which the interpretation works out what is “presupposed” in this way. By presupposing what we seek, however, we seem to be moving in a circle. Yet Heidegger holds that this movement, which describes the “hermeneutic circle,” is not “vicious”; it is not a logical flaw to be avoided, but rather a constitutive feature of understanding. Understanding requires a “fore-structure” in

17. Ibid., 140–41.
order to provide a direction for the work of interpretation. Far from invalidating the inquiry, he argues, we must affirm the hermeneutic circle as determined by the ontological structure of understanding. The task of understanding is not to acquire a “presuppositionless” starting-point, but to ensure that the fore-having, fore-seeing, and fore-grasping are appropriate to the entity in question. As he says, “What is decisive is not to get out of the circle but to come into it in the right way.”18 Only then can one be confident that the interpretation will not be waylaid by inappropriate constructions but instead will be secured “by working out these fore-structures in terms of the things themselves.”19 Heidegger thereby remains true to his phenomenological inspiration inasmuch as he seeks those conditions under which the die Sachen can show themselves from themselves as they are in themselves. However, those conditions are now thoroughly historical and hermeneutical.

For Heidegger, interpretation (Auslegung) is integral to understanding; understanding grounds interpretation and interpretation elaborates understanding. By working out what understanding projects, interpretation completes understanding. “In interpretation,” Heidegger says, “understanding does not become something different. It becomes itself.”20 Interpretation thus consists in the articulation of what is pre-understood, so to speak, in the initial projection. It enriches understanding by making the disclosed possibilities more definite. In particular, interpretation reveals the “as-structure” by which something is understood. With the notion of “Auffassung,” Husserl already identified an interpretive element of intentionality whereby the given is apprehended “as” something.21 But Heidegger returns interpretation to the context of circumspective concern from out of which things first become accessible to us. For example, preoccupied by the work to be done, my grasping the hammer implies that I have prereflectively taken it “as” a tool for pounding nails. Such “taking-as” is not an act of predication (by which I assign a property to the “hammer-thing”), but a more primordial articulation of intelligibility that Heidegger calls the “hermeneutic ‘as.’” Assertion modifies the as-structure of understanding from the “hermeneutic-as” of our prethematic engagement with something ready-to-hand in circumspective concern into the “apophantic-as” of a predicative beholding of something present-at-hand in pure intuition. For Heidegger, assertion is thus a derivative mode of interpretation.22 The hermeneutic-as is therefore closely related to “discourse” (Rede), another primordial mode of disclosure.

18. Ibid., 143.
19. Ibid.
20. Ibid., 139.
22. Heidegger, Being and Time, 147.
that Heidegger claims underlies both interpretation and assertion. In language the intelligibility of the world disclosed in discourse is put into words. Dasein therefore finds itself in an already interpreted world of meanings.

The “hermeneutic circle” that characterizes the relation of understanding and interpretation also governs the hermeneutic inquiry of *Being and Time*. Such thematic questioning requires that understanding project the being interrogated upon the horizon that enables this being to disclose itself in its Being. So the decisive matter is to ensure that the projected horizon has sufficient depth and breadth to let the phenomenon show itself from itself. The interpretive task pursued in the “Existential Analytic” itself proceeds by an anticipatory projection that understands the Being of Dasein as “existence” (*Existenz*). Much is at stake in this projection since the interpretation of Dasein not only proceeds from the horizon of existence but constantly returns to it. That is why Heidegger speaks of a “relatedness backward and forward” between understanding and interpretation as the inquiry works out the meaning of Dasein’s Being as existence. Thus the point is not to step out of the circle but to enter into it more deeply so that the possibility projected by the understanding can be worked out more fully in the interpretation. Just as projection and retrieval are connected in the Being of Dasein, they are likewise connected in the thematic interpretation of Dasein’s Being. The hermeneutic structure of Heidegger’s inquiry in *Being and Time* therefore reflects the hermeneutic structure of Dasein’s Being.

### Heidegger’s interpretation of historicity

Heidegger addresses Dasein’s historicity on the basis of a temporal interpretation of Being-there. Such a temporal interpretation, in turn, presupposes that the Being of Dasein exhibits a unified structure that consists in “Care” (*Sorge*). According to Heidegger’s analysis, the Care-structure of Being-there is disclosed in the existentially privileged disposition of anxiety. Unlike fear, Dasein is never anxious about something in the world; rather, Dasein is anxious about its Being-in-the-world. Dasein is both anxious about its facticity – that is, about its being-thrown into the world – and anxious for its existence – that is, for its own potentiality-for-Being in the world. What anxiety discloses is Dasein’s absorption in the world where it adopts prevailing viewpoints and popular concerns.

---

23. The circularity is what requires the repetition of the “Existential Analytic” in Division II, where the temporal meaning of the Being of Dasein must be worked out. The integral relation of repetition and circularity in the being of Dasein and in Heidegger’s interpretive strategy in *Being and Time* is deftly discussed by John Caputo, *Radical Hermeneutics: Repetition, Deconstruction, and the Hermeneutic Project* (Bloomington, IN: Indiana University Press, 1987), 60–92.

Having thus “fallen” into the world, Dasein conforms its own potential-to-be to the expectations “They” have, thereby shirking responsibility for its own existence. Because anxiety exposes Dasein as “being-fallen” (Gefallensein), it reveals that the elements of Dasein as Being-in-the-world – that is, existence, facticity, and falleness – constitute a unified phenomenon that justifies the interpretation of Being-there as Care. On this basis Heidegger reveals the “authentic” manner of Being-there by reference to which he elicits the temporal meaning of Dasein’s Being. In this way the analysis of Dasein in Division II of \textit{Being and Time} exhibits the very relation of understanding and interpretation described by the hermeneutic circle. Guided by the fore-structure of understanding that demands we have the whole of Dasein’s Being in view, Heidegger’s interpretation circles back on itself in order to retrieve Dasein’s authentic manner of existence from its “average everydayness.” Only then can the thematic interpretation fully work out the understanding’s initial projection of Dasein’s Being as existence.

The retrieval of authentic existence opens with “the call” (das Beruf) of conscience that addresses anxious Dasein, summoning Being-there from out of its fallleness into the world to take over its thrownness by taking up its own potentiality-for-Being. Dasein responds to this call by projecting upon death as its most extreme, unique, and certain possibility. By resolutely projecting upon this possibility (of its own impossibility), Dasein anticipates death. Such “being-toward-death” (Sein-zum-Tod) constitutes Dasein’s authentic comportment toward its own potential-for-Being. By resolutely confronting the possibility of its own absence, Dasein is able to retract its preoccupation with worldly concerns, break the dominance of the “They,” and shatter the hold of the present. Yet being-toward-death requires no renunciation of the world; it rather enables Dasein to authentically engage its situation. In “anticipatory resoluteness,” Dasein thus seizes certain possibilities that are uniquely its own. This provides the existential basis for authentic selfhood. Dasein constitutes its “self” as a “whole” by steadfastly drawing itself out of its dispersal in the “They” and its absorption in the world. Existentially, the “self-constancy” achieved in anticipatory resoluteness must be understood in terms of Care – and not misconstrued metaphysically as the selfsameness of an enduring substance that is always present-at-hand. Heidegger is now able to confirm the temporal meaning of Care as the ontological structure of Dasein. The Care-structure exhibits the dimensions of an existential (“ecstatic”) temporality: “Being-ahead-of-itself” Dasein comes toward itself by projecting possibility (future); “Being-already-in-(the-world)” Dasein

\footnote{25. The threefold structure of care expresses the manner of being of intentionality. Hence “Heidegger notes that Husserl’s description of intentionality is simply the phenomenon of care – ‘only seen from the outside’” (Daniel Dahlstrom, \textit{Heidegger’s Concept of Truth} [Cambridge: Cambridge University Press, 2001], 289).}
comes back to what it already was (having-been); “Being-alongside (entities encountered within the world)” Dasein makes entities manifest in their possibility (present). Existential temporality is thus the “meaning” of Dasein’s existence; it is that “upon which” understanding projects the Being of Dasein as Care. This structural feature of Dasein sets the stage for Heidegger’s temporal interpretation of Being-there and its authentic historicity.

Heidegger conceives the authentic temporal Being of Dasein as a forward movement that is at the same time a movement back that illumines the present. Drawing on Kierkegaard, Heidegger describes this circular movement of Dasein as one of repetition or retrieval. Here we begin to see the full depth of Heidegger’s hermeneutical conception of Dasein’s Being. As “existence,” Dasein projects its own potential-to-be such that it is always coming toward itself as possibility. As “facticity,” Dasein is disclosed as “thrown” Being-in-the-world, which brings Dasein back before the sheer fact of its Being-there. As “thrown projection,” Dasein returns to its present situation, disclosing some possibility into which it has already been inserted. By projecting upon this possibility Dasein recovers its own potential-to-be. Repetition thus delineates the basic dynamic of Dasein’s Being as it moves forth and back from its futurity to its having-been in a movement of self-retrieval in the present. The enactment of this movement in anticipatory resoluteness Heidegger calls “authentic existence.” As such it is the counter-movement to Dasein’s fallenness whereby Being-there retrieves its authentic existence from its fallen and inauthentic way of Being. Anticipatory resoluteness thus discloses the temporality proper to Dasein: projecting upon its ownmost possibility, Dasein comes toward itself; freed to take over its thrownness, Dasein comes back to what it has been all along; drawn out of its fallenness, Dasein illuminates its situation in a “moment of vision” enabling it to seize possibilities hitherto hidden.

The historical dimension of existence that Heidegger now adds is of greater significance to his hermeneutic phenomenology than the space devoted to it would indicate. In §74, he interprets the sense of having-been in terms of the Dasein’s historicity. As a factual being that is always already thrown into the world, Dasein carries its past along with it. This aspect of Dasein’s temporal being is now specified as its “heritage” (Erbe). Authentically projecting upon its ownmost possibilities, resolute Dasein is brought back to its present situation in order to disclose those possibilities that have been handed down to it. Dasein’s inheritance may be individual or collective, it may be a matter of “fate” (Schicksal) or “destiny” (Geschick), but in either case it points to the authentic historicity of Being-there. According to Heidegger, only the Dasein that resolutely anticipates death breaks free of its immersion in the actuality of the present

in order to disclose those possibilities transmitted by tradition and seize them in the present moment. The authentic historicizing of Dasein is thus a matter of repetition – which is now understood as explicitly taking over those possibilities inherited from the tradition. “Repetition” (Wiederholung), however, is not a “bringing back again” (Wiedererbringen) of what once was; it does not mean reinstating some past actuality, but rather bringing forth a new possibility. Such possibility is always historically situated and determinate since it is a matter of disclosing a possibility delivered by the past that opens another future within the present. Thus the published portion of Being and Time effectively culminates with an account of the historicity of Dasein that outlines a theory of historical repetition. Indeed, repetition marks the structure of the “happening of tradition” (Überlieferungsgeschehen) that provides the point of departure for the further development of philosophical hermeneutics.

II. CLAIMS OF PHILOSOPHICAL HERMENEUTICS: GADAMER

Gadamer’s recovery of tradition

The human sciences return to the foreground of hermeneutic inquiry in Gadamer’s Truth and Method, where, in the second part, he sets about recovering the hermeneutic dimension of historical understanding and legitimating an experience of truth proper to the finitude of our historical being.27 His critical engagement with hermeneutics and historicism in the nineteenth century has two principal thrusts. First, he challenges the psychological orientation of hermeneutics – central to Schleiermacher’s hermeneutic approach – that claims understanding requires the “reconstruction” of the author’s experience, arguing that understanding involves the “integration” of past and present. Second, he confronts the epistemological orientation of hermeneutics that seeks to ground the human sciences methodologically, arguing that historicity is the condition of understanding and not a restriction on it. Dilthey plays a crucial role in Gadamer’s critical engagement with the tradition of hermeneutics, which culminates in his diagnosis of the ambiguity that persists in Dilthey’s dual commitment to the objectivity of historical knowledge and to the significance of life philosophy. On the one hand, Dilthey asserts that historical consciousness must rise above its immersion in history by assuming a “standpoint of reflection and doubt” that surmounts tradition. On the other hand, Dilthey holds that reflection arises within life such that the objectifications of mind in tradition (qua

---

27. Gadamer’s philosophy, as well as Ricoeur’s, is also the focus of an essay by Wayne J. Froman in The History of Continental Philosophy: Volume 6.
morals, law, and religion) and historical consciousness remain immanent to life. Gadamer concludes that Dilthey’s concern for the epistemological foundation of the human sciences precludes him from fully integrating the historicity of human experience. By rejecting the primacy of reflection and absorbing historical consciousness into the historical process, Gadamer moves beyond this impasse in Dilthey’s thought toward a philosophical hermeneutics that recognizes the speculative structure of “living being” (Lebewesen) that constantly separates and unites with itself.

Gadamer’s own inquiry into the ontological conditions of understanding takes up Heidegger’s hermeneutics of facticity and the primacy it grants life over self-consciousness. Accordingly, he affirms Heidegger’s insight into understanding as a mode of human being-in-the-world. But while Heidegger’s temporal interpretation of existence highlights the futural dimension of Zukunft, Gadamer emphasizes the hermeneutic import of Gewesenheit – the past, literally, “having-been” – that marks our facticity. To be thrown into the world is to find ourselves cast into history. As he says, “history does not belong to us; we belong to it.”

The accent of Gadamerian hermeneutics thus lies on the manner in which understanding belongs to tradition. The ontological priority of our belonging to tradition constitutes the finitude of historical understanding and the limit of self-reflection. He argues that the methodical distance cultivated in the human sciences presupposes the primordial belonging to tradition without which there would be no access to the historical. For Gadamer, tradition is a dynamic reality that consists in the movement between “belonging” (Zugehörigkeit) and “distanciation” (Verfremdung) through which tradition is constantly appropriated anew in an event of transmission. He conceives this process of appropriation in Hegelian fashion as involving both integration – that is, the mediation of past

31. For Ricoeur, the relation of belonging and distanciation in Gadamer’s thought yields an “antinomy” between the “alienating distanciation” that makes possible the objectivity in the human sciences and the “primordial relation” of belonging by which we participate in historical reality. His hermeneutic theory seeks to overcome this impasse by developing a concept of the text that reintroduces a positive, productive notion of distanciation into the historicity of human experience, thereby developing a new concept of interpretation that incorporates explanation and understanding. See Paul Ricoeur, *Hermeneutics and the Human Sciences*, John B. Thompson (ed. and trans.) (Cambridge: Cambridge University Press, 1981), 131–44, 145–64.
and present, which produces new meanings – and preservation – that is, the historical continuity whereby the past holds in reserve possibilities for recasting the present. The occurrence of such an event Gadamer calls the “happening of tradition” (Überlieferungsgeschehen) in which understanding participates.

The prior belonging of understanding implies that the fore-meanings involved in interpretation are drawn from those traditions that situate the interpreter. Confirming the projective character of understanding in Heidegger’s analysis, Gadamer holds that fore-meanings function literally as “pre-judgments” (Vorurteilen) by which the interpreter is able to engage the text.32 Hence it is impossible to disengage our prejudices without annulling the very condition under which understanding is possible. Consequently, he inveighs against the attempt to secure objectivity in the human sciences by the methodical suspension of prejudices. In Gadamer’s estimation, this misguided program is a legacy of the Enlightenment and its “prejudice against prejudice,” which is responsible for the negative connotation of the term as unfounded judgment. By contrast, he stresses the primary and positive role of pre-judgment as a legitimate precedent. Gadamer therefore argues for the “rehabilitation of prejudice,” which would recognize that prejudices form the common bond that links understanding with tradition, a bond that is constantly being developed. Hence he claims that “the prejudices [Vorurteile] of the individual, far more than his judgments [Urteilen], constitute the historical reality of his being.”33 Ultimately, the attempt to remove prejudices in order to neutralize the distortions of tradition succeeds only in denying the historicity of historical being. To this extent Gadamer is prepared to defend the provisional authority of tradition as the accumulation and distillation of what has been found reasonable. Consequently, he rejects the Enlightenment equation of authority and domination. There is, he maintains, an inherent rationality preserved in custom and tradition that remains operative in historical life.

32. Following Heidegger, Gadamer sees interpretation as a matter of working out what is anticipated in the “fore-meanings” projected by understanding, but in view of die Sache. Interpretation therefore executes a movement between the matter at issue that appears in the text and our projected fore-meanings. This back and forth movement is readily recognized as an enactment of the hermeneutic circle. The solution is not to break out of this circle but to follow it through to its pertinent “completion.” Such completion occurs when the anticipations of meaning, revised in the encounter with the text, allow the matter at issue to present itself. Here there is a coming to an agreement in which a common meaning emerges that belongs to neither text nor interpreter alone. As Gadamer puts it: “The meaning of a text goes beyond its author, not only occasionally, but always” (Truth and Method, 296).

33. Ibid., 278.
Gadamer’s principle of effective-history

Gadamer uses the term “effective-history” (Wirkungsgeschichte) to convey this operative principle of philosophical hermeneutics, which marks “the power of history over finite human consciousness.”\(^3^4\) It means that historical being is effective and that its being consists in the history of its effects. Historical understanding, in turn, takes part in the effective-history of the historical being it understands. This comprises the commonality that binds us to tradition even while that commonality is constantly being formed in our relation to tradition. Taking part in the effective-history of what it understands, understanding participates in an event of transmission by which tradition forms itself anew. So Gadamer’s formulation of the hermeneutic circle acquires its genuine ontological dimension when rendered as the interplay between tradition and understanding. Understanding that comprehends its belonging to tradition and is therefore conscious of its historicity Gadamer calls “effective-historical consciousness” (wirkungsgeschichtliches Bewusstsein). Effective-historical consciousness is aware that the conditions that make it possible also render impossible the complete illumination of those conditions. This marks the finitude of historical understanding that is bound to a concrete situation and circumscribed by a historical horizon. But this horizon appears as such only when the alterity of the text that addresses us from tradition resists the anticipated meaning with which we engage it. The horizon of the text then differentiates itself from our own, creating a “temporal distance” (Zeitenabstand) between the horizons of past and present. But temporal distance is less a gap than a tension between the two that is productive of new meaning. So viewed, historical understanding accomplishes a “fusion of horizons” (Horizontverschmelzung) which enables the text that reaches us from the past to speak to the present. Gadamer nevertheless rejects a Hegelian teleology that anticipates the “end” of history in the overcoming of difference that incorporates all otherness into absolute selfrelation.

The tension between the horizons of past and present highlights the issue of historical understanding as a problem of application. This is evident in biblical or legal interpretation, where it is a matter of applying the claims of scripture or the prescriptions of law to the demands of the present. But Gadamer believes that this holds universally; because understanding is always bound to a historical situation, interpretation is always a matter of application. Gadamer therefore revisits the traditional division of hermeneutics into understanding, interpretation, and application as separate spheres governed by independent subdisciplines. Instead he considers them to be interrelated moments in a unified process of understanding where interpretation mediates between past and

\(^3^4\) Ibid., 300.
present precisely by applying the text to the given situation.\textsuperscript{35} In this respect, the hermeneutic problem of application can be conceived on the model of mediating the universal and the particular. Interpretation involves applying the same text (the universal) to a different situation (the particular) so that we always “understand differently” if we understand at all.\textsuperscript{36} Gadamer also argues that Aristotle’s concept of \textit{phronēsis} pertains to the problem of application. As moral knowledge, \textit{phronēsis} cannot be detached from the person who exercises it or from the situation in which it is deployed. Because it requires a decision that commits one to action, moral knowing is inseparable from one’s own being; as a mode of self-knowledge \textit{phronēsis} is thus distinct from \textit{tecnē}. Because it must address concrete circumstances, moral knowing seeks what is right in this case; since it contains a moment of application \textit{phronēsis} is also distinct from \textit{epistēmē} (as abstract knowledge of the Good). Similarly, Verstehen is a mode of self-understanding that alters the way we see both ourselves and our situation.

Gadamer thus views understanding as experience (\textit{Erfahrung}), which, in its most genuine sense, involves self-transformation. He draws on the significance of this concept for Hegel in the \textit{Phenomenology of Spirit}, where it means undergoing an experience through which one changes. Like Hegel, Gadamer emphasizes that experience involves negation. In more phenomenological terms, genuine experience occurs not when our expectations are confirmed, but when they are disappointed. In this regard, Gadamer endorses Hegel’s conception of the dialectical character of experience where negation alters both our knowledge and its object such that the new object contains the truth of the old one.

In hermeneutic experience as well, not only our understanding of the matter changes, but so too does our self-understanding. In this experience we come up against something “other” that challenges our preconceptions and compels us to reconsider what we have taken (for granted) as true. Hence Gadamer affirms that hermeneutic experience is always related to the other as a “Thou” and never merely as an object.\textsuperscript{37} This requires an openness to the other that exhibits the priority of the question in all understanding. The model of dialogue prevails where each partner in the conversation is open to the other and to the truth of the matter at issue. However, Gadamer parts ways with Hegel, who anticipates a final dissolution of negativity and difference in complete self-knowledge. By contrast, Gadamer holds fast to the finitude of hermeneutic experience. Against Hegel he asserts that the end (\textit{telos}) of experience does not lie in the overcoming of experience; rather, he insists that experience finds its proper completion in the openness to new experience. Being experienced does not mean knowing this or

\textsuperscript{35} Ibid., 307.
\textsuperscript{36} Ibid., 296.
\textsuperscript{37} Ibid., 310ff.
that; it means knowing one's limits. In other words, it means knowing that one's being exceeds one's knowing.

**Gadamer's concept of language**

Gadamer devotes the third part of *Truth and Method* to the hermeneutical relation of understanding and language. Following Heidegger, Gadamer eschews any approach that would objectify language. For, “language is the universal medium in which understanding occurs.”38 It is never simply an object because language comprehends everything that can ever be an object. Indeed, language only “is” in speaking where it allows what is said to be understood. Language is not simply one among other things in the world, because it is the condition for our having a world. “Not only is the world world only insofar as it comes into language, but language too has its real being only in the fact that the world is presented in it.”39 Language thus constitutes our belonging to the world; as the very element in which we live, language provides the primordial familiarity that Gadamer calls our “being at home” in the world. Potentially infinite, language constitutes an open horizon of intelligibility within which the meaning of things becomes understandable. Language therefore encompasses everything that can be understood or, in Gadamer’s words, “Being that can be understood is language.”40 The scope of hermeneutic understanding is therefore coextensive with the universality of language. Indeed, their integral relation is such that understanding only achieves its proper completion in language. When this occurs Gadamer speaks of coming to an “agreement” (Verständigung) that is linguistically mediated. The dialogical structure of understanding prepares us for this linguistic turn. As in conversation, interpretation seeks the right word, that is, the word that belongs to the thing meant, allowing it to be understood. Where this word is found, a common language is created that enables the sharing of a common meaning. This relation of the word to what it says reveals a deeper, speculative dimension to the being of language.

The belonging-together of “word” (Wort) and “thing” (Sache) exhibits a “speculative unity.” Gadamer appeals to the mirror image to clarify this unity because the mirror image is an appearance that has no being of its own and yet lets the thing appear by its means, “like a duplication that is still only the one thing.”41 As an appearance of the original, the image and the imaged seem distinct although they cannot ultimately be distinguished; image and original belong essentially

38. Ibid., 390.
39. Ibid., 440.
40. Ibid., 470.
41. Ibid., 461.
together. The same unity is found in the word and its relation to the thing meant. The two appear distinct and yet belong together as presentation and presented. As with image and original, word and thing meant are not differentiated. In this respect, the word is something like an image and must be contrasted to the sign. The concept of the sign is defined by its reference to something else. But Gadamer’s point is that the word is not externally related to the thing meant in the manner of a sign. In order to get at this Gadamer draws on the Christian idea of the verbum, the “Word” that becomes flesh in the mysterious unity of the Father and the Son. The event of the Incarnation provides insight into the intimate unity of word and thought in the experience of language. Because the intellectual emanation of the inner word exists in the full perfection of thought it also includes the “the subject matter thought through to the end (forma excogitata).” By making the intended object present, the verbum affirms the unity of word and thing. Hence “the word is a process in which the unity of what is meant is fully expressed.” The “processual character” of the word is integral to the self-presentation of the thing; it is an ontological event. “Thus everything that is language has a speculative unity: it contains a distinction, … between its being and its presentations of itself, … that is really no distinction at all.”

Gadamer explores a further implication to the speculative dimension of the word, namely, its relation to the whole. Indeed, words do not so much reflect beings as they express a relation to the whole of being. Therefore, “all human speaking is finite in such a way that there is laid up within it an infinity of meaning to be explicated and laid out.” Hence there is a “living virtuality” of human speech that brings a totality of meaning into play without being able to totally express it. The said implicates the unsaid thereby opening on to an inner multiplication of the word. Here the relation between the unity of the word and its multiplicity – the identity and difference of meaning in language – exhibits the dynamic that constitutes living language itself as an event. In this event there is a “realization” (Vollzug) of meaning that always remains open to other, different realizations. This openness marks at once the finitude of language and its speculative structure. To say what one means is thus “to hold what is said together with an infinity of what is not said in one unified meaning.” When what is meant is expressed in this way one speaks in a speculative manner inasmuch as “the possibilities of the word are directed toward the sense intended as

42. “A word is not just a sign. In a sense that is hard to grasp, it is also something like a copy or an image [Abbild]” (ibid., 416).
43. Ibid., 432.
44. Ibid., 470.
45. Ibid., 454.
46. Ibid., 464.
the hermeneutic transformation of phenomenology toward the infinite.\textsuperscript{47} This view reflects Gadamer’s conception of language as the “center” (\textit{Mitte}) through which we are related to the totality of beings and are mediated to ourselves and to the world. “[E]very word breaks forth as if from a center and is related to a whole through which alone it is a word. Every word causes the whole of language to which it belongs to resonate and the whole world-view that underlies it to appear.”\textsuperscript{48}

III. PHILOSOPHICAL HERMENEUTICS IN CONVERSATION: ENCOUNTERS

Various aspects of philosophical hermeneutics are set in relief through the series of debates into which Gadamer enters with contemporary theorists and philosophers.\textsuperscript{49} The exchange with Italian legal theorist and historian Emilio Betti\textsuperscript{50} bears on the question of hermeneutics as methodology. Betti’s hermeneutical theory was fully elaborated prior to the publication of \textit{Truth and Method}, in his \textit{Teoria generale della interpretazione} (1955), but his basic theory and critique of Gadamer is outlined in “Hermeneutics as the General Methodology of the \textit{Geisteswissenschaften}” (1962). There he is primarily concerned to counter the “subjectivism” and “relativism” he discerns in the “existential hermeneutics” of Heidegger and Bultmann and its legacy in Gadamer by deploying a hermeneutical methodology that would secure the objectivity of interpretation in the human sciences. For Betti, the creative mind expresses itself through ideal, “meaning-bearing forms” (\textit{sinnhaltige Formen}) that the interpreter seeks to understand. Following Schleiermacher, he conceives this task as an inversion of the creative process in which the interpreter reconstructs the author’s intention by recreating the meaning of their expression within oneself. Betti’s methodology develops canons of interpretation that specify the conditions under which it is possible to understand the author’s meaning objectively. Specifically, he identifies four “hermeneutical canons,” which are paired off according to whether they relate more to the “object” or “subject” of interpretation. While

\textsuperscript{47} Ibid.
\textsuperscript{48} Ibid., 454.
\textsuperscript{50} Emilio Betti (August 20, 1890–August 11, 1968; born in Camerino, Italy; died in Camorciano di Camerino) received degrees in law from the University of Parma (1911) and classical literature from the University of Bologna (1913), and also studied at the Universities of Marburg and Freiburg. His influences included Dilthey and Schleiermacher, and he held appointments as Professor of Law at the Universities of Parma (1915–17, 1925–26), Camerino (1917–18), Macerata (1918–22), Messina (1922–25), Florence (1925–27), Milan (1928–47), and Rome (1947–60).
the canons of “autonomy” and “coherence” specify the independence of the object (the meaning-bearing forms) as an internally coherent and integrated whole of meaning, the canons of “actuality” and “correspondence” ensure that the subject (the interpreter) engages the object by corresponding to the spirit expressed in these forms and by integrating them within the interpreter’s own intellectual horizon. Against Gadamer, he charges that the concept of historical understanding as the mediation of past and present threatens the objectivity of interpretation. By requiring that the meaning of the past be transposed into the present, Gadamer fails to safeguard historical understanding from the subjective interests (i.e. prejudices) of the interpreter. For Betti, this simply confuses the original meaning of a text with its present significance. For the same reason, he criticizes Gadamer’s integration of application with understanding and interpretation. Gadamer replies in “Hermeneutics and Historicism” (1962)51 that he is not proposing a method, but describing what always happens with understanding regardless of method. For Gadamer, Betti’s return to a psychological conception of hermeneutics narrows the hermeneutic phenomenon. As a result, he argues, Betti is entangled in the very subjectivism that philosophical hermeneutics seeks to overcome. “Understanding is to be thought of less as a subjective act than as a participating in an event of tradition, a process of transmission in which past and present are constantly mediated.”52 In Gadamer’s view, Betti fails to sufficiently acknowledge the integration of understanding into the historical process itself.

Gadamer’s debate with Jürgen Habermas concerns the relation of hermeneutics to social praxis.53 Habermas initiates this debate with a review of Gadamer’s Truth and Method, which first appeared in On the Logic of the Social Sciences (1967), where he takes issue with the universality that Gadamer claims for hermeneutic reflection. Concerned to ground the social sciences in a theory of language, he concedes that Gadamer clarifies how understanding occurs as the mediation between languages. However, Habermas also asserts that Gadamer “hypostasizes language” as “the subject of forms of life and tradition,” thereby falling prey to “the idealist presupposition that linguistically articulated consciousness determines the material practice of life.”54 In his view, Gadamer’s exclusive emphasis on language and tradition as the medium of

53. Habermas’s critique of Gadamer is also discussed in the essay on Habermas by Christopher F. Zurn in The History of Continental Philosophy: Volume 6.
social interaction neglects the material conditions of social action in labor and domination. It also fails to appreciate the possibility that the social consensus attained in language could be the result of coercion. Where ideology prevails as “systematically distorted communication,” the emancipatory interest of critical reflection is necessary to expose it; hermeneutics must pass into the critique of ideology. For Habermas, psychoanalysis provides an explanatory model for the critical unmasking of such “false consciousness.” Gadamer responds, in “On the Scope and Function of Hermeneutical Reflection” (1967), by denying the limits within which Habermas would circumscribe hermeneutic reflection. He argues that the distinction that sets language apart from labor and domination (as extralinguistic conditions of social action) is artificial, claiming it absurd to regard them as lying outside our linguistically mediated understanding of the world. He further argues that the claim to critically unmask systematically distorted forms of communication seriously overestimates the power of reflection. Moreover, he finds the appeal to psychoanalysis problematic in that the unique relation between patient and analyst cannot simply be extrapolated to society. Gadamer holds that hermeneutic reflection not only suffices for critically confronting prejudice, but that it alone is capable of doing so while remaining mindful of its bond to tradition. He further asserts that critical reflection becomes dogmatic when it pretends to rise above its historical conditions to systematically examine all prejudices. He again affirms that prejudices are not ipso facto illegitimate and that tradition is not something whose authority can or even need be dissolved by reflection. For the transmission of tradition constantly happens behind the back of critical reflection.

The debate with Paul Ricoeur addresses the question of methodology and the aims of interpretation. This least publicized of Gadamer’s debates occurred at a meeting of the Society for Phenomenology and Existential Philosophy in 1976. At that time Ricoeur characterizes the hermeneutic situation as a “conflict of

56. Habermas later modifies his position in a theory of communicative action that seems closer to Gadamer. But this theory develops a “formal pragmatics” that posits an ideal speech situation in which participants are able to examine disputed “validity” claims under conditions free of all constraints due to force or coercion. For Gadamer, the notion of a “rational consensus” that expresses “unconstrained communication” distorts hermeneutic reflection and remains “shockingly unreal.” See Hans-Georg Gadamer, “Replik zu Hermeneutik und Ideologiekritik,” in *Hermeneutik und Ideologiekritik*, Karl-Otto Apel (ed.) (Frankfurt: Suhrkamp, 1971), 314.

57. The record of this exchange is found in a volume in the series publishing the principal papers from these meetings. See Paul Ricoeur, “The Conflict of Interpretations,” in *Phenomenology: Dialogues and Bridges*, Ronald Bruzina and Bruce Wilshire (eds) (Albany, NY: SUNY Press, 1982).
interpretations” between what he calls “the hermeneutics of suspicion” and “the hermeneutics of reenactment.” Standing before the “dramatic condition” of this intractable divide within modern culture, Ricoeur believes there is an important place for a hermeneutic approach that would begin by patiently working through the epistemological issues presented by the human sciences.58 So while he acknowledges that dialogue offers a significant gesture of mediation, Ricoeur resists the presumptive integration he detects in Gadamer’s hermeneutic ontology of understanding. Instead, Ricoeur turns his attention to the mediation of those conflicts within interpretation that arise between the respective roles of explanation and understanding in the human sciences. Hence he asks: “what can we do with a philosophy of dialogue that is not able to be reconnected with the discipline of the human sciences?”59 Against Gadamer, Ricoeur claims that hermeneutics must not take the ontology of understanding as its point of departure. He describes this as the “short route” because it breaks with any discussion of method and proceeds directly to the ontological problematic in order to recover the phenomenon of understanding. The longer route that Ricoeur takes aims to move to the level of ontology but only by first going through successive investigations into the science of linguistics and other specific human sciences. In taking this longer route, Ricoeur hopes to reconnect interpretation to a moment of explanation. In emphasizing the positive accomplishment of explanation as the methodic moment in interpretation, Ricoeur seeks to rescue method from its neglect by Gadamer and thereby resist the temptation to separate it from truth. In the actual exchange with Ricoeur, Gadamer began his remarks by noting that the version of Heideggerian hermeneutics that he follows differs from Nietzsche’s hermeneutics of suspicion. His intent was not only to open up the issue of the conflict of interpretations as he saw this being developed by Ricoeur, but also to set off his position from that of Ricoeur, who had appealed in his book on Freud to the necessity of a hermeneutics of suspicion. Like Ricoeur, Gadamer too wants to escape the illusions of objective self-consciousness, but in his view this escape can be accomplished only in the hermeneutic of communication as the exchange of words in speech (Vollzug des Sprechens) and not by the hermeneutics of suspicion. Gadamer’s intent in raising anew the question of hermeneutics is precisely “to go behind the conflict of interpretations that may preoccupy our scientific and methodological

58. In response to a question from the audience, Ricoeur said: “What I tried to do was to focus on certain epistemological situations in which we may proceed accurately in this task of mediation, instead of starting from, let us say, the cultural situation of our time, this desperate situation in which there is no bridge to build between the ongoing process of what Nietzsche called the devaluation of the highest values, and our desperate attempt to make sense of our whole heritage” (“The Conflict of Interpretations,” 314).

59. Ibid., 317.
interests.” In the end, he holds, the conflict of interpretations can be resolved by philosophical hermeneutics inasmuch as “every radical form of critique should be and needs to be reintegrated into the basic process of social life” for which dialogue constitutes the model.

In their 1981 encounter at the Goethe Institute in Paris, Gadamer and Jacques Derrida address the question of text interpretation and the supposed radicality of philosophical hermeneutics. The title of the conference, “Text and Interpretation,” identified the matrix wherein hermeneutics and deconstruction could be thought together. But the papers presented, along with the subsequent exchange of questions and responses, made it clear that joining hermeneutics and deconstruction would be problematic. The importance of Nietzsche and the “destruction” (Destruktion) of the history of metaphysics in these essays clearly indicates that the legacy of Heidegger’s thought is at stake. On the one hand, by characterizing his strategy of reading philosophical texts as “deconstruction,” Derrida intends his sustained interrogation of metaphysical concepts to mark a critical engagement with Heideggerian “destruction.” Gadamer, on the other hand, claims to resume the task of “destruction” by returning the fixed conceptuality of metaphysics to the living language from which it arises. From Derrida’s perspective, the hermeneutic commitment to dialogue and its model of understanding as coming to agreement threatens to suppress difference. Behind the “good will” required of the partners in dialogue, Derrida detects an avatar of the “(good) will to power” that remains complicit with the metaphysical drive to domination. At issue is whether the agreement at which hermeneutic understanding aims does not ultimately appropriate the other. Of course, Gadamer had already been at pains to distinguish hermeneutics from any such Hegelian gesture, insisting on the alterity of the text that disrupts our preconceptions. In Gadamer’s view, the task of understanding is not so much a

60. Ibid., 302.
61. Ibid., 304.
matter of deciphering meaning as it is an accomplishing of meaning in which “the voice of the other” is allowed to address us. Moreover, the “happening of truth” that takes place in understanding is not something that we possess; it is rather something that possesses us. Yet the very mention of “truth” invokes a relation of meaning and presence that deconstruction aims to put into question. Where hermeneutic interpretation seeks the meaning shared in common with the text, deconstructive reading works to displace the meaning that initially organizes the text. Looming behind Derrida’s remarks about hermeneutics is the charge of “logocentrism,” a charge that Gadamer confronts implicitly in “Text and Interpretation” and explicitly in “Hermeneutics and Logocentrism.” For Gadamer, there is no “language of metaphysics.” His “step back” into dialogue undermines the priority of assertion, enabling a retrieval of dialectic from the metaphysics of German idealism. Ultimately this retrieval sends Gadamer back behind Hegel to the Socratic-dialogical element of Platonic dialectic in order to reclaim its presupposition – namely, the anamnēsis awakened in logoi. What is recollected in dialogue, though, is not the eidē but rather “the spirit that would like to unite us” – we who are a conversation.

IV. CONCLUSION

The hermeneutic transformation of phenomenology has been profound. Heidegger’s acknowledgement of Husserl’s insight into philosophy as a way of “seeing” is indicative of the phenomenological impulse behind hermeneutics. But even as he heeds Husserl’s recourse to “the things themselves,” Heidegger construes it as the demand that we attend to beings and the manner of their self-disclosure. This emphasis on the event of a being’s self-presentation signals the ontological turn that characterizes Heidegger’s critical appropriation of phenomenology. But the element of absence that belongs to the ontological structure of such self-presentation requires a hermeneutic turn as well. Especially where the self-showing of Dasein as existence is at issue, Heidegger finds that the self-concealing tendency of Being-there requires a hermeneutic strategy of interpretation rather than a phenomenological strategy of reduction. Further, with the introduction of Dasein, Heidegger deliberately disrupts Husserl’s transcendental program by returning the immanent subjectivity of consciousness and its intentional acts to the original openness of Dasein as Being-in-the-world. On this basis, Heidegger articulates his ontological conception of understanding

64. Risser develops this aspect of Gadamer’s thought into an entire re-reading of his philosophical hermeneutics. See Risser, The Voice of the Other.
65. Michelfelder and Palmer (eds), Dialogue and Deconstruction, 110.
as a mode of disclosure that constitutes Dasein’s distinctive manner of Being. He develops the hermeneutic aspect of this conception through his insight into the circular relation of understanding and interpretation. Anticipatory in character, understanding projects the horizon, which delineates in advance the Being of what is to be understood. Rooted in understanding, interpretation elaborates what is therefore “pre-”understood. Thus the “hermeneutic circle” both defines hermeneutic understanding and describes the hermeneutic situation. It is because existence is thoroughly historical and hermeneutical that Dasein always finds itself to be historically situated within an already interpreted world.

Gadamer resumes this ontological and hermeneutical reorientation of phenomenology by drawing out further implications of the hermeneutic circle. Following Heidegger, he underscores the historicity of understanding, construing its anticipatory fore-structure as a prejudgment drawn from tradition. By so doing he emphasizes that the condition for understanding consists in its prior relation to history. Gadamer’s insight into the ontological priority of our belonging to tradition lies at the heart of his philosophical hermeneutics. In fact, “effective-historical consciousness” is just the recognition of being historically situated by our belonging to tradition. He therefore refuses to conceive understanding and interpretation in epistemological terms as providing a methodologically secured objectivity for historical knowledge. Instead, he conceives them in ontological terms as constituting our participation in the happening of tradition as an event of transmission. Moreover, Gadamer conceives language as the very medium of this transmission. He thus pursues further Heidegger’s hermeneutic insight into the historicity of understanding and its essential relation to language. As the condition for having a world, it is through language that Being can be understood. Elucidating its speculative dimension, Gadamer conceives the word as it breaks forth from the center of language to be uniquely capable of saying the whole in an appropriately finite way.

Perhaps more than other strands of continental philosophy, hermeneutics has sought resolutely to situate thought within the historical conditions of possibility that both enable and surpass it. In this respect, it has pursued “the hermeneutics of facticity” that originally motivated Heidegger’s departure from phenomenology. Indeed, the rigor with which it adheres to this original motivation may well serve as the most appropriate standard by which to measure its success. To the extent that it succeeds according to this measure, hermeneutics can still contribute to the development of a genuinely finite thinking in continental philosophy.
Heidegger’s long career – his significant works range from 1919 to 1973 – coupled with the rapid pace and revolutions of history during his lifetime, meant that his work underwent some very real transformations.¹ Heidegger was an uncommonly productive writer; his collected works is planned for over a hundred volumes. He was also unusually self-critical in his work so that there never emerges something like a “system” or even clear “fundamentals” that might characterize his work. His work needs to be read as very much a work in progress, guided by rather steady goals and concerns, but always evolving. The motto that Heidegger chose for his collected works – “Wege, nicht Werke” (paths, not works) – is one of the ways that Heidegger himself would call attention to this evolutionary quality of his work. One important consequence of this constantly evolving quality of Heidegger’s work is that even real transformations in his thought need to be understood in relation to earlier stages of his thinking. That is why this evolution of his thought is crucial and needs to be addressed in any effort to understand his philosophic contributions.

The chronology of these developments in his thought is in dispute among scholars. While there is clear agreement that we find an important “turn” in Heidegger’s thought during the 1930s (Heidegger himself will use the word “turn” when speaking of this period), there remains much dispute about whether

---

¹ Martin Heidegger (September 26, 1889–May 26, 1976; born in Messkirch, Germany; died in Freiburg) was educated at the Gymnasium, Konstanz (1903–1906), Gymnasium and archiepiscopal convent, Freiburg im Breisgau (1906–1909), and Freiburg University (1909–15). His influences included Aristotle, Augustine, Dilthey, Hegel, Husserl, Kant, Kierkegaard, Lask, Luther, Nietzsche, and Rickert, and he held appointments at the University of Freiburg (1915–23, 1928–45) and the University of Marburg (1923–28).
later transformations in his thought should be regarded as indicating perhaps a “third” stage of his thought.\(^2\) In the end, however one parses the various stages of Heidegger’s thought, what needs to be stressed is the unity of Heidegger’s thought. Dynamic and self-critical, full of turns and at times even repudiating his own earlier vocabulary, Heidegger’s works ultimately need to be read as stages on a path that does not always move in a straight line. What we commonly refer to as the “late Heidegger” needs to be understood as the culmination of Heidegger’s lifelong project of thinking and so has a special importance.

Dating the beginning of the “late” Heidegger is difficult. There does seem to be agreement that we find an important “turn” in Heidegger’s thought during the 1930s. This “turn” seem to begin with the essay on the artwork (“Origin of the Work of Art”; 1935) and reaches its summit in Heidegger’s exceedingly difficult but decisive work, *Contributions to Philosophy* (1936–38), which ushers in themes and approaches that will stay with Heidegger until the end of his life.\(^3\) However, there is good reason to date the beginning of his later work from the years after the Second World War. That was a time of great crisis for Heidegger – albeit more personal, indeed almost private, than political – and it too needs to be seen as providing the impulse for a significant change in Heidegger’s thought. One sees this “new” phase in his thought beginning with “Letter on Humanism” (1946) and with “The Saying of Anaximander” (1949). There will be no single major work anchoring Heidegger’s thought after the Second World War; rather, one finds shorter essays and addresses. At the end

---

2. One of the first and most important early commentators on Heidegger’s work, William Richardson, makes a distinction between Heidegger I and Heidegger II. In response to this distinction, Heidegger writes to Richardson the following: “The distinction you make between Heidegger I and II is justified only on the condition that this is kept constantly in mind: only by way of what Heidegger I has thought does one gain access to what is to-be-thought by Heidegger II. But [the thought of] Heidegger I becomes possible only if it is contained in Heidegger II” (William Richardson, *Heidegger: Through Phenomenology to Thought* [The Hague: Martinus Nijhoff, 1963], xxii). [*] Heidegger’s earlier work, up to and including *Being and Time*, is the subject of Miguel de Beistegui’s essay in *The History of Continental Philosophy: Volume 3*.

3. One should not underestimate the impact of Heidegger’s disastrous foray into political life on his thought and the questions that guide him. Heidegger’s Rectorship was what he called “the greatest stupidity of my life” (private comment reported to me by Gadamer), and while it can be interpreted with reference to Heidegger’s personal character, it can also – indeed should – be interpreted as a philosophical problem and as a powerful impulse driving the turns in his thought during these years. Among the most interesting of the many approaches to the questions posed by Heidegger’s infamous Rectoral Address is Derrida’s *On Spirit*.

4. The years after the war involved the use of his house by the French occupying forces, the denazification process, and his removal from his university teaching post, and then, in 1949, Heidegger had what was described as a “nervous breakdown.” On the events of Heidegger’s life, see Rüdiger Safranski, *Martin Heidegger: Between Good and Evil*, Ewald Osers (trans.) (Cambridge, MA: Harvard University Press, 1999).
of his life Heidegger helped prepare the plan for the release of his collected works. As those works are released, further texts, notebooks, and letters give new insights into the character of his thought throughout his life. One suspects that questions about the evolution of Heidegger’s thought will not be answered until those works are finally fully available.

Nevertheless, three themes tend to define the “late Heidegger”: the increasing technologization of the world, the achievements of the work of art, and the enigmatic character of language. In order to treat these themes Heidegger seldom, if ever, turns to contemporary authors. When he does refer to other texts or authors he does so by almost exclusively returning to ancient Greek texts – especially Presocratic – and to select German poetic texts of the nineteenth and twentieth centuries – especially Hölderlin, Trakl, and George. Whatever theme is addressed, these later texts beginning just after the war and continuing until Heidegger’s death in 1976 can seem to be rather hermetic and are invariably deceptively dense as well as intensely focused. The intention of the remarks that follow is to trace these three central themes as a way of presenting some of Heidegger’s most innovative and important later work.

I. TECHNOLOGY: MACHENSCHAFT AND GESTELL

In 1949, Heidegger presented a series of four lectures collectively entitled “Einblick in das was ist” (“Insight into That Which Is”). In 1954, the first two of those lectures, “The Question Concerning Technology” and “The Thing”, would be expanded and then published in the volume Vorträge und Aufsätze (Lectures and addresses). Those essays mark the beginning of Heidegger’s later investigations into the character of a world dominated and framed by technological and scientific reasoning. To be sure, these works are not the beginning of Heidegger’s concern with technology. The recent release of his works from the 1930s – above all Contributions to Philosophy (From Enowning) and On Ernst Jünger – provides evidence that his involvement with the question of technology stems from this earlier period.5 Already in those early texts one sees some of the later traits of Heidegger’s analysis and critique of technological reason; above all one sees the link between technology and the history of metaphysics. Technology, in all of the different determinations Heidegger gives it, is inevitably understood

5. Beiträge zur Philosophie: Vom Ereignis (Contributions to Philosophy [From Enowning]) was composed during the years 1936–38, but was not published until 1989. Zu Ernst Jünger was composed during three periods – 1934, 1940, and 1954 – but was not published until 2004. One even sees the question of technology emerging in the 1935 lecture course Introduction to Metaphysics (first published in 1953), which concludes with remarks about National Socialism and the encounter of globally defined technology.
as the culmination of the history of metaphysics and of the assumptions that underpin that history. Technology is, in the final analysis, the concretization of metaphysics. Consequently, even in the earlier essays, technology is regarded in terms that also characterize metaphysics; namely, the increasing subjectivization, rationalization, calculability, explicability, consolidation, and uniformity of the world. The present historical juncture marks the summit of this increase, the point of its most extreme development, and that means that the present moment is a time of crisis and that this crisis needs to be thought with reference to the technologization of the world.

The first word that Heidegger uses to get at the essential character of the technological world is Machenschaft (machination). He introduces this notion in Contributions to Philosophy, saying:

What does machination [Machenschaft] mean? That which is set free into its own chains. Which chains? The schema of thoroughly calculable explainability through which everything draws closer to everything else and becomes thoroughly alien to itself, indeed becomes completely other than what is simply alien. The relationship of unrelationality.6

Later he will describe the epoch of Machenschaft as “the most extreme intensification of the power of calculability. What is at work here is the most indifferent and blind denial of the incalculable.”7 In Geschichte des Seyns (The history of beyng), a text composed in 1938–40, Heidegger will link Machenschaft and Macht (power) saying that “the essencing of power is the most extreme form of metaphysics”8 and then that “in power, spirit unfolds itself in the most extreme and unconditional manner, and it comes to the point of unrestricted ‘Unwesen’ [non-sense, de-essence].”9 Power is thus the culmination and consummation of the illusions that hold the operations of Machenschaft in place. One quickly realizes that Heidegger’s characterization of the technologically defined world is all-embracing and crushing. It is a relation to being that disturbs the very possibility of any such relation at all.

6. Martin Heidegger, Contributions to Philosophy (From Enowning), Parvis Emad and Kenneth Maly (trans.) (Bloomington, IN: Indiana University Press, 1999), 92, translation modified.
7. Ibid., 314.
8. Martin Heidegger, Geschichte des Seyns, in collected works, Gesamtausgabe 69 (Frankfurt: Klostermann, 1998), 69, my translation. During this period, Heidegger writes the word “Sein” (“Being”) with a “y” in order to distinguish it from the term as it appears in the history of metaphysics.
9. Ibid., 78, my translation.
 Shortly after *Contributions to Philosophy*, Heidegger will drop the word “Machenschaft.” However, the essential features that this word designates will remain much the same when Heidegger comes to the question of technology in later years. Above all, Heidegger will continue to argue that the question of technology is not defined by machines or tools or inventions. It is rather a relation of being itself. In “The Question Concerning Technology,” Heidegger will open by reinforcing this claim:

The essence of technology is *by no means anything technological*. Thus we shall never experience our relationship to the essence of technology so long as we merely *represent* and push forward the technological, put up with it, or evade it. Everywhere we remain unfree and chained to technology, whether we passionately affirm or deny it. But we are delivered over to it in the worst possible way when we regard it as something neutral; for this conception of it, to which today we particularly like to do homage, makes us utterly blind to the essence of technology.10

Two points should be noted about this remark: first, that Heidegger insists that the essence of technology is nothing technological, that is, its essence is not something that can be thought from out of technology; and second, that representational thinking, conceptual thought – in other words, philosophy as it has long been defined – will not be able to grasp the essence of technology. In other words, to confront and think technology as the dominant form of the appearance of being in our times, a new way of thinking is needed, one not submitted to the “logic” of technological reason.

Heidegger elaborates on this claim by outlining the rather standard and widely accepted view that technology is a means to an end and that it is something defined and controlled by human beings. In short, he discusses the viewpoint that holds technology to be a tool at our disposal.11 In order to deepen our understanding of what really is said in such a viewpoint, Heidegger unpacks the conception of causality at the basis of such a view, ultimately shifting the central point from how technology is a tool to how it needs to be understood as a form of production, of bringing into being (*Hervorbringen*). After having made the case for thinking technology as a form of “*Her-vor-bringen*,” a “bringing-into-being,”

---

11. Although Heidegger does not point to his earlier work, *Being and Time*, here one would do well to return to the discussion of the tool in that book. See for instance section 15 and following.
Heidegger then cites Plato’s *Symposium* (205b): “hē gar toi ek tou mē onton eis to on ioni hotioun aitia pasa esti poiēsis.” Heidegger interprets this sentence by saying that “Every occasion for whatever passes over and goes forward into presencing from that which is not presencing is poiēsis, is bringing-forth [Hervor-bringen]” (QT 317). Then he comments:

It is of utmost importance that we think bringing-forth in its full scope and at the same time in the sense in which the Greeks thought it. Not only handicraft manufacture, not only artistic and poetical bringing into appearance, and concrete imagery, is a bringing-forth, poiēsis. *Physis* is indeed poiēsis in the highest sense. For what presences by means of *physis* has the irruption belonging to bringing-forth, e.g., the bursting of a blossom into bloom, in itself (*en heautōi*). In contrast, what is brought forth by the artisan or the artist, e.g., the silver chalice, has the irruption belonging to bringing-forth, not in itself, but in another (*en allōi*), in the craftsman or artist. (Ibid.)

The question of technology thus becomes a question of the becoming of being itself. Here Heidegger makes the distinction between beings that we summon into being, that is things that we produce, and those that come into being without our doing, namely, what is unbidden. Both, however, are modes of the disclosure of what is; both, in other words, are forms of alētheia, of revealing, of truth. It is from this point of view, not from the view that technology is a matter of the tool, that Heidegger will undertake his further inquiry into the essence of technology.

This is the point at which Heidegger will set apart the real hallmarks of modern technology. He begins by asking:

What is modern technology? It too is a revealing. Only when we allow our attention to rest on this fundamental characteristic does that which is new in modern technology show itself to us. And yet, the revealing that holds sway throughout modern technology does not unfold into a bringing-forth in the sense of poiēsis. The revealing that rules in modern technology is a challenging [Herausfordern].

(QT 320)

---

12. It is helpful to read Heidegger’s discussion in these pages against the background provided by Aristotle’s *Physics*, Book II. One might also turn to Heidegger’s 1939 analysis of Aristotle on this point in “On the Essence and Concept of *physis* in Aristotle’s *Physics B*,” in *Pathmarks*, William McNeill (ed.) (New York: Cambridge University Press, 1998).
Such a challenging, such a demand, that “orders” and “stockpiles” what is revealed would seem to be something at the disposal of human beings, of the will. Heidegger argues that such is not the case and furthermore that this challenging “captures” human beings and claims the possibilities open to human being: “The challenging gathers man into ordering” (QT 324). In other words, human beings are necessarily caught up in the framework of such disclosure and become another element in the realm of what is calculable. The human being comes to be regarded as a statistic and even as “producible” or “reproducible.”

In order to name the essential character of this situation, Heidegger does not return to his earlier notion of *Machenschaft*, but introduces a new word, “*Gestell*” (usually rendered in English with the neologism “enframing”). Even though the word Heidegger now enlists to characterize the essence of technology is different from *Machenschaft*, which was the word he used in the 1930s, the meaning of those words remains very much the same: calculability, speed, reproducibility, manipulability, reliability, and utility are some of the key features of how Heidegger unfolds the notions of both *Machenschaft* and *Gestell*. But with the word *Gestell* Heidegger does want to emphasize something new, namely, the way in which something is posited and assembled (the prefix “*Ge-*” refers to a linking action, while the verb “*stellen*” that is the other part of the word “*Ge-stell*” means “to posit”). The *Gestell* is a composed realm, a region in which nothing remains open for what does not conform to what is already composed and set up as real.

It is this foreclosure of the region of appearances that constitutes the aspect of the *Gestell* that Heidegger identifies as the great danger of the technological age. While he does not deny that the risk to the environment is especially great in the age of technology, his claim is that the deeper and more devastating danger is to the realm of appearance as such: that the only appearances possible will be those determined in advance as compatible with the demands of the world composed by the *Gestell*, the world that can be calculated, measured, controlled, ordered, and regulated. To close this realm would be to immobilize the conditions of appearance, it would, in some sense, be to freeze history:

> [T]he essence of modern technology starts human being upon the way of that revealing through which the real everywhere more or less distinctly, becomes a stockpile. “To start upon a way” means “to send” in our ordinary language. We shall call that sending-that-gathers which first starts human being upon a way of revealing

---

13. One thinks here of new developments that lead some to speak of a time in which human beings could be cloned or genetic manipulation could enable parents to select, among other attributes, the gender of their child.

14. One thinks here of Max Planck’s celebrated remark that “the sole facts are what can be measured.” From such a point of view, what is not able to be measured does not qualify as real.
destining [Geschick]. It is from out of this destining that the essence of all history is determined. (QT 329)

What is at stake in the age of technology, thought as the Gestell, is the possibility of a future. That is why Heidegger says “the destining of revealing is in itself not just any danger, but danger as such” (QT 331). The danger is that the Gestell will “conceal that revealing which, in the sense of poiēsis, lets what presences come forth into appearance” (QT 333). More precisely, “what is dangerous is not technology. There is demonry of technology, but rather there is the mystery of its essence. The essence of technology, as a destining of revealing, is the danger” (ibid.).

Heidegger’s sense is that the risk of our times, the risk that emerges out of the essence of technology, is a profound one. But he also argues that confronting this risk, entering into what it exposes, is the path that “saves” us from that risk. Citing Hölderlin, Heidegger remarks that “But where danger is, grows / The saving power too” (ibid.). What Heidegger means in this case is that it is precisely by rethinking the natures of disclosure and of production, and by opening the space of appearance such that possibilities become possible again, that there can be a hope for a future: “it is precisely in this extreme danger that the innermost indestructible belongingness of human being within granting may come to light” (QT 337). That is why he suggests that the essence of technology is “ambiguous”: properly thought, it can refer us to (even if only as a danger) the riddle of all disclosure and coming into appearance, that is, of truth.

Heidegger amplifies this possibility by noting that technology emerges out of what the Greeks analyzed under the notion of technē, namely, that mode of bringing into being that has to do with human handiwork. He notes as well that technē was also the name for the production of the work of art in which our productions were a bringing into “radiance.” Art, which Heidegger at this time defines as the poetical, opens the possibilities of bringing into appearance, of production, a manner that does not challenge and demand, does not frame the possibilities of appearance, but rather lets things be: “the poetical brings the true into the splendor of what Plato in the Phaedrus calls to ekphanestaton, that which shines forth most purely. The poetical thoroughly pervades every art, every revealing of coming to presence into the beautiful.”

Heidegger concludes this analysis of technology with a gesture toward the importance of the work of art and of reflection on such works. In one of the

---

15. Also, “Because the essence of technology is nothing technological, essential reflection upon technology and decisive confrontation with it must happen in a realm that is, on the one hand, akin to the essence of technology and, on the other, fundamentally different from it. Such a realm is art” (QT 340).
companion pieces to “The Question Concerning Technology,” namely, “The Thing,” Heidegger will pursue yet another path to a more open future. There he will ask, as he had done in earlier years, what makes a thing what it is. This time, he will do so as part of an effort to recover the sense of a thing from its character in the Gestell as a reproducible object designed for consumption and as identical with other such objects. In pursuing this question of the thing, Heidegger will propose a notion that seems to be something of a counterpart to the notion of Gestell, namely, the notion of the Geviert (fourfold). While the notion of the Gestell is Heidegger’s way of characterizing the present age as a time of the constriction of the possibilities of life, the notion of the Geviert names the more original and free relation to the possibilities of our being in the world. The Geviert is among Heidegger’s most enigmatic notions. While it never receives any clear or determinate formulation, he does describe it always as a play; more precisely, as an interplay, of the relations among the four basic dimensions of existence: the earth, the world, the mortals, and the divine. These four dimensions are difficult to understand, especially because Heidegger insists that, in the end, they cannot be understood in isolation, but that each can only be understood out of the interplay of their mutual relation. The Geviert therefore does not designate any rigid measure indicating how we should regard or order life. Quite the contrary, it names what comes into play when the possibilities of life are set free, it names an “event.” Early in his career, Heidegger spoke of the relation of Dasein and world; some years later he spoke of the need for human beings to find our place in the relation of earth and world, that is, in a place we cannot define or control. This same concern for understanding what Heidegger once characterized as the relation of Dasein to being comes to guide the notion of the fourfold relation of earth, world, mortals, and divine: it is a concern with finding the place of life of mortal beings in the world. But here, in the notion of the fourfold, we see how the human being, located in the dimension of the mortal, does not occupy the center and so does not define or control the world in which it finds itself. Therefore, in the age of the Gestell (with the framing and ordering of life that defines this age), the Geviert needs to be understood as a critical idea, as the reminder of what comes into play when the range of possibilities open to us are freed up. Although the fourfold is a complex and difficult notion, it remains, along with reflection upon art, among the ways in which Heidegger attempts to think through the dominant and most pressing question of our age, namely, the question concerning technology. It stands as well as a reminder of just what is lost in the age of technological reason.

16. See Martin Heidegger, What is a Thing?, B. Barton and Vera Deutsch (trans.) (Chicago, IL: Regnery, 1967), which, although first published only in 1962, is the text of a lecture course given in 1935/36.
II. “THE ORIGIN OF THE WORK OF ART”

The critique of metaphysics as a form of ossified thinking, and the project of overcoming it had been well established by Heidegger in his earlier works;\(^ {17}\) however, the notion that art opens an alternative to metaphysical forms of thinking, in other words, that art bears an original relation to truth, emerges as first fully developed in “The Origin of the Work of Art” (1935). Part of the intention of that essay is to destroy the traditional philosophical categories for speaking of artworks. One sees this intention operating in the first sections of the text, where Heidegger quickly dispenses with longstanding notions such as substance and accident, sensation and formed matter. One also notices that the idea of beauty is mentioned only once and even then only as “one way in which truth essentially occurs as unconcealment.”\(^ {18}\) There is also an attempt to forge a new vocabulary for speaking of artworks: notions such as work, world and earth, struggle, clearing, rift, and endowing all emerge here as efforts to resituate and rethink the language that speaks of art. Heidegger also makes clear that the goal of this essay has nothing to do with what is called “aesthetics” or “art theory,” which he regards only as a way in which the metaphysical tradition has marginalized the accomplishments of the work of art. Rather, the goal of the essay is to rethink the artwork from its incipient moment, its “origin,” and to do so with an eye to asking how such a new starting-point for thinking opens thinking to possibilities closed off in metaphysics.\(^ {19}\) In short, the ambition of “The Origin of the Work of Art” is enormous and that, in part, accounts for the enduring importance of this essay in Heidegger’s work. The range of themes that emerge as a result of the reflections on art is wide – truth, the nature of the thing, history, the idea of a people, the character of the polis are only some of the themes addressed – so wide that this text sometimes seems to almost be a manifesto for the task of thinking. But at the center of all of these themes is the

---

17. One sees this, for example, in *Being and Time*, *What is Metaphysics?* (in *Basic Writings*), and *On the Essence of Ground* (in *Pathmarks*), as well as in *Kant and the Problem of Metaphysics*.

19. In other texts, Heidegger will even draw a tight link between the history of metaphysics and the history of art. So, for instance, one reads the following: “To this transformation of the essence of metaphysics there also corresponds a transformation of art in terms of its essence as symbolic image. That is why, for example, a Greek vase painting, wall paintings from Pompeii, Reichenauer frescoes from the Ottonian era, the paintings by Giotto, a painting by Dürer, and a picture by C. D. Friedrich, are not only different according to their style, for the style is itself of a different metaphysical essence” (*Hölderlin’s Hymn “The Ister,*” William McNeill and Julia Davis [trans.] [Bloomington, IN: Indiana University Press, 1996], 24–5). In “The Origin of the Work of Art” one finds a similar remark: “the transformations in the essence of truth correspond to the essential history of Western art” (OWA 206).
Heidegger develops as illuminating the character of art are the pair “earth and world.” As was noted above, this pair anticipates the fourfold. Just as the fourfold departed from the technological view of the world as completely calculable, these notions must be understood as radical departures from the orthodox categories concerning artworks. Generated out of a discussion of a painting of shoes by van Gogh and the ruins of a Greek temple found in Paestum, Italy, these notions need to be understood as radical departures from orthodox categories for considering works of art. Most of all, they need to be understood as in a struggle with one another, as oppositional movements even, and this struggle needs to be seen as resulting in the opening of a space of appearance, ultimately, the space of truth. Heidegger puts the point this way:

The world is the self-opening openness of the broad paths of the simple and essential decisions in the destiny of a historical people. The earth is the spontaneous forthcoming of that which is continually self-secluding and to that extent sheltering and concealing. World and earth are essentially different from one another and yet are never separated. The world grounds itself on the earth, and earth juts through world … In this essential struggle the opponents raise each other into the self-assertion of their essential natures.

(OWA 174)

What happens in art, the “work” it instigates and sets forth, is precisely this struggle. Heidegger further describes what “happens” in art as the showing, the unconcealment, of world and earth insofar as each is brought forward in the work. Out of the earthly character of the work, a world emerges into view; likewise, the earth element of the work shows itself as earthly insofar as the world displayed recedes. For one element to emerge, the other needs to recede. Or, in Heidegger’s words:

The essence of truth, that is, of unconcealment, is dominated throughout by a denial. Yet this denial is not a defect or a fault, as though truth were an unalloyed unconcealment that has rid itself of everything concealed. If truth could accomplish this, it would no longer be itself. This denial, in the form of a double concealment, belongs to the essence of truth as unconcealment. Truth, in its essence, is un-truth.

(OWA 179)

This remark, “Truth, in its essence, is un-truth,” appears frequently throughout Heidegger’s work. It refers to the fact that when something appears, it never
appears completely, that there is still some hiddenness to it or in it. The “un-” of “un-truth” refers to this remaining hiddenness. The artwork, insofar as it has an earthly character – the sheer bulkiness of the marble in the temple or the sheer plasticity of the paint in the painting – seems especially to draw our attention to something not present. The basic impulse of the work of art is this disclosure of finite truth: “Art then is a becoming and happening of truth” (OWA 196).

Heidegger develops this relation of art and truth in several ways in “The Origin of the Work of Art.” Most importantly, perhaps, it is on the basis of this relation that he will find an essential link between the workings of art and history. The instigation of this struggle is the origination of something new. Each work, as uniquely itself, opens up the space of appearance in its own manner. In this way, the work clears a new space for appearance by transfiguring the given. Heidegger puts this as follows:

At each time a new and essential world irrupted … Whenever art happens – that is, whenever there is a beginning – a jolt enters history; history either begins or starts over again. History here means not a sequence of events in time, of whatever sort, however important. History is the transporting of a people into its appointed task as entry into that people’s endowment. (OWA 201–2)

From such a remark one can perhaps understand why it is that Heidegger contends that art is essentially an origin. It is a way in which truth comes into being, which means that it is a way in which truth becomes historical.

When Heidegger writes the epilogue to “The Origin of the Work of Art” (1956) – after the war, after his deepened concern with the question concerning technology – the conviction that art did indeed offer a way in which thinking could move outside the empire of metaphysical assumptions is no longer self-evident. Referring to Hegel’s claim that “art is and remains for us, on the side of its highest vocation, something past,”20 Heidegger will write “Is art still an essential and necessary way in which that truth happens which is decisive for our historical existence, or is art no longer of this character? … The truth of Hegel’s judgment has not yet been decided” (OWA 205). One might rephrase this and ask whether a painter such as van Gogh (who Heidegger admired in “The Origin of the Work of Art”) still possesses the power to set into motion history. Do works that hang in a museum preserve the founding power to gather a people together? Can art still open the relations that found the life of a people? This hesitation about the promise of art had appeared just a few years after

“The Origin of the Work of Art” in the small text composed in 1938 entitled “Die Überwindung der Metaphysik” (The overcoming of metaphysics). There Heidegger would write a sentence that can only be heard as a criticism of his own earlier essay on art: “the attempt to rescue art by means of a more original interpretation of the work of art is misguided.”

A deep ambivalence about the prospects of art for the task of thinking characterizes Heidegger’s work after “The Origin of the Work of Art.” He will continually return to investigations of art and he will not cease to speak of the potential “saving power” of art, but, in notes and other works that would not be published until after the war, it becomes clear that the question of the promise of the work of art is no longer settled for him. Nonetheless, after the war, Heidegger will continue to point to art as a promise of the sort of transformation that he argues is necessary in our times. The celebrated essay on technology is just one of the better known of such gestures. References to art will continue during this last stage of Heidegger’s career, but, strangely, there will be no further major work on the nature of art as such even while art seems to take on a growing importance for Heidegger.

Even if he has doubts about the prospects of art in the age of the Gestell, it is clear that whatever new future we might find will, in some sense, be beholden to the achievements of art.

Only in recent years have we begun to learn just how important the question of art was for Heidegger in the 1950s – and just how impossible it had become for him. Although there was long a rumor of a major work that Heidegger had composed on Paul Klee, it now seems that such a text does not exist. However, we do now have access to many of Heidegger’s notes on Klee and on the basis of those notes, as well as letters and other evidence, one can see that a new problem regarding art had emerged for Heidegger during these postwar years. The notes on Klee are, like all notes, fragmentary, obscure, and not intended for a reader other than their author. Nonetheless, one can see in them a strong self-critique regarding the approach to art in “The Origin of the Work of Art” and a sense that art has undergone a very real transformation, one in which the promises of art are greater than ever. In those notes, Heidegger recognizes that his early treatment of art was too restricted to the art of the past, to an art that was intimately bound up with the very metaphysics that he was seeking to overcome:

22. Most of the texts on art are smaller essays (for instance, “Die Kunst und der Raum” of 1969 or “Die Herkunft der Kunst und die Bestimmung des Denkens” of 1967) and they are never as extensive or ambitious as “The Origin of the Work of Art.”
“The Origin of the Work of Art” thinks out of the past of art … no longer [should one think with reference to] the production of world and the setting forth of earth as thematized [in that essay] … the art of the future should be given over to [thinking from out of] the bringing forth of relations from out of the event of the fuge.24

While this note is rather hermetic, it is clear that Heidegger is suggesting that a new approach to the work of art is needed, since his earlier effort to take up the challenge of art was insufficient insofar as it remained wedded to the art of the past, in other words, to an art still bearing an essential relation to metaphysics.

Heidegger remarks, both in his notes as well as in letters to friends, that “[in Klee’s paintings] something becomes visible that we have barely even glimpsed before.”25 He is so overwhelmed by his “discovery” of Klee that Heidegger tells his friends that he plans on writing a pendant or sequel to “The Origin of the Work of Art.”26 He concedes that art has undergone a real transformation, even a revolution, that he had not previously recognized, and that this new shape of the work of art did indeed offer the possibilities for thinking that he had come to doubt since composing “The Origin of the Work of Art.” What he comes to recognize is that abstract art, art that sheds entirely any semblance of being a “copy” of objects in the world, can make visible the process of production, of coming into being, that Heidegger had sought in his earlier essay on the artwork: “the less [the painting is] interpreted according to objects, all the more evident the world brings itself forward.”27 By dispensing with the object as an object, abstract art can let something else appear, namely, the act of production, of coming into appearance, in which Heidegger had always located the real “workings” of art.

When he takes up the Greek temple as an exemplary artwork in “The Origin of the Work of Art,” Heidegger remarks that he is “deliberately choosing a non-representational work of art … that does not copy anything” (OWA 167), but in choosing an ancient work of architecture, one that expresses the spirit of a different time, Heidegger misses the revolution of art in his own times that he would later recognize as providing a genuine opening to something new, to an art not determined by metaphysical assumptions. Klee’s paintings, but also Klee’s

26. He has his first serious encounter with Klee’s works at the Beyeler Foundation in Basel in 1956. The pendant to the artwork essay was never written.
own theoretical writings and diaries, would open Heidegger’s eyes to this new possibility. It would even lead him to an interest in Zen artworks and the Zen conception of art, but this great excitement of 1956–59 that Heidegger finds in Klee’s paintings and writings would essentially disappear around 1960. He would republish “The Origin of the Work of Art” in 1960, but make no reference to any of the insights of his rather passionate involvement with Klee during the preceding five years. This second life of the question of art in Heidegger’s thought never bears fruit in any publications, nor does it seem to leave a mark on his efforts in related matters. The reason that such an important and promising path never leaves significant traces is not at all clear. Further discussions of the work of art in Heidegger’s later work tend to express a concern about the possibility of art in the age of technology and the Gestell. His worry is that the place for the appearance of art might well be foreclosed in our times, but when he does explore the vital possibilities of art those discussions center almost exclusively on art that happens in language, most of all in language as it appears in poetry.

### III. LANGUAGE: POESIS AND ETHOS

The question put to us by language is perhaps the most enduring question of Heidegger’s career and occupied his attention in some of his earliest works as well as in his final works. Language already had a prominent place in the project of fundamental ontology as it is articulated in Being and Time (1927), and the texts and lectures of the 1930s that are so often devoted to reflections on Hölderlin’s poetry only serve to refine and intensify Heidegger’s early focus on the nature and experience of the word. Immediately after Heidegger’s disastrous political engagement as Rector (1933–34), he would turn to Hölderlin’s texts to find a way to think through some of the issues pressing on the times: the character of Germany, the nature of a people, the role of language in history, the experience of nature in the modern age, are among the topics that find their locus in Heidegger’s readings of Hölderlin. Hölderlin would also mediate

---

28. Heidegger was especially interested in a lecture that Klee gave in Jena (1924) entitled “On Modern Art.”

29. See the protocol of the seminar that he held in Freiburg with Hisamatsu (1958), “Das Kunst und das Denken” [Art and thinking], in Martin Heidegger, Reden und andere Zeugnisse eines Lebensweges 1910–1976, in Gesamtausgabe 16 (Frankfurt: Klostermann, 2000), 551–8.

30. See, for instance, the discussion of the equiprimordiality of language in the disclosure of a world as it is laid out in Being and Time, section 34.

31. It is important to bear in mind that Heidegger was seriously interested in Hölderlin’s work for many years prior to this (one can date this interest to the early 1920s), but that his philosophical interest began to show up in his lecture courses and published texts only in the mid-1930s. It
Heidegger’s return to the Greeks, especially to Greek tragedy as one finds it developed in Sophocles, which was another large and abiding interest of the 1930s and 1940s. Heidegger’s work on language will always bear the imprint of this deep affection for Hölderlin’s poetry and theoretical texts. Hölderlin will always seem to mark the summit of the possibilities of language for Heidegger; even when he is not mentioned explicitly, one should always keep Hölderlin in mind when speaking of Heidegger and the question of language.

In addition to that deep involvement with Hölderlin’s work, perhaps the most significant development in Heidegger’s considerations of language comes when he links his concern with language to his concern with the work of art, so that language in the poem emerges as the essential character of language as such. Heidegger argues that no matter what else it might be “about” – plums, flowers, love, despair, an April day – language in the poem is always language “about” language. In the poem, language calls attention to itself (much as an abstract painting will call attention to the image, not to any object it might “represent”), so that one must say that language in the poem is language at its most self-reflexive moment. Language in the poem is the essential form of all language. Heidegger had argued for a long time – at least since *Being and Time* – that we live “in” language and that “language is the supreme event of human existence.”

Later, this view would come to be expressed by the oft-cited phrase “language is the house of being.” When he joins these two fundamental convictions – that language is the definitive event of human life and that poetry marks the culmination of the possibilities of language as such – he will arrive at the view, already expressed by Hölderlin, that we “dwell poetically upon the earth.” Our relation to language is at the basis of the very character of our being and the most pristine form of this basis, its intensified expression, comes in the form of poetic language. But while poetic language is language that calls attention to itself, it needs also to be said that for the most part language is poorest at doing just that. To think the nature of language, one needs to begin by recognizing that language is poorest at articulating itself and tends to hide its own nature.

would continue to be an active interest through much of the war, but would fade somewhat in the years after the war.

34. This phrase comes from Hölderlin’s late prose poem, “In lieblicher Bläue ...” (In lovely blueness ...), and is quite frequently cited by Heidegger. It even serves as the title of an essay that he originally presented as a lecture in 1951.
For Heidegger, it is important not to regard language as a tool or means of thinking, as if language was something we could pick up and put down.\(^{35}\) The intimacy of language and thinking is too great ever to think them separately. Language is not something that we “use.” Heidegger is so insistent on this point that he will say that “One speaks only insofar as one responds to language. Language speaks.”\(^{36}\) Language speaks us, giving shape and form to our world, our relations, our self-understanding. Even more: for Heidegger, the intimacy of language, world, and human being is so inextricable that to think one member of that relation is to think the other two. Language, one might say, is the relation of all relations. However, precisely because it does not, for the most part, call attention to itself, it is difficult to hear language as language. So it is not surprising that Heidegger’s discussions of language also inevitably speak of a requisite listening that is required for genuine speaking. In some sense one needs to say that this listening is “prior” to any genuine speech since all such speech is a response to the way that language discloses being.

Such a comment does not mean that poems surpass works of philosophy or that we should all simply write poetry. Heidegger makes a distinction between the “poetic” and “poems,” and the nature of the “poetic” is a key concern for him. It belongs to the question of the work of art, to the question about technology, to the question of how we are to live and inhabit our world. It is important, then, to recognize that Heidegger’s concern with such literary works does not lead him to questions about various literary genre or into literary critical questions. Rather, his turn to these poetic texts is undertaken in order to broach – in a new and revolutionary manner – questions about the most basic character or way we belong to and experience the world. In Homer’s language, the word “ethōs” referred to the way and the place an animal lived. That word forms the ancient roots of our modern word “ethics.” I believe that this more archaic sense of ethōs is what one finds at stake in Heidegger’s reflections on language. Heidegger has often been criticized for never having addressed questions of political and ethical life, questions of our living together on the earth and in the time that we share.\(^{37}\) Heidegger could indeed be seemingly oblivious to the realities of suffering produced in our times. He could equate homelessness and the forgetfulness of being, the gas chambers of the Shoah with the mechanization

\(^{35}\) It is, however, important to note that Heidegger expresses serious concerns about language in the age of the Gestell. He is deeply critical of the view that holds language to be foremost a matter of “information.”

\(^{37}\) The “Letter on Humanism” (1946) (in *Basic Writings*) is the text in which Heidegger most directly responds to such a criticism. One might also refer to the interview published in *Der Spiegel* (1976) entitled “Nur ein Gott kann uns retten” (Only a god can save us).
of agriculture, and he never spoke directly of the political realities and immense sufferings brought into the world by the Nazis. Above all, and almost incomprehensibly, Heidegger never apologized or honestly discussed his own involvement in the politics of Nazi Germany. There is undeniably truth in such criticisms. To be sure, Heidegger’s thought tends to remain rather remote from the exigencies of life and history. He seems removed from his own times and unconcerned with what one easily sees as problematic about those times. Indeed, one sometimes has the feeling as well that all of those he regards as dialogue partners are dead. But such remarks miss the real point to which reading Heidegger’s work can lead us: Heidegger’s work has driven to the hidden foundations and impulses, the deepest imperatives, that have given shape to the present form of our world. He has shown, with exemplary insight, just how concealed the real sources of our contemporary problems are and how far-reaching any effort to truly address those problems must be.

IV. CONCLUSION: READING HEIDEGGER

Reading Heidegger one is quietly drawn into the heart of the riddles that define us. Heidegger’s work presses mightily to drive toward the questions that have been forgotten. He already demonstrated this trait in Being and Time, which opens by retrieving a question that has long been forgotten and covered over: the question of what it means to be.38 It is a trait that will define his entire career and all of his work from whatever period of his life. One does not find clear “positions” in Heidegger’s work; one finds, as he said, “ways” or “paths.” One finds as well a passionate investigation of questions that we need to be asking since, as Heidegger once remarked, “questioning is the piety of thought” (QT 341). Heidegger’s later work is a refinement of this passion. Some of the themes have changed since his beginnings, some of the assumptions as well. Certainly, the world had changed immensely in the years from which one might date his later work: computers, cell phones, video, and so many other inventions have changed the shape of daily life. Heidegger’s later work is an effort to respond to those changes. To what extent he has succeeded one can judge only by reading his work closely and carefully.

MAJOR WORKS

This essay has a heuristic intention. It attempts to sketch one of the most significant concepts of philosophical and theological thought, a concept that was developed on the basis of and in critical reflection on phenomenology and existential philosophy in the twentieth century. Despite their philosophical differences and their religious differences, the various thinkers to be discussed all share a fundamental characteristic, namely, that the Being (Sein) or existence of the human cannot be conceived without including a relation to the divine. The positions and projects linked to the names Edith Stein, Jacques Maritain, Emmanuel Mounier, Martin Buber, and Gabriel Marcel as well as Martin Heidegger, Rudolf Bultmann, and Paul Tillich will be examined.

I. ATTEMPTS AT A CHRISTIAN AND A JEWISH PHILOSOPHY: STEIN, MARITAIN, MOUNIER, BUBER, AND MARCEL

One of the noteworthy consequences of Husserlian phenomenology was that it gave rise to quite divergent philosophical developments and elaborations in the work of his students. This applies in particular to the religious-philosophical projects of Edith Stein and Martin Heidegger. Stein, Husserl’s private assistant, born Jewish and a convert to Roman Catholicism in 1922, attempted to

---

1. Edith Stein (October 12, 1891–August 9, 1942; born in Breslau (Wroclaw), Poland; died in Auschwitz Concentration Camp) was educated at the University of Göttingen (doctorate, 1916). Her influences included Catholic theology (Aquinas) and mysticism (Teresa of Ávila), Heidegger, and Husserl. She held appointments at the Universities of Freiburg (1916–19) and Göttingen (1919–22), Dominican Girls School, Speyer, Germany (1922–32), Discalced...
bring Thomistic and phenomenological thought explicitly into dialogue. For her, “Christian philosophy” (oriented by Catholicism) is supposed to find its fulfillment in theology, but without conceiving itself as theology and without making theological claims. In contrast, Heidegger, who followed her as Husserl’s assistant, grew out of Catholicism to advocate a fundamental methodical atheism in philosophy, rejecting Christian philosophy, in “Phenomenology and Theology” (1927/28), as an impossibility, as a “square circle.” For Heidegger, unlike Stein, theology requires philosophy, namely, as a “guiding corrective”; philosophy, however, in no way requires theology in order to be philosophy. How can the specificity of these disparate options, which ultimately are mutually exclusive, be more closely determined? The resolution of this question is important. In fact, it will be shown that the disagreement that emerged between Stein and Heidegger in the question of a “Christian philosophy” marks something like a foundational rupture and, at the same time, a basic structure in the field of debates presented here.

In her magnum opus, *Finite and Eternal Being*, Stein follows Heidegger and characterizes the question of Being as the central motif of her investigations (FEB xxix–xxx). For Stein, however, the “meaning of Being” can accordingly only become clear in the “overcoming” of the finite toward the infinite. If one proceeds from *Dasein* (human existence) in its radical finitude – as Heidegger does – one succumbs, in virtue of this perspective, to the danger of already cutting oneself off from the meaning of Being (FEB 20). Thus, Stein claims that what Heidegger’s project of the “destruction of the tradition” (under Nietzsche’s influence) had to reject – the thought of the infinite or the beyond – is actually crucial for philosophy. Having become a faithful Catholic, Stein thinks that she

---

5. A more comprehensive individual study of Stein’s, contained in the sixth volume of her collected works, makes critical reference above all to *Being and Time* in the same sense, but also refers to Heidegger’s Kant book, as well as the later, shorter texts *On the Essence*
is called on to demand precisely this supplement to philosophy. The direction of her thinking is emphatically expressed in an ontology of the human person that combines scholastic theology with mysticism and phenomenology. It is toward this kind of ontology that her thought aims. The investigation of finite Being leads Stein “to eternal being [as] that primordial being which conditions every other kind of being” (FEB 380). Finite Being is disclosed in a “relationship of image to divine Being” (FEB 418). For Stein, the ontological and ethical presupposition of finding oneself is that one finds God (FEB 509). Stein therefore strives for a “Christian philosophy” whose “foremost task” is conceived as the “pathfinder of faith.”

Although Stein elaborates her thought with a critical view to Heidegger’s Being and Time, a certain proximity to other figures of the phenomenological movement, such as Max Scheler (1874–1928)⁶ and Hedwig Conrad-Martius,⁷ can be discerned.⁸ Thomism, which exerted a strong influence on her and which she sought to understand in intensive study after her baptism, certainly seems to be a determining element. The book Finite and Eternal Being frequently cites the authority of “St. Thomas,” but also refers to such Catholic thinkers as Maritain and Marcel, whose work, for their part, is oriented toward the concept of “person” as a means of linking ontology and ethics.

Under the title Integral Humanism, Jacques Maritain⁹ conceives of a social order arising from the primacy of the human person. Maritain proposes a
so-called “integral” or, as he also says with more pathos, “heroic” humanism as the figure of a secular Christianity oriented toward the “ideal of a fraternal community.”

The point is “a veritable socio-temporal realization of the Gospel” (IH 94). For Maritain, the latter is not characterized solely by the fact that it is communal, but rather – and above all – by the fact that it is personalistic. And that means for him, as a Thomistic thinker, that the earthly temporal life order has to pay deference “to the eternal interests of the person … in such a manner as to facilitate the access of the latter to his supernatural ultimate end” (IH 97). This main idea of a “Christian philosophy of culture” (IH 142) connects to a double line of attack against socialism and Marxism, on the one hand, and against liberal individualism, on the other. In fact, the perspective of “Christian personalism” (IH 133) as the core content of a “new Christianity” is linked to the demand for a “Copernican revolution” in the concept of political action: “to act politically in a Christian style, to bring a thoroughly Christian life to the world” (IH 252). In no way does such action mean for Maritain the return to notions of sacred unity from the Middle Ages (IH 146), but he deems it to be possible, as well as necessary, to create new political images “of an essentially Christian spirit.” This is the core of “the proper task of Catholic action” (IH 269). “In order that there should succeed to capitalist civilization in decadence a new world superior to Communism,” explains Maritain, “nothing less is required than the personalist and integral humanist principle in its widest significance” (IH 279). The “integral humanism” shows itself to be, at least for Maritain, the “solution” to the enigma of history (IH 285).

Emmanuel Mounier also proposes a decidedly Christian personalism that emphasizes, next to its personal structure, the communal character of Christian faith and life as its hallmark. The concept of personalism for Mounier also opposes the “ideology” of modern individualism, in so far as it regards humanity abstracted from all social and religious relations. The fundamental experience of a person is, as Mounier emphasizes, the experience of being spoken to, that is, the second-person experience, or, as Mounier says with reference to Buber’s philosophy of dialogue, the precedence of the You before the I (PER 20), the

---

11. Emmanuel Mounier (May 1, 1905–March 22, 1950; born in Grenoble, France; died in Châtenay-Malabry) was educated at the University of Grenoble (1924–27). His influences included Bergson, Maritain, Charles Péguy, and Christian mysticism.

12. Emmanuel Mounier, Personalism, Philip Maret (trans.) (Notre Dame, IN: University of Notre Dame Press, 1952), 80–81; hereafter cited as PER followed by the page number.
affirmation of self-alienation. Mounier says: “Alter then becomes alienus, and I in my turn become a stranger to myself, alienated. One might almost say that I have no existence, save in so far as I exist for others, that to be is, in the final analysis, to love” (ibid.). The economy of the person is an “economy of donation” and not an economy of compensation or of calculation (PER 22). The person exposes himself as a countenance (visage) (PER 45). Radicalizing Buber’s philosophy of dialogue, Levinas even speaks of the irretrievable primacy of the Other, whose face addresses an infinite responsibility to “me,” calling on me to respond to the demands that come from him. Like Levinas, Mounier conceives of responsibility on the basis of the speech act of the response; the human is free as one who answers – and in this way he is responsible. If we hear the word in a more literal sense as a responding (and relation) to a call with a vow, then we see that responsibility is ultimately “religion,” “devotion” (PER 64). The human as a person is neither merely in himself nor for himself, but rather “movement”: movement from being toward being. Accordingly, Mounier can speak of the “superabundance” of the person, or, with Marcel, of the person as what “cannot be inventoried” (PER 67). “The personal being is made for a movement that exceeds itself,” and the person is this superabundance ultimately in relation to “one supreme Person.” Mounier concludes, “Christian personalism goes the whole way, and deduces all values from the unique call of the one supreme Person” (PER 68).

It is not by chance that Mounier refers us to Martin Buber, who is regarded as the founder of dialogical personalism. Buber’s I and Thou, which was first published in 1923, established a philosophy of dialogue that left its mark on theology (for example in the works of Friedrich Gogarten [1887–1967], Karl Heim [1874–1958], and Emil Brunner [1889–1966]), but also on philosophy, preeminently in the thought of Emmanuel Levinas, whom we have already mentioned. Levinas was later to return to Buber as the “pioneer” of a thought of the Other that does not take recourse to prior knowledge or to a certain structure of consciousness (as is the case in Husserl), but rather emphasizes that the

13. Martin Buber (February 8, 1878–June 13, 1965; born in Vienna, Austria; died in Jerusalem, Israel) was educated at the Universities of Vienna (1896), Leipzig and Berlin (1897), Zurich (1898), and received a doctorate in philosophy and art history from the University of Berlin in 1904. His influences included Kant, Kierkegaard, and Nietzsche, and he held appointments at the University of Frankfurt (1924–33), and Hebrew University, Jerusalem (1938–51).
singularity of the relationship between I and Thou cannot be reduced to I–It relationships.\textsuperscript{16}

According to Buber, I–Thou and I–It are fundamentally distinct “basic words” characterizing man’s relationship to the world. Whereas the word pair “I–It” stands for the intentional, objectifying approach to the world, the “Thou” in the pair “I–Thou” is not a something. The Thou is not an entity that could be experienced and spoken about. “Someone who says ‘Thou’ does not have a something, he has nothing. But he is in the relationship” (IT 55), a relationship that is characterized by presence and immediacy (IT 62). According to Buber, this does not mean that there is nothing other, no one other than the Thou, which is the Other. Rather, the idea is intended to express the fact that everything else, which is other and different from me, lives in the light of the Other (IT 59). I only become I inasmuch as I say Thou. “I become via the Thou; becoming I, I speak Thou” (IT 62). Or, as we read in another passage: “Man becomes I via the Thou” (IT 80).

The “realm of the Thou” (IT 54) that is established in the basic word “I–Thou” is divided in Buber’s view into three spheres: “life with nature,” which takes shape “on the threshold to language”; the linguistically grounded and constituted “life with human beings”; and finally “speechless, but language-generating” “life with spiritual beings” (IT 57). In each Thou found in each sphere, we have to do with God as the “eternal Thou”: “In each Thou,” writes Buber, “we address the eternal [Thou], in each sphere in its own manner” (ibid.; cf. IT 113). This basic idea is developed in the third and last part of the book. For Buber, the religious dimension, the relationship to the “eternal Thou” proves to be the relationship that founds and supports all other relationships. To enter into the “pure relationship,” that is, the relationship to God, means for him to place the world “on its proper ground” (IT 127). In the eternal Thou, the world finds its unifying center “in which the extended lines of relationships intersect” (IT 148). Among the three spheres of the Thou-world, however, Buber highlights the second, the relationship to man. It is only in the relationship to the other person that a word receives a response. Hence, the relation to the other person turns out to be “the proper metaphor to the relationship to God,” because here, to say this again, a “genuine address receives a genuine answer” (IT 151). In the “pure” relationship to the eternal Thou, however, man does not have God. Man can only be regarded as a recipient here, but one who does not receive an object or a content, but rather living presence (IT 158). Indeed, it contradicts the essence of God to make him an It – even though man always tends to make him a something, an object, like any other Thou that we encounter within the world (IT 161; cf.

existential theology

IT 69). But God cannot be inferred from the world as the ultimate cause or as something of the sort. God as ultimate cause belongs to the categories of traditional onto-theology, which for Buber (no differently than for Heidegger, of whom Buber was otherwise critical\(^\text{17}\)) have to be left behind. God can “rightfully only be addressed [angesprochen], not asserted [ausgesagt]” (IT 129). Theology as speaking of God (as Bultmann also understood) is thus shown to be fundamentally problematical. It is subject to the suspicion that it degrades God to an It, to a mere object of knowledge – thus missing his presence (IT 161). How to speak of God – except in appealing to him, in prayer?\(^\text{18}\) The relationship to God can ultimately only prove itself ethically, that is, in the fact that man, as Buber says, “according to his strength, in the measure of every day realizes God anew in the world” (IT 163). It is neither an atomized subject nor a collective subjectivity that characterizes human existence appropriately. “In the beginning is the relationship,” this is Buber’s basic thesis (IT 69). This is a relationship that is established through language, dialogically. Thus, the “sphere of the intermediate” must be conceived as the “fundamental fact of human existence,” as the space of encounter between I and Thou.\(^\text{19}\)

Gabriel Marcel\(^\text{20}\) unquestionably counts as one of the central figures worthy of special attention in the frame of an account of “existential theology.” Largely forgotten today, Marcel was in his time widely discussed as the main representative of Christian existentialism. The extent of his influence can be seen in Paul Ricoeur’s early work,\(^\text{21}\) where Marcel functions as an important mediator of

18. In his essay, “Welchen Sinn hat es, von Gott zu reden?” (“What does it mean, to speak of God?”) (1925), Bultmann attempted to make a strict distinction between speaking “of” (von) God and an objectifying speaking “about” (über) God, and was thus remarkably close to Buber’s dialogics; with respect to the concrete existential situation of man, Bultmann also rejected the traditional distinction between subject and object as inappropriate. With a view toward the scientific-technical thought that is predominant in the present day, Heidegger reflected in his later thought on theological discourse about “Das Problem eines nichtobjektivierenden Denkens und Sprechens in der heutigen Theologie” [The problem of a non-objectifying thought and speech in contemporary theology]. Heidegger rejects “the claim that all thought as thought is objectifying” as being “groundless,” and identifies “discussing within its own realm of Christian faith what it has to think and how it has to speak in terms of its [faith’s] specific essence” as a “positive task for theology.” In this connection, however, for Heidegger it must be asked “whether theology can still be a science – because it presumably must not be a science at all” (Heidegger, Pathmarks, 59, 61).
19. As Buber puts it in his later work Between Man and Man, 202.
20. Gabriel Marcel (December 7, 1889–October 8, 1973; born and died in Paris, France) was educated at the Sorbonne (1906–1907). His influences included Bergson, Bradley, Royce, and Schelling.
Husserl, Heidegger, and Jaspers’s thought, and therefore as an important source of ideas.22 His influence is also seen in Levinas, who refers to him repeatedly and appreciatively.23 But what is remarkable about Marcel is that he wrote about the relationship between I and Thou in his *Metaphysical Journal* (1927) at almost the same time as Buber, although independently of him. In retrospect, Marcel himself noted and appreciated the substantive proximity to Buber’s dialogics. Decidedly a “Christian philosopher,” Marcel explicitly emphasizes the significance of Buber’s “philosophy of the intermediate.” He links, however, his recognition of Buber’s accomplishment with the critical question as to how the Jewish thinker’s insight “can be transferred to the level of dialogue without degenerating.” Is Buber’s characterization of the intermediate as a “relationship” not already a false objectification of what happens between I and Thou? Is the living communication with the Other not completely frozen in language, does it not inevitably lead to an objectification of the Other?24

Proceeding from the Cartesian-idealistic tradition of philosophy and in increasingly critical reflection on it, *The Metaphysical Journal* interestingly documents an effort to view the problem of existence beyond and outside the long-established metaphysical dualisms such as body–soul and immanence–transcendence. According to Marcel, the reality of the *cogito* is “of quite a different order from existence.” The existence for which Marcel is seeking is not to be *established*, as the “I am” of Descartes’s *cogito* was; it is to be *identified* in the sense that its absolute metaphysical priority must be noted.25 The point is to “determine the metaphysical conditions of personal existence” (MJ 255, my emphasis). Although it is unsystematic, and, as the author repeatedly admits, often quite obscure, the journal displays something of a conceptual center in the question of religion (God) as the question of the absolute or “pure” Thou (MJ 160; cf. MJ 86). It shows Marcel on the way to a “philosophy of the second

---

person,” which regards the encounter between I and Thou as an ontological “mystery” (MJ 160). This is a secret that ultimately – in the reality of love – proves to be, as in Buber, ethical. The Thou is present not in the judgment of a proposition, but rather in the answer or better in the response to a question (MJ 199–200; cf. MJ 138). For “where no answer [response] is possible, there is room only for the ‘him’ [the It]” (MJ 138).

According to Marcel, his studies of the problem of human existence lead back to a distinction that was to provide the title of his main work, Being and Having (MJ 310–12). To have or to be, that is the question for Marcel. Being and Having contrasts two realms in its title concepts, realms that appear to be “the very nature of man’s metaphysical condition” (BH 174). According to Marcel, the realm of having is the realm “at the root of the problem or the techniques” (BH 172), while Being counts as that “sphere” (accessible in contemplation or worship) “that transcends all possible possession.” Being is the sphere in which love is rooted as “the essential ontological datum” (BH 167, 173). With this difference between being and having, Marcel is attempting to reconsider the topic of ontology, but he is doing this in a way that is entirely differently from that of Heidegger. According to Marcel (and here he looks quite close to Stein), the possibility of ontology reveals itself only “on a ground previously prepared by revelation” (BH 120). That is why Marcel sees himself directly required to caution his contemporaries against an uncritical adoption of the “language of the German phenomenologists, which is so often untranslatable” (BH 158). This directly refers to Husserl, but one would not be wrong to read this warning as addressed to a certain popular French Heideggerianism, represented by Sartre and others. Irrespective of this disassociation from “the German phenomenologists,” Marcel claims the concept “phenomenology” for his investigations. For him, phenomenology concerns a possible, accurate identification of the “nonpsychological” and, conversely, an accentuation and discovery of the decisive “content of the thought” (the “noemata” in the Husserlian sense) (ibid.). However, the ontologically primary “datum” is for Marcel, ultimately, the love that is grounded in God and that reveals existence to be a mystery. The

---

27. Marcel prefers to speak of “encounter” and not of “relationship,” as does Buber, so as to emphasize the character of performance that eludes objectification. The concepts existence and objectivity are “radically dissociated” for Marcel (MJ 281), and, accordingly, the repeated question is “how it is possible to conceive a Thou that is not at the same time a him” (MJ 281; cf. 200). To put it in Levinas’s terms, the encounter with the Other resists a theoretical incorporation, the – infinite – significance of the human face resists conceptual classification (cf. Levinas, “Martin Buber, Gabriel Marcel and Philosophy,” 35).

28. Gabriel Marcel, Being and Having, Katharine Farrer (trans.) (Gloucester, MA: Peter Smith, 1976), 199; hereafter cited as BH.
“existence of a Christian datum” (BH 120) is thus an essential starting-point for his phenomenological-metaphysical meditations, which involve (as do those of Maritain) a critique of “modern individualism.” “But I think,” writes Marcel, “it is beyond dispute that if pure subjectivism ought really to be considered as a standpoint attained once and for all by the modern mind, then the religious question would indeed have to be regarded as obsolete” (BH 188). But he immediately adds – with reference to Maritain – that “I think that this subjectivism cannot be for one moment regarded as an established position” (BH 188–9). It is necessary to climb back up the “hill down which modern philosophy has been slipping for more than two centuries” by means of a new reflection on the (religiously grounded) meaning structures of human existence (BH 189).

This critique of modernity applies first of all to the idea of freedom in the Kantian sense. Based on the concept of autonomy, Kantian ethics strikes Marcel as an utterly “monstrous contradiction, a sort of speculative aberration” (BH 131). According to Marcel, Kant did not see “that the self can and should be transcended without there being any need for heteronomy to replace autonomy in consequence” (BH 174). Being faced with the fundamental mystery in religion, art, and metaphysics, the human becomes aware of a creative freedom that cannot be grasped as autonomy. In religion and art, it is shown that “freedom is not autonomy,” that, rather, here “the self … is entirely absorbed by love.” But Marcel extends his criticism of modern thought beyond Kant; it includes as well liberalism, Marxism, and Sartre’s existentialism. “Condemned to freedom,” as Sartre puts it, the human sees himself in a state of plain incomprehensibility, thrown back on to himself alone. However, to conceive of man as the Absolute is, in the final consequence, “self-destruction or idolatry,” as Marcel formulates it in his work Problematic Man.29 It belongs to Marcel’s basic convictions that human freedom can be defined only with reference to divine grace “in depth” (PM 60), but that freedom and grace must be understood in a language beyond a language of causality (PM 55). It is understandable that Marcel refused to accept the label of “existentialism” and characterized his position rather as a “neo-Socraticism” (PM 60). Self-questioning or putting-oneself-into-question, however, does not stop with ascertaining the mere questionability of the human. With Marcel, it opens – no differently than with Stein, Maritain, and Mounier – into religion and invocation, the invocatio dei: “You who alone possess the secret of what I am and of what I am capable of becoming” (PM 63).

---

II. HEIDEGGER AND CHRISTIAN EXISTENTIALISM:
BULTMANN AND TILLICH

At the outset, we already indicated that Martin Heidegger proposed a path entirely different from the one taken by Husserl’s former assistant Edith Stein. The conception of a Christian philosophy appears to him to be a “square circle”; the different varieties of humanism, including Christian humanism, are summarily dismissed in his later “Letter on Humanism,” without giving any indication of a detailed examination of the relevant works. Regardless of its definition, each kind of humanism remains, for Heidegger, within the horizon of metaphysics. They do not, therefore, attain the “other perspectives” on Being and the human, which for Heidegger are the only ones to offer a prospect of a radically different thinking that has overcome metaphysics. The “essence of the holy” can be conceptualized only on the basis of the “truth of Being,” and the “essence of divinity” only on the basis of the “essence of the holy.” In turn, it is only “in light of the essence of divinity” that it can “be thought and said what the word ‘God’ should name.” The later Heidegger, after the so-called “turn,” sees Hölderlin as the definitive “prethinker” and the witness to such a different thought. Thereby, Heidegger blurs or even obscures the vestiges of his own earlier, quite intensive interest in the Christian tradition, especially his notable interest in Martin Luther’s theology. In fact, he disassociates himself from his earlier close cooperation and friendship with the protestant theologian Rudolf Bultmann. Bultmann, of course, has drawn substantial impulses from Heidegger’s Being and Time and passed them on to a whole generation of theologians through his work. Yet, in spite of all of the critique and (self-)disassociation, Heidegger

31. Correspondingly, Heidegger considers the talk of ontology as well as ethics and a union of the two as inadequate and dismisses them in favor of a “primordial ethics,” understood as “originary” thought of the truth of Being. See ibid., 271.
32. Ibid., 267.
33. See Grossmann, Heidegger-Lektüren, 11ff., as well as Karl Lehmann, “Sagen, was Sache ist: der Blick auf die Wahrheit der Existenz” and Otto Pöggeler, “Heideggers Weg von Luther zu Hölderlin,” both in Heidegger und die christliche Tradition, Norbert Fischer and Friedrich-Wilhelm von Herrmann (eds) (Hamburg: Felix Meiner, 2007). In order to distinguish the “theological” approach of the early Heidegger from his thought after the “turning,” one can call the latter, with Françoise Dastur, a “theiological” thought. As Dastur writes: “Après la Kehre, la dimension du divin fait sa réapparition. Mais c’est là, me semble-t-il, une tout autre perspective, qui souvre, non plus théologique, mais proprement théiologique [After the Kehre, the dimension of the divine made its reappearance. But this was, it seems to me, a completely different perspective that emerges, no longer a theological, but properly speaking a theiological perspective]” (“Heidegger et la théologie,” Revue philosophique de Louvain 92 [1994], 239).
34. This generation would include such prominent figures as Ernst Fuchs and Gerhard Ebeling.
could concede that he “never would have reached the path to thought” without his theological background.35

Indeed, the young Heidegger was able to represent himself – in a letter dating from August 19, 1921, to his student, Karl Löwith (1897–1973) – as a “Christian theologian.”36 In this way, Heidegger tried to characterize himself as one who strove to explore the logos of an existential understanding shaped by Christian faith. The early Heidegger regarded the early Christian life experience, as it is attested in the epistles of St. Paul, as a paradigm for the elucidation of what he calls “historical facticity” or “factual existence,” that is, a life that is profoundly determined by history (by the event of Jesus) and yet determined by a history whose source cannot be reached (since part of the event of Jesus is that he died). The fact that the grounds of one’s life are out of reach defines, for Heidegger, the facticity of human existence. Despite modeling facticity on Paul’s epistles, Heidegger conceives the business of philosophy as the “radically explication” of the facticity of human existence in its questionability without having at its disposal any support in Revelation.37 As a formally indicative hermeneutics, it can point out that there are religious dimensions, but has to leave the religious decision up to factual existence.38 As Heidegger ultimately says, faith, as a specific possibility of existence, remains the “deadly enemy” “with respect to that specific form of existence that is essential to philosophy.” Yet, Heidegger emphasizes equally and no less vehemently that this radical antithesis yields “the possibility of a community of the sciences of theology and philosophy.”39 Heidegger’s lecture “Phenomenology and Theology,” which we mentioned at the beginning, is evidence of this community. It resulted from Heidegger’s discussions with Bultmann40 at the University of Marburg. Bultmann’s own work demonstrates the possibility of theology and philosophy forming something like a community.

40. Rudolf Bultmann (August 20, 1884– July 30, 1976; born in Wiefelstede, Germany; died in Marburg) was educated at the Universities of Tübingen, Berlin, and Marburg (doctorate, 1910; habilitation, 1912). His influences included Karl Barth and Heidegger, and he held appointments at the University of Marburg (1921–51).
As we just mentioned, Bultmann’s theology received crucial inspiration from Heidegger.\textsuperscript{41} It is no exaggeration to say that Bultmann’s dialogue with Heidegger determined his theology as one guided by the question of understanding human existence, as a hermeneutical theology. In particular, the “existential” interpretation of the New Testament gave his theology a systematic expression. To this day, Bultmann’s name remains associated with this hermeneutical approach, which, somewhat misleadingly, he also called “demythologization.” Although the term “demythologization” gave rise to much controversy, the expression is basically only another word for the task, absolutely necessary in Bultmann’s eyes, of existential interpretation of biblical texts. Demythologization is done as existential interpretation, and vice versa. This formula means that biblical texts are not to be understood historically, but rather probed for the understanding of the human existence that they express. The issue in “demythologization” is “whether the New Testament offers us an understanding of ourselves that constitutes for us a genuine question of decision.”\textsuperscript{42} According to Bultmann, to be related in the present, the biblical texts – for example, the accounts of miracles and the stories of Christ’s resurrection – have to be dissociated from the mythical “world picture” presupposed in them. Without “demythologization” then, the gospel of the New Testament would not be valid for us living today. Bultmann discovers the theological reason for this claim in the fact that “myth talks about the unworldly as worldly, the gods as human” (NTM 10). Insofar as the myth itself, with its objectifying representations, obscures and undermines “its real intention to talk about a transcendent power to which both we and the world are subject” (\textit{ibid.}), it contains in itself the motive for criticizing it. The criticism allows one to interpret it so that it reveals “the truth of the Kerygma” (NTM 14), that is, the message of the New Testament. It must be stressed, as Bultmann himself has said, that the demythologizing criticism does not definitely mean “the elimination of the myth” (NTM 9). In the end, Bultmann is concerned less with myth than with the kerygma, that is, the preaching of Revelation as “an occurrence in existence.”\textsuperscript{43}

The object of theology is God. Yet, God is not an object in an abstract sense, but rather in relation to the human, that is, in the sense in which human existence – in faith – is determined by God. Therefore, Bultmann can also say that the theme of theology is “the existence of the human determined by God.” According to this notion, Christian faith is not a phenomenon of general religiousness. Faith is – concretely – “the response to the proclaimed word of God,” which opens up for human existence its distinct, “proper” self-understanding. Christian theology has no other task than “to explicate preaching in such a way that the understanding of human existence given in it emerges as an interpretation of human existence in which the human can understand himself.” Theology, accordingly, is the “conceptual explication of faithful existence,” a “task imposed on faith for faith.” As such, and as Heidegger had said in substantive agreement with Bultmann, theology is a positive science sui generis: a science serving faith.

Finally, turning from Catholicism to Protestantism, we come to Paul Tillich. Influenced by the existential philosophy of this period, Tillich explicitly discusses the theme of religion or faith in its “existential” meaning. Here existential theology refers to a theology of culture, in which all the varieties of culture are seen as determined by the Unconditional. Tillich frequently uses this expression: the Unconditional is that “which concerns us unconditionally.” The basic idea is that the symbols of the Christian message are answers to existential questions that arise from the human situation. In the modern era, the human situation

47. *Ibid.*, 163, 166.
48. Paul Tillich (August 20, 1886–October 22, 1965; born in Starzeddel, Germany; died in Chicago, Illinois, USA) received a doctorate from the University of Breslau in 1911. His influences included Heidegger, Husserl, Kierkegaard, and Schelling. He held appointments at the Universities of Marburg (1924–25), Dresden (1925–29), and Frankfurt (1929–33), Union Theological Seminary (1933–55), Harvard University (1955–62), and the University of Chicago (1962–65).
49. Cf. on this point Werner Schüssler, “Was uns unbedingt angeht”: Studien zur Theologie und Philosophie Paul Tillichs (Münster: LIT-Verlag, 1999); for the broader context see also Hermann Fischer (ed.), *Paul Tillich: Studien zu einer Theologie der Moderne* (Frankfurt: Athenäum, 1989).
is characterized by the experience of non-being and anxiety: the experience of “the death of God” (Nietzsche). In his work The Courage to Be, Tillich argues that nothing other than this experience is at the basis of the existentialism of the twentieth century: “[Existentialism] is the expression of the anxiety of meaninglessness and of the attempt to take this anxiety into the courage to be as oneself.”

In this description of anxiety, one can see Heidegger and Kierkegaard in the background. But, the existential expression of the experience inevitably leads to the question of whether and how such abysmal anxiety can be overcome. According to Tillich, we are able to overcome anxiety only by means of a negation of a negation, such “that the acceptance of despair is in itself faith and on the boundary line of the courage to be” (CB 175). In the same way, we are able to speak of Being appropriately and sufficiently only in the manner of a double negation. “Being must be thought of as the negation of the negation of being” (CB 179).

As such Being, God appears as “God above God” (CB 182). As he appeared in Jesus as the Christ, God is a God beyond the theistic God. In “absolute faith” and “courage,” the God of theism is in fact transcended, inasmuch as faith integrates doubt directly into itself. “Absolute faith and its consequence, the courage that takes the radical doubt, the doubt about God, into itself, transcends the theistic idea of God” (ibid.). “The courage to be is rooted in the God who appears when God has disappeared in the anxiety of doubt” (CB 190). The notion that faith is not faith without doubt amounts to what Tillich calls the “dynamics of faith.” Insofar as faith includes courage, it includes doubt about itself, and insofar as it integrates doubt, it proves itself to be faith as faith in the sign of the Cross. Tillich would have completely agreed with Heidegger, who explained at the beginning of his Introduction to Metaphysics (1935) that “if such faith does not continually expose itself to the possibility of unfaith, it is not faith but a convenience. It becomes an agreement with oneself to adhere in the future to a doctrine as something that has somehow been handed down.” Heidegger continues that such faith is tantamount to “indifference,” “which can then, perhaps even with keen interest, busy itself with everything, with faith as well as with questioning.” To speak with Tillich again, it is characteristic of the “Protestant principle” not to yield to such indolence and to recognize that the element of doubt is “sublated” in faith. The certainty of faith does not prove itself in abstract self-relatedness, but rather – in reference to God as the Unconditional or Absolute – in the midst of the insecurity and uncertainty of existence. When faith is conceived in this

way as “ultimate concern,” it is “the centered movement of the whole personality toward something of ultimate meaning and significance.”54 It is the expression of finite freedom in the face of the Absolute. In this and no other way, it is “an essential possibility of the human.”55

III. CONCLUDING REMARKS

“Existential theology;” as the name for the various philosophical and theological conceptions that have been outlined in this essay, tends to denote a field of overlapping interests rather than any doctrinal coherence. The traditions from which the approaches stem are disparate, the outlooks on the possibility and shape of – primarily Christian – philosophy or theology advocated by the various thinkers are controversial, and their individual standpoints with regard to what is called “existential philosophy” are contentious. What must be noted, however, is the special significance of the thought of Heidegger, which, whether critically challenged or positively received, has been shown to have influenced all of the thinkers here surveyed.

As far as the intellectual history of the past century is concerned, the friendship between the philosopher Heidegger and the theologian Bultmann is doubtless one of the most important chapters in the dialogue between philosophy and theology. Documented in their recently published correspondence,56 this friendship was founded strikingly on the attention to the issue of thought. Perhaps what ultimately calls for thinking is existence (Dasein). But in regard to this issue, the theologian parts ways with the philosopher (or the thinker, as Heidegger might say). For the theologian, what is called “existence” is an issue that cannot be described in neutral terms. As fallen, or more precisely, sinful existence, human existence is at the same time existence determined by God. When it speaks of God, according to Bultmann’s conception, theology therefore must at the same time speak of man. What “existence” means thus refers to the relationship that is constitutive for existence: the relationship to God, who is solely present in his word and who comes toward man. And inasmuch as we have still not found the appropriate way in which to describe, express, and explain existence as the relation to God, existential theology remains relevant. It must remain on the agenda of the dialogue between philosophy and theology – whatever form it may take.

Paul Tillich

Religion and ethics in mid-twentieth-century Europe appeared in terms of the dominant contemporary ideologies, as outdated, indeed atavistic phenomena. Science and politics, often in strange and atrocious combinations, appeared to supersede religion and ethics in molding the fate of humanity. The goals of redemption and salvation, consolation and meaning, had been usurped by competing ideologies, those of Nazism, Marxism, and liberal capitalism, among others. These ideologies shared a common pretension to scientificality and an understanding of the ends (or non-ends) of humankind in terms of political and historically determinate solutions. In such terms religion and ethics – if they had any real value – were matters of the private sphere alone. Yet, and in part in response to this situation, this same period witnessed a renewal of intellectual traditions within Catholicism, Protestantism, and Judaism coupled with an increasingly insistent emphasis on the transcendent – conceived in ethico-religious terms – in opposition to the immanent spheres of technological science and politics.

The revitalization of the intellectual traditions of Roman Catholicism, Protestantism, and Judaism was not only responding to the contemporary developments of the time, but was also and concurrently reacting against the inheritance of the nineteenth century within those denominations. The struggle with modernity in the manner of its decentering of God and religion from the mainstream of science, politics, art, and daily life generally – a struggle that arguably can be traced to the end of wars of religion in the mid-seventeenth century and the concurrent rise of the New Science – had generated many theological

1. This essay is dedicated to my late father Aibhistín Ó Murchadha, the theologian in the family.
responses: liberal Protestant theology, historical theology, modernism, and, on the other side, neo-Thomism. These responses ran many risks: those of anthropocentrism, which made theology vulnerable to a Feuerbachian-type critique; of a radical Pietistic decoupling of belief from knowledge; of an obscurantist rejection of contemporary science and ideas (best exemplified perhaps in the Papal Encyclical *Syllabus of Errors* [1864]). These issues became all the more pressing in the aftermath of the First World War. The shattering of optimism in human progress called liberal theology into question, while the neo-Thomist return not so much to Aquinas as to a scholastic Thomism was itself unconvincing, both philosophically and theologically. Within that situation, certain key thinkers emerged whose responses to these issues have had profound consequences for later thought. Indeed, the theological or religious turn in phenomenology in many ways bears the philosophical fruit of these trends, but already theologically by the middle of the century, a 180 degree shift (Karl Barth) from the inheritance of the nineteenth century had been effected.

Certain key preoccupations can be discerned in this period, which – if we look at the debates surrounding the so-called theological turn in recent French, and more recently, North American phenomenology\(^2\) – have in many respects a contemporary ring. This essay will be divided into four sections dealing with some of these key issues. The first question explored is that of the relation of God to humanity, a relation understood increasingly in this period on the basis of a robust account of revelation as articulated in different ways by Franz Rosenzweig and Karl Barth. From Gabriel Marcel onward, the importance of the Incarnation in any such understanding of revelation was fundamental, and in this motivated profound and groundbreaking analyses of the human body and materiality generally. The human body was understood by Marcel and by Emmanuel Mounier as an expression of the person, and indeed religious and ethical thought of this period is incomprehensible without some understanding of what Mounier called the “paradox of personal existence”. Underlying many of these issues are reflections on the difference between the visible world of nature and society and the invisible or the supernatural. This difference was conceptualized in terms of grace, but through a rethinking of grace especially in the work of Henri de Lubac.

---

I. RELATION OF GOD AND HUMANITY

As in many spheres, in theology and philosophy one can end the nineteenth century not in 1901, but in 1914. The First World War undermined for the intellectual elites of the day – in Germany, but also well beyond that country – the belief of the previous century in “modern man.” The human being and human capacities seemed a less and less suitable model for understanding the world or the divine. Ludwig Feuerbach had long before shown the logical conclusion of a theology that emphasized the humanity of God above all else; namely, that God be reduced to nothing more than a projection of humanity. But, with the exception of Kierkegaard (who remained theologically and indeed philosophically largely uninformative until the interwar years), no other significant voice was raised against what could be called the domestication of the divine, that is, the understanding of the divine in the mirror of the human. It was only with the breaking asunder of that modern image of the human – prophesied by Nietzsche, but only realized with the First World War and the realities of industrialization – that theology began to free itself from the model of the human.

If the human and its capacities no longer ground the understanding of the divine, then nor can the highest human capacity – science – arbitrate the understanding of the divine. What we see in the immediate aftermath of the First World War is the growing emphasis on the limits and indeed the violence of the pretensions of human knowledge. Theologically the correlate to such an emphasis is a radicalization of the notion of revelation and in turn the re-evaluation of the place of the miraculous in religious understanding. Such a re-evaluation and radicalization we see in two central figures of the 1920s: Barth and Rosenzweig.

5. Karl Barth (May 10, 1886–December 10, 1968; born and died in Basel, Switzerland) was educated at the Universities of Bern, Berlin, Tübingen, and Marburg (1904–1908). His influences included Anselm, Kierkegaard, and Schleiermacher, and he held appointments at the Universities of Göttingen (1921–25), Münster (1925–30), and Bonn (1930–35).

Franz Rosenzweig (December 25, 1886–December 10, 1929; born in Kassel, Germany; died in Frankfurt) studied medicine at the Universities of Göttingen and Munich, and history and philosophy at the Universities of Berlin and Freiburg, receiving a doctorate from Freiburg in 1912. His influences included Buber, Cohen, and Hegel, and he founded the House of Jewish Learning, Frankfurt (1920).

Mention must be made in this context also of Rudolf Otto, whose book *The Idea of the Holy* (originally published in 1917) was, along with Barth’s *Commentary on the Epistle to the
What is most striking about both of these figures, and that which marks in them a radical break with what went before, is the centrality of miracle for both. For Rosenzweig and Barth, revelation can only be understood as miraculous. In this respect, they both reject any attempt at rationalization of revelation.

Rosenzweig points out that for ancient humanity “miracle” did not connote a break with the natural order but rather its confirmation. Miracles were signs, signs of divine providence. Crucial to miracles was the testimony of witnesses. The decline of belief in miracles corresponds to what he terms the “third Enlightenment,” that based in the critique of experience: the “historical Enlightenment.” This critique of experience rendered testimony itself suspect and relative to historical contingency. In the face of such critique two possibilities emerged: pietistic belief virtually unconnected to the historical objectivity of miracles, and rationalistic theology, which in embarrassment tries to rid itself of any dependence on the verity of miracles. For Rosenzweig, though, both mark a betrayal of the very notion of revelation, without which theology (and he thinks also philosophy) is not possible. Revelation is fundamental because it is the only bridge from subjectivity to objectivity, from the Weltanschauung of the philosopher to the “truth [which] is and remains the only soil in which truthfulness of experience can grow” (SR 107). Revelation, then, is a disclosing of truth, truth of the ultimate unity of what is: “In the authentic idea of revelation the three actual elements of the all – God, world, man – emerge from themselves, belong to one another and meet one another” (SR 115). It is difficult not to hear this echoed in Heidegger’s later notion of the fourfold. But here what Rosenzweig is concerned with is the relation of revelation to creation. For Rosenzweig, revelation is not creation, but is foreseen in creation and as such regains the authentic

Romans (originally published in 1923), one of the two most influential works in theology in the interwar years. Otto’s account of the numinous parallels some of the themes that I will be exploring in Rosenzweig and Barth. I do not discuss him here partly for reasons of space, partly also because Otto does not mark the same break with nineteenth-century theology as do both Barth and Rosenzweig, as he develops an account of religion on the basis of Schleiermacher (for all the critical distance he takes from him) with certain neo-Kantian resonances. Nonetheless, Otto’s emphasis on the “wholly other” can quite fruitfully be brought into dialogue with the work of Barth. Barth himself wrote on reading The Idea of the Holy of his “considerable joy” because, though Otto was very ‘psychologically orientated,’ he did point ‘beyond the boundaries to the moment of the numinous,’ to the ‘divine in God.’” Quoted in G. C. Berkouwer, A Half Century of Theology: Movements and Motives, Lewis Smedes (trans.) (Grand Rapids, MI: Eerdmans, 1977), 47.

6. Cf. Franz Rosenzweig: “For the consciousness of earlier humanity miracle was based on its having been predicted, not on its deviation from the course of nature as this had previously been fixed by law” (The Star of Redemption, William Hallo [trans.] [London: Routledge & Kegan Paul, 1971], 94). The Star of Redemption is hereafter cited as SR followed by the page number.

character of revelation: that of becoming wholly and solely the fulfillment of the promise made in creation.8 The difference between creation and revelation lies in language. “The language of revelation speaks” (SR 186),9 it addresses, it names. The name is just as essential as the thing, but it cannot be derived from the thing, even though “the thing is the presupposition and mute prediction of its name” (SR 188). From things alone, from the mere fact of creation, it is impossible to reach God. God is accessible only in terms of himself, as a showing of himself, that is, in revelation. In revelation the relation of God and world opens up into a threefold relation of God, world, and human. Such revelation is the showing itself of love. “Love cannot be ‘purely human.’ It must speak … and by speaking love already becomes ‘super-human,’ for the sensuality of the word is brimful with its divine super-sense” (SR 201).

Contemporaneous with Rosenzweig, Barth also affirmed the miraculous and did so in the name of revelation.10 Similar to Rosenzweig, Barth is countering the liberal theological approach of effectively subordinating theology methodologically to science. For Barth – to use his image – theology in the nineteenth century opened its windows to that which does not belong in the house of theology and allowed it to stay.11 Nonetheless, he as much as the theologians of the previous century responded to the Kantian critique that seemed to deny to reason any claims on the divine. Kant’s arguments as to the speculative nature of any rational account of the existence or being of God are accepted by Barth. But while, for liberal theology, this led to concentration on the human reality of religious feeling and practice, for Barth the true consequence to be drawn is the distance between God and humanity. This distance, which in his early work Commentary on the Epistle to the Romans, was absolute, is modified in the later work by an increasing emphasis on Christology and the phenomenon of revelation. Theology, if it has a future at all in the modern world, could have that future only through resisting any attempt to reduce the divine to the human. Christian scripture, in that context, far from being a text reducible to scientific, specifically historical, methods, bears testimony to a life, which – if properly understood – gives true insight into the human being itself. Barth defines revelation as

8. “Creation is the prophecy which is only confirmed in the miraculous sign of revelation” (SR 134).
9. The passage continues: “While the language of revelation addresses, the language of creation delineates, re-counts, de-termines.”
10. Rosenzweig was highly critical of the early Barth – the only Barth he knew – for what he saw as the overemphasis in Barth of the distance between God and humanity. Barth in his later work greatly modified this emphasis and came to see it as an overreaction to the then dominant liberal theology. Cf. Rosenzweig’s letter to Buber December 1922 in Gesammelte Schriften (The Hague: Martinus Nijhoff, 1979), vol. 1.2, 875.
God’s sovereign action. In other words, revelation cannot be understood from the human sphere, but must rather be understood as that received, as that for which no prestructure exists. The coming to us of the truth of and about God is revelation. Human beings know God only through his self-revelation. But this self-revelation of God is not simply a concern of theology – a discourse about God. Christian theology, Barth tells us, is really “The-anthropology.”\footnote{Ibid., 9.} In other words, theology’s real concern is not God as such but the relationship of God and human. In this contention, Barth does not differ greatly from the liberal theologians of the previous century. Where he does differ, however, is both in the emphasis he places on the divine side of that relation and the consequences he draws from this for the understanding of the human: “It is man as he is revealed in the light of revelation and only that man who can be seriously treated theologically.”\footnote{Karl Barth, 
Church Dogmatics, G. W. Bromiley and T. F. Torrance (eds). G. T. Thomson et al. (trans.) (Edinburgh: T&T Clark, 1956–1977), I.2, 296.} Anthropology, in his view, is based on theology or, more specifically, on Christology. For Barth, Jesus of Nazareth, understood in Christianity as the Christ, is not to be understood as human by extrapolation from what we know nontheologically about human beings, but rather human beings can only be understood starting from the person of Jesus Christ.

The fundamental here is the issue of sin. Jesus Christ being without sin is not less human but actually more human than any other human being. This is so because the true nature of human beings is that created by God and “what God knows of man beyond his sin … is the real creaturely nature of man.”\footnote{Barth, Church Dogmatics, III.2, 38; hereafter cited as CDIII.2 followed by the page number.} In other words, human beings as we know them are not pure expressions of their nature. The nature of human beings that we see is a fallen nature, one that has turned away from its own true source of being in God. If, then, we are to seek a human being that truly expresses its own nature, we need to find a being “like us in all things but sin.” This being we find in Jesus of Nazareth. Jesus of Nazareth, Barth says, is man as God willed and created him. This again carries methodological implications. If we want to discover the nature of Jesus Christ, we can listen to no other “logos of supposed humanity,” but only to him. But this means that in understanding ourselves we can look to nowhere else: “Our self-knowledge can only be an act of discipleship” (CDIII.2 53). This act of discipleship, this turning toward an other in self-knowledge, actually reflects the humanity of Jesus of Nazareth: “Jesus cannot speak ‘of himself’ … Never in any event … does He seek or do His own will” (CDIII.2 63). Rather, Jesus of Nazareth always refers himself to the one who sent him. He is always one of two. Jesus of Nazareth’s participation in the Godhead is the basis of his humanity. What this means is that the
human being is the being that is essentially for God and as such surpasses all other creatures. For this reason Barth rejects – much like Heidegger – the definition of the human being as a rational animal. Such a definition goes from the general to the particular and is essentially naturalistic for this reason. But the most universal and decisive feature of human reality is the most particular about a person; namely, her existence in a history determined by God’s attitude toward her (CDIII.2 78). Only when we ask this question, when we ignore every question about human *nature* and ask about human *existence*, do we really seek the human as subject and not alone as object. But in reaching the human as subject we are nonetheless concerned with ontology, with the ontological basis of the human. Ontologically, Barth is claiming, the human is turned toward God. The human is essentially turned away from herself toward others, toward the wholly other. In that case sin is an “ontological impossibility” for the human (CDIII.2 136).15 If the human denies God, she denies herself. Sin is first and foremost ontological rather than ethical: it is an affirmation of the nothingness, which God as creator has negated. It is the ultimate nihilism as it negates not only human being but all creation. Fundamentally such nihilism arises out of a self-assertion that paradoxically is a negation of the self. This can be seen, for Barth, in the mirror of Christ: here we see the human not as the presupposition of his own being, not as self-sufficient, but as radically other directed. God in his Word is the presupposition of Christ. This means that Jesus of Nazareth is not to be understood substantially, as a timeless being. Rather, “Jesus exists only in his history” (CDIII.2 160). By history, here Barth understands something very specific – history is not the working out of that which is already intrinsic in a being, but rather the:

> history of a being begins, continues and is completed, when something other than itself and transcending its own nature encounters it, approaches it and determines its being in the nature proper to it, so that it is compelled and enabled to transcend itself in response and in relation to this new factor. The history of a being occurs when it is caught up in this movement, change and relation, when its circular movement is broken from without by a movement towards it and the corresponding movement from it, when it is transcended from without so that it must and can transcend itself outwards.

(CDIII.2 158)

Such a concept of “being as history” is, for Barth, “the existence of the man Jesus” (CDIII.2 159). Without Jesus of Nazareth, there is no history in the strict sense in which Barth is using it. In effect, what is at issue here is the relation of creator and creature: history is as history through the Incarnation, through which the creator becomes creature and the creature creator in Jesus Christ. This is the radically new event of the Incarnation, which can be understood only as history, not in terms of any ahistorical ontology. This is so because it rests on an identity between creator and creature in Jesus of Nazareth, which is not a simple identity but a relation of transcendence and response. In such a relation, history in the emphatic sense begins.

History is inaugurated in transcendence. But the self-transcendence that occurs would be impossible in and of itself. As Barth makes clear, there is no way from human self-awareness to God. The only transcendence here possible is that of response. The initiating event had to come from elsewhere, from the wholly other, from God. But this elsewhere is also here, close by, because “in Jesus Christ there is no isolation of man from God or God from man.” Furthermore: “His free affirmation of man, His free concern for him, His free substitution for him, this is God's humanity.”

II. INCARNATION AND HISTORY

The question of history addresses one of the key concerns of modern thought. With the dethronement of the ideal of modern man, the understanding of history as progress also became, for both religious and secular thinkers, an issue of increasingly anxious concern. Fundamental to such concerns is the place of material progress in human history, a concern related closely to the question of technology. While both Barth and Rosenzweig emphasized the incapacity of humanity to reach the divine, hence the need for revelation, arguably the twentieth century saw the fulfillment of the technological promise of almost unlimited development of the human capacity to act on the world, and concurrently an increased emphasis on the materiality of the world and indeed of the human being itself. In France, the work of Marcel and Mounier was important in somewhat contrasting ways in reflecting these developments in broadly Christian terms. They did so by problematizing the mode of relation to the

17. Ibid., 48.
*18. For biographical information and major works for Marcel and Mounier, see the essay by Andreas Grossmann in this volume.
material world, namely, that of incorporation, of embodied being, in terms of a “higher” destiny for both than simple additive increase in material goods.

Paul Ricoeur credits Marcel with having opened up “the way for a philosophy of the lived body [corps proper] and given to philosophy the means of thinking the incarnation”\(^{19}\) through his critique of sensation as message and the body as instrument. Fundamental to this achievement was Marcel’s distinction between being and having, in terms of which the body holds a particularly ambiguous position: it seems to be something we have yet, unlike other things we have, we cannot dispose of it. The body is the condition of possibility both of our being and of our having. The relation of having is itself an ambiguous one in the sense that as a relation of possession it leaves us open to being “devoured by what we possess.” As Marcel puts it, “It seems to be the essence of my body or of my instruments insofar as I treat them as possessions, that they should tend to suppress me, I [moi] who possesses them.”\(^{20}\) This, Marcel suggests, is all the more evident where I am inactive, where I merely possess inertly my inert possession. When, however, I work on them creatively – Marcel gives the examples of the garden for the gardener, the farm for the farmer, the piano or violin for the musician, the laboratory for the scientist – then the possibility exists of transmuting or sublimating the relation of having into one of being (\textit{ibid.}, 180). In such cases the duality of possessing and possessed is abolished in a “living reality” (\textit{réalité vivante}) (\textit{ibid.}). Such living reality is, for Marcel, always incarnate.

The relation to “my body” is neither one of pure having or of pure being. As he puts it: “to be incarnated is to appear to oneself as body, as this particular body, without being identified with it nor distinguished from it.”\(^{21}\) This peculiar situation, which is fundamental to my being in the world, is nonrelational: there is no relation between self and body because relations exist only between objects. Incarnate being exists and existence Marcel understands as “participation.” Participation is not to be understood as relation, because such an understanding would involve an objectification of participation and as such its denial. The key notion here is that of sensation: sensation cannot be understood relationally in terms of message and translation as is routinely done. Indeed, any notion of translation is out of place here: “sensation is immediate, the basis of all interpretation and communication, hence not itself an interpretation or communication” (\textit{CF} 25). This immediacy, however, gets lost in action: action is

19. Ricoeur, in Gabriel Marcel, \textit{Tragic Wisdom and Beyond}, Stephen Jolin and Peter McCormick (trans.) (Evanston, IL: Northwestern University Press, 1973), 222, translation modified. This is part of a conversation between Ricoeur and Marcel reproduced in \textit{Tragic Wisdom and Beyond}.

directed toward objects and cannot help but understand sensations as messages from such objects “without bothering about the absurdity of describing them in this manner” (ibid.).

Sensation is reception, but what is it to receive? To receive, Marcel understands in terms of receiving another person – admitting or welcoming “an outsider into one’s home” (CF 27). Being at home is not a relation of objects, but rather a feeling, indeed a mysterious feeling: “I cannot refer to my feeling at home unless I grant or imply that the self does or can seem to itself to impregnate its environment with its own quality, thereby recognizing itself in its surroundings and entering into an intimate relationship with it” (ibid.). Thus, in exploring sensation Marcel comes unexpectedly to the phenomenon of hospitality. As a welcoming into one’s home, hospitality is a welcoming into that region in which the self seems to itself to impregnate its own quality. In this sense, to receive is to invite the stranger into participation with that region impregnated with those qualities. Once receptivity is understood in terms of hospitality, it does not “fill up a void with an alien presence but [makes] the other person participate in a certain plenitude” (CF 28).

Marcel concludes from this analysis that since Aristotle feeling has falsely been identified with passivity. Feeling rather has an active element: taking oneself up or opening oneself up to … (CF 29). It is this active element that turns feeling into creativity. A key notion, for Marcel, here is that of admiration. Commenting on a contemporary dramatist who declared admiration for him to be a humiliating state, Marcel states in “Belonging and Disposability” that this is the “same as to treat the subject as a power existing for itself and taking itself as a center” (CF 49). This is the result of a free choice to resist participation, resist the feeling of receptivity. But, conversely, to affirm admiration to be “an exalted state is to start from the inverse notion that the proper function of the subject is to emerge from itself and realize itself primarily in the gift of oneself” (ibid.). This gift of oneself is what Marcel understands as creativity: not a self-expression, but rather a becoming other in expression. In this sense creativity is responsive. Response is “the wholly inner reaction evoked by an appeal” (CF 51). The appeal of the other does not coerce us but rather “mysteriously restores

22. In reading Marcel and Mounier, one finds some themes, such as hospitality, that have emerged more recently in French thought. It is perhaps indicative of the relative neglect of Marcel’s (and Mounier’s) work in France today that (as far as I am aware) no reference is made to him in the work on hospitality by Jacques Derrida, Jean-Luc Chrétien, or Jean-Luc Marion. For their respective accounts of hospitality see Jacques Derrida, Of Hospitality, Rachel Bowlby (trans.) (Stanford, CA: Stanford University Press, 2000); Jean-Louis Chrétien, L’Arche de la parole (Paris: Presses Universitaires de France, 1998), and Jean-Luc Marion, Being Given: Towards a Phenomenology of Givenness, Jeffrey L. Kosky (trans.) (Stanford, CA: Stanford University Press, 2002).
us to ourselves” (*ibid*.). The creative individual responds freely to this appeal, this call. The work that is to be accomplished by his creative act is the “embodiment of his vocation, and that vocation is related to others and to the world. It is his way of giving himself” (CF 53). This sacrifice Marcel understands as being characteristic of the saint (CF 56). I will return to vocation and the figure of the saint in the next section, but for the moment I want to relate this discussion to the distinction between problem and mystery in Marcel in the context of his account of technology and progress.

In “An Outline of a Concrete Philosophy,” Marcel himself states the distinction between the mysterious and the problematic quite succinctly as follows: “A problem is something which one runs up against, which bars the way … A mystery, however, is something in which I find myself involved” (CF 68). That which bars the way is something that is set before me as a problem to be solved. This Marcel tends to understand along the model of the machine: a machine breaks down, this malfunction can be examined from the outside, and certain techniques can be employed to get it running again. The problematized finds its place in an order, which is an order for me, in the end an extension of my own body. The mysterious, on the other hand, is something I find myself in; it can never become a problem for me, because it is not for me at all. Rather, I experience it as that which transcends and envelops me. The mysterious cannot even strictly speaking be acknowledged, but only greeted (CF 69).

What this points to is a decentering of the subject, something at the core of the personalist movement of which Marcel can be considered part. While individualism aims to center the person on himself, personalism aims to decenter him, to open up new perspectives. At the heart of such a decentered person is *generosity*. “Personal being is generosity,” according to Mounier. In other words, the personal being is one that does not close itself down according to the model of things, but opens itself up to the other. As with Marcel and Barth, for Mounier the model of such openness to others is to be found in Jesus Christ, and more specifically in the Incarnation. Furthermore, again in line with their thinking, for Mounier the Incarnation places history at the heart of thought: “Christianity was to graft human history into the very heart of divine life, through the mediation of Christ incarnate.” But, while Marcel tends to dichotomize problem and mystery, thereby separating the history of salvation from secular history, Mounier begins with the human being as maker: “the nature of man is artifice.”

---

The creative potential of the human being is not to be found only in art, poetry, and metaphysics, as Marcel seems to imply, but in the banality of the instrumental world. For the Christian, then, no dichotomies are possible, not even one between the spirit and technology. In this respect Mounier quotes Bergson against Marcel in affirming the inner dialectic of machine and mysticism, problem and mystery. For Mounier, technology is an extension of the body and as such cannot be divorced from the Christian dialectic of body and spirit, implicit in the doctrines of the Incarnation and Resurrection. The exploitation of nature Mounier understands in terms of this dialectic of matter and consciousness as an opening up of the highest possibilities of humanity. But this is not to be understood as a possession of nature, but rather as its humanization rooted in the relation of naming affirmed in Genesis (PER 13). “To deny nature as given [in order] to affirm it as work [œuvre],” he says (PER 12). As he puts it further, “Nature is not the property of the human being, but a sort of natural sacrament which contributes to the turning towards God, as he contributes himself to the orientating of nature to God.” In this respect, Mounier makes an anti-Jansenist affirmation of the world. Quoting St. Paul, he states that the Christian must be in the world as if not of the world, but he stresses the first part of the sentence, namely being in the world. Politically this found expression in his Christian socialism; but more fundamentally it meant an understanding of the relation of transcendence and immanence as one of mixture in which all dichotomies are reduced neither to monistic materialism or spiritualism (Mounier affirms clearly that personalism is not spiritualism [PER 10]), nor to any dualism, but rather to the body as the expression of personal being.

Understood in this way, Christianity, far from being an obstacle to progress, is its richest expression. Progress, as Mounier understands it, cannot be non-teleological: progress is always toward something, hence the idea of indeterminate progress is a *contradictio in adiecto*. It is only in terms of a history of salvation that progress makes sense. This salvation, however, needs to be understood not in individual, but rather in collective, or even cosmic, terms (PER 64). Salvation is being understood here in terms of the “glory of God,” which marks the end of

---

29. Jansenism was a movement within the Roman Catholic Counter-Reformation of the sixteenth and seventeenth centuries that was particularly strong in France. In its heyday, it was associated with the Port Royal philosophers and theologians such as Arnaud and Pascal. Jansenism stressed human depravity and the need for grace in order to reach salvation. Jansenist thinking remained strong in France well into the eighteenth century.
history as the final reconstituted unity of God, history, and the human race. “The idea of certain solidarity between the fate of the universe and the destiny of man was already familiar to the Fathers of the Church.”

The problem of modernity is not so much its belief in progress, but in its misconception of the nature of progress. Such a misconception poses serious dangers, which were, for Mounier, particularly apparent with the rise of fascism. The key term in his analysis of this danger was “person.”

III. THE “PARADOX OF PERSONAL EXISTENCE”

“[B]eing a person in view of the present threat to man from the material world and its organization” was the major focus of personalist philosophy from Scheler through Mounier and beyond. The place of the person was at the forefront of the movement in France that led to the founding of the periodical Esprit. We need first of all to become clear on this very concept of “person.” Mounier, along with Marcel and later Ricoeur and Levinas, distinguished person from self in the sense of the self-same. In Mounier’s terms, such a distinction can best be understood in relation to the “paradox of personal existence.”

The “paradox of personal existence” Mounier understands as the fact that being a person is the most human form of existence but is one that must be incessantly conquered (PER xix). This paradox is not accidental but essential to personhood, as a person is a free and creative existence. For this reason, unlike objects, persons cannot be defined. For Mounier, a classic philosophical mistake is to understand persons in terms of objects. This mistake he finds in Hegel, whose system he conceives as an imperialism of the impersonal order (PER xxiv). The impersonal order is that of objects, systems, and forseeability. Such an order fails to understand movement. For Mounier, under the influence of Bergson, movement is that which can neither be quantified nor predicted. Fundamentally, movement is not locomotion, but rather the movement of personalization of the person (PER 19). This movement lies at the core of the paradox of personal existence: the person is never manifest in the totality of its

34. In this respect Mounier echoes Sartre’s slogan of “existence precedes essence,” but in fact his affirmation of the person has more in common with Rosenzweig’s statement that the distinctiveness of a man is not accidental, but his essence. Cf. Rosenzweig, The Star of Redemption, 64.
existence; rather the in itself – en soi – of the person is what Mounier calls the secret (PER 35–6). At the core of the person is that which is secreted, that which does not appear, which remains foreign to the world. The person is in this sense not in the order of being at all. Rather, the “person is more a presence than a being, an active presence without basis [sans fond]” (PER 35). Such personal existence we discover not through an analysis of objects in the world, but rather by recollection or meditation (recueillement), which is a relation to itself beyond the distractions of the world. Such meditation is the coming to understanding of the singular presence of the person, which I can only know from within. The person’s relation to the world derives from this inner knowledge and is first manifest in the sense of modesty. Mounier understands modesty as the sentiment of the person that his manifest existence is not to be taken as his total existence. In this sense, physical modesty is not rooted in any sense of the impurity of the body, but rather in the person’s sense that he – as an incarnate being – is infinitely more than his body as perceived and seen (PER 35–6).

Much of this account has commonalities with the analysis we find in Sartre. One is reminded specifically of Sartre’s account of nudity and gracefulness in Being and Nothingness.35 The distinction between person and object reminds us also of the Sartrean dichotomy of pour soi and en soi. However, the implications that Mounier derives from this are quite different and these can be seen if we look at his accounts of freedom and of vocation. “Freedom is not welded [rivée] to a personal being as a condemnation, it is offered to him as a gift” (PER 58, translation modified).36 The reference to Sartre here is clear: for Mounier, freedom is not the negating power to nihilate, but rather is the gift of the capacity to value. Mounier recognizes in nature two forms of freedom: that of indifference and that of the indetermination (PER 54–5). The former is a type of freedom that human beings can never fully realize. The latter, which is present at the molecular level, is not genuine freedom but does lay the precondition of freedom in that it opens up domains of choice. Only the person is, however, truly free and that freedom is fundamental to the inner movement that is characteristic of the person. This freedom is not a freedom of choice in the Sartrean sense. Mounier furthers Bergson’s insight into the abstract nature of choice by emphasizing the centrality of value to freedom. My freedom begins with the sense of the freedom of the other. Faced with that freedom, I am faced not with an object but with a value, or rather with the affirmation of value. I discover my freedom in my response to that affirmation of value. The free human being in

36. “La liberté n’est pas rivée à l’être personnel comme une condamnation elle lui proposée comme un don.”
that sense is the responsible human being (PER 64).37 Freedom is in the encountering of that which is other to me. It begins with that encounter with being and is manifest in an affirmation of being. Against Sartre, Mounier claims that only thus can one sensibly speak of being in a situation: for Sartre, nothing is ever encountered, because freedom as he conceives it “creates the obstacle itself, and never comes against ultimate limits.”38 As such, for Mounier, “it is ultimately useless to talk about the notion of situation if the concept of encounter with it is eliminated.”39 Understood as response to an encounter with being, freedom, Mounier affirms, is always situated. Its situatedness is not simply negative, in the sense of being a limitation to freedom: freedom is liberation, it involves a movement toward the other – a movement of personalization of the world and of myself. In that sense freedom does not isolate, it rather unites, indeed it is “religion” and “devotion” in the original sense of those words (ibid.). Freedom is, in this sense, responsibility toward another and toward oneself. Both these senses of responsibility are captured by the notion of vocation.

For all the emphasis on the secrecy and inner life of the person, Mounier is clear that the person as incarnate being is both inner and outer. As he puts it: “the person is an inside which has need of the outside” (PER 44). This outer movement Mounier understands as desire. In her desire the person discovers her vocation. Such vocation is not something solitary; rather, it truly expresses freedom as a permanent devotion. It is permanent devotion to what Mounier calls three “united societies” (society being understood as being in relation to specific kinds of being, of which relations with fellow humans only constitute one): under her, the society of matter; beside her, the society of fellow human beings; and above her, the totality of spirit.40 The singularity of each person consists in the manner in which she responds to each of these calls, the manner in which in the freedom of her response she values matter, the mixture of matter and spirit, and spirit. These calls are, for Mounier, calls to love as devotion. Such love finds its exemplar in God, specifically in the creative acts of God. Creatio ex nihilo, for Mounier, expresses a supreme being characterized by an infinite capacity for singular acts of love.41 Such creative acts are free as loving, not as violent, affirmations of the self. Above all, the singularity of love is reflected in vocation, which is never generalizable. At the same time, vocation, like love, is

37. There are parallels here with Marcel. To quote again from Ricoeur’s conversation with Marcel, he says to Marcel: “For you, the freedom of response goes beyond the freedom of choice” (Tragic Wisdom and Beyond, 241).
39. Ibid., 104.
40. Mounier, L’Engagement de la foi, 17.
41. Ibid., 9.
unifying. Indeed, for Mounier, the renouncing of one of the threefold vocations toward the societies mentioned above is materialism. “Materialism” is not, in this understanding, a reduction of reality to matter, but rather the displacing of matter from its proper place in reality. The human vocation is to devote oneself to matter as that which expresses divinity, creation. This expression begins with the body itself. This Mounier terms “Christian extremism,” an extremism of the Incarnation: “it always chooses in the real and for the real.” Vocation is found at its ultimate in the saint. The saint lives the threefold call of devotion and does so in the singularity of his own being. The saint takes his exemplar in Christ, not in the world. This requires an openness to the secrecy of the heart in which Mounier affirms, quoting St. Paul, God reveals his son in me.

IV. THE VISIBLE AND INVISIBLE

In the figure of the saint is expressed one of the key problems of religion in twentieth century thought, namely the relation of religion – or more specifically, in terms of Europe, the relation of Christianity and Judaism – to the world, or more specifically the modern world. Although this issue had institutional, political, and communicative aspects, it concerned in the first instance the deeply “metaphysical” problem of the relation of the visible to the invisible, something manifest within the churches themselves. Already Aquinas pointed out that the term “church” had an equivocal meaning: both the physical building (and by extension the visible institutions) and the spiritual people of God on their (spiritual) journey. In the wake of the liberal theology of the nineteenth century (and to a lesser extent the modernist movement in the Roman Catholic Church), a strong reaction against the perceived reduction of the invisible to the visible is evident in religious and theological thinking in Germany and France. We have already discussed this in terms of Rosenzweig’s and Barth’s accounts of revelation. According to the latter, the fatal move in eighteenth-century theology occurred in the work of Johann Franz Buddeus, for whom religion was not

42. Ibid. 24.
43. Ibid., 202. See Galatians 1.15–16. Louis Lavelle, the successor of Bergson at the Collège de France and a contributor to Esprit, engaged in a striking meditation on the figure of the saint in a book published in 1951 entitled The Meaning of Holiness. Lavelle stressed in respect to the saint, as does Mounier, the intersection of transcendence and immanence: “holiness belongs to eternity – but to eternity which is incarnate in time” (Louis Lavelle, The Meaning of Holiness, Dorothea O’Sullivan [trans.] [London: Catholic Book Club, 1956], 24).
44. Johann Franz Buddeus (1666–1729), a Lutheran theologian who taught at Jena, is best known for his critique of Spinoza. Although an orthodox Lutheran, his thought was strongly influenced by Pietism.
Religion and ethics

to be understood in the light of revelation, but rather revelation in the light of religion.\textsuperscript{45} Religion understood as a human, historically specific phenomenon now became the site of revelation. On that basis the question of the religion of Christ could meaningfully be asked and a gap opened up (as it was by Gotthold Ephraim Lessing) between the faith of Christ and the faith in Christ. Out of this, for Barth, arose the increasing dependence of nineteenth-century theology on the philosophy of religion and, indeed, methodologically, it led to the situation in which theology allowed itself to be told by philosophy, history, and the natural sciences what the free investigation of truth really is.\textsuperscript{46} In such a situation, religion becomes one cultural phenomenon among others, and Christianity a subset of that cultural phenomenon. What is lost here, for Barth, is the specificity of revelation. In opposition to this, Barth states: “Revelation is understood only where we expect from it, and from it alone, the first and last word about religion.”\textsuperscript{47} Christianity in this sense is not the fulfillment of religion, but rather that which abolishes religion – or rather that which sublates religion (Barth’s term is \textit{Aufhebung}) into that which is open to justification from without. Religion is constantly falling into idolatry, but such a judgment of idolatry is possible only in the light of revelation. The light of revelation is an invisible light, is the light of the sovereign act of God, which act however can only be understood in its relation to human beings: the “Word of God” addressed to humanity.

Even for those who would not draw such radical consequences as Barth, the problem of the relation of the visible and the invisible is one that exercised religious thinkers of this time. The Kierkegaardian critique of visible Christianity in the name of the invisible became a dominant theme. Concurrently, especially within Roman Catholicism, the intersection of the visible and invisible became thematic, finding particular expression in the theology of the “mystical body of Christ.”\textsuperscript{48}

The problem that many theologians, both Roman Catholic and Protestant, set themselves – and a problem, that we find also in such thinkers as Simone

\textsuperscript{45} Barth, \textit{Church Dogmatics} I.2, 288–9.
\textsuperscript{46} Ibid., 293.
\textsuperscript{47} Ibid., 295.
\textsuperscript{48} The notion of the “body of Christ” as that in which all members of the Christian church participates goes back to St. Paul (cf., e.g., Ephesians 5.22–32). The term “mystical body of Christ” is more recent, dating probably from the twelfth century. In our period, a theology of the mystical body of Christ was developed by the German theologian Karl Adams and was received enthusiastically in the French-speaking Roman Catholic world through the work of Yves Congar. For Mounier, this theology was one of collectivism, of the person understood not as individual but in his ethical and political responsibility as participating in an invisible, because spiritual and supernatural, destiny. (Cf. Hellman, \textit{Emmanuel Mounier and the New Catholic Left}, 49–50).
Weil,49 Mounier, Marcel – was how to understand the intersection of the natural and the supernatural beyond inherited dichotomies. Fundamental to this was the question of grace. Traditionally in Christian thinking there is a tension between nature and grace based in the gratuitousness of the loving gift of God. Henri de Lubac,50 in a breakthrough work, called into question the then pervasive concept of “pure nature.”51

Within Roman Catholic theology, a dominant manner of understanding the relation of nature and grace was through the postulation of a “pure nature.” Pure nature refers to the human being with a body and rational soul, which have purely natural capacities and a purely natural end. This natural end would be the love of God, but the love of God as the author of that nature and those capacities. In theological terms, this pure nature is a construct; such a human being for most Roman Catholic theologians never actually existed. The human being that does in fact exist has a supernatural destiny, a destiny that has a source beyond the visible world, beyond that world that corresponds to its capacities. The point of this construct, though, is to emphasize the gratuitousness of grace: such a nature would have no knowledge of, and would not in any way be owed, a supernatural destiny. But implicit in this concept is a certain dichotomy of natural and supernatural that allows a – if only notional – separation of the visible realm of natural capacities from the invisible realm of grace. Such a separation is shown by de Lubac to have served a profound methodological purpose in modernity. The force of de Lubac’s argument is, in the first place, historical: to show that the notion of pure nature is a modern one, which has been read back into Aquinas by modern Thomists. De Lubac quotes Maritain as maintaining that:

in the time of William of Vair and Charron, and later of Descartes, it was as though thinkers who were still Christian had thought up a purely natural man whose duty was to philosophize, and upon

---

49. Simone Weil (February 3, 1909–August 24, 1943; born in Paris, France; died in Ashford, England) was educated at the École Normale Supérieure (1928–31). Her influences included Émile Chartier (“Alain”), Buddhism, and Hinduism, and she held appointments at lycées in Le Puy, Auxerre, Roanne, and Bourges (1931–36).

50. Henri de Lubac (February 20, 1896–September 4, 1991) was ordained to the Catholic priesthood (Jesuit) in 1927, and studied at the Pontifical Gregorian University, Rome (1928). He held appointments at the Catholic University of Lyon (1929–61), and the College of Cardinals (1983–91).

51. De Lubac’s book *Surnaturel*, published in 1946, caused a major debate in Roman Catholic theological circles by questioning the concept of “pure nature.” I will rely solely on his later (1965) book *Le Mystère du surnaturel*, which responds to (and takes account) of the main contributions to this debate. Hereafter de Lubac’s *The Mystery of the Supernatural*, Rosemary Sheed (trans.) (London: Chapman, 1967) will be cited as MSN.
whom was superimposed a man with the theological virtues and a duty to merit heaven. (Quoted in MSN 233–4)

This allows the separation of theology from other disciplines and the evacuation of theology from the realm of the human considered in terms of such a nature, which although theologically hypothetical reflects very well the presupposition of modern anthropology.

De Lubac argues in response for the reintegration of the natural and the supernatural, the visible and the invisible. He rejects the methodological move of constructs such as pure nature. For one thing such constructs presuppose a dichotomy of nature and supernatural even when theologians go on to deny the actuality of such a dichotomy. Second, the hypothesis, although possible, concerns as he says another universe and one that is not constituted by God’s call. To place oneself in a universe in which one is not destined to see God is, de Lubac affirms, impossible: “You may put into this hypothetical world a man as like me as you can, but you cannot put me into it” (MSN 77). He goes on to say that between those two people (the man like me and me) there is a difference in nature. In other words, the place to begin in understanding the gratuitousness of grace is in its concrete reality. This concrete reality de Lubac understands as the dynamic of call and desire. The desire to see God is not an accident, but rather is essential to human nature as constituted by God’s call. This call is a call to finality, that is, a call to fulfillment of the nature of each person. “As soon as I exist … no other finality … seems possible for me than that which is now really inscribed in the depths of my nature; there is only one end and therefore I bear within me, consciously or otherwise, a ‘natural desire’ for it” (MSN 72).52

Yet despite this, de Lubac emphasizes the distance between the natural and the supernatural: “between nature as it exists and the supernatural for which God destines it, the distance is as great, the difference as radical, as that between non-being and being” (MSN 107). Similarly to Rosenzweig, de Lubac distinguishes here between creation and revelation: through creation human beings are brought into being, but by grace they are called to their final supernatural end. To understand how these two belong together, it is necessary to see the nature of the gift involved. De Lubac is quick to deny the analogy with gift giving: in gift giving, the giver and the receiver preexist; in the divine gift, he says, quoting Marcel, “all is gift. He who receives the gift is himself the first gift

52. Karl Rahner makes a similar point using the vocabulary of the personal being: “it is precisely the essence of the personal being (his paradox without which he cannot be understood) that he is ordained to personal communion with God in love (by nature) and must receive just his love as free gift” (“Concerning the Relationship Between Nature and Grace,” in Theological Investigations, vol. 1, Cornelius Ernest [trans.] [London: Darton, Longman & Todd, 1961], 305).
he receives” (MSN 100). But the gift of creation does not necessitate the gift to a supernatural destiny. As created, human beings have a capacity for the supernatural, but this capacity de Lubac compares to a birthplace rather than a seed or embryo (MSN 109). The natural capacity is not a disposition, indeed the supernatural end is “natural to [the human being] without being naturally accessible to him” (MSN 110). This is not a faculty but rather an “aptitudo passiva” (ibid.). The desire for God, although a natural inclination, is not an inclination sufficient or appropriate to its object (MSN 111). It depends rather on the sovereign action of God: grace.

Within the visible the invisible is traced. This is, for de Lubac, inherent in creation itself. He quotes Bonaventure in saying that creation is double (duplicis est creatio): once as nature, then as grace. This doubling is manifest in the human being, who “was not created to remain within the bounds of nature” (MSN 141). This means that any natural account of the human, any cosmological account, that is, any account that places the human being in the world and only in the world, loses sight of that destiny embedded in the deepest desire of the human being – a desire essential to human nature (MSN 142).53

This appeal to the transcendent as that which cannot be suspended – even methodologically – in considering the human suggests that in every sphere of existence there is at work in the immanent world an invisible instance, an instance understood as vocation, as call and response. The denial of that call is at all times possible, but it is a denial that places the human being against its own nature.

V. CONCLUSION: THE RELIGIOUS IMPULSE

With Levinas’s publication of Totality and Infinity in 1961, a new era of philosophy was opened up, although this became apparent only much later.54 Although his initial breakthrough was characterized by Levinas himself in terms of a reversal of the priority of ontology over ethics, ethics in Levinas’s sense is that space opened up by transcendence. The force of Levinas’s thought is to reaffirm the priority of transcendence and the positivity of the infinite. The affirmation of transcendence (variously understood) – against the immanentist tendencies of modernity – is evident in each of the thinkers we have looked at. In each of them (and in others whom, for lack of space, we have not touched on), the

53. Here he says, “there is something in man, a certain capacity for the infinite, which makes it impossible to consider him one of those beings whose whole nature and destiny are inscribed in the cosmos.”
54. This era is often termed that of “new phenomenology.”
irreducibility of discourse about the divine to worldly discourse means that there is manifest in human desire an excess, one that is without ground. This excess we can, without distortion, term the ethical. To understand the human purely rationally is to do so in a discourse sufficient to itself. But such a discourse has no need of the other, no need to listen, no need for vocation. Vocation is not the determination of a plan of life, but rather the answering of a call from elsewhere. Such a rupturing call “cuts across vision,” in other words, throws vision back on itself, exposing its pretensions to self-sufficiency. While vision commands, the ear in attending to the vocation waits. Waiting, Weil tells us, is not passivity, but the act of attention. “Attention consists of suspending our thought, leaving it detached … thought should be empty, waiting, not seeking anything, but ready to receive in its naked truth the object which is to penetrate it.” Such openness, for Weil, is not confined to a private piety of faith, but rather is essential to all truth, because only through attention does an object disclose itself to the one who studies it. In that sense, all knowledge aims at prayer, which is “attention … directed towards God.” Attention is an act constituted by its own insufficiency. Such insufficiency, however, is not divorced (any more by Barth than by Marcel or Mounier or de Lubac) from the ontological – the natural, the visible, the fallen – but only from an ontology not informed by the religious impulse of transcendence. Indeed, this religious impulse, this impulse of receptivity towards the self-revealing, is understood in this period from different standpoints as liberating the question concerning the human from totalizing systems; in this way the human is made manifest in response to a vocation, a vocation that constitutes not a utopian projection, nor even a prescription, but rather the very being of the person.

We are able to come to understand the philosophy of the concept only in its opposition to a philosophy of consciousness or a philosophy of the subject. In a way, we must even say that the philosophy of the concept is defined by this very opposition. And, as Saussure’s linguistics shows, where language is made of “differences without positive terms,” neither of the terms seem to make sense without the other. Moreover, both the philosophy of the concept and the philosophy of the subject maintain a certain amount of indeterminacy. In particular, the opposite of the philosophy of the concept can be called either a philosophy of consciousness or a philosophy of the subject. The opposition first appears in the last lines of Jean Cavaillès’s posthumous work, “On Logic and the Theory of Science,” which was not published until 1947. But then, one has to wait for Georges Canguilhem’s reference to Cavaillès, in the 1960s, for this opposition to really impose its mark on French philosophy. From then on, this opposition

1. Jean Cavaillès (May 15, 1903–February 17, 1944; born in Saint-Maixent (Deux-Sèvres, Poitou-Charentes), France; died in Arras) was educated at the École Normale Supérieure (1923–26) and the Sorbonne (1926–27). His influences included Brunschvicg and Husserl, and he held appointments at the École Normale Supérieure (1931–35), lycée in Amiens (1937), the University of Strasbourg (1938–41), and the Sorbonne (1941).

2. Georges Canguilhem (June 4, 1904–September 11, 1995; born in Castelnaudary, Languedoc, France; died in Marley-le-Roi) was educated at the École Normale Supérieure (1924–28). His influences included Bergson, Paul Bernard, and Nietzsche, and he held lycée appointments in Charleville (1929–30), Albi (1930–31), Douai (1932–33), Valenciennes (1933–35), Béziers (1935–36), and Toulouse (1936–40), then appointments at the University of Strasbourg (relocated to Clermont-Ferrand, 1941–45; in Strasbourg, 1945–48), and as Inspecteur Générale de Philosophie (1948–55), Director of the Institut d’Histoire des Sciences et des Technique and Chair in the History of Philosophy of Science at the Sorbonne (1955–71).
structures French philosophy of the 1960s and 1970s. Canguilhem’s texts are very much polemical, and they are intended to defend Michel Foucault and early structuralism against phenomenology. The debate between structuralism and phenomenology then becomes omnipresent in French philosophical circles to the point that, as contemporaries relate, one had to be on the side of the concept or on that of the subject: there was no way out. Later still, Foucault gives a wider scope to this opposition. Underneath the opposition, Foucault states, there are two tendencies that have shaped philosophy in France since the Enlightenment: experience and science. However, the opposition between the concept (science) and the subject (experience) seems to disappear from the philosophical debate in the 1980s. Philosophers today may appeal to the philosophy of the concept, Alain Badiou for example, or to the philosophy of the subject, as Jean-Michel Salanskis does. But the opposition now remains marginal, and the appeal to the concept or to the subject is understood as referring to a tradition rather than a contemporary debate.

Insofar as the opposition between philosophy of the concept and philosophy of consciousness or of the subject was based in a polemic, the opposing categories seemed to shift and remain vague. Nevertheless, the opposition is not meaningless. One might even be tempted to characterize the French philosophical tradition by the very existence of this opposition. Indeed, it seems to catch a particular tradition of philosophy. For example, the opposition would make no sense in the context of German idealism. Thinking of Kant or Hegel, one cannot oppose the concept and the consciousness. Similarly, the opposition would work neither in analytical philosophy nor in American pragmatism. The simple possibility of opposing consciousness to concepts seems to be peculiar to this period of French philosophy (roughly from 1947 to 1985). One can de facto offer this (nominal) definition of French thought as a set a philosophies that should be able to be categorized under “philosophy of the concept” or “philosophy of the subject.” One thing is clear, however. During this period, the idea of a philosophy of the concept expresses a response to phenomenology. But as we just mentioned, neither of the terms is well defined by itself, and the philosophy of consciousness does not unequivocally refer to phenomenology. On one side, we must include doctrines such as Léon Brunschvicg’s (1869–1944) “critical

4. See, for example, Alain Badiou, *Logic of Worlds*, Alberto Toscano (trans.) (London: Continuum, 2009), 7–8, with a remarkable shift in the names associated with the two opposed traditions.
idealism,” doctrines that are not related to phenomenology; and, on the other side, we would be hard pressed to decide whether to include certain philosophies heavily influenced by phenomenology within a philosophy of consciousness or, even, a philosophy of the subject. Nevertheless, it is clear that the perspective of building an alternative philosophy to phenomenology is at the center of the idea of philosophy of the concept.

The aim of this essay is to analyze the idea of a philosophy of the concept and the opposition to phenomenology that it represents. In this perspective, we will study three texts, by Cavaillès, Canguilhem, and Foucault. We will first simply present these texts, going backward from Foucault to Canguilhem and Cavaillès. We will then discuss in greater detail the meaning of the philosophy of the concept in Cavaillès, in order to understand better the different moves that then enable Canguilhem and Foucault to give a wider meaning to the opposition between the concept and the subject. As we will see, there are three steps involved in the development of this opposition (represented by Cavaillès, Canguilhem, and Foucault). But these three steps make the opposition unstable. It then becomes quite difficult to extend the opposition to the philosophical positions found in subsequent twentieth-century French thought, in particular, those of Deleuze and the later Merleau-Ponty.

I. THREE STEPS IN THE DEFINITION OF THE PHILOSOPHY OF THE CONCEPT

It is Foucault who gives the widest scope to the opposition between the philosophy of the concept and the philosophy of the subject. Paradoxically, the Foucault text that summarizes this division in French philosophy, during the 1960s and 1970s, was first published in English in 1978. It is the introduction that Foucault gives to the first English translation of Canguilhem’s *The Normal and the Pathological*. Foucault’s article would be published in French only in 1985, after Foucault’s death, in a volume of the *Revue de métaphysique et de morale* dedicated to the work of Canguilhem. At the very beginning, Foucault draws a line that “separates a philosophy of experience, of sense and of subject and a philosophy of knowledge, of rationality and of concept. On the one hand, one network is that of Sartre and Merleau-Ponty; and then another is that of

*6. For a discussion of Brunschvicg, see the essay by Sebastian Luft and Fabien Capiellères in *The History of Continental Philosophy: Volume 3.*

*7. For more on Merleau-Ponty, see the essay by Mauro Carbone in this volume. For more on Deleuze, see the essay by Daniel W. Smith in *The History of Continental Philosophy: Volume 6.*
Cavaillès, Bachelard, and Canguilhem.” The revised French text is more detailed than the English translation:

[C’est une ligne] qui sépare une philosophie de l’expérience, du sens, du sujet et une philosophie du savoir, de la rationalité et du concept. D’un côté, une filiation qui est celle de Sartre et Merleau-Ponty; et puis une autre, qui est celle de Cavaillès, de Bachelard, de Koyré et de Canguilhem. Sans doute, ce clivage vient de loin et on pourrait en faire remonter la trace à travers le XIXème siècle: Bergson et Poincaré, Lachelier et Couturat, Maine de Biran et Comte.

The English translation would be:

[this is a line] that separates a philosophy of experience, of sense and of subject, and a philosophy of knowledge, of rationality and of concept. On the one hand, one filiation is that of Sartre and Merleau-Ponty; and then another is that of Cavaillès, Bachelard, Koyré, and Canguilhem. Probably, the separation dates from far back and one can trace it through the twentieth century: Bergson and Poincaré, Lachelier and Couturat, Maine de Biran and Comte.9

Later, we will discuss the remark on phenomenology that in the English text replaces the last sentence of the French text. In both texts however, the “concept” and the “subject” are inscribed in wider sets of terms, “experience, meaning, and subject” on one side, and “knowledge, rationality, and concept” on the other. In addition, in the French text at least, these opposite sets of terms are taken to

8. Michel Foucault, “Introduction,” in Georges Canguilhem, The Normal and the Pathological, Carolyn R. Fawcett, in collaboration with Robert S. Cohen (trans.) (New York: Zone Books, 1991), 8. This essay was revised and first published in French as “La Vie: L’Expérience et la science,” in Revue de métaphysique et de morale (January 1985); it was reprinted in Dits et écrits, Daniel Defert and François Ewald (eds) (Paris: Gallimard NRF, 1994), vol. 4. The quote in French that follows can be found in Dits et écrits, 764.

[*] For more on Sartre, see the essays by S. K. Keltner and Samuel J. Julian, and William L. McBride in this volume.

Gaston Bachelard (June 27, 1884–October 16, 1962; born in Bar-sur-Aube, Champagne, France; died in Paris) was educated at the Collège de Bar-sur-Aube (1919–22), and received a doctorate from the Sorbonne in 1929. He held appointments at the Collège de Bar-sur-Aube (1919–30); Faculté des Lettres de Dijon (1930–40), and the Sorbonne (1940–55).

describe two deep trends in French philosophy, which, as Foucault adds a few lines below, date from the Enlightenment. These two remarks are enough to distinguish Foucault’s view from that of Canguilhem.

Canguilhem’s comments on the opposition “concept versus subject” appear in a series of texts on Cavaillès from the 1960s. Intended for the general public, these texts are not strictly academic. Here is one example taken from a speech given for the inauguration of the amphitheatre Jean Cavaillès at the Sorbonne. Canguilhem refers to the posthumous work of Cavaillès, “On Logic and the Theory of Science”. In fact, it is Canguilhem himself who gave the title to this manuscript, which Cavaillès had simply left as his “philosophical testament.” Before we look at this passage, we should recall the historical context behind Canguilhem’s statements. Active in the underground since the French capitulation in 1940, Cavaillès created and led an important resistance group. He was first arrested in 1943. He wrote his posthumous work while in prison. He escaped but was arrested a second time and, eventually, was shot by the Nazis in 1944.¹⁰ These actions made Cavaillès very famous. So, now let us look at what Canguilhem says:

This text [“On Logic and the Theory of Science”] ends with several pages which seemed at first enigmatic to most of us. But we can understand today that the enigma was an announcement. Twenty years in advance, Cavaillès delineated the task that philosophy is now taking up: to substitute the primacy of the concept, the system, or the structure, for the primacy of lived or reflected consciousness. And it happens that this philosopher [Cavaillès] who does not believe in history in the existential sense, refutes in advance, by the actions he led while feeling that he was being led, by his carnal participation in history and by his historical death, the existentialist argument of those who try today to discredit what they call “structuralism” by condemning it to engender, among other misdeeds, a passivity before what has been accomplished.¹¹

¹⁰. For more details, see the biography of Cavaillès by his sister, Gabrielle Ferrière, Jean Cavaillès: A Philosopher in Time of War, T. N. F. Murtagh (trans.) (Lewiston, NY: Edwin Mellen Press, 2000).

¹¹. Georges Canguilhem, “Inauguration de l’amphithéâtre Jean Cavaillès,” in Jean Cavaillès, Œuvres complètes de philosophie des sciences (Paris: Hermann, 1994), 674. The French is: “Et il se trouve que ce philosophe qui ne croit pas à l’histoire, au sens existentiel, réfute par avance, par l’action qu’il mène en se sentant mené, par sa participation charnelle à l’histoire et par sa mort historique, l’argument existentialiste de ceux qui cherchent aujourd’hui à discréditer ce qu’ils appellent le structuralisme en le condamnant à engendrer, entre autres méfaits, la passivité devant l’accompli.”
Canguilhem relies on both Cavaillès’s actions and his philosophy in order to defend early structuralism. An argument against structuralism, broadly speaking, could be that, by putting aside the subject, one loses the ground for moral responsibility. That is, if the person is only an effect of the structure, he cannot be responsible for his action. And therefore all philosophy can do is observe the structures and their changes: “passivity before what has been accomplished.” Canguilhem’s answer to this criticism is clear: Cavaillès holds a philosophical position similar to that of structuralism (we will return to this similarity), but he still felt a moral demand. The feeling led him to actions, which the existentialists had not done. Canguilhem himself was active in the underground. His speech continues in this way:

Today some philosophers cry with indignation because certain other philosophers have formed the idea of a philosophy without a personal subject. The philosophical work of Jean Cavaillès may be called upon in order to support this idea. His mathematical philosophy was not built with reference to the subject who could be identified as Jean Cavaillès. This philosophy from which Jean Cavaillès is radically missing has commanded a form of action which led the philosopher through the narrow path of logic to the point from which one does not come back. Jean Cavaillès is the logic of resistance lived all the way up to death. Let the philosophers of the existence, of the person, do as much next time if they can.12

Canguilhem certainly uses an argument ad hominem. More generally, one could question to what extent the actions of a philosopher can be called on to support or undermine his or her philosophy. We will discuss later how Cavaillès’s philosophy, which only concerns mathematics, could appear to Canguilhem as “commending” a certain form of action.

In addition to being ad hominem, Canguilhem’s remarks are highly polemical, even more so than those of Foucault. They do not intend to give a historically accurate account of Cavaillès’s position in French philosophy. Their aim is both to praise the philosopher – for Cavaillès, shot by the Nazis, was certainly a hero – and to defend, in a heated polemic, structuralism. Cavaillès becomes the tutelary figure of structuralism, both theoretically and politically. Cavaillès here appears to give to structuralism both theoretical roots and a political caution. If we compare Canguilhem’s remarks with those of Foucault, we also see two differences. First, in opposition to the “concept,” Foucault speaks of the

“subject” and he associates it with two other terms, “experience” (*vécu*), and “meaning” (*sens*). Canguilhem speaks in turn of “consciousness,” “subject,” or “person.” The opposite of the “concept” is not always designated with the same term, as if the philosophy of the concept could not name its opponent. It is certainly significant that the philosophy of the concept does not always have the same meaning. Second, in Foucault’s text, the philosophy of the concept is a deep trend in philosophy in France, a trend that dates from the Enlightenment, whereas in Canguilhem’s texts, the philosophy of the concept appears as a new movement, a “task that philosophy is now taking up.” The meaning, and the importance, of the philosophy of the concept have changed from Canguilhem to Foucault. It has, by Foucault’s time, established itself and is looking for deeper roots.

But if we now go to the last lines of “On Logic and the Theory of Science,” to which Canguilhem refers in comments for the inauguration of the Cavaillès amphitheater, “the philosophy of the concept” seems more elusive. After a lengthy examination of Husserl’s phenomenology, which takes about half the book, Cavaillès argues for a “philosophy of the concept” against the “philosophy of consciousness.” This is what he says: “It is not a philosophy of consciousness but a philosophy of the concept that can give a theory of science [une doctrine de la science]. The generating necessity is not the necessity of an activity, but the necessity of a dialectic.” As Canguilhem notes, these lines are enigmatic. They end Cavaillès’s essay, without giving much information on the nature of this philosophy of the concept. And Cavaillès’s early death does not allow him to develop this project called a “philosophy of the concept” or, as he had written one year earlier, a “dialectic of concepts.” Our next task will be an examination of Cavaillès’s writings in order to understand his idea of a philosophy of the concept and its relationship to phenomenology. But we can say now, at the least, that these texts from Cavaillès, Canguilhem, and Foucault, indicate a progression, three steps in the constitution of a “philosophy of the concept”: (i) a project for Cavaillès; (ii) a contemporary movement for Canguilhem; (iii) an established trend for Foucault. They also show an ambiguity concerning the opposite of the philosophy of the concept: (i) a philosophy of “consciousness”; (ii) a philosophy of the “subject” or of the “person”; (iii) a philosophy of “experience, meaning and subject.”

---

II. CAVALLÈS’S EPISTEMOLOGY AND THE PHILOSOPHY OF THE CONCEPT

Our task now is to investigate at length the philosophy of the concept and the response to phenomenology that it underlies. Cavaillès’s first two books, which were his two doctoral theses, were published in 1938. His thèse complémentaire, Remarques sur la formation de la théorie abstraite des ensembles (Remarks on the formation of the abstract theory of sets), describes the development of Cantor’s theory from the early work in analysis up to the paradoxes. His primary thesis, Méthode axiomatique et formalisme (Axiomatic method and formalism), concerns the problem of the foundations of mathematics. It ends with Gödel’s theorem. Both books are historical studies. It is only in the conclusion of the second thesis (the last ten pages or so) that Cavaillès delineates a philosophical position. This position is still very much influenced by Brunschvicg, and Cavaillès himself acknowledges he has taken his model from Brunschvicg’s 1912 work, Les Étapes de la philosophie mathématique (The stages of mathematical philosophy).

The posthumous work, “On Logic and the Theory of Science”, takes a new turn. Abandoning the history of mathematics, Cavaillès aims here to investigate the philosophical tradition in order to find a philosophy that is faithful to mathematics. “On Logic and the Theory of Science” does not, however, set forth a philosophical theory. The book is purely critical. It only presents a tradition that ends with Husserl and, according to Cavaillès, one that calls for a philosophy of the concept, instead of Husserl’s philosophy of consciousness. To set up this movement, Cavaillès starts with Kant’s analysis of logic. As is well known, Kant defines logic as the science of the form of thought and he separates mathematics from logic since mathematics relies not on a logical analysis but on constructions in intuition. To prove that the sum of the angles of a triangle equals two right angles, the geometer does not analyze the concept of a triangle; he draws a figure and reasons on the basis of this figure. The status that Kant gives to logic leads to several difficulties. In particular there is the question of how one is to obtain the logical form from the concrete thought. Quite generally, Kant’s position opens up two paths for the philosophy of mathematics. On one side, one may emphasize that mathematical development is irreducible to logical analysis. One then comes to what Cavaillès calls the “philosophies of immanence,” Brouwer and Brunschvicg.14 On the other side, one may concentrate on logical

14. Luitzen Egbertus Jan Brouwer (1881–1966) was a Dutch mathematician best known for his work in topology and as the founder of the mathematical philosophy of intuitionism.
analysis and try to build a logic that would recapture mathematical development. On this side, one is led to Bolzano’s theory of science.\textsuperscript{15}

Cavaillès defers the critical examination of Brouwer and Brunschvicg’s positions. He mentions a single, but essential difficulty. In different ways, Brouwer and Brunschvicg put aside logic and analyze reflexively the acts of the consciousness that does mathematics. It is in this manner that they intend to account for the development of mathematics: by describing the acts of the subject. The question that Cavaillès then raises is how one passes from mathematics to consciousness. Mathematics does not speak of the acts of consciousness. So how, with what philosophical hypothesis, may one see in a mathematical development a series of subjective acts?

This discussion takes only one long paragraph. Instead of examining Brouwer and Brunschvicg’s positions more thoroughly, Cavaillès follows the second path, through Bolzano’s theory, which leads him eventually to logical positivism. The problem with logical positivism, according to Cavaillès, is the following. The aim of reducing mathematics to tautologies eliminates the need to refer mathematical propositions to an independent objectivity. However, logical positivism (like Hilbert’s program) uses a formalization of mathematics and metamathematical reasonings that considers mathematical signs as independent objects. Cavaillès argues that mathematical signs, signs as they are used in a mathematical activity, are the products of the history of mathematics. Therefore, logical positivism happens to reintroduce an independent objectivity in the foundations of mathematics, and the status of this objectivity (the objectivity of the signs) is far from clear. Logical positivism then calls for a general theory of the relationship between our acts, in mathematics, and their objects, and, according to Cavaillès, this is what Husserl’s phenomenology offers. So Cavaillès engages in a detailed examination of phenomenology, which takes about half of the entire book.

The last part of “On Logic and the Theory of Science” is one of the first discussions in French of Husserl’s phenomenology. From the viewpoint of the philosophy of mathematics, Cavaillès finds several points of disagreement with Husserl. But the point that leads up to the call for a philosophy of the concept is Husserl’s theory of history in his later writings, in particular, as it is found in “The Origin of Geometry.”\textsuperscript{16} As is well known, in “The Origin of Geometry,” Husserl discusses the nature of the history of mathematics by means of the example of geometry. Geometrical concepts are constituted on the basis of the lifeworld. What then happens in the development of geometry is that the orig-

\textsuperscript{15} Bernhard Bolzano (1781–1848) was a Czech logician whose work was a major influence on Brentano and Husserl.

inal meaning of the concepts is, to use Husserl's word, “sedimented.” The original meaning is, in a way, forgotten. It no longer appears in the way we use our concepts. However, it has not completely disappeared. It is still there but it is hidden, implicit in our geometry. Thus it is possible to reactivate the original meaning of geometrical entities. One does not need to study *in concreto* the history of geometry. One rather has, by a phenomenological analysis, to reenact the process of the constitution of geometrical entities. By reflection, one discovers the acts that first produced geometrical entities and, in this way, clarify their original meaning.

In the phenomenological view, the history of mathematics is a process of growth in which the foundations are “sedimented,” not reshaped but buried by progress. In a way, nothing changes. The past, the origin of geometry, is still present in our geometry. Cavaillès's contention is precisely that the history of mathematics shows changes, or a real becoming, where the past is literally erased from the present. For example, when a new theory is introduced that generalizes a former one, the meaning of the concepts is radically modified. The former concepts now appear as specifications of more general ones. Their original meaning is irremediably lost: “One of the essential problems of the doctrine of science is that progress itself may not be augmentation of volume by juxtaposition, in which the prior subsists with the new, but a continual revision of contents by deepening and eradication.” Cavaillès's conclusion is that the reflexive analysis, on which phenomenology is based, is of no interest for the understanding of the history of mathematics. What one must understand is the internal workings of the becoming of mathematics, the way in which concepts call for one another and transform themselves. This “dialectic” has nothing to do with an analysis of consciousness. As we have seen, “It is not a philosophy of consciousness but a philosophy of the concept that can give a theory of science. The generating necessity is not the necessity of an activity but the necessity of a dialectic.”

Although we understand better the movement leading up to a call for the philosophy of the concept, in fact what we have seen is a movement that splinters, with one branch ending with Husserl’s phenomenology, and the other with Brouwer’s and Brunschvicg’s positions, which also represent philosophies of consciousness. As we noted, in “On Logic and the Theory of Science,” Cavaillès does not discuss in detail their positions, but we can find elements that explain

---

his rejection of Brunschvicg’s “critical idealism” in some of his other writings. Brunschvicg thinks that the foundation of mathematics lies in its history. In fact, “science [namely, mathematics] taken outside its history is an abstraction.”\textsuperscript{19} New methods, or new theories, always appear as answers to specific problems in the existing fields. They have, so to speak, a context. In fact, the various steps of the history of science have, in Brunschvicg’s epistemology, the same structure. There is an open problem. “Human reason,” in Brunschvicg’s words, invents a new concept, leading to a new theory. But this concept must then be verified in experience; in the case of mathematics, it must prove its fruitfulness in the existing theories, or, in the case of physical science, in the empirical world. The history of science is then a “dialogue,” a “mutual reaction” between human reason with its faculty of invention, and experience, where new concepts must be tested.\textsuperscript{20}

Like Bachelard, Cavaillès inherits Brunschvicg’s historical perspective. However, he will try to dispense with Brunschvicg’s reference to “human reason.” Already, in the 1938 thesis, Cavaillès argues that the history of mathematics has an “internal necessity.” That is, Cavaillès believes that new methods, or new theories deriving from them, are entirely determined by the open problems of the existing fields. Each step in the history of mathematics can be accounted for by considering the problems that were raised immediately before, as Cavaillès demonstrates with the example of Cantor’s set theory, which seems to stem from an attempt to solve certain problems in the analysis of Fourier series.\textsuperscript{21} Thus there is no need to refer to Brunschvicg’s “reason” or to any subjective motivations (such as the psychology of the mathematician). Cavaillès thus gives a kind of autonomy to the history of mathematics: since its development can be explained internally, by analyzing the open problems in the existing theories, one can consider the history of mathematics in abstraction from the fact that it is produced by mathematicians or that it may refer to something else (such as the physical world). It has an objectivity that is independent both of the physical world and of the human mind: “There is an objectivity of the becoming of mathematics, an objectivity that is itself grounded mathematically”,\textsuperscript{22} or:

Science [in fact, mathematics] is no longer considered as a simple intermediary between the human mind and being in itself, depend-

ing as much on one as on the other, and not having its own reality. Now science is regarded as an object *sui generis*, original in its essence of its own, autonomous in its movement.23

The philosophy of mathematics then becomes the analysis of this historical development. We find against Brunschvicg a point similar to that made against Husserl, namely, that the philosophy of consciousness misses the main problem, which is to understand the “becoming” of mathematics, its necessity and its transformations. This necessity in mathematics cannot be accounted for by an analysis of our acts. It depends on relations internal to mathematics, between the concepts or between former problems and new methods.

A closer reading of Cavaillès's texts would certainly show other elements in his criticism of the philosophy of consciousness.24 Cavaillès questions the possibility of reflection on *lived-experience* (“vécu” in French, “Erlebnis” in German; “Erlebnis” is a key term of Husserl's phenomenology, usually rendered in English as “lived-experience,” but sometimes as “mental process”). Some of his analysis also seems to point toward a constitution of subjectivity through the historical development of mathematical concepts, therefore reversing the phenomenological perspective (which describes the constitution of concepts in subjectivity) and anticipating structuralism. However, the root of Cavaillès's rejection of the philosophy of consciousness lies, as we have seen, in the uselessness of the philosophy of consciousness: it cannot account for the becoming of mathematics.

We must add two remarks on Cavaillès. The first concerns his relationship with Spinoza. In his remarks at the inauguration of the amphitheater Jean Cavaillès, Canguilhem alluded to Cavaillès's Spinozism. However, the importance of Cavaillès’s reference to Spinoza does not come from his writings, but from a spoken remark to Raymond Aron. Although one may see a “Spinozistic atmosphere”25 in all of his writings, Cavaillès mentions the name “Spinoza” and the derivative “Spinozistic” only once. But, when summoned to explain his involvement in the underground, Cavaillès answers, “I am Spinozist. I believe in necessity. The necessity of mathematical inferences, the necessity of the history of mathematics, the necessity also of the struggle in which we are engaged.”26 In his *Ethics*, Spinoza posits two parallel developments, in the ideas that call

the philosophy of the concept

for one another, and in the things themselves that lead to one another. Now Cavaillès seems to relate the history of mathematics to the developments of ideas, in Spinoza’s system, and to allude to a parallel development in history itself. Therefore, just as mathematical problems require certain solutions, historical situations require certain actions. And, as the mathematician does what is required to solve an open problem, Cavaillès acts according to what the situation requires from him. This oral remark to Aron lies at the bottom of Canguilhem’s reference to Cavaillès. It, indeed, establishes a link (although not a necessary relation) between Cavaillès’s philosophy and his action during the war. In that sense, it seems indeed to refute the existentialists’ argument that a philosophy without subject was condemned to “passivity before what has been accomplished.” In fact, Spinoza, against Descartes, will remain the tutelary figure of the philosophy of concept. He will be particularly important for Althusser and his school.27

Our second remark concerns the importance that Cavaillès himself gives to the expression “philosophy of the concept” or “dialectic of concepts.” Although the call for a philosophy of the concept concludes what Cavaillès called his “philosophical testament,” it is not clear that it represents the center of Cavaillès’s outlook. Indeed, one year before writing “On Logic and the Theory of Science,” Cavaillès mentions in a shorter essay called “Transfini et continu” (Transfinite and continuation) that “The relationship between the dialectic of concepts and intuitive superposition remains the central problem of the philosophy of mathematics.”28 “Intuitive superposition” describes the way in which different modes of expression in mathematics – such as figures in geometry, formulas in logic or in algebras, the drawing of graphs in analysis – interact and, in this interaction, acquire meaning. The problem that Cavaillès raises concerns the attempt to understand how new concepts can, so to speak, “incarnate” themselves in new modes of expression. The mathematician does not invent a new concept, a new theory, and then devise a way to express the new domain of thought that he has opened. This is so because a concept, or a theory, can only be used, or is only truly possessed, when it is transcribed into an appropriate medium of expression. But how can a concept find its expression when one already needs this expression in order to truly possess the concept? In any case, in the passage we just quoted, the “dialectic of concepts” appears as only one level of the philosophy of mathematics, while a second level seems to be the study of the “intuitive superposition,”

that is, the study of transformations and interactions in the mathematical modes of expression. It could be that, in his last work, Cavaillès concentrates on one aspect of what is for him the full problem of the philosophy of mathematics. If so, one may doubt that the expression “philosophy of the concept” already had for Cavaillès the importance that it will acquire in the French postwar philosophy.

III. CANGUILHEM AND STRUCTURALISM

Whereas Cavaillès’s call for a philosophy of the concept expresses (at least in part) his later philosophical standpoint, Canguilhem’s analysis in the passage we quoted above is not clearly related to his own philosophy. In fact, the philosophy of the concept, in this passage, is basically identified with “structuralism.” The word “structuralism” could be deciphered by a whole array of philosophies that relate subjectivity to structures. To put this simply, “structuralism” would mean that the subject is considered as an effect of a structure. Against phenomenology, such a structuralism would claim that there are structures independent of the subject and that they determine our subjectivity. One can include under this structuralism authors such as Lacan, Althusser, and Foucault. This is not to say that these authors hold the same position. On the one hand, for example, although Althusser relates his concept of ideology back to Lacan, Althusser’s concept of “ideology” constitutes the subject in its very existence. The ideology, which means the implicit conceptual background of our society, is based on a process of “interpellation” (“hey you”), that gives rise to the existence of individuals. Indeed, Althusser never mentions a notion of subjectivity that would precede the ideological individuals that we are. On the other hand, Lacan recognizes a primordial “I,” the subject of the enunciation in “I think,” or “I lie.” This “I,” for Lacan, is devoid of content, and only gains its content through the imaginary and symbolic structures that are imposed on it by the Other. In the same way, Foucault’s The Order of Things describes the genesis of Man in the modern epistêmē, without touching on the existence of a subject.

*29. For further discussion of Althusser, see the essay by Warren Montag in The History of Continental Philosophy: Volume 6; for Lacan, see the essay by Ed Pluth in The History of Continental Philosophy: Volume 5; and for Foucault, see the essay by Timothy O’Leary in The History of Continental Philosophy: Volume 6.

As we seen, the philosophy of the concept, for Cavaillès, is a project, a philosophy that does not yet exist. For Canguilhem however, the philosophy of the concept is a self-asserting movement in contemporary philosophy. Besides, in “On Logic and the Theory of Science,” the call for a philosophy of the concept is first motivated by the inability of the philosophy of consciousness to understand the development, the very “becoming” of mathematics, even though Cavaillès may elsewhere intend to relate the constitution of the subject to the becoming of science. By Canguilhem’s time, this point – relating the constitution of the subject to the becoming of science – occupies the center of the “philosophy of the concept”: the constitution of the subject in structures that are independent of the subject. One could say that this point explains the shift in terminology from the philosophy of “consciousness,” in Cavaillès’s texts, to a philosophy of the “subject” or of the “person” in Canguilhem’s analysis. The “philosophy of consciousness” refers to a methodology. It refers to the idea of explaining the origin and the development of mathematics by a reflection on our acts. Above all, it is this methodology that Cavaillès rejects. Yet, the opposition between the philosophy of the concept and the philosophy of the “subject” puts into question, rather than the methodology, the fundamental domain of philosophy, the domain of being on which it bases its account. Thus, one may note differences and shifts between Cavaillès’s call for a philosophy of the concept and Canguilhem’s analysis. Nevertheless there is a marked continuity, and the authors of the “philosophy of the concept,” above all others, Althusser and Foucault, refer to Cavaillès.

IV. FOUCAULT’S AMBIGUITY

Foucault transforms more deeply the opposition between the philosophy of the concept and the philosophy of the subject. The philosophy of the concept, with Foucault, has become a deep trend of French philosophy, dating back to the Enlightenment. But let us look again at the name of the authors that, as we saw in the French version of the passage from his Introduction to Canguilhem’s The Normal and the Pathological, Foucault relates to the philosophy of the concept. It is hard to see how Poincaré and Bachelard could be said, in Cavaillès or Canguilhem’s sense, to side with the concept as opposed to the subject. As is well known, in his controversies with Couturat, Russell, or Hilbert, Poincaré stresses the role of the subject in mathematics.33 In particular, Poincaré argues

*33. Some of these controversies are discussed in the essay by Babette Babich in The History of Continental Philosophy: Volume 3.
against nonpredicative definitions in arithmetic or analysis.\textsuperscript{34} Nonpredicative
definitions, which define an object by referring to the set to which the object
belongs (as in “the tallest tree of the forest”) presuppose, according to Poincaré,
that the objects exist independently of our definitions (just as trees in a forest
do). For, if one considers that objects are created by our definitions, there is a
circle in claiming to create an object on the basis of a collection in which the
object already appears. But nonpredicative definitions seem to lead to paradoxes.
This outcome is, for Poincaré, a sign that nonpredicative definitions are illegiti-
mate. Mathematical objects must be treated as the mathematician’s creations,
and that implies certain restrictions on mathematical rationality. Poincaré antici-
pates Brouwer’s intuitionism. He would be placed, in Cavaillès’s opposition, with
Brouwer on the side of the philosophy of consciousness.

In the same way, Bachelard is a direct heir of Brunschvicg. He takes up
Brunschvicg’s description of the history of science as a “dialogue” between
reason and experience.\textsuperscript{35} Reason invents new concepts that must be tested in
experience, as if Reason was asking questions to Experience, and Experience
answering by a yes or a no. It is true that Bachelard introduces a domain that
does not appear in Brunschvicg’s writings: the imagination. The prime objec-
tive of science, according to Bachelard, is to break with the imaginary, the poet-
ical description of the universe, and develop conceptual schemes that may be
precisely verified. In another series of writings, Bachelard analyzes in detail our
imagination, which is built around the four elements of earth, water, air, and fire.
Bachelard describes his two-sided philosophical project as a “bi-psychoanalysis”:
a psychoanalysis of science that describes its break with imagination, and a
psychoanalysis of imagination that describes science’s structure. Althusser will
relate his notion of ideology to Bachelard’s imagination. He will in particular
borrow the idea that science emerges from its prehistory (in imagination or in
ideology) by a break or by what Althusser calls an “epistemic cut.”\textsuperscript{36} However,
it is again clear that, in Cavaillès’s opposition or in Canguilhem’s opposition,
Bachelard would belong with Brunschvicg on the side of the philosophy of the
subject. The reference to “psychoanalysis,” in Bachelard’s project, confirms the
central character of the subject.

One must then conclude that Foucault gives a new meaning to the opposition
between concept and subject. But, in Foucault’s text, the opposition, although
it clearly refers to Canguilhem and Cavaillès, concerns a wider set of terms:
“experience, meaning, and subject,” on the one side, and “knowledge, rationality,

\textsuperscript{34} See Henri Poincaré, Science and Method, F. Maitland (trans.) (London: Thomas Nelson and
Sons, 1914).

\textsuperscript{36} Louis Althusser, “On the Materialist Dialectic,” in For Marx, Ben Brewster (trans.) (New York:
and concept” on the other. In fact, Foucault seems to conflate two different oppositions. He certainly takes up the opposition, inaugurated by Cavailléès, between the philosophy of the concept and the philosophy of consciousness. But Foucault brings together this first opposition with a second one: an opposition between a philosophy that aims at describing experience, at “bringing experience to expression,” in the words that Merleau-Ponty uses in *The Visible and the Invisible*, and a philosophy that rather sees itself as an analysis of knowledge, in its plurality, or an analysis of the history of science. In the English version of the quote from the Introduction to Canguilhem’s *The Normal and the Pathological*, immediately after the passage we quoted above, Foucault describes the second filiation, Cavailléès, Bachelard, and Canguilhem, as a completely different way to take up phenomenology, “heterogeneous” to the way Merleau-Ponty and Sartre had taken it up.\(^37\) However, it seems that, here, Foucault refers to the idea of phenomenology rather than to phenomenology’s classical texts. The examination of Husserl’s phenomenology, which takes up about half of “On Logic and the Theory of Science,” is certainly crucial for Cavailléès. But one would not make the same claim for Bachelard and Canguilhem. In fact, in the remainder of his article, Foucault opposes Canguilhem’s idea of the living with the lived-experience of phenomenology.\(^38\) Thus it seems that the second network, Cavailléès, Bachelard, and Canguilhem, if related to phenomenology, appear as a completely different way to do phenomenology, or a completely different acceptation of phenomenology. The analysis of knowledge played very little role in French phenomenology (in Sartre or Merleau-Ponty). This tradition of philosophies of science, which reconsidered experience in light of knowledge, offered a means to break with phenomenology.

Let us add two more remarks. First, if Foucault brings together two different oppositions – concept against subject, knowledge against experience – the examples of Poincaré and Bachelard show that the two oppositions are by no means equivalent. By conflating them, Foucault truly changes the opposition put in place in the writings of Cavailléès and Canguilhem. Second, Foucault’s view has the effect of hiding certain possibilities on the checkerboard of French philosophy. One of these possibilities, which finds no place in Foucault’s opposition, is a phenomenology of mathematics, such as that of Jean-Toussaint Desanti in *Les Idéalités mathématiques* (Mathematical idealities).\(^39\) Another possibility, which

---

the relation between philosophy of the concept and the philosophy of knowledge seems to erase, is a philosophy of experience that would not be a philosophy of consciousness. This nonconsciousness philosophy of experience would be the exact counterpart to Poincaré and Bachelard’s positions, which are philosophies of knowledge but also philosophies of consciousness. One example would be Merleau-Ponty’s later ontology. In the notes for *The Visible and the Invisible*, Merleau-Ponty, in 1961, is one of the first, after Cavaillé, to explicitly oppose his philosophical project to the “philosophies of consciousness.” Another example could be Deleuze, in particular in the period of his collaboration with Guattari. *Anti-Oedipus* can hardly be seen as a philosophy of consciousness in the sense that Cavaillé rejects. But nor is it a philosophy of knowledge in the sense of Foucault’s opposition.

V. CONCLUSION

We have reviewed three steps in the opposition between the philosophy of the concept and the philosophy of consciousness or the philosophy of the subject. This opposition is a polemical one, and its terms do not always have a precise meaning. Nevertheless, we have seen that each of these three steps gives different values to this opposition and delineates different responses to phenomenology. For Cavaillé, the philosophy of the concept first means a change in methodology: it is useless to investigate the becoming of science by a reflection on the acts of the subject. For Canguilhem, the philosophy of the concept seems to refer essentially to the structuralist idea that the subject is constituted as an effect of (social or psychological) structures that the subject does not determine. For Foucault, finally, the philosophy of the concept becomes the philosophy of knowledge, a philosophy that centers itself on the analysis of knowledge, in opposition to a philosophy that finds its foundations in the description of our immediate experience.

The relationships between phenomenology and the analytic tradition – the main rival to phenomenology in the twentieth century, which eventually became the dominant approach in anglophone academic philosophy – are complex and became increasingly fraught over the course of the century.\(^1\) Early in the twentieth century, there was considerable interaction between both phenomenological and analytic European philosophers. Husserl, for instance, was one of the first philosophers to recognize the philosophical significance of Gottlob Frege (arguably the founder of analytic philosophy). Similarly, Bertrand Russell read Frege and Meinong, and corresponded with them in German; Wittgenstein moved between Austria and Cambridge; Moore read Brentano and chaired one of Husserl’s lectures in London; Ryle lectured on Austrian philosophy at Oxford; Carnap attended Husserl’s seminars in Freiburg in 1924–25; and so on. On the other hand, there was lack of knowledge of the different traditions: for instance, Paul Ricoeur lamented that he could find no one in Paris from whom to learn Russell’s philosophy in the 1930s and Russell’s *History of Western Philosophy*
(1946) is notorious for its poor treatment of European philosophers such as Nietzsche and for ignoring twentieth-century developments apart from “the Philosophy of Logical Analysis.”

While there was interaction and discussion between the various schools and traditions, the Second World War seemed to have had a decisive impact and, in the postwar years, the two traditions grew apart and developed separately from one another, leading eventually to a kind of détente, although one based largely on mutual ignorance. Karl-Otto Apel, Jürgen Habermas, and Paul Ricoeur are rare examples, in the period under discussion, of European philosophers who sought to incorporate the insights of Wittgenstein, Austin, Searle, and others. Meanwhile, Anglophone analytic philosophers, especially in the 1950s and 1960s, simply paid no attention to phenomenology and its European followers. It was not until the end of the 1970s that analytically trained philosophers such as Richard Rorty began to pay close attention to Husserl, Heidegger, and the phenomenological tradition. The “analytic” response to phenomenology in fact has to be found largely on the European continent and then within the larger neo-Kantian tradition.

Some of the sharpest critical responses to phenomenology (primarily, the work of Husserl and Heidegger) came from within the loosely organized phenomenological movement itself, and indeed many of these criticisms anticipated those made subsequently by analytic philosophers. As Ricoeur put it, phenomenology is “both the sum of Husserl’s work and the heresies issuing from it.” In this chapter, however, I shall be concerned with what may be broadly construed as the analytic reception of phenomenology. Because neo-Kantian criticisms of phenomenology in many ways anticipated and indeed inspired the analytic criticisms, it will be necessary to discuss the neo-Kantian reaction to phenomenology en passant. Furthermore, I will begin my narrative a little earlier than 1930, since critical responses to phenomenology began to appear especially after Husserl published his major book on phenomenological method, the programmatic Ideas I in 1913; and, owing to the absolute dearth of interrelations between the

3. A noteworthy exception is Wilfrid Sellars, who allowed some room for phenomenology, albeit without the Wesensschau, and who had studied Husserl with his teacher Marvin Farber, who himself had studied with Husserl in Freiburg.
4. In this regard, Rorty’s *Philosophy and the Mirror of Nature* groups Russell with Husserl as epistemological foundationalists and links the later Wittgenstein with Heidegger as critics of foundationalism and representationalism. [*] For a discussion of Rorty, see the essay by David R. Hiley in *The History of Continental Philosophy: Volume 6*.
traditions during the 1960s, I will end my survey a little later than 1970 with the
Searle–Derrida debate that began in 1977. I take this encounter to be one of the
paradigmatic cases, although Searle himself denied that this debate represented
“a confrontation between two prominent philosophical traditions.”7

I. CHALLENGES TO PHENOMENOLOGY IN EUROPE

Phenomenology was inaugurated as a specific method at the outset of the twen-
tieth century by Edmund Husserl (1859–1938), especially in the Introduction to
the second volume of his massive “breakthrough” work, Logische Untersuchungen
(Logical Investigations; 1900/1901).8 Husserl systematically developed phenomenology in his subsequent publications, that is, Ideas I (1913), Formal and Transcendental Logic (1929), Cartesian Meditations (1931), and the articles of The Crisis of the European Sciences that appeared in the journal Philosophia (1936). In the period from 1913 to 1929, Husserlian phenomenology vied with neo-Kantianism (Windelband, Rickert, Natorp, Cassirer)9 as the most prominent philosophical movement in Germany, with phenomenology gradually challenging and eventually eclipsing the once dominant neo-Kantian tradition, while the tradition of “life philosophy” (Lebensphilosophie; Dilthey, Simmel) remained a somewhat minor voice until the revival of Nietzsche’s work in the 1930s. The neo-Kantians took phenomenology seriously and engaged critically with it: Paul Natorp, for instance, reviewed both Husserl’s Logical Investigations and his Ideas I, and was prescient in predicting that Husserl would move closer to neo-Kantianism. When, in 1916, Husserl moved from the University of

---

Göttingen to take up the Chair of Philosophy in Freiburg (previously occupied by Heinrich Rickert), phenomenology became installed in the neo-Kantian heartland. In the following decade or so, from 1916 to 1928 (the year of his official retirement), Husserl established himself as the most influential philosopher in Germany. His protégé Martin Heidegger was his preferred successor and, with Husserl’s support, succeeded him to the Chair of Philosophy in Freiburg in 1928. Heidegger’s Sein und Zeit (Being and Time; 1927), which Husserl himself had arranged to be published in his Jahrbuch, had immediate impact, but the ground for his fame had already been prepared by his lectures at Marburg (1923–28), which had already made him famous with a generation of students, as Hannah Arendt would later recall.¹⁰

Heidegger’s own intellectual formation owed much not only to Catholic neo-Thomism (through which he encountered Brentano’s work on Aristotle, which led him to Husserl),¹¹ but also to neo-Kantians such as Rickert (his Doktorvater) and Emil Lask. Despite his ten-year exposure to Husserl, in his magnum opus Heidegger deliberately linked phenomenology to hermeneutics, as found in the German tradition of Schleiermacher and Dilthey, as well as drawing on Kierkegaard’s and Jaspers’s existentialism, and thereby changed phenomenology radically from within. Presuppositionless, descriptive eidetic insight, gained under the rigorous application of the epochē, gave way to interpretation, historical situatedness and an appreciation of human finitude and of the anxiety involved in personal existence. Husserl’s term “consciousness” (Bewusstsein) was replaced by Heidegger’s “Dasein” (existence).¹² Soon after, with the publication of Kant and the Problem of Metaphysics, Heidegger deliberately distanced himself from neo-Kantianism, very publicly in his famous Davos debate with Ernst Cassirer in 1929.¹³

When he eventually came to read Being and Time in 1929, Husserl was deeply disturbed by Heidegger’s distortion of transcendental phenomenology. He was also especially disturbed after he read Georg Misch’s 1931 study, Lebensphilosophie

¹³. For Heidegger’s debate with Cassirer, see Martin Heidegger, Kant and the Problem of Metaphysics, Richard Taft (trans.) (Bloomington, IN: Indiana University Press, 1990), 171–85.
which discussed Husserl, Heidegger, and Dilthey in terms that suggested it was Heidegger who was the leading new voice of hermeneutical phenomenology insofar as he had absorbed the best impulses of life philosophy: the attempt to grasp life itself. Husserl embarked on a series of responses to the Heideggerian challenge that culminated in his 1936 *The Crisis of the European Sciences*. But his young assistant Eugen Fink also sought to defend Husserl’s phenomenology against its critics – in particular in his 1933 *Kant-Studien* article “The Phenomenological Philosophy of Edmund Husserl and Contemporary Criticism,”16 which Husserl himself explicitly endorsed – in which he responded to the accusation that with *Ideas I*, Husserl had drawn closer to neo-Kantianism.

By 1930, phenomenology had become something of an orthodoxy in Germany and was already beginning to experience a backlash. Thus, for example, Max Horkheimer, in his speech inaugurating the newly emerging Frankfurt School, had characterized phenomenology as belonging to “traditional” rather than “critical” theory.17 The neo-Kantians, following Rickert, had renewed their attack on phenomenology, precisely because they claimed there was no pure given back to which phenomenological intuition could turn. They were effectively challenging what Sellars would later call the “myth of the given.” Scheler’s sudden death in 1928 and Heidegger’s “turning” (die Kehre) away from the constraints of academic philosophy during the 1930s also contributed to the decline of phenomenology, as did the Nazi purge of Jewish academics from the universities. Even younger German philosophers sympathetic to phenomenology – including Gadamer and Fink – believed that Husserlian phenomenology needed to be wedded to something more fundamental: in Gadamer’s case, it was hermeneutics and the nature of language; in Fink’s, it was Hegelian speculation.

After the Second World War, interest in phenomenology sharply declined in Germany. Husserl had died in isolation in 1938; Heidegger was under a teaching

---

suspension and was giving private talks on German poets such as Hölderlin; Fink was developing his own philosophy, writing about Nietzsche; Gadamer was developing hermeneutics (and reviving Hegel); and critical theory would eventually be revived when exiled members of the Frankfurt School (including Adorno) returned to Germany. In addition, emerging young philosophers such as Habermas were shocked by Heidegger’s lack of self-questioning regarding his National Socialist activities, as instanced by the fact that in his published 1935 lectures Introduction to Metaphysics, Heidegger had left standing remarks concerning the “inner truth and greatness” of National Socialism. Moreover, Heidegger’s invocation of “metaphysical” concepts such as the “being of beings” was considered anathema by philosophers who follow the positivist rejection of metaphysics as nonsense. Phenomenology’s legacy was now tainted both by Heidegger’s connection with fascism and by the unfashionable specter of reviving metaphysics!

As we have seen, phenomenology was being challenged in Germany by neo-Kantian and Frankfurt School thinkers during the 1930s–1950s. But phenomenology also came under attack from various offshoots of the neo-Kantian tradition, especially the Vienna Circle movement that gradually evolved into logical positivism. I will now turn to the analytic challenge to phenomenology, which I will present in the form of four paradigmatic confrontations.

II. FOUR CONFRONTATIONS

The first confrontation: phenomenology (Husserl) and Viennese logical positivism (Schlick) plus neo-Kantianism (Natorp and Rickert)

Phenomenology, itself the child of the Austrian tradition of philosophy founded by Bolzano and Brentano, did have a specific line of influence in Vienna

during the development of logical positivism.\textsuperscript{21} Felix Kaufmann (1895–1949),\textsuperscript{22} a graduate in jurisprudence and an enthusiastic reader of Husserl’s phenomenology, attended meetings of the circles around Hans Kelsen (his doctoral supervisor), the economist Von Mises, and the group that eventually became known as the Vienna Circle. Kaufmann had a significant influence on the social phenomenology of the young Alfred Schutz,\textsuperscript{23} and his book on the \textit{Infinite in Mathematics and its Exclusion} (1930)\textsuperscript{24} was highly regarded by Husserl. Kaufmann often discussed Husserl at meetings of the Vienna Circle (supposedly much to the annoyance of Schlick and some others) and also wrote on the relations between phenomenology and logical empiricism. In 1938, Kaufmann emigrated to the United States where, as an academic (teaching law and philosophy) at the New School for Social Research, he wrote several papers on the relation between phenomenology and analysis and, indeed, debated with his fellow émigré Rudolf Carnap on the nature of induction and truth in the pages of the newly founded \textit{Philosophy and Phenomenological Research}.\textsuperscript{25} It is clear that Carnap respects Kaufmann and that Kaufmann was recognized as an influential mediator between phenomenology and the emergent logical positivist tradition.\textsuperscript{26} In particular, Kaufmann defended Husserl’s concept of \textit{Wesensschau} against Moritz Schlick’s criticisms (which I will discuss below), and argued that Husserl’s concept of evidence (\textit{Evidenz}) had been misunderstood by those critics who regarded it as a subjective feeling of certainty.

During the early 1930s, critical philosophical responses to phenomenology came especially from Vienna Circle logical positivists such as Schlick and

\begin{itemize}

(Cambridge, MA: Harvard University Press, 1940). For a full list of his works, see Harry P. Reeder, “A Chronological Bibliography of the Works of Felix Kaufmann,” appendix in Kaufmann, \textit{The Infinite in Mathematics}.
\end{itemize}
Admittedly, Schlick had already challenged Husserl’s phenomenology in the first edition (1918) of his Allgemeine Erkenntnislehre (General Theory of Knowledge). Husserl responded to Schlick’s criticisms in the foreword to his second edition of the Sixth Investigation (which was published as a separate volume in 1921). Here Husserl asserts that many criticisms drawn from outside phenomenology fail to understand the effect that bracketing has on one’s opinions and convictions. He dismisses as absurd the view that Schlick attributes to him:

How readily many authors employ critical rejections, with what conscientiousness they read my writings, what nonsense they have the audacity to attribute to me and to phenomenology are shown in the Allgemeine Erkenntnislehre of Moritz Schlick. On page 121 of that work it is said that my Ideas “asserts the existence of a particular intuition, that is not a real psychic act, and that if someone fails to find such an ‘experience,’ which does not fall within the domain of psychology, this indicates that he has not understood the doctrine, that he has not yet penetrated to the correct attitude of experience and thought, for this requires ‘peculiar, strenuous studies.’” The total impossibility that I should have been able to utter so insane an assertion as that attributed to me by Schlick in the above italicized sentences, and the falsity of the rest of his exposition of the meaning of phenomenology, must be plain to anyone familiar with this meaning.

The tone of Husserl’s dismissal of Schlick indicates that there is a certain hostility in his attitude to him. Husserl is incredulous that Schlick apparently believes that his eidetic intuition is not also a real psychic act. Husserl goes on to remark: “I must expressly observe that, in the case of M. Schlick, one is not dealing with irrelevant slips, but with sense-distorting substitutions on which all his criticisms are based.” Husserl is particularly annoyed that a doctrine of special

27. Moritz Schlick (April 14, 1882–June 22, 1936; born in Berlin, Germany; died in Vienna, Austria) was educated at the University of Berlin. His influences included Carnap, Planck, and Wittgenstein, and he held appointments at the University of Vienna.
28. The second edition of Schlick’s Allgemeine Erkenntnislehre is translated as General Theory of Knowledge. Schlick dropped most of the Husserl discussion and condensed his criticisms into a single paragraph in the second edition; Moritz Schlick, General Theory of Knowledge, A. E. Blumberg and H. Feigl (trans.) (Chicago, IL: Open Court, 1985), 139. For an interesting discussion, see Roberta Lanfredini, “Schlick and Husserl on the Essence of Knowledge,” in Logical Empiricism, Parrini et al. (eds).
30. Ibid.
or indeed mystical intuition is being attributed to him and to phenomenology. Husserl believes the meaning of the *epoché* has been completely misunderstood by Schlick. Phenomenology is not a Platonic gazing at essences given in a kind of intellectual intuition; it is based on hard work, akin to mathematics.

In fact, Schlick had been targeting Husserl’s account of essential intuition (*Wesensschau*) in the *Logical Investigations* from as early as 1910.31 In general, Schlick was opposed to the idea that knowledge (which he conceived of as essentially propositional) could be any kind of intuition. As he puts it in a 1932 paper, “Form and Content: An Introduction to Philosophical Thinking”: “Intuition is enjoyment, enjoyment is life, not knowledge.”32 For him, the pure content of intuitive experience was inexpressible. He writes, “The difference between structure and material, between form and content is, roughly speaking, the difference between that which can be expressed and that which cannot be expressed.”33 And he goes on to say: “Since content is essentially incommunicable by language, it cannot be conveyed to a seeing man any more or any better than to a blind one.”34 For Schlick, one can see a green leaf and say that one sees the green leaf, but one’s saying it does not communicate the intuitive content “green.” This is his position against phenomenology. Schlick maintained that all knowing involved seeing-as and hence conceptualizing and judging. Pure intuiting, for Schlick, could not have the status of knowing. Ironically, Schlick does not challenge Husserl on the basis of any kind of verifi cationism. Both Husserl and Schlick were advocates of kinds of empiricism whereby knowledge is founded on perceptual experience, but Husserl always rejected positivism on the grounds that it overly narrowly restricted the content of experience (to sense data) and did not grasp the nature of what Husserl termed “categorial intuition.”

Nevertheless, the brief but acrimonious debate between Husserl and Schlick more or less set the tone for future confrontations between phenomenology and the nascent analytic movement. Schlick returned to attack Husserl’s phenomenology again in 1930, this time attacking Husserl’s defense of synthetic a

priori propositions (Husserl’s “material a priori”), which Schlick regarded as empty tautologies, rather than significant eidetic insights.\textsuperscript{35} For Schlick, as for logical positivism in general, there is no synthetic a priori. Schlick followed Wittgenstein’s \textit{Tractatus} in holding that \textit{a priori} statements were simply tautologies and as such did not “say” anything. For Husserl, on the other hand, there are certain truths that are \textit{a priori} but that depend on the nature of the matter in question.\textsuperscript{36} Thus, something being blue and at the same time yellow is not, for him, a purely formal truth based solely on the law of noncontradiction, but rather an \textit{a priori} synthetic truth grounded in the essential nature of color as essentially dependent on surface. Interestingly, as we will see below, the mature Wittgenstein would side with Husserl against Schlick on this issue of the synthetic \textit{a priori}.\textsuperscript{37}

Husserl may have been particularly irked by Schlick precisely because the latter was repeating a criticism of phenomenology’s reliance on intuition that was to be found not just in the nascent logical positivist tradition to which Schlick belonged but also in orthodox neo-Kantianism. For neo-Kantianism, it was a matter of orthodoxy that intuitions without concepts were blind. Prominent German neo-Kantians of the day, including Rickert and Natorp, as well as other prominent philosophers such as Hans Cornelius (one of Adorno’s teachers), had also criticized phenomenology’s assumptions concerning pure unmediated givenness. Phenomenology was seen as a new form of irrational or nonconceptual intuitionism, and, as such, would be doomed to failure. Indeed, Rickert and others said as much in their criticisms of Husserl.

It is one of the ironies of the history of philosophy that in his early lectures at Freiburg, Heidegger, himself a student of Rickert, takes up the challenge of defending phenomenological intuition against both Natorp and Rickert. In his 1919 lecture course, “The Idea of Philosophy and the Problem of Worldview,” Heidegger takes issue with Natorp’s criticism that phenomenology’s claim to be founded in immediate intuition is bankrupt since all immediacy has to be mediated by concepts and since consciousness, which is the basis for all objectification, is itself something that escapes determination. For Natorp, original experience can at best be “theoretically regained” or “reconstructed” by some

\textsuperscript{36} For a recent discussion, see Jocelyn Benoist, \textit{L’A priori conceptuel: Bolzano, Husserl, Schlick} (Paris: Vrin, 1999). Benoist carefully distinguishes the question of the nature of analyticity (as raised by Quine) from the question of the nature of the synthetic a priori.

\textsuperscript{37} For a discussion of the transformation from the early to the late Wittgenstein, see the essay by Bob Plant and John Fennell in \textit{The History of Continental Philosophy: Volume 3}.  

244
Volume 4
kind of working back through the original “construction” process whereby the experience was subsumed under generalizing concepts. Natorp, then, challenges the view that phenomenology can recover direct unmediated experience. Phenomenology can at best be a “reconstruction” of experience.

Against Natorp’s critique, the young Privatdozent Heidegger defends phenomenological viewing by arguing that conceptual description is in fact founded in an original experience that is originally nontheoretical in character. Furthermore, it is a mistake to consider phenomenological “signification” to be itself another kind of standpoint; it is in fact the attempt to free thinking from standpoints. The “original sin” against phenomenology, as Heidegger puts it in the same lecture course, is to assume that the phenomenological stance is merely another standpoint. For Heidegger, phenomenological meaning-apprehension goes along with the life process itself and grasps the essential “worldliness” of experience in a nonfalsifying way. According to Heidegger, now embarking on his own original conception of phenomenology, phenomenology essentially operates with what he terms in 1919 “hermeneutical intuition” (hermeneutische Anschauung).

Heidegger is, as we can clearly see, already on the road to the hermeneutic transformation of Husserlian descriptive phenomenology.

In later lecture courses, Heidegger offers a similar defense of phenomenology against his former teacher Rickert. In agreement with Natorp, Rickert also maintained that experience necessarily involves conceptualization and he would soon afterward (in 1920) publish a virulent critique of the “vitalism” of the then popular life philosophy (which Rickert understood broadly as including Nietzsche, Simmel, Dilthey, Bergson, Scheler, et al.) on the grounds that life had...

41. Heidegger, Towards the Definition of Philosophy, 93; Gesamtausgabe 56/57, 109. Interestingly, at various points in his own lecture courses, Husserl himself designated the original sin of philosophy as the fall into psychologism and naturalism.

42. Heidegger, Towards the Definition of Philosophy, 99; Gesamtausgabe 56/57, 117.
to be conceptualized in order to be understood. 43 Rickert attacks those supposed life philosophers who argue for the need to remain “true to life.” This is simply impossible for Rickert, since reality is grasped not just through sense impressions, but is mediated through language. Language, with its generalizations and “species names,” is, according to Rickert, precisely a necessary reduction of the complexity of the world of sensuous experience. It is conceptualization that brings order and system into the world of sensory experience that otherwise would be a chaos of fleeting sensations (as Kant had pointed out). Rickert concludes that “what is directly experienced as reality cannot be known. Thus, there is no metaphysics of life. … Life, as the unmediated reality, can only be lived through. As immediate life it mocks any attempt to get to know it.” 44 Of course, Rickert shared Husserl’s disdain for what they regarded as irrationalist “life philosophy,” brimming with “enthusiasm” but lacking solid argumentation and conceptualization. Indeed, it was largely owing to Heidegger and Jaspers that more existentialist figures such as Kierkegaard and Nietzsche were reclaimed by the philosophical tradition. Scheler too had been responsible for a new appreciation of the role of personhood, emotions and feelings, in philosophy, but neo-Kantianism resisted the lure of life philosophy and continued to insist that the business of philosophy was the clarification of scientific knowledge, not the celebration of life. Even the term Erlebnis, dear to both Dilthey and Husserl, is a concession to vitalism, according to Rickert, and he identifies and criticizes the urge toward life that is to be found in Heidegger’s philosophy (inspired by Dilthey).

The attack of the positivists was essentially a reprise of the original criticisms of phenomenology made by the neo-Kantians. Yet Husserl remained well disposed to the neo-Kantians, especially Natorp. During his Freiburg years, he also maintained formal but cordial relations with Rickert and corresponded with him frequently. Indeed, as he pointed out to Rickert, both were in agreement in opposing the increasingly dominant naturalism. Both phenomenology and neo-Kantianism understood philosophy to be primarily an a priori and transcendental enterprise and resisted all attempts at naturalism. On the other hand, Husserl was more antagonistic toward the new positivism. Having originally been an admirer of Ernst Mach, one of the forerunners of the Vienna Circle, and having characterized phenomenology, with its unprejudiced viewing, as

44. The German reads: “… was als Realität unmittelbar erlebt wird, kann nicht erkannt werden. Also gibt es keine Metaphysik des Lebens. … Das Leben als das unmittelbar Reale lässt sich nur erleben. Es spottet als unmittelbares Leben jedem Erkenntnisversuch” (Rickert, Die Philosophie des Lebens, 113; my translation).
the genuine positivism in Ideas I §20, in later years Husserl went on to claim in The Crisis of the European Sciences that “positivism, in a manner of speaking, decapitates philosophy,”\(^{45}\) by ignoring the role of the subject in the constitution of knowledge.

*The second encounter: Carnap reads Husserl and Heidegger*

The second encounter between phenomenology (this time represented by Husserl and Heidegger) and analytic philosophy (this time represented by Carnap) was even sharper in tone than the earlier dispute between Husserl and Schlick. Heidegger’s famous *Antrittsrede*, “What is Metaphysics?,” delivered at the University of Freiburg in July 1929, was deliberately provocative and evoked very strong reactions. Carnap, who was present at the talk, was, reputedly, appalled by Heidegger’s claims. His reply, entitled “The Overcoming of Metaphysics Through the Logical Analysis of Language,” appeared in the new journal of the logical positivists, *Erkenntnis*, volume 2, in 1931.\(^{46}\) Carnap’s essay was actually a programmatic manifesto against traditional metaphysics involving the supposed demonstration of the meaningless of metaphysical claims based on a “logical analysis” of meaning. With this essay, the battle between a certain tendency in phenomenology (regarded by Carnap as a kind of obscurantism) and logical analysis (later transformed into “analytical philosophy”) had begun.\(^{47}\) Indeed, the journal *Erkenntnis* had been explicitly founded by Carnap and Reichenbach to preach the logical positivist message and explicitly advocate “scientific philosophy.”\(^{48}\) Carnap’s attack on Heidegger was in effect a deliberate declaration of war, just

---

47. For a discussion of some of these battles see the essays in Parrini et al. (eds), *Logical Empiricism*; see especially Gottfried Gabriel, “Carnap’s ‘Elimination of Metaphysics through Logical Analysis of Language’: A Retrospective Consideration of the Relationship between Continental and Analytic Philosophy.”

48. As Carl Hempel recalled in 1975, “The old *Erkenntnis* came into existence when Hans Reichenbach and Rudolf Carnap assumed the editorship of the *Annalen der Philosophie* and gave the journal its new title and its characteristic orientation; the first issue appeared in 1930. The journal was backed by the Gesellschaft für Empirische Philosophie in Berlin … and by the Verein Ernst Mach in Vienna, whose philosophical position was strongly influenced by that of the Vienna Circle; a brief account of these groups, and of several kindred schools and trends of scientific and philosophical thinking, was given by Otto Neurath in ‘Historische Anmerkungen’ [vol. 1, 311–14]” (Carl Hempel, “The Old and the New ‘Erkenntnis,’” *Erkenntnis* 9 [1975]).
as Heidegger’s own Inaugural Address was meant to challenge both Husserl and neo-Kantianism.

For subsequent followers of analytic philosophy, Carnap’s essay has been seen as effectively unmasking Heidegger’s nonsense (literally). Indeed, the significance of Carnap’s criticisms of Heidegger may be compared with Heidegger’s own criticisms of Cassirer in his famous Davos debate of 1929. Just as Heidegger’s debate with Cassirer had the eventual result of elevating phenomenology over neo-Kantianism in Germany, Carnap’s debate with Heidegger had the eventual result of elevating analytic philosophy over Heideggerian phenomenology in the anglophone world.49

In fact, however, Carnap was actually much closer to Husserlian phenomenology than many analytic philosophers have been willing (until recently, for example, in the work of Michael Friedman50) to acknowledge. Carnap had been a student of the neo-Kantian philosopher Bruno Bauch at Freiburg, and had even attended Husserl’s seminars in 1924–25, when he was living near Freiburg and assembling the material that would become *Der logische Aufbau der Welt* (The logical construction of the world; 1928).51 Carnap became associated with the Vienna Circle after he moved to take up a position in Vienna in 1926, introduced through his friend Hans Reichenbach.52 In 1929, Carnap, along with Hans Hahn and Otto Neurath wrote the manifesto of the Vienna Circle, which aimed at propagating a “scientific conception of the world ["wissenschaftliche Weltauffassung"]” in opposition to traditional metaphysical and theological worldviews.53 This manifesto suggested that the survival of metaphysical outlooks could be explained by psychoanalysis or by sociological investigation,

49. Carnap participated in the debate at Davos. Michael Friedman claims that Carnap’s virulent attack on Heidegger in “Overcoming Metaphysics Through the Logical Analysis of Language” essay grew directly out of his encounter with Heidegger in Davos in 1929 (A Parting of the Ways. Carnap, Cassirer, and Heidegger [La Salle, IL: Open Court, 2000], x).

*50. See, for example, the essay by Michael Friedman and Thomas Ryckman in The History of Continental Philosophy: Volume 3.

but most advanced was the “clarification of the logical origins of metaphysical aberration, especially through the works of Russell and Wittgenstein.”

Husserl, Heidegger, and Carnap all shared a view of philosophy as attempting to clarify certain basic matters and getting beyond certain traditional philosophical problems that they regarded as “pseudo-problems” (Scheinprobleme). Husserl himself often made derogatory remarks about “windy metaphysics” not grounded in intuition and indeed his clarion call “to the things themselves” was meant to be a repudiation of metaphysical speculation. So the rejection of metaphysics alone did not single out Carnap’s approach from that of the phenomenologists. Furthermore, Carnap cited Husserl in positive terms in several places in the Aufbau, as he had earlier done in his dissertation published as Der Raum (1922), where he discusses Husserl’s views on the intuited nature of space. There is even some debate about the extent of Husserl’s influence, especially on Carnap’s central conception of “construction” (Aufbau). Carnap certainly played down the influence in later years but it is clear that, in the mid-1920s, he was well disposed toward the Freiburg phenomenologist.

In general, the Aufbau shows strong neo-Kantian influences, although Carnap is also deeply in debt to the new Russellian “logistics,” which he regards as the “most comprehensive” (Aufbau §3). Following on from the tradition of Meinong, Husserl, and others, who were also seeking a “theory of objects,” Carnap is seeking to identify various forms of object and begins broadly from the division between physical objects, psychological objects, and cultural objects. Like Husserl, Carnap operates with a very wide conception of an “object” – an object is anything about which a statement can be made (and hence includes relations, events, etc.). Carnap confirms the positive connection between his approach and Meinong’s theory of objects as well as Husserl’s “mathesis of experiences” (as he finds explicated in Husserl’s Ideas I).

Analytic philosophers may be surprised to learn that Carnap even invokes Husserl’s epoché approvingly in Aufbau §64. In speaking about beginning from one’s personal experiences (which Carnap, adapting the term “methodological

---

56. See Richardson, Carnap’s Construction of the World, 153–4. Carnap wanted to maintain both that purely geometrical space was a formal construct, derivable from mathematics, and that physical space was experienced in intuition, albeit it in a limited way.
57. Carnap, Logical Structure of the World, 9. Carnap refers to Husserl’s Ideas I (1913), §75, but this does not seem to be the right reference for “mathesis.”
individualism,” calls “methodological solipsism”), Carnap says that he will suspend belief as to whether the beliefs are actual or not:

At the beginning of the system, the experiences must simply be taken as they occur. We shall not claim reality or nonreality in connection with these experiences; rather, these claims will be “bracketed” (i.e., we will exercise the phenomenological “withholding of judgment”, epoche, in Husserl’s sense (Ideas I §§31, 32).58

Interestingly, perhaps inspired by the Humean approach (which Husserl himself, following Brentano, adopted in the first edition of the Logical Investigations until convinced by Natorp of the need to recognize the “I”), Carnap believes that original experiences are given in a non-egoic manner (Aufbau §65). They do not have to be related to a “subject” or a “self,” concepts that Carnap believes are higher “constructions” in his sense. Some kind of “I-relatedness” is not an original property of the basic experiences, Carnap claims, since to invoke the “I” is already to invoke “others” and these are higher-order entities, outside the original given. Departing from the mature Husserl of Ideas I (who had restored the pure ego as the transcendental source of all experience), Carnap believes that the assumption that experiences must be related to a subject is actually a prejudice driven by the subject–predicate structure of our language. Carnap acknowledges that in divorcing experiences from subjects he is departing from certain philosophical “systems,” including that of Husserl (Carnap refers to Ideas I, 65; presumably §37).59 The Aufbau then offers the kind of building-up or construction of objects from experiences that Husserl’s phenomenology also tried to trace, but it does so by avoiding the introduction of the pure or transcendental ego.60

59. Ibid., 106.
60. In an illuminating article, Abraham Stone has summarized the correlations between Husserl and Carnap in the Aufbau as follows: “Carnap’s initial realm of the ‘autopsychological’ clearly corresponds (as he explicitly points out [Logical Structure, §64]) to Husserl’s region of pure consciousness; its fundamental objects are called Erlebnisse. Next comes the physical realm, where, as in Husserl, the fundamental objects are ‘things.’ Carnap even follows Husserl on the detailed steps by which such ‘things’ are constituted: first, a level of visual things (Sehdinge), i.e., mere colored surfaces moving in space (Husserl, Ideas I, §151; Carnap, Logical Structure, §128); then, a narrowly ‘physical’ level of quantitative description in which movement is determined by strict causal law (Husserl, Ideas I, §52; Carnap, Logical Structure, 180–82); finally, the level of ‘intersubjective’ objects (though in this case, as both make clear, there is a kind of interweaving by which higher-order, psychological objects are used to complete the constitution of lower-order, physical ones) (Husserl, Ideas I, §151; Carnap, Logical Structure, §§148–9). After the physical realm comes a ‘heteropsychological’ one (corresponding to Husserl’s psychological region), and finally a realm or realms of Geist. Carnap follows Husserl, moreover, in referring to the process responsible for this structure, by which one object is
In his 1931 article “Overcoming Metaphysics,” Carnap continues in the spirit of the Vienna Circle manifesto to apply the methods and procedures of the new logic (which Heidegger himself had written about as early as 1912) to show that Heidegger’s “metaphysical” claims about nothingness were not just false but literally nonsensical. It is worth noting that Heidegger is but one target of Carnap’s analysis. Carnap makes clear that he could have drawn his nonsensical statements from any one of a number of “metaphysicians” and, indeed, those cited in the paper include Fichte, Schelling, Hegel, and Bergson, as well as Heidegger. Carnap uses the concept of “pseudo-statements” in order to criticize Heidegger. A “pseudo-statement” is a sentence that has a surface grammatical sense but which on analysis turns out not to assert anything that is meaningful (capable of verification) and hence that is literally meaningless. As Carnap puts it, such pseudo-sentences accord with “historical-grammatical syntax” but violate “logical syntax.”

In “Overcoming Metaphysics,” Carnap argues that there is a fault in human language that admits sentences (both meaningful and meaningless) that possess the same “grammatical form.” Carnap suggests that sentences in Heidegger’s 1929 essay – Carnap places Heidegger in “the metaphysical school” – such as “The Nothing nothings” (Das Nichts selbst nichtet) bear a superficial grammatical resemblance to acceptable sentences such as “The rain rains.”61 But this sentence is misleading because, Carnap asserts, “nothing” cannot function like a name. He points to the difference between the “is” of predication (e.g. “he is hungry”) and the “is” of existence (e.g. “he exists”) and asserts that the correct logical form of the “is” of existence is that it is applicable only to predicates, and not to signs for objects. Carnap writes:

To be sure it has been known for a long time that existence is not a property (see Kant’s refutation of the ontological proof of the existence of God). But it was not until the advent of modern logic that full consistency on this point was reached: the syntactical form in which modern logic introduces the sign for existence is such that it

---

61. Heidegger’s text is quoted by Carnap: “What is to be investigated is being only and – nothing else; being alone and further – nothing; solely being, and beyond being – nothing. What about this nothing? … Does the Nothing exist only because the Not, i.e., the Negation, exists? Or is it the other way around? Does Negation and the Not exist only because the Nothing exists? … We assert: the Nothing is prior to the Not and the Negation … Where do we seek the Nothing? How do we find the Nothing … We know the Nothing. … Anxiety reveals the Nothing. … What about this Nothing – The Nothing itself nothings [Das Nichts selbst nichtet]” (“The Overcoming of Metaphysics Through Logical Analysis of Language,” 24).
cannot, like a predicate, by applied to signs for objects, but only to predicates …

This extends the Frege–Russell treatment of the existential quantifier. According to Carnap in his essay “Overcoming Metaphysics,” Heidegger makes the logical mistake “of employing the word ‘nothing’ as a noun [Gegenstandsnamen]” instead of recognizing it is a negative existential sentence or assertion. Carnap's approach, of course, is precisely an application of Russelian logical analysis (as exemplified by Russell in his “On Denoting” [1905]) to a typical sentence of metaphysics to show that its apparently meaningful grammatical form masks an underlying logical nonsense.

Carnap's attack on Heidegger has been seen in some analytic circles as devastating. His views were popularized in the anglophone world by A. J. Ayer, especially in his Language, Truth and Logic, published in 1936, shortly after Carnap's visit to London. But the original target for the logical positivists had been Hegel and, when logical positivism moved to Britain, neo-Hegelians such as Bradley and Greene. Carnap's article, however, went much further in its attacks, not just targeting Hegel (who also writes about the Nothing), but even criticizing Descartes for his supposed pseudo-statement “I am,” presented as the conclusion of his cogito ergo sum. Most analytic philosophers would not follow Carnap in his analysis of the supposed logical flaw in Descartes's famous dictum, yet he was treated as having effectively dismissed Heidegger. In fact, between the 1930s and the 1970s, analytic philosophy was largely defined by its overt hostility to all forms of metaphysics, but the situation has changed rapidly since the 1970s and something called “analytic metaphysics” – inspired by the work of Roderick Chisholm, Peter Strawson, David Lewis, David Armstrong, and others – is now a leading branch of analytic philosophy. Moreover, Carnap's rejection

62. Ibid., 28.
63. In Language, Truth and Logic (1936), for instance, A. J. Ayer quotes a sentence from Bradley's Appearance and Reality as nonsensical: “the Absolute enters into, but is itself incapable of, evolution and progress.” In the same work, Ayer also criticizes Heidegger's assumption that “Nothing” is “a name which is used to denote something peculiarly mysterious,” but he himself makes clear that he is repeating Carnap's analysis in his “Overcoming Metaphysics” article of 1931. See A. J. Ayer, Language, Truth and Logic, 2nd ed. (New York: Dover, 1952), 36.
64. In large part, the debate between phenomenology and logical positivism was about the meaning and status of the a priori. As Friedman, among others, has pointed out, Carnap's reaction to phenomenology, and indeed to Heidegger, was complex. Husserl's account of the a priori comes close to that of the logical positivists. Of course, both Carnap and Heidegger had received their initial training in neo-Kantianism. See Friedman, A Parting of the Ways, and his essay “A Turning Point in Philosophy: Carnap–Cassirer–Heidegger,” in Logical Empiricism, Parrini et al. (eds); see also Gabriel, “Carnap's 'Elimination of Metaphysics Through Logical Analysis of Language.'”
of Heidegger has in fact been revisited by analytic philosophers, many of whom now acknowledge the limitations of Carnap’s approach.

In 1935, Carnap delivered three lectures in London, published as *Philosophy and Logical Syntax*. In these lectures, he states that the only proper task of philosophy is logical analysis and offers as his example the logical analysis of metaphysics. Carnap defines metaphysical statements as follows: “I will call metaphysical all those statements which claim to represent knowledge about something which is over or beyond all experience, e.g., about the Essence of things, about Things in themselves, the Absolute, and such like.”65 He includes statements by ancients such as Thales (“the Essence and Principle of the world is water”), Heraclitus, Anaximander, Pythagoras, and Plato, as well as moderns such as Spinoza, Schelling, Hegel, and Bergson. According to Carnap, all the statements of metaphysicians of this kind have no empirical content, hence no possibility of being verified and are thereby literally nonsensical. The supposed problems of metaphysics were, for him, in reality pseudo-problems. Carnap does allow for metaphysical statements to have a function, namely, an expressive one, similar to the function of “lyrical verses”: “The metaphysician believes that he travels in territory in which truth and falsehood are at stake. In reality, however, he has not asserted anything, but only expressed something, like an artist.”66

Although Heidegger never directly replied to Carnap, he does seem to have been affected by Carnap’s criticism. Thus, in his 1943 “Postscript to ‘What is Metaphysics?’” Heidegger insisted that one of the chief “misconceptions” concerning his position was that it “declares itself against ‘logic.’”67 Heidegger goes on to claim that logic has degenerated into “logistics” and that “exact thinking” is not really the most rigorous or penetrating form of thinking: “exact thinking merely binds itself to the calculation of beings.”68 Calculative thinking is in pursuit of mastery; in opposition to this, there is another form of thinking, which Heidegger here calls “essential thinking,” whose aim it is to find the word that speaks “the truth of being.” The question “How is it with the nothing?” is not a question of logic. The “nothing” is more originary than the logical concepts of “not” and negation. The fundamental mood of anxiety reveals the nothing in a

66. Carnap, “The Elimination of Metaphysics Through Logical Analysis of Language,” 79. Interestingly, in these lectures, Carnap takes issue with Wittgenstein’s claim in the *Tractatus* that his own statements were without sense. For Carnap, the sentences of the *Tractatus* have sense as logical analysis but not as a competing metaphysics.
67. For further discussion of Heidegger’s early work on logic, see the essays by Miguel de Beistegui and Babette Babich in *The History of Continental Philosophy: Volume 3*.
way that is more primordial. Heidegger simply shifts the ground for the entire discussion. Issues from within formal logic cannot affect a kind of thinking that is more originary than logic.

The third encounter: Cambridge (Wittgenstein) and Oxford (Ryle) consider phenomenology

In general Ludwig Wittgenstein69 seems to have been uninterested in phenomenology, just as he was uninterested in or impatient with other philosophical movements of the time – including the logical positivists, whom he himself had influenced and who continued to admire him, even after he had abandoned the position that they embraced! There have been suggestions that his work of philosophical clarification has much in common with the kind of method pursued by Husserl in his *Logical Investigations*, but the precise nature of Wittgenstein’s knowledge of that book has not been established.70 Occasionally, especially in the late 1920s and early 1930s, Wittgenstein employed the term “phenomenology” in a positive sense, with an entire chapter of his so-called “Big Typescript” (1933) entitled “Phenomenology is Grammar.”71 Similarly, in some remarks made in 1929, Wittgenstein offered apparently sympathetic reflections on Heidegger’s *Being and Time*, wherein he recognized the importance of “anxiety” or “dread” (*Angst*) and related the notion of the experience of astonishment concerning the experience of running up against the limits of language.72 In remarks that were recorded by Friedrich Waismann, Wittgenstein said:

I can readily think what Heidegger means by Being and Dread. Man has the impulse to run up against the limits of language. Think, for example, of the astonishment that anything exists. This astonishment cannot be expressed in the form of a question, and there is also

---

69. For a detailed discussion of Wittgenstein, see the essay by John Fennell and Bob Plant in *The History of Continental Philosophy: Volume 3*.
no answer to it. Everything which we feel like saying can, a priori, only be nonsense. Nevertheless, we do run up against the limits of language. … This running up against the limits of language is Ethics. I hold that it is truly important that one put an end to all the idle talk about Ethics – whether there be knowledge, whether there can be values, whether the Good can be defined, etc.73

Heidegger had discussed the nature of Angst in Being and Time §40, but he returned to it also in his July 1929 lecture “What is Metaphysics?,” which we have already discussed. Around this time also, in 1930, Wittgenstein made a comment, recorded by his friend Maurice O’Connor Drury, concerning Schlick’s upcoming presentation at the Moral Science Club in Cambridge, where he had been asked to speak about phenomenology. Wittgenstein commented acidly: “You ought to make a point of going to hear this paper, but I shan’t be there. You could say of my work that it is ‘phenomenology.’”74 In several of his remarks, Wittgenstein speaks of a kind of phenomenology of color experiences, for instance, that cannot be contradicted by physics; and he acknowledges the appeal of phenomenology in his Remarks on Color. But more than that, in his later career Wittgenstein was developing an appreciation for a priori synthetic propositions that Schlick has explicitly rejected as part of the phenomenologist’s toolbox.

Meanwhile, at Oxford, the ordinary-language philosopher Gilbert Ryle (1900–1976),75 who was responsible for lecturing on phenomenology and Austrian philosophy, had his own way of reading Husserl and others.76 Initially, Ryle was reasonably well disposed toward phenomenology, both for its descriptions of conscious states and for its conception of philosophy as independent of the sciences. But by the late 1930s, he had come to reject it in favor of a kind of linguistic behaviorism that repudiated most “internalist” accounts of the stream of consciousness.

75. Ryle was a graduate of Oxford in classics and philosophy, who spent his entire academic life at Christ Church, and he eventually became Waynflete Professor of Metaphysical Philosophy.
Very early in his lecturing career, Ryle reviewed Husserl’s Polish student Roman Ingarden’s *Essential Questions* (*Essentiale Fragen*)\(^{77}\) in *Mind* in 1927 and Heidegger’s *Being and Time*\(^{78}\) in *Mind* in 1929, just two years after that work had originally appeared in German, and, in 1929, he even visited Husserl in Freiburg and discussed phenomenology with him.\(^{79}\) Ryle initially seemed to have been quite favorably disposed to phenomenology, which he saw as offering the same kind of conceptual analysis that he favored. In 1932, Ryle contributed a fairly detailed article explaining phenomenology to the *Supplementary Volume* of the *Proceedings of the Aristotelian Society*,\(^{80}\) and his later articles on phenomenology (especially his review of Husserl’s American student Marvin Farber’s *The Foundations of Phenomenology*\(^{81}\)) are extremely valuable and insightful with regard to the initial reception of phenomenology in the anglophone world.\(^{82}\)

In his 1932 article “Phenomenology,” Ryle points out that phenomenology, which he defines as the “science of the manifestations of consciousness,” is not to be confused with phenomenalism. He explains Brentano and his fellow phenomenologists as asking the question: “What is it to be a case of remembering, judging, inferring, wishing, choosing, regretting, etc.?” (CP1 167). This, for Ryle, is a conceptual question totally distinct from empirical inquiries into what causes one to remember, and so on. Ryle therefore explicitly endorses the phenomenologists’ separation of their discipline from empirical psychology. He further agrees with Husserl that the discipline of phenomenology is a priori. Phenomenology, for Ryle, is a kind of a priori conceptual analysis. He disagrees, however, with Husserl’s claim that phenomenology is a rigorous science, since Ryle simply thinks that philosophy generally, as the “analytic investigation of types of mental functioning,” has nothing to do with science: “Philosophical methods are neither scientific nor unscientific” (CP1 168). Philosophy is *sui

---

82. In the postwar years, Ryle became more emphatic in his criticisms of many aspects of phenomenology’s manner of proceeding. While Ryle’s quirky writing style may sound today somewhat chauvinistic in its championing of Anglo-Saxon values over those he styles “Teutonic,” there is no doubt that he makes every effort to understand phenomenology as well as to criticize it.
analytic philosophy and continental philosophy

generis, although that does not mean that it is occupied with special sorts of entities such as abstract objects, sense data, and other philosophical terms of art. Interestingly, in endorsing Husserl’s apriorism, Ryle agrees with Husserl’s opposition to various forms of naturalism and empiricism. Ryle further agrees with Husserl that philosophy should not engage in the construction of speculative systems. While he does find some metaphysical constructions in Husserl, Ryle goes on to assert: “But with his [Husserl’s] official view, that the business of philosophy is not to give new information about the world but to analyze the most general forms of what experience finds to be exemplified in the world, I completely agree” (CP1 170).

On the other hand, Ryle explicitly disagrees with Husserl’s account of ideal entities (abstract objects, propositions, and so on), which he thinks is close to Meinong’s. He opposes the view that one can have essential or eidetic insight in the manner of a supposed direct inspection of essences. As Ryle sees it, Husserl often speaks as if one simply inspects or “constatates” (Ryle’s word) essences.83 This is misleading because he also talks about identifying the eidetic laws. Ryle writes:

> Philosophy is, accordingly, a kind of observational science (like geography); only the objects which it inspects are not spatio-temporal objects but semi-Platonic objects which are out of space and time. These are correlates to acts of conception and judgment, though whether it is essential to them to be so correlative or whether it is accidental is left rather obscure by Husserl’s writings. (Ibid.)

Ryle supposes that Husserl conceives these ideal objects as something independently subsisting (akin to Meinong), although for Ryle, Husserl is not clear enough on this point. In his later writings on phenomenology, Ryle continues to dismiss Husserl’s Platonism concerning these ideal entities (CP1 219). He believes it is both an “impropriety” and a “nonsense” to speak of seeing essences in this manner (CP1 220). Taking his cue from the later Wittgenstein, Ryle notes that “we elucidate their significations by fixing the rules of their uses and not by any operation of gazing at any wearers of labels” (CP1 221). For Ryle, thought does not begin with a vocabulary and then develop a syntax; rather, “its vocabulary is syntactical from the start.” In his 1946 review of Farber’s The Foundations of Phenomenology, Ryle is more emphatic:

> The proprietary method claimed for Phenomenology is a sham, and Phenomenology, if it moves at all, moves only by the procedures by

83. See Ryle, “Review of Marvin Farber,” CP1 221.
which all good philosophers have always advanced the elucidation of concepts, including consciousness-concepts. Husserl’s practice bears this out. He does often produce acute original and illuminating elucidations of such concepts. (*Ibid.*)

Ryle concedes that Husserl engages in conceptual clarification, but in general, as he puts it in his review of Heidegger’s *Sein und Zeit*, he fears that the phenomenological approach will end in a “windy mysticism.” In “Phenomenology,” Ryle thinks that Husserl does not have to cling to the doctrine of eidetic intuition. Indeed, for Ryle, the main doctrine of phenomenology is the thesis that all consciousness is consciousness of something; in other words, that all consciousness is intentional, or, in Ryle’s terms, “transitive” (CP1 171). Although he is deeply interested in Husserl’s account of intentionality, Ryle ends up criticizing its conception of mental acts as “consciousness-of.” Rather, Ryle thinks (following the former Wykeham Professor of Logic, John Cook Wilson’s views), mental acts such as believing involve reference to knowledge; and hence “knowledge-of” should replace Husserl’s locution of “consciousness-of.” In his “Phenomenology” of 1932, we already see phenomenology being criticized from the standpoint of the newly emerging analytic philosophy of language. Furthermore, Ryle is explicitly unhappy with Husserl’s turn to a kind of “egocentric metaphysic” (CP1 174), having gone beyond its original purpose of providing conceptual analyses of mental acts or states.84

In his main work, *The Concept of Mind* (1949), Ryle rejected all philosophical efforts to postulate an ego or Cartesian-style mind as some kind of “ghost in the machine,” favoring instead a behaviorist, “dispositionalist” account of sentences that purported to involve mental predicates. Ryle writes:

> It is being maintained throughout this book that when we characterize people by mental predicates, we are not making untestable

84. In the 1950s, Ryle participated in the famous Royaumont conference in France, along with Merleau-Ponty. Unfortunately, there does not appear to have been much useful exchange of views. In the immediate aftermath of the Second World War, Ayer, who was stationed in Paris attached to the British Embassy, and Merleau-Ponty were known to have had lengthy conversations and to have radically disagreed. In one encounter in 1951, recorded by Georges Bataille, Ayer, Bataille, and Merleau-Ponty took opposing sides on the meaning of a sentence such as the “sun existed before humans were on earth,” with Ayer insisting it was completely meaningful and Bataille being incredulous. Unfortunately, we know little more about these conversations. See A. J. Ayer, *Part of My Life: The Memoirs of a Philosopher* (New York: Harcourt Brace Jovanovich, 1977), 285. For an interesting analysis of the Ryle–Merleau-Ponty debate, see Juha Himanka, “Does The Earth Move? A Search for a Dialogue between Two Traditions of Contemporary Philosophy,” *The Philosophical Forum* 31(1) (Spring 2000), esp. 58–9.
inferences to any ghostly processes occurring in streams of consciousness which we are debarred from visiting; we are describing the ways in which those people conduct parts of their predominantly public behavior.\textsuperscript{85}

As a result, Ryle was characterized as a logical behaviorist and his views strongly influenced his student Daniel Dennett, who employs the Rylean strategy of the “category mistake” to diffuse ontological commitments with regard to mental entities.\textsuperscript{86} Ryle was now rejecting the very concept of a stream of consciousness and was advocating that our mental categories (what he calls “category habits”) be replaced by new “category disciplines” that are purged of Cartesian myth. Ryle’s views on the ego, of course, are actually not far removed from those of Jean-Paul Sartre, especially as given in his 1936 essay \textit{The Transcendence of the Ego}, where Sartre too tries to dissolve reference to the ego in sentences such as “I am chasing a street-car.” For Sartre, the immediate conscious experience has the form “street-car to be chased.” Ryle’s criticism of Husserlian approaches to consciousness, then, might not have extended to all phenomenology’s exponents. The problem with the encounter between phenomenology and ordinary-language philosophy as exemplified by Ryle at Oxford, is that the confrontation was one-sided. The phenomenologists and their continental followers rarely showed interest in what was happening in the anglophone world. For all intents and purposes, Wittgenstein, Carnap, Feigl, and others, were completely absorbed into anglophone, Anglo-American philosophy, and their roots in European thought were ignored until a new subject, the history of analytic philosophy, emerged in the 1980s.\textsuperscript{87}

\textit{The fourth dimension: John Searle and Jacques Derrida arguing over Austin}

The fourth paradigmatic encounter I will discuss in this essay is the confrontation that took place between the American philosopher John R. Searle and the French philosopher Jacques Derrida in the late 1970s. While this is somewhat outside the parameters of the historical period under consideration in this volume, it has to be acknowledged that the 1960s perhaps represents a particularly barren period in terms of the relations between analytic and continental philosophy (understood here as the legacy of phenomenology) generally. On the one hand, it was only in the postwar years that many of the classics of the continental

\textsuperscript{86} See, for instance, Daniel C. Dennett, \textit{Content and Consciousness} (London: Routledge, 1969).
\textsuperscript{87} A milestone in the development of the history of analytic philosophy was Michael Dummett’s \textit{Origins of Analytical Philosophy}, originally delivered as lectures in Bologna in 1987.
tradition – Husserl’s *Logical Investigations* (translated 1970), Heidegger’s *Being and Time* (translated 1962), Sartre’s *Being and Nothingness* (translated 1958), and Merleau-Ponty’s *Phenomenology of Perception* (translated 1962) – first began to be discussed seriously in the anglophone world. Philosophers such as John Wild, J. N. Findlay, Hazel Barnes, and others played an important intermediary role here. On the other hand, a growing hostility to continental philosophy and an increasing insistence that philosophy as such was analytic become particularly strident in the English-speaking world during that decade. Philosophically, the 1960s is a period of apartheid and separate development, and it is difficult if not impossible to find a fruitful encounter between analytic philosophy and phenomenology. Within the analytic tradition there were lone voices – such as those of P. F. Strawson (defending descriptive metaphysics), and Wilfrid Sellars – that were relatively favorably disposed to certain kinds of post-Kantian philosophy, but there was no serious effort to engage with phenomenology or its continental followers.

Hence the need to look to the 1970s to round off our narrative. The confrontation that I want to consider ostensibly took place over Derrida’s interpretation of the Oxford philosopher’s John Austin’s account of performatives, but it reaches to the very heart of Searle’s and Derrida’s versions of what constituted the nature of language, the practice of philosophy, and indeed the standards governing textual interpretation. This debate continues to generate controversy as to its importance for the confrontation between so-called “analytic” and “continental” ways of philosophizing, and represents a convenient place for us to end our story in this essay.

Searle studied at Oxford in the 1950s with Austin and others. He initially worked on philosophy of language and became well known for his book *Speech Acts* (1969), which systematized Austin’s work on performatives and other kinds of illocutionary acts. In Europe, Searle’s work had a strong influence on both Habermas and Apel. Searle then moved to write on issues in the philosophy of mind and especially on the nature of intentionality. Searle’s *Intentionality* (1983) is modeled on his earlier analysis of speech acts. Just as, in speech acts, there is a distinction between propositional content and illocutionary force, in intentional states there is a similar distinction to be found between the propositional content and its propositional attitude or what Searle terms “psychological mode.” Searle claims that in researching his book *Intentionality*, he could find nothing useful in the analytic literature:

---

So I turned to the phenomenologists, and the book that I was urged to read was Husserl’s *Logical Investigations*. Well, I read the First Logical Investigation, and, frankly, I was very disappointed. It seemed to me that it was in no way an advance on Frege and was, in fact, rather badly written, unclear, and confused. So I abandoned the effort to try to learn something about intentionality from previous writers and just went to work on my own. … I learned nothing from Husserl, literally nothing, though, of course, I did learn a lot from Frege and Wittgenstein.  

Searle, then, claims to have rediscovered intentionality and to have made it intelligible within analytic philosophy of mind without further reference to the phenomenological tradition.

In contrast to Searle’s, Derrida’s intellectual formation came primarily through his engagement with the phenomenology of Husserl and Heidegger in particular. He wrote three early, formative studies on Husserl. Derrida’s work was deeply inspired by a “linguistic turn” that took place in French philosophy in the 1960s largely through the influence of Heidegger’s later essays on language, on the one hand, and the renewed interest, starting with the later Merleau-Ponty, in the protostructuralist linguistics of Ferdinand de Saussure, on the other. While most often associated with poststructuralism, by his own account, Derrida remained deeply indebted to Husserlian phenomenology and the practice of the *epoché* in particular.

It is true that for me Husserl’s work, and precisely the notion of *epoché*, has been and still is a major indispensable gesture. In everything I try to say and write the *epoché* is implied. I would say that I constantly try to practice that whenever I am speaking or writing.

---

91. For a discussion of Derrida’s philosophical formation and influences, see my *Introduction to Phenomenology* (London: Routledge, 2000), 435–73. [*] See also the essay on the linguistic turn in continental philosophy by Claire Colebrook in *The History of Continental Philosophy: Volume 6*.
Derrida’s controversy with Searle was occasioned by the publication of an English translation of his essay “Signature Event Context” in the first issue of a new journal of textual studies from Johns Hopkins University – *Glyph* – in 1977.93 As Searle recalls, there was a reading group at Berkeley, of which he was a part, and someone proposed reading this Derrida essay. He was very critical of the paper and was invited to submit his comments to the new journal. His reply, “Reiterating the Differences: A Reply to Derrida,” appeared in the same volume of *Glyph*.94

In his original paper, Derrida offers a complex and often enigmatic discussion of Austin’s use of performatives. Derrida’s paper in general is a meditation on the supposed centrality of the communicative function of language and involves discussion of the views of Condillac (taken as maintaining the classical view of language as a representation of ideas) and Husserl, as well as Austin. Derrida’s topic is the multiple nature or “polysemy” of communication, and his essay introduces many of his more familiar themes, including *différance*, the absence of the signified, and so on. Indeed, part of his aim is to explain and apply aspects of Husserl’s analysis of language. Sentences (even observational sentences) have sense even apart from the experience that is being described. The experience may be absent. Similarly, in written language, the “speaker” may be absent. A key feature of linguistic acts is their “iterability,” by which Derrida means that linguistic statements need to be repeatable and be able to function outside their immediate context, and especially beyond the purview of the immediate range of receivers, listeners, readers, and so on.

The essay begins with a short quotation from Austin’s *How to Do Things with Words* (1962), where Austin states that for simplicity he will restrict his discussion to spoken utterances, and indeed literal speech, excluding such things as an actor pronouncing words on stage, or other “parasitic” forms, such as playful speech, metaphors, and so on. Austin writes: “Language in such circumstances is in special ways – intelligibly – used not seriously, but in ways parasitic on its normal use – ways which fall under the doctrine of the *etiolations* of language.”95

93. Derrida’s essay was originally delivered as a paper at a Canadian conference in 1971, whose overall theme was “communication,” and was published in *Marges de la philosophie* in 1972.
In his essay, Derrida challenges the view that there is a single meaning to communication, and indeed points to the complex nature of what is supposed under the notion of “literal meaning” and the complexities introduced by metaphorical uses of language. For Derrida, the true complex nature of language where metaphor, and so on, are in play from the beginning is being ignored here, making Austin’s otherwise interesting analysis beside the point. Derrida carefully focuses on Austin’s apparently innocent use of the metaphorical term “parasitical,” which suggests that metaphorical and analogical uses of language are extensions of the basic literal function of language, as if that “literal” function was itself perfectly clear. Metaphor, fiction, and so on, are seen by Austin and others as some kind of (perhaps dispensable) add-on to the literal use of language.96

In his reply, Searle simply dismissed Derrida’s interpretation of Austin as a misunderstanding, owing, he claims, mostly to Derrida’s ignorance of post-Wittgensteinian developments in linguistics and the philosophy of language. Searle denies that iterability is a specific feature of written rather than spoken language. Rather, permanence is what distinguishes the written mark. In reply, Derrida claims he has been misunderstood, his statements taken out of context, ignoring the larger claims of his other work, and so on. Derrida’s evasion, his play on the very notion of seriousness in philosophy, all indicate that he was not seeking to seriously engage with his opponent. Searle regarded his “debate” with Derrida as a non-event and refused to continue it. He later commented:

With Derrida, you can hardly misread him, because he’s so obscure. Every time you say, “He says so and so,” he always says, “You misunderstood me.” But if you try to figure out the correct interpretation, then that’s not so easy. I once said this to Michel Foucault, who was more hostile to Derrida even than I am, and Foucault said that Derrida practiced the method of obscurantisme terroriste (terrorism of obscurantism). We were speaking French. And I said, “What the hell do you mean by that?” And he said, “He writes so obscurely you can’t tell what he’s saying, that’s the obscurantism part, and then when you criticize him, he can always say, ‘You didn’t understand me; you’re an idiot.’ That’s the terrorism part.” And I like that. So I wrote an article about Derrida.97

III. CONCLUSION: MORE OF THE SAME

To be sure, the context of analytic philosophy had changed considerably as the Wittgenstein of the *Philosophical Investigations* replaced the earlier Wittgenstein of the *Tractatus*. Where the backdrop to Carnap’s approach had been the *Tractatus* view, the backdrop to the Oxford ordinary-language philosophy of Ryle and Austin – which Searle encountered in the 1950s – was the view that what ordinary speech enshrines makes sense and is somehow “right.” Nevertheless, the exchange between Searle and Derrida in many ways resurrects a point at issue between earlier opponents such as Heidegger and Carnap; namely, whether language can be exact and also precisely refer to the real world in some literal way. Both Carnap and Searle begin from the literal use of language, which they see as fundamental to science as the articulation of truth. Both Heidegger and Derrida, on the other hand, see language as essentially and inescapably symbolic and metaphorical. For them, the poetic function is not one function among many of language, but is rather the primary force that makes language possible at all. It is precisely because language points beyond itself and indeed beyond what is immediately indicated that it is capable of functioning for the transmission of meaning. At the time of his dispute with Heidegger, Carnap was trying to fix the meanings of language, or at least to have a scientific language that was logically purified and unambiguous and which picked out the one true world (although later Carnap moved to recognize the multiplicity of irreducible “conceptual schemes,” as his pupil Hilary Putnam terms them). Heidegger, on the other hand, was growing increasingly dissatisfied with the stultified language of the philosophical tradition and wanted to exploit the poetic resources and ambiguities in language, especially the German and ancient Greek languages, as ways of expressing the manner in which Being reveals and conceals itself across history.

In what has come to be known as analytic philosophy generally, enormous emphasis is placed on the values of clarity, accuracy, precision, and rigor in argumentation. From that point of view, Heidegger and Derrida are seen as needlessly obscure, engaged in “rhetoric” or literary allusion, offering bad arguments or even no arguments at all. Indeed, as we have quoted above, Searle even used the phrase (which he claims he took from Foucault’s assessment of Derrida) “terrorist obscurantism.” Even Rorty, who agrees with much of what Derrida has to say, is quite willing to concede that “Searle is … right in saying that a lot of Derrida’s arguments … are just awful.” On the other hand, Heidegger,

98. Wilfrid Sellars spoke about Wittgenstein’s *Philosophical Investigations* having moved analytic philosophy from its Humean to its Kantian phase.

as we also saw, regarded such demands for exactitude as part of calculative rather than originary thinking. Phenomenology privileged eidetic insight and description over argumentation. Of course, the later Wittgenstein had a similar view of philosophy as presenting a particular view on matters or perhaps escaping from the grip of a prevailing mistaken picture of things. This does not require argumentation but rather what Husserl would call a “change of attitude” (*Einstellungänderung*) or what Thomas Kuhn would call a “paradigm shift.”

There is no doubt that there is obscurity in Derrida and Heidegger; but this is seen as necessary in relation to the complexity of the thought and its need to break its relation to its tradition. Rigorous argumentation, moreover, is but one aspect of philosophical inventiveness. The Platonic dialogues show how discussions can lead to aporias and to insights that are not quite what was intended in the argumentation. Hermeneutics, for Heidegger, had exactly this function. Indeed, Husserl’s own position was that phenomenology came through insight and attention to what is *given* and gained by insight, rather than through argumentation and deduction. In a sense, the encounters between analytic philosophy and phenomenology have constantly returned to this battleground originally staked out by the neo-Kantians: the relation between sensuous intuition and conceptualization (which itself requires language).

This tension between what can be intuited and what must be deduced continues in the latest versions of the debate. For example, influential commentators, including Hubert L. Dreyfus, have interpreted Searle himself as pursuing a kind of phenomenology with his close description of the essential conditions of intentionality and his interest in consciousness, perception, and other themes familiar to phenomenology. In reaction, Searle has attempted to distinguish his practice of (what he terms) *logical analysis* from what he takes to be *phenomenological analysis*. This distinction largely repeats the kinds of distinction of approach made by Schlick against Husserl, Ryle against Husserl, Carnap against Heidegger, and so on. Yet, it would be wrong to think that the encounters are simply indications of incorrigible misunderstandings and misconnections. Phenomenology continues to develop and mutate and analytic philosophy has discovered that it is not just a method but a tradition that has its own hermeneutical dimensions. Indeed, there is little agreement today as to what constitutes the core of analytic philosophy, and there are challenges to the whole idea of philosophy as a *priori* analysis of intuition. One positive gain is that many analytic philosophers have recognized that phenomenology does have some

---

value. Searle, for instance, is critical of phenomenology, and yet, in a certain sense, has written approvingly of what phenomenology tries to do: “I want to emphasize at the start that if phenomenology is defined as the examination of the structure of consciousness, I have no objections whatever to phenomenology. My misgivings are about some specific authors and their practice of this method.”¹⁰¹ Searle goes on to say, and perhaps we should leave this as a suitable last word for this essay: “Properly understood, there is no conflict between analytic philosophy and phenomenology. They offer noncompeting and complementary methods of investigation and anybody prepared to do serious work should be ready to use both.”¹⁰²

    Index 335
“Continental philosophy” is itself a contested concept. For some, it is understood to be any philosophy after 1780 originating on the European continent (Germany, France, Italy, etc.). Such an understanding would make Georg von Wright or Rudolf Carnap – respectively, a Finnish-born philosopher of language and a German-born logician who taught for many years in the US – a “continental philosopher,” an interpretation neither they nor their followers would easily accept. For others, “continental philosophy” refers to a style of philosophizing, one more attentive to the world of experience and less focused on a rigorous analysis of concepts or linguistic usage. In this and the accompanying seven volumes in this series, “continental philosophy” will be understood historically as a tradition that has its roots in several different ways of approaching and responding to Immanuel Kant’s critical philosophy, a tradition that takes its definitive form at the beginning of the twentieth century as the phenomenological tradition, with its modern roots in the work of Edmund Husserl. As such, continental philosophy emerges as a tradition distinct from the tradition that has identified itself as “analytic” or “Anglo-American,” and that locates its own origins in the logical analyses and philosophy of language of Gottlob Frege. Whether or not there is in fact a sharp divergence between the work of Husserl and Frege is itself a contested question, but what cannot be contested is that two distinct historical traditions emerged early in the twentieth century from these traditions’ respective interpretations of Husserl (and Heidegger) and Frege (and Russell). The aim of this history of continental philosophy is to trace the developments in one of these traditions from its roots in Kant and his contemporaries through to its most recent manifestations. Together, these volumes present a coherent and comprehensive account of the continental philosophical tradition.
that offers readers a unique resource for understanding this tradition’s complex and interconnected history.

Because history does not unfold in a perfectly linear fashion, telling the history of continental philosophy cannot simply take the form of a chronologically organized series of “great thinker” essays. And because continental philosophy has not developed in a vacuum, telling its history must attend to the impact of figures and developments outside philosophy (in the sciences, social sciences, mathematics, art, politics, and culture more generally) as well as to the work of some philosophers not usually associated with continental philosophy. Such a series also must attend to significant philosophical movements and schools of thought and to the extended influence of certain philosophers within this history, either because their careers spanned a period during which they engaged with a range of different theorists and theoretical positions or because their work has been appropriated and reinterpreted by subsequent thinkers. For these reasons, the volumes have been organized with an eye toward chronological development but, in so far as the years covered in each volume overlap those covered in the subsequent volume, they have been organized as well with the aim of coordinating certain philosophical developments that intersect in a fashion that is not always strictly chronological.

Volume 1 begins with the origins of continental philosophy in Kant and the earliest responses to his critical philosophy, and presents an overview of German idealism, the major movement in philosophy from the late eighteenth to the middle of the nineteenth century. In addition to Kant, the period covered in the first volume was dominated by Fichte, Schelling, and Hegel, and together their work influenced not just philosophy, but also art, theology, and politics. This volume thus covers Kant’s younger contemporary Herder, and his readers Schiller and Schlegel – who shaped much of the subsequent reception of Kant in art, literature, and aesthetics; the “Young Hegelians” – including Bruno Bauer, Ludwig Feuerbach, and David Friedrich Strauss – whose writings would influence Engels and Marx; and the tradition of French utopian thinking in such figures as Saint-Simon, Fourier, and Proudhon. In addition to Kant’s early critics – Jacobi, Reinhold, and Maimon – significant attention is also paid to the later critic of German idealism Arthur Schopenhauer, whose appropriation and criticism of theories of cognition later had a decisive influence on Friedrich Nietzsche.

Volume 2 addresses the second half of the nineteenth century, in part as a response to the dominance of Hegelian philosophy. These years saw revolutionary developments in both European politics and philosophy, and five great critics dominated the European intellectual scene: Feuerbach, Marx, Søren Kierkegaard, Fyodor Dostoevsky, and Nietzsche. Responding in various ways to Hegelian philosophy and to the shifting political landscape of Europe and
the United States, these thinkers brought to philosophy two guiding orientations – materialism and existentialism – that introduced themes that would continue to play out throughout the twentieth century. The second half of the nineteenth century also saw the emergence of new schools of thought and new disciplinary thinking, including the birth of sociology and the social sciences, the development of French spiritualism, the beginning of American pragmatism, radical developments in science and mathematics, and the development of hermeneutics beyond the domains of theology and philology into an approach to understanding all varieties of human endeavor.

Volume 3 covers the period between the 1890s and 1930s, a period that witnessed revolutions in the arts, science, and society that set the agenda for the twentieth century. In philosophy, these years saw the beginnings of what would grow into two distinct approaches to doing philosophy: analytic and continental. It also saw the emergence of phenomenology as a new rigorous science, the birth of Freudian psychoanalysis, and the maturing of the discipline of sociology. Volume 3 thus examines the most influential work of a remarkable series of thinkers who reviewed, evaluated, and transformed nineteenth-century thought, among them Henri Bergson, Émile Durkheim, Sigmund Freud, Martin Heidegger, Edmund Husserl, Karl Jaspers, Max Scheler, and Ludwig Wittgenstein. It also initiated an approach to philosophizing that saw philosophy move from the lecture hall or the private study into an active engagement with the world, an approach that would continue to mark continental philosophy's subsequent history.

The developments and responses to phenomenology after Husserl are the focus of the essays in Volume 4. An ambiguity inherent in phenomenology – between conscious experience and structural conditions – lent itself to a range of interpretations. While some existentialists focused on applying phenomenology to the concrete data of human experience, others developed phenomenology as conscious experience in order to analyze ethics and religion. Still other phenomenologists developed notions of structural conditions to explore questions of science, mathematics, and conceptualization. Volume 4 covers all the major innovators in phenomenology – notably Sartre, Merleau-Ponty, and the later Heidegger – as well as its extension into religion, ethics, aesthetics, hermeneutics, and science.

Volume 5 concentrates on philosophical developments in political theory and the social sciences between 1920 and 1968, as European thinkers responded to the difficult and world-transforming events of the time. While some of the significant figures and movements of this period drew on phenomenology, many went back further into the continental tradition, looking to Kant or Hegel, Marx or Nietzsche, for philosophical inspiration. Key figures and movements discussed in this volume include Adorno, Horkheimer, and the Frankfurt School,
Schmitt, Marcuse, Benjamin, Arendt, Bataille, black existentialism, French Marxism, Saussure, and structuralism. These individuals and schools of thought responded to the “crisis of modernity” in different ways, but largely focused on what they perceived to be liberal democracy’s betrayal of its own rationalist ideals of freedom, equality, and fraternity. One other point about the period covered in this volume is worthy of note: it is during these years that we see the initial spread of continental philosophy beyond the European continent. This happens largely because of the emigration of European Jewish intellectuals to the US and UK in the 1930s and 1940s, be it the temporary emigration of figures such as Adorno, Horkheimer, Lévi-Strauss, and Jakobson or the permanent emigration of Marcuse, Arendt, and Gurwitsch. As the succeeding volumes will attest, this becomes a central feature of continental philosophy’s subsequent history.

Volume 6 examines the major figures associated with poststructuralism and the second generation of critical theory, the two dominant movements that emerged in the 1960s, which together brought continental philosophy to the forefront of scholarship in a variety of humanities and social science disciplines and set the agenda for philosophical thought on the continent and elsewhere from the 1960s to the present. In addition to essays that discuss the work of such influential thinkers as Althusser, Foucault, Deleuze, Derrida, Lyotard, Irigaray, Habermas, Serres, Bourdieu, and Rorty, Volume 6 also includes thematic essays on issues including the Nietzschean legacy, the linguistic turn in continental thinking, the phenomenological inheritance of Gadamer and Ricoeur, the influence of psychoanalysis, the emergence of feminist thought and a philosophy of sexual difference, and the importation of continental philosophy into literary theory.

Before turning to Volume 7, a few words on the institutional history of continental philosophy in the United States are in order, in part because the developments addressed in Volumes 6–8 cannot be fully appreciated without recognizing some of the events that conditioned their North American and anglophone reception. As has been mentioned, phenomenologists such as Alfred Schutz and Aron Gurwitsch, and other European continental philosophers such as Herbert Marcuse and Hannah Arendt, began relocating to the United States in the 1930s and 1940s. Many of these philosophers began their work in the United States at the University in Exile, established in 1933 as a graduate division of the New School for Social Research for displaced European intellectuals. While some continental philosophy was taught elsewhere around the United States (at Harvard University, Yale University, the University at Buffalo, and elsewhere), and while the journal *Philosophy and Phenomenological Research* began publishing in 1939, continental philosophy first truly began to become an institutional presence in the United States in the 1960s. In 1961, John Wild (1902–72) left Harvard to become Chair of the Department of Philosophy at Northwestern University. With a commitment from the provost of the university...
and the Northwestern University Press to enable him to launch the Northwestern Series in Phenomenology and Existential Philosophy, Wild joined William Earle and James Edie, thus making Northwestern a center for the study of continental philosophy. Wild set up an organizational committee including himself, Earle, Edie, George Schrader of Yale, and Calvin Schrag (a former student of Wild’s at Harvard, who was teaching at Northwestern and had recently accepted an appointment at Purdue University), to establish a professional society devoted to the examination of recent continental philosophy. That organization, the Society for Phenomenology and Existential Philosophy (SPEP), held its first meeting at Northwestern in 1962, with Wild and Gurwitsch as the dominant figures arguing for an existential phenomenology or a more strictly Husserlian phenomenology, respectively. Others attending the small meeting included Erwin Straus, as well as Northwestern graduate students Edward Casey and Robert Scharff, and today SPEP has grown into the second largest society of philosophers in the United States. Since those early days, many smaller societies (Heidegger Circle, Husserl Circle, Nietzsche Society, etc.) have formed and many journals and graduate programs devoted to continental philosophy have appeared. In addition, many of the important continental philosophers who first became known in the 1960s – including Gadamer, Ricoeur, Foucault, Derrida, Lyotard, and Habermas – came to hold continuing appointments at major American universities (although, it must be mentioned, not always housed in departments of philosophy) and, since the 1960s, much of the transmission of continental philosophy has come directly through teaching as well as through publications.

The transatlantic migration of continental philosophy plays a central role in Volume 7, which looks at developments in continental philosophy between 1980 and 1995, a time of great upheaval and profound social change that saw the fruits of the continental works of the 1960s beginning to shift the center of gravity of continental philosophizing from the European continent to the anglophone philosophical world and, in particular, to North America. During these years, the pace of translation into English of French and German philosophical works from the early twentieth century as well as the very recent past increased tremendously, and it was not uncommon to find essays or lectures from significant European philosophers appearing first in English and then subsequently being published in French or German. In addition, the period covered in this volume also saw the spread of continental philosophy beyond the confines of philosophy departments, as students and faculty in centers of humanities and departments of comparative literature, communication studies, rhetoric, and other interdisciplinary fields increasingly drew on the work of recent continental philosophers. Volume 7 ranges across several developments during these years – the birth of postmodernism, the differing philosophical traditions of France, Germany, and Italy, the third generation of critical theory, and the so-called
“ethical turn” – while also examining the extension of philosophy into questions of radical democracy, postcolonial theory, feminism, religion, and the rise of performativity and post-analytic philosophy. Fueled by an intense ethical and political desire to reflect changing social and political conditions, the philosophical work of this period reveals how continental thinkers responded to the changing world and to the key issues of the time, notably globalization, technology, and ethnicity.

The eighth and final volume in this series attempts to chart the most recent trends in continental philosophy, which has now developed into an approach to thinking that is present throughout the world and engaged with classical philosophical problems as well as current concerns. The essays in this volume focus more on thematic developments than individual figures as they explore how contemporary philosophers are drawing on the resources of the traditions surveyed in the preceding seven volumes to address issues relating to gender, race, politics, art, the environment, science, citizenship, and globalization. While by no means claiming to have the last word, this volume makes clear the dynamic and engaged quality of continental philosophy as it confronts some of the most pressing issues of the contemporary world.

As a designation, “continental philosophy” can be traced back at least as far as John Stuart Mill’s On Bentham and Coleridge (1840), where he uses it to distinguish the British empiricism of Bentham from a tradition on the continent in which he sees the influence of Kant. Since that time, and especially since the early twentieth century, the term has been used to designate philosophies from a particular geographical region, or with a particular style (poetic or dialectical, rather than logical or scientistic). For some, it has been appropriated as an honorific, while for others it has been used more pejoratively or dismissively. Rather than enter into these polemics, what the volumes in this series have sought to do is make clear that one way to understand “continental philosophy” is as an approach to philosophy that is deeply engaged in reflecting on its own history, and that, as a consequence, it is important to understand the history of continental philosophy.

While each of the volumes in this series was organized by its respective editor as a volume that could stand alone, the eight volumes have been coordinated in order to highlight various points of contact, influence, or debate across the historical period that they collectively survey. To facilitate these connections across the eight volumes, cross-referencing footnotes have been added to many of the essays by the General Editor. To distinguish these footnotes from those of the authors, they are indicated by an asterisk (*).

John Abromeit completed his PhD in history at University of California, Berkeley in 2004 and was a member of the University of Chicago Society of Fellows from 2004 to 2008. He is currently Assistant Professor in the history department at SUNY, Buffalo State. He is the coeditor (with W. Mark Cobb) of *Herbert Marcuse: A Critical Reader* (2004) and (with Richard Wolin) *Herbert Marcuse: Heideggerian Marxism* (2005). He is currently finishing a book with the title *Dialectic of Bourgeois Society: An Intellectual Biography of the Young Max Horkheimer, 1895–1941*.

Peg Birmingham is Professor of Philosophy at DePaul University. She is the author of *Hannah Arendt and Human Rights: The Predicament of Common Responsibility* (2006). She is the coeditor with Philippe van Haute of *Dissensus Communis: Between Ethics and Politics* (1995). She has published in journals such as *Research in Phenomenology*, *Hypatia*, and the *Graduate Faculty Philosophy Journal* on topics that include radical evil, human rights, and the temporality of the political.

Thomas F. Broden is Associate Professor of French at Purdue University. His research interests include modern French literature, semiotics, critical approaches to literature, the history of modern linguistics, and the cultural context of fashion in modern France. His articles have appeared in *Semiotica, RS/SI Recherches Sémiotiques/Semiotic Inquiry, the Journal of General and Comparative Literature, Protée, the American Journal of Semiotics, the International Journal of Communication,* and *Morphé*. He edited a volume of juvenilia

**Peter Tracey Connor** is Associate Professor and Chair of the French Department at Barnard College and Director of the Barnard Translation Center. His research interests include the theory and practice of translation, literary theory, contemporary French philosophy and modern French literature. He is the author of *Georges Bataille and the Mysticism of Sin* (2000). He has translated Georges Bataille’s *The Tears of Eros* (1989) and Jean-Luc Nancy’s *The Inoperative Community* (1991).

**William L. McBride** is Arthur G. Hansen Distinguished Professor of Philosophy at Purdue University and President of the International Federation of Philosophical Societies (FISP). In addition to French philosophy, especially Sartre’s, his research interests include social and political philosophy and philosophy in Eastern Europe. He was cofounder and first director of the North American Sartre Society and is immediate past President of the North American Society

**James McFarland** teaches German at Connecticut College. His research interests include Walter Benjamin and Friedrich Nietzsche, and he has published on Theodor Adorno and Thomas Mann’s collaboration on the novel *Doktor Faustus*, on the hermeneutics of Peter Szondi, and on the political theology of George Romero.

**Ed Pluth** is Associate Professor of Philosophy at California State University, Chico. He works on contemporary continental philosophy, and is the author of *Signifiers and Acts: Freedom and Determination in Lacan’s Theory of the Subject* (2007) and *Badiou: A Philosophy of the New* (2010).

**Brian C. J. Singer** teaches at Glendon College, York University, and is associated with the graduate programs in sociology and social and political thought. He is the author of *Society, Theory and the French Revolution: Studies in the Revolutionary Imaginary* (1986), and is presently working on a book-length study of Montesquieu and the “discovery of the social.” He has translated works by Jean Baudrillard and Claude Lévi-Strauss, among others, and he is the author of some two dozen articles and book chapters on issues relevant to contemporary French political and social thought, as well as that of the eighteenth century.

**Chris Thornhill** is Professor of European Political Thought at the University of Glasgow. His major recent publications are *German Political Philosophy: The Metaphysics of Law* (2006), *Niklas Luhmann’s Theory of Politics and Law* (with M. King, 2003/2005), and *Karl Jaspers: Politics and Metaphysics* (2002/2006). His main research interests are political theory and political sociology; theories of legality and legitimacy; Hegel, Marx and critical theory; fascism and its theories. He is currently completing a number of historical/theoretical projects on statehood, constitutionalization, and the social and legal preconditions of political legitimacy.
The years separating 1920 and 1968 were cataclysmic for the world and for philosophy. The destruction wrought by two world wars could be seen as an indictment of Western civilization itself. Depending on one’s point of view, the upsurge of totalitarian and ideological fanaticism marked either the utter eclipse of reason (in the words of Max Horkheimer) or its apocalyptic apotheosis in nihilism. The Cold War that predictably restored faith in reason also witnessed its fetishization, as liberals and socialists accused each other of ideological blindness. The most important continental philosophy during this period was in fact openly left wing and Marxist. Resignation to the rational, bureaucratic order of the liberal welfare state would eventually give way to the revolutionary optimism of the 1960s, reflected in the rise of militant student and working-class movements whose countercultural visions of an alternative society would resonate in the aesthetic philosophies of an emerging poststructuralist sensibility. But in the days that followed the Paris Revolt of May 1968 and the brutal Soviet suppression of the liberal communist regime that had flourished in Czechoslovakia (the so-called “Prague Spring”), this challenge to the established order of reason collapsed with an astounding suddenness. The demise of a revolutionary Marxist humanism would prefigure the emergence of more sober forms of thought that would once again seek to rearticulate the rational meaning underlying modernity. Yet the new wave of critical social theorists was inclined to the view that the contradictions of the liberal welfare state – increasingly laid bare in the emergence of a new global economic order – were intransigent to rational resolution.

The figures, schools of thought, and themes represented in this volume can best be understood as responses to this chronic crisis of modernity and, more specifically, the liberal state. The dawning of twentieth-century Europe revealed
a stark contradiction between newly emergent mass democracies and the rationalist philosophies upholding the older liberal order. The older order had arisen during a time in the previous century when the bourgeoisie had maintained a virtual monopoly on political power. Despite its undemocratic nature, this order had ruled in the name of all citizens. Or, to put matters somewhat differently, its claim to legitimacy resided in upholding universal rights whose foundation was ostensibly identical to reason itself. With the rise of a new corporate phase of capitalism and its by-product – a socialist movement representing the interests of the working class – that pretension was called into question. The sanctified right to property and its corresponding vision of untrammeled individual liberty seemed increasingly anachronistic and even dangerous in a corporatist world that depended on the suppression of class conflict for the sake of maintaining productive social stability.

The liberal reason that natural law theorists, social contractarians, and utilitarians had formerly appealed to in various ways in underwriting the foundations of a stable legal order therefore seemed, in the opinion of many political theorists, incapable of responding to the divided nature of social reality. Thinkers on both the Right and the Left accordingly converged in rejecting Enlightenment rationalism and liberalism. These shibboleths of the previous century, they believed, had exhausted their vitality and, having never been the “neutral” force for universal progress that their proponents had once claimed for them, had finally been unmasked as the mere bourgeois ideologies they in fact were – hence the allure, on the Right, of fascist dictatorial regimes supported by nationalist sentiment and the attraction, on the Left, of communist workers’ associations supported by class interests. In both cases, the crisis of formal rationality and legal positivism opened the door for more substantive philosophies of collective identification, action, and order.

That the thinkers represented in this volume generally represent more nuanced attitudes toward rationalism and liberalism should not mislead us into underestimating their critique of sterile forms of formal rationality and liberal ideology. Indeed, some of them demonstrate less nuanced antirationalist tendencies; this is the case, for instance, with George Bataille and the Collège de Sociologie, the decisionism of Carl Schmitt, and the critical theory of Walter Benjamin. The situation is unquestionably more complicated when we turn to the major exponents of the Frankfurt School, to the structuralism of Claude Lévi-Strauss and Louis Althusser, or even to the existential phenomenology that keenly informs the thought of Hannah Arendt, Jean-Paul Sartre, and many currents of French Marxism and black intellectual thought. In general, these latter tendencies – like their more scientifically oriented counterparts in Austrian and Anglo-American philosophy (pragmatism and logical positivism) – take issue with certain aspects of rationalism or liberalism while retaining others.
The Frankfurt School, for instance, developed a sweeping criticism of formal (or instrumental) accounts of rationality that they, following Georg Lukács, identified with capitalism and its abstract individualism or, even more sweepingly and in keeping with their Nietzschean diagnosis, with the primal will to identify and dominate inherent within subjective consciousness as such. At the same time, however, they retained a healthy – albeit not uncritical – respect for notions of individual autonomy and critical reflection associated with the heroic phase of the bourgeois Enlightenment. Although existential phenomenology certainly rejected scientism for its failure to comprehend lived experience of reality, the philosophers influenced by existential phenomenology in this anthology did not embrace the sweeping dismissal of liberal individualism, freedom, and rationality so characteristic of Heidegger’s thought, for example.

I. PHILOSOPHY AND HUMAN SCIENCE: APPROPRIATION AND REACTION

The critique of scientism undertaken by existential phenomenologists should not obscure the enormous attraction that the modern human sciences exerted on Marxist and structuralist philosophy during the twentieth century. The critique of sterile forms of philosophical rationalism that had provided so much of the ideological underpinnings of liberal ideology during the previous two centuries meant that philosophy, too, would have to abandon its claim as a self-sufficient source of pure reflective knowledge. Nineteenth-century philosophers like Bentham, Hegel, Marx, and Mill had incorporated the insights of political economy into their thinking. The philosophical amalgamation of anthropology, economics, and politics would proceed apace with the birth of the new social sciences and the transformation of the older humanistic disciplines – philology, anthropology, history, and psychology – into full-blown human sciences, modeled in some respects on the natural sciences.

Marxism, of course, was especially well situated to take advantage of this synthesis of philosophy and science, given its dialectical account of the laws of historical development and natural evolution. By the second decade of the twentieth century, the members of the newly founded Frankfurt Institute would enrich this interdisciplinary vocabulary further with additions from Freudian psychoanalysis and Weberian social science. These research programs, they noted, were less susceptible to assimilation to the natural science paradigm, and so were more or less immune to the accusation of “scientism” that plagued other less critical, “positivistic” social scientific programs (see Chapter 12).

In the meantime, the French developed their own schools of philosophical social science. Marx’s analysis of the deep economic structures determining
entire epochs had opened the way to examining the linguistic and cultural structures underlying all thought. Thinkers as radically diverse as Ferdinand de Saussure, Lévi-Strauss, Jacques Lacan, and Althusser would embrace this scientific structuralism as a more rigorous basis on which to found the study of society.

In sum, the crisis of rationalism manifested both a rejection of liberalism, with its abstract individualism and divisive parliamentarian politics, and an embrace of critical social science as a great engine for revolutionary social and political transformation. Beginning as forms of progressive humanism, these social scientific philosophical movements would eventually lead, by the end of the 1960s, to a strange philosophical reversal: the radical questioning of humanity as a freely self-determining subject of its own making. But this ironic end of the human sciences – and the displacement of the individual as the center of social study and politics – was long in the making, and so we now turn to a brief recapitulation of the intellectual history that led up to it.

II. POST-FIRST WORLD WAR: REACTIONS TO LIBERALISM AS A RATIONALIST IDEOLOGY

Post-Second World War political philosophy evinced a renewed appreciation for liberal individualism and humanism that would belie the structuralist (and poststructuralist) scientific critique of “man” on which I concluded the previous section. But liberal humanism was seen very differently by social philosophers prior to and immediately following the First World War. The mass democracy that had empowered the European working class also raised serious questions about the so-called neutrality of the liberal state in representing the universal interests of all citizens, conceived as abstract holders of formal rights. The rising demand among the working class for a socialist state clearly contradicted the principles of private property and contractual exchange on which the liberal regime had been founded. Orthodox and revisionist forms of Marxism both predicted the demise of this regime, albeit according to somewhat different scenarios. For orthodox Marxism, the collapse of capitalism would follow of economic necessity, as foretold by a scientific understanding of its laws. For revisionist Marxism, the welfare state would gradually evolve into a socialist society as working-class parties gradually wrested political power away from their liberal counterparts. But neither variant of Marxism seemed coherent from the standpoint of practical politics. The revolutionary language of the orthodox camp belied its theoretical defense of economic determinism, which in turn reinforced political passivity; the reform language of the revisionist camp belied its radical aims, which could hardly be reconciled with liberal-democratic principles of compromise and
cyclical transfers of partisan rule. Neither the apolitical rationalism of scientific socialism (economic determinism) nor the political rationalism of lawful social democratic governance (compromise) sufficed to justify what seemed evident to many socialist thinkers influenced by the syndicalist wing of the French and Italian socialist movements: the need for an uncompromising general strike – in short, a revolutionary stoppage – of the capitalist system once and for all.

Georges Sorel’s very influential Réflexions sur la Violence (1908) can be taken as an early sign of what was to come later in the century. Sorel argued that what was needed to spur on the socialist cause was not a theory or politics of reason but a myth heralding the heroic overthrow of the capitalist system by the working class in one single stroke. Sorel’s romantic vision of the working class would later inspire both communists, such as Antonio Gramsci, and fascists, such as Benito Mussolini (himself a former socialist) into developing models of political organization that relied more on the mythic constitution of militant collective identity (proletarian or nationalist) than on any rational appeal to individual self-interest. Of course, Italian fascism was certainly more consistent than its communist counterpart in rejecting Enlightenment conceptions of individual freedom and equality in the name of heroic collectivism, even if it itself remained a movement divided between modernist and antimodernist factions.

Indeed, fascism’s elevation of will over reason would strike a deep chord with conservative jurists such as Schmitt (see Chapter 1). Schmitt was above all else a defender of the state as a bastion of order. His critique of liberal parliamentary democracy was firmly based on what he perceived to be the irrational, conflictual nature of a social reality riven by incompatible ideologies. In the midst of this Hobbesian friend versus foe conflict, only an absolutely sovereign will seemed to stand any chance of imposing order. Schmitt’s examination of the liberal social democracy that had been instituted in Germany in 1919 and that was ostensibly founded on the rationalist legal positivism defended by Hans Kelsen, Max Weber, and other neo-Kantian jurists seemed to confirm his diagnosis. The Weimar Republic’s short life was marked by a succession of “exceptional” states in which the president, as defender of the state, was forced to take advantage of the extraordinary dictatorial powers granted to him by the constitution to restore law and order. The illegitimacy of a parliamentary system in which each party sought to impose its will on the other could not but effect the statutory interpretation of the constitution itself. Ultimately, only the president could “decide the exception,” that is, finally decide what the law was and how it should be applied.

Much has been made of Schmitt’s influence on the later course of German legal history under the Third Reich, but he was no ally of the Nationalsozialistische Deutsche Arbeiterpartei (NSDAP) prior to 1933, viewing it (correctly) as a grave threat to the state. Nor, despite his opposition to the liberal separation of powers, was Schmitt opposed to all forms of constitutional democracy. To be
Sure, Schmitt was opposed to the (in his opinion) vapid discourse of reasoned justification that supposedly played itself out in parliamentary sessions to no apparent effect. Free speech, he believed, was mainly offered as a show of civil harmony when in reality its effects were quite divisive. With its irrational propagandistic fervor, the full advent of mass “class” politics pitting irreconcilable ideological enemies laid bare the illusion of enlightened liberal debate oriented toward an all-inclusive consensus on universal (or rational) interests. With Rousseau in mind, Schmitt hoped that in place of this lawless state of anarchy a strong national identity might ground a unitary sovereign will that could dispense with discursive and representative forms of partisan-based parliamentary democracy in favor of forms based on direct, popular plebiscites. In this way, the people (discounting those whom the majority judged to be ideological or ethnic outsiders) could be directly identified with the supreme commander and chief, thereby legitimating his decisions as expressions of a general will.

Schmitt’s interest in what he called “political theology” and his Rousseauian belief in absolute sovereignty as a reflection of unitary will maintaining and reflecting community resonated with other strands of thought contained in this volume – some of them remarkably antagonistic to the conservatism of Schmitt’s own philosophy. One extreme example is the Collège de Sociologie (1937–39) and its most renowned member, Bataille (see Chapter 6). Although members of the Collège reflected a broad spectrum of political opinion – from Georges Bataille, Alexandre Kojève, André Breton, and Walter Benjamin (the last three fellow travelers who regularly attended meetings) on the Left to Pierre Libra on the Right – they all gravitated around a profound disinclination toward the enervating effects of liberal capitalism and its worship of rational efficiency and utility. The Collège was devoted to studying the prerational (or religious) unity underlying social community. This venerable theme had been the centerpiece of Émile Durkheim’s pioneering work on the collective consciousness underlying religious-based community over thirty years earlier, but in the hands of the Collège it was given a distinctly Nietzschean (or Dionysian) signification. For Bataille, especially, human existence truly comes into its own only during those moments of transgression and excess when it achieves an absolute sovereign freedom from action, exchange, utility, and morality (understood as a conformity to rules). Only during these rare moments does it experience itself as a kind of unity, and nowhere more so than in primitive rituals of sacrifice that form the life of secret communities (of which the Collège’s companion society, Acéphale, was one). Benjamin’s own singular synthesis of theological messianism and Marxism (see Chapter 4), as reflected in his posthumously published essay based on Paul Klee’s etching of Angelus Novus (the Angel of History), “On the Concept of History” (1940), and his “Critique of Violence” (1920–21), written as a synthesis of Schmitt and Sorel, also sought to defend the possibility of a violent
rupture with the status quo and the whole deterministic history leading up to it by appeal to an apocalyptic leap into the past as an explosive moment of (or secular illumination from within) the present. Not surprisingly, Benjamin’s fascination with surrealism and cinema as a method of propaganda would strike his more rationally inclined compatriots within the Frankfurt School (most notably Adorno) as a dangerously reactionary (and in the Freudian sense, regressive) attempt to dissolve the Apollonian limits of the autonomous individual vouchsafed by liberalism into the solvent of a Dionysian collective unconscious.

Despite Schmitt’s disdain for German revisionist Marxism, whose corporatist conceptions of the state he thought were corrosive of any unified polity, some of his most famous students were Marxists who shared his critique of the modern state. Franz Neumann and Benjamin both came under Schmitt’s spell. Otto Kirchheimer, who along with these thinkers would later associate himself with the Frankfurt School, argued in his dissertation (written under Schmitt’s direction) that parliamentary democracies instituted on a capitalist base inevitably lack legitimacy. In his opinion, the sphere of private law allows capitalist enterprises to contest the sovereignty of the state in asserting their own partial interests in the form of statutory protections. The solution to this problem, Kirchheimer argued, was the abolition of an autonomous sphere of private law immune from democratic regulation by the state. Thirty odd years later, Kirchheimer’s Schmittian diagnosis of capitalist democracy would resurface in Jürgen Habermas’s youthful masterpiece, *The Structural Transformation of the Public Sphere* (1962), which documented the decline of a liberal public sphere grounded in rational, open debate in the face of propagandistic class democracy. Habermas’s later masterpiece, *Legitimation Crisis* (1973), reframes this diagnosis in terms of a vaguely Schmittian conception of legitimacy, understood as a process of democratic will formation whose legal results reflect a unitary consensus on common interests, as distinct from a strategic compromise that balances plural interests according to their relative share in political power. This notion of legitimacy – which Habermas has since considerably qualified – was presented by him as starkly antagonistic to the principles underlying the liberal state: the separation of powers, the private law/public law distinction, and the grounding of legal policy in class compromise.

Two other Marxist thinkers whose ideas resonate with Schmitt’s are Lukács and Gramsci (see Chapter 1). In general these thinkers agreed with Schmitt that law is inherently political (not rationally neutral), that politics is essentially a partisan struggle to monopolize power in defining the law, and that in liberal democracy the most powerful economic interests (representing the capitalist class) will generally dominate this struggle. Like Sorel, Gramsci rejected the economic determinism of orthodox Marxism and emphasized the importance of voluntary syndicalist action and the crucial role of political parties in organically
shaping and founding hegemonic (sovereign) historical blocs (hence his tribute to Machiavelli’s *The Prince*). As Gramsci’s voluminous *Lettere di Carcere* (*Prison Notebooks*; 1929–35) attest, the state is not an instrument of rational economic management but rather the center of a vast cultural-ideological apparatus that infuses all of society. Hence, far from being a superstructure that more or less passively adapts itself to autonomous economic class structures, it is rather key in constituting these structures. The function of the Party is to unify various sectors of society – “the multiplicity of dispersed wills with heterogeneous aims” – in wresting control of the state’s ideological apparatus, thereby ensuring the continued dominance of the Party as sovereign.

Lukács developed these voluntarist themes in terms of a far-reaching critique of formal rationality, which he took to be the hallmark of reified, capitalist society. Written without knowledge of Marx’s then still-unpublished *Paris Manuscripts* (1844) and *Grundrisse* (1857–58), Lukács’s *Geschichte und Klassenbewusstsein* (*History and Class Consciousness*; 1923) adopted the Hegelian distinction between dialectical rational reflection (*Vernunft*) and analytical formal reason (*Verstand*) in arguing against Engel’s and Lenin’s assimilation of Marxism to natural scientific categories. According to Lukács, scientific analyses of reality view society no less than nature as an objectified ensemble of isolated phenomena externally and deterministically connected by formal causal laws. As a consequence of this abstraction, not only do such analyses conceal the dynamic, historical essence of society, but they themselves actually reflect the alienation and commodity fetishism (the principles of exchange and identity) of a capitalist system whose functioning seems at once anarchic and machine-like (that is fragmented and yet determined). By contrast, dialectical insight grasps the totality or mutual relatedness of all phenomena, as a function of conscious, historical praxis.

Lukács believed that only the proletariat, which comprises simultaneously active producers and passive consumers, can experience the contradictions embedded in the “natural” laws of capitalism. Hence, he concluded, only the proletariat can overcome the alienation of subject from object (and, thanks to the collective nature of organized production and organized resistance, individual from society), acquire dialectical insight into society’s unitary, practice-based essence as a whole, and thereby become the free and united conscious agent of history.

### III. THE FRANKFURT SCHOOL

Perhaps the most significant school of humanistic Marxism (or rather neo-Marxism, since its interests were more philosophical than political) from the
1920s until the 1960s was that associated with the Institute for Social Research founded in Frankfurt in 1923. The institute’s first director, Carl Grünberg, had allied himself with the neo-Kantian revisionism associated with Austrian Marxism, whose main exponents included such notables as Max Adler, Otto Bauer, Rudolf Hilferding, Otto Neurath, and Karl Renner. These philosophers insisted on retaining a strict separation between scientific economic theory and morality-based political practice. Thanks to the influence of the Hegelian Marxism of Karl Korsch and Lukács, at least some members of the school (notably Kirchheimer) would take a more totalizing, revolutionary stance. But as the failure of the Russian Bolshevik Revolution to develop forms of workplace democracy became apparent, the members of the school became disillusioned with prospects for revolutionary practice. The authoritarianism implicit in the German Communist Party, the ability of the NSDAP to win over workers to its program (which initially promised to side with workers against the “Jewish capitalist class”), and the increasing “convergence” of communist, fascist, and social-democratic liberal states toward a kind of “state capitalism” (as Friedrich Pollock referred to it) led the school to retreat step by step into a shadow of pessimism from which it would never return.

Here, for the first time in the twentieth century, we witness a variety of non-revisionary Marxist thought that sought to preserve the ideas of the bourgeois Enlightenment in a reconciled form, free from the integuments of class domination. However, as against the moral idealism of neo-Kantian rationalism that formed the core of Austro-Marxism, we here find a materialist (or hedonist) appreciation for the satisfaction of basic instinctual drives and desires. Indeed, Horkheimer, who as a close childhood friend of Pollock was recommended to become Grünberg’s successor as director of the institute in 1931 (see Chapter 2), was receptive to the psychoanalytic research of Erich Fromm and Wilhelm Reich in articulating the sexual allure of fascist propaganda, authoritarianism, and mass culture.

One of his most telling appointments was an acquaintance of his from the early 1920s: Theodor Wiesengrund (who would later adopt his mother’s surname, Adorno). Benjamin, another important contributor to the institute’s Zeitschrift, had been influenced by the Jewish messianic Marxism of his mentor, Ernst Bloch (see e.g. the latter’s Prinzip Hoffnung), and this feature of Benjamin’s thought would also impact the younger Adorno. Benjamin wrote on literature, art, and culture (including theological reflections on language and history). His most influential essay, “The Work of Art in the Age of Mechanical Reproduction” (1936), discusses how cinema, photography, and lithography alternatively destroy and refashion the sacral aura of the work of art that attaches to its original site. The reproduction disenchants the timeless authority of the work and makes it available for more secular uses while at the same time relying on vestigial traces.
of the aura to illuminate (in secular fashion) the present. So conceived, reproduced images can function as mass propaganda (as in Eisenstein’s movies or in the Nazi pageant’s echo of monumental art forms characteristic of the Roman Empire) or – as in the case of surrealism and Dadaism – as clashing images that shock and disrupt perception.

Although Adorno (see Chapter 3) was much less sanguine than Benjamin about the revolutionary potential of mass artistic reception and its secular destruction of the transcendent autonomy of art, he was, as noted above, more receptive to Benjamin’s theological reflections as contained in “On the Concept of History.” Adorno’s tribute to this essay in his lectures on history delivered in the 1960s was foreshadowed by the earlier masterpiece, *Dialektik der Aufklärung* (*Dialectic of Enlightenment*; 1944), which Adorno coauthored with Horkheimer (with assistance from Leo Löwenthal). Written in exile during the height of the Second World War and filled with literary and theological allusions, this darkly pessimistic work initiated a decisive break with the Frankfurt School’s former mode of interdisciplinary social scientific research and, more radically, impugned the very possibility of scientific critique in its thesis that formal (instrumental) rationality, far from emancipating humanity, binds it all the more firmly to those natural forces it seeks to dominate and suppress. Largely neglected and misunderstood in this masterpiece and its companion volume (Horkheimer’s *Eclipse of Reason* [1944]) was the left-wing pragmatism of John Dewey that had come to define so much of the progressive philosophical landscape of their adopted country: a “scientism” that had managed to articulate a similar critique of positivism and abstract formal rationality, but without jettisoning experimental instrumentalism, which it interpreted phenomenologically as a form of radical, democratic praxis. Despite Adorno and Horkheimer’s missed opportunity to assimilate this American philosophical strand of thought whose critique of reification resonated so strongly with their own, their extension of Lukács’s equation of analytic rationality with the capitalist commodity form and its archaic prehistory in mythic thought still spared dialectical reason as a category of critical reflection, a category of rationality that neo-Hegelian pragmatism also deployed, albeit under the guise of a kind of naturalistic idealism. However, twenty years later, in Adorno’s *Negative Dialektik* (*Negative Dialectics*; 1963) and in the posthumously published *Ästhetische Theorie* (*Aesthetic Theory*; 1969), even this most hallowed of Marxian categories was subjected to withering critique, thereby foreclosing any possibility of reconciling subject and object, theory and practice, outside an aesthetic mode of communication.

This almost total retreat from political action (which Lukács derided as a retreat to “Hotel Abyss”) did not describe Herbert Marcuse (see Chapter 2), who gained considerable notoriety in the 1960s as the guru of the new left counterculture. Marcuse had been active in the German Social Democratic Party
(SPD) from 1917 until 1919 and attended rallies by Karl Liebknecht and Rosa Luxemburg. Their assassination in 1919 (which Marcuse blamed on the leaders of the SPD) and the failure of the Munich Council Republic in the spring of that year ended his revolutionary activism. Studying with Heidegger and Husserl, his first important theoretical efforts involved synthesizing Heideggerian existential conceptions of historicity and authenticity with Marxian categories of political praxis. The publication of Marx's *Paris Manuscripts* in 1932 drew him ever more closely to a philosophically (and later psychoanalytically) informed hedonism that relied heavily on the classics of German thought, most notably Schiller, Hegel, and Nietzsche. Although his most famous books, *Eros and Civilization* (1955) and *One-Dimensional Man* (1964), develop a sustained criticism of modern technological society, they also entertain the possibility of an emancipated society based on an alternative, aesthetic rationality. It was this vision that the countercultural currents of the new left found so appealing in his thought. Not surprisingly, Marcuse's name could be seen right beside Marx's and Mao's on the placards carried by student demonstrators in Europe during the turbulent events of 1968.

**IV. CONTINENTAL SOCIAL PHILOSOPHY DURING THE COLD WAR**

The aftermath of the Second World War followed by the arrival of the Cold War elicited two responses from continental social philosophers. On one hand, there were those such as Arendt (see Chapter 5) who argued that the totalizing ideologies of Left and Right were both equally complicit in ushering in the totalitarian demise of political life that Europe had just witnessed. On the other hand, the defeat of fascism (and the popularity enjoyed by the Communist Party in light of the heroic role it played in the Resistance) as well as the birth of new independence movements in the third world – many students from the African and Caribbean colonies were now entering French universities – gave new hope to philosophers schooled in Marxist thought that their revolutionary hopes were not for naught.

Arendt's own condemnation of totalizing philosophies (ideologies) marked something of a reaffirmation of the liberal state. Like Karl Popper's *The Open Society and Its Enemies* (2 vols; 1945) (see Chapter 12), her major studies on totalitarianism and the human condition generally contain a strong indictment of the kind of totalizing philosophy from Plato through Marx that seeks to impose unity over plurality, closure over the unpredictable and open. Her hostility to political theory in the normal sense of that term as well as her dismissal of deterministic philosophies of history led her to embrace a kind of existential phenomenology of the political – or, more precisely, of political action – that
reflected her own highly idiosyncratic synthesis of the ancient Greek philosopher Isocrates, Augustine, Kant, and Heidegger (whose student and lover she had been). Key to Arendt’s phenomenology of the political is her distinction between labor, work, and action, a distinction, she thought, that had its justification in the most original form of political life: the ancient Greek *polis*. While laboring activity is oriented toward producing and consuming the necessities of life, cultural work is given over to producing relatively permanent artifacts that express meaning. Unlike these modes of activity, which can be subject to formal (instrumental) rational discipline, political action is always subject to the contingency of beginning and ending. Action undertaken before and in concert with others is always a response to a prior action and its own final meaning is essentially deferred and open with respect to others who interpret it and take it up. So construed, the essence of action is contingency, unpredictability, and plurality. Its *modus operandi* is expressive speech, not decision and its aim is not to rule but to disclose the individuality of the actor.

Given this understanding of political action, it is not surprising that Arendt would single out Marxism as a false doctrine of emancipation. In her opinion, the Marxist utopia of a stateless society of pure producers is not at all a free society, since freedom is essentially a political category that occurs within a contested public space that is free from both economic and administrative constraints. Although modern revolutions that found states are the purest forms of spontaneous action (subsequent generations of citizens being less free to initiate a new beginning), they contradict their own political intention if, like the French Revolution, they are conceived as affecting a total transformation of society in the name of a general will (the people) and especially if that transformation includes the top-down economic administration of life. For this reason, Arendt felt an especially strong kinship to the American founding fathers, who had the temporary luxury of ignoring the “social problem” (slavery) and who could thereby concentrate on the problem of dispersing power whose guarantee was so essential to the preservation of political action. That said, Arendt’s own political proclivities were neutral: her equal admiration of Luxemburg and John Adams, worker council democracy and New England town hall democracy, stand as monumental testimony to her nonideological commitment to action wherever it might occur.

Arendt’s writing reflects her years of living in exile, first in France, where she worked for Jewish relief organizations, and later in the United States. As noted above, social circumstances also explain the remarkable vitality of French Marxism (see Chapter 7) and the French Communist Party during the period from 1945 until 1968 (a vitality that led Sartre to declare that Marxism represented the “unsurpassable horizon of our time”). Before the war, during the short-lived Popular Front of 1936–38, the Party had joined with the Socialists.
in a coalition government (which collapsed with the conclusion of the Stalin–Hitler pact). During this time there were a number of humanistic currents of French Marxism that competed with the Party’s official “scientific” (dialectical) materialist line. One such current of French Marxism was inspired by Kojève’s introductory lectures at the École Pratique des Haute Études on Hegel’s *Phenomenology of Spirit* and especially his proto-Marxist interpretation of the famous passage beginning the section entitled “Self-Consciousness,” more familiarly known as the dialectic of “master and slave” or “lordship and bondage.” Those attending these lectures, which Kojève delivered in the 1930s, included Bataille, Lacan, Maurice Merleau-Ponty, and many others. Although some of those influenced by Kojève were members of the Communist Party – this was true of Henri Lefebvre, who translated Marx’s *Paris Manuscripts* into French – others of more independent streak, who were not beholden to the Party’s own conception of dialectical materialism (Diamat), were receptive to Kojève’s own proto-existentialist variety of Hegelian Marxism.

Although the Party frowned on the “bourgeois individualism” of the new existentialist philosophy that was all the rage in France after the war, existentialists – who included Sartre, Merleau-Ponty, and Simone de Beauvoir – were much taken with Marxism’s focus on concrete action. Their synthesis of Marxism and existentialism was not original (Marcuse had anticipated this development by almost twenty years), but it was certainly more volatile within the peculiar context of Sartre’s own Cartesian version of it, which postulated an ontological dualism between Being and nothingness (or consciousness). In any case, the founding of the journal *Les Temps modernes* in 1945 (named by its chief editors, Sartre and Merleau-Ponty, after the famous Charlie Chaplin film), provided a lively forum for French existential Marxists to explore their differences with one another and with more orthodox Marxists, such as Roger Garaudy and Lefebvre.

The most important postwar book written by an existential Marxist was Merleau-Ponty’s *Humanism and Terror* (1947), which sought to rebut Arthur Koestler’s argument in his novel *Darkness at Noon* that the main fictional character (representing former top Soviet official Nicolai Bukharin) had dishonestly confessed to having committing treason during the infamous Moscow Purge Trials of 1937. Merleau-Ponty’s response was not intended as an apology for Stalin’s regime (although it was interpreted by many that way, including Albert Camus, who broke off relations with Merleau-Ponty following the book’s publication). Rather, it was offered as a philosophical discussion of the possibility of being objectively guilty of betraying a cause without having intended to do so.

Merleau-Ponty was to split from Sartre over the Korean War, which Merleau-Ponty blamed on North Korean aggression and Sartre blamed on American provocation. The result was Merleau-Ponty’s *The Adventures of the Dialectic* (1955), in which he accused Sartre of being an “ultra-Bolshevik” whose adherence to
Cartesian dualism led him to undialectically equate the spontaneous decisions of the Communist Party with correct understanding of history. According to Merleau-Ponty’s understanding of embodied existentialism, experience and perception are themselves intermediate between consciousness and being, so that political decisions are always ambiguous in meaning and agency is never transparent or absolute.

Merleau-Ponty’s claim in that book that “revolutions are true as movements but false as regimes” could have stood as the epigraph of Sartre’s own response to Merleau-Ponty. Written during the Algerian War, Sartre’s *Critique of Dialectical Reason* (1960) represents a sustained attempt to reinterpret his dualistic existentialism within a Marxian framework. The “analytic” or *regressive* part of the book postulates an unsurpassable antagonism between freedom and material scarcity. Freedom can be realized authentically only within revolutionary groups that are consciously oriented toward “totalizing” revolutionary projects involving radical self-choice. However, the very scarcity that generates injustice and enables such “groups-in-fusion” spontaneously to coalesce in defining themselves in opposition to their oppressors also acts to dissolve them into mechanically regimented individuals (or serial groups). The “fraternity terror” that organically fused agents impose upon themselves in order to limit voluntary defections from the group eventually becomes crystallized in the form of a bureaucratic state that institutionalizes freedom and justice only by once again reducing its constituent members to passive appendages of the “practico-inert.”

As recounted in the historical (or *progressive*) part of the *Critique* contained in the second volume (whose unfinished text was published posthumously), this dialectic is exemplified in the history of Stalinist Russia in the 1930s. The lesson of this narrative seems clear enough. As in Arendt’s existential phenomenology, economic necessity comes to trump political freedom.

This is a starkly pessimistic diagnosis for any philosophy, let alone one that calls itself existentialist and Marxist. Given this paradox, it is not surprising that by the mid-1960s, existentialism was being seriously challenged by structuralism, the latter presenting itself as a more scientific mode of philosophizing. Lévi-Strauss (see Chapter 10), a friend of Sartre’s, had already become famous with the publication of his *Anthropologie structurale* (1958) in which he argued, against Sartre and with Kant, that the mind is structured by certain universal categories that find expression in dichotomous ways of classifying reality (e.g., culture versus nature). Consequent upon this shift we observe a new wave of structuralist Marxists whose chief exponent was Althusser (see Chapter 7). Althusser, who mentored several generations of students at the École Normale Supérieure, including such distinguished students as Michel Foucault, Jacques Derrida, Étienne Balibar, and Bernard-Henri Lévy, did not expressly identify himself as a structuralist for fear that his philosophy would be confused with
the kind of formalism associated with Lévi-Strauss. Yet his major works, *For Marx* (1965) and the two-volume *Reading Capital* (published in the same year and prepared with the help of Balibar and others), display strong structuralist features. In contrast to humanistic varieties of Marxism, Althusser’s structural Marxism insists on a sharp “epistemological break” (as Gaston Bachelard puts it) between objective science and truth, on one side, and subjective experience and ideological practice, on the other. In the Althusserian version of this break, science is one of four autonomous, irreducible spheres of production within society, the other three being identified with economics, politics, and ideology. True science – as distinct from bourgeois empiricism, historicism, and Hegelian essentialism – seeks to uncover society’s global structure that predominantly conditions but does not exhaustively determine the mutually interacting and autonomous structures governing the other spheres of production (the “law of overdetermination”). The “structure of dominance” is by no means necessarily economic; in feudal society it is dominated by the political sphere, in early capitalism it is dominated by the economic sphere, and in late capitalism – with the growing importance of governmentally regulated forms of economic activity requiring technical education, mass communication, and a variety of incentives related to work, consumption and investment, and loyalty – it is dominated by ideology.

In *For Marx*, Althusser dismissed Marx’s early Hegelian writings as unscientific while at the same time maintaining that the mature Marx of *Capital* had inaugurated a new epistemological break – equal in importance to the breaks initiated by Greek mathematics and Galilean physics – in his discovery of social and historical science. This theory, along with the theory of structural overdetermination, has exerted a strong influence on the anthropology of Maurice Godelier and the critical sociology of Nicos Poulantzas, as well as on the post-structuralist archeaology of knowledge of Foucault. Meanwhile Althusser’s emphasis on the dominance of ideological structures resonated with a whole school of semioticians on the Left who have sought to uncover the unconscious mythical codes that reinforce bourgeois culture and class hierarchy (the latter include Roland Barthes, Derrida, Julia Kristeva, Lacan, and others, many of whom were associated with the journal *Tel Quel*).

Finally, to conclude this chapter of existential Marxism, one should not neglect the important connection between African and African American varieties of existentialism and Marxism (see Chapter 8) and the French varieties discussed here. Marxism, of course, had been an attractive philosophy for leading African American intellectuals such as W. E. B. Du Bois and Richard Wright because of the American Communist Party’s active role in the early civil rights movement. After Wright permanently moved to Paris in 1946, he became a part of a circle of intellectuals that included such notable existentialists as
Sartre, Beauvoir, and Camus. In 1956, he organized the Black Writers Congress of 1956, which featured such notable Afro-Caribbean existentialists as Aimé Césaire and his former student, Frantz Fanon.

Césaire’s *Discours sur le colonialisme* (*Discourse on Colonialism*; 1953) deepened the Marxist theory of class by postulating that class exploitation and racism were essentially linked to the extent that exploitation was directly proportional to the dehumanization of the exploited, a fact that explained the enslavement of Africans but not Europeans. Indeed, in true dialectical fashion he argued that dehumanization dehumanizes the dehumanizer as well. In keeping with his existentialism, Césaire insisted that the peculiar context of racial dehumanization in which blacks found themselves could be reversed, so that blackness and the unique aspects of the African personality could be positively affirmed.

Much of Césaire’s philosophy of *Négritude* was taken up by Fanon and the Senegalese social theorist Léopold Senghor. However, as Fanon observed, it was easier for this philosophy to get off the ground in an African country whose majority was overwhelmingly black than in a Caribbean context. So it was Fanon, a revolutionary psychoanalyst, who explored the psychological dynamics of racism in his memorable works, *Le Damnés de la terre* (*The Wretched of the Earth*; 1960–61) and *Peau Noire, masques blancs* (*Black Skin, White Masks*; 1952). Fanon had studied with Merleau-Ponty (he later successfully solicited Sartre to write the preface to *The Wretched of the Earth*), but his postdoctoral work in hospitals in Tunisia and Algeria as well as his experience in treating both torturers and the tortured while secretly training forces for the Front de Libération Nationale gave him a unique perspective on the effects of colonial racism on the black psyche. Especially central to his Sartrean analysis is the phenomenon of black antiblack racism, in which blacks internalize the gaze of whites and wear this gaze as their own mask. Yet in another sense, blacks are never allowed by whites to wear these masks no matter how hard they try to “pass.” Hence, there is a sense in which blacks are not even allowed to enter into the “master–slave” dialectic of unequal (or failed) recognition that Hegel had in mind when speaking of European class society. Indeed, the task faced by blacks to find acceptance as reasonable and rational (and therefore as human) is impossible once reasonableness and rationality are stamped as white; the more they act like white people – and try to surpass white people in being reasonable – the less normal and reasonable black people appear.

V. CONTINENTAL SOCIAL THOUGHT IN THE AFTERMATH OF THE 1960S

Anticolonial fervor reached its climax during the Vietnam War, just as existential Marxism was being eclipsed. Although Althusser had been a member of the
Communist Party, he was never among the inner circle, and his student Bernard-Henri Lévy followed many other students in leaving the Union des étudiants communistes (UEC) after the Party refused to support the students in their call for a general strike during the May Revolt of 1968. At first the revolt seemed to gain momentum (Sartre gave a short speech encouraging the students), but it was soon crushed by the government. The years following the revolt saw many philosophers, including Sartre and Foucault, drifting over to the ultra-left Maoist Gauche Prolétarienne. Also on the rise was a strong anti-Marxist reaction, which received impetus after revelations of the Stalinist gulags became public (Lévy was one who switched his allegiance from the Maoists to the Nouveaux Philosophes, as they were called). Former members of Socialisme ou Barbarie, Cornelius Castoriadis and Jean-François Lyotard, also moved away from their former radical positions. Among the major figures, only Alain Badiou, Étienne Balibar, and Jacques Rancière retained a strong Marxist identity.

With the eclipse of existentialism and Marxism, new philosophies of postmodern and poststructural bent came to the fore. These philosophies claimed a certain nonideological pedigree, as befit their structuralist lineage. Indeed, for all of his political activism, Foucault’s archaeological and genealogical studies were nothing but exercises in creative textual exegesis whose aim was to stir people to think about the historically changeable structures determining their own knowledge of self, society, and world rather than to call them to action (Foucault even went so far as to describe himself as a “happy positivist”). The same could be said of Derrida’s deconstructive efforts and Lyotard’s paradoxical ruminations on the “postmodern condition.” The linguistic turn, anticipated some years before by the structural linguistics that had been inaugurated by Saussure (see Chapter 9) seemed to have all but extinguished the speaking and acting subject, or dissolved it into a dynamic chain of signifiers. With the end of the subject came the end of all the humanistic categories associated with “metaphysics”: totality, history, community, individuality, rationality, and freedom. Of course, these poststructuralist studies – like the psychoanalytic course lectures presented by Lacan (see Chapter 11) and the ethnological interpretations elaborated by Lévi-Strauss – contained a critique of capitalist modernity and its liberal conceptions of abstract rationality and individuality. The critique of totalizing, reductive approaches indeed had the beneficial effect of pluralizing the field of political hierarchies beyond class to include hierarchies of gender, race, ethnicity, culture, nationality, sexual orientation, age, species, and so on. A similar reaction could be found among second and third generation critical theorists, but under an entirely different influence. With its progressive synthesis of neo-Kantian and neo-Hegelian idealism, on the one hand, and evolutionary naturalism, on the other, the American pragmatist tradition of John Dewey, George Herbert Mead, and Charles Sanders Peirce (see Chapter 12) offered a critical
phenomenology that was close to Marx’s own early writings. By contrast, in French philosophical circles dominated by postmodernism, poststructuralism, and deconstructionism the aim was no longer to revolutionize the world apart from revolutionizing our understanding of the self, something that philosophers had always done more or less well since Socrates, thereby bringing to a close an era of radical social thought.
I. LIBERALISM AND MARXISM: SHARED ANTINOMIES

The transformation of liberalism

The first decades of the twentieth century were marked by a wide-ranging rejection of the body of theoretical concepts that had supported most ideas of state legitimacy through the nineteenth century: that is, liberalism. First, this period witnessed an increasing hostility towards positivism, which had been the dominant doctrine among liberal constitutional theorists of the European bourgeoisie. Second, this period also witnessed a growing opposition to the various outlooks associated with Kantianism, which, especially in Germany, had shaped the more progressive political theories of the liberal class.1

Positivism and Kantianism, although diametrically opposed in questions of normative deduction, shared much common ground. In particular, both outlooks can be viewed as theories promoting minimalist models of statehood and constitutional rule, and both converged around the view that states obtain legitimacy through formal and largely apolitical normative processes. That is to say, both outlooks claimed that states acquire legitimacy by ensuring that their actions comply with a thin set of norms (objectivized as constitutional rights) that are withdrawn from everyday politicization; both implied that in modern societies political systems demonstrate legitimacy through formal acts of rights-attribution, and they are not required to integrate members of society

1. For a discussion of the influence of both positivism and Kantianism in the early decades of the twentieth century, see the essays by Mike Gane and Sebastian Luft and Fabien Capeillères in The History of Continental Philosophy: Volume 3.
as active participants or even specifically to respond to the definite relations of civil society; both thus defined constitutions as documents that legitimize the state by ensuring that the state does not become a battleground for rival social interests and by restricting the degree to which its foundations need to be explicitly contested. In principle, therefore, both positivism and Kantianism can be seen as liberal theories that deduced the form of political legitimacy from a principal antinomy between law and politics, and both presupposed that the law independently sets the preconditions for political legitimacy and political freedom, so that particular state actions and particular political volition always remain subsidiary elements in the constitution of political legitimacy. In both views, in fact, this antinomy was rooted in a wider set of antinomies, between norms and facts, ethics and action, reason and will, and theory and praxis, which together gave rise to the distinctive liberal claim that the sources of political freedom and legitimacy are essentially external to the state itself, and the state plays little factual, active, volitional, or practical role in securing the conditions of its legitimacy.

Viewed from a historical point of view, it can be observed that the liberal visions of positivism and Kantianism reflected the reality of European constitutional states that had not fully entered the condition of mass democracy, and in which the social interests that could be legally represented were restricted. With the increasing demands for substantial franchise reform in most European states after 1900, however, liberal theories began to modify their formalistic constructions of legality and legitimacy. The reorientation of liberal theory became particularly intense during the First World War, by which time it had become clear in most states that the political apparatus would shortly be forced to integrate materially divided and intensely nationalized civil constituencies. It is in the context of this precarious shift to mass-democracy, most importantly, that the political writings of Max Weber are best appreciated. Weber’s writings might be seen as emblematic for the redirection of liberal theory at this time. Weber argued for a reconstruction of liberalism as a doctrine that, although accepting the need for a parliamentary system and the formal rule of law, was able to integrate diverse social sectors by promoting techniques of elite leadership and personalistic legitimation not widespread in standard liberal theories. Underlying this new brand of liberalism was the quasi-Nietzschean

*2. For further discussion of Weber, see the essay by Alan Sica in The History of Continental Philosophy: Volume 2.

3. It is notable, however, that Weber’s position was not conceived in a liberal vacuum, and it had a clear analogy to Vilfredo Pareto’s account of modern society as shaped by the conflictual circulation of elites, each of which seeks to preserve the monopoly of material and ideological control. See his Sociological Writings, S. E. Finer (ed.), D. Mirfin (trans.) (London: Pall Mall Press, 1966), 315. For background to Weber in this respect, see Walter Struve, Elites
assumption that classical liberal ideas had too easily assumed that all society could be pacified under law. They had failed to reflect on the ineluctable aspect of conflict in all politics, and they had omitted to observe that modern democratic polities could be unified – and legitimized – only through encompassing political experiences, which integrate citizens in the formal-legal, the active, and the emotive-experiential dimensions of their lives. For Weber, therefore, the stability of democracy depended on the extent to which it was informed by the direct personal appeal of its leaders.

The transformation of Marxism

Similarly, the early twentieth century was also marked by an increasingly hostile critique of the orthodoxies upholding the other main ideology of the nineteenth century: Marxism. As is well documented, in the later nineteenth century Marxist orthodoxy consolidated itself around deterministic and quasi-scientific ideas, and Marxist theorists tended to endorse a brand of socialism that construed the progression toward a socialist economy as a quasi-natural process and used categories of political economy for providing formal analysis of class relations at different junctures in this process. Although clearly separated from liberal principles on questions of material ethics, therefore, the main lineages of socialist orthodoxy before 1900 had important points of overlap with mainstream liberal theory. Most particularly, Marxist orthodoxy shared with liberalism the positivistic conviction that society could be interpreted as a body of rule-bound and rationally constructible social facts, and that the evolution of society was largely independent of human volition and required little transformative intervention. In its political dimensions, moreover, Marxist determinism also followed liberal outlooks in accounting for human improvement and liberation as an essentially apolitical process, in which positive laws of progress pre-determined functions and limits of political action, and in interpreting the political apparatus of society as a deterministically produced element of superstructure, possessing neither directive nor integrative force for society as a whole. In this respect, the orthodox Marxism of the late nineteenth century might be seen to have partly replicated the formal-antinomical structure of liberalism, and it too ordered its account of social reality around underlying antinomies between reason and action, freedom and history, and law and politics.

In consequence, the reaction against orthodox Marxism after 1900 showed similarities with the reaction against liberalism, and it brought a dramatic expansion of the political-actionistic content of Marxist theory. This was manifest in the works of Rosa Luxemburg, who developed a theory that emphasized the role of spontaneous industrial action as a “political weapon” in class struggle.6 This was also visible in the works of Lenin, who proclaimed that the political party was the vanguard of the proletariat engaged in class struggle, and assigned to the party the central role in coordinating the revolutionary process.7 At the same time, different strands of French and Italian syndicalism began to accentuate local political action as the central source of political transformation and so fully to reject the rule of law and the rationalized state bureaucracy as forces for social change.8 This syndicalist tradition culminated in the works of Georges Sorel, who sought to eradicate the positivist and formalist dimensions from Marxist theory, and argued that radical social upheaval could be induced only by unreflected collective voluntarism, which was to be concentrated in the general strike.9 During the First World War, moreover, this actionistic reconstruction of Marxism also migrated across the political spectrum, and it was reflected in the ideas of Benito Mussolini and other early Italian fascists.10 Mussolini’s doctrine, after he had abdicated his position on the actionist wing of the Italian socialist movement, was designed to overcome the perceived actionistic weakness in Marxism by identifying the nation as a focus of political identity, which could unify human action far more potently than any sense of class affiliation.11 He thus championed, not the class, but the mythical nation as a unit of political

action capable of overthrowing liberalism and so also of building a robustly integrated state.\(^\text{12}\)

The early twentieth century, in sum, brought about a theoretical realignment at all points in the political landscape, through which political action came to act as a term for correcting the formalistic dimensions of the main pre-1914 ideologies. Indeed, by the end of the First World War the self-critique of liberalism was showing clear signs of coalescing with the self-critique of Marxism, so that antiliberal and anti-Marxist political attitudes were manifestly beginning to run together. In both theoretical lineages, it was argued that liberalism and Marxism had failed to support their ideas of government and progress with anything more than highly abstracted and quasi-metaphysical accounts of natural order, and that only a more substantial concept of political existence could overcome the conceptual antinomies responsible for this. Politics, thus, was configured as a unifying category of social voluntarism, which superseded the abstraction of human society and human experience under liberalism and Marxism, and which was posited as decisively implicated in all social transformation and as decisively constitutive of all human freedom.

II. CARL SCHMITT AND LIBERALISM

It is in this context that the intellectual origins of the works of Carl Schmitt\(^\text{13}\) can be located. Schmitt, a Roman Catholic born in the (strongly Catholic) Rhineland area of Germany, was the preeminent constitutional lawyer in Germany during the interwar era, and he was a fierce conservative critic of the Weimar Republic. He gained particular notoriety for his endorsement of the use of prerogative legislation in the early years of the Republic, for his advocacy of executive rule and authoritarian governance after 1930, and for his substantial part in the constitutional suspension of the democratic Prussian parliament in 1932. Although originally associated with the Roman Catholic party (the Zentrum), after 1933 Schmitt (to the surprise of his associates) became one of the leading spokesmen of the regime established by the NSDAP. He fell out of favor with the regime in

\(^{13}\) Carl Schmitt (July 11, 1888–April 7, 1985; born and died in Plettenberg, Germany) was educated at the Universities of Berlin, Munich, and Strasbourg (1907–10). His influences included Hegel, Hobbes, Jellinek, Kierkegaard, Pareto, and Weber, and he held appointments at Universität Greifswald (1921), Universität Bonn (1922), Handelshochschule Berlin (1926), Universität Köln (1932), and Universität Berlin (1933).
the mid-1930s, but he was incarcerated during the period of de-Nazification after 1945 and was barred from holding positions at universities in the Federal Republic of Germany.

Schmitt's entire work might be viewed as a critique of the antinomies of liberalism (and, to a lesser extent, of Marxism), and it has the particular characteristic that it defined constitutional law as the theoretical discipline in which a political corrective to these antinomies was most urgently required and could be most persuasively administered. Schmitt, therefore, was a constitutional lawyer, who pursued analysis of particular constitutional problems in Germany in order to examine the legitimatory predicaments of modern mass-democratic states, to explain how the legitimacy of these states could be reinforced, and to counteract the destabilizing loss of political content and political will, which he saw as the result of both liberalism and Marxism.

Schmitt's work had its theoretical center in a critique of the liberal constitutional theories associated with legal positivism, and especially of Hans Kelsen's pure theory of law. In this regard, Schmitt reserved particular antipathy for Kelsen's assumption that law is a neutral medium of social organization, whose normative or value-rational content is not politically determined, and he denounced the Kelsenian assumption that state legitimacy is produced by neutral legal norms, enshrined in a formal constitution, to which the state is perennially obligated and over the terms of its obligation to which the state cannot exercise decisive influence. Central to Schmitt's work through the 1920s was the conviction that the legal neutralism of positivism had created a tradition of weak statehood in Germany. This tradition, culminating in the constitution of the Weimar Republic (ratified in 1919), had produced a succession of states that were fraught with internal divisions, that lacked cohesive foundations, and that were inclined to extreme indecisiveness and instability, thus imperiling the national freedom of all Germans. In consequence, he concluded that a legitimate political order could not be founded in neutral or external legal norms: it must be founded in the one uniform and sovereign will of a constituent power, and this will must provide totally decisive and fundamentally political preconditions for all acts and laws of the state. At the center of Schmitt’s political outlook was thus the Hobbesian claim that the liberal-constitutional Rechtsstaat is based in falsely idealized assumptions about the ethical standards and the principles

14. The sections on Schmitt below contain condensed versions of arguments I have set out elsewhere, notably in German Political Philosophy: The Metaphysics of Law. However, both the thrust and the context of the argument here are rather different from the earlier work.
of sociality governing human life, and that real human order depends on the constant exercise of inalienable and indivisible sovereign power.

Throughout his career, in consequence, Schmitt devoted himself to isolating the corrosive elements of liberal theory, to identifying the concrete reasons why liberalism undermined the integrity of particular states, and – as a matter of day-to-day political engagement – to elaborating principles to counteract the dissolution of statehood enacted by liberal arguments and liberal principles of institutional design. Schmitt’s analyses of liberal theory converged around the following critiques.

**Liberalism and private law**

First, Schmitt claimed that liberal constitutional ideas had weakened the state because they had led to the construction of state power around principles of *private law*. Central to the liberal doctrines and early parliamentary-democratic regimes of the nineteenth century was the belief that political power should recognize and represent private interests, and that positive law, neutrally formulated in legal codes, could ensure that private-legal interests delineated the form and limits of state power. One result of early liberalism, in consequence, was that it created political regimes in which the state resigned structural primacy in society, and it became increasingly accountable to “organizations” of “individual freedom,” whose power was sanctioned, within the state, under the system of private law. Liberalism thus instilled a “pluralism of concepts of legality” at the center of the state, and in so doing it established a state whose ability to define conditions of political order for society was debilitating. This problem remained relatively imperceptible during the period of high liberalism, in which states were only expected to integrate small and relatively uniform constituencies. However, through the later institution of mass-democracies and welfare-democracies after 1918, states were compelled to represent and even to internalize an amalgam of acutely antagonistic private prerogatives, all of which were equally and neutrally protected under private law. The outcome of this, then, was that in most societies the state was transformed into a legal battlefield in which organized groups of private interests vied with each other for the power to influence legislation and to use the state as a clearing house for advancing particular private ambitions: the state became an “instrument of social and political technology,” which could only presume legitimacy by responding, however fitfully, to the demands of the

---

pluralized private associations that it incorporated.\textsuperscript{19} The norms of private-legal positivism thus acted as masks for the destructive self-interest of powerful social groups, and the chimerical neutrality of liberal legal thought allowed these groups to destroy the state. In consequence of this, Schmitt concluded, modern states could never be sovereign, legitimate, or integrally political: their attempts to demonstrate legitimacy through sovereign will-formation were always offset by their need to uphold a precarious balance of private material interests, they could only sustain their sovereignty as an unselective and inherently unstable system of command, and society as a whole was no longer able to rely on the protective functions that states had conventionally performed.

\textit{Liberalism and political parties}

Second, Schmitt argued that the principle of legal neutrality in liberalism had a particularly corrosive impact on states that defined themselves and their legitimacy as democratic, and he thus claimed that liberalism and democracy necessarily existed in an uneasy relation to each other. Under the principle of positive-legal neutrality, Schmitt argued, the modern form of the democratic state had evolved as a regime that was in principle indifferent to the actual persons exercising a share of its political power, and it was widely (and neutrally) assumed that the state would retain a persistent integrity against the singular decisions of the governments that it incorporated. This principle, then, had permitted the modern state to evolve, not as a true democracy, but as a parliamentary democracy, which, Schmitt suggested, was a governmental form that both contradicted the inner legitimatory spirit of real democracy and eroded the structure of the state. Schmitt in fact argued that the original democratic belief that the will of the people is the sole constituent foundation for both state and government was a principle that, under certain sociological conditions, was surely capable of founding legitimate sovereign states. This principle, however, had been abandoned through the fateful fusion of liberalism and democracy. It had been replaced by the idea of a state apparatus in which constitutional law sanctioned and supported the fragmentation of the political will between different organs (i.e. executive, legislature, and judiciary) within the state, and in which the positive laws regulating parliament ensured that power was substantially placed in the hands, not of the constitutional demos, but of its appointed representatives in political parties. These parties commonly originated in and represented particular milieux within society, and they were consequently

incapable of acting together to articulate one decisive voice that could be transmitted through society as the foundation for legitimate laws. Indeed, Schmitt asserted, it is particular to parties that they obstruct the formation of one sovereign or constituent political will, they allow the political will to fragment in “compromises and coalitions” and so remain at a level of extremely unresolved particularity,\(^{20}\) and they ensure that the day-to-day running of government is internally focused on the details of inter-party bargaining in order to manage and prevent the erosion of these compromises and coalitions. Once placed at the center of government, the compromises underlying party-parliamentary government might temporarily be glossed over or incompletely mediated by the technical principles of positive law. Yet it is impossible for a government founded in inter-party compromises to generate unitary principles that give integrity and legitimacy to its laws, and it is impossible for such government to act in a legitimately sovereign or legitimately democratic fashion. Government conducted through parties in parliament, in short, is always an external adjunct to the state, and it cannot derive legitimacy from or reciprocally consolidate the legitimacy of the state. Over long periods of time, parliamentary government must necessarily weaken the power of the state, and it must frivolously give state power to social groups outside the state, who wish to overthrow it or use its power for democratically nonmandated ends. Indeed, for Schmitt, the fact that modern mass-democracies normally permit any party to gain access to power, regardless of whether this party supports or opposes the principles of democratic rule, underlined the weakness of party democracies and their creed of legal neutrality, and it demonstrated in symbolic simplicity that parliamentary states were wholly unable to express clear principles of sovereign – or democratic – order. The positivist ideals of liberal law, in sum, had fed a mirage of legal neutrality and neutrally brokered legitimacy within the parliamentary-democratic state. In so doing, they had created conditions in which real democracy was impossible, and in which the state could be easily dismantled and the fiction of its legitimacy revealed.

\textit{Liberalism and peace}

Also of central importance in Schmitt’s theory was the claim that liberal theories erroneously assume that \textit{peace} is the natural condition of human coexistence, and liberal governments naively presuppose that positive law could sustain itself by referring to simply moderated compromises between all members of society. For Schmitt, however, the opposite is true: he saw the liberal belief in “social harmony” as a metaphysical belief, which jeopardized the most reliable factual

precondition of social peace – that is, the will of the sovereign state itself. He argued in particular that mass-democratic polities are characterized by extreme antagonism between social groups, and the state of a mass democracy cannot rely on any conditions of ordered coexistence that it does not produce for itself through its own acts of volition. Indeed, Schmitt concluded that the legitimacy of any state, in the final analysis, depends on its ability to withstand the total absence of natural peace and natural norms and to exert a sovereign will in exceptional conditions of normative suspension. In other words, Schmitt claimed that it is only in those moments where a state assumes for itself the final responsibility for underwriting social order and for autonomously generating its own sovereign political ethic that the state fully obtains and demonstrates legitimacy. It is only in the “state of exception,” Schmitt thus declared, that “the core of the state” is revealed “in its concrete character.” It is against this conceptual background, then, that Schmitt outlined the most famous aspect of his political theory: namely, the claim that the exercise of legitimate power presupposes the existence of a political will that is able to make a concrete decision between friend and foe. In this claim, Schmitt concluded that a state that cannot differentiate between those that support it and those that threaten to undermine it cannot stand the acid test of exceptionalist pressure, and it cannot produce a will likely to facilitate its survival: it is not sovereign. At this juncture, Schmitt argued that to be legitimate the state must be founded, not in neutral or natural norms, but in concrete decisions, which form the basis of political order as they are sustained and enforced by a constant and sovereign political will. Schmitt did not insist that the decision upholding legal/political order must be an expression of violent or dictatorial sovereignty. This decision might be a decision of a historically united and sovereign people. Or, equally, it might be the decision of a president or a commissarial dictator. Whatever its source, however, the decision that founds state legitimacy must be a manifestation of unity and integrity, which, where required, is able to assert itself, exceptionally and totally, to the exclusion of other wills and other decisions. Radical acceptance of underlying social antagonism, therefore, must remain the primary indicator of a state’s capacity for obtaining and conserving legitimacy.

In consequence of these criticisms, throughout his career Schmitt concluded that state legitimacy is sustained only where the constitution of a state renounces

22. Schmitt, Der Hüter der Verfassung, 131.
the liberal commitment to *polycracy*, and where its content is declared as the expression of one constituent will. Schmitt accounted for the uniform will embodied in a legitimate constitution in different ways at different times. In his writings of the early-Weimar era, he argued that, at least in periods of crisis, commissarial dictatorship might be the governmental form that can most effectively “protect” the constitutional will of the state. He concluded at this point that dictatorship itself might under some circumstances be more democratic and more legitimate than parliamentary governance. Throughout the 1920s and early 1930s, then, he defended government by presidential prerogative, and he argued for the concentration of political power around a presidial executive elite. He claimed at different points that a president, partly freed from parliamentary accountability, was the most effective custodian of the principles embodied in a constitution, and he insisted that a president could secure sufficient legitimacy for his tenure on power by garnering popular *acclamation* in one-issue plebiscites. This argument was especially relevant for the regime in Germany in the last years of the Weimar Republic (1930–33), when Germany was governed by a succession of increasingly authoritarian chancellors, to whom Schmitt provided extensive consultative service, who relied for their legitimacy on presidential nomination and had little or no parliamentary mandate. However, in *Constitutional Theory* (1928), Schmitt also endorsed a more broad-based system of constitutional rule for Germany. He claimed here that the democratic constitution of the Weimar Republic could be viewed as founded in the unified will of the German people, and it could be seen to obtain a degree of legitimacy as an expression of the historical existence of the united national community. At this point, he attempted to explain how the legitimatory status of the Weimar constitution might be reinforced, and he sought to clarify the measures required to ensure that it was not eroded by the technical provisions for legal pluralism more generally characteristic of liberal constitutions. He concluded that all traces of liberal legalism – that is, the guarantees for a separation of legislature, executive, and judiciary, and the catalogue of basic rights – should be removed from the constitution, so that all acts of state could be traced to one undisrupted and unifocal constituent will. At this juncture, Schmitt’s ideas might be placed on a certain continuum with strong-state republicanism, and his thought contained

26. Ibid., 22.
27. Schmitt, *Der Hüter der Verfassung*, 159.
a partial justification of democratic statism. The hallmark of a legitimate constitution, he claimed at this point, is that it guarantees the integrity of a strong central state, capable of ensuring that emphatic principles of order are reflected in every act of state power – and he saw no reason why this could not also be a feature of a strongly centralized and constitutionally concentrated democracy. Indeed, even at the end of the Weimar era, Schmitt was reluctant to lend assistance to those groups agitating for a complete overthrow of the republic, and (to no practical effect) he urged that the state should be reinforced so that parties intending to dismantle the republic (especially the NSDAP) should be prevented from entering government.31

Throughout all changes in his more practical commentaries, however, Schmitt's defining claim was that legitimate order must embody one set of constituent and fully sovereign principles. These principles must – if necessary – override all pluralistic aspects of the polity. Underlying this view was the conviction that all political wills have a total dimension: that is, each will seeks to impose principles through the state that determine social life in all its dimensions. Politics, thus, is always, residually, a conflict between total acts of volition. The neutralism at the heart of liberalism meant that liberal regimes could not recognize this fact, and they could, over longer periods of time, not produce principles to sustain reliably legitimized states.

III. SCHMITT AND MARXISM

Schmitt was emphatically hostile to Marxist political theory and, as discussed, he offered service to a number of authoritarian rightist cabinets in Germany. Schmitt's deep hostility to Marxism is seen in a number of different ways. Most obviously, he viewed the quasi-corporate regime of the Weimar Republic as an irresponsible outgrowth of the revisionist Marxism of the German Social Democratic movement. Throughout his work, he campaigned against the principle that political order could be reliably organized around inter-party deals

31. At one point, for instance, Schmitt denounced the total “parties” or the “activist parties” seeking to “dominate the state” in late-Weimar politics (Schmitt, “Weiterentwicklung des totalen Staats in Deutschland,” in Verfassungsrechtliche Aufsätze aus den Jahren 1924–1954: Materialien zu einer Verfassungslehre [Berlin: Duncker & Humblot, 1958], 359–71, esp. 362–3). More famously, he also went to great pains to show that the supposed neutrality of law under the parliamentary systems made it easy for parties to hold “legal power in their hands” in order entirely to destroy the constitution. In this analysis, he implicitly suggested that the president should use decisive powers to prevent the assumption of power, by legal means, by the NSDAP (Carl Schmitt, Legalität und Legitimität [Berlin: Duncker & Humblot, 1932], 37; Legality and Legitimacy, Jeffrey Seitzer [trans.] [Durham, NC: Duke University Press, 2004], 36).
concerning material provision or welfare, and he derided the corporatist revision of Marxism in the German labor movement as a particularly debilitating political pluralism. More generally, then, he also indicated that in espousing a final vision of a naturally evolving society without scarcity, Marxism reflected the weaker aspects of liberalism in pledging itself to an antipolitical utopia, and in so doing it deeply depleted the capacities for conflict and decision that every successful movement requires; indeed, it negated the constitutive structure of politics itself. Despite this, however, Schmitt’s arguments against liberalism also contain a series of points that both intersected with and supported Marxist analysis of modern democracies.

First, Schmitt’s critique of the positivist rule of law replicated elements of more common Marxist analyses of the concept of legality in parliamentary democracies. Above all, Schmitt dismissed as a fiction the belief that law can be extracted from political struggle and used as a medium that can independently or neutrally prescribe or manufacture preconditions for political legitimacy. For Schmitt, law is always political, and as such it is always an object of the total struggle for power between rival ideological visions and rival political movements, which forms the irreducible structure of all politics. In close analogy to Marxist principles, therefore, he argued that the law has no functional autonomy, it cannot produce legitimacy through palliative administrative acts, and its content must always be observed as asserting an underlying and potentially hegemonic political will. Indeed, Schmitt came close to suggesting that the liberal/positivist belief in the neutrality of law is simply ideology. Certainly, the Kelsenian idea that there can be pure norms in a society must appear both to a Schmittian and to a Marxist perspective as a deeply absurd and in fact evidently ideological fallacy.

Second, Schmitt indicated that in democratic states sanctioning the neutral rule of law and guaranteeing equal opportunity to all political and economic actors, there is always a high probability that economically advantaged social groups will exploit the parliamentary apparatus for their own ends, and they will monopolize the law to consolidate their own authority over the state and through society more generally. The tension between liberalism and democratic legitimacy, therefore, is always flanked by a tension between capitalism and democratic legitimacy, or between capitalism and democracy tout court. In this aspect of his theory, Schmitt evidently had much in common with radical left-leaning critiques of the parliamentary system, and he even cleared the terrain for a specific critique of democracy under conditions of late capitalism. In particular, he claimed that under the system of neutrally protected private law in modern democracies it is inevitably the case that the boundary between polity and economy becomes blurred, and this allows private economic agents to use the power attached to their social positions outside parliament to secure
a dominant stake in the parliamentary apparatus of the state. This has the result that the state forfeits the ability to consolidate its legitimacy above or against the plural associations of civil society, and, under certain conditions, the state is forced to fuse with private prerogatives receiving only minimal political sanction and support. Where this is the case, the state can easily be transformed into an instrument of economic control.

In addition to this, third, it can also be observed that Schmitt’s thought overlapped with some of the more radical-voluntarist stances at the political fringe of Marxist theory in the early twentieth century. Specifically, Schmitt shared with left-oriented political voluntarism the conviction that the main ideologies arising from the nineteenth century were deficient because they examined social existence in antinomical, dualist/metaphysical and politically depleted terms. Like other voluntarists, Schmitt argued that these ideologies catastrophically undermined their own programs by failing to understand that the political dimension of society could not be separated out from other (perhaps economic or legal) aspects of society, and by omitting to recognize that in modern societies, and especially in mass democracies, all political organs (both states and parties) are incessantly engaged in a conflict for the monopoly of political power. Schmitt’s claim that political organs are called on to legitimize themselves through a fundamental exercise of the will, that they must recognize all social acts as relevant for and even formative of political power, and that the consolidation of political power requires the presence of an integral political bloc, might thus have appeared particularly accurate and helpful to theorists on the voluntarist Left, who were necessarily committed to ideas such as mass-mobilization and uniform solidarity, and who were deeply skeptical about pluralism and the rule of law. In any case, the emphasis that Schmitt placed on the decisive sovereign will as the unitary basis for political ethics fused clearly with theories on the political Left, and it was correlated both with the radical-Left critique of liberalism and the radical-Left critique of deterministic Marxism. In particular, Schmitt’s thought intersected closely with views of those on the Left who also suspected that the formal rule of law and the sharing of power between classes in a parliamentary apparatus could not place the state-founding sector of society (in this instance, the revolutionary class) in an enduring position of advantage, and that consequently concluded that legitimate (i.e. sovereign) government always presupposes an aspect of totalism.

32. I found helpful commentary on this in Renato Cristi and Pablo Ruiz-Tagle, La República en Chile: Teoría y Práctica del Constitucionalismo Republicano (Santiago: LOM, 2006), 66.
33. Hence also Schmitt’s closeness to some aspects of Austro-Marxism, especially to Max Adler’s argument that a socialist state presupposes unified solidarity; see Max Adler, Die Staatsauflösung des Marxismus: Ein Beitrag zur Unterscheidung von soziologischer und juristischer Methoden (Darmstadt: Wissenschaftliche Buchgesellschaft, 1973), 49.
IV. SCHMITT AND EARLY WESTERN MARXISM

The Frankfurt School

The utility of Schmitt’s concepts for neo-Marxist political analysis was not lost on his contemporaries. For instance, some theorists peripherally attached to the Institute of Social Research in Frankfurt made productive use of Schmitt’s work. Most importantly, Otto Kirchheimer, whose doctorate was supervised by Schmitt, elaborated a critique of liberal parliamentarism, in which he tied Schmitt’s critique of legal pluralism to a political-Marxist account of the legitimatory processes and the role of modern law in modern democracies. Kirchheimer argued that in societies combining capitalism and parliamentary democracy states invariably suffer from a lack of legitimacy, and fundamental – that is, sovereign – decisions regarding the constitutional form of the state are dissolved by principles that are protected under liberal private law, which in fact asserts a surreptitious primacy over all other law. Kirchheimer thus extended the implicit critique of late-capitalism in Schmitt’s theory by arguing that states secure legitimacy only if they possess a unitary constitution containing a mandatory decision concerning all the areas of society that can be legally regulated – including, expressly, the private economy – and if this decision can be enforced in order to subordinate to the state all elements of legal pluralism – including, most particularly, private law. Kirchheimer’s programmatic constitutional voluntarism clearly repudiated many of Schmitt’s principal stances. However, his theoretical approach was strongly influenced by Schmitt, and it clearly marked an attempt to translate Schmitt’s theory of sovereignty into a model of decisive government under a decisively class-based constitution.

At a later stage in the formation of critical theory, then, Jürgen Habermas also transfigured some of Schmitt’s arguments, and he harnessed these views to a radical-democratic conception of legitimate political order. Most obviously,

*37. Habermas’s work is discussed in more detail in the essay by Christopher F. Zurn in The History of Continental Philosophy: Volume 6.
in *The Structural Transformation of the Public Sphere* (1962), Habermas joined Kirchheimer in asserting that modern capitalist democracies are marked by a suppressed tension between the sociofactual conditions of legal validity and the normative democratic decisions that are enshrined in the constitution as principles of state legitimacy. In political systems commonly viewed as democratic, he claimed, the unitary political will of the people is undermined by compromises between political parties, and by organs of corporate interest and economic management that disrupt and parcelle the sovereign public will.\(^{38}\) As a result of this, in modern (capitalist) democracies, laws do not reflect commonly formed interests or agreements, and they cannot represent a clearly legitimizing political will: they are technical institutions that are utilized primarily for administering material goods in order to maintain basic conditions of social harmony, and their essential function is to palliate social conflicts, to obscure the legitimationary weaknesses that underlie the polity, and to pursue emollient strategies of regulation. Only a democratic polity that is constitutionally based in universal agreements, obtained in communicative political interaction in a free public sphere, can, for Habermas, be authentically legitimate.\(^{39}\) Even Habermas’s later argument, outlined in *Legitimation Crisis of Late Capitalism* (1973), that late-capitalist polities are invariably hamstrung by insoluble weaknesses arising from the fact that they *materialize* their reserves of political legitimacy, cannot quite obscure its origins in Schmitt’s critique of liberal pluralism.\(^{40}\)

**Georg Lukács**

If Kirchheimer and Habermas undertook the most literal reception of Schmitt on the political Left, however, it can also be observed that, because of the conceptual horizons in which they worked, the concerns motivating Schmitt’s thought were quite generally reflected among radical theorists. For this reason, even theorists on the Left who vehemently opposed, or in fact had no first-hand knowledge of Schmitt’s work also developed theoretical structures that showed a marked similarity with elements of Schmitt’s approach.

Similarities with Schmitt’s critique of liberalism as political metaphysics and his attempt to found a sovereign politics beyond the antinomies of liberalism can

---

be seen, for example, in the works of Georg Lukács. Lukács was in many ways the leading Marxist intellectual of interwar Europe. His works assumed seminal importance in the formation of the theoretical canon of Western Marxism. Born in Hungary, he studied in Germany, where he was deeply influenced by Weberian sociology, neo-Kantian epistemology, and Kierkegaardian existentialism, and he wrote many of his major works in German. He was a member of Béla Kun’s government during the short-lived Hungarian Soviet Republic of 1919, after the collapse of which and the assumption of power by Miklós Horthy’s counter-revolutionary regime he went into exile, first in Berlin and then in Moscow. He later held office in Imre Nagy’s anti-Stalinist government in Budapest in 1956. After the dissolution of this government, he was interned in Romania, and he remained on very uneasy footing with the Soviet authorities.

Although he referred to Schmitt only in tones marked by intense invective, Lukács’s work moved close to Schmitt in a number of ways. In particular, Lukács’s work mirrored Schmitt in that he too claimed that liberal thinking is prevented by its inner antinomies from envisaging the sources of integral social life, and that, because of this, it cannot produce principles to institute or even imagine a fully legitimate system of public order. Moreover, he also moved in parallel to Schmitt in arguing, against the antinomical constructions of liberalism, that each mode of social order reflects an absolutely integral condition of society, that there can be no enduring coexistence between elements of rival systems of social order, and that the political aspects of society must be analyzed as sustained by a highly pervasive and effectively total set of underlying forces.

At a primary level, Lukács argued that liberalism was not only a series of theoretical stances or political dispositions, but also a socioepistemological reality that needed to be analyzed both in its economic and in its cognitive/theoretical dimensions, and that could only be superseded if its cognitive foundations were both adequately comprehended and dismantled. Liberal society, Lukács claimed, had its formative substrate in a formal-subjectivist or quasi-monadic conceptual apparatus, which he termed false consciousness, and which he saw as concentrated in exemplary fashion in the ideologies of liberalism: positivism and Kantianism. Lukács viewed false consciousness, most especially, as consciousness that is unable accurately to reflect its formative relation to objective reality: that is, it is a mode of consciousness that constructs itself within a duality between subject and object, between rational truth and material history.

---

41. Georg Lukács (György Szegedy von Lukács; April 13, 1885–June 4, 1971; born and died in Budapest, Hungary) was educated at the Universities of Budapest and Berlin. His influences included Hegel, Kierkegaard, Lask, Marx, and Rickert, and he held appointments as: Commissar for Culture and Education, Budapest (1919); Member of Parliament, Budapest (1949–56); Professor of Aesthetics and Cultural Philosophy, Budapest University (1945–56); and Minister of Culture, Budapest (1956).
between ethical norms and social facticity, and that supports its claims to knowledge by positing the forms of its knowledge as antinomically or metaphysically independent of the objectively determinant reality of material history. False consciousness, Lukács then explained, is causally enmeshed with the economic base of capitalism, and, in imagining human rationality as dislocated from and indifferent towards historical objects and historical processes, it also reflects the capitalist social order as an invariable or even quasi-natural external order of society. As a result, however unwittingly, it helps ideologically to solidify and perpetuate the relations of economic exchange characterizing capitalism. False consciousness, in sum, is the foundation for the liberal-capitalist condition of society in its totality.

For this reason, Lukács also claimed that the objective or institutional forms typical of bourgeois society also result from and reflect false consciousness, and they are preserved by distinct patterns of rationality and concept-formation. His attack on liberal bourgeois reason thus also contained an attack on the ethical and the juridical/political foundations of liberal thinking. In particular, he claimed, in ascribing to human reason a primary capacity for static norm-production and in assuming that the institutions of society could be prescribed by statically deduced norms, the false consciousness of liberal reason directly impedes insight into the concrete/material determinacy of society’s laws, and it again constructs its truth claims in categorical forms that reflected the outer reality of the capitalist order in metaphysically apologetic terms. The tendency in Kantianism and in positivism to provide entirely formalized accounts of legal validity was thus, for Lukács, an example of a mental attitude that reproduced and reinforced the “intellectual forms of bourgeois society,” and so served ideologically to legitimize both inner and outer reality as perennial and unshakably natural. For Lukács, therefore, the legal ideas of liberal consciousness might once have purported to promise ethical integrity and political freedom for modern society. In fact, however, they obstructed any meaningful objective analysis of the conditions of freedom, and they deeply consolidated the overarching condition of social heteronomy that they sought to supplant.

In setting out these analyses, Lukács concluded that liberalism could be grasped only if it was approached as the total form of a society, incorporating the material base, the legal-political superstructure, and the principles of human cognition in one highly alienated and coercive social bloc. This society, then, could be overcome only through a total transformation, impelled formatively by

43. Lukács, Geschichte und Klassenbewußtsein, 207; History and Class Consciousness, 109.
a change in the structure of reason: that is, it could be overcome only if human consciousness evolved from the state of false or bourgeois consciousness to a state of proletarian consciousness. A proletarian consciousness, he suggested, is consciousness that has the following features: it recognizes its objects as materially produced and determined by underlying social (economic) process; it reflects itself as mediated through the totality of objective (economic) historical conditions in society; it comprehends the ways in which changes in material process determine subjective consciousness and in which changes in subjective consciousness alter material processes; it overcomes its antinomical reification towards material contents and processes by examining both itself and its objects as socially produced; it obtains, as a result of these facts, a degree of constitutive freedom and historically formative autonomy in its relation both to itself and its objects.\footnote{44} Postbourgeois consciousness, in short, must necessarily take the form of revolutionary consciousness, and as soon as consciousness has acquired unitary knowledge of itself and the objective conditions of its formation, it must express this knowledge in a single revolutionary moment. That is, it must – in the “free act of the proletariat” – liberate itself from the conditions of its objective determinacy and recreate the objective reality of society as a condition of objectively realized collective freedom.\footnote{45} Lukács thus saw the revolutionary act, coordinated by a political party embodying “proletarian class-consciousness,”\footnote{46} as an act that removes the material causes of false liberal consciousness (that is, it removes capitalism), that institutes a sociopolitical order that is no longer dominated by the cognitive fictions of liberal reason, and that creates a collective order in which the legal apparatus is fully unified with the needs of human beings as these arise from their objectively determined societal position. Proletarian consciousness, Lukács thus concluded, is consciousness that finally leads to a genuinely human political society, in which consciousness, reflected through the totality of its objective conditions, provides a unifying cognitive foundation for all society.\footnote{47}

In this respect, Lukács’s critique of liberalism and liberal consciousness can be seen as the most far-reaching attempt to envisage a political condition resulting from the end of liberal antinomism. That is to say, it imagined a condition in which human cognitive/ethical and active/practical life were unified in a social order that integrated human life in its totality: that is, that no longer separated human existence into the false antinomies of theory/praxis, law/politics, norms/action, reason/will, and so on. At the same time, Lukács’s work also embodied

\footnote{44} Lukács, Geschichte und Klassenbewußtsein, 282; History and Class Consciousness, 159.\footnote{45} Lukács, Geschichte und Klassenbewußtsein, 355; History and Class Consciousness, 209.\footnote{46} Lukács, Geschichte und Klassenbewußtsein, 455; History and Class Consciousness, 299.\footnote{47} Lukács, Geschichte und Klassenbewußtsein, 328; History and Class Consciousness, 190.
the most radical attempt to overcome the scientific determinism in Marxism. Lukács argued that a socialist society can develop only under specific cognitive preconditions, and he claimed that the material transformation of society has its precondition in a total cognitive and a total active transformation of society. Although far removed from Schmitt’s express concerns, therefore, Lukács’s thought clearly circled on the same antinomies that preoccupied Schmitt, and his idea of legitimate order as a total condition of society reflected aspects of Schmitt’s thought. Like Schmitt, in particular, his attempted resolution of these concerns critically traversed the ideological divide between liberalism and Marxism, and it proposed a concept of social totality that aimed, at once, to resolve the antinomies in both these theoretical stances.

**Antonio Gramsci**

After Lukács, Antonio Gramsci can also be named as a Marxist theorist whose thought showed a distinct, although also only very partial, parallel to Schmittian ideas. Gramsci was the main Marxist theorist of twentieth-century Italy. He was a founding member of the Italian Communist Party, whose effective leader he had become by 1924. With Palmiro Togliatti and others, he ran the journal *L’Ordine nuovo*, which played a highly influential role during the years of industrial unrest in Italy after 1918. He was imprisoned under Mussolini’s emergency laws of 1926, and was very roughly treated in prison, often being kept in isolation. He died shortly after his release on grounds of ill health.

Naturally, it might appear rather absurd to mention Schmitt and Gramsci in the same breath. There is no strong evidence to suggest that Gramsci knew or was sympathetic to Schmitt’s thought. However, at the level of theory-construction, Gramsci’s work revolved around the same conceptual problems as Schmitt’s ideas, and it can also be viewed as a theory that sought to imagine legitimate political order by moving at once beyond the antinomies of liberalism and the antinomies of classical Marxism.

The first point requiring analysis in this respect is Gramsci’s critique of the prevalent *economism* in Marxist theory. For Gramsci, the assumption in orthodox Marxism that social transformation follows a deterministic path,

---

48. Antonio Gramsci (January 22, 1891–April 27, 1937; born Ales, Sardinia, Italy; died in Rome) was educated at the University of Turin (1911–15). His influences included Croce, Lenin, Marx, and Pareto, and he held appointments as: editor of the journal *Grillo del popolo* (1917); founder of the newspaper *L’Ordine nuovo* (1919); Leader of the Italian Communist Party (PCI) and Communist Deputy in Parliament for Veneto (1924).

49. See the treatment of this relation in Andreas Kalyvas, “Hegemonic Sovereignty: Carl Schmitt, Antonio Gramsci and the Constituent Prince,” *Journal of Political Ideologies* 5(3) (2000). This is an excellent essay, but it does not substantially inform my discussion here.
and that scientific economic analysis provides sufficient utensils to understand
the course of social change, was deeply misguided, and it failed to identify the
elements of concrete conflict and selective strategy by which social change
is caused. Marxist economism, Gramsci concluded, was an outlook directly
derived from liberalism, and it replicated many of the antinomies of liberal-
ism.\(^50\) On this basis, he argued that it was essential to rescue Marxism from
economism, and to ensure that the Marxist theory of social revolution incorpo-
rated an adequate account of political action and an adequate knowledge of the
specific historical constellations in which political action was to be conducted.
Gramsci therefore followed Sorel in introducing a strongly voluntaristic dimen-
sion into Marxist doctrine, and he focused his work on the need to examine the
specific modes of political organization required to effect and consolidate social
revolution.

This emphasis on the necessity of political analysis, political action, and polit-
ical consciousness had a number of implications for Gramsci's thought as a
whole. In his early work during the \textit{biennio rosso},\(^51\) for instance, he ascribed
singular importance to the political activities of workers' councils, which he
specifically differentiated from the particularistic interests pursued by syndicates
and trade unions,\(^52\) and which he defined as cells promoting a general ethic of
political self-organization and quasi-Tayloristic "self-discipline" among the revo-
lutionary class.\(^53\) The organization of workers in councils, he argued, brought
the primary benefit that it allowed workers to assume political responsibilities
close to those assumed by states and political institutions in society more widely,
and it enabled them to gain educational experiences of self-administration and
to propagate a political and ideological culture likely to support eventual prole-
tarian autonomy. He consequently defined the council as the "model of the
proletarian state," in which members of the proletariat received the opportunity
to test out practices likely to consolidate a pattern of statehood adequate to revo-
lutionary interests and revolutionary consciousness.\(^54\)

Throughout the course of his work, moreover, Gramsci also defined the
political party as a crucial center of political organization, and he ascribed to

\(^{50}\) Antonio Gramsci, \textit{Quaderni del carcere}, Sergio Capriglio and Elsa Fubini (eds) (Turin:
Einaudi, 1975), vol. III, 1589; \textit{Prison Notebooks}, Joseph A. Buttigieg (trans.) (New York:

\(^{51}\) This term describes the two years of widespread and often violent industrial agitation in
northern Italy after the end of the First World War.

\(^{52}\) See Gwyn A. Williams, \textit{Proletarian Order: Antonio Gramsci, Factory Councils and the Origins

\(^{53}\) On Gramsci's enthusiasm for US-style Taylorism, see Gramsci, \textit{Quaderni del carcere}, vol. III,

the party a distinctive function in creating conditions likely to facilitate and solidify social transformation. In his notes on Machiavelli, contained in his *Prison Notebooks*, he claimed that in modern societies political parties have a position analogous to that of the state-founding or sovereign activities of the prince in a classical republic, and the revolutionary party acts as an “organism” that forms and articulates the “collective will” required to found and stabilize new political institutions.\(^5\) In addition to this, Gramsci also accorded crucial significance to the political function and status of the intellectuals in the political party, and he argued that, admittedly with certain “distinctions of degree,” all members of political parties perform intellectual functions for society. That is, all party members operate as “agents of general activities,” and they provide educational and ideological support to underscore the hegemony of dominant social groups.\(^6\)

In each of these respects, Gramsci clearly indicated that human society contains irreducibly political elements, and that the formation of a political – that is, relatively generalized – consciousness is constitutive for all effective social transformation. In addition to this, however, Gramsci’s critique of Marxist economism also brought forth a further and more encompassing political argument, which gradually, through the course of his theoretical career, became the central and most distinctive pillar of his thinking. This dimension arose from the fact that he saw economist analysis as pursuing a deeply reductive approach to the political superstructure of modern society, and that he increasingly perceived the formal-instrumental conception of the state in Marxism as incapable of explaining either the sources of political stability and compliance in society or the mechanisms required for restructuring society through revolutionary action. Even in his early work, therefore, Gramsci envisioned the state, even under the domination of capital, as performing distinctively generalized functions in society, and he refused to accept the economist claim that the state could be analyzed as a technical element of the superstructure: that is, as an institution that possessed no directive or legitimatory primacy for a society as a whole. Whatever its role in regulating exchange and securing conditions for the production of excess capital,\(^7\) he argued, a state always relies on and generates some degree of general legitimacy or social consent, it cannot be accounted for in narrowly coercive terms, and it even performs educational and rationalizing responsibilities for society as a whole.\(^8\) It is on this basis, then, that Gramsci introduced the concept for which he is most renowned: hegemony.

\(^{5}\) Gramsci, *Quaderni del carcere*, vol. III, 1558; *Prison Notebooks*, Notebook 13, §1.

\(^{6}\) Gramsci, *Quaderni del carcere*, vol. III, 1518, 1522; *Prison Notebooks*, Notebook 12, §1.

\(^{7}\) Gramsci freely admits that states have these primary roles; see Gramsci, *L’Ordine nuovo 1919–1920*, 4.

developed this concept in an attempt to propose a multilayered analysis of the conditions of domination and stratification in a society, and he used it to argue that the primacy of one class at one social juncture must be understood as the expression, not only of its monopolization of the means of production, but of its own pervasive political ideology – or even its own political culture – which is both concentrated around and in turn underpins and strengthens the apparatus of the state. He saw class dominance, in other words, as a total political condition of society, in which the status of one social class is “stabilized on a universal level” (i.e. it forms the historical bloc around which society as a whole is organized), and in which this class ensures that its interests, its underlying mental dispositions, and its social values transfuse the entirety of society and create overarching (or total) conditions through which its dominance will be reinforced and perpetuated. The state, thus, is the aggregate of institutions that both stabilize the hegemony of one class and promote a wider generalized culture that makes the ongoing dominance of this class probable. For this reason, Gramsci indicated that social analysis had to be primarily focused on the superstructure, and that it was only through adequate interpretation of hegemonic relations in the superstructure that the conditions for effective social transformation could be ascertained.

On each of these counts, in consequence, Gramsci replaced the thin and technical Marxist account of the political apparatus of society with a culturally and ideologically embedded concept of the political. In this approach Gramsci developed the claim that the assertion of a political will is the precondition of all social transformation, and, like both Sorel and Vilfredo Pareto, he examined the consolidation of political power as the accomplishment of a class combining both material supremacy and the capacity for producing pervasive cultural motivations. This ascription of relatively autonomous formative power to the political system also led him to conclude that any transformation of society had to be preceded by a transformation in the superstructure, and this could only be effected through a concerted and far-reaching cultural, ideological, and educational endeavor, in which new intellectual or cultural conditions for sustaining governmental power were established throughout society in its totality. Radical social transformation, in other words, was necessarily tied both to political revolution and to cultural/intellectual revolution. Conditions of material equality in the economy could not be instituted without the strategic construction of a new hegemonic bloc, able to establish and maintain an ideological force likely to stabilize these conditions. It is for this reason that Gramsci imputed to the political party such a crucial role in effecting social transformation. Unlike Lenin, who viewed the party as the relatively autonomous source of leadership for the

Gramsci argued that the party must act as a mediating link between the revolutionary class and the means of governmental coercion, and it must act to found and consolidate not only a public apparatus supporting the material interests of the revolutionary class, but also a broad culture likely to sustain the ultimate political hegemony of the working class. He thus viewed the success or otherwise of any workers’ party as determined by the degree to which it was able to “possess its own proper notion of the state” and its own “program of revolutionary government.” Indeed, although he occasionally acceded to Engels’s dictum that after a successful social revolution the state would finally disappear and be replaced by a “regulated society,” Gramsci suggested that each stage of history necessarily produced its own hegemonic structures and that each socioeconomic condition was articulated with a particular mode of hegemony or with a particular mode of statehood. A proletarian society, in consequence, would not exist without a political system. A proletarian state would be a state of proletarian hegemony, founded by a quasi-sovereign political party.

On balance, therefore, it can be concluded that Gramsci imputed three distinctive meanings to politics, and in each of these he saw politics as a distinct realm of human praxis and as formative for society as a whole. First, he argued that the state is a quasi-universal dimension of human society, which disseminates increasingly generalized principles through society, and whose power cannot be construed exclusively in instrumental terms. Second, he argued that any moment of social transformation must be analyzed, prepared, and conducted, not merely at the level of economic relations, but also at the level of superstructure, and that societal analysis that formally detaches politics from society cannot grasp the composition of society as a whole. Third, he argued (albeit more implicitly) that, even after the transition towards a socialist society, some kind of hegemonic apparatus would remain, as socialist societies retain a requirement for the universalizing and rationalizing resources contained in and enforced by state power. In each of these respects, Gramsci’s work can be seen as an internal correction of the antinomies of classical Marxism: it relocated the

impetus of societal transformation onto the terrain of resolute political action, and it stated that societies lose consistency if they are not held together – or even legitimized – by an overarching political or sovereign will and by a total political culture. In each of these respects, Gramsci’s reconfiguration of Marxism was also intended to move Marxist analysis conclusively away from the residues of liberal doctrine. Indeed, as discussed, from Gramsci’s perspective classical Marxist economism and formal-democratic liberalism were often coterminous. In each of these respects, moreover, Gramsci’s argument also turned on the quasi-Schmittian insistence that legitimate order was not thinkable without a highly pervasive will, capable of transmitting principles of political form through all levels of society.

V. CONCLUSION

Schmitt’s ideas, it can be concluded, had a central exemplary status in the theoretical history of early-twentieth-century Europe. First, they proposed a concept of the political that was designed to overcome the theoretical antinomies of liberalism. In this, second, they at once overlapped with the Marxist critique of liberalism and contributed to the self-critique of Marxism by proposing a theory of volitional conflict and sovereign will-formation as the only means of securing order in highly unstable and deeply contested societies. In such societies, Schmitt argued, principles of order always possess a totalizing character, and the political apparatus sustained by such principles could not be understood as a mere neutral adjunct to the formative processes in society. Political Marxists tended to differ from Schmitt’s view in that, unlike Schmitt, they saw, not the state, but the political party as the organ of political will-construction. However, Schmitt’s broader claim that no aspect of social exchange can be immediately excluded from politics, and that the sovereign will must constantly work to reinforce its hold on all society and to preserve itself against rival and equally total ideological positions, moved him close to much political Marxism. Simultaneously, third, Schmitt’s ideas also reflected the wider sense that pervaded (often in a half-reflected manner) many theories in the early decades of the twentieth century that the political ideals of the nineteenth century had allowed human life to fragment into false oppositions between theory and praxis, ethics and action, process and transformation, law and politics, legality and legitimacy. They had consequently dismembered human society and crucially undermined its resources for self-preservation, freedom, legitimacy, and abiding stability. The diagnosis that this malaise could be surmounted only through the end of political antinomies – or of political metaphysics – and through a restatement of politics as an integral category of generalized action was a diagnosis that moved
between perspectives formally attached to the political Right and perspectives formally attached to the political Left, and that could be sympathetically received by much thinking that imagined conditions of enduring order outside the classical conventions of liberalism and Marxism.

2
THE ORIGINS AND DEVELOPMENT OF THE
MODEL OF EARLY CRITICAL THEORY IN THE
WORK OF MAX HORKHEIMER, ERICH FROMM,
AND HERBERT MARCUSE

John Abromeit

At the risk of being overly schematic, one could say that three main currents went into the formation of the critical theory of the so-called first generation of the Frankfurt School. The first and most important current was developed by Max Horkheimer\(^1\) in collaboration with Erich Fromm in the late 1920s and early 1930s.\(^2\) The second, significantly weaker, but nonetheless important current was introduced by Herbert Marcuse,\(^3\) when he joined Horkheimer’s

---

1. Max Horkheimer (February 14, 1895–July 7, 1973; born in Stuttgart, Germany; died in Montagnola, Switzerland) was educated at Johann Wolfgang Goethe Universität (1919–25), and took his habilitation there in 1925. His influences included Freud, Hegel, Kant, Marx, Nietzsche, and Schopenhauer, and he held appointments at Johann Wolfgang Goethe Universität (1925–33, 1950–58), including Rector (1951–53), and was Director of the Institute for Social Research (1930–58).

2. Erich Fromm (1900–1980) was born to an upper-middle-class, orthodox Jewish family in Frankfurt. While completing his training as a psychoanalyst Fromm became involved in the Berlin Psychoanalytic Institute and he also helped found the Frankfurt Psychoanalytic Institute in 1929. Horkheimer offered Fromm a lifetime membership in the institute in 1930 and placed him in charge of a psychoanalytically informed empirical study of the German working class. Fromm published a number of pioneering articles in the Zeitschrift für Sozialforschung in the early 1930s, which helped lay the foundations for the institute’s innovative theoretical synthesis of Marx and Freud. But in the mid-1930s, Fromm began to question orthodox Freudianism. His critique of Freudian drive theory, in particular, pushed him away from Horkheimer. Fromm’s membership in the institute was officially terminated in 1939. His social-psychological study of the roots of fascism, Escape from Freedom, was published in 1941 and still bore the marks of the institute’s theoretical positions. For an overview of Fromm’s life and work, see Rainer Funk, Erich Fromm: His Life and Ideas (London: Continuum, 2000).

3. Herbert Marcuse (July 19, 1898–July 29, 1979; born in Berlin; died in Starnberg, Germany) was educated at Humboldt University (1919–20) and the University of Freiburg (1920–22, 1928–33). His influences included Dilthey, Freud, Hegel, Heidegger, Horkheimer, Lukács, Marx,
Institute for Social Research in 1933. Finally, with the growing estrangement between Horkheimer and Fromm in the late 1930s, the path was cleared for a closer working relationship between Horkheimer and Theodor Adorno, which initiated the beginning of a new phase in the development of critical theory. Although Horkheimer and Adorno became acquainted in the early 1920s, the development of their thought followed different trajectories in the late 1920s and early 1930s. Adorno's greater interest in aesthetic issues and the significant influence of Walter Benjamin on his thought during this time are just two examples of this divergence. Adorno and Benjamin's work is treated elsewhere in this volume, so I shall limit myself in this essay to an examination of the first two of the three main currents that led to the formation in the 1930s of the distinctive and highly influential school of thought known as critical theory. In the late 1930s and early 1940s Horkheimer and Fromm abandoned some of the key assumptions of this early model of critical theory, but it continued to inform Herbert Marcuse's work. For this reason and also owing to Marcuse's key role in introducing critical theory to a much broader audience in the 1960s, I shall also provide a brief overview of his later writings.

I. MAX HORKHEIMER

Max Horkheimer was born in 1895 in Zuffenhausen, a suburb of Stuttgart, Germany. His parents were members of Stuttgart's Jewish community, which had grown steadily in the course of the nineteenth century and had succeeded in establishing itself as an integral part of the city's economic, political, and cultural life. His father was of modest origins, but took advantage of the economic boom in Wilhelmine Germany and established himself as a successful textile manufacturer. His father hoped that Horkheimer would take over his factory, but Horkheimer demonstrated little interest in the life of an industrialist. In 1911,
Horkheimer met Friedrich Pollock, whose father was also a wealthy industrialist. The two of them soon became inseparable friends—a bond that would prove decisive for the development of critical theory over the next half century. Horkheimer and Pollock's parents sent them to Paris, Brussels, and London to learn French and English and to study the most advanced techniques in textile production. While living abroad, Horkheimer and Pollock devoted most of their time to their burgeoning interests in literature and philosophy and to pursuing a bohemian lifestyle. With the outbreak of the First World War, they were forced to return to Stuttgart and Horkheimer took a position working in his father's factory. Having already lived abroad and realizing that other Europeans were no better or worse than the Germans, Horkheimer was immune to the nationalist hysteria that accompanied the outbreak of the war. As the war and his labors in his father's factory dragged on, Horkheimer's already significant disaffection with the bourgeois world of his parents and the career path his father had chosen for him grew to a fevered pitch. Horkheimer expressed his radical rejection of the war and the society that had produced it in a series of novellas, short plays, and diary entries. After serving briefly as a noncombatant in the war, Horkheimer was sent to a sanatorium near Munich to recover from a debilitating illness. While there Horkheimer made contact with Germaine Krull, an avant-garde photographer and a leading figure in the radical leftist, bohemian circles that

---

6. Friedrich Pollock (1894–1970) was born to a wealthy, highly assimilated Jewish family in Freiburg, Germany. Soon after moving to Stuttgart around 1910, he met Horkheimer and formed a friendship that would last for the rest of their lives. In 1923, Pollock completed his PhD in economics with a dissertation on Marx's theory of money. At about the same time he, Horkheimer and Felix Weil—who was also the son of a wealthy industrialist—hatched the idea for an Institute for Social Research, which would be financed by Weil's father Hermann. The following year the institute was officially opened, with Carl Grünberg as its first director. Unlike Horkheimer, Pollock worked directly for the institute during the 1920s. His first full-length study, *Experiments in Economic Planning in the Soviet Union*, was sponsored and published by the institute. After Horkheimer assumed Grünberg's position as the director of the institute, Pollock's role became increasingly administrative, although he did contribute a series of articles on the topic of “state capitalism,” which contributed to a substantial shift in Horkheimer's theoretical position in the late 1930s. Pollock accompanied Horkheimer and Adorno from New York to Los Angeles in 1941. *Dialectic of Enlightenment*, the product of Horkheimer and Adorno's theoretical collaboration during this time, was dedicated to Pollock on the occasion of his fiftieth birthday. Pollock returned to Frankfurt with Horkheimer after the war and worked in the re-established institute.

would spearhead the Munich council republic in 1919. Horkheimer became close friends with Krull and presented his novellas and plays at social gatherings in her atelier, which were attended by prominent members of Munich's bohemia and literati, such as Rainer Maria Rilke, Ernst Toller, and Stefan Zweig. After the brutal suppression of the Munich council republic by the Freikorps in May 1919, Horkheimer decided that the possibility for a mass-based social revolution was foreclosed for the time being. Horkheimer's explorations of bohemia and his self-understanding as an artist were brought to an end by his decision to move to Frankfurt with Pollock in order to get a rigorous theoretical education, which he now viewed as the prerequisite for any serious social critique.

Although his first genuine philosophical interest was Schopenhauer, Horkheimer became interested in Marxist theory toward the end of the war. While he chose psychology and philosophy as his major fields of study at the newly founded J. W. Goethe University in Frankfurt, he continued to study Marx on the side with Pollock, who in 1923 would complete a dissertation on Marx's theory of money. In the fall of 1919, Horkheimer and Pollock met Felix Weil, with whom they shared the unlikely combination of a bourgeois family background and interest in socialist theory and politics. The sustained discussions between the three of them, along with the generous financial support of Weil's father Hermann, led to the formation of the Institute for Social Research in 1923. Although Horkheimer – unlike Pollock – was not involved directly with the institute during its early years, he did play an important role in conceiving the idea of the institute. Horkheimer's critical theory developed independently in the mid- and late 1920s and would not become the guiding force of the institute until 1931, when he became its director. In the early 1920s Horkheimer became acquainted with several of the other figures who would play an important role in the institute's later endeavors, such as Leo Löwenthal and Adorno.

9. Leo Löwenthal (1900–1993) was born in Frankfurt and he became friends with Fromm and Adorno during the First World War. In addition to contributing numerous articles on the sociology of literature to the institute's journal, Zeitschrift für Sozialforschung, Löwenthal also served as its copy-editor from 1932–42. During the Second World War, Löwenthal took a position at the Voice of America, while at the same time working on a study of authoritarian propaganda techniques – Prophets of Deceit – which was part of the institute's larger research project, Studies in Prejudice. Löwenthal went on to teach at the Stanford Center for the Advanced Study of Behavioral Sciences, before accepting a position in 1956 in the Sociology Department at the University of California, Berkeley, where he would remain for the rest of his life. For a fascinating and very readable account of Löwenthal's life and his relations to the other members of the institute, see Leo Löwenthal, An Unmastered Past: The Autobiographical Reflections of Leo Löwenthal, Martin Jay (ed.) (Berkeley, CA: University of California Press, 1987).
But neither played an important role in the development of Horkheimer’s critical theory at this time. The most important figure in Horkheimer’s academic studies at the University of Frankfurt in the early 1920s was Hans Cornelius, an idiosyncratic and polymathic professor of philosophy, whose primary interest was neo-Kantian epistemology. Horkheimer had impressed Cornelius early on with his thorough knowledge of Schopenhauer and Kant, which led Cornelius to take him under his wing, both academically and personally. In 1923 Cornelius sent Horkheimer and Pollock to Freiburg to study with his friend and interlocutor Edmund Husserl. While in Freiburg Horkheimer and Pollock also attended lectures by Martin Heidegger, but they were unimpressed. Horkheimer wrote both his dissertation and Habilitationsschrift under Cornelius’s guidance. Both works addressed Kant’s *Critique of Judgment* and both criticized Kant—and implicitly German academic neo-Kantianism as well—from a standpoint that reflected Cornelius’s philosophical arguments. Although Horkheimer learned some important lessons from these academic writings, they remained within the horizon of Cornelius’s philosophy of consciousness. Horkheimer’s critical theory took shape in the period between 1925 and 1930 as an explicit critique, not only of Cornelius, but of consciousness philosophy as a whole. Horkheimer’s move beyond consciousness philosophy proceeded along two different axes: the historical and the social.

In a remarkable series of lectures and unpublished essays from the late 1920s, Horkheimer developed a sophisticated materialist interpretation of the history of modern philosophy, from Bacon and Descartes all the way up to contempo-

---

10. In one of his later interviews, Friedrich Pollock relates a story that sheds light on his and Horkheimer’s impression of Heidegger at this time. They attended Heidegger’s lectures on “Introduction to Metaphysics.” When, after the first three weeks of the course, Heidegger was still lecturing on the concept of “Introduction,” Pollock and Horkheimer left a derogatory note on his lectern to express their dissatisfaction (Max Horkheimer Archiv [J. W. Goethe Universitätsbibliothek, Frankfurt], Document X 183a, 51).

11. A Habilitationsschrift is a second dissertation that one had to write in order to become a professor in the German university system.

12. For a summary of the arguments in Horkheimer’s first and second dissertations, see my “The Dialectic of Bourgeois Society,” 100–110.

13. “Consciousness philosophy” refers here to the modern tradition of rationalist epistemology, which was inaugurated by Descartes, and continued through the work of Leibniz, Kant, the neo-Kantians, Husserl, and Horkheimer’s academic mentor Cornelius. Consciousness philosophy attempts to provide a foundation for knowledge from within a reflective examination of the mental contents and/or necessary conditions of consciousness, mental experience, or cognition. [^] For detailed discussions of Husserl and neo-Kantianism, see the essays by Thomas Nenon and Sebastian Luft and Fabien Capeillères in *The History of Continental Philosophy: Volume 3*. 
rary schools such as neo-Kantianism, phenomenology, and vitalism.\textsuperscript{14} Implicitly following Marx, Horkheimer demonstrated how modern European philosophy represented a mediated expression of the uneven development of bourgeois society. For example, Horkheimer argues that the Enlightenment achieved its paradigmatic form in France rather than Britain or (what would become) Germany, owing to the particular constellation of social, economic, and political forces there. Whereas Britain had already carried out a bourgeois political revolution in 1688, and was well on the way to establishing a modern market society during the eighteenth century, the development of bourgeois political and economic institutions lagged behind in France and even more so in the Holy Roman Empire. Horkheimer interprets the basically affirmative character of British political economy and the resigned skepticism of David Hume as mediated expressions of a triumphant bourgeois society. Horkheimer views the lingering importance of theology and metaphysics (e.g. Kant’s efforts to rescue a metaphysics of morality) in the German Enlightenment as an expression of the still relatively weak state of bourgeois society there. Only in France, where the spread of market relations – including the massive sale of offices and titles of nobility – in the eighteenth century testified to the growing strength of a bourgeois class eager to emancipate itself from the remaining constraints of the ancien régime, did Enlightenment ideals attain a self-consciously political form. Horkheimer believed that the critical and predominantly materialist principles of the philosophes – the right of all men and women to freedom, equality, and happiness in this life – were truly universal ideals, which were an expression of ascendant bourgeois society, but which also pointed beyond it. Horkheimer’s lectures demonstrate that a critical concept of Enlightenment was crucial to his thought from early on. But perhaps even more importantly, Horkheimer placed the Enlightenment, along within the rest of modern European philosophy, within the larger context of the uneven development and subsequent transformation of bourgeois society. In so doing, he insisted that ideas could not be understood purely from the standpoint of consciousness, but were always historically mediated.

If Horkheimer’s lectures represented a decisive step beyond consciousness philosophy along a historical or diachronic axis, then the theory of contemporary society, which he developed during the same period, represented its synchronic counterpart. Horkheimer forged a critical theory of contemporary society out of three main components: Marx’s critique of political economy and ideology, empirical social research, and psychoanalysis. Horkheimer explored the continuing relevance of Marx’s ideas in \textit{Dämmerung: Notizen in}

\textsuperscript{14} These schools are discussed in several essays in \textit{The History of Continental Philosophy: Volume 3}.
Deutschland, a collection of aphorisms that use micrological observations of the inequities of everyday life to demonstrate the concrete ways in which people experienced and unconsciously reproduced abstract social domination. The collection was published under the pseudonym Heinrich Regius in 1934, after Horkheimer had already fled Germany, but – as the subtitle suggests – it was written between 1926 and 1931 and many of the aphorisms address the social situation in the final years of the Weimar Republic. For example, in “The Impotence of the German Working Class,” Horkheimer analyzes the ways in which technological developments in production have altered the composition of the German working class. He shows, in particular, how a political and ideological divide had emerged between workers with stable jobs, who tended to support the Social Democratic Party, and the mass of unemployed, who tended toward the German Communist Party. Although his unflinching diagnosis of the deep divisions among German workers seemed to refute Marx’s predictions about the increasing pauperization, homogenization, and unification of the proletariat, Horkheimer did not as a result take leave of Marx’s theory altogether. Instead he recalled Marx’s argument that “there is a tendency in the capitalist economic process for the number of workers to decrease as more machinery is introduced,” in order to explain the rise of a large unemployed underclass and the resulting schism in workers’ social conditions and consciousness. He also took issue with the widespread belief that Marx had advocated a progressive, or even deterministic, philosophy of history. Horkheimer’s early study of Schopenhauer and the traumatic experience of the First World War had immunized him to the idea that progress toward a better society was inscribed in the very logic of modern capitalism itself, as many revisionists and Social Democrats had interpreted Marx. So he recognized that the rational tendencies introduced by capitalism had long since been eclipsed by the irrational tendencies identified by Marx, such as periodic crises and commodity fetishism. Progressive historical change could be brought about only through conscious intervention, not passive reliance on the “logic” of history or capital. As he would put it later, “as long as world history follows its logical course, it fails to fulfill its human

15. One possible translation of the title would be “Dawn and Decline: Notes in Germany.” “Dämmerung” means both “dawn” and “decline” (or “dusk”) in German, and while the latter, darker meaning of the term definitely dominates the aphorisms, the former meaning is also intended.

16. Regius (1598–1679) was a professor of medicine in Utrecht and a materialist student and critic of Descartes.

18. Ibid., 61.
Horkheimer’s rejection of progressive philosophies of history was one example of his efforts to revitalize Marx’s ideology critique. But, as his penetrating observations of the discordant state of the German working class made clear, he insisted that ideology critique and all of Marx’s other concepts be tested and reformulated, if necessary, in light of changed historical conditions.

This insistence on the importance of thorough knowledge of present social conditions explains Horkheimer’s early interest in empirical social research. Horkheimer’s interest in empirical scientific research was sparked during his university studies in the early 1920s and was soon extended to empirical social research in the late 1920s. In his lectures on the history of philosophy Horkheimer displayed more sympathy for the empiricist than the rationalist tradition. Furthermore, he believed that an empirical deficit existed in the young discipline of sociology in Germany, so he looked instead to the work of American sociologists, such as Robert and Helen Lynd’s *Middletown: A Study in American Culture*, as models for the integration of empirical social research into his own incipient critical theory. In 1929 – at a time when it was already apparent that he would become the next director of the Institute for Social Research – Horkheimer was able to put his ideas about empirical social research to the test for the first time. He and Fromm planned and carried out an empirical study designed to provide insight into the conscious and unconscious political attitudes of the German working class. Horkheimer and Fromm’s interest in psychoanalysis informed their conceptualization of the study. Like many Marxists in the 1920s, Horkheimer wondered why large sections of the German working class had initially supported the First World War and had proved to be such reluctant revolutionaries in 1918/19. With the rising threat of National Socialism, Horkheimer also wondered how the German working class would react if the Nazis attempted to seize power. With these concerns in mind, Horkheimer and Fromm used psychoanalytic techniques in their design of the questionnaires and their interpretation of the responses. Over 3000 questionnaires were distributed in 1929, and by 1931 over 1000 had been returned. Based on the preliminary results of study – which was never completed

20. Horkheimer had strong reservations about publishing the study in the US in the 1930s, allegedly because many of the questionnaires had been lost in transition to New York; in reality, the still rather unrefined methods of the survey and the explicitly Marxist political assumptions that guided it were probably of greater concern to Horkheimer, who was careful not to expose the institute’s politics in a way that could danger their fragile status as exiles in the US. Horkheimer’s unwillingness to publish the study contributed to growing tensions between him and Fromm, which would eventually lead to Fromm’s departure from the institute in 1939 (see below). The preliminary results of the study were published in 1980 by Wolfgang Bonß.
Horkheimer and Fromm discovered a divergence between workers’ professed political views and their unconscious attitudes, which, in many cases, were deeply authoritarian. Horkheimer and Fromm’s conclusion that the German working class would not offer substantial resistance if the National Socialists attempted to seize power was soon borne out by historical events.

Psychoanalysis was the third component of Horkheimer’s theory of contemporary society. His interest in psychoanalysis was already apparent in 1927, when he underwent analysis with Karl Landauer (1887–1945), a Frankfurt-based psychoanalyst who had studied with Freud and become a member of the Vienna Psychoanalytic Society in 1913. Horkheimer’s analysis was motivated primarily by intellectual, rather than therapeutic, reasons. At about the same time, Horkheimer established a working relationship with Fromm, which would prove decisive for the further development of critical theory. After undergoing analysis in 1924 with his future wife, Frieda Reichmann, Fromm decided to become a psychoanalyst. He completed his training in Frankfurt with Karl Landauer. Soon afterwards he became an active participant in the Berlin Psychoanalytic Association, which was conducting pathbreaking discussions of the social and political implications of psychoanalysis. Horkheimer was drawn to Fromm intellectually not only because of his knowledge of psychoanalysis, but also because he had completed a PhD in sociology and was thus in a position to help Horkheimer integrate psychoanalysis into his critical theory of society. Fromm’s later split with the institute and the subsequent acrimonious debates he had with Adorno and Marcuse have tended to obscure Fromm’s crucial role in the early formation of critical theory. Horkheimer appointed Fromm as director of the empirical study on the attitudes of German workers and would soon offer him a permanent position at the institute. Furthermore, in the spring of 1929 Horkheimer and Fromm – along with Landauer and Frieda Fromm-Reichmann – founded the Frankfurt Psychoanalytic Institute, which was located in the same building as the Institute for Social Research. As Freud himself confirmed with gratitude in a letter to Horkheimer at the time, the founding of the Frankfurt Psychoanalytic Institute represented the first time that a German university had recognized psychoanalysis as a legitimate scientific discipline.

By the time Horkheimer was officially installed as the new director of the Institute for Social Research in January 1931, the basic components of his critical theory were already in place: a materialist interpretation of the history of modern philosophy as the mediated expression of the uneven development

---

of bourgeois society and a theory of contemporary society based on a critical synthesis of Marx, empirical social research, and psychoanalysis. The further development of Horkheimer’s critical theory in the 1930s can be seen as an attempt to carry out, test, and refine these basic ideas. In his inaugural address as the new director of the institute, Horkheimer outlined “The Present Situation of Social Philosophy and the Tasks of an Institute for Social Research” very much in these terms. Horkheimer argues that Hegel laid the groundwork for modern social philosophy with his critique of Kant’s consciousness philosophy. Nevertheless, Hegel remained beholden to a metaphysical philosophy of history, which justified the newly emergent bourgeois society as part of a preordained process of the historical realization of reason. Since the emancipatory ideals of the bourgeoisie had given way to the reality of class conflict, economic crisis, imperialism, and social catastrophes, such as the First World War, Hegel’s faith in the inherent rationality of history was no longer tenable – if it ever was – according to Horkheimer. But he also objected to the two main contemporary philosophical responses to this situation: a rejection of social philosophy in the name of “rigorous” positivist social research or a rejection of science in the name of metaphysics. As an alternative, Horkheimer insisted that social philosophy grasp bourgeois society as a totality, but not assume that this totality was rational. To this end, Horkheimer proposed an interdisciplinary research program that would rely on the “continuous, dialectical penetration and development of philosophical theory and specialized scientific praxis.”22 Of particular interest for the institute’s future work would be “the question of the connection between the economic life of society, the psychical development of individuals and the changes in the realm of culture.”23 By this time the study of the attitudes of German workers was already well underway; Horkheimer would soon initiate a second major empirical research project on the relationship between authority and family structure in Europe and the United States, which would be published in 1936.24 In addition to these projects, Horkheimer would edit the institute’s now famous journal, the Zeitschrift für Sozialforschung (1931–41), which published essays by the remarkable group of scholars directly and indirectly affiliated with the institute, as well as a truly extensive array of reviews of recent publications in the social sciences and humanities.

In addition to directing these collective projects of the institute, Horkheimer continued to develop the philosophical and historical foundations of critical

---

23. Ibid., 11. Horkheimer’s emphasis here on the “relative autonomy” of the culture and psychic character structures illustrates the important difference between his critical theory and the mechanistic “base-superstructure” model advocated by many Marxists (if not Marx himself).
theory in a series of remarkable essays he published over the course of the 1930s. The main themes of Horkheimer’s essays from this time were materialism, the anthropology of the bourgeois epoch, and dialectical logic. Let us examine materialism first before turning to the latter two. In the essays “Materialism and Metaphysics” and “Materialism and Morality,” which were both published in the second volume of the *Zeitschrift für Sozialforschung* in 1933, Horkheimer develops a thoroughly historical concept of materialism, in order to elucidate the philosophical foundations of critical theory. Horkheimer recognizes that materialism has usually been a pariah in the history of philosophy, a seemingly easily refuted metaphysical dogma that higher mental processes can be derived from “matter.” Horkheimer argues that this definition contradicts the basic antimetaphysical tendency of materialism to locate reason within history and society and to see it as a means to improving the quality of human life, not an end in itself. Philosophical materialism is less concerned with absolute truths – such as the primacy of “matter” over “mind” – than with the possibilities of augmenting human freedom and happiness at a particular time and place. Materialism has practical, political implications and has often been associated with concrete freedom movements. Its aim and content are derived from the barriers to human freedom and happiness that exist at any given time and its efforts to comprehend and overcome them.

Horkheimer’s 1936 essay “Egoism and Freedom Movements: On the Anthropology of the Bourgeois Epoch” contained the first comprehensive formulation of the theoretical results of his collaboration with Fromm in the early 1930s. Although Horkheimer had already applied psychoanalysis to empirical studies of contemporary society, by this time he had integrated psychoanalysis into his theory of history as well. He had moved from the “history of bourgeois society” – which served as the foundation for his lectures on modern philosophy in the late 1920s – to the “anthropology of the bourgeois epoch.” Horkheimer’s use of the concept of anthropology must be distinguished from the tradition of philosophical anthropology, which maintains the possibility of determining fundamental characteristics of human beings outside history. Horkheimer, in contrast, analyzes the origins and function of the characteristics of man that have become dominant during the bourgeois epoch. Drawing on Fromm’s efforts in the late 1920s and early 1930s to synthesize psychoanalysis and historical materialism, Horkheimer demonstrates how common historical experiences can create similar psychic structures among members of the same social group. Since these psychic

25. For a more detailed discussion of the theoretical premises that informed this essay, see also his 1932 essay, “History and Psychology,” in *Between Philosophy and Social Science*, 111–29.
structures are relatively autonomous from the dynamic economic base of society, they can play a crucial role in either advancing or – as is more frequently the case – retarding historical progress. Insofar as Marx’s theory of history presupposed a relatively straightforward interest psychology, it needed to be supplemented by the more sophisticated insights of psychoanalysis, which could account for the relative autonomy of psychic structures and the frequent willingness of the lower classes to act in ways that ran contrary to their own best interests.

Through a close historical examination of several typical “bourgeois freedom movements” in the early modern period – ranging from Cola de Rienzo and Savanarola to the Reformation and French Revolution – Horkheimer demonstrates how the bourgeoisie mobilized the masses as allies in their struggle against feudalism and absolutism, while at the same time never allowing their demands to progress to a point that would call into question bourgeois hegemony. The dominant character structures of both the bourgeoisie and the lower classes were formed in this historical process. Following Marx, Nietzsche, Weber, and others, Horkheimer recognized that both the bourgeoisie and the lower classes were subjected to historically unprecedented levels of socially mediated repression. But the function of this repression differed for the two groups, insofar as the self-repression of the bourgeoisie was at the same time its self-assertion, whereas the repression of the lower classes was sacrifice. Horkheimer illustrates various ways in which the lower classes were compensated for their sacrifices, from the reward of membership in the imagined community of virtuous citizens, to the tacitly sanctioned permission to persecute internal or external “enemies” who refuse – or merely appear to refuse – to make the sacrifices demanded of them. Horkheimer drew heavily on Freud’s notions of the mutability of libidinal drives and the baleful consequences of repression to make this last argument. He was particularly interested in overcoming Freud’s naturalization of aggression in a “death drive” by grasping the historically specific forms of cruelty in the bourgeois epoch.

The third key concept in Horkheimer’s critical theory at this time was dialectical logic. It represented a much richer reformulation of his reflections on materialism from the early 1930s and a continuing effort to flesh out the philosophical foundations of a critical theory adequate to twentieth-century societies. In letters from the 1930s Horkheimer speaks repeatedly of his “long-planned work on dialectics,” and makes it clear that he viewed the essays he was

27. Horkheimer’s concept of “dialectical logic” takes as its point of departure Hegel’s efforts to develop an alternative to strictly formal (i.e. analytic and deductive) modes of thinking, which take seriously the unavoidable complementarity of what otherwise appear to be opposed and self-contained categories or aspects of reality.
writing at this time as “in truth merely preliminary studies for a larger work on a critical theory of the social sciences.” Horkheimer’s seminal conceptualization of critical theory in his most familiar and influential essay from this period, “Traditional and Critical Theory” (1937), should be seen as the culmination of the first stage of this larger project, which would eventually become – in a much different form – *Dialectic of Enlightenment*. This larger project can be understood only by examining the other substantial essays Horkheimer wrote during this period, including “Bergson’s Metaphysics of Time” (1934), “The Rationalism Debate in Contemporary Philosophy” (1934), “On the Problem of Truth” (1935), “The Latest Attack on Metaphysics” (1937), and “Montaigne and the Function of Skepticism” (1938). When one re-examines these essays together, the contours of Horkheimer’s larger project on dialectical logic emerge. Horkheimer develops further his criticism of consciousness philosophy, with its reified notion of the ego, which exists outside history and society, and its static and dualistic concept of knowledge, which is unable to conceptualize qualitative change or the relationship of knowledge to society. Horkheimer also puts forth the argument that the philosophy of the bourgeois epoch as a whole is characterized by a recurring dichotomy between science and metaphysics. Horkheimer shows how this antinomy attains its most consequential formulation in Kant's philosophy: for example, in his efforts to limit the natural sciences’ claims to absolute knowledge while at the same time preserving certain key metaphysical principles in the sphere of practical reason. According to Horkheimer, this antinomy appears in different forms throughout the history of modern philosophy: from Montaigne all the way up to vitalism and logical positivism. Although Hegel's philosophy moved decisively beyond the static and dualistic character of traditional logic, he too ultimately reproduced the antimony of science and metaphysics, with his notion of history as the preordained self-realization of Absolute Spirit. Only with Marx’s materialist critique and appropriation of Hegel’s idealistic social theory, was the groundwork for a genuinely empirical and historical understanding of the contradictions of modern capitalist society laid. Horkheimer stresses, in particular, the way in which Marx integrated the findings of the most advanced bourgeois theories of society (Hegel and classical political economy), while at the same time developing a critical conceptual apparatus that also pointed beyond the existing social totality. Horkheimer’s dialectical logic project was an attempt to flesh out the philosophical foundations of Marx’s critical theory and, where necessary, to reformulate it in light of changed historical conditions.

Whereas the concepts of the anthropology of the bourgeois epoch and dialectical logic marked the culmination of his early thought, the period 1938 to 1941 witnessed a significant shift in some of his most basic philosophical positions and set the stage for a new phase in the development of critical theory. This important theoretical shift cannot be fully understood without first examining certain crucial changes in Horkheimer’s life during this time. Foremost among these changes was Horkheimer’s split with Fromm and his increasingly intimate working relationship with Adorno. Fromm had been Horkheimer’s most important theoretical interlocutor from their collaboration on the empirical study of German workers in 1929 through the publication of the *Studies on Authority and Family* in 1936. During this time Horkheimer remained distant from Adorno and, to a surprising extent, critical of his work. But when Fromm began to move away from his earlier, more or less orthodox psychoanalytic position in the mid-1930s, serious tensions began to develop between him and Horkheimer. As was already apparent in his 1935 essay “The Social Determinants of Psychoanalytic Theory,” Fromm had become increasingly critical of Freudian drive theory and Freud’s insistence that the analyst maintain a neutral and distant relationship with his or her patients. Fromm began increasingly to privilege social over sexual factors in the formation of character and the etiology of neuroses; he also followed George Groddeck and Sandor Ferenczi in favoring a more caring relationship between patient and analyst. Adorno, who was living in exile in Oxford at the time, attacked Fromm’s revisions of Freud in a letter to Horkheimer in March 1936, claiming that they represented a “genuine threat to the line of the *Zeitschrift*.” The final break between Horkheimer and Fromm was precipitated by a financial crisis at the institute in the late 1930s. Since Fromm had his own psychoanalytic praxis and was able to earn an independent living, Horkheimer and Pollock asked him in early 1939 to forego his monthly stipend. When Fromm

31. As a member of the Faculty of Philosophy of Frankfurt University, Horkheimer had read and evaluated Adorno’s *Habilitationsschrift* on Kierkegaard in 1931. While praising Adorno’s unconventional method of interpretation and his remarkable grasp of the history of modern philosophy, Horkheimer was skeptical of the strong theological moment in Adorno’s work, which he had appropriated from Benjamin and which Horkheimer believed demonstrated “a philosophical intention that is radically different from my own” (Max Horkheimer, “Bemerkung in Sachen der Habilitation Dr. Wiesengrund,” Archiv des Dekanats der Philosophischen Fakultät der J. W. Goethe Universität, Frankfurt a.M. [Section 134, Number 4], 5). As a result of his debate with Benjamin, an enthusiastic reception of Horkheimer’s writings and a renewed study of Hegel in the mid-1930s, Adorno moved somewhat closer to Horkheimer. After his arrival in New York in February 1938 and the beginning of their intense collaboration – which would culminate in *Dialectic of Enlightenment* – Horkheimer also abandoned many of his positions in the 1930s and moved closer to Adorno.

insisted on his pay, Horkheimer and Pollock offered him a lump sum of $20,000 as a settlement for the termination of his contract as a lifetime member of the institute. In the meantime, Horkheimer had patched up his relationship with Adorno, who left Oxford in February 1938 and finally became an official member of the institute on his arrival soon thereafter in New York. Horkheimer’s theoretical collaboration with Adorno in the following years would lead to a reconfiguration of his own thought of the tradition of critical theory as a whole, which found its first full expression in 1944 with the publication of *Dialectic of Enlightenment*.34

Horkheimer’s theoretical shift in the late 1930s and early 1940s has been variously described as a “pessimistic turn,”35 a “rephilosophization of Critical Theory,”36 and a shift from “the critique of political economy to the critique of instrumental reason.”37 The most important overall factor in this shift was Horkheimer’s adoption of a modified version of the “state capitalism” thesis, which had been worked out over the course of the previous decade by his longtime friend and institute colleague Friedrich Pollock. Pollock and Horkheimer viewed state capitalism as the logical conclusion of a process that had begun with the rise of liberal capitalism in the eighteenth and nineteenth centuries and continued with the transition to monopoly capitalism around the turn of the century. Whereas liberal capitalism had been defined by a large number of small and medium-sized privately owned firms, which competed with each other in both domestic and international markets and whose relations were regulated by formal law, under monopoly capitalism increasingly large corporations and cartels came to dominate domestic markets and compete with each other at the international level. State capitalism reinforced and completed these tendencies by bringing the large corporations and cartels under state control, for the purposes of more efficient, planned domestic production and distribution and more effective international competition. Horkheimer identified the “integral statism” of the Soviet Union as the purest form of state capitalism, but he viewed fascism and the new state-interventionist economies of Western Europe and the United States as different versions of the same basic form. What characterized state capitalism everywhere, according to Horkheimer, was the tendential elimination of the economic, social, and cultural forms of mediation peculiar to bourgeois society in its liberal phase. These included not only the market, the rule of law and

34. *Dialectic of Enlightenment* was republished in a larger, revised edition in 1947. For a discussion of *Dialectic of Enlightenment*, see Deborah Cook’s essay in this volume.
replacement of individual owners by shareholders or the state, but also relatively autonomous spheres of bourgeois cultural life, such as art, the family, and even the individual him or herself. Social domination had, in other words, become much more direct under state capitalism. The independent economic dynamism of capitalism had been replaced by the primacy of politics. The operations of politics came increasingly to resemble a common “racket”; survival and protection were secured through obedience to the most powerful groups. Capital and large labor unions collaborated in the planning of the economy and divided up the spoils between them. Insofar as surplus value continued to be produced and appropriated by a dominant social class, capitalism still existed, but the political and ideological integration of the working class eliminated the possibility of any serious opposition emerging in the future.

Horkheimer’s acceptance of the state capitalism thesis reflected the changed historical realities of state-interventionist economic models that arose in the mid twentieth century. From our contemporary post-Soviet, post-Fordist perspective, it is clear that “state capitalism” was not the “end of history” – as Horkheimer and Adorno feared at the time – but rather a new phase in global capitalist development that would begin to unravel in the early 1970s. But Horkheimer’s adoption of the state capitalist thesis brought with it a fundamental rethinking of many of the basic assumptions that had informed his critical theory in the 1930s. First, the focus of critical theory shifted from a historically specific critique of social domination within modern capitalism to a transhistorical critique of instrumental reason and the domination of nature. Second, this shift was reflected in the increasing prominence of a negative philosophy of history, which Adorno had adopted from Benjamin in the late 1920s. Third, Horkheimer became increasingly skeptical about the emancipatory character of the Enlightenment ideals that had guided his earlier work. While working on his project on dialectical logic, Horkheimer still believed in the possibility of a materialist reinterpretation and realization of basic Enlightenment principles. Dialectic of Enlightenment demonstrated clearly his new conviction that only a radical critique of these principles could create a new, self-reflexive concept of Enlightenment that could transcend its inherent limitations. Fourth, Horkheimer’s new-found pessimism about the Enlightenment also translated into a radical critique of science in its traditional forms. Whereas Horkheimer’s model of critical theory in the 1930s rested heavily on a critical integration of research from a wide variety of scientific and scholarly disciplines, in Dialectic

38. For a detailed examination of this important shift of emphasis, see Gerd-Walters Küsters, Der Kritikbegriff in der Kritischen Theorie Max Horkheimers (Frankfurt: Campus, 1980).
The principal tenets of critical theory, as it was practiced by the institute in the 1930s, were developed by Horkheimer, although he also benefited greatly from his collaboration with Fromm. The other members of the “inner circle” of the institute in the 1930s – Pollock, Löwenthal, and Marcuse – all made crucial practical and theoretical contributions to the institute’s work. We have already discussed Pollock’s ideas on state capitalism, which became so important for Horkheimer in the late 1930s. Pollock also served as the main financial administrator for the institute. Löwenthal published several key essays on the sociology of literature in the *Zeitschrift*, which reflected the institute’s Marxist principles and its concern with authoritarian ideology. Löwenthal also served as the principal copy-editor of the *Zeitschrift* throughout its ten-year existence. Nonetheless, in terms of their contributions to critical theory in the 1930s, one can say that Herbert Marcuse played a more significant theoretical role than did Pollock or Löwenthal. Marcuse’s contribution to the development of critical theory during this time is also worth examining more closely insofar as he remained loyal to this model of critical theory for the remainder of his life. Marcuse’s popularity as an exponent of critical theory in the 1960s and 1970s also justifies a more detailed analysis of his early trajectory and his contributions to critical theory in the 1930s.

II. MARCUSE AND EARLY CRITICAL THEORY

Herbert Marcuse was born in 1898 to a wealthy, assimilated Jewish family in Berlin. Just after finishing his final examination for the *Gymnasium* in 1916, Marcuse was drafted into the army where he served until the end of war, without ever facing active combat. As with so many others, Marcuse was radicalized politically by the war. He joined the Social Democratic Party (SPD) in 1917, but

40. Max Horkheimer and Theodor W. Adorno, *Dialectic of Enlightenment: Philosophical Fragments*, Edmund Jephcott (trans.) (Stanford, CA: Stanford University Press, 2002), xiv. The fact that Horkheimer and Adorno continued to carry out empirical research projects in the 1940s (most notably, the five-volume *Studies in Prejudice*) and that empirical research remained a crucial aspect of the institute’s work after its re-establishment in Frankfurt after the war, demonstrated that Horkheimer never completely abandoned his early model of “interdisciplinary materialism.” Nonetheless, *Dialectic of Enlightenment* does represent a substantial break from Horkheimer’s position in the 1930s and a model of critical theory that is more consonant with Adorno’s overall philosophical trajectory.

41. See, for example, Leo Löwenthal, “Knut Hamsun,” in *The Essential Frankfurt School Reader*, Arato and Gebhardt (eds).

42. A *Gymnasium* is an elite German high school guided by the principles of classical humanism.
after the German defeat and outbreak of revolution in November 1918, he served in a revolutionary soldiers’ council in Berlin. During this time Marcuse began to study seriously the writings of Marx and Engels; he also attended speeches and rallies led by Rosa Luxemburg and Karl Liebknecht. When they were murdered in January 1919, Marcuse cancelled his membership in the SPD, whose leaders he held responsible for their death. Although Marcuse admired the ill-fated attempt of the Munich Council Republic in the spring of 1919 to synthesize utopian aesthetic ideals with radical political principles, after his departure from the SPD he would not become directly involved in politics again until the 1960s.43 He began his university studies in 1919 at the Humboldt University in Berlin and then transferred the following year to the Albert-Ludwig University in Freiburg. In Berlin Marcuse studied German literature for four semesters and also participated in discussions in a leftist literary group, which was attended by Benjamin and – less frequently – Georg Lukács. In Freiburg Marcuse continued his studies in German literature and supplemented them by attending lectures in philosophy and national economy.

Marcuse’s dissertation, for which he was awarded a PhD *summa cum laude* in 1922, examined the German *Künstlerroman*, or artist-novel (a sub-genre of the *Bildungsroman*, or novel of development), from the theoretical standpoint of Hegel’s aesthetics and Lukács’ *Theory of the Novel*. According to Marcuse these artist-novels – such as Karl Phillip Moritz’s *Anton Reiser*, Goethe’s *Wilhelm Meister*, and Gottfried Keller’s *Green Henry* – illustrated the fate of the individual and art in a society being transformed by capitalist modernization. Following Lukács, Marcuse argued that in a society characterized by “transcendental homelessness,” the novel assumes the role of preserving the ideal of a less alienated existence.44 The marginal social position of the antiheroes of the artist-novel embody the fate of art in a world that has become prosaic, and their mostly unsuccessful attempts to overcome their alienation highlights the “problematic” nature of society as a whole. Marcuse’s dissertation introduces several themes that would figure prominently in his later work, such as the importance of the aesthetic dimension as a source of transcendent social critique, or the search for new forms of critical subjectivity among marginal social groups.

After a five-year interlude in Berlin, during which time he worked on an extensive bibliography of Schiller and immersed himself in the Weimar cultural

43. Unless one counts as “political” his intelligence work for the Office of Strategic Services during the Second World War. For this chapter of Marcuse’s life see Barry Katz, *Herbert Marcuse and the Art of Liberation* (London: Verso, 1982), 111–35.
44. “The novel is the epic of an age in which the extensive totality of life is no longer directly given, in which the immanence of meaning in life has become a problem yet which still thinks in terms of totality” (Georg Lukács, *Theory of the Novel*, Anna Bostock [trans.] [Cambridge, MA: MIT Press, 1971], 56).
scene, Marcuse returned to Freiburg to study philosophy with Heidegger, who had just published his magnum opus, *Being and Time*. Like many others of his generation, Marcuse was deeply impressed with *Being and Time*, which he saw as a breakthrough beyond the sterile positivism and neo-Kantianism that had dominated philosophical debates in German universities for several decades. Marcuse viewed Heidegger’s existential analytic of Dasein as the most advanced attempt to bring the individual subject, in its full concreteness, back to the center of philosophical debate. He was also fascinated by Heidegger’s stress on the historicity of Dasein, and his argument that Dasein could be authentic only if its actions were guided by a full awareness of its historical possibilities. But Marcuse never became a Heideggerian himself; his purpose from the beginning was to use the most advanced aspects of Heidegger’s project to revitalize the reified Marxist theory of his day. Frustrated with the economist orthodoxy of the Second International, which provided ideological justification for the Social Democratic reformism, and no less satisfied with the vanguardism of the Bolsheviks, Marcuse wrote a series of essays while studying with Heidegger that sought to re-establish the importance of subjectivity and historicity in Marxist theory. His efforts eventually led him down the same path Lukács had followed a few years before in *History and Class Consciousness*, namely to a re-examination of the philosophical origins of Marx’s theory, particularly in the work of Hegel. Marcuse’s *Habilitationsschrift*, which he wrote under Heidegger’s guidance, was an attempt to recover the concepts from Hegel’s work that he believed were necessary to put Marxist theory back on the right track. In this, his first full-length study of Hegel, and in his essays from this period, Marcuse developed a highly original, and often trenchant interpretation not only of several of Marx’s and Hegel’s central concepts—such as labor, alienation and the dialectical method—but also of *Being and Time*.

Heidegger’s own political reading of *Being and Time*, which led him temporarily to pin his hopes on the National Socialists as the potential saviors of “fallen” German Dasein, came as a shock to Marcuse and forced him to rethink his

45. For Marcuse’s essays from this period see *Heideggerian Marxism*, Richard Wolin and John Abromeit (eds), John Abromeit et al. (trans.) (Lincoln, NE: University of Nebraska Press, 2005).
47. Heidegger’s concept of “Dasein,” which he develops most fully in *Being and Time*, represents an attempt to overcome the tradition of subject–object dualism characteristic of modern consciousness philosophy (see note 13, above). Heidegger argues that human beings are always already located within the broader contexts or “worlds” of “involvement” and “meaning.” The traditional concepts of “subjectivity” or “individuality” are false insofar as they presuppose the possibility of the abstracting of human “Dasein” from the “worlds” in which it is ontologically embedded.
relationship to Heidegger’s philosophy, Marcuse had the good fortune of being able to pursue this self-critical re-evaluation of Heidegger, and to contribute more broadly to the development of critical theory, through his collaborative work with Max Horkheimer’s Institute for Social Research in the 1930s. After a brief stint at the institute’s branch office in Geneva, Marcuse immigrated to New York to join Horkheimer and the other members of the relocated institute, whose former headquarters in Frankfurt had been confiscated by the Nazis. Marcuse’s theoretical production in the 1930s converged with Horkheimer’s on three main issues: the dialectic of bourgeois society, and the critique of positivism, and authoritarianism.

Marcuse adopted Horkheimer’s model of a dialectic of bourgeois society, which can be summarized in the following way. With the historical transformation of the bourgeoisie from a revolutionary social force in the early modern period to the new ruling class in the nineteenth century, the progressive concepts and ideals, which it had used to justify its struggle against feudalism and absolutism, often assumed a repressive or ideological function. For both Horkheimer and Marcuse this historical dialectic posed critical theory with several tasks: the critique of the new, ideological function of these concepts and ideals, the recovery of their original, progressive content, and their transformation into a new, critical form adequate to the changed historical conditions. Two examples of the dialectic of bourgeois society, as it appeared in Marcuse’s work at this time, can be found in his discussion of the concepts of natural law and essence. In his 1934 essay “The Struggle Against Liberalism in the Totalitarian View of the State,” Marcuse shows how the historical transformation of bourgeois society brought with it a transformation of the basic understandings of nature and natural law.48 Whereas natural law had provided bourgeois philosophers in the early modern period with an immutable transcendent standard, to which they could appeal in order to criticize the fixed hierarchies and inherited privileges of the feudal order, under fascism the “laws of nature” were used to justify irrational mythologies of blood and soil and to prevent any transcendent critique of the status quo. Whereas the new market economy had been justified as a natural and harmonious order, under fascism existing inequalities were concealed and justified by the pseudo-scientific theories of social Darwinism and inherent racial inequality. Similarly, in his 1936 essay “The Concept of Essence,” Marcuse demonstrates how, at the beginning of the modern epoch, philosophers attributed the power to separate essence from appearance to the free and rational individual. With the help of their rational faculties and/or their

48. These two and the rest of Marcuse’s main essays from the 1930s are available in Herbert Marcuse, Negations: Essays in Critical Theory, Jeremy J. Shapiro (ed. and trans.) (Boston, MA: Beacon Press, 1968).
senses, each person had the ability to establish the truth on their own. But by the end of the epoch – signaled by the triumph of fascism – the concept of essence was used to bind unfree individuals to the status quo and to undermine their belief in the critical power of reason. In philosophy, the autonomous spontaneity of the concept was replaced by the heteronomous receptivity of the “intuition of essences.” In the new authoritarian ideology, essentialist concepts of gender and race were used to justify exploitative social relations.

But Horkheimer’s understanding of the dialectic of bourgeois society also implied recovering the progressive content of the philosophical ideals of the bourgeoisie during its “heroic” phase. In contrast to some of his later, more pessimistic positions – *Dialectic of Enlightenment*, for example – in the 1930s Horkheimer still believed that Enlightenment ideals were essentially critical and ultimately pointed beyond bourgeois society. At a time when the Enlightenment and the ideals of 1789 were being subjected to virulent criticism by theorists sympathetic to fascism, such as Giovanni Gentile (1875–1944) and Carl Schmitt, the defense and recovery of their progressive content became more urgent than ever. In contrast to Horkheimer, who became wary early on of the dangerous political implications of the widespread revolt against science, the Enlightenment, and rationality more generally in Weimar Germany, Marcuse’s work in the 1920s and early 1930s was still heavily influenced by phenomenological and vitalist critiques of reason. It was not until after Marcuse joined the institute in 1933 that he re-evaluated his earlier antirationalist positions and developed an explicit critique of the “political existentialism” of Heidegger and Schmitt. Marcuse’s new-found respect for the critical potential of rationalism came through clearly, for example, in the following passage on Descartes:

> It is often asserted today that Descartes, by beginning with the *ego cogito*, committed the original sin of modern philosophy, that he placed a completely abstract concept of the individual at the basis of theory. But his abstract concept of the individual is animated by concern with human freedom: measuring the truth of all conditions of life against the standard of rational thought.⁴⁹

Marcuse’s continued re-evaluation of the critical potential of the rationalist tradition culminated in his 1941 study *Reason and Revolution: Hegel and the Rise of Social Theory*. His earlier study *Hegel’s Ontology and the Theory of Historicity* was written under the guidance of Heidegger and developed an antiepistemological interpretation of Hegel by reconstructing the concept of “life” in his early thought: that is, the same concept that vitalism philosophers such

---

as Nietzsche and Bergson had mobilized in their critiques of rationalism and positivism. *Reason and Revolution*, in contrast, emphasized Hegel’s critical and dialectical rationalism in order to dispel the widespread Anglo-American view that his philosophy had somehow inspired the authoritarian ideology of the National Socialists.

Marcuse’s first book written in English, *Reason and Revolution*, was intended to introduce the theoretical premises of the institute to a broader audience. It can still be read profitably today by anyone interested in nineteenth-century social theory or the intellectual historical foundations of critical theory. At the core of *Reason and Revolution* was a critique of positivism, which provided the historical background for arguments set forth by Horkheimer in the mid-1930s. As with the key philosophical concepts of natural law and essence, the concept of reason had also undergone a decisive historical shift as a result of the dialectic of bourgeois society. The critical, transcendent, and dialectical notion of reason, which Marcuse had identified in the philosophy of Descartes and – to a much greater extent – Hegel, had devolved into an affirmative subordination of reason to the natural sciences, which denied the very distinction between essence and appearance. Whereas Horkheimer had been deeply concerned by the irrational reactions to positivism in Weimar Germany, after fleeing to the United States and being confronted with the increasing dominance of positivism in Anglo-American intellectual life – which was reinforced by the arrival of exiles from Austria and Germany who were sympathetic to positivism, such as the members of the Vienna Circle – the focus of his arguments began to shift. Horkheimer refused to accept the reduction of reason to the methods of “logical empiricism,” as Rudolf Carnap, Bertrand Russell, and others would have it. In his 1937 essay “Philosophy and Critical Theory,” which Marcuse wrote as a companion piece to Horkheimer’s “Traditional and Critical Theory,” he extrapolates on Horkheimer’s critique of positivism and defends both the role of speculative philosophy and the imagination in the determination of the truth against the restrictive limitations placed on reason by the logical positivists.

One last way in which Marcuse’s theoretical work in the 1930s converged with Horkheimer’s vision of critical theory was his critique of authoritarianism. We have already briefly examined Marcuse’s analysis of authoritarian ideology in his essay “The Struggle Against Liberalism,” but Marcuse also contributed

52. *Ibid.* [*] See also the essay by Michael Friedman and Thomas Ryckman in *The History of Continental Philosophy: Volume 3*. 

68

Volume 5
a lengthy and substantial intellectual historical introduction to the institute's *Studies on Authority and Family*, which was published alongside Fromm's social-psychological and Horkheimer's general introductory essays.\(^{53}\) In his essay, Marcuse applies once again Horkheimer's model of the dialectic of bourgeois society, with a focus this time on the historical transformation of the concept of freedom. Beginning with a discussion of Luther and Calvin, Marcuse shows how the bourgeois concept of freedom was contradictory from the very beginning. Luther and Calvin's theology contained strong anti-authoritarian impulses, whose historical role was to emancipate the individual from his or her dependence on the centralized power of the papacy and the Church, and the feudal institutions they legitimized. But this emancipation remained partial and actually prepared the way for the uncritical acceptance of new forms of secular authority. Marcuse stresses, in particular, the *internalization* of freedom implied in Luther's writings and the compatibility of this pure, internal notion of freedom with external authority of almost any kind. Continuing with a discussion of Kant and Hegel, Marcuse argued that both men placed freedom at the center of their philosophies, albeit in an idealistic form, which led all too quickly and easily to accommodation with the unfree political conditions of the time. Marx's critique of the internalized, idealist concept of freedom represented a decisive step forward, insofar as he identified its social origins and linked the expansion of freedom to the transformation of existing social relations. Marcuse also examines the explicitly authoritarian doctrines of the counter-revolutionary theorists Edmund Burke, Louis de Bonald, and Joseph de Maistre. He attempts to demonstrate how their doctrines, which were originally a defense of feudal and/or absolutist institutions against the most progressive elements of the bourgeoisie, were in many cases adopted by the bourgeoisie as it consolidated its power in the course of the nineteenth century and was forced to meet the challenge of a militant workers' movement. Finally, Marcuse demonstrates how Georges Sorel and Vilfredo Pareto – despite their political differences – marked the transition to the new authoritarian doctrines of the twentieth century with their celebration of irrationality, discipline, and the necessity of ruling elites.

While there is no question that Marcuse eagerly adopted Horkheimer's model of critical theory and found it congenial to his own philosophical interests, he also continued to develop ideas of his own in the 1930s. Most important in this regard were Marcuse's abiding interests in concrete subjectivity and aesthetics. Although Horkheimer was also very much interested in developing a sophisticated theory of subjectivity – to supplement Marx's theory – he approached this problem by way of psychoanalysis. Like Horkheimer, Marcuse believed that

---

Marx’s theory needed to be supplemented by a more sophisticated theory of subjectivity and his initial attraction to Heidegger was based in large part on his belief that his existential analysis of Dasein in Being and Time might be useful for this purpose. While Marcuse’s philosophical reliance on Heidegger diminished greatly after the publication of Marx’s Paris Manuscripts in 1932 and Heidegger’s political debacle in 1933, he did not integrate psychoanalysis into his own thought until the 1950s.

In his 1938 essay “On Hedonism,” Marcuse approached the problem of subjectivity instead from a historical and philosophical standpoint. After examining the philosophical doctrines of Cyrenaic and Epicurean hedonism and their ancient (Plato) and modern (Hegel) critics, Marcuse identified the critical moment in hedonism – and its affinity with critical theory – in its defense of individual happiness and pleasure against their internalization, spiritualization, and subordination to “higher” faculties or the demands of the community. Marcuse was not defending an anarchist or libertarian free for all; in fact, he praised both Plato and Hegel’s critiques of hedonism for demonstrating that happiness has an essential objective moment and cannot ever be truly realized outside a well-ordered and just society. But insofar as the particular interests of everyone are not adequately contained in the social totality of modern capitalist societies, the hedonist demand for individual gratification retains critical truth-value. Marcuse demonstrates how the subordination of individuals’ sensuous needs and desires in the society dominated by abstract labor is reflected in idealist concepts of rationality, morality, and freedom. He writes: “Insofar as the individual partakes of universality only as a rational being and not with empirical manifold of his needs, wants, and capacities, this idea of reason implicitly contains the sacrifice of individual.”

Marcuse also points out how hedonism provides an important antidote to the debilitating effects of repressive forms of socialization. Hedonism counteracts the formation of authoritarian character structures, because a “man educated to internalization will not be easily induced, even under extreme wretchedness and injustice, to struggle against the established order.”

Marcuse’s first dissertation on the German artist-novel testified to an early interest in aesthetics that would remain a crucial aspect of his thought for the rest of his life. His 1937 essay “The Affirmative Character of Culture” demonstrated that aesthetic issues continued to play a crucial role in his thinking. Marcuse argued that in modern, bourgeois society art had two primary and contradictory

56. For an interpretation that stresses the centrality of aesthetics for Marcuse’s critical theory as a whole, see Katz, Herbert Marcuse and the Art of Liberation.
functions, both of which resulted from its separation from the material sphere of the production and reproduction of the necessities of life. On the one hand, the artistic expression of the deepest needs and highest ideals of humanity played an affirmative, ideological role, insofar as it concealed the social mechanisms that prevented their realization. On the other hand, by articulating and preserving these needs and ideals art provided a transcendent critique of the status quo, a promesse du bonheur of the possibility of better society. Marcuse also demonstrated how the relative importance of these two roles shifted during the historical transformation of bourgeois society. During its early, revolutionary phase, the critical, utopian function of art was more important, while in the later, more repressive phase the affirmative character of art began to gain the upper hand. With the triumph of authoritarianism in the twentieth century, the transcendent, “aesthetic dimension” was completely eliminated, as art was forced into direct service of oppressive political regimes.

III. MARCUSE’S LATER WRITINGS

The primary purpose of this essay has been to provide a comprehensive overview of two of the three main currents that went into the formation of the “first-generation” Frankfurt School critical theory in the 1920s and 1930s. But since Marcuse went on to play an important role in the dissemination of critical theory, particularly in the Anglo-American world, and since he retained and developed many of the assumptions developed by Horkheimer and Fromm in the 1930s – even after they had abandoned them themselves – I shall also offer a brief overview of his later work. Although Horkheimer played a crucial role in the re-establishment of the Institute for Social Research in Frankfurt in 1951, his theoretical production after the war was quite limited compared to that of Adorno and Marcuse. Since Horkheimer carried out his most important work in the 1930s and 1940s, an examination of his writings in the postwar period is not essential to understanding the main currents of critical theory.

57. Marcuse borrowed this expression (“promise of happiness”) from Nietzsche (On the Genealogy of Morals, Third Essay, §6), who had adopted it, in turn, from Stendahl.
The early 1940s were an important transitional period for the critical theorists. During this time the operations of the New York office of the institute were drastically reduced, the last issue of the Zeitschrift für Sozialforschung was published, and Horkheimer moved to Los Angeles to dedicate himself to completing his project on dialectical logic. While he had originally intended to collaborate with Marcuse on this project, Horkheimer had in the meantime developed a higher estimation of Adorno’s theoretical ability and had chosen him as his primary collaborator. The shift in Horkheimer’s position in the late 1930s had pushed him away from Marcuse and brought him closer to Adorno theoretically. This shift, combined with Adorno’s new role as a full partner in the project, explains why Dialectic of Enlightenment represented something qualitatively new vis-à-vis Horkheimer’s original plans for a dialectical logic. Marcuse remained committed to the theoretical position developed at the institute in the 1930s, but due to Horkheimer’s increasing proximity to Adorno and the financial crisis of the institute, Marcuse chose to accept a job working for the Office of Strategic Studies (OSS) in Washington in the fall of 1942. The newly created OSS was dedicated to gathering intelligence for the war and the postwar reconstruction of Germany. Marcuse worked there for nearly a decade and was joined at various times by several other influential émigré scholars, including his former institute colleagues Franz Neumann and Otto Kirchheimer. Although not a particularly productive period for Marcuse theoretically, it was not a period of intellectual dormancy either. Marcuse produced several important studies of National Socialist Germany, which have been published only recently, and

60. On the OSS and the role foreign scholars such as Marcuse played in it during the war, see Barry Katz, Foreign Intelligence: Research and Analysis in the Office of Strategic Services, 1942–5 (Cambridge, MA: Harvard University Press, 1989).

61. Franz Neumann (1900–1954) and Otto Kirchheimer (1905–65) both trained as legal scholars and both were actively involved in politics in Weimar on the left wing of the Social Democratic Party. After fleeing from the Nazis, both became associates of the Institute for Social Research. Kirchheimer joined the Paris branch of the institute in 1934 and continued working for the New York office after his emigration to the US in 1937. Neumann retrained himself as a political scientist at the London School of Economics, completing a PhD under the direction of Harold Laski in 1936. In 1942 Neumann published his massive study of National Socialism, Behemoth, which differed in important respects from the institute’s core members’ analysis of Nazism, but was nonetheless recognized by Horkheimer and others as a remarkable achievement. For an overview of Kirchheimer and Neumann’s work and their relationship to the other members of the institute, see William E. Scheuermann, Between the Norm and the Exception: The Frankfurt School and the Rule of Law (Cambridge, MA: MIT Press, 1994).
worked through a massive amount of empirical data on fascism, which would inform his later work.\(^{62}\)

Since his critical appropriation of Heidegger’s existential analysis of Dasein in the late 1920s, Marcuse had been attempting to move beyond the abstract theories of subjectivity that had dominated Western philosophy. But in contrast to Horkheimer and Adorno, who both became interested in psychoanalysis in the 1920s, Marcuse did not seriously engage with Freud’s writings until after the Second World War. The result was *Eros and Civilization: A Philosophical Inquiry into Freud*, which Jürgen Habermas has aptly described as Marcuse’s “most characteristic” work.\(^{63}\) In *Civilization and its Discontents* and elsewhere, Freud had argued that the levels of instinctual repression necessary to maintain civilization were more or less constant throughout history. But, following the path blazed by Fromm and Horkheimer in the 1930s, Marcuse sought to recover a hidden, emancipatory trend in psychoanalysis, through a historicization of Freud’s categories. Although he does not mention Marx’s name explicitly a single time in the text, Marcuse’s main argument rests heavily on his dialectical analysis of modern capitalist societies. With his analysis of abstract labor and the ascetic character of the bourgeoisie, Marx had demonstrated that modern capitalism brought with it historically unprecedented levels of socially mediated repression. But, at the same time, by forcing the development of science and technology and increasing the material wealth of society as a whole, capitalism also created the possibility for a society in which levels of alienated labor – which Marcuse translates into Freudian terms as repressive sublimation – could be greatly reduced. The dominant place formerly occupied by wage labor would give way to new forms of nonrepressive sublimation, which would more closely resemble artistic creation or play. In a crucial theoretical supplement Marx’s focus on objective historical factors, which draws on Horkheimer and Fromm’s social-psychological investigations, Marcuse argues that the objective emancipatory tendencies in capitalism are thwarted subjectively by the internalization of repressive character structures. Marcuse draws, in particular, on Freud’s speculative theory of the origins of society as a revolt against patriarchal authority followed by a restoration of even stricter fraternal law, in order to demonstrate how the “archaic heritage” of “repression – revolt – restoration of repression at a higher level” is still at work in modern capitalist societies.\(^{64}\)

---

levels of repression attenuate the inherent tendency of Eros to form lasting social bonds and keep the destructive impulses of Thanatos in check, then this historical cycle becomes more ominous in modern societies. Auschwitz and the atom bomb leave no doubt about the catastrophic potential for the “scientific extermination of men” that modern technology has brought with it. Thus, far from defending an optimistic social or technological determinism, *Eros and Civilization* draws attention to the subjective factors necessary to realize the objective possibilities of a “nonrepressive civilization” and a “pacification of existence” created by modern capitalism.

Although his next two books seem very different on the surface, *Soviet Marxism* (1958) and *One-Dimensional Man* (1964) have much in common. Both proceed from an analysis of technological rationality that, according to Marcuse, plays a dominant role in the organization of both Soviet state socialism and Western capitalist democracies. As always, Marcuse stresses the contradictory character of technological rationality. On the one hand, its development creates the possibility of overcoming the “primacy of industrialization over emancipation” in the Soviet Union and the “comfortable, smooth, reasonable, democratic unfreedom” in the West. On the other hand, technological rationality also conceals and perpetuates social domination in both contexts: that of the state and party bureaucracy over the rest of society in the Soviet Union and that of the ruling class and the “conservative popular base” over the “outcasts and outsiders, the unemployed and the unemployable” in the West. What Marcuse says here of the Soviet Union, also holds true in the capitalist West:

> The technological perfection of the productive apparatus dominates the rulers and the ruled while sustaining the distinction between them. Autonomy and spontaneity are confined to the level of efficiency and performance within the established pattern … Dissent is not only a political crime but also a technical stupidity, sabotage, mistreatment of the machine.

In addition to analyzing the peculiar social forms of the state-centric forms of Fordist capitalism, which emerged around the globe in the mid twentieth century, Marcuse also devotes substantial attention in both works to the forms

---

of ideology that accompanied them. Through an “immanent critique” of Soviet ideology, Marcuse shows how Marx’s critical and historically specific categories were transformed into the affirmative, metaphysical doctrine of “dialectical materialism.” Through an analysis of the “closing of the universe of discourse” in the spheres of politics, philosophy, and art, Marcuse demonstrates how any critical tendencies, which point beyond capitalist social relations in the West, are also stifled or recuperated. The concept of one-dimensionality refers precisely to this elimination of transcendent impulses, which results in a society “without opposition.”

Despite the deeply pessimistic character of its analysis, One-Dimensional Man would soon become one the most important theoretical texts for the New Left and the burgeoning protest movements of the 1960s. Selling over 100,000 copies in the late 1960s, One-Dimensional Man catapulted Marcuse out of his role as a relatively unknown philosopher and social theorist, to one of the most widely debated public intellectuals of the day. This changed role was also reflected in Marcuse’s writings from the time.69 In 1965 he published what is certainly his most controversial essay: “Repressive Tolerance.” At a time when the liberal establishment was escalating the war in Vietnam and the civil rights movement was becoming increasingly militant owing to the violent backlash against its efforts to secure basic constitutional rights for African Americans, Marcuse’s essay was an explicit endorsement of the necessity of an “extra-parliamentary” opposition in the US. Echoing Horkheimer’s model of a dialectic of bourgeois society, Marcuse argued that tolerance had originally been a revolutionary value, intended to undermine the monopoly of the Church and absolutist state on the means of legitimate expression.70 But after the historical triumph of the bourgeoisie, the concept of tolerance lost its critical and transcendent character, insofar as the informed and the uninformed, the progressive and the reactionary, the humane and the cynical were now all “tolerated” equally. On this basis, Marcuse proceeded to the following problematic conclusion:

Withdrawal of tolerance from regressive movements before they can become active; intolerance even toward thought, opinion and word, and finally, intolerance in the opposite direction, that is, toward the political Right – these anti-democratic notions respond to the actual development of the democratic society which has destroyed the basis for universal tolerance.71

69. For a sampling of Marcuse’s writings from this period, see Herbert Marcuse, The New Left and the 1960s, Douglas Kellner (ed.) (New York: Routledge, 2005).
70. Horkheimer made a very similar argument about tolerance in the essay, “Montaigne and the Function of Skepticism,” in Between Philosophy and Social Science.
71. Ibid., 110–11.
Marcuse's tendency here to see democratic rights primarily as a form of ideology used to mask social domination, and not as a historical achievement that would need to be preserved in any future socialist society, points to a democratic deficit in his thought, which was also apparent in his tendency to place more emphasis on the similarities rather than the differences between Soviet and Western societies. In this respect, too, Marcuse continued the legacy of Horkheimer's critical theory in the 1930s, which had since been abandoned by Horkheimer himself.\textsuperscript{72}

Marcuse's next two works, \textit{Essay on Liberation} (1969) and \textit{Counter-Revolution and Revolt} (1973), were also products of the highly charged political conditions of the time. True to Marx's and Horkheimer's determinations of materialism and his own earlier insistence that philosophy play an active role in changing society, Marcuse saw no contradiction between theoretical reflection and political engagement.\textsuperscript{73} Marcuse participated actively in many different political events in the late 1960s, including numerous teach-ins and marches against the war in Vietnam.\textsuperscript{74} Marcuse was in France when the massive wave of student protests and workers' strikes erupted in May 1968 and he participated actively in political debates and actions. The strong sensual and aesthetic moment expressed in the utopian posters and slogans that appeared on the walls during the May “events” – such as “all power to the imagination” and “the restraints imposed on pleasure excite the pleasure of living without restraints” – resonated deeply with Marcuse's vision of an emancipated society.\textsuperscript{75} In fact, Marcuse dedicated \textit{Essay on Liberation} to the “young militants” and “rebels” of May 1968.

The most important concept Marcuse introduced in \textit{Essay} was the notion of a “new sensibility,” which expressed once again his theoretical interest in the subjective conditions of social transformation in advanced capitalist societies. Marcuse argued that the strong erotic and aesthetic moment in the May events, and the 1960s counter-culture more generally, may anticipate the development

\textsuperscript{72}. This is not to say that Horkheimer's trend toward an unreflective Cold War liberalism was unproblematic; instead, it points to the necessity for a re-examination and reintegration of the best aspects of the liberal-democratic political tradition into critical theory. This was a project that was already begun by Neumann in the 1930s and which was continued – in a much different way – by Habermas.

\textsuperscript{74}. For a humorous account of Marcuse's participation in an anti-war march in Oakland in 1965, see Carl Schorske, “Encountering Marcuse,” in \textit{Herbert Marcuse: A Critical Reader}, Abromeit and Cobb (eds), 256.

of new character structures, which pointed beyond what Horkheimer had earlier identified as the “anthropology of the bourgeois epoch.” Soon chastened by the ferocious backlash against the protest movements and the dissolution of the counter-culture into regressive and escapist forms, Marcuse was forced to admit in *Counter-Revolution and Revolt* that his hopeful analysis had been premature. The sado-masochistic character structure, which had originally taken shape among the bourgeoisie in the early modern period, had since become dominant among the majority of the working class in the most advanced industrialized countries, which explained the *retour à la normale* in France and the reassertion of the “silent majority” in the US. While Marcuse warmly greeted what he considered the two most important outgrowths of the 1960s protest movements, namely a revival of feminism and the birth of a substantial environmental movement, the prognosis for the present was on the whole rather bleak.

He called, in particular, for a re-examination of the link between capitalism and authoritarianism, as analyzed in the social-psychological and empirical studies of Horkheimer, Fromm, Löwenthal, and Adorno.

In his final work, *The Aesthetic Dimension* (1979), Marcuse completed a full circle that brought him back to his earliest concerns with aesthetics. As we have seen, in his earlier work on aesthetics, such as “The Affirmative Character of Culture,” Marcuse had placed more emphasis on the ideological character of bourgeois art than on its critical and transcendent qualities. Marcuse’s much less qualified defense of the autonomy of aesthetic form in *The Aesthetic Dimension* not only testified to the failed attempts in the 1960s to revive the program of the historical avant-garde of merging art and life, but also represented a gesture to Adorno’s posthumously published magnum opus, *Aesthetic Theory*, which reiterated his longstanding criticisms of such attempts. The change of emphasis

---

80. For a clear articulation of Adorno’s reservations about this aspect of the historical avant-garde, see his exchange with Benjamin in *Aesthetics and Politics: The Key Texts of the Classic Debate within German Marxism*, Ronald Taylor (ed. and trans.) (London: Verso, 1977), 110–33.
in Marcuse’s position and his greater proximity to Adorno come through clearly in the following passages:

In contrast to orthodox Marxist aesthetics I see the political potential of art in art itself, in the aesthetic form as such. Furthermore, I argue that by virtue of its aesthetic form, art is largely autonomous vis à vis the given social relations. In its autonomy art both protests these relations, and at the same time transcends them. Thereby art subverts the dominant consciousness, the ordinary experience.81

The more immediately political the work of art, the more it reduces the power of estrangement and the radical, transcendent goals of change. In this sense, there may be more subversive potential in the poetry of Baudelaire and Rimbaud than in the didactic plays of Brecht.82

Marcuse’s defense of aesthetic form and autonomy was also accompanied by a reconsideration of other “bourgeois” concepts, such as the individual and interiority.83 Returning once again to Horkheimer’s 1930s’ model of a dialectic of bourgeois society, Marcuse argued that although these concepts had developed historically in modern bourgeois society, they were not merely ideological; they also pointed beyond this society. Marcuse had always defended the claims of the concrete individual to happiness against the ideological demands of abstract collectivities, but he emphatically reaffirmed this position at the end of his life. Recalling one of Marx’s central categories from the Grundrisse, Marcuse wrote: “That is orthodox Marxism: the ‘universal individual’ as the goal of socialism.”84

82. Ibid., xii–xiii.
83. Marcuse writes, for example: “Marxist literary criticism often displays scorn for inwardness [Innerlichkeit] … But this attitude is not too remote from the scorn of the capitalists for an unprofitable dimension of life. If subjectivity is an ‘achievement’ of the bourgeois era, it is at least an antagonistic force in capitalist society. … I have pointed out that the same applies to the critique of the individualism of bourgeois literature offered by Marxist aesthetics. To be sure, the concept of the bourgeois individual has become the ideological counterpoint to the competitive economic subject and the authoritarian head of the family. To be sure, the concept of the individual as developing freely in solidarity with others can become a reality only in a socialist society. But the fascist period and monopoly capitalism have decisively changed the political value of these concepts … Today, the rejection of the individual as a ‘bourgeois’ concept recalls and presages fascist undertakings” (Ibid., 37–8).
Of the original critical theorists, survived only by Löwenthal and Fromm, Marcuse passed away in Starnberg, Germany in 1979.

**MAJOR WORKS**

**Max Horkheimer**

“Montaigne und die Funktion der Skepsis.” *Zeitschrift für Sozialforschung* 7 (1938): 1–52. Published

---

85. Since much of Horkheimer’s best theoretical work was published in essays, rather than books, I have mentioned several of his “minor” works as well.
in English as “Montaigne and the Function of Skepticism,” in *Between Philosophy and Social Science*, 265–312.

**Herbert Marcuse**

When the Institute for Social Research opened in Frankfurt-am-Main in 1924, its benefactor Felix Weil could hardly have imagined that its diverse members would contribute significantly to the development of disciplines such as sociology, influence the methodology of empirical social research, reshape Marxist theory and Freudian psychoanalysis, and act as a powerful stimulus for political activism during the late 1960s and early 1970s. In the first years of its existence, the institute promoted interdisciplinary studies devoted to the theory and history of socialism and the labor movement. But after its first director, Carl Grünberg, resigned owing to illness, Max Horkheimer took his place in 1930 and gave the institute a decisively new orientation. Work funded by the institute under Horkheimer’s leadership would analyze prevailing social tendencies with a view to developing a theory of contemporary society.¹ The institute would treat society as a complex totality comprising a variety of distinct but interacting factors. As Horkheimer explained in his inaugural address, institute members should examine

the connection between the economic life of society, the psychical development of individuals, and the changes in the realm of culture

… (to which belong not only the so-called intellectual elements, such as science, art, and religion, but also law, customs, fashion, public opinion, sports, leisure activities, lifestyle, etc.).

To explore the connections between these aspects of social life amounted to rethinking “the connection of particular existence and universal Reason, of reality and Idea, of life and Spirit.”

Horkheimer’s political radicalization began when he met Friedrich Pollock in 1911. Pollock helped Horkheimer to free himself from his conservative background, and became his lifelong friend and close associate at the institute. After the collapse of the Weimar Republic, the two young men studied in Munich where they came into contact with the socialism of Erich Mühsam, Ernst Töller, Gustav Landauer, and others. However, Horkheimer and Pollock eventually turned to Marx because he offered a historically grounded model for radical social transformation. Both Horkheimer and Pollock are communists, wrote their new acquaintance, twenty-one-year-old Theodor W. Adorno, in a letter to Walter Benjamin dated July 1924. After spending ten days with the two men in a house they shared in Kronberg, Adorno reported that they had had long and passionate debates about materialist conceptions of history, the relationship between philosophy and the modern sciences, and philosophy’s response to the growing evils of society. These politically engaged and philosophically informed discussions would continue for more than half a century.

Although Adorno was not associated officially with the institute until 1935, he and Horkheimer had initiated the productive philosophical partnership, and jealously guarded friendship, that would end only with Adorno’s death in 1969.

3. Ibid., 12.
6. Theodor W. Adorno (September 11, 1903–August 6, 1969; born in Frankfurt-am-Main, Germany; died in Zermatt, Switzerland) was educated at Johann Wolfgang Goethe Universität (1921–24; 1926–27; 1929–31) and the University of Oxford (1934–37) and took his habilitation at Johann Wolfgang Goethe Universität (1931). His influences included Benjamin, Freud, Hegel, Kant, Kierkegaard, Kracauer, Lukács, Marx, and Nietzsche. He held appointments at Johann Wolfgang Goethe Universität (1931–33), Princeton University (1938–40), and Johann Wolfgang Goethe Universität (1949–69), and was Associate at the Institute for Social Research (1935–38) and Director of the Institute for Social Research (1958–69).
In the early 1930s, they both contributed to the institute’s journal, the Zeitschrift für Sozialforschung (later renamed Studies in Philosophy and Social Science). However, with the victory of Hitler’s National Socialist Party in 1930, the institute, nicknamed Café Marx, was closed and its property confiscated by the Gestapo on March 13, 1933, on the grounds of its communist leanings. Having taken the precaution of placing the institute’s funds in the Netherlands in 1931, in 1934 Horkheimer had the resources needed to establish a branch of the institute at Columbia University, where he was soon joined by Pollock, Herbert Marcuse, and Leo Löwenthal. In its New York office, the institute initiated a number of empirical research projects, the most important of which examined the effects of unemployment on the authority structure of the American family. This project, which was supervised by Paul Lazarsfeld and involved the collaboration of Marcuse and psychoanalyst Erich Fromm, would culminate in Studien über Autorität und Familie, which was edited by Horkheimer and published in Paris in 1936.

As the institute settled in the United States, Adorno was studying at Oxford with the philosopher Gilbert Ryle, who agreed to supervise a thesis he proposed to write on Edmund Husserl. It was not until 1938 that Adorno decided to emigrate to New York with his new wife Gretel. Having studied composition with Alban Berg in the mid-1920s in Vienna, Adorno had already published a number of essays on music. Upon his arrival, Horkheimer arranged for him to work with Lazarsfeld in New Jersey as head of the music section of the Princeton Radio Research Project, funded by the Rockefeller Foundation, where until 1940 Adorno was responsible for overseeing empirical research into the psychological value of radio music for listeners.

8. Ibid., 177.
10. Ibid., 110.
11. Ibid., 168. As Wiggershaus also notes on the next page, parallel projects were initiated in the institute’s European branches.
By 1940, however, it was glaringly apparent to the émigrés, some of whose family and friends were suffering horribly under the Nazi regime, that anti-Semitism was virulent in many European countries. In the early 1940s, Adorno began to study anti-Semitism, following the lead of Horkheimer in “The Jews and Europe,” an essay published in the Zeitschrift in 1939. In 1941, the institute also published a series of articles on National Socialism in the newly renamed Studies in Philosophy and Social Science; this special volume included articles by Marcuse and Pollock as well as Adorno’s essay “Veblen’s Attack on Culture,” and an article by Horkheimer entitled “The End of Reason.”

Horkheimer declared that all his work in the 1930s was a prelude to a book he planned to write on dialectical logic. He considered Adorno the ideal collaborator for this project as early as 1935. By 1938, the project had become more concrete. In a letter to Benjamin, Adorno wrote that Horkheimer had spoken to him about “his eagerness to begin work on a book on the dialectic of the Enlightenment.” However, this work only started after the institute moved most of its resources from New York to Los Angeles in 1941. Some of its central ideas were outlined in Horkheimer’s Eclipse of Reason. Dedicated to Pollock to mark his fiftieth birthday, Adorno and Horkheimer finished the book in the spring of 1944; it first appeared in 1947 in the Netherlands under the title Dialektik der Aufklärung.

Dialectic of Enlightenment opens with a strident warning. If the modern deployment of reason was supposed to emancipate humanity, it is now the case that the “fully enlightened earth radiates disaster triumphant.” Drawing on Max Weber’s idea of the disenchantment of the world through rationalization, as well as on the dialectic of faith and enlightenment in Hegel’s Phenomenology of Spirit, the first chapter of Dialectic of Enlightenment purports to show that, for all its claims to supersede the mythic worldview, enlightenment is actually an outgrowth of myth and ends by reverting to myth. Manipulating and controlling objects in the interest of preserving the self against a nature that is perceived as hostile, enlightened reason confuses “the animate with the inanimate, just as myth compounds the inanimate with the animate.” Enlightenment and myth share a fear of nature – a fear that has reached such a pitch in enlight-

18. Ibid., 160.
ened thought that nothing is allowed to remain outside its conceptual purview. Compulsively forcing natural objects into explanatory schema in order to dominate them, reason continues to be driven by nature. Enlightened reason merely makes nature “audible in its estrangement” because the very attempt to master nature only enslaves reason all the more thoroughly to nature.

This theme, which is central to the later work of Adorno as well, is elaborated in subsequent chapters of *Dialectic of Enlightenment*. For example, in the excursus on the *Odyssey* that follows the first chapter, Horkheimer and Adorno trace enlightened thought to the dawn of human history, when reason developed as a means to the end of thwarting the powers of nature, as exemplified in the cunning of Odysseus. They argue that control over nature was finally achieved only by delaying the gratification of instincts and needs, or by repressing them altogether. Driven by survival instincts, human beings denied nature in themselves in order to preserve themselves in the face of nature. Mastery over nature practically always involves the annihilation of the subject in whose service that mastery is maintained, because the substance which is mastered, suppressed, and disintegrated by self-preservation is nothing other than the living entity, of which the achievements of self-preservation can only be defined as functions – in other words, self-preservation destroys the very thing which is to be preserved.

The idea that the instinct for self-preservation propels much of Western history helps to explain a remark at the end of *Dialectic of Enlightenment* to the effect that the official history of Europe conceals a subterranean history. Europe’s underground history “consists in the fate of the human instincts and passions repressed and distorted by civilization.” Although it is only implicit in this passage, this reference to Sigmund Freud (*Civilization and its Discontents*) is a distinguishing feature of first generation critical theory as a whole. Based on Marxism, the theory’s materialist account of capitalism encompasses not just economic factors but psychological ones as well.

Martin Jay explains that “the unexpected rise of an irrationalist mass politics in fascism, which was unforeseen by orthodox Marxists,” made it necessary to incorporate psychology into a critical account of society. Yet, even after the defeat of National Socialism, “psychological impediments to emancipation” remained in “the manipulated society of mass consumption that followed in its

---

Concern about these impediments is forcefully expressed in a chapter of *Dialectic of Enlightenment* called “Enlightenment as Mass Deception,” where the psychology underlying fascist propaganda is compared to the psychotechnology of the Hollywood-based culture industry; extensive use is also made of psychoanalysis in the following chapter on anti-Semitism.

However, it was not just the relevance of psychoanalytic theory for understanding fascism and the culture industry that made Freud indispensable. What particularly recommended Freud to Adorno was his recognition that nature and history have always been dialectically entwined. Originally attributing this idea to Georg Lukács in a 1932 lecture called “The Idea of Natural History” (which was presented to the Kant Society in Frankfurt), Adorno would later cite *The German Ideology* in support of this claim. In “Die Revidierte Psychoanalyse” – a lecture given to the Psychoanalytic Society in San Francisco in 1946 – Adorno also defended Freud against revisionists such as Karen Horney, arguing that Freud is “not content to leave reason and socially determined behavior unexplained but attempts to derive even complex mental behaviors from the drive for self-preservation and pleasure.” Equally importantly, Freud did not deny that nature is historically conditioned; he never precluded the possibility that “the concrete manifestation of instincts might undergo the most sweeping variations and modifications” throughout history. What Adorno draws from Freudian theory, then, enables him not only to explain phenomena such as Nazi Germany and the culture industry, but to elaborate in psychological terms on Marx’s speculative claims about the relationship between nature and human history.

Adorno also developed a psychological perspective on labor, observing that our participation in both production and consumption has historically been impelled by survival instincts. If Marx criticized capitalism for disrupting the metabolism between labor and nature, as well as for alienating individuals...
from the products of their labor and the productive activity that characterizes their species life, Adorno not only adopted this view but gave it a Freudian spin. In *Minima Moralia*, dedicated to Horkheimer on the occasion of his fiftieth birthday, he remarked that individuals are both biological and social beings. Under capitalism, however, human beings increasingly become mere means to the end of production as human labor and its products are transformed into commodities. We can now survive only by subordinating ourselves completely to exchange relations. In this situation, the “will to live finds itself dependent on the denial of the will to live: self-preservation annuls all life in subjectivity.”

Although he was neither an orthodox Marxist nor an orthodox Freudian, and he never fully addressed the problems connected with reconciling Marx and Freud, Adorno examined the impact of the capitalist system on the psychological development of individuals in most of his work, claiming that capitalism fosters widespread social and psychological pathologies such as authoritarianism, narcissism, and paranoia. However, Adorno had argued as early as 1927 (in his first *Habilitationsschrift* which he was forced to withdraw), that psychopathologies can be overcome, not by psychoanalysis, but only by completely transforming economic and social conditions. He also criticized Freud in *Minima Moralia*, charging that psychoanalysis encourages adaptation to prevailing conditions, and that it vacillates between “negating the renunciation of instinct as repression contrary to reality, and applauding it as sublimation beneficial to culture.” Still, Adorno was certainly not persuaded to jettison Freudian theory altogether. Even as he advanced these criticisms, he was discussing the psychology of anti-Semitism with Freudian social psychologists, and he wrote two pieces substantially influenced by Freudian theory. He elaborated on his ideas in *The Authoritarian Personality* which involved an extensive, empirically based, psychological account of fascist tendencies in the United States.

It was not simply his supplementation of Marxism by psychoanalysis that made Adorno a less than orthodox Marxist. For, in “Reflexionen zur Klassenheorie” (composed as a working document comprising nine theses in 1942), Adorno measured his distance from both Marx and the orthodox Marxism of the Soviet Union. Since Marx’s prediction about the concentration and centralization of

capital had been realized, the nature of capitalism changed, particularly with respect to the composition of classes. Consisting of relatively independent entrepreneurs during the earlier phase of liberal capital, the bourgeoisie lost much of its economic power as monopoly conditions developed. Today, the economically disenfranchised bourgeoisie and the proletariat form a new mass class that confronts the few remaining owners of the means of production.36

In a Hegelian remark about the Aufhebung – the preservation and sublation – of classes under monopoly capital, Adorno writes that the concept of class must be preserved because “the division of society into exploiters and exploited not only continues to exist but gains in force and strength.” Yet the concept must also be sublated “because the oppressed who, as the theory predicted, are the vast majority of people today, cannot experience themselves as a class.”37 So, while class stratification persists, classes themselves have changed, and the subjective awareness of belonging to a class has evaporated. Marx’s theory is no longer straightforwardly applicable to existing conditions precisely because he was right about the emergence of monopoly conditions.

In this essay, Adorno also takes issue with Marx’s theory of impoverishment, arguing that this theory can be confirmed only in a metaphorical sense because workers today have far more to lose than their chains. Compared to the situation of workers in nineteenth-century England that Marx analyzed, the standard of living of workers in the West has actually improved. The establishment of the welfare state, which Marx could not have foreseen, is partially responsible for this improvement. The work day is now shorter, and workers enjoy “better food, housing and clothing, protection of dependents and the aged, and, on average, a higher life expectancy.” It is now unlikely that “hunger would force them into an unconditional alliance and into revolution.”38

Borrowing a phrase from The Communist Manifesto, Adorno argues that, with the welfare state, the “ruling class” effectively secures “for ‘slaves their existence within slavery’ in order to ensure its own.” In this new context, impoverishment refers to the “political and social impotence” of individuals who have become “pure objects of administration for monopolies” and their political allies.39 Survival now depends on adaptation to a constantly changing and unstable economic system. Adaptation is reinforced by sophisticated psychotechnologies and the prevailing ideology that glorifies existing states of affairs. By these means, the needs of the new mass class are forced to harmonize with commodified offers of satisfaction. Conformity to socially approved models of behavior

39. Ibid., 386.
now appears more rational than solidarity. This is another reason why prospects for revolutionary change have faded.

Adorno also observes that political power has increased in the West. However, he does not adopt Pollock's state capitalism thesis, which asserts that there has been a transition in Western countries “from a predominantly economic to an essentially political era,” thereby calling into question Marx's view of the primacy of economic forces within society. If the state now intervenes more frequently in the economy, direct political domination existed only in Nazi Germany. At most, Pollock's state capitalism thesis signals certain ominous tendencies in other Western countries.

What changed under monopoly capitalism was that the ruling class became anonymous: it disappeared “behind the concentration of capital.” Today, the concentration of capital has reached such proportions that capitalism “appears as an institution, as an expression of the entire society.” Indeed, Adorno sounds a profoundly Lukácsian note that resonates throughout his work when he criticizes the reifying effects of the capitalist economy on human beings. Since it now pervades almost every aspect of human life, “the fetish character of commodities, which reflects relations between people as those between things, ends in the socially totalitarian aspect of capital.” As Stefan Müller-Doohm observes, the pervasiveness of reification under monopoly capitalism also helps to answer the question posed in the preface to *Dialectic of Enlightenment*; namely, why humanity is sinking into a new kind of barbarism, rather than entering into a truly human state.

The urgency of this question did not abate after Adorno returned to Frankfurt to teach again at the Johann Wolfgang Goethe Institute in 1949. Until his death,

42. I am restating criticisms raised in my *Adorno, Habermas, and the Search for a Rational Society* (New York: Routledge, 2004), 11–16. The view that Adorno adopted the state capitalism thesis in the mid-1940s is reiterated by Willem van Reijen and Jan Bransen in a commentary at the end of Jephcott's translation of *Dialectic of Enlightenment*, 252, where the authors state that Horkheimer and Adorno distanced themselves “definitively from a form of Marxism which assumed the primacy of economics.” However, this view is false. In “Society,” Fredric Jameson (trans.), *Salmagundi* 3(9–10) (1969–70), 149, Adorno repeats the claim he had already made in “Reflexionen zur Klassentheorie” that society remains class society. Three years later, in “Late Capitalism or Industrial Society,” Fred van Gelder (trans.), in *Modern German Sociology*, V. Meja et al. (eds) (New York: Columbia University Press, 1987), 242, Adorno states categorically that the economic system continues to predominate over the political system.

---
almost all his work – including many of his books and essays on music and literature – deals with the related problems of fascism and monopoly capitalism. What concerns Adorno above all else is that conditions similar to those that accompanied the rise of Nazism in Germany persist in the West. Indeed he argues that little has changed since the end of the Second World War: “The economic order, and to a great extent also the economic organization modeled upon it, now as then renders the majority of people dependent upon conditions beyond their control and thus maintains them in a state of political immaturity.” In the interest of survival, individuals must “negate precisely that autonomous subjectivity to which the idea of democracy appeals; they can preserve themselves only if they renounce their self.” Conformity to the interests of the ruling economic and political class is reinforced by psychological techniques similar to the ones used by Hitler. Hitler revealed what critical theorists had been saying for some time; namely, that “the appeal to the unconscious, the natural, to unconstructed nature, to the gifted personality, and whatever else propaganda highlights by way of irrational powers, only contributes to the ultimate strengthening of the hegemony of a dehumanized apparatus, and ends in complete inhumanity.”

After 1950 – the year *The Authoritarian Personality* appeared along with four other volumes in a series entitled *Studies in Prejudice* – Adorno wrote a number of articles dealing with research methodology in the social sciences. While he was critical of empirical social research, arguing that social science must be guided by the normative idea “of a true society,” Adorno nonetheless continued to engage in empirical studies throughout the 1950s. In 1952, for example, he returned to Los Angeles to work briefly for the Hacker Foundation, where, among other things, he drafted a qualitative analysis of astrology columns

---

46. Theodor W. Adorno, “Individuum und Organisation,” in *Soziologische Schriften I*, 440. This essay has not yet been published in translation.
in the *Los Angeles Times*, as well as two sociological studies of television. On his return to Germany, he took part in a project that examined the relationship between the manifest political opinions of Germans from different social strata and their latent attitudes. Part of the study focused on the ways in which German citizens sought to deny their recent past. Here again Adorno used psychoanalytic theory to explore the interaction between the guilt feelings of the German people and the defense mechanisms that enabled them to assuage their guilt.

According to Wiggershaus, however, Adorno abandoned empirical research at the end of the 1950s in order to devote himself completely to the elaboration of his critical social theory. Among the more important of his writings during this period is “Progress,” a “preliminary study” that “belongs within the complex” of Adorno’s major philosophical work *Negative Dialectics*. Here, Adorno revisits an idea that was advanced as early as *Dialectic of Enlightenment*, when he states that what counts as progress today is the domination of external and internal nature, which, impelled by the instinct for self-preservation, now threatens to destroy what it is supposed to preserve. Progress worthy of that name would entail that humanity has become aware of its “own inbred nature” in order to put an end to “the domination that it exacts upon nature and through which domination by nature continues.” Catastrophe can be averted only if “a self-conscious global subject” develops and intervenes, using “technical forces of production” to abolish all forms of material deprivation on the planet, and rationally to establish “the whole society as humanity.”

Adorno was developing new ideas in the work he wrote in the late 1950s and throughout the 1960s. Among the more important of these are the ideas of identity and nonidentity thinking. Identity thinking had certainly been discussed as early as *Dialectic of Enlightenment*, even if it had not been given that name. As J. M. Bernstein observes, what Adorno and Horkheimer describe as the principle of immanence in *Dialectic of Enlightenment* was later called identity thinking. The principle of immanence entails that an object is known “only when it is classified in some way,” or “when it is shown, via subsumption, to share

55. *Ibid.*, 144.
characteristics or features” with other objects. Similarly, “an event is explained if it can be shown to fall within the ambit of a known pattern of occurrence, if it falls within the ambit of a known rule or is deducible from (subsumable by) a known law.” For their part, concepts, rules, and laws have a cognitive value only when they are “subsumed under or shown to be deducible from higher-level concepts, rules, or laws.”

Bernstein resumes: “[c]ognition is subsumption, subsumption is necessarily reiterable, and reiteration occurs through cognitive ascent from concrete to abstract, from particular to universal, from what is relatively universal, and thereby still in some respect particular, contingent, and conditioned, to what is more universal.”

Owing to this subsumption of objects and events under concepts and laws, and the higher-order subsumption of concepts and laws under explanatory systems, we have effectively dissociated ourselves from our lived experience of the world in order to dominate it. We substitute unity for diversity, simplicity for complexity, permanence for change, and identity for difference. Once particular objects are tethered to concepts, there is allegedly nothing more of importance to be said about them. Identity thinking consists in the claim that diverse objects fall under concept “X”; it thereby effectively obliterates the particularity of objects, their differences from one other, their individual development and histories, along with other distinctive traits they may possess. Classifying, ordering, and explaining the objective world by ranging it under concepts that are then organized systematically, identity thinking seeks – to quote Nietzsche, who interpreted this behavior as a manifestation of the physiological will to power – “to make all being thinkable,” to make it “yield and bend” for us.

The substitution of universal concepts for particular, nonconceptual objects is not problematic just on epistemological grounds; Adorno also claims that identity thinking reinforces stereotypical and schematic views of objects, while fostering conformity to the status quo. To solve these problems, he proposed a new cognitive paradigm: nonidentity thinking. Müller-Doohm claims that Adorno first publicly referred to nonidentity thinking in an essay on Hölderlin where he claimed that the poet had managed to surpass identity thinking; his is a poetry of the nonidentical. Yet the idea of nonidentity thinking was advanced earlier in Adorno’s 1959 lectures on Kant’s *Critique of Pure Reason*. Although identity thinking persists in Kant to the extent that he wants to “ground being in

---

the subject,” Kant begins to develop a nonidentity philosophy when he “attempts to restrict the claim to identity by insisting on the obstacle, the block, encountered by the subject in its search for knowledge.” Nonidentity appears in the idea that not only do our “affections” “arise from things-in-themselves,” but that these things are not reducible to our concepts and categories of them.\(^{60}\) In fact, in *Against Epistemology*, Adorno had already praised Kant’s view of the nonidentity of concept and object.\(^{61}\)

Adorno’s *magnum opus*, *Negative Dialectics*, is devoted to exploring the alternative cognitive paradigm of nonidentity thinking.\(^{62}\) In the introduction, he distinguishes Hegel’s dialectics from his own, arguing that his version of dialectics involves “the consistent sense of nonidentity” (ND 5). Later remarking that identity thinking merely “says what something falls under, what it exemplifies or represents, and what, accordingly, it is not itself,” Adorno contrasts it to nonidentity thinking, which “seeks to say what something is.” By saying “it is,” Adorno concedes that nonidentity thinking does identify; it even “identifies to a greater extent” than identity thinking. But nonidentity thinking identifies in “other ways” because it is not content merely to subsume objects under universal concepts with a view to manipulating and controlling them. Rather, nonidentity thinking tries to make its concepts consonant with nonconceptual particulars. In so doing, it reveals the “elements of affinity” between the nonconceptual object and our concepts of it: an affinity that makes concept formation possible in the first place (ND 149). This affinity exists because concepts themselves are thoroughly entwined in nonconceptuality; they are “moments of the reality that requires their formation, primarily for the control of nature” (ND 11). In nonidentity thinking, these “elements of affinity – of the object itself to the thought of it – come to live in identity” (ND 149).

Considerations like these on the affinity between concept and object may lend some support to Bernstein’s assertion that identity thinking is parasitic on nonidentity thinking.\(^{63}\) Concepts must be turned back toward nonconceptual particulars because they are generated in embodied contact with material things, and they continue to refer to these things by virtue of their meaning in which their mediation by the nonconceptual survives (ND 12). Yet concepts have a twofold relation to objects. On the one hand, they depend on the nonconceptual matter that provides their content and is the source of their power to name.

---

In order to convey “full, unreduced experience in the medium of conceptual
reflection,” nonidentity thinking must immerse itself in things (ND 13). On the
other hand, concepts also transcend the objective realm by heeding “a poten-
tial that waits in the object,” and intending in the object “even that of which
the object was deprived by objectification” (ND 19). In this case, nonidentity
thinking grasps objects by means of possibility (ND 52). It deploys possibility to
indicate what an object would become if the damaged conditions under which
it developed were altered.

If concepts approximate objects by virtue of their orientation toward the
object’s material axis, the object in turn must approximate the concept. In the
context of discussing the affinity between concept and object, Adorno speaks
about the “longing” of the concept to become identical with the nonconceptual
thing. This longing reflects the inadequacy of objects with respect to concepts. It
is this inadequacy that nonidentity thinking also thematizes even as it attempts
to forge a route beyond it. Adorno illustrates this point when he discusses the
emphatic concept of freedom. Individuals are both more and less than the
freedom that may be ascribed to them. They are always more than free because
freedom is, at best, only one of their attributes. Yet they are less than free because
“the concept feeds on the idea of a condition in which individuals would have
qualities not to be ascribed to anyone here and now” (ND 150). In the latter
case, nonidentity thinking reveals the inadequacy of individuals to our concept
of them as free.

Adorno advocates this twofold orientation towards objects in Negative
Dialectics. Nonidentity thinking involves the “[r]eciprocal criticism of the
universal and of the particular.” It must judge both “whether the concept does
justice to what it covers” and “whether the particular fulfills its concept.” These
two critical operations jointly “constitute the medium of thinking about the
nonidentity of particular and concept” (ND 146). To remain content with the
judgment that the concept does (or does not do) justice to what it “covers” would
amount to leaving “behind the medium of virtuality, of anticipation that cannot
be wholly fulfilled by any piece of actuality.” Interpretation would be abandoned
in favor of merely positing what exists; this would make thought “untrue.”64 The
nonconceptual particular would satisfy its concept only by making good on its
own immanent potential – a potential that some emphatic concepts invoke or
intimate. Nonidentity can be said to contain identity in the prospective longing
of the concept to become identical with the thing (ND 149). In nonidentity
thinking, concepts are given a speculative orientation by aiming “at what would
be different” (ND 153).

64. Adorno, Minima Moralia, 127.
Nonidentity thinking therefore “contains identity” in a peculiar fashion. Attempting to make good on “the pledge that there should be no contradiction, no antagonism” between the object and the thought of it (ND 146), nonidentity thinking prospectively identifies the object with the concept. Its emphatically critical concepts point forward to changed conditions, such as the condition of a free society in which objects would be able to develop their possibilities unfettered. Evoking conditions that do not currently exist, these concepts “overshoot” what exists precisely in order to grasp it. (Parenthetically, Adorno shows in his posthumously published Aesthetic Theory that artworks share the proleptic orientation of nonidentity thinking when they anticipate “a being-in-itself that does not yet exist.”65 Modern art “constantly works at the Münchhausean trick of carrying out the identification of the non-identical.”66) Since nonconceptual particulars have been damaged under monopoly conditions and do not realize their potential, Adorno argues throughout his work that no particular is “as its particularity requires” (ND 152). He complains that the “substance of the contradiction between universal and particular” is that the nonconceptual particular “is not yet – and that, therefore, it is bad wherever established.” When it holds fast to what universal concepts usually rob from particulars, nonidentity thinking tries to retain the “‘more’ of the concept” as compared to these particulars (ND 151).

Inextricably entwined in nonconceptuality, concepts may evoke something more than what exists owing to their determinate negation of the existent. In fact, at the end of his 1965 lectures on metaphysics, Adorno claims that determinate negation is “the only form in which metaphysical experience survives today.”67 Resembling labor in its inherent resistance to “mere things in being” (ND 19), thought’s resistance is all the more powerful when its concepts are forged in the crucible of its painful experiences of damaged life. For in such experiences, the negative conditions that give rise to suffering are themselves negated in ideas and concepts that evoke conditions under which pain and suffering may one day end. Pain and negativity are “the moving forces of dialectical thinking” (ND 202) because, through them, human beings may glean reality’s better potential. To cite Marcuse, whose remarks echo Adorno’s, emphatically critical concepts point to “potentialities in a concrete historical sense” to the extent that they synthesize “experiential contents into ideas which transcend their particular realizations as

---

66. Ibid., 23.
something that is to be surpassed, overcome."68 Through determinate negation, these concepts “conceptualize the stuff of which the experienced world consists, and they conceptualize it with a view of its possibilities, in light of their actual limitation, suppression and denial.”69

Again, Adorno illustrates these ideas in his discussion of the concept of freedom: the shape of freedom “can only be grasped in determinate negation in accordance with the concrete form of a specific unfreedom” (ND 231). Because the idea of freedom emerges in the negation of the negative, unfreedom is not just “an impediment to freedom but a premise of its concept.” Ideas of freedom are derived from a negation of those aspects of reality that cause suffering by perpetuating unfreedom. Both freedom and unfreedom are therefore conceived in “relation to extramental things: freedom as a polemical counter-image to the suffering brought on by social coercion; unfreedom as that coercion’s image” (ND 223). Indeed, Horkheimer had made a similar comment about dignity in Eclipse of Reason: the idea of human dignity was “born from the experience of barbarian forms of domination.”70 Although Adorno does not explicitly mention them, he invites us to think of emancipatory movements such as abolitionism, women’s liberation, and gay rights. In movements like these, the unfree conditions that cause suffering point to their possible reversal by giving rise to the idea of a condition in which oppression would cease to exist. Since an emphatic idea such as that of freedom arises within oppressive situations “as resistance to repression” (ND 265), what is possible – in this case, freedom from oppression – can be glimpsed historically only in experiences of unfreedom.

Emphatic concepts such as freedom must be deployed with other concepts in what Adorno calls a constellation. As opposed to identity-thinking, which dissociates itself from objects owing to its abstraction from them, Adorno claims that a constellation of concepts illuminates “the specific side of the object, the side which to a classifying procedure is either a matter of indifference or a burden.” Indeed, he praises Weber’s employment of ideal types, or of concepts that are “‘gradually composed’ from ‘individual parts … taken from historic reality’” (ND 164). To illustrate this procedure, Adorno turns briefly to Weber’s discussion of capitalism in The Protestant Ethic and the Spirit of Capitalism, where Weber gathers diverse concepts around capitalism – concepts such as acquisitiveness, the profit motive, lucrateness, calculation, organization, bookkeeping – in order to express what capitalism “aims at, not to circumscribe it to operational ends” (ND 166). Conceding that constellations are the result of an entirely subjective

69. Ibid., 215.
process, Adorno thinks that this “subjectively created context” is “readable as a sign of objectivity,” or of the “spiritual substance” of phenomena (ND 165).

Adorno defines truth as “a constellation of subject and object in which both penetrate each other” (ND 127). Even in this form, however, truth is not something static. Rather, thought must constantly renew itself “in the experience of the subject matter,” a matter that, for its part, is first determined by subjective concepts themselves. Truth is therefore “a constantly evolving constellation.”

At best, truth manifests itself in the progressive approximation of objects by concepts; this may help to explain why Adorno maintains that objects are “infinitely given as a task.” Moreover, Adorno again stresses the fallibility of emphatic ideas when he writes that “the truth of ideas is bound up with the possibility of their being wrong, the possibility of their failure.”

Devoting much of his later work to devising an alternative cognitive paradigm to overcome identity-thinking, Adorno also continued to criticize oppressive socioeconomic conditions. In fact, individuals now stand in relation to society in much the same way that material particulars stand to universal concepts. Adorno implies as much throughout his work when he refers to society as the “universal.” Whereas identity-thinking falsely maintains the primacy of concepts over objects, society reifies individuals by subsuming them under abstract exchange relations. In this respect, identity-thinking and exchange are isomorphic. Just as identity-thinking expunges particulars by identifying them with universal concepts in order to manipulate and control them with a view to ensuring our survival, exchange relations serve the same goal by making “nonidentical individuals and performances become commensurable and identical.”

Following Lukács, Adorno also argues that exchange relations currently encroach on areas of life that were formerly unaffected by them. Exchange plays such a dominant role in human life that activities other than labor have fallen victim to reification as well. Indeed, bourgeois individualism, which celebrates the individual as the substance of society, masks an entirely different reality: the predominance of exchange relations and their homogenizing and leveling effects on needs, behavior, thought, and interpersonal relations. Although we

73. Adorno, Metaphysics: Concept and Problems, 144.
have always subordinated ourselves to economic conditions that determine whether we work, when, where and how we work, as well as our working conditions, today even our needs and instincts are manipulated and controlled to correspond to available offers of commodified satisfaction, and our behavior is molded to fit socially approved models. Forced to adapt to a world “whose law is universal individual profit,” individuals now submit to forms of integration so complete and so far-reaching that Adorno compares them to genocide (ND 362).

Under late capitalism, individuals measure their own self-worth and the worth of others in terms of the value of the goods they possess and the places they occupy within the economic system; their possessions and occupations serve as social markers that position them within groups and distinguish them from other individuals and groups. In other words, individuals relate to one another as mere “agents and bearers of exchange value” (ND 148–9). At the same time, they are isolated and alienated from one another precisely because their interpersonal relations are often cemented by nothing more substantive than these exchange-based relationships. Indeed, Adorno is especially concerned about the damage done to social solidarity under the reifying conditions characteristic of late capitalism. As the exchange principle becomes more pervasive, degrading relations between people to relations between things, the solidarity needed to surmount these relations has evaporated. In other words, exchange relations undermine the very social solidarity that is required to overcome them.

Economic conditions today are such that they also severely impair the autonomy of the family and the public sphere. Owing to the development of monopoly conditions, most individuals are now completely dependent for their survival on the often fickle largesse of the state and the economy. This has made it all the easier for public and private institutions and agencies to usurp the role the family once played as the primary agent of socialization. As the authority of experts and specialists replaces authority structures within the family, ego development suffers because individuals no longer acquire a degree of autonomy by measuring their strength against their parents through rebellion and resistance. The ego’s defenses against the instinctual forces of the id and the superego have become extremely weak. Ego weakness contributes to the marked increase in narcissistic pathologies that Adorno was among the first to diagnose; these pathologies are characterized by emotionally shallow and manipulative interpersonal relations, a diminished capacity for intimacy and social commitment, and fantasies of omnipotence – all of which are easily exploited by demagogues and political leaders.74 Owing to the psychic economy of the reified and narcissistic personality, society “extends repressively into all psychology in the form of

---
censorship and the superego.”

Regressive forms of solidarity have emerged in movements such as Nazism and neo-Nazism, where leaders attract followers by reanimating narcissistic superego introjects; these are formed in the image of “an omnipotent and unbridled father figure” that, bearing little or no resemblance to the individual’s real father, may be “enlarged into a ‘group ego.’”

Attempting to understand phenomena such as Nazism, Adorno found Freud’s work remarkably prescient. In “Group Psychology and the Analysis of the Ego,” Freud had explained that, once individuals have identified with a leader, “what is heterogeneous is submerged in what is homogeneous” because the “mental superstructure, the development of which in individuals is so dissimilar,” is undermined “and the unconscious foundations, which are similar in everyone, stand exposed to view.” As members of a group, individuals behave instinctually rather than according to their egocentric interests. Adorno also adopted Freud’s view that groups frequently act as a “negatively integrating force.” Negative emotions toward out-groups (Jews, blacks, communists, etc.) offer a narcissistic gain for followers of the in-group because they believe that “simply through belonging to the in-group,” they are “better, higher, and purer than those who are excluded.”

More generally, Adorno remarks that collective narcissism compensates for social powerlessness by enabling people to turn themselves “either in fact or imagination into members of something higher and more encompassing to which they attribute qualities which they themselves lack and from which they profit by vicarious participation.”

Whereas the family no longer serves as the primary agent for socialization, the public sphere fails to fulfill its role as “the most important medium of all politically effective criticism” because it has become so commodified that it currently “works against the critical principle in order to market itself.” Speaking about opinion formation in his 1960 lecture “Opinion Delusion Society,” Adorno also argues that public opinion is now imposed from above by “the overall structure of society and hence by relations of domination.”

77. “It is not an overstatement if we say that Freud, though he was hardly interested in the political phase of the problem, clearly foresaw the rise and nature of fascist mass movements in purely psychological categories” (ibid., 120).
the privately owned culture industry merely reflect those of the economic and political elite: public opinion today is “indissolubly entangled” with particular interests in profit and power that only masquerade as universal. Not only has truth been replaced by statistically generated opinions, but the public has lost the capacity for concerted reflection and self-reflection that is “required by a concept of truth.” Now a mere expression of prevailing opinions that reinforce the public’s narcissistic view that it is *au courant*, the average public opinion has become a fetish. If the democratic principle of free speech, which includes “the right to propose, defend, and if possible successfully champion one’s own opinion, even when it is false, mad, disastrous,” presupposes a society that consists of “free, equal, and emancipated people,” it is currently the case that “society’s actual organization hinders all of that and produces and reproduces a condition of permanent regression among its subjects.”

This loss of individuality, autonomy, and freedom, which Adorno charts in all his work, can be traced to the surrender of the task of self-preservation to the welfare state and the capitalist economy. Acknowledging that this surrender was necessary to enable individuals to survive “in more highly developed social conditions,” Adorno nonetheless observes that Western societies now abstract from their living human substratum in their relentless pursuit of profit. Although necessary, the transfer of self-preservation to society has placed “the general rationality at odds with the particular human beings whom it must negate to become general, and whom it pretends – and not only pretends – to serve” (ND 318). To survive under capitalism, individuals are compelled to become the involuntary executors of the law of exchange (ND 312). As Simon Jarvis puts it in his introduction to Adorno’s work: “The more obvious it becomes that the economic basis of any individual’s life is liable to annihilation, and the more real economic initiative is concentrated with the concentration of capital, the more the individual seeks to identify with and adapt to capital.” To this Jarvis adds a chilling note: “For capital, however, the individual’s self-preservation is not in itself a matter of any importance.”

Adorno complains that even reflective people capable of criticizing society often have little choice but “to make an alien cause their own” (ND 311). But the vast majority of individuals remain the unconscious and largely helpless pawns of an economic system that uses and abuses them with the sole aim of promoting its particular interests in profit and power. Once the “self-preserving function” of their egos was “split off from that of consciousness” and subordinated to

economic and political agents and institutions, their attempts to preserve themselves effectively “surrendered to irrationality.” 87 Now that individuals are wholly dependent on society for their survival, late capitalism is able to dispense with “the mediating agencies of ego and individuality,” which it had originally fostered under the earlier stage of liberal capitalism. It thereby arrests “all differentiation,” while exploiting “the primitive core of the unconscious.” 88 Substantially weakened, few can resist the manipulation and exploitation of their instinctual drives.

Openly conceding that he was exaggerating the “sombre side” of our contemporary predicament, 89 Adorno was attempting to describe objective tendencies in the West where “the immense concentration of economical and administrative power leaves the individual no more room to maneuver,” that is, where “the structure of such a society tends toward totalitarian forms of domination.” 90 Yet he did not believe that individuals were doomed to remain oblivious to the ways in which they perpetuate their own powerlessness. Although survival instincts have led human beings to do destructive things both to themselves and to the nature on which their very survival depends, things might have gone, and may yet go, differently. It may still be possible to direct self-preservation consciously to the goal that it implicitly contains: the preservation of the species as a whole. In fact, Adorno argues that reason “should not be anything less than self-preservation, namely that of the species, upon which the survival of each individual literally depends.” 91 Reason can never be “split off from self-preservation,” not only because it owes its development to this drive but also, more emphatically, because the “preservation of humanity is inexorably inscribed within the meaning of rationality.” Self-preservation “has its end in a reasonable organization of society,” 92 a society that would orient itself to the goal of preserving its subjects “according to their unfettered potentialities.” 93

EPILOGUE

The goal of establishing a rational society that will preserve and enhance the lives of every one of its members without exception was championed by all first...

88. Ibid., 95.
92. Ibid., 272.
93. Ibid., 272–3.
generation critical theorists. Horkheimer and Adorno thought that this goal was currently within reach. Advancing a point that Marcuse also made in _One-Dimensional Man_, Adorno claims that “technical forces of production are at a stage that makes it possible to foresee the global dispensation from material labor, its reduction to a limiting value.”94 If it was once necessary to “struggle against the pleasure principle for the sake of one’s own self-preservation,” it is now the case that labor can be reduced to a minimum and need no longer be tied to self-denial.95 Adorno repeats this point in _Negative Dialectics_: the state of productive forces is currently such that much of our labor is superfluous. Consequently, “models of conduct which were formerly rational” have long since become “outdated.” Impelled by survival imperatives that continue to demand the sacrifice of internal nature and the domination of external nature even after technology has made self-preservation easy, the logic of history is logical no longer (ND 349).

To be sure, capitalism now appears to be second nature; it seems to have evolved naturally, and therefore to be unchangeable. Nevertheless this appearance is illusory because, as Adorno puts it, “[t]he rigidified institutions, the relations of production are not Being as such, but even in their omnipotence they are man-made and revocable.”96 That Marx’s reference to the “natural laws” of capitalism should not be taken literally is “confirmed by the strongest motive behind all Marxist theory: that those laws can be abolished” (ND 355). Necessity in history must be recognized as “realized appearance,” and historical determination as “metaphysical accident.” On a more heuristic note, Adorno adds:

> Only if things might have gone differently; if the totality is recognized as socially necessary semblance, as the hypostasis of the universal pressed out of individual human beings; if its claim to be absolute is broken – only then will a critical social consciousness retain its freedom to think that things might be different some day.

(ND 323)

The legacy of first generation critical theory lies not only in its diagnosis of conditions under which individual freedom and autonomy have been substantially undermined, but in its sustained defense of the need to envisage conditions that are fundamentally different from and better than these. Whereas second and third generation critical theorists, such as Jürgen Habermas and Axel Honneth,97

have largely been content to promote the reform of existing economic, political and social institutions, their predecessors were far more radical: they wanted to overcome capitalism, along with the pseudo-democratic institutions and procedures that prop it up. Although they have certainly been criticized for failing to provide a blueprint for radical social change, Horkheimer and Adorno were convinced that such change was needed in order to foster the reconciliation of the individual and society that would enable individuals to develop freely outside economic constraints that have become as unnecessary as they are irrational. They were also convinced that critical reflection on our current predicament is the first step towards emancipation. Modifying Spinoza’s claim that all determination is negation, Adorno declares that “the false, once determinately known and precisely expressed, is already an index of what is right and better.”

To acquire a sense of what a more rational society might look like, we need to have a thorough grasp of the irrational conditions that continue to fetter us.

MAJOR WORKS

---

generation of critical theorists in _The History of Continental Philosophy: Volume 7_.

Published in English as *The Positivist Dispute in German Sociology*, translated by Glyn Adley and David Frisby. London: Heinemann, 1976.

Although Walter Benjamin\(^1\) was recognized during his lifetime as one of the most adventurous and penetrating thinkers of the Weimar period in German cultural history, his career was marked by poverty, exile, and disappointment. His ideal intellectual position would have been the completely autonomous critical metropolitan engagement embodied by Karl Kraus\(^2\) and his journal *Die Fackel* in Vienna, but his various attempts to institute a periodical of his own were unsuccessful. He worked at the margins of German academic philology, Brecht’s political theater, the Institute for Social Research in its prewar incarnations, and was primarily a contributor on cultural matters to ephemeral German and French left-wing feuilletons. Setting aside his translations of Baudelaire and Proust, he was able to see only three of his books into print, and his magnum opus, the *Arcades Project*, remained a collection of obscure notes hidden in the national library in Paris when Hitler’s advancing armies pushed Benjamin to suicide on the Spanish border.

And yet in the decades since his death in 1940, his reflections on the melancholy tenor of allegory, the emancipatory potential of anachronism, the political

\(^1\) Walter Benjamin (July 15, 1892–September 26, 1940; born in Berlin, Germany; died in Port Bou, Spain) was educated at Albert-Ludwigs-Universität zu Freiburg/Br. (1912–13), Friedrich-Wilhelms-Universität, Berlin (1913–15), Ludwig-Maximilian-Universität, Munich (1915–16), and the University of Bern (1917–19). He wrote his dissertation at the University of Bern in 1919, and his habilitation was rejected by the University of Frankfurt am Main in 1925. His influences included Bergson, Brecht, Cohen, Kant, Kraus, and Lukács.

\(^2\) Karl Kraus (1874–1936), poet, playwright and satirist, published his journal *Die Fackel* (The torch) in Vienna from 1899 to his death, for most of its run writing the entire publication himself. His satirical quotations of corrupt government officials and sycophantic journalists made *Die Fackel* a powerful and feared voice throughout the German-speaking world.
resilience of detritus, and the mnemonic dislocation of modernity have become touchstones of the contemporary intellectual landscape. His essay “The Work of Art in the Age of its Technological Reproducibility” stands as a founding document of the discipline of media studies. The rehabilitation of allegory and fragmentation as signifying processes that he championed continues to inform deconstructive criticism in both Europe and America. Theodor Adorno and Max Horkheimer’s *Dialectic of Enlightenment* and the Frankfurt School’s cultural critique of the commodity form in late capitalism would be unimaginable without Benjamin’s theoretical inspiration. His notions of divine violence, bare life, and the inherent debility of sovereign authority nourish post-Soviet reflections on political theology by Giorgio Agamben, Jacob Taubes, and others. And beyond strictly theoretical discourse, in the music of Laurie Anderson3 or the architecture of Daniel Libeskind (whose Jewish Museum in Berlin reflects in its sixty broken sections the sixty shattered aphorisms of Benjamin’s *One Way Street*4), Benjamin’s writings continue to provoke a dizzying variety of responses. In paradoxical fashion, this peripatetic thinker of the scorned and the trivial at the end of civilization has come to preside in spirit over much of our contemporary theoretical self-awareness. By returning Benjamin’s multitudinous writings to the trajectory of his life as it unfolded, the following account does not aspire to reclaim an authoritative philosopher from even the most casual or outlandish appropriation of his work. The dispersed and discontinuous condition of his reception is far truer to Benjamin’s insights and their legacy than even the most careful and exhaustive paraphrase can be. Rather, a systematic reconstruction of Benjamin’s intellectual career is offered not as the conclusive explanation of its meaning but as a provisional renewal of the force of its emergence in service to subsequent encounters with the richness of his work by later readers, whose insights it cannot pretend to anticipate.

Walter Benjamin was born in 1892 in Berlin, Germany, the eldest son of Emil Benjamin, a prosperous antiquities dealer and auctioneer, and his wife, Pauline née Schoenflies. As the son of an assimilated Jewish *haute-bourgeois* family, Benjamin enjoyed a privileged education, taking his abitur in 1912 from the Kaiser-Friedrich-Schule in Charlottenburg, after having spent between 1905 and 1907 two academic years at the experimental *Landerziehungsheim* (rural residential school) in the tiny town of Haubinda, Thuringia. It was there that Benjamin first encountered the educational reformer Gustav Wyneken, who taught philosophy in Haubinda until 1906, when, in the midst of Benjamin’s

---

brief tenure, conflict with its founder forced him to leave. Wyneken’s involuntary departure from the school interrupted any preliminary relationship with Benjamin, but his erstwhile pupil returned to the Kaiser-Friedrich-Schule a self-conscious representative of his teacher’s reformist attitudes. Wyneken meanwhile went on to found the experimental Freie Schulgemeinde Wickersdorf (Wickersdorf Free School Community) to enact more directly his pedagogic theories.

Upon achieving his abitur, Benjamin left Berlin for Germany’s Catholic south, enrolling in the Albert-Ludwigs Universität in Freiburg. The intellectual atmosphere in Freiburg was dominated by the neo-Kantian philosopher Heinrich Rickert and the historian Friedrich Meinecke, and Benjamin attended lectures by both men. But his interests, although intensely intellectual, were situated outside the lecture hall. He had soon become a prominent participant in the activism of the “Free Student Movement,” an uncoordinated network of reform-minded groups poised against the traditional Korporationen or dueling fraternities of the German university system. Among the loose amalgamation of extra-curricular reform organizations was a “chapter” established the year before in sympathy with Wyneken and his Wickersdorf theories: the “Detachment for School Reform.” This was the framework for Benjamin’s thinking and writing in Freiburg throughout 1912, and continued to inform his sympathies when he returned to Berlin and enrolled in the Friedrich-Wilhelm-Universität late in 1913. In the months before the outbreak of the First World War, Benjamin moved back and forth between these universities, while consistently promoting the extracurricular Wickersdorf ideal, becoming one of the most prominent student activists of his day.

In later years, Benjamin would disavow the intellectual vacuity of the ante-bellum Youth Movement debates, and his later friends and eventual biographers have tended to share that assessment. But a scornful attitude toward the substantive goals of Youth Movement organizations – toward their shrill commitments to abstinence, coeducation, or Zionism, not to mention the darker nationalistic and anti-Semitic tendencies metastasizing through them – was in fact central to Benjamin’s peculiar activism at the time, so his later disavowal is less straightforward than it might at first seem. Benjamin’s involvement in the “Detachment for School Reform” throughout his student years was unconditionally emphatic, but his understanding of “Youth,” the ideal for which he campaigned, was vested

5. For a discussion of Rickert’s philosophy, see the essay on neo-Kantianism by Sebastian Luft and Fabien Capeillères in The History of Continental Philosophy: Volume 3.

6. Although the group abjured any overt confessional identity, a large percentage of its members were Jewish, despite Wyneken’s own lack of interest in Jewish influences in German society (a lack of interest that would in turn offer his opportunism little moral resistance, despite his broadly left-wing political sympathies, when the Nazis came to power).
in such a generalized antithetical attitude toward the mature society and its recognized culture that any practical consequences of his efforts were difficult to distinguish from disengagement. “This constantly vibrating feeling for the abstractness of pure spirit is what I call Youth,” Benjamin wrote to his friend Carla Seligson in 1913. “For only then (if we don’t want to become mere workers for a movement) when we keep our view clear to perceive spirit wherever it may be, will we become those who realize it. Almost everyone forgets that they themselves are the site where spirit realizes itself.”

Important for Benjamin were not the specific pedagogic recommendations implied by Wyneken’s theories, such as the prefect system or an emphasis on music education, but rather the confrontational attitude that Wyneken himself exemplified toward preexisting pedagogic frameworks. What Benjamin called “Youth” simply was this antithetical posture, logically prior to any objective issue that might occasion it, and so potentially conditioning any issue whatsoever. In lieu of a common object of concern that would define a movement externally, Benjamin’s activism aspired to the mutual recognition of those sharing that “youthful” posture as the precondition to an unspecific cultural renewal. The practical result was not a policy or program but a site in which programs and policies were already in contention: the Sprechsaal, or “discussion forum” he founded in Berlin.

What Benjamin would later recognize, and what would sever his mature thought irrevocably from this initial foray into cultural politics, was that a site from which such an unconditional critique of culture can be conducted never simply appears in the society as a specific condition, such as youth, or a specific locale, a Sprechsaal. Rather, such topoi are entirely unpredictable and tangential, “the most endangered, excoriated and ridiculed creations and thoughts embedded deeply in every present,” as he would say in his eventual farewell to the Youth Culture Movement, “The Life of Students.” Far from being an autonomous venue in which an ideal receptivity could reinterpret its entire social and cultural inheritance, the actual Sprechsaal was conditioned by all the moral inexperience and class myopia that characterized its attendees, and hence was intellectually irredeemable; this Benjamin would later insist on. But a receptive posture so sensitive to the elided authority of the past that it acts in the present as an example itself, and an attitude toward the contemporary world so antithetical

---

to its collective evaluations that only a postponed transparency suspended in a permanent future perfect will have been able to recognize it: these recognize, demonstrative, and anticipatory orientations remain fundamental to Benjamin’s thought until the end.

In August 1914, twin catastrophes destroyed the context of Benjamin’s student activism and catapulted him into his adult career. Germany plunged into the Great War with a flurry of martial enthusiasm that left Benjamin entirely cold but swept up Wyneken, alienating him from his leading disciple. Almost simultaneously, Benjamin’s close friends Fritz Heinle and Rika Seligson committed suicide together in the Berlin Sprechsaal that had been the locus of their reformist efforts. The disaster destroyed both the masculine and the feminine paradigms of a “youthful” interlocutor and obliterated the site of conversation. Whatever the biographical or psychological repercussions of these events might have been, the theoretical shock explodes the elements of his youthful theorizing and starts Benjamin’s efforts on their mature trajectory. And this is the fourth aspect of enduring relevance in Benjamin’s youthful experience, along with the receptive position, demonstrative posture, and anticipatory attitude: thought, for Benjamin, unfolds always against the alternative of self-destruction.

With the Sprechsaal obliterated and the society it sought to reform plunged into war, Benjamin left Berlin for Munich and the Ludwig-Maximilian-Universität, and eventually concluded his studies in neutral Switzerland, at the University of Bern. During this time, he met his lifelong close friend the Cabbala scholar Gershom Scholem, and associated with various exiled artists and intellectuals, including the Dadaist Hugo Ball and his wife Emmy Hennings. As a scholar, he researched early German Romanticism, the writings of Novalis and Friedrich Schlegel, about which he would write his dissertation after the war, as well as the history of German drama, which would inform his central theoretical work, the Origin of German Trauerspiel. In addition to this philological orientation, Benjamin also subjected the literary canon to more personal and impassioned critiques in essays on Hölderlin, Dostoevsky, and Goethe. And he produced a number of dense hermetic reflections that not only provided a persistent orientation for his own further theoretical work but, in the decades since their formulation, have proved to be inexhaustible stimuli for subsequent theorists as well. Although Benjamin never aspired to articulate a philosophical system, the coherence of these texts founds the undeniable concinnity in his subsequent views across the remarkable variety of his cultural interests.
At the origin of Benjamin’s thinking is an unyielding skepticism toward any supposed process of mediation. The topic is already central to his dissertation on the *Concept of Art Criticism in German Romanticism*. That treatise is organized around a derivation of what Benjamin calls the “Refl exionsmedium,” or medium of reflection. A commitment to such a medium defines early Romanticism. The notion, if not the term itself, is illustrated, so Benjamin claims, by Fichte’s metaphysics, which posits a subjective moment, the “I,” through which all objectivity, the “Not-I,” is necessarily mediated. What the early Romantics retained from this schema was not – despite the usual interpretation – its irreducible first-person subjectivity but the priority in it of active reflection over passive awareness. It is this activity and not the first-person orientation that Romanticism generalizes, and Fichte’s concrete “I” becomes the abstraction of an active self. “The Romantics start from mere thinking-oneself, as a phenomenon; this is proper to everything, for everything is a self.”9 Within this reflective process, an object is understood to be the unending potential to exhibit comprehensible form along a trajectory toward the infinite Absolute. An unlocalized reflective activity ends by constituting, so Benjamin thought, its unachievable Absolute not in an ideal identity of subject and object at the site of the subject, but as latently endless mediation at the site of the object. “In itself one would designate this Absolute most correctly as the medium of reflection …. Reflection constitutes the Absolute, and constitutes it as a medium.”10 This mediating Absolute is what Romanticism means by art, and particular artworks are consequent centers of reflection in which this prior absolute self-relation comes to itself for us and we to ourselves for it.

This Romantic idea of a continuously self-reflecting medium within which individual artworks gesture toward an infinite philosophical truth is the inverse of Benjamin’s own developing perspective on the relation between art and truth. In an appendix to the dissertation that he did not submit for the degree, Benjamin uses Goethe’s aesthetic theory as a contrast that clarifies his own differences from this Romantic position he had just described. The idea of an infinite Absolute that mediates works of art is tantamount to the conflation of artistic and speculative expression under the common rubric of form. The meaning of an artwork, beyond its mere perceptibility, opens directly on to the process of its formal comprehension: this is what Benjamin means when he claims that the Romantic “idea of art” is “the a priori of a method.” By contrast, Goethe’s understanding of the artwork, and by extension Benjamin’s own, relates it to a substantive ideal, “the a priori of a … content.” The ideal Goethe discerns in art is not an abstractly continuous formal process but a

---

discontinuous arrangement of concrete achievements. It “is not a medium that
shelters in itself and builds out of itself the context of forms, but a unity of a
different sort. It can be grasped only in a limited plurality of pure contents, into
which it decomposes.” 11

The traditional plurality of the Muses suggests the irreducible plurality of
these pure contents; Goethe calls them “primal images” (Urbilder). Like his
hypothesis of the Ur-plant, a discrete botanical species the stages of whose life
cycle would manifest directly the process common to vegetation in all its divers-
ity, Goethe’s ideal of art distributed into primal images relates artworks substan-
tively to a truth essentially distinct from them and resident in the shared world
with which they contrast. Inasmuch as it opposes the conceptual mediation of
aesthetic form with this indirect apprehension of historical truth, the position
Benjamin attributes to Goethe is essentially his own. Benjamin, too, denies any
objectively continuous medium that would guarantee the intact transmission
of a durable abstract significance inscribed into the individual artifact. Rather,
the artifacts themselves despite their ultimate impermanence and diversity have
a logical priority over any abstract continuum. The permanent meaning of an
artwork is not borne explicitly by its enduring content but inhabits the vicis-
situdes of its historical testimony as artifact; what matters is not the “spell,” as
Benjamin calls it, of aesthetic artifice, but the contrast between that spell and
the changing circumstances into which it is cast.

This means that ultimately, despite his critical focus on works of art, Benjamin
is a historian and not an aesthetician. The work of art is of interest not for its own
sake but because it permits the indirect perception of a discontinuous historical counter-truth that the continuities of explicit historical traditions otherwise
necessarily overwrite. The constant reference to the author’s name in the titles of
Benjamin’s critical essays from this time is symptomatic of this perspective: “Two
Poems by Friedrich Hölderlin” (1915); “Dostoevsky’s The Idiot” (1917); “Goethe’s
Elective Affinities” (1922). The work does not appear alone but in the company of
the transient human life against which it arose, and if its interpretation involves
an imaginative projection into that prior authorial posture in all its estrangement
from present concerns, this is only in order to relate that posture historically to
a reimagined now-time. Benjamin captures this disillusioning theoretical move-
ment in his correlated distinctions between material content and truth content,
commentary and critique. The work is read scrupulously in order to reconstruct
that original substantive statement in its material content; this is commentary,
the enduring affinity of Benjamin’s literary theory with philological discipline.
But the truth the work provides appears as the ability of that latent content to
manifest a neglected urgency in the present. Discerning this truth content in the

present is critique. Where the historical circumstances fixed by commentary and
the eventual significance produced by critique have diverged sufficiently through
time, philology is the science that governs the reconstruction of their relation.
But even where no historical distance pertains in the intellectual engagement
with contemporaries, the urgency of the critical present encounters a dispassionate positivist deference to the object; a material content becomes the occa-
sion for an entirely heterogeneous truth content. Benjamin’s philological essays
on Dostoevsky, Hölderlin, and Goethe from this early period thus anticipate the
dislocated portraits of his contemporaries Marcel Proust, Karl Kraus, and Franz
Kafka through which Benjamin would triangulate his own mature position in
the early 1930s. More generally, Benjamin’s interpretive sensitivity to historical
discontinuity and his theoretical commitment to truth’s irreducible plurality
have meant that his writings have resonated powerfully with many subsequent
nontraditional approaches to culture in the post-Second World War world.

In addition to the academic work and the more personal literary essays,
Benjamin was also writing explicitly philosophical articulations of his position.
If his academic disquisition and his literary-historical critique pursue strate-
gies of indirection, so too do these hermetic writings. Such early statements
as “On Language as Such and on the Language of Man” from 1916 or “On the
Program of the Coming Philosophy” from the following year do not employ
traditional forms of philosophical argument, with hypotheses ventured and
defended against possible objections. Their rhetoric is categorical and apodictic,
invoking overtly metaphysical and theological concepts to which it seems assent
is simply expected. For the most part they circulated privately and operated in
part as probes for a receptive consensus that has sometimes appeared to later
readers as dogmatic. But this appearance of dogmatism is deceptive, and these
writings do not fall outside the skepticism that defines Enlightenment discourse.
The assertoric character of Benjamin’s exposition and his recourse to exegetical
techniques are all in the service of a radically disillusioning interrogation of
received philosophical notions.

As in the dissertation, a principle of mediating continuity is consistently at
issue in these early essays. Whether communicative language in “On Language
as Such and on the Language of Man,” the neo-Kantian notion of the formal
limits of experience in “On the Program of the Coming Philosophy,” or the
causal nexus in “Fate and Character” (1919), in each case Benjamin’s exposi-
tory strategy – his signature dialectical trope – is to confront a mediating conti-
nuity with a qualitative interruption. Thus, “bourgeois” human language as a
medium of communication is disrupted by an utterly heterogeneous dimen-
sion in which Being as figured by God’s creative Logos (i.e. “language as such”)
encounters human ontological openness as figured by Adam’s responsive naming
(i.e. the “language of man”). The program of the coming philosophy will be to
overcome the neo-Kantian equation between the formal limits of experience and the knowledge mediated by physical science with an alternative experience whose truth rests in something beyond the continuous synthesis performed by a scientific subject on a persistent natural object. And in “Fate and Character,” the intuition that the causal nexus could comprehensibly link a moral life to its natural circumstances is supplanted by an oblique perspective that sees the natural continuity of life already as a fatal imbrication of tragic conditions, the impersonal guilt unto death once typified in the Athenian theater, whose interruption is promised, perhaps, by the comedic fixity of human character as it appears on Molière’s stage.

II

With his dissertation behind him, Benjamin spent several productive months in Heidelberg, where he associated with the circle around Marianne Weber, the widow of Max Weber, a circle that included at various times Ernst Bloch, Georg Lukács, and Scholem. The naive dream of the Sprechsaal re-emerged in the far more sophisticated and promising shape of a critical journal, to be called Angelus Novus after the watercolor by Paul Klee which Benjamin had recently acquired, and which would eventually inform one of his most famous texts, the ninth aphorism in “On the Concept of History,” describing the angel of history. In the unstable economic atmosphere of Weimar Germany, the journal was never realized, but the exemplary independence it promised guided Benjamin’s engagement with political theory. He read carefully Ernst Bloch’s Spirit of Utopia, Franz Rosenzweig’s Star of Redemption, and Georg Lukács’s History and Class Consciousness.

During this time Benjamin composed the difficult text on “The Task of the Translator” as well as the enigmatic fragments on “Capitalism as Religion” and on the relation of messianic to profane history, the so-called “Theological-Political Fragment.”12 The task of the translator, Benjamin suggests, is not simply mediating between idioms but lies in arranging the very plurality of languages so that they resonate with the absence of an ultimate perfect communication, what Benjamin calls the “pure language.” “Capitalism as Religion” adopts Max

12. The dating of this fragment remains controversial. Graphological evidence from the manuscript is inconclusive, and Benjamin’s executors, Scholem and Adorno, differed as to whether it was a late or an early text. On the strength primarily of the reference to Bloch’s Spirit of Utopia, which Benjamin is known to have been studying at this time, Scholem dated the fragment to 1920–21, while on the strength of its explicit messianism and reference to happiness, both of which find an echo in the second aphorism in “On the Concept of History” of 1940, Adorno thought the text clearly a late one.
Weber’s vocabulary to envision a specifically capitalist experience as a type of religious ritual stripped of both dogmatic authority and redemptive promise, a perpetual ceremony bestowing on its practitioners not salvation but a relentless indebtedness and guilt, or Schuld. Even in the ideologically diverse environment of Weimar Germany, these reflections on authority and history, couched in a theological terminology that places them beyond any localized partisan commitments, cannot be easily situated on a political spectrum. Rather, what characterizes them is their uncompromising extremism. Perhaps the epitome of that extremism is caught by the “Theological-Political Fragment,” where, under the sign of “nihilism,” the very self-destructiveness of happiness as such is embraced in order to solicit indirectly a Messianic transformation of the world. Benjamin would never mitigate this extremism, even as his relation to Europe’s accelerating political collapse grew more self-conscious and tactical. Until the end of his life his political credo remained: “immer radikal, niemals konsequent,” “always radical, never consistent,” as he put it in a letter to Scholem.13

Benjamin’s most overtly political text from this time is “The Critique of Violence,” a daring synthesis of the anarchist-socialist Georges Sorel, whose Réflexions sur la Violence advocated “mythic violence” in the shape of the general strike, and the Catholic conservative Carl Schmitt, whose Politische Theologie linked sovereignty to legal exception and thus set limits to the justifiability of public authority. Benjamin’s ideologically unclassifiable text further demonstrates his radicalism, and has garnered increasing attention as postwar ideological categories have seemed to lose their historical relevance. In Benjamin’s essay, violence – his term is Gewalt, a word whose meaning includes more generally force or coercion – is congruent with the notion of means in a political context. A critique of violence thus calls into question the intentional means–ends schema that renders human action rationally comprehensible. Independently of its role as the effective means for realizing reasonable ends, Benjamin maintains that public violence exerts an irrational fascination that testifies to its mythic origins. Benjamin analyzes this mythic power, through which violence appears clothed in the inevitability of fate, into lawmaking and law-preserving violence, the former evident in military conquest and the latter in judicial punishment. These aspects of violence exist in dialectical tension, for law-preserving violence claims to be the legitimate continuation of the lawmaking violence that inaugurated it but that inevitably provokes an antagonistic lawmaking violence in reaction to its authoritative exercise. The mythic closure of this dialect of violence could be interrupted only by violence of a totally different kind, a Gewalt that

overwhelms the instrumentality of law entirely and points toward an unprecedented social transformation. Benjamin calls this messianic notion “divine” violence, and how much it would look like the fascinating violence unleashed by wars and revolutions and deployed by policemen and executioners remains a point of interpretive contention.

Goethe, as well, continued to organize Benjamin’s theoretical work. The elaborate consideration of Goethe’s late novel *The Elective Affinities* dominates Benjamin’s writing in the first years of the 1920s. His long three-part essay uses Goethe’s tale of marital abdication and intertwined adulteries in service to a general characterization of the relation of life to appearance. The philosophical ambitions of the essay thus reach far beyond the meaning of a single literary work, whose role in the overall exposition is to exemplify the appearance with which actual human life in its mortal extremity contrasts. This essay represents the most densely imagined version of Benjamin’s dialectical critical method, drawn up at the outset of his mature career, and its methodological and thematic exemplarity justifies a slightly more detailed consideration.

As Benjamin reads it, Goethe’s novel has a material content anchored in its mortal origin, the historical circumstances from which it emerged, that can potentially reveal a consequent truth content to the moment of its surviving reception. Those original circumstances Benjamin identifies with the Enlightenment: Goethe’s novel appears at a historical moment singularly dismissive of supernatural traditions and with a particularly defiant attitude toward the superhuman forces that condition human life. Those superhuman forces in their relation to individual choice – the chemical metaphor of the title – is the material content of *The Elective Affinities*; Benjamin names this material content the Mythic. Despite the absence of anything overtly supernatural in Goethe’s story, a mythic condemnation pushes the emancipated spouses toward their eventual destruction beyond their hedonistic inclinations and rational agreements. Not the individual lovers but the superhuman forces on which they depend are in fact emancipated by the collapse of the marriage vow that had banned them, and those forces reveal their mythic nature in the inevitability of the death that they demand. This is the meaning of *The Elective Affinities* taken on its own. A material content, *mythic sanction*, reveals a truth content, *the inevitability of death*. In Benjamin’s reading, the significance of the novel verges on nihilism.

Yet the novel does not have the last word in the essay. Having produced in its first, philological section this somber literary acknowledgement of the limits of Enlightenment humanism, the second and third sections of Benjamin’s exposition confront this bleak vision with its vital antithesis. A novel as an aesthetic artifact is something other than a human life. Although both are historical phenomena, and so can be understood to have a material content and a truth
content, this does not mean that these material and truth contents are the same in both cases. If they were, if the material content of life were also mythic sanction, then the truth content of life would be the inevitability of death, as well. But if the material content of life were something other than subordination to the superhuman, then the truth content of life would be something other than inevitable death. This would mean, in short, that there is hope. This is the point of the second, existential section of Benjamin’s essay: to show that the material content of life is something other than the material content of the artwork. These material contents are different because art is circumscribed by appearance, Schein, while life at least potentially can exceed what it appears to be.

In order to demonstrate this difference, Benjamin aligns human life not with an apparent element in The Elective Affinities but rather with an expressive discrepancy between episodes: the contrast between the action of the novel and the fairy tale “the Miraculous Neighbor Children” that it contains. The unrepresentable difference between life and art finds an analogy in the difference between the realistic narrative of a marriage surrendering to amorous passion and the embedded fabulous love story. The material content of human life, and so its potential truth content, is reflected from outside the artifact back into it as a contrast between its figures and the figures of the fable. This is ultimately a contrast between duplicitous choices and irrevocable decision. The fairy tale shows us a pure decision: the miraculous neighbor children’s self-sacrificial leap for love into the surging water from which they are then rescued. This contrasts with the ambiguous choices made by the characters in the novel that lead eventually to the drowning of the infant from Eduard and Charlotte’s hollow marriage. Both sets of figures are motivated by passionate love, but the miraculous children reach a redemptive, pure act of decision that breaks with the mortal world, while the novel’s figures make choices on the basis of inclinations that bind them ever more completely to the world. The space between a pure act of decision from love and ambiguous choices from passion is the living space within which a material content is manifested. This space is governed not by representations but by its potential to host a pure decision, a fundamental interruption. The novel makes room for this possibility by opening a space between representable choices (the novel itself) and the artificial presentation of a pure act (the embedded fairy tale). Outside the artifice of a fable, such a pure decision is silent; its very purity precluding its Schein or manifest appearance, leaving it nothing but its truth. The truth content of human life appears when its material content is understood as pure decision, and it appears only paradoxically, in what Benjamin calls the “expressionless,” the silent epitome of expression. The final section of the essay traces, in the consequent renunciation and fatal expiration of the beautiful Ottilie after the child in her care has drowned, the extinction of philosophical appearance in its relation to truth. Truth never appears; it only occurs.
III

Benjamin’s efforts to secure an academic post in Germany, although eventually unsuccessful, did produce his most fully realized theoretical statement, *The Origin of German Trauerspiel* of 1925. This treatise takes as its topic a relatively obscure literary object, *Trauerspiel*, the highly stylized allegorical dramas written in Catholic Germany in the seventeenth century, in the wake of the devastating Thirty Years War. In examining these Baroque plays with their unmotivated characters, extreme plots, and stilted allegorical interludes, Benjamin is not attempting to discover an overlooked aesthetic competence in them. Rather, precisely by relating their representational eccentricities to the political atmosphere in which they arose, Benjamin discerns in the discontinuities of these works an index of historical crisis that has once again become legible in modernity.

The treatise has two main sections: the first half sharply distinguishes *Trauerspiel* as an aesthetic object from the Greek tragedies whose traditional continuation their authors imagined them to be, while the second rehabilitates the signifying processes of allegory. Benjamin’s theory of tragedy, which draws on Lukács and Rosenzweig as well as the work of his friend Florens Christian Rang, emphasizes the parallels between Greek theater and the Greek judicial court. The tragic hero stands accused of mythic transgression, and his response culminates in a defiant silence- unto- death that demonstrates his superiority to the powers that destroy him and allows him to exemplify a new and better community. But this tragic silence can appear on stage only in the uniquely propitious circumstances of Periclean Athens, for the elements from which it was composed – myth, hero, sacrifice – have never again arisen in comparable purity. What *Trauerspiel*, by contrast, demonstrates is the impossibility of a successful foundation of collective meaning. For, ideally, the poets of the German Baroque, like their Athenian predecessors, also wanted to redeem their shattered world in the light of a recognizable heroic sacrifice. But the world in which they worked could not in fact be made whole, and in their attempts to accommodate this blasted environment the dramatists were pushed out of the self- evidence of mythic conflict and sacrifice, and into artificial apparatuses of plot intrigue, overdetermined props, and most symptomatically, allegorical willfulness.

The second part of Benjamin’s treatise is thus a re- examination of allegory as a method of signification. In contrast to the Romantic symbol, in which Benjamin

---

14. The centrality of this distinction to Benjamin’s exposition makes John Osborne’s English translation of the title, *Origin of German Tragic Drama*, untenable. Translating the treatise remains a heroic achievement, but the irreducible point of the entire book is that *Trauerspiel* is not tragic drama.
sees a disingenuous appropriation of religious dogma to resolve representational aporias, allegory acknowledges its discontinuous artifice and consequent dependence on an anticipated audience. The audience for Trauerspiel was not simply anyone, but the Traurige, the melancholy. “For these are not so much plays which cause grief [Trauer], as plays through which grief finds its satisfaction: plays for the melancholy [Spiele vor Traurigen].”¹⁵ The historical relevance of Trauerspiel is mediated to the present by the melancholy indigenous both to the Baroque and to today, an affinity that appears in the spark of comprehension struck by the sharp conjunction of the stilted, anachronistic citations with Benjamin’s theoretical prose. Eventually it is this melancholy attitude that can realize in the allegorical skull upon Golgotha the ephemeral truth borne by the very experience of semantic collapse: “The bleak confusion of Golgotha … is not just a symbol of the desolation of human existence. In it transitoriness is not signified or allegorically represented, so much as, in its own significance, displayed as allegory.”¹⁶ This shift between representation and display, from communicating allegorical content to showing in itself the ultimate impermanence of any meaning, is the redemptive pivot that melancholic concentration performs within the allegorical emblem.

As a contribution to German philology, The Origin of German Trauerspiel, like Benjamin’s dissertation on the concept of art criticism in German Romanticism, has proved its scholarly value. But the treatise has exerted influence far beyond those concerned with questions of Baroque allegory in its middle-European context. This is in part the result of Benjamin’s existential generalization of the significance of allegorical tropes, as well as the incidental theories of sovereignty, tragedy, performance, melancholy, and natural history that emerge from his exposition. Nor should the aphoristic beauty and audacity of Benjamin’s style be underestimated in accounting for the book’s appeal. The virtues and frustrations of this elliptical and analogical expression are nowhere more in evidence than in the philosophical essay with which Benjamin introduced the treatise, the “Epistemo-critical Foreword.” The dense initial twelve paragraphs of this prefatory text are one of Benjamin’s most resonant discussions, although the exact nature of the claims he puts forth and the exact extent of his investment in the overtly idealist terminological in which they are couched remain contentious. The difficulties, despite appearances, lie less in any willful obscurity on Benjamin’s part and more in the consequent extremity of the position he is advocating. For the “epistemo-critical” foreword is not a critical epistemology but a critique of epistemology and its governing assumption: the possibility of human

---

knowledge. Just as the earlier theory of language in “On Language as Such and on the Language of Man” used an emphatic notion of superhuman presentation passing obliquely through human words in order to subvert our ordinary notion of language as a communicative medium, so here the foreword subverts the notion of knowable truth by contrasting it with a more emphatic truth of pure presentation latently situated beyond the intentions embodied in works of art, as their independent relation to eternal ideas. It is the paradoxical proximity of the philological reconstruction of forgotten textual content to a skeptical truth beyond representation that has lent Benjamin’s treatise its enduring fascination.

The *Origin of German Trauerspiel* is the culmination of Benjamin’s early efforts toward as direct an articulation of his concerns as possible. The foreword is the point at which the possibility of explicit communication passes into the necessity of implication. After this, the implicit significance of Benjamin’s writing takes ever more precedence over its explicit content. And even here, what can be explicitly stated is ultimately nothing but the negative impress of genuine insight. Operating on a boundary with expressive nihilism, the treatise could hardly have been acceptable to the academic standards of Benjamin’s day. This is something Benjamin seems to have anticipated, and his ambivalence about formal scholarship is reflected in the alternative book that he published along with *The Origin of German Trauerspiel*. On the Mediterranean island of Capri where Benjamin was working on his habilitation, he was also composing a series of brief aphorisms and reflections, a form Adorno would come to call the “thought-image,” with his close friends and associates in mind. These were the formal antithesis of continuous scholarly discourse, and when gathered together they would become his second book, *One Way Street*, published within weeks of *The Origin of German Trauerspiel*.

IV

An avant-garde text that challenges the very form of the book itself, *One Way Street* testifies to Benjamin’s increasingly radical perspective on the experience of modernity, and on the rhetorical sensitivity called for in addressing it.¹⁷ Sixty short texts ranging from accounts of dreams to descriptions of children’s

---

¹⁷ Michael W. Jennings has shown that the relation of *One Way Street* to aesthetic avant-garde movements of the time, in particular to Russian constructivism and German Dada, was by no means accidental but reflected at least to some extent Benjamin’s involvement with Hans Richter and the “G-Group,” and its publication *G. Zeitschrift für elementare Gestaltung*. See Michael W. Jennings, “Walter Benjamin and the European Avant-garde,” in *The Cambridge Companion to Walter Benjamin*, David S. Ferris (ed.) (Cambridge: Cambridge University Press, 2004).
behavior to lists of similarities between books and prostitutes are coordinated with headings drawn from everyday placards and signs of the modern metropolis. For all its modernist polish, *One Way Street* demonstrates a challenge to theoretical expression whose implications could not be contained by a concept of the “work.” In the closely linked notions of the *Denkbild*, the linguistic thought-image, and the conceptual operation it registers, *Dialektik im Stillstand*, dialectics at a standstill, Benjamin discerned a basic methodological constraint on contemporary speculation: the limit-figure of a “dialectical image.”

The vast research project on the Parisian arcades, whose preliminary texts date from this time, pursues through this figure its aim of promoting into a tenuous if resilient visibility potential alternative conceptual affinities, an “Ur-history” of superhuman influences whose traces have been extinguished by the human history informing the bourgeois present in its self-evidence. As a principle of linguistic composition, the thought-image contrasts with the studied aphorism and the accidental fragment. It governs not only those texts Benjamin explicitly labeled “thought-images”18 but such varied discussions as the autobiographical *Berlin Childhood around 1900* or “The Work of Art in the Age of its Technological Reproducibility” owe their presentational rhythm to this principle of lyrical concentration and abrupt transition. The disruptive effect on settled habits of thought these thought-images are meant to bring about has at its vanishing point the dialectical image itself. The language of the thought-image is meant to respond to a dialectical contradiction inscribed in the world. The figure in which two heterogeneous temporalities intersect is dialectical. The *Flâneur* drifting idly across the surface of the industrious city, the child at play among the ruins of adult enterprise, the conspirator scheming toward the eventual destruction of established order – these figures assemble around themselves the dialectical energies unleashed by the incompatible temporal perspectives they embody, the trespass of forgotten past or alternative future into present self-evidence and automatism. These marginal figures are the dialectical shepherds in the artificial arcadia of Benjamin’s Parisian arcades. The “static dialectic” they bring into focus continues to refract the now into discontinuous constellations with the then as it proceeds down the inconceivable continuity of time. Discerning those particular constellations that appear across the spurious sheen of the nineteenth-century Parisian commercial arcades in their ephemeral pomposity was the project that came to guide all of Benjamin’s explorations through and reflections on the experience of modern disintegration.

*One Way Street* thus represented a breakthrough in Benjamin’s theorizing of no less moment than its companion treatise, and one that would, in a paradoxical

---

way, prove more directly relevant to Benjamin’s subsequent irreducibly indirect expressive strategies. It moved Benjamin considerably closer to realizing in the thought-image the idiosyncratic element, the intellectual pulse of his writing. It also brought him immeasurably closer to his international political affiliations. The experience whose limits the thought-images were designed to illuminate, even when illustrated by German political conditions, was an urban disorientation in which historical contemporaneity overwhelmed any particular national situation. Only a political perspective militantly committed to overcoming those national conditions could accommodate the temporal urgency of this experience. That perspective was international communism, the organized destruction of the unjust bourgeois order. In Heidelberg, Benjamin had articulated a position suspended between anarchistic defiance and an absolute fatalism, in which the Marxism of Lukács and Bloch or Scholem’s Zionism, not to mention any publicly accredited ideological faction, must appear as a provisional orientation within an eternal violent oscillation in authority: the justification of violence passing into the violence of justification. But in the increasingly polarized political atmosphere of inflation-wracked Germany in the 1920s, that merely radical position of pure critique was proving insufficient to the substantive demands of the day.

Although *One Way Street* was hardly the expression of an unambiguous political credo, its rejection of the form of the book marked a decisive recognition of the inevitability of a communist framework for the theoretical questions Benjamin was asking. This framework had been affectively illuminated by his intense attachment to Asja Lacis, an associate of Bertolt Brecht’s and a fervent revolutionary, with whom he had fallen in love on Capri. Just as the breakthrough to which his Goethe essay testifies had been motivated by his passion for Jula Cohn, so in his captivation by Lacis’s fusion of aesthetic integrity and political commitment, Benjamin sensed in himself the possibility of a pure revolutionary affinity between historical effectiveness and messianic radicality. For a time, then, his revolutionary commitment evinced this political optimism. But while his commitment persisted to the end, his optimism would soon fade. Toward the end of 1926 Benjamin traveled to Moscow in pursuit both of Lacis and an intellectual role in Bolshevik Russia. The melancholy diary his sojourn produced recounts the collapse of the love affair and of his hopes for the Soviet experiment. For the rest of his career, Benjamin would orient his cultural reflections not toward Russian communism directly but across the widening Franco-Prussian fissure in European politics toward the cosmopolitan affinities between Berlin and Paris. In the history of German and French cultural radicalism, Benjamin would seek the origins of a transformative politics that would point beyond the gathering darkness of twentieth-century culture.
As the Weimar Republic stumbled toward the end of the decade, Benjamin had abandoned any hope of an academic career, and was supporting himself as a freelance book reviewer and journalist, contributing travel reports and cultural criticism to major German periodicals, in particular Ernst Rowohlt and Willy Haas’s *Literarische Welt* and the feuilleton of the *Frankfurter Zeitung*, edited by his friend Siegfried Kracauer. In these venues he published with brief commentary various letters, puzzles, and anecdotes that his researches on nineteenth-century culture had unearthed, evidence not only of the eclectic range of his interests but of the theoretical scope that the thought-image and its crystalized dialectic could accommodate. In 1928, he presented the beginnings of a theoretical exploration of the dialectical image in his essay on the first wave of French surrealism.

What is at stake in the essay “Surrealism: The Latest Exposure of the European Intelligentsia” is not in the last instance the meaning of surrealism as an aesthetic movement but the role of a “European intelligentsia” in promoting revolution in historical circumstances. Like Lukács in his analysis of reification and class consciousness, Benjamin understands any awareness of society and its revolutionary potential to be conditioned by the standpoint from which society is perceived. Bourgeois consciousness, therefore, which takes its currently dominant position to be anchored in a universal human truth beyond any historical change, is inevitably blinded to the historical reality of the world that has produced it. But unlike Lukács, Benjamin does not imagine that an alternative proletarian perspective congruent with the objective historical dynamic is available in the present. That is to say, Benjamin denies the implicit assumption in Lukács that the philosophical distinction between material base and ideal superstructure coincides with the sociological antagonism between proletariat and bourgeoisie. The revolutionary intellectual is not a denizen of the superstructure anticipating the integrated culture of a victorious proletarian base. Rather, every position in bourgeois-dominated society is inherently partial and prerevolutionary, anchored in substantially exploitative relations and beholden to deceptively universal ideologies. When Benjamin insists that the problem of proletarian culture cannot be solved “contemplatively” by the revolutionary intelligentsia,\(^\text{19}\) he is implicitly criticizing any attempt to substitute for the bourgeois ideal of an ahistorical Absolute Knowledge a virtual proletarian consciousness that in the end is not praxis but a *concept* of praxis.\(^\text{20}\)

---

20. This difference between Benjamin’s commitment to a necessarily partial practice mediating any accurate conception of the social whole and Lukács’s commitment to a concept of totality...
At the close of the surrealism essay, Benjamin deploys Henri Bergson's terminology from the first chapter of *Matter and Memory* to characterize his alternative perspective. Bergson starts his metaphysical reflections from a highly idiosyncratic concept of “image” as the fundamental category of reality, contrasting it with idealism’s “representation” and realism’s “thing [chose].” A thing, taken as an element of ultimate reality, cannot in vital practice exceed its knowability, its eventual image, while a representation is that aspect of an image relevant to a particular embodied human perspective, a “living center.” In itself the domain of images has no center but is merely superhuman lawful movement. When Benjamin invokes the “image space,” “the world of universal and integral actualities, where the ‘best room’ is missing,” to describe the field of political engagement, he is using Bergson’s concepts to circumvent the Hegelian assumption of a metaphysically privileged perspective on historical reality from which a revolutionary outcome can be reliably anticipated. Materialism in Benjamin’s sense just *is* the acknowledgment of the partiality of any human awareness of the shared world and the corresponding recognition that totality is always only intermittently accessible to the present. In contrast to the dogmatic insistence on the metaphysical primacy of matter, Benjamin calls this actual materialism “anthropological.” The practical task of the intellectual is to reveal and transform the anthropological conditions of his own practice, even at the cost of his own existence, not to redeem proletarian labor culturally.

Benjamin’s essay on surrealism inaugurates the central period of his philosophical practice, which corresponds to the decline of the Weimar Republic. These years are dominated by Benjamin’s three great intellectual portraits of Proust, of Kraus, and of Kafka. His own theoretical position emerges indirectly through his recognition of these contemporaries. This is not to say that Benjamin imputes to Kraus or Proust positions that in fact he himself holds; rather, his own position appears negatively, as the displacement between the nominal object of the essay and the authorial attitude toward that object. Throughout his career, Benjamin’s own position remains intimate with a principled silence that bears the full impress of truth but that by that very token can never emerge immediately. The parallax of Benjamin’s eccentric perspective on Proust, Kraus, and Kafka converges on a fundamental dimension of historical becoming: what

*21. For a discussion of Bergson, see the essay by John Mullarkey in *The History of Continental Philosophy: Volume 3*.

in his final works Benjamin will come to call the “now of knowability,” or the
now-time. Proust recognizes an elegiac happiness in resisting the suffocating
legacy of the past by translating it into language; Kraus exemplifies a radical
antithesis to the present in his demonic citational practice; and Kafka preserves
in his ascetic vigil over primordial forces an irreducible relation to an unantici-
patable redemption. At the risk of reductive schematization we can say that these
three essays capture Benjamin’s mature historical philosophy of the superhuman
image space, Proust illuminating its recognitive relation to the past, Kraus its
demonstrative relation to the present, and Kafka its anticipatory relation to the
future.

By the summer of 1932 Benjamin’s economic situation had deteriorated
considerably, and in a hotel room in Nice on his fortieth birthday he made
serious preparations for suicide. He did not carry through the intention, but
this moment represents the nadir of his emotional existence until the fall of
France to the Nazis eight years later. Around this time as well he forged a lasting
friendship with the playwright Bertolt Brecht, who would offer him a refuge in
Denmark in the difficult years ahead. Brecht, in his nomadic and ferocious prac-
ticality, served as the fourth of the contemporary heralds of the image-space, the
destructive avatar of its gestural character. This limit to the meaning available in
the image-space, in its inevitable affinity with insurrectionary attitudes, would
grow in importance for Benjamin’s theory in the subsequent peripatetic years.
For with the Reichstag fire of February 17, 1933, Germany had become impos-
sible for him to survive. In March he began an exile in which death overtook
him and so which has never ended.

VI

Living hand to mouth in Paris and with his ex-wife Dora in San Remo, Italy, with
occasional stays in Denmark with Brecht, Benjamin continued to research the
Parisian arcades and although irrevocably delivered to the occasion, produced
a considerable number of enduring essays and studies. His main source of
income was Horkheimer and Adorno’s exiled Institute of Social Research, which
provided Benjamin with an indispensable stipend, as well as a largely sympa-
thetic theoretical venue in their Journal. At the same time, Adorno’s commit-
tment to a Hegelian concept of dialectical mediation did lead to fundamental
misunderstandings of Benjamin’s late work, which Adorno found perilously
close to mysticism and beholden to an undertheorized immediacy. And the
deep hostility that the institute evinced toward Brecht and his partisan engage-
ment would eventually distort the posthumous image of Benjamin that Adorno,
together with Scholem, promoted in the postwar years. Nonetheless, it is not too
much to say that Horkheimer and Adorno saved Benjamin’s life in these difficult times. And their requests for a publishable text from the Arcades material provoked Benjamin to write what would become his most famous text: “The Work of Art in the Age of its Technological Reproducibility.”

This essay, like much of Benjamin’s later work, is subterraneously informed by the concept of an image-space. In nineteen dense aphoristic sections, Benjamin marshals a discontinuous multitude of descriptive frameworks to present what he sees as a contemporary mutation in the relation of cultural artifacts to the practices that give them meaning. This mutation can be perceived in the work of art in its historical exposure to technological reproduction. In extended considerations of the photographic and the cinematic image, Benjamin discerns as a consequence of this historical mutation what he calls “the decay of the aura” of the work of art and the rise of a new “reception in distraction.” What film and photography as techniques of reproduction call into question is the singularity and uniqueness of an image beyond its function as a representation for human concerns. The boundary at which an image-as-representation-of-something-else meets the image-in-itself is what Benjamin calls its aura. In archaic times, the relation between human purposes and the independent reality of the image was held in place by supernatural ritual. The holy relic, whose mere presence exceeds the symbol it embodies and which organizes a sacred space of cultic ceremony, is the paradigm of an auratic object. Today, however, the aesthetic object defines a disenchanted exhibition-space entirely subordinated to human purposes. The museum, and even more typically the theater, host the desecrated version of auratic singularity. It is into this exhibition-space that cinema, according to Benjamin, introduces the antithesis to imaginary aura: the apparatus. A term suspended between the expressionist anguish of Kafka’s “eigentümlicher Apparat” (peculiar apparatus) from “In the Penal Colony” and the constructivist euphoria of Vertov’s “Chelovek s kinoapparatom” (Man with a movie camera), the apparatus inhabits the image-space in a way that comes to light in the distracted reactions of the masses to mass-reproduced representations, and exposes the deepest conservative vulnerabilities of auratic hierarchy. Mass reception in distraction is the Ur-manifestation of the material apparatus that the insurrectionary positions in society must conquer for the revolution.

Deutsche Menschen (German Men and Women), the last book Benjamin was able to see published in his lifetime, came together quickly in 1936. In the pages of the Frankfurter Zeitung Benjamin had published a series of letters to and from nineteenth-century German cultural figures along with his own introductions. The book assembled those letters and introductions into an eccentric recollection of the humane tendencies in bourgeois history that National Socialism was in the process of remorselessly extinguishing. Published in Switzerland by an ad hoc press and bearing a pseudonym – Detlev Holz – that disguised its exiled
Jewish and communist provenance (and echoed Kant’s “krummen Holz,” the “crooked timber” of humanity), Deutsche Menschen was Benjamin’s attempt to refract the present through juxtaposed historical inscriptions and in so doing to preserve for the future an image of the German language as the occasion of a better alternative history. Although often misunderstood as a straightforward anthology, Deutsche Menschen, like Benjamin’s two earlier books, is an experiment. Where The Origin of German Trauerspiel was conducted on the scale of a discipline and its genre, the treatise, and One Way Street on the scale of an experience and its instantiation in the book per se, Deutsche Menschen operates across the institutions of writing in any possible form, from the public newspapers that harbored Benjamin’s original exposure of these letters to the private intimacies the archive shelters. This last book stages Benjamin’s antihumanist position as the suspended ad hominem implicit in these surviving eccentric fragments. To this day Deutsche Menschen remains an elusive and underappreciated achievement.

As the 1930s drew to a close, Benjamin’s reflections on European modernity and its origins came to focus more and more on the haunted figure of Charles Baudelaire. Benjamin found in Baudelaire’s marginal existence and perfect lyrics an epitome of the critical orientation art takes toward the historical present, around which the vast material gathered for the Arcades Project could be organized. The relationship between the poète maudit and the city of Paris came to dominate Benjamin’s understanding of the Ur-history of the European nineteenth century, and a planned reworking of the Arcades Project as Charles Baudelaire, a Lyric Poet in the Age of High Capitalism produced the studies “The Paris of the Second Empire in Baudelaire,” as well as “On Some Motifs of Baudelaire,” Benjamin’s final explorations of the antithetical role of art in history.

In February 1939 Benjamin’s German citizenship was revoked. In September the Second World War ignited. Shortly afterward French authorities interred Benjamin for several weeks, on the basis of his revoked nationality, in a detention camp in the town of Nevers, before the intervention of French cultural figures brought about his release at the end of November. In the half-year before the fall of Paris to the Nazis in June 1940, Benjamin managed to bring to paper the most compressed and profound expression of his philosophical position, the aphoristic sequence “On the Concept of History.” In these eighteen brief texts and two addenda, Benjamin claims for the thought-image its durable boundary with the modernist prose-poem. His subtle and evocative language challenges the intuition of a linear, progressive temporality underlying historical change. This notion of a neutral continuous time connecting past, present, and future in a predictable way was the proton pseudos or original flaw of those humanistic theories – in particular revisionist social democracy – that had so wretchedly failed to resist fascism. In contrast to a progressive “historicist” orientation toward history, Benjamin invokes a complex “historical materialist” temporality,
in which unpredictable conjunctions of past and present give rise to a volatile
now-time whose future can never be entirely closed off. This now-time is the
last surviving version of a Jewish transformational temporality for which “every
second was the small gateway in time through which the Messiah might enter.”
Here, at the end of European culture, Benjamin takes its death mask in the
concept of the now-time, as the ultimate vanishing point of the image-space he
had explored his entire life, and that harbored its last most tenuous hope.

Benjamin fled Paris only hours ahead of the Nazis and made his way south.
For months he had been negotiating a visa to the United States with the help of
Adorno, Horkheimer, and Hannah Arendt, with whom he had been friends since
1936, and who would be instrumental in mediating his legacy to the English-
language world. It was issued to him in Marseilles in September, but he was
not able to procure an exit visa from Nazi-complicit France. In the company of
several other refugees, he attempted to cross into Spain illegally through a pass
in the Pyrenees. They reached the border town of Port Bou on September 26,
but were halted there by Spanish officials. As night fell outside his rented room,
anticipating deportation back to hostile France, Benjamin killed himself with
an overdose of morphine; on the next morning the remaining refugees were
permitted to proceed to Lisbon. The site of Benjamin’s grave was lost.

VII. CONCLUSION

In the years after Benjamin’s death his memory was kept alive by his friends
in exile, in particular Arendt and Adorno in the United States and Scholem in
Jerusalem. Those of his papers that survived the Nazi catastrophe, after various
relocations and consolidations, were preserved in three different archives, one
assembled around Scholem’s collection in the Hebrew University in Jerusalem,
another from the texts Adorno gathered together in Frankfurt after the war, and
a third rescued from Vichy Paris and stored eventually in the literary archive of
the East German Academy of Arts in Berlin. Adorno’s publication in 1955 of a
two-volume collection of Benjamin’s essays, Schriften, in the Federal Republic
of Germany, began his reintroduction to wider audience. Arendt edited and

24. A useful compendium documenting the underexamined relation between Arendt and
Benjamin has been published: Arendt und Benjamin: Texte, Briefe, Dokumente, Detlev
Schöttker and Erdmut Wizisla (eds) (Frankfurt: Suhrkamp, 2006). The volume reproduces a
fascinating variant of Benjamin’s “On the Concept of History” that he had sent to Arendt.
25. A detailed account of Benjamin’s publishing history (to which this summary is indebted)
is provided by Detlev Schöttker, “Edition und Werkkonstruktion: Zu den Ausgaben der
introduced an English translation of several of Benjamin’s major essays in 1968 under the title *Illuminations*. The enormous influence on contemporary aesthetic and media theory in the English-speaking world exercised by Benjamin’s essay on “The Work of Art in the Age of its Technological Reproducibility” can be dated from its appearance in this edition.

The developing interest in Benjamin’s work in the late 1960s and 1970s coincided with the conjunction of avant-garde aesthetics, revolutionary politics, and university reform that produced the Student Movement in West Germany and the New Left in the United States. Benjamin’s revolutionary political commitments and his use of explicitly Marxist categories to express them were particularly appealing to a generation in rebellion against the legacy of genocidal Western European fascism. Philologically, this period in Benjamin’s reception produced as well (and in a certain tension with the Student Movement) the ambitious German *Gesammelte Schriften* (Collected Writings), whose eventual seven volumes would be completed in 1989. By making most of the documents preserved in archives outside the Eastern bloc available to scholars, the *Collected Writings* gave a far more comprehensive picture of the scope and depth of Benjamin’s theoretical interests, and demonstrated far more convincingly his philosophical sophistication than had the earlier eclectic publications.

It was this edition and the readings it made possible that brought Benjamin’s work in the 1980s into the milieu of American poststructuralism. His delight in the arcane and obscure, reflected most vibrantly in his friendship with the scholar of mystical Cabbala Scholem, his sensitivity to the modernist dislocation of Baudelaire in the nineteenth century and Kafka in the twentieth, not to mention his rediscovery of Baroque allegory in the seventeenth century and the centrality of translation to his ontology, all made his work attractive to deconstructionist literary theory. At the same time, Benjamin’s deeply skeptical attitude toward humanist traditions and his fundamental sympathy for the politically and socially marginalized elements of history lent his thought a profound affinity with postcolonial cultural critiques from a subaltern position.26 The oft-cited sentence from the aphorisms “On the Concept of History” – “There is no document of culture which is not at the same time a document of barbarism”27 – brings to a point the demystifying aspect of Benjamin’s production that animated an important part of his reception in the 1980s and 1990s. This aspect only grew in relevance with the end of the Cold War and the reunification of Germany. A Marxist critical theory centered more on the capitalist

26. Benedict Anderson’s *Imagined Communities* from 1983 bears an epigraph from Benjamin, drawn from the seventh aphorism “On the Concept of History”; just one indication of the profound influence Benjamin has exerted on critical cultural studies.

27. Benjamin, *Gesammelte Schriften*, vol. 1, 696; *Selected Writings*, vol. 4, 392.
commodity than on the historical class struggle appeared less compromised by
the collapse of the Soviet system than did many other communist theories. And
the rise of fundamentalist religious politics throughout the world at the end of
the 1990s contributed to a rise in interest in the explicitly theological dimension
of Benjamin’s political theory.  

The end of the 1990s saw, as well, the beginning of a more comprehensive
English-language edition of his writings, the four-volume *Selected Writings*
completed in 2003. Adhering to a strictly chronological organization, this edition
gives a far clearer impression of Benjamin’s simultaneous interests than does
the awkwardly structured German edition that underlies it, introducing many
untranslated texts while regularizing the translations that had appeared before.
With the appearance of the material Benjamin assembled for the *Arcades Project*,
first in German in 1982 and then in English translation in 2002, a concrete
example of Benjamin’s method for “redeeming” through dialectical juxtaposi-
tion fragments from across the entire range of a culture’s manifestations became
available to readers.

The ninth aphorism “On the Concept of History,” which describes the Klee
watercolor *Angelus Novus* as the angel of history, envisions the angel facing back-
ward into “the one single catastrophe” that is human history. “The angel would
like to stay, awaken the dead, and make whole what has been smashed.” The
rapid and respectful canonization of Benjamin partakes of that desire, as well.
Such simple satisfactions, though, are alien to Benjamin’s thought. The storm
of progress drives the angel of history “irresistibly into the future, to which his
back is turned, while the pile of debris before him grows toward the sky.”  

No reading, however deferential and celebratory, can rescue Walter Benjamin from
the destruction to which history drove him. It is rather his writings in their poly-
valent inventiveness and passion that will continue to exert their “weak messi-
anic power,” their potential to rescue us from the barbaric collapse that always
threatens our common future.

Hannah Arendt,¹ one of the most important political philosophers of the twentieth century, saw that the fundamental task of political theory today is to radically rethink the concept of the political after the event of totalitarianism revealed the bankruptcy of our traditional categories of moral and political thought.

In the first volume of *The Life of the Mind*, Arendt asks the question, “What makes us think?” Nowhere is her answer more clearly given than in her 1945 essay, “Concern with Politics in Recent European Philosophical Thought.”² While agreeing with the Greeks that philosophy begins with wonder at what is, Arendt harbors no nostalgia for recovering the Greek experience. Instead, she claims that whereas the Greek experience of wonder was rooted in the experience of beauty (*Kalon*), the experience of wonder today – if not engaged in a flight from reality – is rooted in the experience of horror at what humans are capable of, the speechless horror that must be philosophically comprehended:

> It is as though in this refusal to own up to the experience of horror and take it seriously the philosophers have inherited the traditional refusal to grant the realm of human affairs that *thaumadzein*, that

¹. Hannah Arendt (October 14, 1906–December 4, 1975; born in Konigsberg, Germany; died in New York) was educated at Marburg Universität (1924–25), Freiburg Universität (1925), and Heidelberg Universität, (1926–29). Her influences included Aristotle, Augustine, Heidegger, Jaspers, Kant, Marx, Montesquieu, and Nietzsche, and she held appointments at the University of California-Berkeley (1955), New School for Social Research (1955–75), University of Chicago, Committee on Social Thought, (1956–74).

wonder at what is as it is … For the speechless horror at what man may do and what the world may become is in many ways related to the speechless wonder of gratitude from which the questions of philosophy spring.³

The differences between these two experiences of wonder have significant consequences for how Arendt understands the task of thinking politics today. The Greek *thaumadzein*, she argues, was wonder at the *kalon*, the beauty of appearances. This wonder extended into the realm of the public wherein the Greek concern was with the *kalon kágathon*, the public appearance of the actor. Wonder today at the horror of contemporary political events is wonder in the face of darkness. If wonder is the condition of thinking and, further, if it is now wonder in the face of obscurity, then the condition of thinking today is a fundamental darkness; it is a thinking that has as its condition the loss of the public realm. In other words, for Arendt, what makes us think today is the loss of the illuminating light of the public space.

The horrifying event of totalitarianism with its death camps and terror marks the extreme condition of this darkness. Indeed, Arendt argues that the first task in thinking politics today is to *comprehend* this unprecedented event. Comprehension, she argues, in the preface to the first edition of *The Origins of Totalitarianism*,

does not mean denying the outrageous, deducing the unprecedented from precedents, or explaining phenomena by such analogies and generalities that the impact of reality and the shock of experience are no longer felt. It means, rather, examining and bearing consciously the burden which our century has placed on us – neither denying its existence nor submitting meekly to its weight.⁴

While for Arendt the event of totalitarianism marks the complete destruction of the political, nonetheless, the political and moral order of Europe had in her view already crumbled before the death camps began their horrifying work. In other words, while the event of totalitarianism revealed the complete bankruptcy of traditional categories of political and ethical thought, the elements of totalitarianism were already present long before they suddenly crystallized into this event.

---

Arendt is very careful in her use of this image of crystallization, insisting that, like crystals, the elements of totalitarianism do not add up to a whole nor do they act as causes that inevitably lead to certain effects. Instead, crystallization describes the sudden and unpredictable ways in which these elements coalesced into this event. For Arendt, her analysis of totalitarianism in *The Origins of Totalitarianism* was not strictly speaking a history of totalitarianism as such, but instead a philosophical examination of an event that marks “the very heart of our own century.” This event, she argues, “illuminates its own past; it can never be deduced from it.”

There is perhaps no more important question for Arendt than this question of thinking, of facing up to and bearing the burden of the events of our own time. Certainly, her abiding preoccupation with thinking is at work in her well-known and often-cited phrase “the banality of evil.” For her, the “banality of evil” is the evil committed out of complete and utter thoughtlessness. Coined at the end of her trial report as Eichmann, standing at the gallows, utters his last cliché, Arendt grasps that evil today is often committed by functionaries and bureaucrats who conform utterly to the society in which they find themselves. At the trial, she is confronted with a person who was unable to speak without using clichés and stock phrases; he lacked any capacity for independent thinking or judging; he simply went along with the course of events in which he was immersed. Eichmann is not alone. For Arendt, thoughtlessness marks the condition of contemporary life. In the prologue to *The Human Condition*, she writes, “thoughtlessness – the headless recklessness or hopeless confusion or complacent repetition of ‘truths,’ which have become trivial and empty – seems to me among the outstanding characteristics of our time.” Thinking, then, is for Arendt the only remedy for the banality of evil. And for her, comprehension – the ability to face up to and bear the burden of reality – is the first order of thought.

Here it is worth noting that Arendt does not agree with those who think it enough to simply repair the traditional categories of political and ethical thought in order to prevent the worst from happening again. Indeed, she ends the preface to the first edition of *The Origins of Totalitarianism* by stating that the event of totalitarianism reveals a subterranean realm that renders all such rehabilitation projects futile: “The subterranean stream of Western history has finally come to the surface and usurped the dignity of our tradition. This is the reality in which we live.” The crystallizing event of totalitarianism allows us a glimpse into the subterranean realm, revealing that modern politics, rooted in the rise of the sovereign nation-state and its declaration of human rights, is deeply entangled in

---

Volume 5
racism and an imperialism that call for something more than a restoration of the Enlightenment project; it calls for a radical rethinking of the concept of politics.

I. RETHINKING THE MODERN NATION-STATE: ANTI-SEMITISM, RACISM, IMPERIALISM

For Arendt, the elements of totalitarianism are rooted in the rise of the modern nation-state with its inherent contradiction between the state as the instrument of law and the nation comprised of a homogeneous people. Nowhere is this contradiction more marked than in the nation-state’s declaration of human rights, which declares that human rights are universal to all of humanity and at the same time claims that these rights belong only to nationals. Anti-Semitism, racism, and imperialism are all elements that emerge from this contradiction.

Hobbes and Rousseau are, for her, the principle theorists of the modern nation-state. While Hobbes denies the presence of free will in a world where all movement is causally determined, he nonetheless defines *jus naturale*, natural right, in terms of the individual’s own power and movement to do what he can do to preserve his own life. In the state of nature, however nasty, brutish and short, each individual is sovereign, with the natural right to everything, including another’s body. For Hobbes, liberty and power are synonymous terms: the natural right to self-preservation is understood as a kind of “natural power.” As is well known, Hobbes defines power in *Leviathan* as the “present means to secure the future.” Power is one’s “present means” to secure one’s future self-preservation, which means one’s future security. As Arendt points out, this is power for the sake of power, power for the sake of itself. Everything – whether in the form of knowledge or wealth – is reduced to power: “Therefore, if man is actually driven by nothing but his individual interests, desire for power must be the fundamental passion of man.”

For Arendt, the sovereign commonwealth follows from Hobbes’s reduction of natural right to the power of a sovereign, self-interested individual who initially has the right to everything. The sovereign power of the Commonwealth, she argues, is made up of private individuals solely interested in the desire for power; it embodies the sum total of private interests:

Hobbes’ *Leviathan* exposed the only political theory according to which the state is based not on some kind of constituting law – whether divine law, the law of nature, or the law of social contract – which determines the rights and wrongs of the individual’s interest with respect to public affairs, but on the individual interests themselves, so that the “private interest is the same with the publique.”

Hobbes is for Arendt the perfect thinker for the rise of bourgeois political power during the imperialist era. He is, according to Arendt, imperialism’s “great thinker” based as *Leviathan* is on the endless desire and accumulation of power. In Hobbes, imperialism’s quest for “power for the sake of power” finds its theoretical underpinnings:

This new body politic was conceived for the benefit of the new bourgeois sketch for the new type of Man who would fit into it. The Commonwealth is based on the delegation of power, and not of rights. It acquires a monopoly on killing and provides in exchange a conditional guarantee against being killed.

In the Hobbesian framework, she argues, natural right corresponds to the endless process of accumulating power. And the equality of human beings lies solely in their equality of cunning in obtaining more power. This equality therefore has no inherent worth. According to Hobbes, it is not the seller but the buyer who determines the worth of an individual, Arendt points out that for Hobbes the individual possesses no inherent dignity worthy of respect; instead, one’s worth is dependent on one’s power, which is determined solely in the eyes of others.

For Arendt, Hobbes therefore excludes in principle the idea of humanity, an exclusion that Arendt argues has disastrous effects in the nineteenth century when Hobbes’s philosophy will provide the underpinnings of race ideology, a key element in the crystallizing event of totalitarianism:

The philosophy of Hobbes, it is true, contains nothing of modern race doctrines, which not only stir up the mob, but in their totalitarian form outline very clearly the forms of organization through which humanity could carry the process of capital and power accumulation through to its logical end in self-destruction. But Hobbes at least provided political thought with the requisite for all race

doctrines, that is, the exclusion in principle of the idea of humanity which constitutes the sole regulating idea of international law.¹³

Moreover, for Arendt the exclusion of the idea of humanity and the reduction of human rights to the self-interested power of a sovereign and isolated individual provides the theoretical underpinnings first to nineteenth-century imperialism in which “everything is permitted” and then to twentieth-century totalitarianism, with its race ideologies, for which “everything is possible.”

In her analysis of Rousseau, Arendt shows how the modern form of political anti-Semitism emerges out of the inherent contradiction between the state as an instrument of law and the nation as embodying the will of the people. Unlike earlier forms of anti-Semitism, which were based on religious differences, she argues that modern anti-Semitism is political insofar as the Jews were not considered nationals. With a history of financing the state’s business, the Jews came to be identified with the state itself. Thus, she argues, any group that found itself at odds with the state thought that it was at the same time at odds with the Jews:

For more than a hundred years, anti-Semitism had slowly and gradually made its way into almost all social strata in almost all European countries until it emerged suddenly as the one issue upon which an almost unified opinion could be achieved. The law according to which this process developed was simple: each class of society which came into conflict with the state as such became anti-Semitic because the only social group which seemed to represent the state was the Jews.¹⁴

When the nation usurped the state at the beginning of the nineteenth century, the political status of the Jews became ever more precarious; having no status as nationals, the Jews had little or no political protection at all.

Arendt’s criticism of Rousseau focuses on his claim that the principle of freedom is found in the sovereign will of the nation. She argues that Rousseau’s turn to the unanimous will of the nation is motivated by the problem of the profound instability of all modern political bodies, which is the result of an elementary lack of authority.¹⁵ One way to solve the problem of legitimate authority, she argues, is to make the nation absolute. The legitimacy of power and the legality of the laws would reside in the sovereign will of the nation: the

¹³. Ibid., 157.
¹⁴. Ibid., 25.
HANNAH ARENDT: RETHINKING THE POLITICAL

general will of the nation that would reflect the innate, natural goodness of each individual heart and will. Because Augustine had already demonstrated that a divided will is impotent, unanimity is mandatory for the concept of a powerful, general will. Thus, Arendt contends, the notion of the general will must be based on unanimous consent: unanimity of opinion rather than a plurality of opinions. In other words, the unanimity of the general will, whose absolute sovereignty guarantees the stability of the political realm, depends on the individual wills giving up their particular interests and consenting to be ruled by a government whose power has become sovereign precisely because individuals have given up their individual power. As in Hobbes, the existence of an absolute sovereign in whom the identical origin of law and power is embodied, makes the law powerful and power legitimate. And this does not change when the absolute sovereign is the general will of the people.

Thus the act of consent combines the principle of absolute rulership and national principles “according to which there must be one representative of the nation as a whole, and where the government is understood to incorporate the will of all nationals.” Here we see the emerging form of the sovereign nation-state. Indeed, Arendt argues that the modern understanding of the self as a subject who is the bearer of inalienable rights is inseparable from the notion of the sovereign nation-state that gets its power from the sovereign general will of the people. Human rights, then, are tied up with the question of national emancipation: “Only the emancipated sovereignty of the people, of one’s own people, seemed to be able to insure them.” In this schema, power is always associated with sovereignty and unity – either the unified sovereign will of the individual or the unity of the general will embodied in the figure of the ruler. Napoleon is the exemplary figure: “I am the pouvoir constituant.”

Arendt argues that the problem with this schema is twofold: first, rights are indistinguishable from the sovereignty of the general will of the nation-state, and this schema does not allow for the rights of those who are not recognized as part of the general will. This leads to the second problem: at the level of the individual, one must be a national in order to have rights. Indeed, Arendt’s critique of the modern understanding of “inalienable rights” is founded on this recognition that these rights were from the beginning tied up with national sovereignty. And, she argues, no group saw this more clearly than those who had lost the protection of the sovereign: “The rights of man, supposedly inalienable, proved to be unenforceable – even in countries whose constitutions were based on them – whenever people appeared who were no longer citizens of any

16. Ibid., 171.
sorthern state.”19 Human beings become singular and concrete by the exercise of human rights tied to state sovereignty, and those who are deprived of them become human beings without portfolio, “human beings in general.”

Most devastating, she argues, is that the world found nothing sacred in the “abstract nakedness” of being human:

If a human being loses his political status, he should, according to the implications of the inborn and inalienable rights of man, come under exactly the situation for which the declaration of such general rights provided. Actually the opposite is the case. It seems that a man who is nothing but a man has lost the very qualities which make it possible for other people to treat him as a fellow-man.”20

At the very moment when protection under the auspices of universal human rights was most desperately needed, no such protection was granted. Outside the law and not belonging to any political community, she and her fellow refugees were reduced to “mere naked human beings” in a “condition of complete rightlessness.”21 Contrary to Edmund Burke, for Arendt the abstraction is the abstract nudity of those who are nothing other than naked human beings, naked as the day they were born. She argues, it was in order to escape this “abstract nudity” that those who were stateless “insisted upon their nationality, this ultimate fact of their being citizens.”22

Arendt’s relation to Burke is complicated. While she agrees with Burke’s critique of the notion of natural rights, she does not agree with his further claim that human rights belong only to citizens of particular nation-states. Indeed, Arendt places Burke in the group of thinkers who are the predecessors of modern state racism. Burke’s insistence on reducing rights to the rights of Englishmen, she argues, is dangerously tied to his notion of a “race of aristocratic blue bloods.” This is possible, she argues, precisely because of his dismissal of a principle of humanity at work in human rights. As we saw above in her critique of Hobbes, racial thinking depends on this dismissal. In her analysis of “race-thinking before racism,” which includes a long section on Burke, she points out that at the heart of race-thinking is the consistent denial of the “great principle upon which national organizations of peoples are built, the principle of equality and solidarity of all peoples guaranteed by the idea of mankind.”23 Race, she argues, “politically speaking, is not the beginning of humanity but its

20. Ibid., 300.
21. Ibid., 296.
22. Ibid., 300.
23. Ibid., 161.
end, not the origin of peoples but their decay, not the natural birth of man but his unnatural death.”

While totalitarianism destroys the legal and moral person, nevertheless, Arendt insists that these regimes are not lawless. A totalitarian regime, she argues, “claims to obey strictly and unequivocally those laws of Nature and History from which all positive laws always have been supposed to spring.”

Raging against the constraining and absent symbolic law, totalitarian politics “promises justice on earth because it claims to make mankind itself the embodiment of the law.” Totalitarianism substitutes another law, a law that is incarnate and reassuring because the law can now be known; it literally dwells among us, having been brought down to earth.

The embodiment of the law is possible through the substitution of history for politics. More precisely, totalitarian regimes replace politics with its fundamental concern with freedom and action with an ideology that assigns reality “[to a] process that unfolds behind the backs of those who act and does its work in secret, beyond the visible historical process, and history comes to mean, in a very literal sense, the flow of history.” Fascist ideology provides the fiction of a ready-made, unified world: fixed, static, without contradiction, and utterly reliable. Its hellish fantasies are characterized by a “strident logicality,” a logic through which the whole of reality is thoroughly and systematically organized with a view to total domination.

For Arendt the appeal of this fiction has its roots in the modern phenomenon of superfluousness. Radical evil, she writes in _The Origins of Totalitarianism_, “has appeared in connection with a system in which all men have become superfluous in some way.” It is the desolation of individuals who are “economically superfluous and socially uprooted” with its peculiar kind of loneliness that provides the conditions for totalitarianism:

Loneliness, the common ground for terror, the essence of totalitarian government, and for ideology and logicality, the preparation of its executions and victims, is closely connected with uprootedness and superfluousness which have been the curse of modern masses … To be uprooted means to have no place in the world, recognized and guaranteed by others, to be superfluous means not to belong to the world at all.

25. _Ibid._, 461.
And the threat of totalitarianism is still with us as long as this condition of superfluousness continues: “The danger of the corpse factories and holes of oblivion is that today, with populations and homelessness everywhere on the increase, masses of people are continuously rendered superfluous if we continue to think of our world in utilitarian terms.”

Totalitarianism is the stripping away of everything that gives one a place in the world, from private property to personal relationships to the right of government protection. It is the stripping away of the legal and the moral person, leaving only the “naked human being.” Stripped down to bare existence, the conditions are set for mass murder: “Only in the last stage of a lengthy process is their right to life threatened; only if they remain perfectly ‘superfluous,’ if nobody can be found to ‘claim’ them, may their lives be in danger.”

If totalitarianism is marked fundamentally by the condition of worldlessness, whereby reality is replaced by a fiction, politics is reduced to the laws of history or nature, and masses of people are rendered superfluous and thereby murdered, then for Arendt our only remedy against the threat of totalitarianism is to recover a sense of reality and a place in the world. In other words, our only remedy is a return of the political. And this for Arendt requires first of all rethinking the fundamental categories of politics, namely, freedom, power, and action.

II. RETHINKING FREEDOM, POWER, AND ACTION

Arendt’s critique of Hobbes, Rousseau, and the modern nation-state is instructive not only for understanding the elements that crystallized into the event of totalitarianism, but also for understanding how her radical rethinking of freedom, power, and action allow her to offer a new theoretical framework for thinking the political. Only through a radical reformulation of power, freedom, and the public space, Arendt argues, is it possible to sever politics from the disastrous twin conceptions of sovereign agency and sovereign state power.

Indeed, Arendt’s rejection of sovereign power has its basis in her rejection of the dominant philosophical understanding of freedom, which, as we saw above, from Augustine onward has largely understood freedom as located in a subjective will. Her understanding of freedom, on the contrary, is political, located not in the “I will” but in the “I am able.” Indebted to Aristotle, she argues that freedom is always the freedom to move and is by definition worldly. Indeed,
she argues that the experience of “worldly freedom” is the condition of an inner sense of freedom:

Hence, in spite of the great influence the concept of an inner, nonpolitical freedom has exerted upon the tradition of thought, it seems safe to say that man would know nothing of inner freedom if he had not first experienced a condition of being free as a worldly tangible reality.

Freedom, she argues, is “experienced in the process of acting and nothing else”; this capacity to act and to move must be understood as the capacity to begin, to get a move on: “The Greek word archein which covers beginning, leading, ruling, that is, the outstanding qualities of the free man, bears witness to an experience in which being free and the capacity to begin something new coincided.” From the outset, Arendt’s understanding of freedom is inseparable from power, the ability to begin. And, to go further, the “I am able” must be understood as the ability to act in a public space, to move in a space of freedom with others.

Moreover, power according to Arendt must always be said in the plural. In other words, for power to exist there must be other centers of power: “Power comes into being only if and when men join themselves together for the purpose of action, and it will disappear when, for whatever reason, they disperse and desert one another.” Domination, by contrast, is the loss of power that occurs only where there is a central ruling power. Thus the notion of sovereignty can denote strength but it can never denote power. The principle of federalism, she argues, illuminates the point. The establishment of the Union of the United States, as James Madison and Thomas Jefferson understood, did not take away from the power of the states, but instead provided a new source of power. Indeed, she argues that if the individual states had not existed, the Union would have had to erect them in order to have the power it did. This again suggests that power is generated by power and to be powerful one must be in relation to other powers. Here we see Arendt’s rejection of Rousseau’s identification of sovereignty with power. Arendt argues instead that action demands a plurality of actors; further, power must be understand as the only “human attribute which applies solely to the worldly in-between space by which actors are mutually related.”

Power therefore denotes not only the ability to act, but action in concert with others. Thus Arendt insists that “the power structure itself precedes and

32. Ibid., 166.
34. Ibid.
outlasts all aims, so that power, far from being the means to an end, is actually the very condition enabling a group of people to think and act in the means–ends category.”36 This is why Arendt argues that full-blown terror, resulting in the complete atomization of the political, is the presence of an absolute violence without the presence of power. Power, present only when people act in concert, has completely disappeared. Charles Montesquieu already saw this problem: terror is ultimately impotent and self-destructive because it fears any and all organization, even turning against those in its own forces who might organize. Going further, Arendt argues that the difference between totalitarianism and tyranny is that the former turns even against the power of its friends.37

How then can we think legitimate power? I submit that Arendt’s understanding of a noncentralized nonsovereign power, synonymous with public freedom and action, allows for rethinking a legitimate principle of power. Here we must grasp that the modern understanding of law, having its roots in Hobbes, is contractual; furthermore, the contractual understanding of law is inseparable from an understanding of power as sovereign. Arendt argues, however, that the contract is not the exclusive foundation for the law. In contradistinction to the contract, the law can be founded on the mutual compact. She points to compacts such as the Mayflower Compact, which were made prior to the American Revolution, and which were made with no reference to prince or king. The principle of the compact (or covenant) is the claim to power without the further claim to sovereignty. The principle was “neither expansion nor conquest but the further combination of powers.”38 The compact, Arendt argues, understands the political bond in the old Roman sense of alliance: “Such an alliance gathers together the isolated strength of the allied partners and binds them into a new power structure by virtue of ‘free and sincere promises.’”39 Again, she argues, this is very different from the contract wherein an individual person resigns his “power to some higher authority and consents to be ruled in exchange for a reasonable protection of his life and property.”40 The difference between an act of covenant and an act of consent is that the first is based on an increase of power through the recognition of others inspired by the principle of plurality, while the second is based on the surrender of power in the recognition of sovereignty inspired by the principle of unanimity.

The notion of law that emerges out of the mutual covenant is one that understands the law as neither sovereign nor dominating, neither commandment nor imposed standard. Rather, following Montesquieu’s insight, Arendt suggests that

39. Ibid., 170.
40. Ibid., 169.
the law must be understood as regulator of different domains of power. Here there is a way to think multiplicity of power with rule. Arendt again looks to Montesquieu for whom the law, “never lost is original ‘spatial significance’ altogether, namely, ‘the notion of a range or province within which defined power may be legitimately exercised.’”41 And since the laws are no more than the relations that exist and preserve different realms of power, and are therefore relative by definition, Arendt argues that Montesquieu “needed no absolute source of authority and could describe the ‘spirit of the laws’ without ever posing the troublesome question of their absolute validity.”42

Yet Arendt does not relinquish the problem of legitimate principles of power, and it is this that moves her from an analysis of power to the formulation of a principle of humanity that would be the basis for distinguishing legitimate and illegitimate forms of power. She accomplishes this through an analysis of the event of natality, drawing on the triple meaning of the Greek word archē, which she argues conveys the triple sense of principle, beginning, and common ground. The principle of action, she argues, lies in its beginning and it is this principle of initium that provides the inspiration for power and action. Now, if it is the case that power is synonymous with action and freedom, and, further, if all three terms denote the appearance of an actor among a plurality of actors in a space of freedom, then the principle that inspires power and political action, and which lends action its legitimacy, is the principle of publicness: “Because of its inherent tendency to disclose the agent together with the act, action needs for its full appearance the shining brightness we once called glory, and which is possible only in the public realm.”43 Insofar as action and power are synonymous terms for Arendt, we can substitute power for action in the above passage. In other words, her analysis suggests that legitimate power is precisely power that allows the actor to appear in a public space with others. This principle of publicness is the principle that ought to inspire the constitution of the political space and all activities carried out therein: it demands that the divisions of power be such that all actors are able to appear and to act. In still other words, the principle of publicness demands that all positive, civil laws constitute and regulate the divisions of power in such a way that all the actors are empowered.

To go further, the principle of publicness also permits philosophically establishing a notion of “rights” that does not have its basis in an understanding of human nature as a sovereign subject endowed with inalienable rights. Arendt is able to reject the fiction of human nature and still think the inalienable right of the actor who in order to act must be able to appear in a public space of

41. Ibid., 186–7.
42. Ibid., 189.
43. Ibid., 180.
freedom. Although stripped of state, stripped of a home, the actor must not be stripped of this fundamental right to be able to appear, because the first act, the act of beginning itself – the event of natality – contains both the beginning and its principle within itself.

The event of natality carries within it the principle of publicness, which restated as the law of humanity (humanity understood as the appearance of the actor among a plurality of actors in a public space of freedom), demands that the actor have the right to appear, or, as Arendt so succinctly states, have “the right to have rights.” Again, this is a right not predicated on a metaphysical understanding of the human being as having a nature, but instead, on an event, the fundamental event of human existence, that is, the event of natality. To be born is to appear on the globe. This is precisely the law of humanity articulated by Kant in his essay “Perpetual Peace” and quoted so approvingly by Arendt in her Kant lectures: “Humans have it by virtue of their common possession of the earth, whereas on a globe, they cannot infinitely disperse and hence must finally tolerate the presence of each other. [For] the common right to the face of the earth … belongs to human beings generally.”

The new principle of humanity that grounds the “right to have rights” is the principle of publicness that demands that each actor by virtue of the event of natality itself has the right to appear; that is, the right to temporary sojourn on the face of the earth. Inseparable from the principle of publicness is the principle of plurality. As she argues in *The Human Condition*, appearance means to be seen and heard by others. The fundamental condition of being human, she argues, “is that men and not man inhabit the world.” In other words, “plurality is the law of the earth.” Being and appearing are coincident, and appearance requires a spectator: “Nothing and nobody exists in this world whose very being does not presuppose a spectator. In other words, nothing that is, insofar as it appears exists in the singular; everything that is is meant to be perceived by somebody.” Indeed, for Arendt “world” is constituted only through a plurality of perspectives. Again, since the fundamental event, the beginning itself, carries its principle within it, the event of natality, the event of appearance itself, carries the principle of plurality – with its inherent publicness – within it.

Moreover, for Arendt, “appearance” carries with it the notion of significant speech and action. It is not enough to give someone a place of refuge; instead, the

---

46. Ibid., 7.
48. Ibid.
principle of plurality, with its inherent publicity demands that there be a public place where one is truly seen and heard. Otherwise, she argues, one is simply the fool or idiot: one who speaks or acts without significance, which is just another kind of invisibility. Moreover, one must be able to initiate human action in concert with others; it is our “freedom to begin something new and unexpected that was not there before.”49 And for Arendt, significant speech and action, as well as the capacity to begin something new, can occur only in a political space. In this context, Arendt’s approving reference to Pericles’s funeral oration receives added import: “Wherever you go, you will be a polis.”50 Wherever one goes, one has the right to belong to a political space where significant speech and action, as well as the capacity to initiate, is possible. And this is because each human being is an appearance who requires a public space in order to truly appear: “To be deprived of it means to be deprived of reality, which, humanly and politically speaking, is the same as appearance.”51

More fundamental than the rights of justice and freedom, for Arendt, is the right to action and opinion, as well as the right to belong to a political community in which one’s speech and action are rendered significant:

We became aware of the existence of a right to have rights (and this means to live in a framework where one is judged by one’s actions and opinions), as well as the right to belong to some kind of organized community, only when millions of people emerged who had lost and could not regain these rights because of the new global political situation.52

Arendt’s theoretical reformulation of the fundamental “right to have rights” emerges out of her reflection on the initium inherent in the ontological event of natality, an initium that makes every human being a beginner. On this point, Arendt is much indebted to Augustine’s insight, “Initium ergo ut esset, creatus est homo, ante quem nullus fuit [That there might be a beginning, man was created, before whom nobody was].”53 This principle of initium, she argues, allows for a radical reformulation of the modern framework of human rights, such that the rights of freedom and agency are rooted in the more fundamental rights of action and speech. Moreover, the right of sovereignty, individual and collective, is replaced with the right to belong to an organized political space, with its inherent plurality of actors. Ultimately, for Arendt, federated political

49. Arendt, Between Past and Future, 151.
51. Ibid., 199.
spaces with a plurality of power centers must replace the notion of the national sovereignty of a nation-state.

### III. REthinking Politics: The Event of Natality

In her analysis of totalitarianism, Arendt claims that with the rise of the historical sciences, “the central position which the concept of beginning and origin must have in all political thought has been lost ....”\(^5^4\) It is not too much to claim that Arendt’s rethinking of politics is an attempt to restore to central place the concept of “beginning.” If Heidegger is the thinker of mortality understood fundamentally in terms of being-towards-death, then Arendt is the thinker of mortality understood primarily in terms of natality, the fundamental event of beginning. Indeed, for her the political concern for immortality is rooted in this event of natality in which the beginner appears and as such desires endurance in time.

In *The Human Condition*, Arendt begins her analysis of the vita activa with a distinction between eternity and immortality. While her discussion of immortality is often read as an argument for heroic deeds and speech that distinguish the actor in the public realm and, thereby, ensure through remembrance his or her endurance in time, close examination of Arendt’s argument reveals that she is not so much interested in the endurance of individual deeds as she is in the endurance of humanity itself. Immortality, she argues, is the concern of those beings who are mortal. Mortality marks the division between life and death; it marks a cut in time whereby human beings move “along a rectilinear line in a universe where everything, if it moves at all, moves in a cyclical order.”\(^5^5\) This transformation of linear into rectilinear time distinguishes the human being from other animal species.

Arendt makes the same point early on in *The Human Condition* in her discussion of the meaning of mortality:

> Men are “the mortals,” the only mortal things in existence, because unlike animals they do not exist only as members of the species whose immortal life is guaranteed through procreation. The mortality of men lies in the fact that individual life, with a recognizable life-story from birth to death, rises out of biological life.\(^5^6\)

Mortality is the cut in the temporality of biological life, and yet mortality is not completely cut off from biological life. Instead, the cut of mortality introduces another temporality into biological life, thereby infusing biological life with mortality. Insofar as the event of natality is for Arendt also the event of mortality, it must be understood as always already introducing this mortal cut into biological life, thereby confounding any strict distinction between the biological and the mortal. Simply put, for Arendt, the mortal never possesses “bare life.”

The concern with immortality is inseparable from a political life:

Without this transcendence into a potential earthly immortality, no politics, strictly speaking, no common world and no public realm is possible … But such a common world can survive the coming and going of the generations only to the extent that it appears in public. It is the publicity of the public realm which can absorb and make shine through the centuries whatever men may want to save from the natural ruin of time.57

Immortality, therefore, is a political achievement that institutes an enduring, common world. Neither a religious sentiment nor founded in the fear of death, the desire for immortality is the desire for a common world that delivers us from obscurity; it is the desire to be visible, to be seen and recognized by equals; it is the desire for our own image granted only through the perspectives of others. Far from celebrating a politics of heroic individualism, Arendt’s emphasis on immortality is rooted in the desire to appear, that is, the desire to be: “The term ‘public’ … means, first, that everything that appears in public can be seen and heard by everybody and has the widest possible publicity. For us, appearance – something that is being seen and heard by others as well as by ourselves – constitutes reality.”58 The fulfillment of this desire depends on there being a plurality of others who share a common world. Citing Aristotle, she argues, “To men the reality of the world is guaranteed by the presence of others, by its appearing to all; ‘for what appears to all, this we call Being,’ and whatever lacks this appearance comes and passes away like a dream ….”59 Indeed, our very sense of reality “depends utterly upon appearance” in a common world, the reality of which “relies on the simultaneous presence of innumerable perspectives and aspects in which the common world presents itself and for which no common measurement or denominator can ever be devised.”60 It is clear in these passages that

Arendt is thinking the solidarity of humanity not as a solidarity that identifies with the other nor as one established in a reciprocity of identifications; rather, solidarity emerges out of the irreducible nonintegration of different standpoints wherein there is equality (not identification) in difference: “the sameness of utter diversity.”

Arendt goes so far as to call this desire to appear an “innate impulse” as compelling as the fear which accompanies the urge for self-preservation:

It is indeed as though everything that is alive – in addition to the fact that its surface is made for appearance, fit to be seen and meant to appear to others – has an urge to appear, to fit itself into the world of appearances by displaying and showing, not its “inner self” but itself as an individual.61

Looking to the research of the Swiss biologist and zoologist Adolf Portmann, Arendt argues that this “urge to appear” cannot be explained in functional terms; instead, she suggests, the “urge to appear” is gratuitous, having to do with the sheer pleasure of self-display. Human beings, who have a concern with an enduring image, transform this urge to self-display into a desire for self-presentation, which she argues involves a “promise to the world, to those to whom I appear, to act in accordance with my pleasure.”62

The division between the natural and mortal/immortal being, therefore, coincides with the first division between the private and public realm. For Arendt the only way our individual and collective desires can avoid the fanaticism and madness of radical evil is by the political institution of a different form of time – the time of immortality – rooted not in religion or fear but in the desire for an enduring image and mode of appearance. This is a desire met only in a public space with an irreducible plurality of others with whom we promise our pleasures rather than assert our needs. Indeed, Arendt’s highly controversial distinction between the social and the political must be understood against the background of this transformation of temporality.

Finally, Arendt suggests that the political institution of the temporality of immortality must be accompanied by an affectivity that provides an animating or dynamic basis for the political bond or what Arendt calls “the solidarity of humanity.”63 Indeed, one could read her “politics of natality” and its insistence
