63. Insisting on an affective dimension to political life, Arendt is in the tradition of Montesquieu, who argues that the laws and institutions (the form) of any political regime is always animated by an affective principle (the spirit of the laws) that establishes the political bond. Thus the laws and institutions of a monarchy are animated by the love of honor, while the laws and
on the move from the natural to the mortal/immortal, from zoē to bios, as adding another properly political chapter to Hobbes’s understanding of the human being. Contrary to Hobbes’s natural position, Arendt’s political understanding of the human being insists on the transformation of the time of self-interest to the temporality of public happiness with its promise of shared pleasures. This, in turn, allows her to reformulate the “solidarity of humanity” and its predicament of common responsibility.

In her essay On Violence, Arendt takes up the issue of whether “enlightened self-interest” can adequately resolve conflict and prevent violence. Using the example of a rent dispute between tenant and landlord, Arendt argues that enlightened interest would focus on a building fit for human habitation; however, the argument that “in the long run the interest of the building is the true interest of both the landlord and the tenant,” leaves out of account the time factor which is of paramount importance for all concerned.64

Because of mortality, she argues, the self qua self cannot calculate in long-term interest:

Self-interest, when asked to yield to “true interest” – that is, the interest of the world as distinguished from that of the self – will always reply, “Near is my shirt, but nearer is my skin” … it is the not very noble but adequate response to the time discrepancy between men’s private lives and the altogether different life expectancy of the public world.65

To move from self-interest to “world-interest” requires a move from fear to love of the “public thing.”66

Love of the “public thing” occurs only through the vigilant partiality of political friendship, which rejects from the outset any notion of truth, engaging instead in the practice of questioning and doubt that marks the secular ordeal of modern humanity.

---

64. Arendt, On Violence, 78.
65. Ibid.
66. Ibid.
For Arendt, Gotthold Lessing is the figure who embraces this secular ordeal:

He was glad that – to use his parable – the genuine ring, if it had ever existed, had been lost; he was glad for the sake of the infinite number of opinions that arise when men discuss the affairs of this world. If the genuine ring did exist, that would mean an end to discourse and thus to friendship and thus to humanness.67

Lessing rejoices in that very thing that has caused so much distress, namely, “that the truth once uttered becomes one opinion among many, is contested, reformulated, reduced to one subject of discourse among others.”68 Arendt goes on to suggest that Lessing was a “completely political person” because of this understanding of the relation between truth and humanity:

He insisted that truth can exist only where it is humanized by discourse, only where each man says not what just happens to occur to him at the moment, but what he “deems truth.” But such speech is virtually impossible in solitude; it belongs to an arena in which there are many voices and where the announcement of what each “deems truth” both links and separates men, establishing in fact those distances between men which together comprise the world.69

This does not amount to tolerance; instead, “it has a great deal to do with the gift of friendship, with openness to the world, and finally with a genuine love of mankind.”70

Lessing’s antimony between truth and humanity provides Arendt with a kind of thought experiment. She asks the reader to assume for a moment that the racial theories of the Third Reich could have been proved: “Suppose that a race could indeed be shown, by indubitable scientific evidence to be inferior; would that fact justify its extermination?”71 She asks the reader not to make the experiment too easy by invoking a religious or moral principle such as “thou shalt not kill”; she asks this in order to show a kind of thinking not governed by legal, moral, or religious principles (she asks this in the sober recognition that legal, moral, and religious principles did not prevent the worst from happening). This way of thinking without recourse to transcendent principles paradoxically gives rise to a fundamental political principle by which to judge our “truths”: “Would

68. Ibid., 27.
70. Ibid.
71. Ibid, 29.
any such doctrine, however convincingly proved, be worth the sacrifice of so much as a single friendship between two men?"\(^{72}\)

The political principle is friendship: any doctrine that in principle barred the possibility of friendship must be rejected. Political friendship retreats from a notion of truth as “objective”; nonetheless, Arendt argues, it has nothing to do with a kind of subjective relativism where everything is viewed in terms of the self and its interests. Instead, “it is always framed in terms of the relationship of men to their world, in terms of their positions and opinions.” Lessing’s understanding of friendship, therefore, has nothing to do with the warmth of fraternity that desires above all to avoid disputes and conflicts. The excessive closeness of brotherliness, Arendt claims, obliterates all distinctions and Lessing understood this: “He wanted to be the friend of many men, but no man’s brother.”\(^{73}\) Finally, while political friendship does not recognize any ultimate arbiter for its disputes and disagreements, nonetheless, it is guided by a fundamental exigency: we must assume responsibility for what is just and what is unjust, answering for our deeds and words.

**MAJOR WORKS**

*Lectures on Kant’s Political Philosophy.* Edited by Ronald Beiner. Chicago, IL: University of Chicago, 1982.

\(^{72}\) *Ibid.*, emphasis added.

Georges Bataille\(^1\) occupies an important if eccentric position in the history of continental philosophy. To the common understanding and practice of philosophy he opposed his own, rather idiosyncratic “method of meditation,” an approach to thinking that would take into account not only what a human subject can know, but also the experience of “nonknowledge” or “unknowing” (le non-savoir) that Bataille saw as the core of human existence. Respectful of erudition, he remained wary of anyone who “acquires his intelligence at the University,”\(^2\) considering much academic philosophy to be pusillanimous (“that careful little man, philosopher!” he wrote of Bergson on finishing the latter’s *On Laughter*\(^3\)). He identified his own project with that of Friedrich Nietzsche, whose writings, on his view, opened the way toward an understanding of man as a “bacchant philosopher”:\(^4\) “What I teach,” Bataille writes, “is a drunkenness … not a philosophy: I am not a philosopher, but a *saint*, maybe a madman.”\(^5\)

\(^1\) Georges Bataille (September 10, 1897–July 8, 1962; born in Billem, France; died in Paris) was educated at the Séminaire de Saint-Fleur (1917), École des Chartes (1918–22), and École des Hautes Études Hispaniques, Madrid (1922). His influences included Hegel, Kojève, Mauss, Nietzsche, Sade, and Shestov, and he held appointments at the Bibliothèque Nationale de Paris (1922–42), Bibliothèque de Carpentras (1949–51), and Bibliothèque d’Orléans (1951–62).

\(^3\) Ibid., 66.

\(^4\) Ibid., 28. [*] Nietzsche is discussed in detail in an essay by Daniel Conway in *The History of Continental Philosophy: Volume 2*.

While his writings address some of the canonical texts of Western philosophy, especially Hegel’s, his engagement with these texts is so thoroughly critical that it would not be an exaggeration to say that Bataille sought, by philosophical means, to escape from philosophy. The cardinal concept of “inner experience” serves in his writings to highlight the limitations of philosophical inquiry and the ultimate “emptiness of intelligent questions.”  

6 Attempting to move beyond what he considered the verbalism and intellectualism of phenomenology (in particular), inner experience represents an attempt to accede to the realm of nonknowledge, the perfect (although unrealizable) expression of which would be silence. Such a project, the repressed traces of which Bataille thought he detected in Hegel’s dialectic, has obvious parallels in the Christian mystical tradition, a corpus that Bataille sometimes invokes; the proximity of his thought to currents of mysticism brought upon him the ridicule of “official” philosophers, such as Jean-Paul Sartre.  

Although Bataille would later claim that his lack of philosophical training was in part a matter of principle (“it was deliberately that I decided not to be a specialist in philosophy”), his intellectual development was nonetheless influenced by encounters with two eminent philosophers, both of them Russian. Lev Shestov (Lev Izaakovic Schwartzmann, 1866–1938), who arrived in Paris in 1920 in flight from the Bolshevik Revolution, served the young Bataille as a “reliable” mentor in philosophical matters; for a number of years, he guided Bataille in his readings of Nietzsche and studied with him some of Plato’s works (Bataille, a good linguist, was able to read Plato in the original). The young Bataille, who had considered entering the priesthood and had attended a Catholic seminary before losing his faith in 1922, was attracted above all to Shestov’s embrace of the tragic side of existence. Author of The Philosophy of Tragedy: Dostoevsky and Nietzsche (1903), Shestov favored figures who stand on the threshold of philosophy and religion (Plotinus, Pascal, Kierkegaard, Dostoevsky, Nietzsche), and whose writings, issuing directly from their experience, place them in proximity to the very categories of “madness” or “saintliness” that Bataille later claimed for himself. Shestov’s manner of writing philosophy also left its mark on Bataille. Aphoristic and often self-contradictory, Shestov’s style reflects his conviction that reason and knowledge alone cannot adequately account for the totality

of human experience. Bataille (who collaborated on the translation of one of Shestov’s books into French) absorbed this fragmentary and deliberately paradoxical style of philosophizing, while the conviction that existence is irreducible to rational inquiry underpins his notion of nonknowledge.

Bataille began to distance himself from Shestov in the late 1920s when, in his own accounting, he turned along with the rest of his generation toward Marxism. He met Alexandre Kojève (Aleksandr Vladimirovič Koževnikov, 1902–68) in the 1930s when he attended Kojève’s lectures on Hegel’s Phenomenology of Spirit at the École des Hautes Études. Kojève was slightly younger than Bataille. In his courses he read, translated, and commented on passages from Hegel that recur in Bataille’s writings, notably in Inner Experience and Guilty, both of which are in part a response to Kojève’s reading of Hegel. The encounter with Kojève allowed Bataille to focus his thinking about human activity in critical relation to phenomenology, and to formulate, in a sort of challenge to Hegel’s philosophy of action, a notion he calls (in a letter to Kojève) “unemployed negativity”: “If action (‘doing’) is – as Hegel says – negativity, the question arises as to whether the negativity of one who has ‘nothing more to do’ disappears or remains in a state of ‘unemployed negativity.’” The idea of remaining in a state of “unemployed negativity” appeals to Bataille; it is a state he theorizes in several essays and represents dramatically via his fictional characters, particularly Dirty and Troppmann in Blue of Noon. Throughout his life, Bataille remained deeply critical of the primacy in modern society of “the world of work,” to such an extent that, in his eyes, criminals, poets, saints and idlers – who refuse the world of work and the principle of utility that governs it, who refuse “action” – represent a destabilizing, even revolutionary energy. More generally, Bataille included in the category of “unemployed negativity” everything that in a given society remains irreducible to assimilation: waste matter, criminality, excess, eroticism, madness, and désœuvrement – all that heterogeneous matter that a system (be it philosophical or political) cannot readily put to use and must expel in order to function smoothly. Bataille’s encounter with Kojève is decisive in that he saw in Kojève’s Hegel exactly what he wanted to refute: a worldview based on knowledge, and that excludes the turbulent, unmasterable experiences that Bataille equates with being human.

From early in his career, Bataille expressed reservations about philosophy’s ability to reflect a reality that he felt to be essentially without form. “All of philosophy,” he wrote in a brief article from 1929, “has no other goal [than that] of giving a frock coat to what is, a mathematical frock coat. On the other hand,
affirming that the universe resembles nothing and is only formless amounts to saying that the universe is something like a spider or spit.”

Since language, especially as it is used in philosophy as an instrument of enlightenment, tends to create the impression that human existence is knowable and obeys discoverable laws, it is not surprising that all of Bataille’s writings struggle with and protest against language’s form-giving powers. Bataille is indeed an important figure in what is sometimes called the “linguistic turn” in philosophy: his emphasis on the complex role of language in philosophical exposition has given rise to searching inquiries on the topic from Julia Kristeva to Jacques Derrida. His manner of writing – his way of insisting that language be made to divest itself of its rhetorical prowess – is a call to philosophers to be more attentive to the issue of how a thought is expressed, to be aware of the linguistic constructedness of a reality often presented as natural. “If it were necessary to give me a place in the history of thought,” Bataille wrote in 1953, “it would be I think for having discerned the effect, in our human life, of the ‘fading of discursive reality’ and for having drawn from these effects an evanescent light.” “Discursive reality” refers here to reality as it is construed in the texts of a number of philosophers for whom discourse and representation remain unproblematized categories. “Discursive reality,” Bataille believes, must not be taken to reflect the totality of existence (or the “whole person” as Bataille puts it). Hence every philosophical system must remain ultimately incomplete, because at its summit it will run up against a discursively untranslatable experience, an experience of “non-sense”: philosophy cannot have the last word.

Bataille is especially interested in those experiences and emotions – laughter, tears, extreme fear and pain, ecstasy, erotism, madness, drunkenness, and so on – that defy sense and resist translation into language. These states express themselves in shrieks, shudders, stammers, sobbing, silence – in some type of rupture with articulate speech. All of them, Bataille is convinced, indicate an absence of meaning; in speaking of them, or writing about them, Bataille is conscious of supplying a meaning they do not have. This is a paradox that Bataille never for an instant forgets; his books are shot through with avowals that his text is a necessary betrayal of a more perfect if impossible communication that would eschew words altogether:

Lautréamont said that the “intellectual bloodstain,” which is the mania for rationalizing, cannot be washed off. And in fact it cannot,

*13. For a discussion of this “linguistic turn” in continental philosophy, see the essay by Claire Colebrook in The History of Continental Philosophy: Volume 6.

I succumb to the use of words: *to be, effect, succumb, use*, all these words, assembled and chained together, proclaim my servitude; and it is not enough to recognize this in order to be rid of it. In fact, even the writer who is the most averse to discourse – to the “order of things” and to the servile language which expresses it – cannot be content with turning his back on it; he is himself forced to express himself on the level of discourse, forced to have an intellectual position. But this is painful to him: he does it against his will, with gnashing of teeth …

From this and dozens of similar passages throughout his *oeuvre* it emerges that Bataille is neither a Wittgensteinian, who would concede that there are things of which we cannot speak, nor a Romantic, lamenting language’s inability to capture ineffable experience. On the contrary, to the extent that there is something like a philosophy of language running through Bataille’s *oeuvre*, it is marked by a paradoxical, almost Beckettian sense of the simultaneous impossibility and necessity of speaking: his emphasis on an obligation (the writer is “forced” to use language) that is “painful” seems to suggest moreover an ethical dimension to writing.

The issue of language is thus for Bataille neither merely rhetorical, nor peripheral; it is primary, and it is intractable. While language defines us as human, we are not so naive as to imagine that language alone can envelop that nonmaterial “plenitude of being” of which every human has or can have a complete experience: “we are … the expectation that no material response can satisfy, no tricks with words deceive.” This frank recognition of the limitations of language incites Bataille to write at the limits of language (he strains syntax beyond the point of comprehensibility, leaves sentences unfinished, uses ellipses to excess) in an attempt to forge a writing that he calls (again echoing Beckett) “impossible.” This impossible language can come about only through “the liberation of the power of words,” which paradoxically means also (in French he employs a double genitive) a “liberation from the power of words”; since “words … serve only to flee” and “drain almost all life from within us,” only a liberation from them can create the conditions for “profound communication,” which, Bataille

writes, “demands silence.”

Only words that have been released from their condition of “servility,” from their “job” of producing meaning (of producing discursive reality), can communicate that moment when “existence gives way in a cry.”

“I cannot consider someone free if they do not have the desire to sever the bonds of language within themselves,” Bataille wrote. Yet the resources of the writer who would turn against language – or try to turn language against itself – are limited (Bataille is prudent in writing of “the desire to sever the bonds of language”). One strategy Bataille adopted in his writing was to refuse to limit himself to a single discursive field or genre, allowing his text to be traversed by multiple discourses and various forms that are often held apart. Bataille juxtaposes poetry and prose, philosophical analysis and personal anecdote, text and image; he borrows examples and metaphors and from the lexicons of political theory, economics, archaeology, ethnology, numismatics, philosophy, theology. His thought relies on a network of key terms, many of which he has so marked that they are virtually synonymous with his name, drawn from these different discursive domains: transgression, expenditure (dépense), consumption, sovereignty, erotism, nonknowledge, atheology, ecstasy, the impossible, restricted/general economy, and so on. The overarching inquiry that links all of these terms is an economic one and concerns the question of communication. Communication, the foundation of social existence, is what allows the isolated individual to escape from the prison of the self and to share in the experience of community. Communication cannot take place between perfectly self-sufficient beings; for communication to come about, there must be on either side a wound – some fissure or opening that allows for one being to enter into contact with another.

Bataille’s ideas about communication and the sacred were influenced by ethnology, with which he came into contact through his friend Alfred Metraux. Marcel Mauss’s 1925 essay The Gift, “a magisterial study” in Bataille’s words, had the greatest influence. In the early 1930s, Bataille was preoccupied with what he called “improductive expenditure” (la dépense improductive), meaning the expenditure of energy without reserve and without any expectation of return. Western capitalist societies are largely allergic to such spending, since the capitalist economy depends on its own endless expansion and this in turn depends on returns from spending and investments. Capitalist society, based on the values of prudence, calculation, and predictability, is produced by and

21. Ibid., 93.
22. Ibid., 119.
24. Mauss is discussed in an essay by Mike Gane in The History of Continental Philosophy: Volume 3.
reproduces a particular type of subject, the *Homo economicus*, who in Bataille’s estimation is an “incomplete man,” a fearful, isolated and rather pitiful creature who has relinquished his sovereignty in exchange for an illusory sense of security. Bataille believed that life is essentially a conflagration, a fundamentally useless consummation of energy that should not be harnessed for any productive end. In reading about the gift-giving ceremony of potlatch among American Indians of the Canadian Northwest, discussed by Mauss, and about sacrifice among the Aztecs, Bataille felt he had come upon the refutation of the very principle of capitalist economics. These rituals suggested to him the possibility of an economy based not on production and gain, but on expenditure and waste, on the destruction rather than the accumulation of wealth. In *The Accursed Share*, he invokes these examples in order to oppose to the restricted economy that prevails a general economy that answers more adequately to humanity’s most fundamental needs.

The theory of general economy states that living organisms produce more than they need for their own survival; while some of the excess energy produced is channeled into expansion, an excess or “surplus” remains that must be expended in prodigious forms of waste:

When one considers the *totality* of productive wealth on the surface of the globe, it is evident that the products of this wealth can be employed for productive ends only insofar as the living organism that is economic mankind can increase its equipment. This is not entirely – neither always nor indefinitely – possible. A surplus must be dissipated though deficit operations: the final dissipation cannot fail to carry the movement that animates terrestrial energy.25

Bataille’s thesis challenged Marxist notions of economics, which tended to emphasize production and growth, shifting the ground of debate toward consumption and loss. If his thesis appears contrary to the logic of the economic market, and even to intuition, this is because the economy has not yet been considered “in general,” but has been envisaged only in a restricted fashion, that is, as a series of “particular operations with limited ends.”26 One need only look to the history of economics in different cultures, Bataille argued, to find instances

in which surplus energy is expended in a manner that does not seek a return or a profit. Bataille believed that human beings crave “deficit operations”; they are indeed “destined” for “glorious operation” and for “useless consumption.”

The Accursed Share thus urges us to take into account, in thinking about economics, a sovereign force running counter to the functional spending of traditional economic theory and that Bataille, trying to describe the object of inquiry of general economics, calls the “explosive character of this world.”

Bataille's interpretation of the meaning of Aztec and North-American Indian rituals, it has been suggested, may have been somewhat lyrical. Christian Duverger for one contests Bataille's citation of Aztec sacrifice as an example of improductive expenditure, showing it to be linked instead to the extension of Aztec power. It appears further that, for the societies that practiced them, potlatch ceremonies served an important regulatory economic function. But Bataille's misreading is instructive insofar as it illustrates what he took to be the challenge facing his generation: to work out an economics based on some principle other than that of accumulation, and in so doing to release man from the alienating effects of unchecked capitalism. This is the major theme of his postwar work, but we can find its origins in the essays Bataille penned in the 1930s. “Perhaps the worst of all ills afflicting human beings,” he wrote in 1938, “is the reduction of their existence to the condition of slavish instrument.”

The predominance of work had in Bataille's estimation resulted in a culture of “exhausting boredom”; the only adequate response, he believed, was “to refuse boredom and live only for fascination.”

It is important to note that while Aztec rituals, gift-giving ceremonies, and even the Marshall Plan fulfilled, on a grand scale, his vision of a society given over to joyful destruction and wastage, Bataille envisaged as well more modest ways of “living for fascination,” including meditation (of which he was an adept, having practiced some form of meditative techniques as early as 1922), the consumption of alcohol, and even smoking. Each of these activities represents a type of improductive expenditure that in itself is mildly revolutionary in that the one who so indulges subtracts himself or herself from the cycle of useful, productive labor and manages to escape momentarily into “ecstatic time.” Of smoking for example Bataille writes:

28. Ibid., 40.
There is in the use [of tobacco] a hidden sorcery: whoever smokes is in harmony with things (things such as the sky, a cloud, light). It isn’t important that the smoker know this: tobacco frees him for a moment from the need to act … Smoke escaping gently from a mouth gives to life freedom, the idleness one sees in the clouds.\footnote{Bataille, "La Limite de l’utile," in Œuvres complètes, vol. 7, 225.}

But perhaps the most pervasive instance of improductive expenditure in Bataille’s writings is eroticism (or erotism, as the French érotisme is sometimes translated). Bataille’s writings begin and end in eroticism, starting with the pseudonymously published *Story of the Eye* (1928), a tale of erotic initiation, and ending with *The Tears of Eros* (1961), a study of eros in art from prehistoric times to the present. A number of his many reflections on the topic – from the place of eroticism in inner experience to an analysis of the Kinsey Report – are collected in *L’Érotisme* (1957; published in English as *Erotism: Death and Sensuality*), a wide-ranging set of essays that complements his *History of Eroticism* (volume two of *The Accursed Share*). As the English title of this collection of essays makes plain, eroticism for Bataille is intimately related to an awareness of death: it is, he writes, “assenting to life up to the point of death.”\footnote{Bataille, *Erotism*, 11. The same sentence appears as a section heading in the chapter devoted to Emily Bronte’s fiction in *Literature and Evil*, Alistair Hamilton (trans.) (New York: Marion Boyars, 1983), 16.} Eroticism is linked to death in a first, rather literal sense in that it is not concerned with reproduction of the species: sex that does not seek a reproductive end is in a sense a refusal of life. But the link between sex and death lies also in the destruction and violence common to both; eroticism entails the “destruction of the structure of the closed being,” and the opening up of that “closed being” (“closed” in the sense that it is habitually confined to the profane world of work and necessity) to “an exuberance of life” that is however “not alien to death.”\footnote{Bataille, *Erotism*, 11.} When Bataille speaks of death in relation to eroticism, he is moreover thinking also in terms of the death of meaning, of a sudden, intense and absolute loss of sense comparable to that known in inner (or mystical) experience. (This is why poetry and eroticism are closely related: each involves a surpassing or a sacrifice of sense [“poetry is the sacrifice in which words are the victims,” Bataille wrote] and each leads to the same place: “Poetry leads to the same place as every form of eroticism, to indistinction, to the confusion of distinct objects. It leads us to eternity, it leads us to death …”\footnote{Ibid.} And as in the case of inner experience, the experience of “non-sense” triggered in eroticism is violent. “‘Violence’ overwhelms us strangely in each case [i.e. in both death and eroticism],” writes Bataille; “each time, what happens is
foreign to the received order of things, to which this violence each time stands in opposition.”38 Violence and eroticism are coterminous for Bataille: eroticism entails violence inasmuch as it involves the sacrifice of meaning, and in almost all cases in Bataille’s writings, violence is read in erotic terms.39

This complex interweaving of death, eroticism, and violence is the very heart of Bataille’s thinking: his philosophy as well as his fiction emerge from the “strangeness” of the world they engender, a world that is incongruous, volatile, unknowable, at times ecstatic, and, like the other instances of improdutive expenditure we have noted, potentially revolutionary. For to the extent that eroticism is linked to death and violence, Bataille conceives of the “the world of lovers” as a unit of political resistance: opposed in practice to the imperative to produce (or reproduce), opposed to “the primacy of work,” eroticism is an experience at once unknowable (the “tears” of Eros are the external sign that the mechanism of understanding is “overwhelmed,” to use his favored term) and unusable.

Eroticism is a key notion in Bataille’s oeuvre in two other, related domains. First, the part of Bataille’s philosophical project that consists in theorizing “nonknowledge” implicates thought in a process of eroticization in which thought finds itself pushed into zones where traditional forms of knowledge falter. The aim of much of Bataille’s philosophizing is to sacrifice thought, meaning at once to sacralize it and to put it to death, and his erotic theory serves this end. It is fair to regard Inner Experience and Guilty as works that seek to violate philosophy, to make it swoon, to open it up to the possibility of nonknowledge and jouissance. “Only violent thinking coincides with the disappearance of thought,” he wrote.40 If at times Bataille insisted that lectures take place in brothels (see below), it is because he wanted to conceive of thought as a festival, or, better, an orgy leading to the “death of thought”: “the death of thought is the voluptuous orgy that prepares death, the festival held in the house of death.”41

Second, in Bataille’s writings eroticism is inseparable from religion. “The meaning of eroticism escapes anyone who cannot see its religious meaning,” he writes; “Reciprocally, the meaning of religion in its totality escapes anyone

39. Bataille was fascinated by violent criminals, especially those whose crimes were sexual in nature. See The Trial of Gilles de Rais, Richard Robinson (trans.) (Los Angeles, CA: Amok, 1991), and The Tears of Eros (especially “Gilles de Rais and Erzébet Báthory” and “Chinese Torture”).
who disregards the link with eroticism.”42 The connection between eroticism and religion lies in their shared “sensibility”: as is the case with eroticism, “religious sensibility … always closely links desire and fright, intense pleasure and anguish.”43 So intimate is the link between eroticism and religion that Bataille, in trying to situate his book Erotism, presents his work as something akin to “theology”: “The determination of eroticism is primitively religious and my work is closer to ‘theology’ than to the scientific history of religion … As for me, I speak of religion from the inside, like a theologian speaks of theology.”44

Of course, the religious experience of which Bataille speaks, like the erotic experience or again the “inner experience,” entails an “inward cessation of all intellectual functioning,”45 such that properly speaking there can be no “science” (or logos) about it. This is why Bataille’s “theology” is an “atheology.” La Somme athéologique (Atheological Summa) is the name Bataille intended for a collected version of a number of his writings. He worked on their arrangement from 1952 until his death, without ever settling on either the content or the order of the edition. We know however from paratextual notes that it was to include at least Inner Experience (including Method of Meditation and an important “Postscript”), Guilty, and On Nietzsche, plus (in another version of the plan) a work on Pure Happiness and another to be entitled The Unfinished System of Nonknowledge. These last two works were never completed, although numerous lectures, essays and aphorisms give us a sense of what they might have included.46

The choice of La Somme athéologique as title for this sprawling, ultimately formless work can be seen as ironic or even parodic. It refers of course to Thomas Aquinas’s Summa Theologica (in his notes, Bataille situates his own endeavor “in the history of religions”47). But whereas Aquinas took the existence of God to be irrefutable and expounded on divine knowledge and Aristotelian science, Bataille wrote in the Nietzschean, acephalic moment after the death of God, insisting on ignorance and the impossibility of knowledge in the absence of God. Atheology is indeed “the science of the death or destruction of God.”48 With his special genius for orchestrating unlikely and promiscuous encounters, Bataille’s atheological Summa was meant to bring together saints and sinners, philosophers, mystics, criminals and poets in an immense parody of rational thinking.

165
Volume 5
At the same time, however, Bataille shares common theological ground with Aquinas in that the object for each of them is God. As Bataille writes about the origins of his book *Erotism* “nothing has intrigued me more than the idea of once more coming across the image that haunted my adolescence, the image of God. This is certainly not a return to the faith of my youth. But human passion has only one object in this abandoned world of ours.” Bataille’s subject would always remain a *homo religiosos*: eroticism (but also meditation and especially poetry) leads, like the God of the mystics, to a “surpassing of personal being and of every limit.”

While never completely abandoning either the lexicon or the canonical texts of philosophical inquiry, Bataille reserves a special place, in his *oeuvre* and in his criticism, for literature and for poetry. The author of numerous works of fiction (*Story of the Eye, Blue of Noon, Madame Edwarda, My Mother*) that have secured for him an important place in the history of French letters, he consistently refuses to partition philosophy and literature, conceiving of his fictional output as a way of engaging otherwise, and complementarily, themes he has explored also in a more philosophical (or at times sociological) idiom. Thus his philosophical reflections on Hegel and Descartes in *Inner Experience* stand cheek by jowl with passages on Proust or Rimbaud or with his own poetry, while Kant makes an unlikely appearance in the pornographic novel *L’Abbé C*. The issue is not simply one of a hierarchy of genres: the ability to approach the “formless” quality of human experience is not by any means an inherent prerogative of literature. This is why Bataille chose to entitle his major statement on fiction *The Hatred of Poetry*, meaning to suggest his hatred for the elegance and refinement with which poetry is sometimes associated, and to distance himself from polite or effete forms of literature that relish their form-giving powers. Rather, Bataille privileges “outsider” writers who have challenged conventional literary and social practices. Some of these writers count among the *poètes maudits* – “that race forever cursed by the powerful of the earth” in Alfred de Vigny’s phrase – such as Baudelaire, Lautréamont, Rimbaud; others lived as political, social, or sexual outcasts in the society of their time (Sade, Blake, Kafka, Genet). What they have in common, according to Bataille, is an intimate relation to “an acute form of evil.” Bataille thus conceived of literature in broadly ethical terms, as a space of absolute freedom, including freedom from morality itself (he spoke of literature as a “hypermorality” resulting only from “complicity in the knowledge of Evil”). Bataille’s conception of aesthetics is thus rigorously

50. Ibid., 130, translation modified.
52. Ibid.
and explicitly opposed to the idea of littérature engagée expounded by Sartre and which Bataille felt to involve a domestication of literature’s subversive potential: “It is important to define what literature, which cannot be reduced to serving a master, brings into play. Non serviam, it is said, is the motto of the devil. In that case, literature is diabolical.”

I. THE COLLEGE OF SOCIOLOGY

Michel Surya notes that of those attending Kojève’s seminar on Hegel, only two – Maurice Merleau-Ponty and Eric Weil – can be considered “pure” philosophers. The others – Bataille, Raymond Queneau, Jacques Lacan, Raymond Aron, André Breton – are of diverse intellectual backgrounds. Bataille was very much at home in this kind of mixed milieu. Convinced of the virtue of collectives devoted to the discussion of ideas, he devoted a great deal of energy to collaborative intellectual labor, beginning with his work on a number of journals and reviews in the late 1920s and 1930s (Documents, La Critique sociale, Contre-Attaque) and his participation in groups in the prewar years, most notably Acéphale and the College of Sociology, but also in the lesser-known Society of Collective Psychology (of which Bataille was vice-president in 1937 and 1938). This commitment to collective undertakings, which he pursued after the war by founding the journal Critique, is very much in keeping with the centrality in his work of notions of community and communication.

Acéphale names both a review that appeared between June 1936 and June 1939 (five issues in all), and a secret society associated with the review and about which we know relatively little. Meetings of the society were held variously at the café L’Univers in the Place du Palais-Royal, in a brothel on the rue Pigalle, or, at night, at the site of a blasted tree in a remote part of the forest of Saint-Nom-la-Bretèche. This last venue was for the members of Acéphale (which included Georges Ambrosino, Roger Cailllois, Pierre Klossowski, Patrick Waldberg, and perhaps half a dozen others) a place for ritualistic acts, including the burning of sulfur. More mundane, daytime rites included refusing to shake the hands of known anti-Semites and eating horsemeat at lunch. Bataille’s fascination during this period with the religion of the Aztecs and with rituals of sacrifice perhaps explains the interest in the ranks of the Acéphale group in the sacrifice of one of its members by another; this act, the summum genus of the lesser rites,

55. Ibid., 255–6.
was to bind the members indissolubly, making of them a sort of brotherhood or even a kind of Church, founded on an “irreparable ritual gesture.”

An article by Bataille published in the first issue of *Acéphale*, “The Sacred Conspiracy,” constitutes something close to a manifesto for the group. Appearing in the turbulent political context of France in 1936, it is remarkable for the untimeliness of its central message: “It is time to abandon the civilized world and its light. It is too late to be reasonable and educated.” Skeptical of the value of political agitation, Bataille offers up in this article a form of religiosity that would facilitate, through a firmness that borders on violence, an escape from the vacuities and impasses of political debate: “we are ferociously religious, and, to the extent that our existence is the condemnation of everything that is recognized today, an inner exigency demands that we be equally imperious. What we are starting is a war.” By “ferociously religious,” Bataille means anti-Christian (Bataille authored an unpublished work entitled *Manual of the Anti-Christian*), and above all Nietzschean: several of the issues of *Acéphale* are devoted to Nietzsche, to his madness and to Dionysus, but also to the highly political issue of the appropriation of Nietzsche’s work by fascists, which Bataille denounced and patiently deconstructed.

The Acéphale group was as much an experiment in community as an intellectual adventure (the two were indissociable for Bataille). The foundation of the College of Sociology was announced in a “Note” in the July 1937 issue of *Acéphale*; the activities of the two organizations were thus concurrent. Like Acéphale, the college was in part an attempt to create a community; unlike Acéphale, its membership was open and it had an explicit theoretical and scholarly agenda – to study the conditions underlying the creation of a community, and specifically the place of the sacred in contemporary society. Meetings began in October 1937 and continued until July 1939; the first took place at the Grand Véfour (at the time a “dusty café at Palais Royal,” according to Caillois), those after that at Les Galeries du Livre, a bookstore in the Latin Quarter. The college was managed by Bataille and Caillois along with Michel Leiris; it seems to have been Bataille and Leiris who together determined the agenda for the meetings and decided who would deliver the lecture that served as a basis for discussion (in spite of its name, the college had no didactic function). Kojève, whose seminar on Hegel Bataille was still attending, was approached early on as a potential ally, but had reservations. According to Caillois, he specifically objected that

56. The words are Caillois’s; see Claudine Frank, *The Edge of Surrealism: A Roger Caillois Reader* (Durham, NC: Duke University Press, 2003), 30.

168

Volume 5
Bataille, in attempting to reintroduce the sacred dimension lacking in modern society, wanted to play at being a sorcerer’s apprentice: “such a miracle-worker,” he is reported to have said, “could no more be carried away by a sacred knowingly activated by himself than could a conjurer be persuaded of the existence of magic while marveling at his own sleight of hand.”59 Kojève foresaw, even before its inaugural lecture, the tension at the heart of the college between a scholarly inquiry into the sacred, on the one hand, and the desire (on the part of Bataille in particular) to arouse, incite, or even incarnate that sacred (a goal he was pursuing quite explicitly with Acéphale). Founding members, in addition to Bataille, Caillios, and Leiris, included Jules Monnerot, who quickly distanced himself, Ambrosino, Pierre Libra, and Klossowski. Participants included Denis de Rougemont, Georges Duthuit, René Guastalla, Anatole Lewitzky, Hans Mayer, Jean Paulhan, Jean Wahl, Kojève (who consented to speak), and (probably) Paul-Louis Landsberg. Walter Benjamin was in regular attendance, although plans for him to present his essay “On Some Motifs in Baudelaire” did not materialize.

In keeping with the thesis that society had been “devirilized” on account of “the relaxation of society’s ties, practically non-existent as a result of the development of bourgeois individualism,”60 the college set about an analysis of elements in society that have a communifying value. The privileged but far from unique object of this analysis was the sacred itself; in an essay entitled “The Sacred,” published in 1939, and which we can consider to have been stimulated by the college’s agenda, Bataille writes: “the sacred is only a privileged moment of communal unity, a moment of the convulsive communication of what is ordinarily stifled.”61 With his emphasis on heterogeneous matter that has historically been excluded (“stifled”) as well as on the “convulsive” nature of the communication of the sacred, Bataille situates the overall project of the college as a critique of the hegemony of reason and science (or “knowledge”). This is also the dominant theme of “The Sorcerer’s Apprentice,” Bataille’s response to Kojève’s withering remark about the incoherence of the college’s aims. Here, Bataille opposes to “dissociated existence” or existence “broken into parts”62 a vision of the “whole person”63 and of the “totality of existence” that might once again become possible if only “simple, intense existence” were not “destroyed by a slavishness to function.”64 Once again, here as elsewhere Bataille seeks for human beings an emancipation from constraints imposed by the modern world of work, with its incitement to careerism and specialization, and more generally

60. Ibid., 45.
63. Ibid., 14.
64. Ibid., 18.
from the pervasive utilitarianism that harbors a denial of what is truly human (“[I]t is human to burn … On the contrary, it is inhuman to abandon existence to a series of useful acts”\textsuperscript{65}).

The cast of characters that make up the college includes a large number of emigrés (the Russians Kojève and Lewitzky, the Italian born Guastalla, the Germans Benjamin, Landsberg, and Mayer, the Swiss de Rougemont). Its members are from diverse intellectual backgrounds (Ambrosino had trained as a physicist, Duthuit was an art historian, Paulhan managing editor at the \textit{Nouvelle Revue Française}, Guastalla a Hellenist, etc.) and of differing political coloring (Bataille was a leftist but politically autonomous, Kojève was a Stalinist, Libra held some right-wing positions, Landsberg was close to Catholic currents of thought, de Rougemont was allied to Emmanuel Mounier’s personalism, etc.). Such professional and political (not to mention temperamental) diversity conforms to the aim of the college (as stated by Caillois on behalf of the founding members) to “develop a moral community” that would be “different from the one ordinarily uniting scholars”\textsuperscript{66} different, in other words, from the university. Wahl, who held a Chair in Philosophy at the Sorbonne since 1936, seems to have been the only university professor involved in the college, and he is moreover an exceptional figure: a specialist of Plato and Descartes and – of more immediate interest to the college – an expert on Hegel and Kierkegaard, he was also a poet (\textit{Connaître sans connaître} [To know without knowing], the title of a volume of poems from 1938, suggests an affinity with Bataille) and translator of poetry (of Thomas Traherne among others). That he was able successfully to conjoin these disparate identities in a professional context resistant to any association between poetry and philosophy (institutional practices at the Sorbonne kept the two rigorously apart\textsuperscript{67}), makes of Wahl a champion in the struggle against institutional forces that seek to reduce existence to a series of rigidly compartmentalized activities. The college, in aiming to create a sort of community without unity, sought to counter the “tendential reduction of human character” and the “reduction of differences”\textsuperscript{68} that Bataille had earlier identified as the state’s preferred mechanisms of social homogenization. The eclecticism of its membership seems moreover to have been willed; its directors explicitly reject the limitations of national, social, and political boundaries:

\textsuperscript{65} Ibid., 21.
\textsuperscript{66} Ibid., 10.
The College of Sociology is not a political organism. Its members hold whatever opinion they please … [I]t urges those, for whom the only solution anguish disclosed is the creation of a vital bond between men, to join with it, with no determining factor other than the awareness of the absolute lie of current political forms and the necessity for reconstructing on this assumption a collective mode of existence that takes no geographical or social limitation into account and that allows one to behave oneself when death threatens.69

Death was indeed threatening when Bataille, Caillois, and Leiris collectively wrote these words (October 7, 1938) in a “Declaration” unequivocally condemning the Munich accords and France’s role in bringing them about. There is therefore a link between what the members of the college see as the “devirilization of man,” witnessed in the absence of a collective reaction in the face of war, and the creation of a “moral community” that would be “bound precisely to the virulent character of the realm studied.”70 That “realm” was “Sacred Sociology,” especially “insofar as that implies the study of social existence in every manifestation where there is a clear, active presence of the sacred.”71 The emphasis placed by the college on “social existence” is in part a critique of surrealism (many of the college’s members were dissident surrealists), which, by overly privileging the individual and the unconscious, had obscured questions concerning the structure of collective entities and their relation to power. “The intention [of the college] is thus to establish the points of coincidence between the fundamental obsessive tendencies of individual psychology and the principal structures governing social organization and in command of its revolutions.”72 The lectures delivered at the college between November 1937 and June 1939 address these collective structures: Bataille spoke about “The Structure and Notion of the Army,” about “The Structure of Democracies,” and about “Hitler and the Teutonic Order”; Caillois spoke about “Animal Societies” and about “Brotherhoods, Orders, Secret Societies, Churches”; Mayer delivered a lecture on “The Rituals of Political Association in Germany of the Romantic Period”; Duthuit talked on “The Myth of the English Monarchy,” and so on.

Bataille’s interest in the dehumanizing effects of a society dominated by a principle of utility is to some extent in line with the critique of bourgeois rationality carried out at around the same time at Adorno and Horkheimer’s Institute of Social Research, especially to the extent that this critique emerged

70. Ibid., 10.
71. Ibid., 11.
72. Ibid.
from Weber’s theses concerning rationalization and the disenchantment of the world. Indeed, as Michael Weingrad has shown, if Benjamin was present at the meetings of the college, this was at least in part because Adorno had asked him to seek out appropriate French co-workers for the institute with a view to “creating an intellectual homeland for Critical Theory in France.”73 But while Bataille at times entered the same orbit as Adorno and Horkheimer’s Dialectic of Enlightenment, his response to the dehumanizing effect of Enlightenment thought is to reject dialectical thinking altogether in favor of his own brand of excess. Bataille’s interest in sorcery, in coincidence, and in miracles around this period represents an attempt to get away from a scientifically explained world in which the values associated with the sacred play no part. Not content with uncovering and subjecting to analysis the processes that lead to dehumanization, Bataille actively urges a return of the forms of social effervescence (sacrifice, rituals, etc.) that modern capitalism has evacuated.

To the Frankfurt School, this looked rather like the kind of “irrationalist confusion” (Adorno’s words) they had deplored in Acéphale and that they associated with a degenerate form of surrealism.74 The celebration of the irrational irked others, including Mauss,75 and troubled also Bataille’s cofounders. The break-up of the college in 1939 is attributed by Bataille himself to fundamental differences between himself and Caillois; the latter felt that Bataille placed too much emphasis on mysticism, madness, and death. Wahl characterized their different approaches as follows: “Caillois is in search of rigor, Bataille appeals to the heart, to enthusiasm, to ecstasy, to earth and fire, to the guts.”76 Leiris for his part was concerned that the Maussian and Durkheimian principles to which the group purported to adhere had been traduced, and even that basic intellectual “rigor” had not been observed in the analyses undertaken. Although there had been a broad consensus that the college would consider “social existence” and “the problems of power, of the sacred, and of myths,” Bataille was almost diametrically opposed to his cofounders as regards the method for carrying out such a study. The fact that the college had a more precise and scholarly agenda than Acéphale, an agenda that attracted many intellectuals into the group, did not in Bataille’s mind mean excluding from its activities the passion and agitation of an existence “lived from within, lived to the point of a trance.”77

74. Ibid., 133–4.
II. BATAILLE’S INFLUENCE

In “From Work to Text” (1971), Roland Barthes cites Bataille as an example of a writer whose “text” subverts conventional notions of clearly defined, individuated works:

What constitutes the Text is … its subversive force in respect of the old classifications. How do you classify a writer like Georges Bataille? Novelist, poet, essayist, economist, philosopher, mystic? The answer is so difficult that literary manuals generally tend to forget about Bataille who, in fact, wrote texts, perhaps continuously one single text.  

Indeed, as much as for any of his individual works or ideas, Bataille is noted for having fashioned a highly original “text” that transcends disciplinary and generic boundaries. Bataille’s style of philosophizing, which seeks to expose philosophy to its others (sociology, economics, literature, erotics, etc.) constitutes in itself an important part of his legacy and has opened up radically new paths in philosophy as well as in other disciplines.

Bataille has contributed significantly to the agenda of poststructuralist philosophy. His tireless promotion of Nietzsche contributed to a wave of re-readings of the German philosopher that form part of the genealogy of poststructuralism. He is often cited as a precursor to thinkers who focus on écriture and on the aporia of language; almost all French intellectuals who came of age in the 1960s (Bataille died in 1962) acknowledge his role in “the linguistic turn.” The notion of the “end of history,” which originates in Kojève’s reading of Hegel, is one key theme that obsessed Bataille and that comes back in the writings of the poststructuralists. Related to this is the more general idea of the “crisis of the subject” (which we could call the crisis of humanism; Kojève said that “The end of history is the death of Man as such”), also a prominent motif in Bataille’s texts. The “crisis of the subject” refers to the preoccupation, shared by many of Bataille’s successors (Barthes, Foucault, Derrida, Kristeva), with the instability of the philosophical subject inherited from Descartes. Foucault has written of Bataille’s writings that they represent a “desperate and relentless attack on the

80. These thinkers are discussed in various essays in The History of Continental Philosophy: Volume 6.
preeminence of the philosophical subject.”81 Bataille consistently sought to open up the rational, thinking, humanist subject, constituted by knowledge, to the effects of that “nonknowledge” that in his view played an equally if not more important part in human experience and that seemed to him to be absent from philosophical accounts of man (with the exception of Nietzsche’s). The “crisis” that this operation engendered takes many forms: in Barthes, it is recognizable in “The Death of the Author”; in Foucault, it can be seen in the shift from the “author” to the less humanist “author-function” as well as in “the disappearance of man” that Foucault traces in The Order of Things; in Derrida, it informs the subject of différance and originary delay; in Kristeva, it recurs in the subject of abjection; Lacan’s split subject owes something to Bataille’s relentless assault on the integrity of the unified subject. The work of Derrida, perhaps as much as anyone’s, shows the pervasive, if at times subtextual, influence of Bataille on contemporary French philosophy. For if “From a Restricted to a General Economy” is rightly credited with having brought to the attention of French and anglophone readers the significance of Bataille’s model of economic thought in a philosophical context, and is known as Derrida’s major statement on Bataille, Derrida has also noted that in fact many of his own texts, including “The Double Session,” “Plato’s Pharmacy,” “White Mythology,” and “several others” are “situated explicitly in relation to Bataille, and also propose a reading of Bataille.”82

The fact that Bataille did not emerge from and was never a member of the French academic establishment has surely been of significance to several of his admirers. He was and remains something of an outsider in relation to mainstream philosophy and as such he has come to serve as an example of resistance to institutionalized forms of thinking. Especially for those who may not have come to philosophy via the classical route, or who have aspired to practice a philosophy at odds with accepted norms (e.g. Derrida, whose philosophy was not easily accommodated in the French academy; Deleuze, who allied philosophy to literature and a radical form of psychoanalysis), Bataille’s work serves as a resource. More broadly, his inscription of everything and everyone that social forces try to expel (criminals, madmen, shit, sperm, tears, blood, etc.) has proved especially meaningful to those whom society has marginalized. Foucault’s essay “A Preface to Transgression” is an homage to Bataille and an enlistment of this serviceable concept; in his own work on criminality and on madness, and to the extent that his project is concerned fundamentally with mechanisms of social

constraint, he develops Bataille's thinking on the oppressive forces of social homogenization.

In France, Bataille's work as an editor of journals and reviews has inspired a number of important publications. *Critique*, the journal he founded in 1946, is still published and continues to be influential in framing public debate. *Tel Quel* (eighty-four issues between 1960 and 1982), under the direction of Philippe Sollers, has been influenced by Bataille and at the same time has done much to promote interest in his writings. The 1972 colloquium on Bataille and Artaud at Cerisy-la-Salle was organized by the members of the *Tel Quel* group and served to bring Bataille to the forefront of the French intellectual scene. *Tel Quel* published Derrida's "From a Restricted to a General Economy" as well as Kristeva's essay on inner experience. *TXT*, an important journal of poetry and poetics, edited by Christian Prigent, takes its cue from Bataille's notion of the "hatred" of poetry. Jean-Christophe Bailly's review *Aléa* is indebted to Bataille; allied with this review, we should mention that the most sustained philosophical reflection on Bataille is Jean-Luc Nancy's *The Inoperative Community* (1982), which seeks to understand Bataille's (and our) experience of the ruptures and the continuities of community that mark the modern era. *Lignes*, a journal of analysis and opinion covering a wide variety of topics, founded in 1987 by Surya, the same year he published his authoritative biography of Bataille, was "born under the auspices" of Bataille.

It was partly because of references to Bataille in the essays of such important philosophers as Barthes, Kristeva, Foucault, and Derrida, that Bataille became a person of interest in the US, where academics were curious to study the intellectual genealogy of poststructuralist and deconstructive practices. Hence Bataille's writings began to be translated only after the writings of those who referenced him had appeared in English. Immensely important in this respect has been the translation of Bataille's essays from the late 1920s and 1930s by Allan Stoekl, entitled *Visions of Excess* and published in the University of Minnesota's *Theory of History and Literature* series in 1985. This series, which prior to publishing Stoekl's translation had published works by Tzvetan Todorov, Hans Robert Jauss, Paul de Man and Jean-François Lyotard, did more than any other to popularize theory in the American academy in the 1980s. The happy inclusion of Bataille boosted his prominence and led to further translations, notably an expanded English version of Denis Hollier's masterful reconstruction of the lectures of the College of Sociology in the same series. Over the next two decades almost all of Bataille's theoretical writings would be rendered into English. A great deal of his work has been brought out by trade publishers (City Lights Press, Zone Books, Paragon, Amok), suggesting that Bataille has a broad following among non-university-affiliated readers. Indeed, Bataille's writings remain difficult to assimilate in the university, where his profoundly interdisciplinary profile
and explosively a-systematic style upset existing paradigms of knowledge. His interest in ethnology has led to studies of his work in the field of anthropology; his fascination with the sacred has generated interest in religious studies; the art world has appreciated his questioning of form; and in the field of literary studies, where his fiction is highly regarded, key notions such as transgression, excess, and the heterogeneous continue to have currency. In the field of philosophy, he has been, perhaps predictably, less influential. For principled reasons he did not produce a cohesive philosophy and his relentless insistence on meaninglessness and nonknowledge are not easily recuperable. The centrality of the eroticized body in his works has led to interest in his sexual politics (Kristeva had already associated Bataille with writing and *jouissance*). While some feminists take issue with his “obsession with virility,” other writers see in Bataille a less orthodox mapping of sexuality (a “straight man with a twist” in the words of Carolyn Dean); for others still his liberatory vision of sexuality proves helpful to queer theory. Most recently, his economic writings, particularly *The Accursed Share*, have been the focus of renewed investigations, suggesting the continued pertinence of his theory of expenditure.

Volume 5
In order to put in proper perspective the significance of Marxism in French intellectual life during the period following the Second World War and continuing until, perhaps, as late as the watershed year of 1968, it is impossible to resist the temptation to cite one of Jean-Paul Sartre's most frequently cited assertions. It occurs in *Search for a Method (Questions de méthode)*, an essay that he originally wrote for a Polish journal that, during the time of the so-called “Thaw” under Soviet Communist Party First Secretary Khrushchev, dedicated a special issue to the intellectual climate in France in that year, 1957. Near the beginning of this essay, which was later to serve as an introduction to the first volume of his *Critique de la raison dialectique*, Sartre offers a disquisition on great philosophers (philosophies) that dominate their historical periods. He names three such eras: those of Descartes, of Kant and Hegel, and, at present, of Marx. Within their respective time frames, he says, there is no going beyond the dominant philosophy: one either works, in one way or another, within its framework, or one tries to revert to an earlier one.¹

Much of the remainder of *Search for a Method* constitutes an attempt to argue for the integration of existentialism,² with its special concern for the individual human being, within the Marxist framework – an attempt made all the more urgent, Sartre contends, by the blockage or rigidification that has occurred within the official Marxism, then often self-servingly referred to as “orthodox Marxism,” of the international Communist Party. Sartre is just as insistent on identifying and

2. Existentialism, and Sartre, are discussed in several essays in *The History of Continental Philosophy: Volume 4*.
criticizing this blockage as he is on asserting Marxism’s intellectual dominance. This is an especially important point to stress at a time, half a century later, when some may still (or again) be inclined to make the assumption that both virulent communists and virulent anticommunists of that period wanted everyone to make, obviously for opposite reasons; namely, that Marxism is equivalent to the “official” communist ideology. But that was not and certainly is not the case, as the evolution of Sartre’s own thought and ultimately the intellectual evolutions of most of the other major figures in the history of French Marxism in its heyday well demonstrate. This essay will focus on a few of those figures, Sartre included, with a view to illustrating the inevitable tension between the intellectual and the political, theory and practice, that prevailed even (or particularly) within a worldview that prided itself on overcoming that very tension – or, as Marx had expressed it in one of his famous _Theses on Feuerbach_ (the one that is to be found, significantly enough, on his tombstone), on changing the world rather than, in traditional philosophical fashion, merely understanding it in various ways.

The French Communist Party already existed, to be sure, in the “period between the two wars,” as it came to be called, and some serious philosophers were members of it. Among these were Henri Lefebvre, who was to outlive most members of his generation; Roger Garaudy, who joined the Party in 1933 as a young man who was a believer in both Marxism and Christianity; and Paul Nizan, who had been Sartre’s classmate at the École Normale Supérieure during the 1920s. The Party was politically active, and it played a role in the formation of the short-lived (1936–38) “Popular Front,” a Left-oriented coalition government. However, by virtue of its disciplined and unwavering commitment to the Soviet leadership, the Party suffered a severe setback, in terms of popularity and membership, when Stalin signed his infamous nonaggression pact with Hitler – a pact that was in effect, it should be noted, for twenty-two months until Hitler invaded Russia in mid-1941. It was during that time that Hitler’s armies invaded Poland, thus triggering the state of war with France and Britain, and that France then surrendered to Hitler after a period of generally ineffective French military resistance, known as the “phony war.” That war was real enough, though, for those who were its casualties; among them was the erstwhile communist Nizan, who had renounced his Party membership in the wake of the nonaggression pact and died in combat shortly before the French surrender. Then, beginning exactly one year after the armistice that ushered in the German Occupation of France, Hitler’s attack on Russia enabled a reinvigorated French Communist Party to begin to play a major role in the clandestine Resistance. (At the same time, during the same war period, some Party members, including Garaudy, were imprisoned by the collaborationist Vichy government simply because they were communists and hence suspect.) It was in large measure because of this role that the Party emerged from the war with renewed popularity, even winning a plurality of votes.
in the French elections of November 1946, and continuing for some time thereafter, despite fierce opposition from other parties, to enjoy the regular support of up to 25 per cent of the electorate. The atmosphere was one of great unrest, with the developing Cold War placing France in a precarious position between the two “blocs,” Soviet and American, even while its successive governments sided with the latter in the international arena; with African and Asian colonies seeking independence; and with a large industrial working class that was still generally poorly paid and at times seemed ripe for revolt. While the socialists as well as some Trotskyite parties claimed to support the interests of that class more authentically than the Communists, the latter remained relatively effective in arrogating to themselves the label “Party of the Working Class.” In short, the French Communist Party, despite its strict discipline and slavish adherence to the “Moscow line” (whatever that might be at any given moment), was very much a force to be reckoned with.

So much for the historical and political background concerning the Communist Party; now, what about Marxism? It is undoubtedly true that Marxist philosophy enjoyed some added prestige that was borrowed from the prestige of the Party, which claimed Marxism as its official ideology (just as, years later, Marxist philosophy lost this borrowed prestige when the Soviet bloc collapsed). However, other, more strictly intellectual, factors also entered into the postwar rise of Marxist thinking in France’s collective psyche. For one thing, there was a widespread revolt, within philosophy and related disciplines, against the abstract, frequently idealist, types of philosophizing that had predominated in the Academy earlier in the century. (The title of one of the earliest books by Jean Wahl, then a young professor at the Sorbonne and a great influence in helping to shape the growing awareness of existentialism as a philosophical movement even during the 1930s, is a significant indicator of this: Vers le Concret [Toward the concrete].) Specific examples of this spirit of revolt were the personalist movement of the religious Left (epitomized in the work of Emmanuel Mounier and the journal Esprit) and the immediate postwar fad of existentialism itself, which in France was most closely identified with Simone de Beauvoir, Albert Camus, and Jean-Paul Sartre. The communists, of course, frowned on both of these currents, since both rejected dialectical materialism as the key to explaining the world. Yet both of them took the Marxist message very seriously as, like the Marxists, they advocated engagement with the real world and its problems and strongly opposed oppressive social relationships, relationships of dominance and subordination.

Among other influences deserving special mention is that of Alexandre Kojève,³ who introduced Hegel’s thought to French intellectuals in courses given

---

³. For a discussion of Kojève and French Hegelianism, see the essay by John Russon in The History of Continental Philosophy: Volume 4.
during the 1930s, and whose reading of Hegel, particularly of the famous dialectic of “lordship and bondage” or “master and servant” in the *Phenomenology of Mind*, was decidedly proto-Marxist – that is, it presented Hegel’s thought as anticipatory of Marx’s. Sartre, in the early pages of his *Cahiers pour une morale*, published only posthumously but written beginning in 1947, makes frequent reference to works by Kojève and by his student, Jean Hyppolite. A further, important stimulus to the burgeoning postwar interest in Marxism was the ever-increasing awareness of Marx’s remarkable *1844 Manuscripts*, excerpts of which had first been brought out in translation by Lefebvre in the 1930s, but which were only “discovered” by wider audiences, in France and in other Western countries as well, after the war. The *Manuscripts* revealed a younger, more “humanistic” Marx than the one previously known, the author of *Capital*. Finally, perhaps most importantly of all, it began to be recognized ever more widely that Marxism offered explanatory categories and concepts that were simply missing from the repertoires of liberal political theories – categories and concepts that fitted more adequately, for example, with the lived experiences of the colonial subjects from Indochina, North and sub-Saharan Africa, and the French West Indies, whose presence within the student bodies of the French universities was becoming increasingly significant. In short, it was no longer Papa’s France (“la France de Papa”), and the cosmopolitan worldview that was a central part of Marxism’s message provided a useful intellectual tool for coming to grips with the new realities.

In late 1945, there appeared the first issue of a journal in which many of the topics that were to dominate the thinking of at least the noncommunist French Marxists and quasi-Marxists during the ensuing years were to play themselves out: *Les Temps modernes*. Named after a film in which Charlie Chaplin, the famous comic actor with strong Marxist sympathies, played the lead, this journal was originally edited by Maurice Merleau-Ponty and Sartre, and a number of other well-known theorists were listed as members of the original editorial board, including Beauvoir, Camus, and even Sartre’s erstwhile classmate, Raymond Aron, who was soon to establish himself as perhaps the leading liberal democratic theorist in France. Some, such as Aron and Camus, soon

---

4. Mention of Indochina conjures up the now somewhat forgotten name of Trân Đức Thao (1917–93), a Vietnamese native who was a student in France from the late 1930s into the 1940s, working with Maurice Merleau-Ponty, receiving high recognition for his treatises on first Hegel and then Husserl, and spending some years composing his outstanding Marxist critique of the latter, *Phénoménologie et matérialisme dialectique*, which was published in 1951 and was widely discussed at the time. In that same year, 1951, he returned to Vietnam and joined in the resistance to the French, eventually becoming the rector of the national university, but later falling out of favor with the regime; he spent most of the remainder of his career in comparative obscurity as a translator of philosophy books from French into Vietnamese. He died in France, where he had gone to seek medical aid.
dropped out of the editorial picture; others, notably Beauvoir, remained. The “Presentation” of the journal in the inaugural issue, signed by Sartre,5 declared the editors’ intention to maintain an attitude of political engagement while not adhering to any particular political party. Many of Sartre’s most important political essays, as his involvement with the noncommunist but still strongly Marxist-influenced Left grew, were first published on the pages of this revue.

One of the earliest and most significant of these was entitled “Matérialisme et révolution,” which appeared in two successive summer issues (vols 9 and 10) in 1946. Sartre’s core point in this essay is that while revolutionary change is desirable and the “orthodox” Marxists’ political objectives are basically sound, and while materialism as a doctrine has the psychologically valuable property of making members of the proletariat who accept it see those in power as being no different from, no better than, they themselves, nevertheless materialism is a myth; a philosophy of revolution that upholds human freedom against doctrinaire materialism is needed to replace the communists’ “diamat.” Sartre there alludes to conversations that he has had with members of the Party, including Garaudy and the even more staunchly materialist thinker Pierre Naville,6 and refers to the work of Lefebvre as well. While he treats the latter with respect, he points to a “confusion” between Lefebvre’s assertion, commenting on a text from the early Marx, that Marx sought to overcome the antinomy between idealism and materialism, and Garaudy’s insistence (in an article printed in a journal of the Party) that Sartre, by rejecting materialism, could not avoid idealism despite his expressed wish to do so. In fact, Sartre displays a certain contempt for Garaudy’s intellectual capacities, reporting, near the end of the essay, on a remark made by one of Garaudy’s comrades to the effect that he is just a scientist and bourgeois Protestant, who, for reasons of personal edification, has substituted historical materialism for the hand of God.7 Sartre agrees with this comment, but points out that the Party still makes use of and endorses his work. Above all, he is appalled by Garaudy’s rigid adherence to Party discipline whatever the cost, as in his continuing insistence on the rightness (at least within the context of that time) and historical inevitability of Stalin’s pact with Hitler.

Such anecdotes are clear evidence that on a personal level, despite the constraints of Party discipline, dialogue was taking place between communists and noncommunists. But public appearances were of quite a different order, as

6. Pierre Naville (1904–93) was a French sociologist best known for his psycho-sociology of work and studies of automation and industrial society. After an early association with surrealism, he passed through communist and Trotskyist parties before aligning himself with various socialist parties from the 1940s through the end of his life.
evidenced by a book by Lefebvre, *L’Existentialisme*, that was published in 1946, the same year as Sartre’s article. In this book Lefebvre, who in fact was the most original and profound of the Communist Party philosophers, charges Sartre with irrationalism, lack of rigor, and even intellectual dishonesty, asserting that for this reason “Sartre does not merit the title of philosopher.”8 Lefebvre’s precise argument here is a plausible enough one, based on his view – one that is central to much of his thought – that knowledge is possible only through the use of concepts, and hence that Sartre’s claim that consciousness could intuit objects directly was unsustainable and self-refuting. But the level of vitriolic polemic, which is maintained more or less throughout this short book, is a reflection of the then-prevalent atmosphere, suffused with the Cold War spirit of what Stalin (and many others) called “the two camps,” one that contrasts sharply with the calm, balanced, although still highly critical, tone of Lefebvre’s later work, particularly after his dismissal from the Communist Party.

One of the most extraordinary works of this immediate postwar period – in many respects the most extraordinary – was *Humanism and Terror* (subtitled “Essai sur le problème communiste”), written by Sartre’s then close friend and associate Merleau-Ponty, and published in 1947.9 Although less, let us say, histrionic than Sartre and less inclined to reveal personal conversations in print, Merleau-Ponty appears to have had closer personal ties with communist intellectuals at the time and indeed, while certainly not accepting the letter of Marxist doctrine (he who throughout his writings emphasized ambiguity and eschewed absolutist systems), to have begun by feeling greater sympathy than Sartre for the communist point of view. This is well illustrated by *Humanism and Terror*, which is an attempt to reach an understanding, one different from and, Merleau-Ponty hoped, more accurate than, the picture painted by Arthur Koestler, in his novel *Darkness at Noon*, of the infamous Moscow Purge Trials of 1937–38, through which Stalin had succeeded in liquidating Nikolai Bukharin and other former top Soviet officials. Merleau-Ponty shows – successfully, I think – how Bukharin could honestly have made the confession in which he admitted to having been objectively guilty of treason while not having subjectively intended to commit it. The book is an exercise in philosophical explanation and really not an apology for the actions taken by Stalin’s agents, but in the hysterical atmosphere of the time it was regarded as being the latter by some perfervid anti-communists. Among them was Camus, who had himself been a Party member for a short time when a very young man in Algeria, and who decided to have

---

9. For a discussion of Merleau-Ponty, see the essay by Mauro Carbone in *The History of Continental Philosophy: Volume 4*.
no further contact with Merleau-Ponty as a result of this book. This was not to be the last rupture between former colleagues over “the communist question.”

The tensions of those early Cold War times in Paris were probably best captured by Beauvoir in her novel *The Mandarins*, a work of considerable philosophical as well as historical and literary interest.\(^\text{10}\) Although Beauvoir always vehemently denied that it was a *roman à clef*, many of its characters bear striking resemblances to actual people in the real world that is reflected in it: Camus, Koestler (who was living in Paris at that time), Sartre, Communist Party members, and even Beauvoir herself as well as her erstwhile American lover, the novelist Nelson Algren, to whom the book was dedicated. Written over a three-year period (1951–54) during which many events of utmost importance for the future of French Marxism were taking place, this book focuses most centrally on a drama that closely resembles certain events that occurred immediately prior to its inception: to wit, the revelation of the existence of an extensive network of slave labor camps in the Soviet Union and the ensuing debate within the editorial board of a putatively fictitious noncommunist revue that has nevertheless striven to make common cause with the communists against Western imperialism and capitalism (called, with deliberate irony, *L’Espoir* in the novel) over whether to publish these revelations and thus risk a complete break as well as damage to the common political cause. An article entitled “Les Jours de notre vie,” jointly signed by Sartre and Merleau-Ponty but in fact written by Merleau-Ponty alone (and later reprinted in his essay collection, *Signes*, under the title “L’URSS et les camps”), which appeared in the January 1950 issue (vol. 51) of *Les Temps modernes*, was the actual outcome of the historical counterpart to Beauvoir’s tale. Among the novel’s other sub-themes with historical counterparts is the effort by some of the characters to develop a viable noncommunist Left political party. Merleau-Ponty and especially Sartre were in fact involved in just such an effort in 1948 and most of 1949; called the RDR (Rassemblement Démocratique Révolutionnaire), it collapsed when it was learned that its most prominent leader, David Rousset, had been receiving *sub rosa* financial assistance from the American labor unions, the AFL and the CIO, as well as from the American former Marxist philosopher turned vehement anticommunist, Sidney Hook.

Nineteen fifty was also the year in which military forces from North Korea invaded the South, initiating a state of war that is still technically in effect. Opinions in France varied as to whether it was a deliberate act of unprovoked aggression, or whether certain American provocations (in particular, a visit to the border by the American Secretary of State, Dulles) had been the real

trigger. Merleau-Ponty was inclined to the first view, Sartre to the second, and this disagreement accelerated a movement of reversal of positions between them, at once political and philosophical, which culminated in the rupture of their friendship and eventually resulted in two important works with opposite tendencies: Merleau-Ponty’s *The Adventures of the Dialectic* (1955) and Sartre’s previously mentioned *Critique of Dialectical Reason* (1960, with the preliminary essay, “Questions de méthode,” from 1957). *The Adventures of the Dialectic* is actually a collection of essays, in which Merleau-Ponty’s theoretical disillusionment with Marxism and with the failure of Marx’s aspiration to combine theory and practice, a point of view that still does not amount to a complete disillusionment with dialectical thinking as such, is interwoven into studies of Lukács, Trotsky, Max Weber, and, in the last and longest chapter, Sartre himself. In that chapter, entitled “Sartre and Ultra-Bolshevism,” Merleau-Ponty alleges that Sartre’s pattern of thinking is absolutist, incapable of taking adequate account of realities that are intermediate between individual human consciousnesses and things (“*médiations*”: history, symbolism, etc.), and hence compatible with an atomistic and opportunistic conception of political action according to which spontaneous decisions of the Party express *eo ipso* the historically correct course. While Sartre himself never replied directly to this attack, Beauvoir did, in a long and excruciatingly well-documented polemical essay entitled “Merleau-Ponty and Pseudo-Sartrism,” which in effect purports to show that Merleau-Ponty (who until the time of the Korean War, she says in her opening sentence, had confused Marx with Kant) simply has Sartre wrong. But one way of viewing Sartre’s entire *Critique of Dialectical Reason* itself is as a very lengthy, detailed response to Merleau-Ponty’s charges; about the *Critique*, more anon.

Meanwhile, prior even to the publication of *The Adventures of the Dialectic* and while the Korean War was ongoing, some developments on the home front were impelling Sartre to his period of closest collaboration with the communists. One was “the Henri Martin Affair,” which began with the arrest of a young French sailor, a Communist Party member, who had fulfilled all his military obligations but had come to realize the injustice of the French war to maintain its control over Indochina as a colony, and therefore wrote and published pamphlets in protest against that war. Arrested and sentenced to five years in prison in 1950, he became the focal point of a campaign by the Communist Party in 1951, a campaign that Sartre agreed to join in early 1952. In connection with this Sartre eventually made a visit to the French president, who conceded that the prison sentence had been too harsh, and collected testimonials on Martin’s behalf to which he added his own hundred-page commentary. Actual publication of *L’Affaire Henri Martin*, however, was for some reason delayed until just after Martin himself had been freed in mid-1953. (Martin, still vigorous and active as a septuagenarian Party member and occasional honored
visitor to Vietnam, was a guest speaker at the annual meeting of the Groupe d’Études Sartriennes in Paris in summer 2006. All the dramatic changes that have occurred since the heyday of French communism should not cause us to forget the many continuities.

Of even greater importance than the Henri Martin Affair, however, was the Jacques Duclos Affair, which occurred during the momentous year of 1952. The Communist Party had organized a rally to protest the arrival in Paris of the new (American) commander of the Supreme Headquarters of the Allied Powers in Europe (SHAPE), General Ridgeway, and had called for a general strike as well. A half hour after the demonstration, French police arrested Duclos, a Party official, on trumped-up charges (e.g. that the pigeons that they found in his car, which were already dead and had been bought to take home for dinner, were really carrier pigeons trained to fly secret messages to Moscow!); and the strike was not supported by the mass of workers. Sartre, on vacation in Italy at the time, was furious when he heard the news and learned of the ensuing triumphalist attitude of the French Right. Convinced that “an anti-Communist is a dog,” he began composing what became a three-part article, in effect a short book, entitled “The Communists and Peace.” Among other points, Sartre claims here, ostensibly on the basis of his own principles and not theirs, that the communists, whatever their failings, are at present the authentic representatives of the working class; that the workers only failed to support the strike out of extreme discouragement; and of course that the communists are in favor of peace, not war. The third part of the essay, which deals in large measure with the history of class conflict in nineteenth-century France and the peculiar evolution of French industry and labor organizations and is both historically and philosophically richer than the first two, was published only in early 1954. But the first two parts appeared in the July (vol. 81) and October–November (combined vols 84–5) 1952 issues of Les Temps modernes, between which, in the August issue, there appeared a polemic that was no doubt much more widely discussed, in France and eventually worldwide, than anything written in “The Communists and Peace”: the public break between Sartre and Camus.

The occasion was the appearance, during the previous year, of Camus's L'Homme révolté (The Rebel in its English title). Such a major essay by such

---

a renowned author clearly called for a review in *Les Temps modernes*, but for some time no one on the staff was willing to volunteer to write it, since there was general agreement that a negatively critical response to it would be the only appropriate one, and everyone realized that this would cause a furor. Camus’s book is in fact, in my opinion, highly defective in a number of respects, certainly including the philosophical dimension. Its fundamental message, although this sometimes becomes obscured by the analyses of various individual writers and movements with which it is filled, is that, while individual rebellion can sometimes be of great cultural value, political revolution is bound ultimately to be counter-productive. Needless to say, this position – the product not only of Camus’s strong disaffection with the communists but also no doubt of the growing torment in his soul over the future of Algeria, where he was born and his mother still lived, the ethnic majority of which was displaying increasing unrest that would soon lead to a bloody struggle for independence from France – found no resonance with the belief in *engagement* shared by all the members of the *Temps Modernes* “team.” Eventually Francis Jeanson, who as a very young man still personally unacquainted with Sartre had authored an extremely perceptive account of the ethical implications, left untouched by Sartre himself, of the latter’s early work (and who was later to become an active clandestine supporter of the Algerian revolution), offered to write the review. Published in the May issue with the title “Albert Camus, ou l’âme révoltée” (a pun, meaning “the soul in revolt”), it was scathing. Sartre offered Camus the opportunity to reply; what he wrote, in a very offended and distant tone (he addressed his remarks, impersonally, to “the director of *Temps Modernes*,” i.e., Sartre, rather than to Jeanson himself, whom Camus treated as simply Sartre’s “stooge”), together with Sartre’s response (which opened with the assertion that their friendship had always been a difficult one, but that he would miss it) and a further essay by Jeanson, was the focal point of the August issue in question. The highly personal and mediatic aspects of this polemic aside, it served well to clarify the divide on the French Left (of which Camus continued to consider himself a part), in which, as usual, perceptions of the Communist Party and views on Marxist philosophy – especially concerning the nature of history and the possibility of fundamental social change – both had a part.

In December 1952 there was a much-publicized peace conference in Vienna, in the preparation of which the international Communist Party played a major role. Sartre was very supportive of it and participated in it. He was to continue to

13. For some detailed reasons for my saying this, see my “After a Lot More History Has Taken Place,” in *Sartre and Camus: A Historic Confrontation*, David A. Sprintzen and Adrian van den Hoven (eds) (Amherst, NY: Humanity Books, 2004). In the same volume other essays that take Camus’s “side” can be found.
be on relatively friendly terms with some Soviet writers, such as Ilya Ehrenburg, throughout the rest of the 1950s and well into the 1960s, and his first trip to the Soviet Union in mid-1954, from which he returned offering a quite excessively positive report on its development, was followed by several more in the ensuing years. Stalin had died and Khrushchev had been named his successor in 1953; that was also the year in which Merleau-Ponty formally severed his connections with Les Temps modernes and finally broke with Sartre as well, although that break was not quite as decisive as their respective breaks with Camus, and Merleau-Ponty and Beauvoir apparently continued on relatively friendly personal terms even after she published her fierce defense of Sartre against his attack on Sartre’s “ultra-Bolshevism” in The Adventures of the Dialectic.

Somewhat coincidentally, it was also in mid-1953 that Garaudy defended his Sorbonne dissertation, which was published that same year under the title Théorie matérialiste de la connaissance. When I read it some years ago, I was struck by its banality and especially by its dogged insistence on defending Lenin’s so-called “reflection theory of cognition”: the idea that all knowledge is in some way or other a reflection, although of course sometimes a very distorted one, of objectively existing empirical reality, as expressed in Lenin’s most purely philosophical (and at the same time also, to my mind, philosophically least defensible) work, Materialism and Empirio-Criticism. It is a dreadfully unsophisticated conception of epistemology, and its detailed elaboration by Garaudy seemed to me to be an excellent vindication of Sartre’s criticism of so-called “orthodox Marxist” materialism in “Materialism and Revolution” and elsewhere. Somewhat to my surprise, but by way of well illustrating the hypocrisy and putrefaction of its “official” ideology that was, in retrospect, inexorably undermining the Communist Party during those years, one finds the same judgment pronounced by Garaudy himself in his autobiography of 1989. I shall cite just a few sentences, in my own translation, from the part of this text in which he discusses that book and the occasion of the formal thesis defense, for which a police guard had been required because of his reputation as a leading Party official:

Quite frankly, I think that Théorie matérialiste de la connaissance is the worst of my books, the only one I forbade to be republished when it went out of print, one year after its appearance, at the Presses Universitaires de France.

It is a conscientious synthesis of what was being written at that time about the philosophy of science in the Soviet Union and among intellectuals of various Communist Parties, from England to Brazil.

Despite some personal research, especially concerning scientific development, its general orientation is invalidated by the theory according to which knowledge is a reflection of the real. Greek,
Thomist, and 18th Century inheritance, and one-sided utilization of Lenin’s book *Materialism and Empirio-Criticism*. I have no excuse, other than a false conception of “Party spirit” making it a duty to share the mistakes of others.\(^1\)

He goes on to recount that some years later he encountered the kindly thesis advisor who had protected him at his defense, Gaston Bachelard, who had by then become quite famous for his work having virtually nothing to do with Marxism, and that in the course of this meeting Bachelard told him that he had completely disagreed with Garaudy’s thesis, but that he had wanted to encourage him rather than to influence him.

Garaudy was somehow to “hang on” as a Communist Party official for many years thereafter: his formal expulsion from the Party finally took place at a meeting in February 1970, as a virtually inevitable sequel to the Soviet invasion of Czechoslovakia in late 1968 and the worldwide disgust that it provoked and that he shared and publicly expressed. I shall return to that event at the end of this essay. Garaudy’s own quite curious later evolution eventuated in his conversion to Islam, which he found to be quite compatible with, and indeed supportive of, his strong commitment to peace movements. But in the intervening years of the late 1950s and the 1960s he managed, in part through the personal support and friendship of the French Communist Party leader, Maurice Thorez, not only to maintain his party membership but also to become the leading French figure in promoting a renewed dialogue between Marxists and Christians, as epitomized in his very popular book, *From Anathema to Dialogue*. A longtime admirer both of the philosophical work of the Jesuit anthropologist, Teilhard de Chardin, and of the “worker-priest” movement in the French Catholic Church, he received further encouragement from the ascendancy of John XXIII to the papacy and the short-lived but influential spirit of *aggiornamento* that the latter created during his reign. In pursuit of this dialogue, Garaudy even deigned, *mirabile dictu*, to make a brief speaking tour of the United States in 1966. There were protests, needless to say, but he received considerable publicity and survived. One has to wonder, in retrospect, whether this tour was more symptomatic of French Marxism’s continued flourishing or of its decline.\(^2\)

Lefebvre, on the other hand, had long since been ousted from the Party: in 1958, in reaction to the publication of his book, highly critical of contem-

---

\(^{2}\) At the end of the century, Garaudy again received considerable publicity in response to his 1995 book *Les Mythes fondateurs de la politique israélienne* (*The Founding Myths of Modern Israel*), in which he denied that the Holocaust had occurred. On February 27, 1998, a French court found Garaudy guilty of “racial defamation” and of violating a law that prohibits the disputing of crimes against humanity, imposing a fine of 240,000 francs (roughly $40,000).
porary thinking among communists, entitled Problèmes actuels du marxisme. (He, however, continued years later to be denied a visa to visit the United States because of his past Communist Party membership.) He had always, at least in the postwar years, been more of an outsider to the Party leadership than had Garaudy: despite his previously mentioned Party-line polemic against existentialism (for which he later expressed regret), he had already published some highly original, creative works on the borderline between philosophy and sociology, perhaps the most interesting of which is Critique de la vie quotidienne (1947). This was republished in the same year as that of his expulsion, 1958, and in the following year he produced a fascinating text combining autobiography with literary criticism, philosophy, sociology, and even some poetry entitled La Somme et le reste. Much more was to follow; his Introduction à la modernité (Introduction to Modernity) is especially well known in the domain of sociological theory, at once drawing on Marx’s thought and yet dealing with many new problems in the daily life of a society that had obviously become quite different from that of Marx’s time, the early Industrial Revolution, and that called for a new critical theory less exclusively focused on the structure of the capitalist economic system and the class struggle that it fostered. It should be little surprise, then, that Lefebvre’s name loomed large during the French student uprising of May 1968, which began with sociology students at the University of Nanterre, on the outskirts of Paris, where Lefebvre was by then a professor. It was the decision of the Party not to support the students and the factory workers who had joined in solidarity with them that, together with the crushing of the so-called “Prague Spring” by Soviet forces a few months later, tolled the death knell of that Party’s serious influence in France, as Garaudy at the time saw quite clearly that it would. But by that same time, the ever-widening gap between communism and Marxist theory, and the ever-growing dispersion of the latter into various novel shapes and forms, had already become quite apparent, as Lefebvre’s intellectual liberation and development well illustrate.

Arguably the most prominent exemplification of both this gap and this dispersion, however, was Sartre himself during these same years of the late 1950s and the 1960s. His Search for a Method, cited at the beginning of this essay as a product of the period of the so-called “Thaw” that began with Khrushchev’s detailed denunciation, given to a closed Party gathering but soon made public around the world, of Stalin’s crimes, was actually published in its first, Polish version several months after the Soviet intervention in Hungary to crush workers’ demonstrations there. Since Poland, for various complex reasons, had (narrowly) escaped the same fate, the special issue on French intellectual life of the journal Twórczość (which also, incidentally, included an article by Lefebvre) was still permitted to be published in April 1957. But by this time Sartre had vehemently denounced the Soviet action in Hungary and made it clear that, as
a result, he was giving up all efforts to make common cause with the French Communist Party, or at least with those who belonged to its still-Stalinist core. This position was first enunciated in an interview that he gave to the magazine, *L’Express*, immediately after the events in question, and soon thereafter in a special triple issue of *Les Temps modernes* on the Hungarian revolt to which Sartre contributed a long essay, “Le Fantôme de Staline” (*The Spectre of Stalin*). At the same time, it must be remembered that Sartre still continued to maintain the judgment expressed in *Search for a Method*, both in its Polish version and in the French version that first appeared a half-year later in *Les Temps modernes*, to the effect that Marxism remained the dominant worldview of the age, *despite* the sclerosis to which “official” Marxism had succumbed. This judgment continued to be an underlying assumption of the *Critique of Dialectical Reason* itself, the 800-page first volume of which he wrote at a feverish pace between late 1957 and early 1960.

My summary here of this very interesting and, in my opinion, still not sufficiently well-known or well-respected work will be very brief and sketchy, intended primarily to single it out as a particularly salient illustration of what I have called the “dispersion of Marxist theory.” Early on in it, Sartre asserts that not only is this critique of his dependent, obviously enough, on the writings of Marx and of Hegel before him, but also that it would have been impossible for anyone to undertake it *prior to* the abuses that have clouded the very notion of dialectical rationality and have produced a new split between *praxis* and the knowledge that illuminates it… It can only happen as the intellectual expression of the *putting back in order* that characterizes, in this *one World* which is ours, the post-Stalinist era.¹⁶

This is as clear an acknowledgment as one can imagine of Sartre’s belief that a historical corner had been turned – a turning that, as he then hoped, would allow for the re-establishment of Marxism itself on more solid ground. Accordingly, the *Critique* proceeds, at a level far more abstract, at least in its early phases, than *Search for a Method*, to fill in the outlines of an idea borrowed from Lefebvre that Sartre had discussed in that earlier work, to wit, the idea of a “progressive-regressive method.” Whereas Marx had generally confined himself to the progressive reconstruction of history as it appeared in his time, saying

---

little about the underlying, interactive structures of human society that would help explain the nature of history, Sartre proposes to devote his investigations in Volume I of the Critique to the latter (“ensembles pratiques,” in the words of its subtitle), that is, to the “regressive” part of the method.\textsuperscript{17}

The starting-point of the Critique is the human being conceived as “praxis” (a term famously associated with the early Marx), living under conditions of scarcity (a notion that, as Sartre was to observe years later, plays much more of a role in the writings of Marx’s bourgeois political economist predecessors than in those of Marx himself), and forced to labor on “inert matter” in order to survive. The domain in which this interaction takes place is designated as the “practico-inert,” and the interaction itself results in a sort of reversal whereby the freedom that for Sartre is most fundamental to praxis comes to be thwarted and human beings are reduced to an alienated condition that he calls “the series” or “seriality.” Under certain conditions, however, often those of threats from outsiders, it becomes possible for some human beings at a given place and time to band together, reasserting their freedom through some common activity, in a type of formation radically different from the series, which he denominates the “group.” His chosen example of a group at its height (“in fusion”) is the residents of the Quartier St. Antoine in Paris in 1789 who, fearing a rumored attack on them by royal troops, decide to capture the fortress-prison, the Bastille, that commanded the entrance to their neighborhood. Success in such an enterprise, should it be successful, is likely to entail follow-up organizational measures in order to preserve it (e.g. mounting watch against the possible return of the troops), leading eventually to the swearing of an oath of loyalty to the group and, from there, to further institutionalization and finally bureaucracy. Sartre insists that neither the sequence in which he depicts these developments nor their rather negative outcome as I have just summarized it is inevitable, and the final part of Volume I is designed as a transition to his planned study of history, conceived as a vast “totalization” (a favorite word of Sartre’s here) in progress. Thus, there is some concession to Marxian optimism concerning the historical future, but only some: the overall impression left by the Critique is indeed far removed from that with which, let us say, The Communist Manifesto concludes.

One of the reasons for the lesser attention paid to Sartre’s Critique as compared with that which had been accorded to his earlier chef d’œuvre, Being and Nothingness, was the fact that by the time of its appearance philosophical

\textsuperscript{17.} Volume II, only partially completed and published posthumously, consists in large measure of a detailed examination, in light of the theoretical conclusions of Volume I, of Russia under Stalin during a portion of the decade of the 1930s; it was to have been the “progressive” portion of the massive projected work, subtitled “the intelligibility of history,” with the Stalin study being only one of several from different eras and different types of sociopolitical organization.
voices of a later generation and of quite different orientations, some of which were soon to become very well known, had begun to be heard and attended to. Among these voices were those of Sartre’s friend and severe critic, Claude Lévi-Strauss, whose very influential *Anthropologie structurale* had been published in 1958, and of Michel Foucault, whose *Folie et déraison: Histoire de la folie à l’âge classique* (*History of Madness*) was published in 1962, but who had already established a certain reputation for his fresh approaches to philosophical analysis. “Structuralism,” a blanket term that came to be applied to many thinkers of the next decade even though most, including Foucault himself, tended to express discomfort with it as a label for themselves, was becoming the new rage, whereas Sartre was still seen as being first and foremost an existentialist, albeit now a “Marxist” (or at least “neo-Marxist”) existentialist. Structuralism, whatever else it meant, entailed a scientistic approach to the understanding of human society, as Lévi-Strauss’s attack on Sartre’s *Critique* in the final chapter, “Histoire et dialectique,” of his book *La Pensée Sauvage* well illustrates.

To those outside France who followed these changes in intellectual currents in that country, by far the best-known figure associated at once with both structuralism and Marxism during the 1960s was, and still is, Louis Althusser. Younger than Lefebvre, Sartre, and Lévi-Strauss, and older than Foucault (whom he tutored in preparation for the latter’s *agrégation* examination and influenced considerably, despite their ultimate disagreement about the value of Marx’s thought), Althusser was a unique individual whose tortured life can be seen, in retrospect, as a living crossroads of the historical contradictions – a term dear to the Marxists themselves – of which the eventual outcome was the end of the Marxist era. Very shortly after completing his diploma, in 1947, at the École Normale Supérieure, he was invited to serve as an instructor there, a position that he still occupied when he famously killed his wife and longtime friend, Hélène Rytmann-Legotien, in an episode of his frequently recurring madness, in 1980: at the time, the École Normale Supérieure was also their place of residence. He joined the Communist Party (of which Hélène had already been a member prior to the war, but from which she had then been excluded because

19. His first book-length work, *Maladie mentale et personnalité* (*Mental Illness and Psychology*), had appeared in 1954, and exhibited considerable influence from, and references to, Marx; in a revised version of the same work, also published in 1962, there is a very significant shift away from these influences and references.

194

Volume 5
of certain alleged “errors”) in 1948 as he became increasingly disillusioned with the Catholicism in which he had formerly believed. Never a member of the Party’s inner circle and on several occasions the object of its strong disapproval because of his publicly expressed criticisms of, for instance, its official acceptance of “humanism,” he nevertheless retained his Party membership until he chose voluntarily to withdraw in 1980, after which he still remained, as he put it citing Lenin, a “communist without party.” He gave courses on structuralism as early as the late 1950s but himself resisted the label because he did not wish to be identified with Lévi-Strauss’s more formalistic approach. Although his best-known book, at least outside France, is his essay collection Pour Marx (For Marx), which was first published in the same year as the four-volume work prepared in collaboration with his student Étienne Balibar and others, Lire Le Capital, he acknowledges in his strange, posthumously published autobiography, L’Avenir dure longtemps (The future lasts a long time; published in English as The Future Lasts Forever), that his own first reading of Capital only occurred in connection with the 1964–65 seminar that produced Reading Capital!\textsuperscript{22}

Not an original systematic philosopher, Althusser is likely to be best remembered as a theorist for his insistence on several debatable points of Marx interpretation. He believed that there was a sharp division between the earlier, “humanist,” Marx and the later one, a division that he famously denominated the “epistemological break.” The later Marx, for him, was the creator of a new science of history, with special emphasis on the word “science.” While history was determined, to be sure, by economic factors, the famous “forces of production,” Althusser took this to be true only “in the last instance,” for history was in fact “overdetermined.” And, while “ideology,” which Marx, unlike the later so-called “orthodox Marxists” of the Communist Party, had regarded as a pejorative term, was according to Althusser to be strictly distinguished from “science,” nevertheless the role of ideology in connecting individuals with the culture of their time and place was for him indispensable and would remain so.

But probably Althusser’s greatest historical significance lay in his influence on and through his students at the École Normale Supérieure,\textsuperscript{23} and his reputation spread far beyond the walls of that elite institution. One of those students, Bernard-Henri Lévy, himself a strange case in many respects but certainly not in the same respects as Althusser, concludes a long, revealing, and far from unqualifiedly positive digression on him, in his own highly controversial book about Sartre, by asking whether we should forget Althusser and replies, “Non,

\begin{flushright}
\footnotesize
\end{flushright}

\begin{flushright}
\footnotesize
\textsuperscript{23} The work of many of Althusser’s students are discussed in the essay by Patrice Maniglier in The History of Continental Philosophy: Volume 7.
\end{flushright}
bien sûr. Justement non.” He goes on to say that it was Althusser who was and still is his master (and indeed the master of a whole generation), who taught him to write and to think, who taught him both his Marxism and his anti-Marxism, and much, much more. It is clear that Althusser had become very much the rage among politically involved students during the period leading up to the confused and confusing events of May 1968. (Lévy was himself a member of the École Normale Supérieure class of ’68.) As Althusser recounts it, many of the students whom he knew best had broken with the Communist Party’s official youth wing, the Union des étudiants communistes (UCEC), to form a new organization called the Union des jeunesse communistes (marxistes-léninistes) (UJC m-l), a move that he had in fact criticized. Nevertheless, his name remained a rallying point for many of the very large number of students who, disdaining all hierarchies and hence not clearly under the leadership of any single faction or individual, marched under red banners and erected barricades in the sequence of events that began, as I have already mentioned, in Nanterre, and then moved on to Paris’s Left Bank, where both the old Sorbonne building and the École Normale Supérieure are located. The revolt seemed to gain momentum for some days, as workers at major factories joined in, and even Sartre gave his endorsement in a short talk (he was told in no uncertain terms, in a note, to be brief) at the student-occupied Sorbonne. But, as I have noted, the ever more enfeebled and rigidified Communist Party leadership refused to support the movement, and eventually President De Gaulle regained the upper hand, even though flare-ups and small street battles continued for a month thereafter, and occasionally even into the early months of the following year. As for Althusser himself, he was being taken by car to another one of his periodic psychiatric hospital commitments when he observed some marching groups that signaled the start of the May uprising.

The dramatic failure of that uprising, which had echoes of diverse kinds in diverse national contexts worldwide, can clearly be seen in retrospect as the end of an epoch, not just for the French Communist Party and other Western Communist Parties but also for Marxist theory itself. In France, since that is our focus here, its sequels included both the ultra-radical but in fact short-lived Gauche Prolétarienne (otherwise known as “the Maos”), to which Sartre lent his name and prestige, on the one hand, and the rise of anti-Marxism in various forms, on the other. Within a few years there developed an intellectual movement known as the Nouveaux Philosophes, the most prominent names among whom were Bernard-Henri Lévy and a former Gauche Prolétarienne

leader named André Glucksmann; fiercely anti-Marxist and critical of modern systematic thinkers such as Hegel, Marx, and Sartre (“master thinkers,” in the words of the title of a book by Glucksmann), it was also short-lived in its original form, although it can be regarded as part of the evolution to what later came to be known as “postmodernism.”

A similar anti-Marxist drift occurred among former Trotskyite thinkers such as Cornelius Castoriadis, one of the originators of the movement known as Socialisme ou Barbarie (socialism or barbarism), which was also the name given to its journal. Estimates of Castoriadis’s importance both as a social philosopher and as one of the significant inspirations of the 1968 student revolt vary greatly. For example, David Ames Curtis, one of the foremost proponents of Castoriadis’s ideas, reports that a leading figure in that revolt, Daniel Cohn-Bendit, claimed to have “largely ‘plagiarized’ Castoriadis’s and S. ou B.’s views.”

However, as Castoriadis himself has made clear, the Socialisme ou Barbarie group, having undergone several previous splits, suffered a decisive one in 1963 and had ceased to function by spring 1966. Castoriadis’s long, varied career, beginning with a brief period as a member of the Communist Youth in his native Greece, continuing with initial enthusiasm for, then disillusionment with, Trotsky’s ideas, followed by systematic repudiation of major tenets of Marxist thought (while at the same time he claimed still to adhere to the ideal of a “revolutionary project”), is a particularly noteworthy case study in the complex process of the dissolution of French Marxism.

One of the other well-known young figures from the May days of 1968, another student of Althusser’s (from the class of ’65), Benny Lévy, moved from being a “Mao” leader (the connection of this group with Mao Tse-Tung’s thought was quite superficial, involving above all the adoption of a provocative label, hence my avoidance of the adjective “Maoist”) to becoming Sartre’s secretary and confidant in his declining years as he went blind and then, after Sartre’s death, to being the leader of an orthodox Jewish commune first in Strasbourg and later in Israel. Sartre himself, in an interview conducted a few years before his death by three interlocutors in connection with the publication of a Library of Living Philosophers volume on him, declared that he no longer considered himself a Marxist – among other reasons because, after all, he no longer thought that Marxism was compatible with a philosophy of human freedom such as his own.

Of course, adherence to the Marxian tradition remains strong among some French philosophers – Balibar continues writing along Marxist lines, for

*26. Balibar’s work is discussed in the essays by Simon Duffy and Patrice Maniglier in The History of Continental Philosophy: Volume 7; his more recent work is also discussed in the essay by Rosi Braidotti in The History of Continental Philosophy: Volume 8.
example – and Althusser in his autobiography (begun in 1985, some five years prior to his death) thinks of such adherence as having remained strong through the 1970s, even while admitting that as the inspiration of a political movement (and indeed of several movements) it did indeed die, slowly but surely, after 1968. As the title of that book of his correctly affirms, the future does indeed last a long time. But I have confined myself to the *heyday* period of Marxism in France, and no objective observer of France today could possibly claim that that period is anything but a now-distant memory.
Frantz Fanon,¹ the famed Martinican psychiatrist and philosopher, succinctly summarized the black predicament of the self: “the black soul is a white construction.”² Prior to the emergence of the modern world, indigenous or first peoples of Africa, Southern Asia, and the South Pacific had no reason to think of themselves as black. That construction is indebted to the anthropology of race and racism born of colonization and global practices of enslavement in the modern world. Black existential thought focuses, *inter alia*, on three themes occasioned by that construction: (i) what it means to be human; (ii) the meaning of freedom and liberation; and (iii) the degradation of reason in the modern world. Black existential thought brings the question of existence to these three problematics.

The first, which we could call philosophical anthropology, is raised by the challenges to the humanity of black people posed by colonialism, slavery, and racism in the modern world. In the case of slavery, the humanity of black enslaved people was challenged by virtue of their status as property. The status of property placed rights in the hands of their owners. One never technically harmed a

---

¹ Frantz Fanon (July 20, 1925–December 6, 1961; born in Martinique; died in Bethesda, Maryland, USA) studied medicine at the University of Lyon (1947–51). Among his influences were Césaire, Sartre, and Senghor. He served as Chef de service at the psychiatric hospital of Blida-Joinville, Algeria (1953–56) and on the editorial board of the Algerian liberation movement (Front de Libération Nationale, or FLN) newspaper *El Moudjahid*.

² Frantz Fanon, *Peau noire, masques blancs* (Paris: Éditions du Seuil, 1952), 11, my translation. There are two English translations available, both of which are published by Grove Press in New York; the first, by Charles Lamm Markman, was published in 1967, and the second, by Richard Philcox, was published in 2008. My references will be to the original French, and the translations will be my own.
slave but a slave owner’s property. Philosophical anthropology comes to the fore when one questions whether any human being could properly be property. The enslaved could, for example, defend their humanity as being the same as those who have enslaved them, but the problem faced is the folly of justifying oneself in such terms in the first place. By what right is the humanity of enslavers, or for that matter those who contend their racial superiority, presumed? Who, or for that matter what, is the proper standard, if any, of the human? This question leads not only to the interrogation of those who challenged the humanity of black people but also to the questioning of the black self: if the black is a white construction, then what is the black left with who attempts to transcend that construction? The interrogation of black existence in this sense leads also to an inquiry into the meaning of the human being and, thus, human existence.³

Concerns with freedom and liberation make sense for a subject bearing the weight of enslavement and colonization. Problems of reason emerge through the kinds of justification offered for the anthropology of black existence and the discussion of freedom. An anthropology that degrades black existence, as found in the rationalizations of racialized slavery and colonization since the sixteenth-century expansion of Christendom into the formation of Europe and the Americas, uses reason to justify itself.⁴ The black existential critique of reason thus poses the question of whether reason is, in a word, reasonable.

Philosophical anthropology, concerns of liberation and freedom, and struggles with reason also come to the fore in black existential discussions of experience. Racialized slavery and racism offer conceptions of black people devoid of an inner life, experience, and the faculty of choice. For existentialists, an appeal to experience is thus a rallying cry against appealing to overdetermined conceptions of black people that precede what they encounter and do. Similar to Sartre’s credo of existence preceding essence, experience is a lived reality that precedes the concepts by which it is understood. Experience cannot be understood, however, without interpretation, meaning, or thought. That being

---

Black existentialism also is the critical reflection on the conditions of black experience.

Black experience as a theme of black existential significance first emerges in black music and literature. The spiritual, as is well known, is an early aesthetic expression of black suffering. That suffering took transformed artistic expression in the blues, which focus on life’s difficulties and bring existential reflection to the world of feeling or black suffering and joy. As an art form, the blues defies predictability and human closure. It welcomes improvisation, which makes it and its offsprings – jazz, rhythm and blues, and the subsequent forms of black popular music – exemplify the credo of existence preceding essence and its connection to the question of freedom. The worst condemnation one could make of black music is that it has become “predictable.” The blues also brings the absurdities of life into focus, which is a form of facing instead of avoiding it, the result of which is an adult sensibility. In a world where black men were called “boys” and black women “girls,” or worse, the blues stood as an important adversary of antiblack racism. It reminds them of being, in a word, “grown.” Yet in spite of such expressions of maturity, the blues were also testaments to ironic dimensions of life in the form of play. In existential thought from Nietzsche to Sartre, and even in some of the poststructural heirs such as Derrida, there is a critique of the spirit of seriousness, by which is meant the treatment of values as material features of reality. Their counsel is to transcend seriousness with play. The blues is a manifestation of this critique through its reminder, as ironic play, of not taking life too seriously. This performance of a suffering people is not, as some critics thought, the folly of a people incapable of understanding their situation. It was, in this reading, indication of their understanding the injustice and suffering they bore, the double standards imposed on them as mundane features of modern life.

The blues were first explicitly brought to literature in the writings of one of the most influential existential novelists of the twentieth century, Richard Wright (1908–60), and one of the most influential poets, Aimé Césaire (1913–2008). The former is the main source of the black Anglophonic literary genealogy, although Wright spent the last decade of his life in Paris, where his

impact on African diasporic thought in Europe was as influential as it was in North America, Africa, and the Caribbean. Césaire plays a similar role for black Francophonic literature, although his influence on literary development in the Caribbean crosses the linguistic lines. Let us turn to the first.

Wright was the son of sharecroppers in Mississippi. After an itinerant, poverty-stricken childhood, in which he did not complete high school, in spite of commencing his writing career at the age of fifteen, he made his way to Chicago, where he became a member of the Communist Party (CPUSA). His work with the CPUSA was primarily as an editor of various publications, which led to accusations of his having bourgeois sensibilities, in spite of his sub-proletariat background. He moved to New York, where he eventually broke from the party and published his acclaimed collection of short stories *Uncle Tom's Children* (1938), and then his monumental novel *Native Son* (1940). Wright's politics was always too radical and left-leaning for the United States. He moved to Paris in 1946, became a French citizen in 1947, and remained there until his death. In Paris, he was part of a community of intellectuals that included Jean-Paul Sartre, Simone de Beauvoir, and Albert Camus, and he was instrumental in organizing forums for writers across the African Diaspora, such as the Black Writers Congress of 1956, which was held in Paris. That meeting included Césaire, Frantz Fanon, James Baldwin (1924–87), and George Lamming (1927–), among others.

Wright articulates black experience at the level of what existentialists such as Sartre and Beauvoir call a *situation*, which they typically describe as a conflict of freedoms. Human beings face their limitations in relation to each other, for another human being has the power of refusal, of being able to reject doing what one wants them to do. More, the resulting situation is also susceptible to manifesting meanings well beyond one's intentions. As we saw with the observation of the black as a white construction, what a black person *means* by his or her action is not necessarily the same as what the situation he or she is in allows others to understand. This observation is evident in Wright's short stories but it is most known through his novels. In *Native Son*, the protagonist Bigger Thomas finds himself “in a situation” when he helps his employer's drunken daughter to her bedroom after chauffeuring her and her boyfriend around town and realizes that he, with her in his arms, was at risk of being “discovered” as a “rapist.” Wright provides reflections on the relationship between choice and options for those who are denied normality in the modern world; often lacking the power to set the conditions and thereby determine the social meaning of their situation, they find themselves constantly thrown into circumstances they would rather have

---

avoided. Ordinary situations such as seeking employment, spending leisure time with one's associates, and simply traveling from one part of a city to another are weighted down by possibilities of white racist inscription: an economic recession that allows black unemployment lines outside factories to be interpreted as a sign of black servility; a criminal justice system that presumes groups of black men at play to be involved in criminal behavior; blacks passing through white neighborhoods facing suspicions of being up to no good. Wright's novel outlines many of the classic existential problems of freedom and responsibility that follow. In “How Bigger Was Born,” his famous introduction to the 1940 edition of Native Son, he argued that American society “makes” Bigger Thomases: people who, in attempting to assert their humanity, become its troublemakers to be forced back “into their place” while being held responsible for their actions. Wright is able to criticize a system for what it does to people while recognizing the importance of responsibility, even under unjust systems, as a necessary condition for human dignity and maturity. In his last novel, The Outsider (1953), he explicitly made through the antihero Cross Damon, who finds himself incapable of experiencing responsibility because he lives in a world that inhibits his development into a man. His greatest fear is realized when he dies confessing a feeling of “innocence” after having killed several people.

Wright's work raises an important challenge to the understanding of death in existential thought. From Hegel through Heidegger, death formed one's subjectivity as a source of fear and anxiety and as an ontological limit that constitutes the self. Wright's work reveals, in a tradition that dates back to the thought of Frederick Douglass, that black subjectivity is constituted by an understanding of freedom as a premonition of early death or being imperiled by risking freedom in social life. But instead of simple fear of death there is the dread of bondage. The decision to live as a struggle for freedom forms, then, a subjectivity of presumed death.

Another theme of black existential thought is invisibility, a subject that has become almost synonymous with the name Ralph Ellison (1913–94) since the publication of his novel Invisible Man in 1952. Here, black invisibility is a function of hypervisibility. It is a form of being what Fanon called a phobogenic object, an object that stimulates anxiety. Ellison laments the madness faced by educated blacks, who believe that their achievements will enable their inclusion (visibility) instead of heightened exclusion (invisibility) in US society. Baldwin also brings such questions to interracial, homosexual, and bisexual settings and

---

8. The Outsider was also the title of the British translation of Albert Camus's most famous novel L’Étranger (1942), whose American translation was The Stranger.

looks at the question of suffering as a struggle to defend the possibility of genuine human relationships. The question of invisibility later takes on a unique form, as well, in the novels of Toni Morrison (1931–), particularly her first, *The Bluest Eye.* There, Morrison brings out the peculiarity of notions such as “ugliness” and “beauty” that dominate women’s lives in general but black women’s in a profound way through their attempt to whiten their appearance. The expectation that black women should look like their white counterparts pressures them into a condition of bad faith and what Du Bois formulated as initial double consciousness: that is, seeing themselves through the eyes of hostile others. They live by a standard that they can never meet. This theme of living by a standard that is not one’s own is taken to another level when Morrison writes of bad “mixture” in a world that creates liaisons between adults and children, the consequence of which is molestation, incest, and madness.

Unlike Wright, who was a US expatriate in France, Césaire was more directly linked, through his studies at the École Normale Supérieure, to the European tradition that received much criticism in his work. A native of Martinique, Césaire and his wife, Suzanne (also from Martinique), were married while both studied in Paris, wherein they were, with Léopold Senghor (1906–2001) and Léon Damas (1912–78), among the founders of the Négritude movement. The Césaires returned to Martinique, where they cofounded (with a collective that included René Ménil [1907–2004] and many other influential Martinican intellectuals) the journal *Tropiques* and taught in the island’s *lycée.* Among their students was Fanon, to whose thought we shall soon turn. Césaire then shifted to a career in politics, where he became mayor of Fort-de-France and député from Martinique to the French National Assembly. Under his leadership, Martinique became an overseas extension of France in 1946. Césaire continued his literary production throughout his career in public service, from which he retired in 2001.

Césaire’s contributions are many, but the most influential are his classics *Cahier d’un retour au pays natal* (*Notebook of a Return to My Native Land*)

---

(1939) and Discours sur le colonialisme (Discourse on Colonialism) (1953). The first was a long poem that grew out of his reflections on Martinique while preparing for his examinations at the École Normale Supérieure. Césaire drew on poetry to articulate the cultural contradictions of an educational system that demanded maximum assimilation while maintaining colonial segregation. He was concerned about a political anthropology that demanded him literally to become, to paraphrase Fanon’s later formulation, a white man in a black skin. That a long string of cultural and economic relations was linked to that body raised the question of unjust relations that were protected by such erasure. Césaire took up that question in the Discours, which locates him in a long tradition of Africana writers on philosophy of civilization.

Although philosophers no longer speak of civilization in such terms, the debates in that area have continued in the social sciences and many areas of the academy, as the debate on Samuel Huntington’s “clash of civilizations” thesis attests, and contemporary discussions of civil society in anthropology and political thought reveal. In Africana thought, the question was at the forefront of the thought of Alexander Crummell (1819–98), who founded the American Negro Academy in 1897. In Césaire’s thought, colonialism was a brutal system of exploitation that jeopardized civilization by creating a binary system of rationalized violence through a racist anthropology. Efforts to de-link class exploitation and racism fail to understand their symbiotic relationship in colonial society. In effect, European colonialism only considered its practices barbaric, he argued, when applied against (white) Europeans. Thus, from Césaire’s point of view, European outrage at the Holocaust against European Jews was not in fact an argument against genocide and brutal exploitation but about whom such activities should be committed against. Such practices were mundane features of life in the colonies and against blacks (and, although he does not mention them, Native American populations). This is because of the philosophical anthropology of dehumanization that governed everyday life under such a system:

> colonization … dehumanizes even the most civilized man; that colonial activity, colonial enterprise, colonial conquest, which is based on contempt for the native and justified by that contempt, inevitably tends to change him who undertakes it; that the colonizer, who in order to ease his conscience gets into the habit of seeing the other

14. For discussion, see, for example, Peter Burke, Civil Society and the Political Imagination in Africa: Critical Perspectives (Chicago, IL: University of Chicago Press, 2000) and What is Cultural History? (Cambridge: Polity, 2008).
15. See my An Introduction to Africana Philosophy, 51–3.
man as an animal, accustoms himself to treating him like an animal, and tends objectively to transform himself into an animal.16

Césaire advanced here a familiar argument in existential thought: that dehumanizing others dehumanizes one’s self. He concluded the text with a demonstration of intellectual rationalizations of colonial relations whose effect is, in today’s parlance, an evocation of a colonial epistêmé (or cultural paradigm of knowledge, authority, and power), and offered the following philosophical anthropological considerations: “One of the values invented by the bourgeoisie in former times and launched throughout the world was man – and we have seen what has become of that.”17 By posing “man” as an invention, Césaire problematized theories of a transcendental anthropology. Man, in this formulation, becomes one among other possibilities of existence. Although he concluded the text in a more Marxist-oriented appeal to the proletariat as transcending another invention (the nation), the argument itself situates his reflections within an existential Marxist framework. Just as Sartre reflected on his own existential Marxism in Search for a Method – his famous preface to his Critique of Dialectical Reason – so Césaire reflected on his when he observed that “the salvation of Europe is not a matter of a revolution in methods.”18

A curious feature of the Discours is the author’s style. Although avowedly an essay, the sentences have poetic significance that challenges the norms of rationalization. Césaire’s philosophy of existence was not only a matter of what he was arguing but also how he did it. Paget Henry has described this, in Caliban’s Reason, as Caribbean poeticism, but when considered in the framework of existential philosophy, additional genealogical links to Søren Kierkegaard and Friedrich Nietzsche, both of whom challenged the norms of philosophical writing, are evident. Whether in the Africana tradition, where a similar point could be ascribed to Du Bois, or the European or Asian ones, it is clear that writing as an activity in which existentialists offer a metacritique of the white’s cold and detached discourse of philosophical reason demands a commitment from existential writers against reductionist reflections on the human subject as an abstract, disembodied locus of pure identity.

Césaire’s writings thus brought the semiological significance of colonization to the fore. His approach of offering a poetic reordering of the valuative signifiers, where the negative constructions of black existence are reordered in positive terms, influenced Africana scholars to the present. Along with the

17. Ibid., 74.
18. Ibid., 78.
Senegalese Senghor and the Guyanese Damas, this reordering was offered in the development of “Négritude,” a term coined by Césaire, whose basic tenet was to affirm blackness and the articulation of a uniquely African personality. These concerns were explored by Senghor, who also became a politician, but his efforts, unlike Césaire’s, led to the independence of Senegal and his becoming its first president. In *Liberté I: Négritude et humanisme* (1964), Senghor offered a critique of modern European notions of freedom by exploring the differences between conceptions of a healthy human being in the West versus those in Africa. His main target was Arthur de Gobineau (1816–82), whose *Essai sur l’Inégalité des Races Humaines* (1854) is one of the founding texts of modern European racism. Gobineau, and many European writers, wrote under the presumption that being dominated by rationality was a source of health, which they contrasted with the African. Such European writers sought inspiration from (and a wished-for genealogical link with) the ancient Greeks, whom they saw as governed by reason. The result is the unfortunate dictum “Reason is Greek as emotion is Negro.” Senghor argued that a healthy human being is a mixture of reason and passion, and, in his brand of Négritude poetry, celebrated the African’s supposedly being at home in the world of affect.

Senghor’s work was well received in francophone regions of the African continent, where it was possible to assert black normativity in ethnic terms not readily available to Césaire, even with blacks being the majority population of Martinique. Although having experienced colonization, blacks in Africa were, and continue to be, more aware of their ethnic identity as an ongoing, lived narrative. The Caribbean black could often only speculate on the ethnic communities to which he or she is related in Africa. Césaire, however, brought race to the forefront with his assertion of a shared blackness that crossed the many ethnic divides in Africa. He did not know whether he was Asante, Yoruba, Igbo, Wimbum, or any of the many ethnic groups of Africa, but he offered those communities the presentation of a more esteemed version of the blackness he shared with the members of those groups. In the francophone Caribbean of Césaire’s younger years, where the only standards of human excellence that mattered were those of Europeans, such reflections were “scandalous” as the local population mocked the idea of a dark-skinned Martinican expressing pride instead of shame in his appearance. “What indeed could be more grotesque,”

---

Fanon recalled of those times, “than an educated man, a man with a diploma, having in consequence understood a good many things, among others that ‘it was unfortunate to be a negro,’ proclaiming that his skin was beautiful and that the ‘big black hole’ [Africa] was a source of truth.”

Césaire’s thought, as we have seen, demanded positive black identification with Africa and an aesthetic that subverted the notion of white Eurocentrism and white superiority over the African/black.

Césaire had an extraordinary impact on Caribbean writers who today include Lamming, Derek Walcott (1930– ), Edouard Glissant (1928– ), Sylvia Wynter (1928– ), Marise Condé (1934– ), and Simone Schwarz-Bart (1938– ). The most explicitly existential of these thinkers, however, is Lamming, whose work reveals the meeting of the genealogical lines of Wright and Césaire. His novel In the Castle of My Skin (1953) stands as a correlate to Fanon’s Black Skin, White Masks. Like Lamming, Fanon was also influenced by the convergence of Wright and Césaire. Lamming’s novel is an autobiographical exploration of problems of existence from the standpoint of a nine-year-old boy. Through the metaphor of rain, Lamming in effect explores Sartre’s famous observation of slime being “the agony of water” or the facticity of the past clinging to, and weighing down, revolutionary action and totalizing self-conscious choice to be “other.” If slime is the agony of water, and if history moves like an unyielding river or, as it is often characterized, tide, then what might be the agony wrought by its recent, epochal flow? What, in other words, is the agony of modernity?

The little boy suffers in Lamming’s novel. He, with many in the community that constitutes the world of his childhood, suffers the agony of modernity. It is agonizing because it promises that which it is not prepared to give without a costly price. He faces this world promised to him by the British Empire, and he walks through it with faith in humanity that stimulates anyone who still believes in promises. But that world, he discovers, is a slimy one – imposing the determinism of white rationalistic order as a condition for “freedom.” Wright reflected on that world as one that constantly generates illicit humanity. Recall that for him, Bigger Thomas was its agony, and even the structural imposition of racial inferiority and denial of agency never entailed an absence of responsibility; there was always the sense that such responsibility was elusive at every moment the inner-man confronted a world that locked him in perpetual boyhood. Wright, as we saw, raised the question of the modern alienation that militated against responsibility through the constant force of innocence. Perpetual guilt takes

22. Ibid.
*23. For further discussion of Glissant, see the essay by Rosi Braidotti in The History of Continental Philosophy: Volume 8.
away agency, thereby mitigating guilt. It collapses upon itself and transforms such guilt into “innocence,” but this makes the black condition one of double jeopardy: the salvation of becoming a man or a woman promises the possibility of damnation, but remaining frozen into the form of an innocent child is a denial of adulthood, responsibility, and freedom.

Lamming also saw this as the paradox of colonization: “Barbados or Little England was the oldest and purest of England’s children.” Lamming revealed an entire island that is a child whose native inhabitants were washed away by what the tide brought in from Europe. In that death was born, allegorically, the new: labor to maintain commerce, the economy, the identities, the peoples, the New World. And in spite of its age, the colony seemed never to grow up. Lamming thus brought to the fore a recurring existential problematic: whether, to paraphrase Kant, a black adult is possible.

I. THE THEORETICAL LINE

Although the literary black existentialists also wrote critical essays on colonialism, their ideas were often suggestive and have been subsequently studied more as a matter of literary interpretation than, in rare cases, philosophical reflection. The existential problematic of reason in an unreasonable world was made explicit, however, in the thought of the revolutionary psychiatrist Fanon, who was also most effective in bringing black existential thought to a variety of disciplines and movements. Fanon was born in 1925 on the island of Martinique. He and his siblings studied at the island’s lycée, where he was awestruck by his teacher, Césaire. He fought against the Germans in the Second World War as a member of the French resistance forces in North Africa and then in Europe, during which he was twice injured and decorated for valor. After a short return to Martinique, where he was active in the successful bid for Césaire’s becoming mayor of Fort-de-France, he went first to Paris to study dentistry and then to Lyon, where he completed his studies in psychiatry. He also studied philosophy in Lyon, where his teachers included Maurice Merleau-Ponty. It was during these years that he married Josèphe-Marie Dublé. His postdoctoral studies earned him the certification of chef de service, which qualified him as supervisor or chief medical officer of any psychiatric facility. His postgraduate training was with François Tosquelles (1912–94), a Spanish exile who grounded his approach to therapy in humanistic social terms. The main thesis of that approach, that there are also social causes of mental illness, became a mainstay of Fanon’s social

thought. After a brief post in Norway, Fanon became Chef de Service of Blida-Joinville Hospital (now Frantz Fanon Hospital) in Algeria. He had written to Senghor in the hope of acquiring such a post in the new Senegalese state, but he had received no reply, so he accepted his first opportunity to return to Africa. His impact on Algerian psychiatry was immediate. He criticized head-on the prevailing “primitivist” view of Africans and Arabs, and he developed a series of initiatives to transform the structure and physical environment of therapy for such patients. His methods proved effective, and he had begun training another generation of young doctors, who included Alice Cherki, the author of the recent Fanon: A Portrait. By 1954 the Algerian war of independence had begun, and Fanon joined the Front de Libération Nationale (FLN) that year. His professional work involved his treating both the torturers and the tortured while clandestinely training FLN forces in warfare and psychological techniques for surviving brutal interrogation. He resigned from his hospital post in 1956, moved to Tunisia, and continued work for the FLN as a representative to negotiate support from other African states. A man marked for death in France, he became somewhat of a Robin Hood figure, appearing in unexpected places (such as the Black Writers conferences in 1956 in Paris), while managing to elude assassination attempts, which included bombings and machine-gunning a hospital room, where his demand to be removed afforded him a narrow escape. By 1960, he was ill with leukemia. It was during this time that he wrote his last and most famous book, Les Damnés de la terre, for which he solicited Sartre to write the preface. The meeting in Rome with Sartre and Beauvoir is the stuff of legend. Fanon insisted on their having an unceasing exchange of ideas over the course of two days and was irritated by Beauvoir’s insistence on Sartre’s need for rest. After receiving an unsuccessful prognosis in the Soviet Union, Fanon went to Bethesda, Maryland, to secure treatment. He was detained for several days by the Central Intelligence Agency (CIA), during which time he developed pneumonia. He died on December 6, 1961, and was buried in Algeria. His widow, Josie Fanon, continued work as a journalist and intellectual in Algeria until her death in 1989.

Four of Fanon’s books, excluding his dissertation, are in print. Each of them is a classic in Africana existential and political thought. In addition to Les Damnés de la terre (1961), the others published in his life time were Peau noire, masques blancs (Black Skin, White Masks) (1952) and L’An V de la révolution algérienne (1959), subsequently available as Sociologie d’une révolution: L’an V de la révolution algérienne. His widow, Josie Fanon, edited Pour la révolution africaine: Écrits politiques (1964).

Les Damnés de la terre is inspired by the Haitian poet Jacques Roumain’s adaptation, in his book of verse Bois-d’Ebene (1945), of the first line of L’Internationale (1871) by Eugène Edine Pottier. Inspired by black struggles in the Caribbean and
Africa, and prefaced by Sartre, the most famous living intellectual at the time, this work eclipsed Fanon’s other writings for nearly twenty years. It took nearly three decades for his earlier thought to acquire appreciation in the English-speaking world, and this was achieved primarily owing to the popularity of postcolonial studies and Homi Bhabha's Lacanian poststructural reading of *Peau noire, masques blancs*, in his famous foreword to the Pluto edition of the text published in London in the 1980s. I shall from this point onward refer to the English title of the text, *Black Skin, White Masks*.

*Black Skin, White Masks* was published in 1952, when Fanon was twenty-seven years old. He had proposed a draft of it three years earlier as his doctoral thesis in psychiatry, which the members of his committee refused to consider. They preferred the “positivist” approach to the study of psychiatry, which called for rooting psychological phenomena in physics and biology. So Fanon wrote on another topic and submitted his dissertation at Lyon in 1951 under the title: “Troubles mentaux et syndromes psychiatriques dans Hérédo-Dégénération-Spino-Cérébelleuse: Un cas de Maladie de Friedreich avec délire de possession” (Mental illness and psychiatric syndromes in hereditary-degeneration-spinal-cerebellum: a case of Friedreich illness with possession delirium). He did not, however, regret rewriting and publishing *Black Skin, White Masks* after achieving his doctorate. As he reflected in the introduction:

[I would have written this book three years ago … But its truths burned in me. Today, they have cooled. These truths don’t need to be shoved in the face of everyone. They don’t need enthusiasm. I don’t like enthusiasm.]

In the Isaac Julien film *Black Skins, White Masks* (1996), Fanon’s brother Joby Fanon recounted being told by his brother’s colleagues that Frantz Fanon was “fireworks on the outside, fireworks on the inside.” Although Fanon claims not to like enthusiasm, he did not appeal to an extinguished flame. The fire cooled in him, but this suggests, as he later makes clear in *Les Damnés de la terre*, a continued flame that threatens eruption. The purpose of his book, Fanon

27. Fanon, *Peau noire, masques blancs*, 6, my translation.
announces on the first page, is to respond to the presence of “trop d’imbéciles sur cette terre” (too many imbeciles in the world).

Similarly to many existential writers before him, and in whose genealogy from Nietzsche to Sartre he welcomed affiliation, Fanon challenges the discursive limits of philosophical and other forms of analysis. He writes first as a thinker struggling with a problem instead of from a discipline such as psychology, history, or philosophy, although each joins the chorus of critical reflection. Although Nietzsche, Jaspers, Sartre, and Césaire receive special attention in the text, Kierkegaardian indirection, through the Afro-Caribbean affinities with the mythopoetics of the trickster in slavery and precolonial lore, is evident in Fanon’s constant use of irony. Added are the metareflective and autobiographical aspects of the text, where Fanon is offered as a subject who suffers disintegration while a metanarrator (the critic) toys with him in a systemic and extra-systemic battle. Should the text’s protagonist succeed in his goal, which is no less than complete cohesion with the modern world, the critic, who is an advocate of revolutionary humanistic change, would face failure; but should the situation be otherwise, the demand is for an alternative social system. Crucial in this challenge is the search for agency, for the imposed realities as contingent features of social life. The protagonist, in other words, should be able to succeed precisely because he or she could also fail. He makes this clear at the outset by announcing that not everyone will be at home in the text. It is primarily for the afflicted.

Fanon offers a trenchant critique of the denial of antiblack racism in France and much of the modern world. Although other writers, such as Du Bois, Wright, Sartre, Beauvoir, and Césaire have criticized such denial, there are several unique features of Fanon’s analysis that have made his work endure beyond the twentieth century. First, he observes that the denial is also symptomatic of many black people. Second, he rejects the structuralist thesis, as we have just seen, by admitting the existential one of contingency and exceptions. In other words, Fanon does not make everyone into racists, and he does not make all black people into victims. Third, he explores the problem at its subterranean levels and in so doing brings out its significance for human study. Fourth, he addresses disciplinary questions and problems of domination at the epistemological level, at the level of knowledge, thereby deepening his social critique. Fifth, he offers novel discussions of the dynamics of freedom and recognition at the heart of human encounters. And sixth, he advances a set of rhetorical devices that perform the many ways of addressing the problem.

Fanon achieves all this by first pointing out that racism and colonialism should be understood as socially generated ways of seeing and living in the world. He calls this sociogenesis. This means, for example, that blacks are constructed as blacks by the societies in which they live. There was, in other words, no reason for people in Africa or Australia or other areas of the South Pacific to have
thought of themselves in racial terms. But society, Fanon argues, is not an independent reality. It requires human beings for its existence, although it is transformed in the complex web of intersubjective relations into that which produces the meanings by which human beings live and appear. To understand how such constructions occur, the logical route is to examine language. Language contains the construction of meaning and the promise of recognition; to master language is to put on the identity of a culture. This promise fails in the white-dominated modern world, however, when practiced by blacks, who are analytically structured in that world as the antithesis of language itself. Even when the language of the dominant white world is “mastered” by such blacks, what appears in such society is their illegitimacy; they are in a constant struggle with that language. Many blacks buy into their own illegitimacy and so repudiate their blackness by trying to pass as nonblack and at times, even worse, avowing themselves as opponents of black people. This black antiblack racism exemplifies a form of narcissism in which blacks seek the deception of mirrors that offer white reflection. They literally attempt to look without seeing, or to see only what they wish to see. This narcissism works at many levels. Many whites, who do not regard themselves as racist nonetheless discriminate against blacks in practice.

The question of language also raises more radical questions about its role in making human subjects. Fanon argued that colonization requires more than the material subordination of a people. It also yokes the means by which they are able to express and understand themselves. He locates this expressive and interpretative constraint in language and scientific methodology. This is epistemological colonialism. Early in the text, Fanon announced that he would like to transform the black into an actional being. This is important because of the impediments to freedom in colonial and racist environments. The problem is made acute in the sixth chapter on psychopathology, where Fanon shows that the modern world has no coherent notion of a normal black person or a black adult. Pathological behavior is often presented as “authentically” black. However, should a black not conduct himself or herself as a black person, that black would be considered “inauthentic,” which also amounts to a reassertion of pathology. The effect of this double bind is familiar in the days when grown black men and women were being referred to as “boy” or “girl,” or, in the French language, as tu instead of the impersonal and respectful vous. Fanon challenges the efficacy of therapy without a model of normality. If black psychology amounts to abnormal psychology – that is, if black existence amounts to abnormal existence or, more accurately, nonexistence – the black would cease to be actional because of having nowhere to go. There would be a nihilistic relationship with the social world.

Fanon here addresses the observation from Du Bois in The Souls of Black Folk that most black people, including those in Africa, are obsessed with “fixing” themselves. This obsession, Fanon’s argument suggests, is a function of social
impotence even at the level of meaning. Since to be black is analytically equated with failure, could a black ever fix himself or herself enough to be successful as a black person? The effort yields a contradiction: that black would have to no longer be black. In much of Latin America and the Caribbean, the region of the world from which Fanon came, success by definition meant that an individual must not be black. This notion leads to an interrogation of standards. By what standard could an individual be successful and black? Take, for example, the contemporary association of blacks with athletic ability. There are many famous black athletes. Fanon argues that an athlete proper is a meeting of body and rationality (as, e.g., in the Greek Olympics). But the black athlete is understood as an instinctual creature, and this is reflected in the prevalence of whites occupying leadership roles in athletic venues where black athletes play a significant and even dominant role. The black athlete in this sense is not much above animals who are used for sport such as horses and dogs. Their skills, being supposedly instinctual and linked to their breeding, are entirely in their bodies. The standards, however, are made by the human beings who race them or pit them against each other, who use them for sport. Similar reasoning applies to blacks in music and dance. They live by standards of which they could never be a legitimating source.

Failing to have an impact on the social world, many, if not most, blacks turn inward. They hide from freedom even while seeking it. As Hannah Arendt notes, freedom requires a public, political appearance (the opposite of the confinement and concealment characteristic of prisons and private households), but one can only appear in a world of others. To turn away from the world sets one on a slippery slope that would eventually lead paradoxically to a loss of the self through too much investment in the self, of becoming the solipsistic world of one’s own, for even self-recognition requires posing the point of view of another. This is a difficult truth, which Fanon makes clear by admitting, at the end of his fifth chapter, “L’Expérience vécue du Noir” (The lived-experience of the black; published in English as “The Fact of Blackness”), that he could not face it before having wept. He tells us, through his own offering of tears, that we must wash away our impediments to a courageous engagement with the difficulties of social reality.

Freedom requires a world of others. But what happens when others do not offer recognition? One of Fanon’s provocative challenges to the modern world emerges here. In most discussions of racism and colonialism, there is a critique of alterity, of becoming the Other. Fanon, however, argues that racism pushes a group of people outside the Self-and-Other dialectic, a relationship that is, in European continental philosophy from Rousseau, Kant, Hegel, and Schopenhauer through to Heidegger and Levinas, the basis of ethical life. The consequence is that nearly everything is permitted against such people, and as
the violent history of colonialism, enslavement, and racism reveals, such license is often acted on with sadistic zeal. The struggle against colonialism and anti-black racism, given Fanon’s argument, then, is not one against being the Other. It is a struggle to enter the Self–Other dialectic of ethical life. That struggle, being a pre-ethical situation, is a political struggle wrought with contingency, which is, in effect, Fanon’s rewriting of Sartre’s famous credo of existence preceding essence, except that the ethical hope could never properly be an essence but a commitment.

Fanon shows, as well, that such a struggle happens not only at the level of social interactions, but also in relation to knowledge and reason. In his words:

La raison s’assurait la victoire sur tous les plans. Je réintégrai les assemblées. Mais je dus déchanter. La victoire jouait au chat et à la souris; elle me narguait. Comme disait l’autre, quand je suis là je n’y suis plus.

[Reason was assured victory on every level. I was ushered back into the human world. But I became disenchanted. That victory played cat and mouse with me and scoffed at me. As the saying goes, when I’m present it is not and when it is present I am no longer.]

To paraphrase, when he walked into the room, reason walked out. Reason, in other words, was being unreasonable; Fanon, here exemplifying the black philosopher’s plight, to which I alluded at the beginning of this chapter, struggles against the unreasonability of reason. We find here the neurotic situation and the melancholy of black people identified by black existential thought in the modern world. To reclaim reason, to seize it, would be to exhibit unreason, even in the face of reason being unreasonable. Fanon, here as the black, must reason with reason. This challenge, to be in effect more reasonable than whites (and Asians) are expected to be, situates the black as having lost before he or she has begun the plea for existence. It signals the melancholia of black existence. In effect, blacks are expected not to have been black in order to legitimate being black. It is an impossible task. Should the black wish for a premodern, or a preblackened state of being, it would require such a contradiction: a black that was not black. Blacks, in other words, face the problem of their relationship to reason and to the modern self. Such a self suffers from melancholia, a loss without which they cannot be what or who they are.

This seemingly dire situation is not, however, a call for pessimism. Fanon reminds us that part of our struggle involves understanding the critical dimensions of questioning, which he exemplifies by closing with a prayer to his own

28. Fanon, Peau noire, masques blancs, 96, my translation.
body to make of him a man who questions. By this, Fanon reminds us that the human being exceeds the bounds of declarations and is also an interrogative. As such, the human being, as a human being, is not a closed subject. This is Fanon’s additional reformulation of the existential credo of human incompleteness.

In *Pour la révolution africaine*, especially the essay on racism and culture, Fanon attacks the blues in favor of written poetry. Yet his reflections in *Black Skin, White Masks* have an unmistakable blues structure. He goes through processes of repetition that lead, as we have seen, to tears through which he is able to face the pathologies of “reality,” and the truth here is that Eurocentric society cannot seem to see black adults and does not seem to know what it means for black people to be “normal.” Blacks seek to become men and women, but they find themselves locked at a level below that status in the white world. In *Les Damnés de la terre*, his search for healthy, active black agents takes the form of his counsel for each generation of blacks to find its mission, which means taking responsibility for humanity’s future.

The theme of reason in an unreasonable world returns, then, in the onus of articulating one’s normality in a world that has defined one as essentially abnormal. Fanon extended this analysis to the seeming allergic response of “reasonable whites” in relation to black people. To paraphrase his reflection in the fifth chapter of *Black Skin, White Masks*, reason takes flight when a black enters a room. Fanon showed, however, that to take flight into unreason would be unreasonable, and that the irony of black existence in the modern world is that blacks are compelled to become the champions of reason for reason’s sake. In other words, reason cannot be forced to stay in the room. It must be persuaded, which affirms, in effect, its necessity. Carried further, the argument reveals a profound melancholic dimension of black existence. For this development of reason is concomitant with the development of the black as a category of reflection. In fact, both are indigenous to that world. That the black must use reason, that which has been used against blacks, in the service of black liberation, and that the black must be critical of the modern world, the world that created the identity with which, and often against which, blacks struggle, reveals a subjectivity – black subjectivity – that emerged from a series of losses from ancestral kidnapping, to the Middle Passage, to marooned existence, to post-slavery racism. Considered from the psychoanalytical perspective of growth through loss, the blues sensibility returns here as a form of generative loss: the loss suffered by blacks in the modern world constituted black subjectivity. Fanon’s response is to think through this loss while searching for an affirmation (a “yes”) to the form of life to live on the one hand and to the establishment of an interrogative (the question) through which that life could claim its humanity.

In *Les Damnés de la terre*, Fanon then returns to the colonial and decolonizing moments to illustrate a chilling point. The colonial condition forces the
colonized to question their humanity. This interrogation occasions alienation of the spirit in the face of loss of land and denigration of mature cultural identity. The decolonization process unleashes an array of violent forces that bring to the surface the many double standards of the colonial system and contingency in a world that once seemed to be absolute and necessary. At the heart of this “hell” is the classic direction of consumed hatred. As Virgil showed Dante’s protagonist two foes, one of whom is so consumed by hatred that he gnaws on the head of his enemy while frozen from the neck down near the cold center of Hell, Fanon presents the horrific implications of being consumed by hatred. There are some attachments, values, of which we must let go, and in so doing, we will find our way outside, where we could emerge, in the words of Dante, “to see – once more – the stars.” This is what Fanon ultimately means when, echoing L’Internationale, he implores us all to “développer une pensée neuve, tenter de mettre sur pied un homme neuf” (to develop new thought, and set afoot a new man).

Fanon offers an ironic twist on L’Internationale here. The connection to L’Internationale, mediated by black struggles in the Caribbean and Africa, challenges a presumption of communist politics, which Césaire affirmed at the end of his Discourse on Colonialism, namely, that the revolutionary class must be the proletariat. By using the line from L’Internationale to discuss people in the Global South, Fanon both advances and challenges Marxist philosophical anthropology.

Many of the themes in Fanon’s thought can be found in the writings of Albert Memmi (1921–). Born in Tunisia of an Italian Jewish father and a Berber (possibly of Jewish descent) mother, his early biography is more like Césaire’s than Fanon’s. He received a French education and studied philosophy in Algeria before completing his studies at the Sorbonne. But where autobiographical reflection for Césaire meant thinking through being black and from a colony of black people, Memmi’s was about being a Jew from a more heavily multi-racial colony and being so with the tensions offered by the additional historic reality of Islam in North Africa. Whereas Césaire looked to Africa after having been immersed in European civilization, Memmi looked eastward to the Middle East from Africa following his European emersion and tried to reconcile all of his disparate cultural perspectives. And like Césaire, and many other existential writers, he drew on aesthetic resources, but in his case it was the novel, not poetry, and the essay that were his preferred conduits. His novel La Statue

217
Volume 5
de sel (A statue of salt; published in English as The Pillar of Salt, echoing the biblical story of Lot’s wife) was published in 1953 with a preface by Camus. He is, however, best known for his theoretical essay on colonialism, Portrait du colonisé, précédé du portrait du colonisateur (Portrait of the colonized, preceded by a portrait of the colonizer; published in English as The Colonizer and the Colonized), which was published with a preface by Sartre in 1957. In that work, he makes a distinction between colonized, colonialist, and colonizer. The second, he argues, lives in the colony above the colonized people but below the colonizers. Memmi saw this as his situation as a Tunisian Jew. (He did not comment on the specific differences in situation separating darker African Jews and lighter Sephardic and Ashkenazi [European] Jews living in North Africa.) He argued, however, that the system was Manichaean, which meant that there was no real room for that second category. The dilemma facing him was whether to distance himself from the colonized by pushing himself closer to colonizers or to identify with the colonized, which increased his distance from the former. His conclusion was that such middle groups were in bad faith because they had the option of identifying with them as colonizers. Yet in spite of their bad faith, the social reality was less amenable to ambiguity. The system demanded the polarization of society into colonizers and colonized. Although this argument may appear to affirm Hegel’s master–slave dialectic, Memmi argues that the interdependence of the two poles, colonizer and colonized, conceals more than it reveals. Colonialism, he contended, produces a unique psychology of inferiority, and like Fanon, he argued that the eradication of colonialism was a necessary condition for the transformation of the colonized into active men and women. Given that perspective, Memmi subsequently perceived an increase in agency during times when the colonized assumed leadership roles in decolonization movements and a corresponding decrease in agency following the overthrow of colonialism, in which war, genocide, extreme poverty, infrastructural deterioration, racism, and increased economic dependence continue on under postcolonialism.

II. INFLUENCE

Black existential thought from the 1940s through 1960s had considerable influence on black liberation politics well into the 1970s and several intellectual movements into the present. Black existentialists were a central part of debates in decolonial struggles that linked intellectual debates from Asia through Africa to North America, South America, and Europe. These intellectuals included Angela Y. Davis in the United States, whose “Unfinished Lecture on Liberation – I,” pitted Sartre’s conception of freedom against Douglass’s, and Steve Bantu Biko in South Africa, whose theory of black consciousness drew on Fanon’s thought.
Another South African, Noel Manganyi, also drew on Fanon and Sartre to develop an existential phenomenology of oppression. Black existentialism also influenced black liberation theological and religious thought (e.g. James Cone and William R. Jones), black cultural studies (e.g. Stuart Hall, bell hooks/Gloria Watkins, Manthia Diawara, Achille Mbembe), prophetic pragmatism (Cornel West), black poststructuralism (e.g. Sylvia Wynter and George Yancy), black queer studies (e.g. Jean-Paul Rocchi, Sara Ahmed, David Fryer), and Africana and black existential phenomenology (e.g. P. Mabogo More, Henry, Linda Martín Alcoff, Danielle Davis, and this author), and, of course, the authors in the anthology *Existence in Black: An Anthology of Black Existential Philosophy*.

The exemplars in the parentheses are, in many ways, artificially located as such since, in true existential fashion, they also belong with the others and resist neat classification. In each of these developments, however, black existential concerns of philosophical anthropological, liberation, and metacritical questions continue to be explored as these writers pose to human study the centrality of contingency and meaning of human possibility.

---

31. Each of these developments is discussed in my *Existentia Africana*, and in the fourth and fifth chapters of my *An Introduction to Africana Philosophy*. See also Danielle Davis, “A Conversation with Lewis Gordon on Race in Australia,” *The C. L. R. James Journal* 14(1) (Spring 2008).
Along with psychology, sociology, and anthropology, linguistics figures among the human and social sciences established in the nineteenth and twentieth centuries that have differentiated themselves as disciplines and have achieved widespread intellectual and institutional recognition, particularly since the First World War. Like the comparative grammar that launched modern linguistics in the early nineteenth century, the structuralist paradigm that marked the first half of the twentieth century concentrated on sound in language, and secondarily on morphology. But Ferdinand de Saussure and like-minded linguists such as Émile Benveniste, Louis Hjelmslev, Roman Jakobson, and Nikolai Trubetzkoy concentrated on the relations among sounds, the superstructure to sound, and the superstructures to the superstructure, translating into terms of the entire historical and present day structure of any language.

1. Ferdinand de Saussure (November 26, 1857–February 22, 1913; born in Geneva, Switzerland; died in Château Vufflens near Geneva) was educated at the Universities of Geneva (1875–76), Leipzig (1876–78), and Berlin (1878–79), and received a doctorate from Leipzig (1880). His influences included the Neogrammarians Bréal and Whitney (see below), and he held appointments at the École des Hautes Études, Paris (1881–91), and the University of Geneva (1891–1913).

Trained by Bopp, Michel Bréal (1832–1915) held the Chair of Comparative Grammar at the Collège de France (1866–1905) and also gave courses at the École des Hautes Études as of its founding in 1868. He published on historical linguistics, comparative mythology, semantics, ancient Greek and Latin, educational policy, and orthography reform.

After studying in Berlin and Tübingen, William Dwight Whitney (1827–94) taught Sanskrit and comparative grammar at Yale. He published widely in both fields as well as in general linguistics, and wrote or edited a number of dictionaries, including the Century Dictionary.

2. Born in Moscow, Prince Nikolai Trubetzkoy (1890–1938) held academic appointments successively at Moscow University (1915–16), Rostov-on-Don University (1918), Sofia University (1920–22), and Vienna University (1922–38). One of the preeminent intellectuals in the Prague Linguistic Circle and the father of structural phonology, the linguist and philologist also published on folklore, mythology, and politics.
Trubetzkoy redefined their discipline in the spirit of their era’s scientific epistemology, elaborating an explicit theory and methodology, emphasizing a holistic approach, and establishing a synchronic perspective on a par with historical perspectives. While steeped in the cultures and texts of the idioms they studied, most structuralists called for modern linguistics to distinguish itself from the wider philological arts by concentrating on the rigorous analysis of internal linguistic mechanisms. Among the scores of groundbreaking works, Saussure’s 1916 *Cours de linguistique générale (Course in General Linguistics)* has made the biggest impact and generated the most debate, particularly outside linguistics. In modern continental thought, Saussure and structural linguists share certain affinities with Freud, Marx, and Nietzsche, the “masters of suspicion” who decenter rationalist and even existentialist models of man focused on the individual’s conscious introspection. Where Freud, Marx, and Nietzsche drew attention to class interest, unconscious mechanisms, and the will to power, these linguists showed how language itself conditions thought and behavior in largely invisible ways, thereby undermining rationalist and Enlightenment thinkers’ confident conjectures about the subject’s ability to progress toward greater understanding and self-knowledge.

Influenced by the methods and principles of structural phonology and general linguistics, postwar intellectuals such as Louis Althusser, Roland Barthes, Michel Foucault, Julia Kristeva, Jacques Lacan, and Claude Lévi-Strauss fostered projects for qualitative “human sciences” based on observation, exacting anal-

Roman Osipovič Jakobson (1896–1982) was one of the most important linguists and intellectuals of the twentieth century. He successively cofounded or helped to found the Linguistic Circles of Moscow (1915), Prague (1926), and New York (1943). A published poet, he also participated actively in Russian and Czech avant-garde artistic movements, cofounding the St. Petersburg formalist poetics society OPOJAZ. Of Jewish origins, he taught at Masaryck University in Brno (1933–39) until Hitler’s expansion forced him to relocate first to Scandinavia, then New York, where he held appointments at the École Libre des Hautes Études (1942–46) and Columbia (1943–49). He joined the faculty of Harvard (1949–67), and, concurrently, the Massachusetts Institute of Technology (1957–67). A Slavist grounded in philology, Jakobson published on Slavic phonetics, phonology, and morphology and on Russian folklore, literature, and film; he wrote seminal papers on general linguistics, phonology, poetics, language acquisition, and linguistic pathology, and helped launch the new fields of language typology, computational linguistics, cognitive studies, and communication studies.

Louis Trolle Hjelmslev (1899–1965) was the leading figure in glossematics, the Danish School’s structural linguistics. He taught at Århus University (1934–37) and the University of Copenhagen (1937–65) and published on case theory and general linguistics.

Émile Benveniste (1902–76) studied comparative grammar under Meillet, then taught at the École des Hautes Études (1927–37) and the Collège de France (1937–70). He published on comparative Indo-European lexicology and grammar and wrote groundbreaking articles in general linguistics and pragmatics.
ysis, and interpretation.\textsuperscript{3} Taken together, the initiatives sketched a multiform structuralist approach that for a time asserted itself as an alternative to the dominant North American paradigm for the social and behavioral sciences founded on controlled experiments and quantitative data. Maurice Merleau-Ponty, then Paul Ricoeur, engaged modern linguistics and sought to define its relation to phenomenology and to reflexive philosophy, while Gilles Deleuze and Jean-François Lyotard worked through linguistic structuralism in developing theories of action and symbolic thought outside mainstream logic and metaphysics. After 1968, Saussure increasingly joined the ranks of the \textit{maîtres à penser} to be critiqued and deconstructed by poststructuralists such as Jacques Derrida and Foucault, who were skeptical of science and critical of the links between knowledge and power.

I. FERDINAND DE SAUSSURE

Ferdinand de Saussure was born in Geneva into an affluent protestant franco-phone family celebrated for its generations of scholastic achievements. He learned German, Latin, and classical Greek in school, then taught himself Sanskrit. In 1876, he joined the Société de Linguistique de Paris, twelve years after its foundation, and enrolled at the University of Leipzig. There he studied comparative grammar, the most advanced linguistics of the day, with the cutting-edge group of young scholars dubbed the \textit{Junggrammatiker} or “Neo-grammarians.”

Whereas rationalism and pre-nineteenth-century linguistic inquiry present language as a stable intellectual instrument, the comparative and historical linguistics launched by Franz Bopp revealed the dynamic character of idioms and highlighted their material substratum in sound. Introducing the phonological concept of regularity, the Neogrammarians Mathilda Brugmann, August Leskien, Herman Osthoff, and their colleagues in Leipzig showed that sound changes occur in absolutely regular fashion throughout a language, while analogical formations account for apparent exceptions. The Neogrammarians developed a new model of linguistic history: whereas the Romantic founders Bopp and August Schleicher had described the formation of a perfect \textit{Ursprache} that “decayed” and fragmented in Time, the Leipzig scholars contended that like all languages, the Proto-Indo-European they were reconstructing comprised a host of dialects that developed at what was simply one chronological moment

\textsuperscript{3} Essays on Lévi-Strauss and Lacan can be found in this volume. Essays that address Althusser, Barthes, Foucault, and Kristeva, as well as several of the other thinkers mentioned in this paragraph can be found in \textit{The History of Continental Philosophy: Volume 6}.
among others. The new generation of linguists asserted strongly antiuniversalist views: whereas the early comparatists considered the historical development of Sanskrit, Greek, and Latin as an evolutionary model valid for all idioms, the Neogrammarians showed that individual languages change in unpredictable and at times idiosyncratic ways. Rejecting the characterization of idioms as natural organisms, they emphasized instead their social character. Adopting a materialist stance, they further argued that the grammatical categories traditionally used to describe classical and archaic tongues represent abstract fictions to be replaced by the more complex and nuanced patterns identified in language-specific analyses of actual forms. Their research produced massive quantities of such data, illustrating the positivist temper of the times. Saussure himself studied with the old master Georg Curtius (1820–85) and with the best young linguist of the day, August Leskien (1840–1916).

After two years in Leipzig, Saussure went to the University of Berlin to complete his training in historical linguistics. Precociously, during his university years he published four articles in comparative grammar in the journal *Mémoires* edited by the Société de Linguistique de Paris. Then in 1878, at the age of twenty-one, Saussure brought out an ambitious, closely argued monograph in the Neogrammatical vein, *Mémoire sur le système primitif des voyelles dans les langues indo-européennes* (Thesis on the original system of vowels in Indo-European languages). The only book he wrote in his lifetime, the *Mémoire* argues that a proper understanding of the “resonants” *l, r, w, y, m, and n*, which function either as consonants or vowels depending on adjacent sounds, illuminates the nature of the syllable, clarifies how words are divided into syllables, and leads to a radically new model of Proto-Indo-European’s entire vowel system. As required by the genre, the study nimbly integrates reams of data on the conjugations, declensions, and morphological categories of a number of archaic languages. Venturing into “the least explored regions” of the field, the essay boldly postulates the existence of two unattested vowels defined by their oppositional and combinatory properties rather than by their actual pronunciation, a move that enabled Saussure to consolidate into one elegant model the early vocalic system that had been viewed as comprising two separate patterns fraught with widespread irregularities.

The groundbreaking proposals in the *Mémoire* inaugurated a new subfield within Indo-European, which soon asserted three unattested laryngeal

---

consonants in the place of Saussure’s two vowels, further consolidating the ancient vocalic scheme. The essay quickly established an international reputation for Saussure as a brilliant scholar. Fifty years later, one of the hypothetical sounds predicted by the Mémoire was identified when Sergei Karcewski deciphered Hittite – thus recalling the discovery of Neptune at the place in the heavens where Newton’s laws had anticipated it. Today, the essay is considered a rigorous and prescient analysis whose novel conclusions required scholars two generations to fully comprehend and integrate. Unfortunately for the young Genevan, the scholar who formulated the most forceful and sustained response was Osthoff, the Neogrammarian most focused on generating empirical data, who condemned the revolutionary study as “failed” and “aborted,” as “a radical aberration.” Stung by the attacks, Saussure wrote and defended a short, uncontroversial doctoral thesis and left Germany for France.

In Paris, Michel Bréal assisted Saussure, having the Swiss linguist join him at the École des Hautes Études as a lecturer and work under him at the Société de Linguistique de Paris as its assistant secretary and the editor-in-chief of its journal Mémoires. Instead of collaborating with the Neogrammarian group in the capital, Saussure moved, taught, and published in Bréal’s circle around the École and the Société, which remained open to other currents in the language sciences. Although his translation of Bopp’s magnum opus had introduced comparative grammar to France, Bréal argued strenuously against the approach’s preoccupation with sound changes, its assimilation of linguistics to then-supreme natural sciences, and its concomitant representation of an idiom as an object external to the individual. Instead, his research emphasized that each child learns language anew and that conscious individuals use words and grammar to express ideas, and also introduce changes in an idiom. As of the 1860s, Bréal lectured and published on the relations between mind and language and on linguistic meaning, coining the word semantics (sémantique) in 1883.

At the École des Hautes Études, Saussure taught the comparative grammar of Gothic and Old High German, Greek and Latin, and Lithuanian; his pupils included Antoine Meillet (1866–1936), the next generation’s greatest comparatist. The once prolific student practically ceased publishing, however. Recent research shows that Saussure undertook a book project on phonetics, drafts of which continue the Mémoire’s exploration of the resonants, respond to Osthoff, and broach questions in theoretical phonetics, positing central

principles that later appear in *Course in General Linguistics.* The phonetics essay emphasizes the necessity to define a sound in a language as the convergence of at least three distinct perspectives: (i) “semiological” or “negative,” purely differential; (ii) “acoustic” or in relation to the listener; and (iii) “physiological” or articulatory, with reference to the speaker. The drafts underline the necessity for linguistics to recognize and define with precision such perspectives: “Most of phonetics' objects are beings of reason, existing only by their definition. [He] who studies them … must surround himself with an extremely rigorous system of definitions.” For Saussure, Osthoff’s arguments beg the central questions at stake, and collapse under their own weight if concepts such as resonant and syllable are properly formulated.

In November 1891 Saussure returned definitively to his native city, accepting a Chair in the History and Comparison of Indo-European Languages at the University of Geneva. During his twenty-two years at the school, in addition to an annual course on Sanskrit, he taught a wide variety of subjects in comparative grammar, dialectology, linguistics, ancient inscriptions, and versification. Correspondence with and comments by colleagues indicate that he continued to follow developments in the field closely and reflected deeply on a wide range of linguistic issues. The return to Switzerland only modestly enhanced the linguist’s research productivity, however. He published a few articles on intonation and accentuation in modern Lithuanian, a “conservative” Indo-European language on which he had done fieldwork and geographical dialectology. Scholarship over the past four decades has revealed that during his Geneva years, Saussure pursued an active research program that progressively moved away from comparative grammar and struck out in three new areas: general linguistics, Germanic legends, and “anagrams.”

Saussure researched and gave talks on general linguistics from 1891 to 1894. His first three public lectures at the University of Geneva argue that the young approach called linguistics deserves to be an autonomous science in its own right, distinct from philology and poised between the particular and the general. On the one hand, in the face of the universal perspectives on language advanced by psychologists, logicians, philosophers, and physiologists, linguists must supply the radically sociohistorical perspective that only a positive study of diverse languages, their dialectal variations, and their transformations throughout history can bring. On the other hand, responding to what he considered his generation’s myopic accumulation of minutiae, the lectures

argue that linguists must “constantly endeavor to illustrate the general problem of language … the universal laws and procedures of language.”10 Weeks after his first lectures in Geneva, Saussure began to write a book on general linguistics entitled De l’essence double du langage (On the double essence of language), of which a draft was discovered in 1996. Presaging the Course in General Linguistics in many ways, this text and related writings from the period argue that the linguist’s activity and point of view are constitutive in the study of languages, and that one must distinguish notably between the historical, “diachronic” perspective and the speaking subject’s “instantaneous,” “synchronic” perspective.11 The drafts outline a “semiological” theory of linguistic value based on the differential “signifiers” and “signifieds” that constitute the sign negatively.12 In 1894, for an article on W. D. Whitney, whom, along with the Polish linguists Baudouin de Courtenay and Karcewski, Saussure considered a brilliant pioneer in theoretical linguistics, he reread the American Sanskritist’s works. Apparently Whitney’s novel insights on language as a social institution persuaded Saussure that the existing principles and terminology of the field needed more radical reform than he was capable of crafting, and he lost heart, abandoned his book project, and lost track of the manuscripts. He only returned to the topic when called on to teach it more than a dozen years later. Those lectures generated keen interest on campus among students and colleagues in linguistics, but Saussure discarded each day the scraps of paper on which he scribbled his lecture notes.

From 1903 to 1911, Saussure worked on a book devoted to Germanic legends, producing over 800 pages of material, including polished drafts of sections virtually ready for publication. “The First Kingdom of Burgundy and the German Epic Legend: Contribution to the History of the Nibelungen Epic”13 was to argue that the popular traditional stories then considered the exclusive patrimony of the German Volk were inspired to a significant extent by what the Burgundians did, not when they occupied the Rhineland-Palatinate in the fifth century, but rather when they formed a Franco-Swiss kingdom centered in Lyon a century later – the period in which they bequeathed sundry place names to Savoy, adjacent to Geneva. Consonant with this revisionist history and geography, Saussure sought to demonstrate that the legends incorporate not just Germanic but also

---

11. Ibid., 6–9, 17–18, 30, 55.
Romance sources, including the Greco-Roman story of Theseus. The research nourished the linguist’s general reflections on signs:

A legend is composed of a series of symbols … subject to the same vicissitudes and the same laws as all the other series of symbols, for example the symbols which are the words of a language. They are all part of semiology … The identity of a symbol can never be fixed as of the moment at which it is a symbol, that is to say immersed in the social body which establishes its value at each moment … Each of the characters is a symbol … which can vary according to a) name, b) position vis-à-vis the others, c) temperament, d) function, acts.14

Among the sign mechanisms that affect the oral transmission of the legends across the miles and the generations, characters are added or dropped, substituted for one another, split in two, or melded into one – as are words and individual sounds throughout the evolution of a language.

Within the same period, from 1905 until 1909, Saussure also intensively investigated Latin, Homeric, Germanic, and Vedic poetry. Analyzing first funereal and ritual inscriptions, then a wide variety of genres, the linguist became convinced that beyond traditionally observed prosodic devices such as meter and isosyllabism, alliteration and acrostic, early poets respected a “strict arithmetic” of phonetics, systematically using every sound an even number of times, for example, and that they regularly wove into their verse anagrams of the names of personae invoked or implied in the text.15 His analyses filled ninety-nine notebooks, including sustained and publishable expositions.

Saussure fell ill in 1912 and died the following year. Colleagues intimately familiar with his work brought out the Recueil de publications scientifiques, which collects almost all of his published scholarship, as well as Cours de linguistique générale, a college textbook they meticulously prepared from multiple sets of notes, mainly students’, on the Geneva courses that encompassed the topic.

II. COURS DE LINGUISTIQUE GÉNÉRALE

Saussure offered a course that combined comparative Indo-European and general linguistics in 1907, in 1908–9, and in 1910–11. He addressed general

---

linguistic issues most amply on the last occasion, when he divided the year into three units: “1. Languages; 2. Language; 3. The language faculty and the individual’s exercise of language.” Unfortunately, summer vacation arrived part-way through the second unit, and the linguist never had the opportunity to develop the last topics. *Course in General Linguistics* presents the principles guiding the historical linguistics of its day, especially the methods of the Neogrammarians and of Friedrich Diez and Hermann Paul; “every part of language is subjected to change … The stream of language flows without interruption … At no time does an idiom have a perfectly stable system of units.” The work innovates by coloring and conjoining these established approaches with three strategies that Saussure adapted from newer trends in linguistics: it outlines and promotes synchronic description, describes language holistically as a *system* constituted by *relations*, and foregrounds the importance of thought and meaning to virtually all processes central to language. Following Bréal, a natural language and the human “linguistic faculty” that informs it represent not an external object but a cognitive phenomenon for a subject: “Synchronic linguistics will be concerned with the logical and psychological relations that bind together coexisting terms and form a system in the collective mind of speakers.” Arguing that in linguistics, “the viewpoint creates the object,” *Course in General Linguistics* highlights the “evolutionary” and “static” points of view, a distinction that organizes the book. Saussure contrasts sound changes and analogy, the two processes by which the Neogrammarians accounted for the evolution of idioms. The former happen unconsciously and over time, altering given phonic sequences, whether they be found in a vocabulary item, a grammatical ending, or a suffix, according to systematic processes specific to pronunciation such as accentuation, aperture, and point of articulation. By such mechanisms, Proto-Indo-European *aiwom* became *aevom* in Latin but *ew* in Old High German, and afterwards *eo* (ever) in modern German, for example. Saussure compares such a development to a game of chess that unfolds according to strict rules but where each move happens by chance, language acting like “an unconscious and unintelligent player.” The evolvement of Latin to French is thus marked by transmutations in vowel qualities and accentuation that disjoined grammatical patterns and dislocated word families (e.g. Latin *decem* [ten] and *undecim* [eleven], but French *dix*.

and one), giving French a more lexical and less grammatical basis than Latin. Diachronic research shows that time and perceptible form impinge on an idiom’s signs and their meaning in ways radically foreign to logico-mathematical, analytical approaches to symbolic mechanisms. When sound changes disrupt the sensible bonds that unite the members of a lexical family, the words drift apart semantically, and when linguistic events lead to the coexistence of two or more similar forms for a given concept, either their meanings diverge over time (French chaise and chaire) or one or more of the terms disappears.

In the process of analogy, speakers create new expressions on the model of analyzable existing ones, as French used il chante (he sings), nous chantons (we sing) together with il aime (he loves) as a “construction rule” (il chante : nous chantons :: il aime : ?) to create nous aimons. The less regular existing form nous amons, which played no role in the emergence of the new expression, eventually fell into disuse. Analogy “acts in favor of regularity,” and all but a short list of words in French entail analogical alteration. “Language is a garment covered with patches cut from its own cloth.”

The strategic move of Course in General Linguistics is to say that while cumulatively and over time, “analogy occupies a preponderant place in the theory of evolution” of languages, analogical creations as such illustrate not so much linguistic change but rather the synchronic functioning of language conceived as a virtual system and as en-ergeia, as a complex of “generative forms”: “A newly formed word like in-décour-able already has a potential existence in language … Language never stops interpreting and decomposing the units given to it.” If certain idioms such as Sanskrit and Esperanto evince word formations governed by roots, affixes, and stems, modern Western tongues frequently flaunt grammatical rules, whether historical or contemporaneous, analyzing words instead in multiple fashions; analogy thus ultimately remains unpredictable in its creations and “capricious” in the extent of its propagation. For Saussure, whereas “ideas play no role” in sound changes, analogy entails an “unconscious comparison” and “interpretation” of existing forms as well as “the awareness [conscience] and understanding of a relation” in the actual creation of the new expression.

Analogy exemplifies the “mechanism of language” that constitutes an idiom as a relational dynamic and as a living instrument for a community at a given time, and the sketch in Course in General Linguistics of a modern linguistic approach to the contemporaneous functioning of a language represents its most influential innovation in linguistics and for the human sciences. More precisely stated, the “idiosyncratic” perspective studies the speech of a social group living in a common space and milieu during a given period. Rather than invoking common linguistic categories, Course in General Linguistics identifies fundamental cognitive processes that function to constitute the signs and general components of any idiom. “Two forms of our mental activity” define syntagmatic and associative relations, respectively. The former designate the relations that terms contract “in discourse … by virtue of being chained together, relations founded on the linear character of language.” Giving examples such as “unpardonable,” “human life,” “God is good,” and “if the weather is nice, we’ll go out,” Saussure emphasizes that in any syntagm, the whole is greater than the sum of its parts, that “The unit is a product, a combination of … interdependent elements that acquire value only through their reciprocal action in a higher unit.”

Associative relations designate those that an expression entertains with other terms that “are associated in memory” because they “offer something in common.” A word such as delightful evinces associative relations with lexemes such as delight and delighting, but also with delirious and delimited, frightful and careful, lovely and enjoyable, and so on: “the mind creates as many associative series as there are diverse relations.” The syntagmatic relation links successive segments in praesentia, while the associative relation unites terms in absentia, and whereas a syntagm entails a fixed sequence, the “mental associations” do not occur in a definite order. Like the Neogrammarians, Course in General Linguistics analyzes the forms of each particular idiom from the “bottom up”; unlike them, however, Saussure asserts the reality of the symbolic categories which the patterned terms of each language define.

While analogy and “syntagmatic types built on regular forms” exemplify “regular patterns” that can provide a certain motivation for numerous signs in an idiom (and cf. onomatopoeia), comparisons among languages quickly

reveal the extent to which their signs entail an undetermined character: in similar circumstances, speakers say *s’il vous plaît* (please) on one side of the border and *bitte schön* on the other.40 *Course in General Linguistics* echoes Whitney in emphasizing the conventional dimension of languages, which represent “genuine institutions”: like the characters of the Germanic epics, linguistic signs are largely “arbitrary,” fixed at a moment in history through their use by a given community, ever subject to change in the process of their transmission through time and individual speakers.41 Rather than viewing idioms as ordered systems that harbor zones of illogicality, *Course in General Linguistics* inverts the proportion to say that their “naturally chaotic” and “irrational” character is limited or tempered by the “mechanism of language” comprising “syntagmatic solidarities” and “associative co-ordinations.”42 Chinese and English illustrate lexicological languages situated toward the purely arbitrary end of the spectrum, while Sanskrit and Esperanto approximate the opposite, grammatical pole.43

The core of *Course in General Linguistics* ponders how to define a linguistic entity, reality, or identity, in the process underlining the specificity of linguistics as a discipline and the particularity of each language as an idiomatic configuration of sound and sense. In a synchronic perspective, and following Courtenay and subsequent research, Saussure emphasizes that a given physical disparity between two sounds may determine wholly distinct words in one tongue but only personal or regional accents in a second, and that a speaker may pronounce the “same” short phrase with as much phonic variation from one occasion to another as she does for different words in the idiom.44 *Course in General Linguistics* further argues that linguistic meaning varies in similar fashion: the sense of an expression changes from one context to another, and languages exhibit significant semantic diversity in both grammar and vocabulary. English and Slavic verb systems thus make fundamental aspectual distinctions (e.g. *it is raining, it rains, it has rained*) absent from French; Hebrew does not distinguish between past, present, and future tense; and many Germanic and Romance languages observe critical contrasts between familiar and formal second-person pronouns that are lacking in English.45

Whereas psychology may study pure ideas and physics raw sounds, linguistics investigates a phenomenon in which the two interact and condition each other at every turn.46 In order to mark their interdependence, Saussure intro-

duces a pair of neologisms: the sign comprises the signifier (cf. sound) and the signified (cf. concept), such that the Janus linguistic entity resembles the sides of a single sheet of paper, or “a chemical compound like water, a combination of hydrogen and oxygen; taken separately, neither element has any of the properties of water.”47 Alongside the associative and syntagmatic relations among signs, Course in General Linguistics argues that signifiers are constituted diacritically vis-à-vis other signifiers, as signifieds are among signifieds: “The idea or phonic substance that a sign contains is of less importance than the other signs that surround it.”48 While an “auxiliary” study can investigate the detailed physiological mechanisms and auditory impressions entailed in the syllable and its component sounds, from the perspective of the language system, “phonemes are above all else opposing, relative, and negative entities.”49 Similarly, in the semantic sphere of an idiom, “synonyms … have value only through their opposition … [they] limit each other reciprocally”; historically, if one disappears, its content goes to its rivals.50 Together, difference and the mechanism of language define synchronic linguistic units and identities through the concept of value, both use and exchange,51 and “the notion of value envelopes the unit, concrete entity, and reality … language is a form and not a substance.”52

Value provides a conception of the sign entirely different from the linear definition central to traditional metaphysics, in which a word symbolizes a universal “affection of the soul” (Aristotle) or in which vox gets its value from conceptus grounded in res, as for Aquinas and the Scholastics (cf. Charles Ogden and I. A. Richards’s triangle Symbol–Thought–Referent53). Instead of saying that a speaker chooses an expression simply “because it signifies what he wishes to express,” Course in General Linguistics emphasizes that the choice depends on the “whole latent system” of a particular idiom; “language is a system all of whose terms are interdependent and in which the value of one term arises only from the simultaneous presence of the others.”54

The diachronic and synchronic perspectives define different linguistic realities. The diachronic identity represents the sequence of transformations that the linguist reconstructs to trace how a term or terms became one or more terms of different function, meaning, and pronunciation at a later time, possibly in other

languages. Synchronic units correspond to all of the terms and only the terms of an idiom that effectively function as components for the members of a given linguistic community.\textsuperscript{55} From a diachronic perspective, French \textit{pas} (not) and \textit{pas} (step) represent the same word, whereas from a synchronic perspective, they designate two distinct signs today, used in different contexts and with different meanings.\textsuperscript{56} Popular but erroneous “folk etymologies” represent false explanations for diachronic linguistics but true associations for synchronic linguistics.\textsuperscript{57} Synchrony by definition involves the \textit{system} of the language, whereas for Saussure, diachronic changes always possess a particular, isolated, spontaneous, nongeneral character.\textsuperscript{58} The \textit{panchronic} perspective, finally, explores the general principles that are always true of any language, similar to the laws of physics or biology.\textsuperscript{59}

\textit{Course in General Linguistics} strives to develop a definition of linguistics as a coherent, autonomous, rigorous science positioned in relation to other disciplines.\textsuperscript{60} To this end, it endeavors to identify a “homogeneous,” “integral and concrete object” at its heart around which the field can be organized.\textsuperscript{61} The essay maps out the language sciences using a series of dyads or triads, privileging one term at the expense of the other(s) in each case. In keeping with already established linguistic orthodoxy, the popular spoken idiom trumps the prestige written form, as “internal” structure takes precedence over “external” phenomena tied to anthropology, sociology, political science, and human geography.\textsuperscript{62} \textit{Course in General Linguistics} further distinguishes between an idiom’s \textit{system} and its concrete manifestations, a distinction adopted in one form or another by the majority of linguists in the twentieth century. Among “the heterogeneous mass of facts entailed in \textit{speech [langage]},” the essay abstracts and promotes \textit{langue} (language), “a self-contained whole and a principle of classification,” and contrasts it with \textit{parole} (speaking).\textsuperscript{63} “\textit{Langue …} is a fund accumulated by the members of the community through the practice of \textit{parole}, a grammatical system existing potentially in every brain, or more exactly in the brains of a group of individuals; for \textit{langue} is never complete in any single individual, but exists perfectly only in the collectivity.”\textsuperscript{64} \textit{Parole} in turn comprises notably

two activities, “the combinations by which the speaking subject uses the code of langue in order to express his personal thought,” and the “psycho-physical mechanism” of muscular articulation “that allows him to exteriorize those combinations.”65 Langue thus contrasts with parole as social versus individual, virtual versus actual, whole versus part, psychological versus psycho-physical, finite versus infinite, and productive schemes versus realized utterances.66 While Saussure’s 1910–11 lectures finally emphasize the solidarity between langue and parole and envision a linguistics that studies the latter, the Course in General Linguistics editors firmly position langue as the unique rightful object of the discipline. Thus, whereas langue and parole remain “closely connected and each presupposes the other,” and while subjects learn and change their idiom through parole, Course in General Linguistics declares the former “essential” and the latter “accessory,” “accidental,” and “secondary.”67 Focused on the sign and on the mechanism of language as defined in Course in General Linguistics, langue highlights the conventional, contingent character of linguistic symbols, fixed by their use in a community through time. Saussure “assign[s] linguistics a place among the sciences” by describing it as the most typical system described by a new discipline he envisions, “semiology (from Greek semeion, ‘sign’) … a science that studies the life of signs within society,” which would be “part of social psychology and thus of general psychology.”68

More than thirty years after Saussure gave his last class in general linguistics, Jakobson stated of it that “No book in this century has exerted as wide and as deep an influence on international linguistics … almost all of the essential problems of modern linguistics are sketched in this book.”69 Quickly recognized as the principal text of reference for forward-thinking linguists, Course in General Linguistics served as the prime vehicle for the critical discussions in the field for almost half a century. Even after Noam Chomsky’s generative grammar achieved dominance toward the end of the 1950s, Saussure’s clear treatment of fundamental linguistic issues, freely illustrated with colorful metaphors, continued to exert great influence in the human sciences. Scholars welcomed its explicit discussion of theoretical topics and concurred with the centrality of its main principles, even as they bemoaned lacunae and disagreed with many of its precise formulations.

Indeed, the qualities and influence of Course in General Linguistics cannot hide its gaps, problems, and debatable proposals, which hosts of subsequent

linguists have observed and endeavored to repair. The work never examines predication, parts of speech (e.g. verb, adjective, conjunction), sentence structure, or intonation, and contains only sketchy statements on syntax. It contradicts itself on occasion, including in its arguments for demoting the written language and external linguistics. Each of Saussure’s fundamental paired concepts incorporates several components whose mappings fail to coincide. Thus while the langue–parole distinction has proved highly influential, Jakobson persuasively argues that it amalgamates three separate antinomies: potential and actual, social and individual, and conformity and nonconformity to a norm.⁷⁰ One of the virtues of the book is the clarity with which it articulates its central oppositions, yet that very precision often comes at the expense of nuance and qualification. The dynamism that Course in General Linguistics ascribes to analogy, to the mechanism of language, and to the propagation of innovations thus calls for a subtler interaction between old and new, between rule and event, than that provided for in the generally dichotomous formulations of langue and parole and of synchrony and diachrony.⁷¹ Eugenio Coseriu, Hjelmslev, André Martinet, and Jakobson formulated finer distinctions that mediate langue–parole, and show the extent to which change and system, far from functioning as dichotomies, in fact remain inextricably intertwined. At times, the mere choice of a term has generated confusion: the word “arbitrary” that Course in General Linguistics uses to designate the contingent, historical character of linguistic structures has often been interpreted as slighting the very mechanisms to which it is meant to call attention.

Viewed retrospectively, Course in General Linguistics seems to exaggerate the extent to which linguistics and its object of study can be defined as one, homogeneous, and neatly bounded and situated. The efforts deployed to this end effectively isolate language and its study from the rest of the social and natural world. Thus, after noting that “the linking of a name and a thing” is anything but “a very simple operation,” Course in General Linguistics proceeds to bracket the issue without ever tackling its complexities.⁷² Similarly, while it founds its central “mechanism of language” on fundamental cognitive processes, the essay describes both thought and sound as “amorphous” before language as social convention constitutes each, thereby slighting the incidence of other sensory-motor processes and of mimetic learning.⁷³ Instead of foregrounding the Leipzig psychologist Wilhelm Wundt’s idea of mental “images” of sounds and concepts, Course in General Linguistics might have done better to maintain

⁷². CLG 97; CGL 65.
Saussure’s own 1891–94 view that language exists as process and event only, hypostatic representations of its dynamic remaining but didactic expository devices. Course in General Linguistics avoids discussing language as interaction and conversation, which both common sense and scholarship available to Saussure place at the heart of speech, and the book never systematically treats linguistic semantics, although considerable historical research was available, including work by Bréal and Meillet.

III. LINGUISTIC STRUCTURALISM

A number of schools grew up that shared the orientations formulated in Course in General Linguistics even as they amended, extended, and developed its proposals, most notably the Prague Circle (Trubetzkoy, Jakobson, Karczewski) and the Copenhagen Circle (Hjelmslev). Trained in the philology and historical linguistics of a particular language group, these linguists elaborated the methods today called structural linguistics. They in turn inspired a younger generation of scholars, including Benveniste, Coseriu, Algirdas Julien Greimas, Martinet, Bernard Pottier, and Lucien Tesnière, who gave new impetus to structural linguistics after the Second World War, often applying the principles of phonology and general linguistics to syntax, semantics, and pragmatics. Returning to the outline that Saussure announced at the beginning of his 1910–11 course, one can say that Hjelmslev and Jakobson further elaborated “2. Language” and broached the investigation of “3. The language faculty,” which Chomsky greatly expanded, while Benveniste founded the linguistic study of “3. … the individual’s exercise of language.”

Hjelmslev, the leading exponent of Danish “glossematics,” adopted the concepts of Course in General Linguistics and its focus on internal structure, but removed the project from the psychological arena, shifting it toward the formal framework of analytical philosophy illustrated by Russell and Carnap. His 1943 Omkring Sprogteoriens Grundlaeggelse (Prolegomena to the Theory of Language) thus translates the cognitive and spatiotemporal associative and syntagmatic relations of Course in General Linguistics into logical disjunction and conjunction, then specifies nine syntactic “functions” among terms corresponding to three forms of implication (mutual presupposition, unilateral presupposition, and simple co-occurrence) obtaining in three modes (disjunctive, conjunctive, and disjunctive-conjunctive). Prolegomena and subsequent

74. Saussure, Writings in General Linguistics, 55.
works formulate a highly abstract but complex and flexible instrument by further applying Saussure’s founding insights on perspective, by analyzing the central paired concepts of *Course in General Linguistics*, and by extending the theory to the whole of science. The point of view adopted in a given analysis determines whether a term functions as signifier or signified in a given context: sensible qualities such as *front*, *rounded*, and *strong* serve as the semantic content of linguistic expressions in one situation, and as the differential characteristics constitutive of phonemes in the next.\(^{76}\) Similarly, *Prolegomena* redefines form and substance as converses determined by positional criteria: the phonologist’s substance becomes the acoustic physicist’s form, as the anthropologist’s form corresponds to the linguistic semanticist’s substance.\(^{77}\) Such reformulations enable Hjelmslev to downplay the focus in *Course in General Linguistics* on the unit sign as a two-sided sheet of paper, and to model instead the relative autonomy of local structures of sound (e.g. syllable) and local structures of meaning that combine in language. The new framework is also able to consider writing and speaking as two “connotators” alongside others such as nation, emotion, genre, and style, each of which may or may not determine a distinct norm within a linguistic system.

The most important and influential development in linguistic structuralism by far, however, was the phonology elaborated by the Prague Circle as of the 1920s. Developed in descriptions of hundreds of idioms, this methodology established the preeminence of linguistics among the human and social sciences of its day, positioning it as a “pilot science” for other disciplines and attracting the emulation of Lévi-Strauss\(^{78}\) and the attention of Lacan, Althusser, and others. Elaborating the focus in *Course in General Linguistics* on value, relations, and system through exacting investigations, Trubetzkoy and his genial protégé Jakobson defined precise methods by which to isolate invariants and variants as well as minimal units and their combinatory rules; they identified levels of phonological analysis, types of relations, and mechanisms by which terms are neutralized in certain environments. The Prague linguists drew a sharp and principled contrast between concrete phonetic segments and abstract phonological models thereof (cf. “-etic” and “-emic” units), and formulated phonological universals and general laws.

The Prague School method was both structural and “functional” or teleological: synchronically, it viewed speech as directed toward definite ends that affected linguistic structure, including referential (communicative), expressive

(social, e.g. regional accent), and appellative (individual, e.g. style) objectives. Following Saussure, it thus distinguished carefully between the phoneme, which models the smallest phonic segment that effects distinctions of meaning in langue, on the one hand, and allophones that function as contextual, regional, or social variants in parole, on the other. Jakobson’s explicit commitment to a concrete, phenomenological, and functional perspective contrasts with Hjelmslev’s formal view that allows for autonomous structures not governed by meaning and intentionality. Diachronically, the Prague functional commitment embraced a Hegelian stance to assert that like all sociocultural phenomena, linguistic changes are “systematic and goal directed.”

Martinet thus demonstrated that phonological economies contain both stable central phonemes and isolated phonemes susceptible to change, and that the schemes evolve in response to twin inverse and competing tendencies, toward concision-least effort, and toward diversification-redundancy that maximizes clarity and thus communication. The Prague linguists strenuously argued against the description in *Course in General Linguistics* of linguistic change as entailing an isolated, unpredictable character, in contrast to the synchronic system; they also further underlined the dynamic character of an idiom and its components.

Jakobson led the way in formulating the current definition of the phoneme as a bundle of distinctive features. Collaborating with Morris Halle and others in the United States, he further differentiated phonology from phonetics by drastically reducing the number of features to a universal set of twelve. Jakobson also convincingly argued that phonological, grammatical, and lexical oppositions are all structured by identical logical binary oppositions in which one of the terms is marked (salient or weighted) and the other unmarked (neutral), thus dispensing with Trubetzkoy’s gradual and multilateral relations, including ternary contrasts among points of articulation (e.g. *p*/t*/k*). Jakobson’s best-known findings in explanatory, universal laws concern the irreversible solidarities that govern how oppositions are distributed throughout idioms, such that if a language possesses nasal vowels, it also has correlative oral vowels, for example. His research in psycholinguistics revealed developmental corollaries: children learn nasal vowels only after they acquire the oral vocalic equivalents. In the late 1960s, Jakobson further investigated such issues when affiliated with the Harvard Center for Cognitive Studies and the Salk Institute for Biological Studies.

The prolific and versatile Jakobson’s inclusive vision of linguistics – he was fond of paraphrasing Terence, “I am a linguist; nothing in language can be alien

---

to me” – sought to reverse the mainstream centripetal definition of the field illustrated by the langue of *Course in General Linguistics*. Developing Saussure’s associative and syntagmatic relations as *similarity* (equivalence) and *contiguity* (temporal and spatial proximity), Jakobson posited that the derived operations of *selection* and *combination* performed by the speaker distinguish two phases of language acquisition in psycholinguistics, determine contrasting types of aphasia in linguistic pathology, subtend metaphor and metonymy, respectively, in the field of rhetoric, and alternately inform symbolism and realism in art and literature.80 Going beyond linguists’ focus on internal structure and analytic philosophers’ concentration on reference, he devised and illustrated a six-point model of communication and linguistic functions that also grants prominence to emotional, technological, and poetic dynamics.81 As early as the mid-1930s, seminal articles apply Prague methods to the analysis of grammar and morphology, describing signs for categories such as case and tense as invariant bundles of distinctive semantic features (e.g. singular–plural, masculine–feminine, subject–object) susceptible of contextual variation.82 Jakobson helped initiate the subfield of linguistic typology, or methods for classifying idioms synchronically by shared grammatical features, alongside established diachronic research in linguistic genealogy or shared origins.

Jakobson’s grammatical essays inspired American anthropological linguists to use similar “componential” analysis to describe kinship terminologies and folk taxonomies of flora and fauna, as his work on universal irreversible solidarities led to studies of categories such as color by anthropologists such as Brent Berlin and Paul Kay.83 As of the late 1950s, the studies launched efforts to develop linguistic structural semantics, which matured in the research of Pottier, Coseriu, and Greimas in the 1960s. Exploring the syntagmatic dimension, Greimas posited the concept of *isotopy* or the repetition and continuity of semantic units that provide coherence in discourse, and developed the *constructed sememe* or cognitive unit of meaning, which the listener/reader creates in summarizing extended discourse.84 Like Jakobson, Greimas and his student François Rastier have sought to widen linguistics and indeed to reassert

the philological paradigm that integrates language into a broader study of texts and cultures; the investigation necessarily entails exploring the interpretation of discourse and no longer its mere analysis. These extensions of structuralism into semantics paralleled J. R. Firth’s contextual theory of meaning, and complemented the forays into a structural analysis of syntax elaborated since the early 1950s by linguists such as Tesnière.

Beginning in the 1940s, the Indo-Europeanist Émile Benveniste published influential articles in general linguistics that establish an exploration of parole and thus of pragmatics. Defining Saussurean langue as the “semiotic” mode of language that comprises the virtual system of differential and combinatory signs, Benveniste describes a parallel “semantic” mode whose main unit is the sentence spoken by an individual in a particular context. Language passes from the semiotic to the semantic mode in the speech event, in which “speech [langage] bears reference to the world of objects … in the form of sentences which relate to specific and concrete situations.” If the utterance (énoncé) represents the product of speech, the “enunciation [énonciation] is the very act of producing an utterance.” Benveniste studies enunciative processes by examining the linguistic mechanisms that effect and represent the speech event and its parameters. Pioneering articles thus analyze constructions for what is today called deixis, including personal pronouns, adverbs of time (e.g. now, later, afterwards) and place (here, there, somewhere), as well as the tenses, aspects, and moods of verbal systems. From the foundational I–thou relation spring both speech and the subject; language no longer appears as an external instrument of communication which the individual freely manipulates, but rather as the symbolic and dialogic dimension in which subjectivity and especially intersubjectivity are constituted.

In the human sciences more broadly, structural linguistics is known for having inspired some of the most brilliant minds of the postwar generation in Europe to renovate their field through theoretical reflection and the development of explicit methodologies defined in precise terminologies. Althusser, Barthes, Lacan, Lévi-Strauss, and other structuralists sought to elaborate models grounded in formal mechanisms that identify distinct levels of relevance, invariants, minimal elements, and the syntactic rules by which components combine. Investigating social organizations, cultural practices, political

87. Ibid., vol. 1, 128.
88. Ibid., vol. 2, 80.
systems, psychological disorders, film, literature, and advertising, they explored how the phenomena function as systems comprising networks of relations, and searched for general conditions and explanatory principles. The structuralists explored the new conceptions of subjectivity and intersubjectivity, and the novel views on the relation between mind and matter introduced by the new theory of the sign and of relational systems. They explicitly defined their field and mapped its relation to other disciplines.

American structuralism developed not through Course in General Linguistics but rather through a parallel and contemporaneous adaptation of Neogrammarian methods to the synchronic study of Native American idioms. Franz Boas reworked nineteenth-century Germanic philology into conjoined and complementary descriptive linguistics and anthropology. Maintaining the close alliance between linguistics and anthropology, Leonard Bloomfield and Edward Sapir integrated the Prague School’s phonology, but not its teleological and communicative functionalism, nor its focus on holism, nor its poetics, nor its engagement with semantics; indeed, Bloomfield coated his theory with a veneer of antimentalistic behaviorism, and argued for fail-safe, sign-based discovery procedures that would guarantee the results of field studies. In the 1950s, Zellig Harris became the first American linguist of note to label his descriptive linguistics “structural,” applying the term to his formal, mathematically based methods for studying discourse and for effecting distributional analyses comparable to computer-assisted concordances, the resultant form classes being considered the grammar of the language studied.

As of the late 1950s, Harris’s brilliant student Chomsky began developing methods focused on syntax that continued but significantly transformed his teacher’s approach: generative grammar analyzed individual sentences instead of corpora, employed newer mathematics, and formulated its descriptions as ordered formal processes rather than as taxonomic classes. Further reversing the American descriptive tradition but following Jakobson’s lead, Chomsky explicitly argued against discovery procedures and instead for explanatory analyses; progressively integrated significant semantic analysis; and increasingly focused his theory on linguistic universals. Chomskian grammars and his followers’ variants quickly replaced American structuralism as the leading linguistic paradigm in the United States, and the new issues in syntax and their associated debates in general linguistics either displaced or seriously rivaled continental structural linguistics as the leading approach in other countries.

At the same time, Chomsky engineered the triumph and even the sharpening of key Course in General Linguistics and structuralist principles over the Neogrammarian heritage maintained in American descriptivism: he ushered in an overwhelming concentration on the virtual linguistic system (competence, I[internal]-Language) and a concomitant demotion of actual usage (performance,
E[xternal]-Language); established an exclusive focus on internal linguistics as against external linguistics; and highlighted cognitive processes, emphasizing the affinity between linguistics and psychology while divorcing language from anthropology. Chomskian grammars attribute even more reality to symbolic categories than does *Course in General Linguistics*, to the point of reinstating traditional grammatical categories and dispensing with explicit language-specific bottom-up analyses of forms. Like Jakobson, Chomsky collaborated with Halle in phonology, bringing forward the central Prague project by proposing a small set of universal articulatory distinctive features, while foregrounding a novel generative approach that posits “deep” and “surface” levels. Like Hjelmslevian glossemics, Chomskian grammars grant significant autonomy to formal structures of syntax and of phonology. On the other hand, Chomsky largely maintained the positive stance of the Neogrammarians and American descriptivists, and never sought to model language as a system of interrelated, mutually constitutive terms.

After serving as the chief source of new linguistic ideas and debates internationally for three decades, Chomsky began to share that role with other approaches, especially embodied cognitive linguistics, as of the late 1980s. While the latter enterprise does not resurrect structuralist paradigms, it turns against Chomskian formalism to reassert and revitalize the phenomenological perspectives central to *Course in General Linguistics* and to Jakobson, and to reclaim the centrality of meaning, adopting the Saussurean definition of linguistic constructions and expressions as comprising closely interdependent phonological and semantic facets. On the other hand, the new cognitive linguistics emphasizes continuities between speech and nonlinguistic experience, both in language acquisition and in subsequent daily use, in ways that greatly expand the motivated character of speech and further qualify its arbitrariness. It also specifically foregrounds human phylogenetic factors that impinge on speech, restoring the dialogue between linguistics and the natural sciences, and qualifying the conventional, nonbiological foundations of speech.

**IV. CONCLUDING REMARKS ON LINGUISTIC STRUCTURALISM: QUESTIONS AND LIMITS**

Today *Course in General Linguistics* remains a historic, significant, and intriguing book, but it was never the comprehensive or definitive work on language

that some nonlinguists took it for in the 1960s–1970s. Like much of modern linguistics, the structural linguistics that it helped to inaugurate concentrated on phonology, devoting far less attention to syntax, semantics, or pragmatics. Structuralism’s initial strategy of tackling the latter areas by transposing the phonological model produced limited results. Structural linguistics wrestled with issues that remain open-ended questions today in the language sciences and indeed throughout cognitive studies, notably how higher-level abstract categories are integrated with lower-level concrete signs, and how general phylogenetic structures are conjugated with particular historicocultural processes.

The establishment of modern linguistics as a rigorous science has so often come at the price of restricting its compass, giving short shrift to the relation between language and rhetoric, communication, texts, society, and the nonverbal world; the narrow focus forms part of the last two centuries’ trend toward increasing specialization and the fragmentation of knowledge. For the postwar scholars who looked to linguistics as a model, the quasi-mathematical character of phonology, its finite inventories, and its direct grounding in a differentiated material substratum project a model of scientific inquiry that cannot be emulated in all other pursuits. Similarly, the focus on internal mechanisms can be limiting, as Greimas’s otherwise powerful semiotics illustrates.

MAJOR WORKS

In retrospect, it seems rather odd to include Claude Lévi-Strauss in a history of continental philosophy. Although he had obtained a degree in philosophy, his turn to anthropology and his travels in the Amazon must be considered a flight from the philosophical tradition with which he was familiar. Moreover, his relation to philosophy was largely disdainful, culminating most notoriously in the violent attack on Jean-Paul Sartre that concludes The Savage Mind. Again, at the end of his massive work on myths, he writes: “I am averse to any proposed philosophical exploitation of my work, and I shall do no more than point out that, in my view, my findings can, at best, only lead to the abjuration of what is called philosophy at the present time.” It is true that, on reading the Mythologiques, one may be left with the impression that the Amerindians were, unbeknown to themselves, very much concerned with philosophical issues. But if Lévi-Strauss can sometimes appear a philosopher in Amerindian disguise, no philosopher has ever read Lévi-Strauss to examine the contents of the myths he discusses. Philosophers read him for other reasons, reasons that now appear based on something of a misunderstanding.

The story begins during the Second World War, when, after brief ethnological expeditions into the Amazon region, Lévi-Strauss, in exile in New York City, met

1. Claude Lévi-Strauss (November 28, 1908–October 30, 2009; born in Brussels, Belgium; died in Paris) was educated at the Sorbonne (1927–32), and received a doctorat d’état there in 1948. His influences included Boas, Durkheim, Jakobson, Mauss, Rousseau, and Saussure, and he held appointments at the University of São Paulo (1935–39), New School for Social Research (1942–45), École pratique des Hautes Études (1950–74), and Collège de France (1959–82).
Roman Jakobson, the leading figure of the Prague School of structural linguistics. By the 1950s, Lévi-Strauss had demonstrated that the method of structural linguistics and, more particularly, of phonology could be applied to cultural domains far beyond that of language proper. By the 1960s, “structuralism” had conquered tout Paris, laying claim to a number of leading intellectual figures. At the time, it appeared as if the key had been found that would allow the human sciences to be truly scientific without having to imitate the natural sciences. To this challenge, almost every philosopher, at least in France, was obliged to respond. Lévi-Strauss himself remained suspicious; he famously said that the only other structuralists in France besides himself were the linguist Émile Benveniste and the mythologist Georges Dumézil, pointedly excluding Louis Althusser, Michel Foucault, Jacques Lacan, Roland Barthes, and others. Moreover, unlike many of the latter, he remained, throughout his intellectual career, faithful to structuralism, understood as a method, and not as an ersatz philosophy. And as method, he had the good sense, at least in his substantive practice, to realize that structuralism was more applicable to certain object domains than others, more particularly to primitive societies and, within the latter, to kinship systems, totemic classifications, and myths. Once structuralism mutated after 1968 into poststructuralism, postmodernism and post-postmodernism, few philosophers still read Lévi-Strauss. By contrast, his anthropological legacy remains palpable (recognizing that his anthropological claims cannot be reduced to structuralism per se).

Lévi-Strauss was the twentieth century’s most famous anthropologist, but his career path was hardly typical of the discipline. He had no formal training in anthropology, and his stay among the Amazonian tribes was quite short. Indeed, his strictly ethnological writings, based on on-site observations, are among his least read and least published works. Admittedly, Tristes Tropiques, which relates his Amazonian peregrinations, was a tremendous success. It represents, however, a sort of “degree zero” of ethnological writing; for it does not recount the positive knowledge gained, but reflects on the “existential” difficulties and moral responsibilities of cross-cultural encounters with doomed, exotic societies. His “positive” contributions would be strictly theoretical, as brilliantly illustrated by his first important work, Les Structures élémentaires de la parenté, a book that revolutionized the study of kinship, and still remains the most important work in its field.

The title clearly refers to Émile Durkheim’s Les Formes élémentaires de la vie religieuse; but the work is better understood as an extension of Marcel Mauss’s classic Essai sur le don.3 As with Mauss, the exchange of gifts is understood not

---

*3. Durkheim and Mauss are discussed in an essay by Mike Gane in The History of Continental Philosophy: Volume 3.
in economic terms, concerned with the individual calculation of profit and loss, but as constitutive of social bonds. Here, the “gifts” exchanged are brides, and the social bonds that result from the circulation of women are kinship relations, seen as the most determinant set of relations in primitive societies. In this manner, Lévi-Strauss shifted the emphasis in kinship studies from the vertical relations of filiation that ensure familial continuity between the generations, to the horizontal relations of alliance between families. When speaking of the simplest, “atomic” structure of the family, he thus includes the “tiers donateur,” the giver of wives (often the maternal uncle). Society supposes, by definition, relations between families, and the circulation of women that ensures such relations supposes the incest taboo. The latter, Lévi-Strauss argues, has no basis in nature; on the contrary, it is directed against natural inclinations, and so marks the movement from nature to culture – hence its universality. Two points should be noted, as they bear on the larger argument. First, the incest taboo is not consequent to the repression of individual desire (as in Freud’s Oedipal complex); it is imposed by the collectivity and, as such, suggests Durkheim’s “conscience collective” or, better, an “inconscience collective” (as it is not devised by conscious accord). Second, the circulation of women supposes what Lévi-Strauss terms “the principle of reciprocity,” that is, families give their daughters (or sisters) to other families because they expect to receive the latter’s daughters (or sisters) in return. Lévi-Strauss views society (or at least primitive society) as essentially échangiste, the exchange of women being completed by the exchange of goods and words. Reciprocity can entail antagonistic relations – insults, blows, vendettas – but antagonistic reciprocity still supposes relative equality. This immediately distinguishes Lévi-Strauss from many of his generation who sought the basic schema of the relation of self to other in that of master and slave. It also helps explain why there is little discussion of power or domination: not just domination within a group, but domination by the group (as, for example, with Durkheim’s discussion of the representation of the collectivity as sacred). Exchange concerns a movement beyond group frontiers, not their establishment or maintenance; and if exchange implies rules, Lévi-Strauss’s concern is with their unconscious functioning, not their conscious justification. As for the question of patriarchy, implied by “the circulation of women” (even in matrilineal or matrilocal societies), it is never really confronted.

The properly structuralist moment of the book concerns the analysis, relative to “elementary kinship structures,” of the terms of the exchange, that is, who is exchanged between whom. By “elementary” structures Lévi-Strauss is not referring to their degree of complexity; he is speaking of kinship systems where the rules concern not just whom one cannot marry (the incest taboo applies to our own “complex” kinship structures) but whom one ought to marry – which is more typical of primitive societies where kinship structures, being
of such commanding importance, are more robustly delineated. Only “elementary structures” provide the restricted number of terms on which structuralist analysis can establish a limited set of possible relations. Lévi-Strauss makes a first distinction between cross-cousins and parallel cousins (cross-cousins being the children of one’s maternal uncles or paternal aunts, parallel cousins those of one’s maternal aunts or paternal uncles), and restricts his analysis largely to the former. Not only is marriage between cross-cousins spread over a more disparate geographical area (thus resisting diffusionist hypotheses), but it better expresses the principle of reciprocity, as the tendency in marriages between parallel cousins is for women to circulate within the limits of a paternal clan. A second distinction is made within cross-cousin marriages between those where one marries the daughter of one’s maternal uncle, and those where one marries the daughter of one’s paternal aunt. Another distinction concerns whether the marriage preference refers to the daughters of, say, one’s maternal uncle’s family or one’s paternal uncle’s clan. And a further distinction distinguishes between “restricted exchange,” where families or matrimonial classes exchange brides directly, and “general exchange” where the exchanges are indirect (group A gives daughters to group B, which gives daughters to group C, while group A receives its brides from group D). In effect, Lévi-Strauss begins with a limit number of terms: father, mother, maternal aunt, paternal aunt, son of maternal aunt, and so on. These terms can be combined in different ways to form a limited number of different combinations, although sometimes the combinations prove quite complicated, and one has to resort to pencil and paper or even mathematical formulas to understand their inter-generational functioning. Some combinations are more common than others, presumably because they respond better to the problem that the principle of reciprocity seeks to resolve, that is, the maintenance of families in continuous relation with each other so as to form a coherent society. But the reason why a given society “chooses” a given combination, although not unaffected by local conditions, is ultimately arbitrary, and all the more arbitrary because “unconscious.” To be sure, a given “choice” may have tremendous “sociological” implications (as already suggested by the effects of parallel cousin marriages on clan formation). Structural analysis, however, is less interested in the analysis of these implications than in uncovering the underlying rules. The supposition of such an analysis is that all societies must respond to the same exigencies (as implied by the incest taboo), using the same range of “materials” (as given by the family’s atomic structure). In contrast to how most anthropologists and sociologists understand the term “structure,” it is viewed here as a model that shapes empirical reality, and not as part of that reality. In effect, one can deduce the possible combinations that form the different kinship structures before, and even without, finding empirical equivalents. Moreover, the empirical equivalents will always be messier than their models; matrimonial
rules can never be fully prescriptive, if only because the demographic facts do not always cooperate.

The next major work after the study on kinship (excluding *Tristes Tropiques* and the essays collected in *Anthropologie structurale*) was *Le Totémisme aujourd’hui*, which Lévi-Strauss claimed was an introduction to *La Pensée sauvage*, which can itself be considered an introduction to the multivolume *Mythologiques*. Totemism had been a key concept in anthropology, although one subject to considerable controversy since the 1920s. It was generally defined as the identification of an individual or group (usually a clan) with a totemic animal that, being deemed an ancestor of the individual or group, is considered sacred, and subject to a number of prohibitions. The problem is that the different elements do not always cohere: the totem need not be an animal (it can be a plant or household article); it can be an object of identification without being considered sacred, or can be considered sacred without being an object of identification. For Lévi-Strauss, the theory of totemism sought to include at once too much (a theory of primitive religion) and, more importantly, too little. Once denied a relation to the sacred, the totemic phenomena can be understood from within a larger, “epistemological” perspective, although this supposes the totems be considered, relative to a given society, in terms of their differential relations (and not individually). They will then be seen to form a classificatory system whereby different animal species are distinguished according to, say, different elements (such that turtles are associated with water, eagles with air, etc.), which system can be applied to establish, organize, and render intelligible social differences, notably in terms of clan distinctions. In this manner, the totem appears not as the object of a cult, but as a conceptual tool, an “*opérateur logique*,” by which the natural world, the social world, and the relations within and between the two, are rendered meaningful.

The work on totemism marks a shift in emphasis from institutional practices (as with bridial exchanges) to a concern with the operations of the “savage mind.” This should not be confused with a shift from a materialist to a mentalist perspective. Kinship structures entail a “mental” element relative to both its invisible rules and their visible effects on language (e.g. with marriage to cross-cousins, parallel cousins will likely be considered as brothers or sisters). This shift does, however, suggest a cognitivist turn, and promises to say something provocative about “thinking,” particularly as it places “thinking” in relation to the unconscious and the symbolic. As the use of these terms is not always clear, it is worth considering each in turn.

In his earlier works, Lévi-Strauss gestures to Freud and Marx when speaking of the unconscious, but such references are soon dropped. As noted, unlike the Freudian unconscious, Lévi-Strauss’s unconscious is collective, not individual. Moreover, although it is inclusive of the incest taboo, it is not particularly
associated with the repression of drives, sexual or otherwise. Similarly, if he speaks, on occasion, of myths as being ideological, he does not correlate the unconscious with a desire to avoid facing certain truths. The “unconscious” does not concern desire, but is strictly mental. The model remains phonology: when speaking, one is “unconscious” of phonemes and their differential relations, although one could neither speak nor, by implication, think without them. And what applies to the “material” level of signifiers or phonemes, also applies to the “mental” level of signifieds or “lexemes.” If one then pushes the analysis beyond the differential relations between specific signifieds and examines the different forms that these relations take independent of their content, the “unconscious” need no longer be tied to a specific code or culture. The “unconscious” becomes the inventory of all the forms that underwrite the content of all possible consciousness: the underlying structure of the human mind in its universality. This is why Lévi-Strauss is able to say that “man has always been thinking equally well.” And it is at the basis of Paul Ricoeur’s much quoted claim that Lévi-Strauss’s structuralism represents a “Kantianism without a transcendental subject,” with the proviso that Lévi-Strauss is referring not to the \textit{a priori} abstract categories necessary to human reason, but to the set of “logical” operations that are prior to any distinction between rational and irrational thought. Lévi-Strauss does not believe that one can uncover such a structuralist unconscious by an act of introspection; one must examine a mind that is spontaneous and undomesticated, a mind associated with the origins of thinking – in short, a “savage mind,” largely, if not entirely, identified with primitive peoples. At this point, two qualifications need to be made, first a minor, then a major one.

One may think that the relation between signified and referent (here the outside, natural world) is completely arbitrary, as the unconscious forms are capable of underwriting multiple possible contents, which are then imposed on a passive, formless world. One may even claim that such arbitrariness is a condition of culture, and of the plurality of cultures, in opposition to nature. However, Lévi-Strauss believes that nature is not entirely without structure and, therefore, lends itself to certain distinctions that will continuously repeat themselves in different cultural areas. He even speculates that certain affinities between the structure of the mind and that of nature may help account for the technological breakthroughs of the “Neolithic revolution.” This raises a larger question: does the unconscious lie on the side of nature or culture? With the hard sciences increasingly discovering codes in nature, notably the genetic code, Lévi-Strauss

tends to come down on the side of nature. At another level, however, his entire corpus can be said to revolve around the distinction between nature and culture, how it arises, and how it is represented.

The major qualification concerns the impression one might have that the forms do not think, but exist anterior to thought, as its condition or instrumentality. This would suppose that the forms are without activity, but for Lévi-Strauss the unconscious mind thinks, spontaneously as it were. What motivates such activity? One wants to say: the need to make sense of the world. Perhaps, but it is a curious sort of sense-making; for it appears devoid of intentionality, and exists in excess of the world it would make sense of. It is as if the mind ran by itself, with an independent will to poesis, not satisfied with attaching a specific content to a specific form, but seeking to continuously modulate the content in the most fantastic ways in order to explore the possibilities entailed by the form. It is such spontaneous mental activity that lies at the heart of the debate about “humanism.” When Lévi-Strauss famously claimed that “les mythes se pensent entre eux” (poorly rendered in English as: “how myths operate in men’s minds without their being aware of the fact”), the implication is not simply that “men” are unaware of the underlying structures when thinking mythically, but that it is the structures, not the men, doing the thinking. Mythical thought is without a subject and without subjectivity; it is a completely objective, prerelative, unthinking form of thought. Such, at least, is the methodological claim. It need not be confused with the more substantive claim that the mind is identical to its unconscious structures, or that certain societies think without thinking. The person narrating a myth, no doubt, is largely unconscious of its underlying structures. He is, nonetheless, conscious of what he is narrating; he probably has a sense of the appropriateness or inappropriateness of any elements he might add. He may even have his own interpretation of what the myth “really means” – although Lévi-Strauss would have us ignore the latter, as it plays no role in the actual construction of the myth.

Consider now the idea of the symbolic. Lévi-Strauss states that society is not at the origin of the symbolic, but the symbolic is at the origin of society. The symbolic would then be understood as all the systems of differential relations constituted on the basis of the mind’s unconscious activity, and which one associates with the idea of culture in its largest, most general sense. There is, however, also room for a more restricted understanding of the symbolic, an understanding best approached through an article entitled “The Effectiveness

of Symbols,” which examines a shamanic cure for a difficult childbirth. The shaman’s chant, recited in the presence of the woman in labor, populates her uterus with good and bad spirits who struggle over the child’s progress down the birth canal. What is of interest here – without entering into the controversies the article has sustained – is the suggestion that the symbols employed by the savage mind cannot be equated with just any sign system and, by implication, the symbolic with just any culture. First, note that the symbols are insufficiently separated from percepts and affects to be considered concepts, the distinctions between ideas, sense impressions and feelings – and thus between the inner and outer world – being far more porous than we are accustomed to. Second, such porosity aids in the movement between diverse levels or codes – here between a psychic level (the different, battling spirits) and a physiological level (the movements of the uterus) – which constitutes the symbolic’s operationality. Such movement is constitutive not just of rituals, but also myths, although the latter remain purely mental phenomenon, unconcerned as to their “real effects.” The movement in myth is more akin to that discussed in totemism, with its move from differential relations between animals to those between clans; although in myth the movement between different strata or codes is infinitely more varied. Finally, the symbolic content saturates the world with sense. In the case of our woman in labor, her pain would make far less sense if she relied on a strictly scientific explanation; moreover, whatever the outcome of the cure, it will find a meaning within the shamanistic universe. The “domesticated mind,” because it would control sense-making in accord with a limited number of largely conscious rules, lacks the creative vivacity of the savage mind that, like the bricoleur, can draw on its material from numerous domains in order to fill all empty spaces. The symbolic order here concerns the “operativity” of sense, and not the sense of sense, which implies reflection.

After *La Pensée sauvage*, Lévi-Strauss dedicated all his efforts to the study of the myth, understood as exemplifying the spontaneous exuberance of the savage mind. The result was the four volumes of the *Mythologiques*, followed by three shorter works. Despite being termed an “Introduction,” the *Mythologiques* are a vast, sprawling, even obsessive work that tries the patience of its readers. Lévi-Strauss is interested in constructing a system of myth, which requires breaking myths down to their individual narrative elements, their mythemes, in view of establishing relations of similarity and difference between these elements both within a given myth, and between variations of that myth as it circulates not just in the tribe, but across different tribes and different linguistic groups. For example, the mythemes in the “bird-nester” myth are: son refuses initiation in big house/son rapes mother/father sends son to scale high cliff in search of

---

eagle eggs / father removes ladder / stranded son is covered in bird excrement, and so on. One might note that the act of incest between generations and the scaling of the cliff both involve vertical relations. The significance of this parallel becomes evident when one realizes that, in a variation of the myth where the incest is “horizontal” (between brother and sister), a “horizontal” mytheme must be substituted for the scaling of the cliff. In effect, one looks for paradigmatic and syntagmatic changes, and their corresponding adjustments, which enable one to link different myths into larger mythical cycles. Most often the variations involve inversions, but other transformational relations are common (substitutions, permutations, symmetry, etc.). Sometimes these variations respond to local conditions (e.g. a tribe lives in an area without high cliffs); sometimes to the desire of one tribe to differentiate itself from other tribes; and sometimes simply to the different “logical” possibilities that inhere in a given mythical structure – that structure consisting, in principle, of all its possible transformations. Such variations are particularly relevant to the movement across different codes, whereby, say, zoological differences are related to climatological differences, which, in turn, are “translated” into different manners of cooking. The movements across different codes can give rise to whole new sets of transformations within or between different mythical cycles.

By tracing the variations and transformations across several, cross-cutting mythical cycles, Lévi-Strauss moves, in the course of the Mythologiques, from one initial reference myth (the bird-nester myth at the beginning Le Cru et le cuî) to over six hundred myths in both North and South America. The starting-point is arbitrary; the bird-nester myth does not constitute an Ur-myth. The transformations usually appear localized between neighboring tribes; but sometimes a mythical cycle appears with remarkable consistency throughout the Americas (such is the case with the bird-nester myth), causing Lévi-Strauss to speculate at times about archaic paths of diffusion, and at other times about transcultural associations presumably rooted in the circuits of the brain. Note that the analysis is not, and cannot be, complete, for there can be no closed mythical totality. The latter, in effect, would have to include every myth that is known, has been lost, or could have been created had the myth-creating societies survived.

What is the sense of the often exceedingly detailed analysis of this mythical corpus? Lévi-Strauss is not interested in myth in terms of, say, a theory of the sacred in primitive societies. If he sometimes claims that myths have a function – to blunt the effect of real contradictions by their progressive, imaginary mediation – this is not borne out by the bulk of his analysis. Nor does he seek the meaning of myth in its general characteristics (e.g. the absence of the distinction between efficient and ideal causality to describe the difference between the natural and human worlds), in its characteristic themes (e.g. the representation
of the difference between nature and culture, despite the titles of some of the books), or its characteristic characters (e.g. the trickster). He does not care to discuss the content of myth at this level of generality, but prefers to construct the sense of myths through their internal analysis. At the level of individual myths, it is clear that many of them seek to explain origins, for example how mountains were created, or how humans first came to use cooking fire. Such meanings, however, are too obvious to interest Lévi-Strauss; he searches for meaning in larger systems of similarities and differences. He is far more interested when, for example, a myth about the origin of fire contrasts terrestrial fire (domestic fire for cooking) with celestial fire (lightning), which is then related to terrestrial water (lakes and rivers) and celestial water (rain) – which suggests that a myth about the origins of domestic cooking is also about the opposition between heaven and earth. But it is not so much a matter of what such an opposition might mean, as of how it is made to signify in a way that produces new myths. Ultimately, Lévi-Strauss is not really interested in what myths mean, but how they come about, and what, relative to other myths, they can do. When he does speak of the meaning of myths, he tends to privilege their formal or, better, morphological content, thus presenting them with an apparently philosophical significance, as when he writes: “it is clear that the myths I am comparing all offer an original solution to the problem of the changeover from continuous quantity to discrete quality.” More generally, however, his analysis is not interpretive, but generative, as it seeks to demonstrate how myths, as a symbolic order, operate. As such, this work would seek to remain very close to the savage thought it describes, even as it seeks to orchestrate its own performativity. This is not really a theory of myth; rather, the science of myth, Lévi-Strauss writes rather impishly, is “a myth of mythology.”

The materials of myth, and the possible content that results from the operations performed on these materials, are seemingly limitless, a trait that immediately distinguishes the analysis of myth from that of kinship, not to mention from phonological analysis proper. What appears limited, by contrast, are the operations that give form to the endless array of mythical narratives. Even before the *Mythologiques*, Lévi-Strauss presented what he claims is the canonical formula of mythical thinking: \( F_x(a) : F_y(b) :: F_{x-1}(y) \). This formula describes a transformation in terms of a relation of equivalence between the elements of two myths (the double colon distinguishes between the two myths; while the single colon marks the syntagmatic articulation of the elements in each myth): the function \( x \) of term \( a \) is to function \( y \) of term \( b \) as function \( x \) of term \( b \) is to

10. Ibid., 12.
an inversion of both the term and function of \( a \) and \( y \). Whether this formula constitutes the ultimate “grammar” of myth is highly debatable, although Lévi-Strauss makes occasional use of it until the very end. What it illustrates is the desire to move the analysis to the level of what he terms “general mythology,” a level of analysis so abstracted of all content that it would be inclusive of all myths. If the latter was to be the culminating moment of the project on myth, finally revealing the modus operandi of the human mind in its original state, suspended between nature and culture, this project came to appear increasingly hollow. For, at this level, it became evident that the analysis would result in an empty formalism, the endless illustration of the same, endlessly repeated operations. Moving the analysis down a notch to include content, if only at the level of form, proves potentially more rewarding. Thus in his last work on myth, Lévi-Strauss ends with a comparison of the Amerindian with the European mind. The comparison involves the question of difference in the same as illustrated by myths about twins. The native American myths suggest that no two terms can ever be exactly the same, the implication being that the Amerindians were more capable of accepting and incorporating difference.\(^{12}\)

Lévi-Strauss always claimed to be engaged in the elaboration of a science. Yet there was always an interest in aesthetics, which was to become increasingly prominent, his last book being exclusively dedicated to such matters. Throughout his œuvre, one finds structuralist analysis of works of art, both primitive and modern, and, consonant with the latter, a critique of modernist painting and music. The temptation is to search for the materials to develop a specifically Lévi-Straussian theory of aesthetics; but such a theory could not just be a theory of aesthetics as there is, in his work, a continuous criss-crossing of the realms of art with those of myth and (structuralist) science. Sometimes this takes the form of the establishment of differential relations, as with the claim that “art lies half-way between scientific knowledge and mythical … thought.”\(^{13}\) Sometimes art and science seem to bleed into each other, the scientific analysis of the Mythologiques being organized in terms of musical metaphors, with the “finale” including a long discussion of how myth resembles music more than language. Such movements are possible only on the basis of deeper affinities. Art, myth and science are all concerned with the sensual qualities of objects (art and myth in an immediate sense, science at the end of its elucubrations); all three evince a concern with form and, therefore, privilege relations over terms; and they are all susceptible to analysis in terms of “double articulations,” whether

between different axes of meaning or between the different senses. One can go further: art, myth, and science articulate structure and event (myth employs events to produce structure; science seeks the structure behind events; while art is sensitive to the structure in the event); all three seek to work up nature by placing it under the discipline of form (science in an effort to master nature, with myth and, traditionally, art being more contemplatively inclined); and they all, in their different domains and different manners, would point to human invariants. Ultimately, for Lévi-Strauss, the arts are a form of knowledge, one that entails an education of the senses, an appreciation of craft, and an appeal to what makes us most human, our cultural creativity as borne by – and here he differs from the individualizing heritage of Kantian aesthetics – the resonance of the underlying “psychological,” and even “physiological” structures on which communication depends.

Beyond the aesthetic moment, there is a strong moral moment, which accounts for some of the attraction of Lévi-Strauss's work, although it confounds the conventional categories of left and right. This latter moment is rooted in a sympathy for, even an identification with, the primitive peoples among whom he sojourned. Thus he does not simply think about these peoples; he bears them an intellectual debt and would think with them, at times against his own society. Structuralism, one could say, bears an affinity with the statics of “cold societies” (societies that refuse to see themselves in historical terms), and Lévi-Strauss is horrified at their fate consequent to the “invasion” of America. Instead of being a representative of a colonialist or imperialist culture, the anthropologist is to be a witness to the terrible destruction wrought by our own “hot societies.” As such, he cannot be entirely at home within his own culture, even as he cannot be entirely without, and instead moves with genuine pathos between the modern and the primitive. Lévi-Strauss values diversity: all societies have their value because they cannot be measured against a single standard. What he abhors is the “ontological violence” of our own society, which, in the name of human progress, so arrogantly and pitilessly places itself at the center of the universe, resulting in an unparalleled destruction of peoples and cultures in their diversity, the prelude to the destruction of the diversity of nature. Lévi-Strauss sees himself as a “bearer of ashes,” sifting through the debris, seeking to preserve, as faithfully as possible, what is and has been lost. In a famous early essay, “Race and History,” originally written for UNESCO in 1952, he attacks all forms of ethnocentrism, upholding a vision of a new world civilization based on increasing cross-cultural communication, which would relativize the West.14 In a later essay, “Race and Culture,” he despairs of such communication, claiming

that it serves to eliminate difference, and pleads instead for the maintenance of a distance between cultures, going so far as to honor the absolute xenophobia of primitive cultures, which refuses a human status to all cultures but their own.\textsuperscript{15} In this most Rousseauist of gestures, he pictures a time of origins prior to the catastrophe that is history, where humanity, stripped of all pretensions, still remains fully human, still lives in equilibrium with nature, and proves capable of surviving tens of thousands of years largely unchanged.

It is difficult to speak of Lévi-Strauss’s philosophical legacy. He was the foremost exponent of structuralism, and when French intellectual life passed through its structuralist and poststructuralist phases, those influenced by such trends drew considerable inspiration from his work. It was, however, always difficult to speak of a specifically structuralist (if not a poststructuralist) philosophy.\textsuperscript{16} Lévi-Strauss himself spoke of structuralism as a science, one that would redeem the scientificity of the “human sciences” because tailored to the specificity of the study of the human mind. As such, structuralism was widely felt to represent a challenge to philosophy, particularly the dominant, phenomenologically oriented philosophy of the time, with its critique of scientific objectivism. This would only be confirmed with the publication of \textit{La Pensée sauvage}, with its blistering critique of Sartre, who was accused of turning history into myth, reproducing the closure of the West relative to its others, and reviving the Cartesian distinction between subject and object (with the distinction between analytic reason, applied to things, and dialectical reason, applied to historical events understood as the aggregate projects of free individuals).

Maurice Merleau-Ponty, who was deeply uncomfortable with the Sartrean opposition between things that, in themselves, are meaningless, and persons who alone confer meaning on the world, was intrigued by Lévi-Strauss’s anthropology.\textsuperscript{17} He saw in it, as well as in Saussurian linguistics, a way to thicken what he termed the “inter-monde” between subject and object, although from the perspective of structuralism this inter-monde cannot be adequately described through the experience of the living subject.\textsuperscript{18} Ricoeur also recognized that, with structuralism, individual sense (the \textit{parole}) is possible only because, at a deeper level, beyond all questions of intentionality, there lies a largely autonomous order of differential relations and their transformations (the

\textsuperscript{16} Patrice Maniglier argues for a \textit{philosophical} legacy of structuralism in his essay in \textit{The History of Continental Philosophy: Volume 7}.
\textsuperscript{17} For a discussion of Merleau-Ponty, see the essay by Mauro Carbone in \textit{The History of Continental Philosophy: Volume 4}.
In effect, structuralism pushes the analysis of cultural productions beyond hermeneutics, by extending the domain of an objectifying explanation into that of inter-subjective understanding (to employ Wilhelm Dilthey’s classic distinction). While recognizing that structuralism has its uses, Ricoeur sought to retain a place for philosophical hermeneutics considered as “a part of self-understanding and of the understanding of being.” Ideally the two approaches can be conjoined, assuming each recognizes its own limits. Nonetheless, structuralism is deemed better suited to the study of societies whose myths are classificatory and synchronic, and hermeneutics to societies whose myths would narrate a common history, which entails traditions with reservoirs of meaning open to continuous reinterpretation. Moreover, hermeneutics appears better suited to societies whose traditions we share, while structuralism is more appropriate to the study of societies outside our hermeneutic circle. Still, there is one difference that cannot be subjected to an intellectual division of labor: where for Lévi-Strauss meaning is immanent to structures, for Ricoeur, meaning or, better, meaningfulness, the sense of sense, requires a relation to an interpreter.

Jacques Derrida sees in anthropology a decentering of the West, and in structuralism, with its infinite play of substitutions, a decentering of the subject, the origin, the telos, the arché, and so on. In effect, Derrida sees Lévi-Strauss as also engaging in a critique of metaphysics, although like all such critiques, it too must borrow concepts from the tradition that it criticizes (e.g. those of nature and culture). One can, however, rigorously question these concepts and their history, or one can, like Lévi-Strauss, simply treat them, in the manner of the bricoleur, as momentarily useful, if not as ontologically valid. The danger with this second approach is that, while claiming to leave philosophy behind, one reintroduces, unknowingly, rather naive philosophemes. The most egregious of the latter concerns the presence of an unsullied, originary “presence.” With its infinite play of substitution, structuralism should reject the latter; yet Lévi-Strauss retains a nostalgia for an archaic innocence, and a remorse for lost origins. If one must borrow from metaphysics, Derrida would prefer, to Lévi-Strauss’s melancholic science, an affirmative, “gay science.”

---

21. Ibid.
Gilles Deleuze and Félix Guattari contrast the indefinite repetition of static structures in the earlier Lévi-Strauss to the theory in the *Mythologiques* “of primitive codes, and of codings of flows and of organs, that goes beyond the exchangist conception on all sides.”\(^2^4\) Not only would this latter theory resist all limits, while refusing to be bounded by a notion of reciprocity, but it would suggest that Lévi-Strauss was a poststructuralist in spite of himself, even as *Anti-Oedipus*, as a generative, performative text, would exemplify a contemporary *pensée sauvage*.

Without the encounter of philosophy with Lévi-Strauss (and it was an entirely one-sided encounter), there could never have been the move to poststructuralism. And yet there was something “malencontreux” about this encounter, because it was often based on a misunderstanding. In retrospect, structuralism appears no more a science than a philosophy. Instead it is better understood as a method, even a heuristics, more applicable to some objects than others, and capable of genuine insights, but not hard truths. Once the turn to poststructuralism had been made, Lévi-Strauss ceased to excite the same interest or controversy among philosophers. This is not to say that, in recent years, there have not been a number of important, philosophically informed studies of his work,\(^2^5\) but the days since his work was seen as holding an incisive challenge to philosophers’ self-understanding are over.

The anthropological legacy of Lévi-Strauss is much more assured, particularly in France. There are no orthodox Lévi-Straussians; but many an anthropologist finds himself employing one aspect of Lévi-Strauss’s thought against another, in an implicitly or explicitly critical fashion. Thus, to provide some of the more salient examples: Françoise Héritier seeks to rewrite Lévi-Strauss in a feminist mode;\(^2^6\) Maurice Godelier questions the *échangiste* basis of society, while positing a theory of the imaginary based on objects that do not circulate;\(^2^7\) Marshall Sahlins, to provide an American example, demonstrates the uses of structuralism for historical analysis through a study of Captain Cook in Hawaii;\(^2^8\) Dan Sperber, while developing a critique of the structuralist method,\(^2^9\) still seeks to uncover the formal mechanisms of the mind, but by drawing on the cognitivist

---

sciences of a more Anglo-American provenance,30 while Philippe Descola, in an important work, takes up the nature–culture distinction, rejecting the search for the fundamental structures of the human mind, in order to develop a structuralist analysis of four fundamental “ontologies” by which different cultures comprehend their relation to the nonhuman, natural world.31 One might say that Lévi-Strauss’s anthropological legacy not only lives, but lives as it were, dialectically. And there is much in this legacy, although it remains much more modest than some of Lévi-Strauss’s more programmatic claims, which can still be of interest to philosophy broadly considered.

MAJOR WORKS

I. BRIEF STATEMENT ON LACAN AND PHILOSOPHY

Jacques Lacan\(^1\) stated in 1964 that psychoanalysis is “governed by a particular aim, which is historically defined by the elaboration of the notion of the subject,” thereby allying psychoanalysis to one of philosophy’s central concerns since modernity.\(^2\) But by adding that psychoanalysis “poses this notion in a new way, by leading the subject back to his signifying dependence,” Lacan in fact makes the subject into a point of contention between philosophy and psychoanalysis.\(^3\) Despite multiple and persistent uses of philosophical concepts in his works, Lacan ultimately holds that something about philosophy renders it constitutively unable to think the dependent and “split” subject that is the focus of psychoanalytic theory and practice.

Philosophy’s failure to think the subject proper to psychoanalytic theory lends it a necessarily illusory or ideological function. This is why Lacan can be thought of as an antiphilosopher, saying once that “Je ne fais aucune philosophie, je m’en méfie au contraire comme de la peste” (I don’t do philosophy at all, I

---

1. Jacques Lacan (April 13, 1901–September 9, 1981; born and died in Paris) was educated at the Hôpital Sainte-Anne (1927–31) and received a doctorat d’état in psychiatry at the Sorbonne (1932). His influences included Freud, Hegel, Heidegger, and Saussure, and he was affiliated with the Société psychanalytique de Paris (1934–40), Société française de psychanalyse (1953–64), and L’Ecole Freudienne de Paris (1964–80).
Yet he would not be the first philosophically inclined thinker to take a strongly negative view of philosophy itself: on this point he was in agreement with many twentieth-century philosophers. What is it that makes philosophy constitutively blind to the psychoanalytic insight into the subject? Lacan stated his views on this on numerous occasions. In reply to a question from some philosophy students about his views on consciousness, he stated: “I say that philosophical ‘consciousnesses’ have no other function but to suture the abyss of the subject.” It is philosophy’s tendency to make consciousness not just a central but an often constitutive feature of human experience that Lacan finds dubious; according to him, it is an attempt to flee from a more fundamental truth about the subject (its opacity to itself) that, he feels, psychoanalytic theory is able to articulate.

It is worth keeping in mind that Lacan’s writings and oral teachings were primarily concerned with training psychoanalysts, and with laying out the theoretical foundations of psychoanalytic practice. They were not trying to chime in on philosophical questions. For a long time even his publications were not read by a philosophical audience. Indeed, they were not widely read outside the relatively small psychoanalytic school under whose auspices they were printed until they were bundled together and republished as the *Écrits* in 1966.

Yet philosophers and key philosophical concepts were of constant and significant help to Lacan in his battle over the Freudian legacy, which he touted as a “return to Freud.” This return involved purging some of the biologism out of Freud’s theory, in favor of what is, originally at least, a more philosophical approach. Later on, Lacan would affirm Freud’s “scientism” in his own attempt to “mathematize” psychoanalytic theory. References to philosophers are few and far between in Freud’s works themselves. Freud was no doubt eager to defend the scientific status of his new discipline, and he would have wanted his theory to be as uncorrupted by the metaphysical musings of philosophy as possible. For Lacan, things were quite different. Indeed, the works of philosophers are important supports for him whenever he is trying to work out the details of some concept for which he had not yet developed his own language. For instance, in the initial articulation of his theory of desire, he samples heavily from Hegel and Alexandre Kojève; in some of his initial attempts to express the claim that the

---

6. For a discussion of Freud’s work and its appropriation by philosophers in the twentieth century, see the essay by Adrian Johnston in *The History of Continental Philosophy: Volume 3*.
unconscious is structured as a language, he refers to Heidegger; when addressing
the nature of the psychoanalytic cure he would sometimes speak of it in terms
of being-towards-death. A close reading of Plato’s *Symposium* is instrumental
to Lacan when he is trying to understand the role of the analyst’s desire in the
psychoanalytic cure, and for clarifying the status of the “object-cause” of desire
in psychoanalysis. Yet Lacan used philosophers primarily as mediators only:
his view seems to have been that philosophers were sometimes working on
issues similar to issues in psychoanalysis, but the latter would ultimately have to
develop its own vocabulary because of philosophy’s essentially mistaken ori-
tention, positing the primacy of consciousness rather than the primacy of the
unconscious.

**II. PHENOMENOLOGY, DIALECTICS, AND DESIRE**

Lacan’s introduction to psychoanalysis in the 1930s required a break from
certain aspects of his medical training. He wrote that the psychiatrist Gatian
de Clérambault had taught him to pay attention to the “subjective text” of the
patients he was treating at St. Anne. This attention entailed a rejection of an
exclusively biological study of the symptoms and psychological problems he
was treating, an approach that is evident in Lacan’s earliest publications, which
were usually coauthored and published in medical journals such as *La Revue
neurologique* and *L’Encéphale*.

By the time he wrote his doctoral thesis, this interest in the “subjective text” of
his patients became primary. In his study of a patient he called Aimée, who had
stabbed a famous actress and was subsequently institutionalized, Lacan argues
that the near murder was just as much an attempted suicide, since Aimée was
striking at a woman who was her ideal self. With its close attention to the char-
acter of Aimée, her identifications and desires, the thesis reads like a psycho-
analytic case study without much in the way of psychoanalytic vocabulary. A
phenomenological orientation is just as present in this work as a Freudian one,
and its writing drew from Karl Jaspers and Edmund Husserl.

So initially, phenomenology and psychoanalysis are co-present in Lacan’s
thought. Yet an increasing interest in language would draw Lacan into other
fields. In an essay a few years later, in what he describes as a “phenomenological
description of psychoanalytic experience,” he claims that language-use is the

---

    Press, 1999), 49.
central thing about that experience. Lacan notes that while much of what is said during an analytic session might not “want to say anything,” the fact that the analysand says it takes on an independent importance, he asserts, because in the analysand’s address to the analyst, the latter can discern how what is said is being said from a specific place or point of view. Lacan writes of this as an “intention,” which may consist of a demand, an accusation, a bit of aggression, and so on. This intention, which is something like the position from which a statement is made, may furthermore be operating without the analysand’s conscious knowledge. The use of language in psychoanalysis thus reveals intentions of which the speaker is not aware, intentions that can be read between the lines of what is said, as it were: “intention thus turns out to be unconscious.”

Lacan began his own analysis with Rudolph Loewenstein in 1932, and started to see patients under supervision in 1934. In this very Freudian decade for Lacan, he also began to attend Kojève’s famous seminar on Hegel’s *Phenomenology of Spirit*. The influence of Kojève’s reading of Hegel on Lacan is clear in an essay he wrote at the end of the 1930s on the “family complexes,” and in many essays that followed. For example, Lacan’s account of identification in the famous essay on the “mirror stage” from 1936 is informed by dialectics. There, identification is described as a dialectical process in which the infant “assumes” a “specular image,” which is initially other to the infant. In this process the infant takes herself to be the image/other, and is yet alienated by this identification because of the gap that remains, that is, because the infant is still not the image or other in question. Identity therefore is not only relational, and thus alienating (we identify with that which we essentially are not), but also a fragile thing, always threatened with dissolution. Consequently, identity itself is a major cause of aggression.

One other way in which dialectics informs Lacan’s thinking about psychoanalytic theory and practice is found in his theory of desire. Desire is a major concept in Lacan’s work, and its place may fairly be said to owe more to the philosophical tradition than to Freud, for desire is not a major Freudian concept. Lacan’s philosophical resources for the concept come from Kojève’s reading of Hegel too, although Lacan had also been interested in Spinoza’s work as a youth.

12. Ibid., 83.
13. Ibid.
and was familiar with the philosopher’s famous claim that desire is the essence of being human.

Kojève took desire in Hegel to be a desire for recognition by others: the pursuit of recognition of oneself as a free, self-conscious being by other free, self-conscious beings. Yet it also becomes a desire to be desired (thus, a desire “for” the desire of others) as well as a desire for what others desire: thus, desire is essentially intersubjective – it is something in which identities and objects get inexorably mixed up with each other and exchanged. Hence Lacan’s fondness for an ambiguous definition such as “le désir, c’est le désir de l’Autre” (desire is the Other’s desire), pointing out that the “de” should be understood as both the subjective and objective genitive. Thus, desire is for the Other (to be recognized by the Other, for example) and equally so a desire to desire as the Other, which entails an identification with the Other’s desire – both with what it desires, and how the Other desires.

Since desire seems to involve, essentially, a relation to others, Lacan also found it helpful for shedding light on two crucial aspects of the psychoanalytic cure: the transference and the temporal structure of the cure itself, or its process. In 1951, affirming that “psychoanalysis is a dialectical experience and this notion should prevail when raising the question of the nature of transference,” he commented on a series of “dialectical reversals” in Freud’s case study of Dora. Each reversal (she recognizes her own libidinal investment in her troubles; she sees that she has identified with the one she professed to hate) is accompanied by a further advance on the path of her truth, which is attained with the recognition of her desire. In his seminar, Lacan spoke of the analytic process as a kind of see-saw, involving a series of flips and inversions that are ultimately spiraling toward a kernel, which would be the truth of the subject’s desire as a desire for recognition, or as a desire for the Other’s desire. At this time, Lacan’s general view of the cure in fact is that “the subject should come to recognize and to name his desire.”

III. THE STRUCTURALIST TURN

The influence of Kojève’s reading of Hegel is found not only in the role of dialectics and desire in Lacan’s theory but also in his early views on language. Lacan noted the importance of language in Hegel as a source of negation: “thus the

symbol first manifests itself as the killing of the thing, and this death results in the endless perpetuation of the subject's desire. After the war, Lacan became more and more interested in the composition of language itself and the role that its structure plays in making us into the “speaking beings” we are. He would call language the “cause of the subject” in an essay from 1960.

His reflections on language led him to develop the famous thesis that the unconscious itself is “structured like a language.” This claim should not be taken to mean that the unconscious is language, or that language is unconscious, or that the structure of the unconscious is identical to that of a linguistic structure. Rather, it means that there is an unconscious because there is language, because we are beings on to whom language is grafted, as it were. And furthermore, the way that the unconscious works – its creations of dreams, puns, fantasies, slips of the tongue, parapraxes, and so on – is due to the structure of language itself; in particular, by what Lacan finds to be the primary meaning-generating operations in language – metaphor and metonymy.

For Ferdinand de Saussure, from whose work Lacan draws, the basic linguistic unit was the “sign,” conceived as a unity of a signifier (a sound-pattern) and a signified (the concept, roughly). The two together would make up the sign’s meaning. Distinct from this, and more important, is a sign’s value. It is the sign’s difference from and relation to other signs that gives a sign its value. Thus, a sign’s value cannot be discerned without an awareness of the overall linguistic system in which it is placed. Meaning, according to Saussure, is a function of the intrinsic link between a signifier and a signified; value is a function of the sign’s overall position in a linguistic system.

Lacan gives differentiation an even more important status in language than Saussure does by giving the signifier priority over the signified, such that it is only by being linked up with other signifiers (in a signifying chain) that any particular signifier is able to take on something that should rightly be called not a signified but only a meaning- or signified-effect. Thus, Lacan severs the unity posited in the Saussurean sign. Borrowing from a study by Roman Jakobson, Lacan’s name for the basic way in which the essentially elusive signified-effect is generated is metonymy, a figure of speech in which a part of something is used to refer to the whole. This mirrors the structure of any signifying chain, since it is never the case that we really “have” the whole chain before us, but only parts at any given time. Lacan argues that desire’s very structure is metonymic too,

20. Ibid., 830.
making it the case that the object of desire remains structurally out of reach. Consequently, desire ends up always being a “desire for something else.”

The other primary linguistic operation is metaphor, which differs from metonymy primarily by generating a signifier that acts a bit more like a classical Saussurean sign. Although signified and signifier are still not really knit together by it – indeed, a signified is always just another signifier – metaphor makes it seem as if this happens. This way, Lacan highlights the enigmatic status metaphors can have, working to convince us that there is a precise signified somehow contained in the metaphor, even though it is ungraspable (whence also the inexhaustibility of interpretation). He associates metaphor not with the creation of desire but with the creation of the subject-effect itself and the process of identification.

Lacan’s early views on identification were shaped by dialectics and phenomenology. Now a linguistic operation, metaphor, becomes the model for thinking about identification. This affects his understanding of the Oedipus complex and other basics about Freudian theory. For Lacan, then, not only is the unconscious structured like a language, but the formative stages and complexes posited by Freudian theory seem to be as well.

Crucial for the resolution of the Oedipal conflict, Lacan felt, is the role of the symbolic father, or the “name of the father.” This name or function substitutes for the child’s early relation to the mother’s desire in what Lacan calls the “paternal metaphor,” a metaphor that generates as an enigmatic signified-effect the phallus. In Lacan’s account, the phallus is primarily a symbolic function, but there is also an imaginary version of it insofar as it is taken to be an object lost owing to castration, or an object of which one is deprived. The (symbolic) phallus turns out to be the signifier of the signified of the mother’s desire; in other words, it is the stand-in, the answer, as it were, to the child’s wondering about what the mother desires. This is different from an imagined object (the imaginary phallus), and of course different from a real object (the penis) too.

IV. THEORY OF THE SUBJECT

Lacan’s thesis that the unconscious is structured like a language also implies that the unconscious is autonomous and machine-like. This shapes quite strongly his view of the subject. The subject of psychoanalysis is seen by Lacan as an effect or product of the circulation of signifiers. Lacan wrote that game theory should therefore be of interest to analysts, since it “takes advantage of the thoroughly

---

calculable character of a subject strictly reduced to the formula for a matrix
of signifying combinations.\textsuperscript{24} This “calculable” subject “must be as rigorously
distinguished from the biological individual as from any psychological evolution
subsumable under the subject of understanding.”\textsuperscript{25} In other words, this subject is
not the subject of philosophy, if that is understood to mean a conscious, autono-

mous agent. Lacan calls his subject the “subject of science”: a subject stripped of
qualities, yet one that, despite its opposition to the philosophical subject, is still
rooted in a Cartesian insight.

Indeed, Lacan expresses his ultimate understanding of the subject through
a series of revisions of the formula for the Cartesian cogito. Early in his career,
Lacan announced the need for a return to Descartes.\textsuperscript{26} But this should not be
misunderstood: the return consisted of a very unorthodox reading of Descartes,
in which the cogito is stripped down to its bare minimum. This “subject of
science” is not the constituting subject of idealism or phenomenology but a
subject without qualities – the subject able to do nothing more than assert that
it is thinking “therefore I am”: “in the test of writing I am thinking: ‘therefore I
am,’ with quotes around the second clause, it is legible that thought only grounds
being by knotting itself in speech where every operation goes right to the essence
of language.”\textsuperscript{27} In other words, this revision of the Cartesian cogito makes the
assertion of being by thought into simply a “thought of being.”

But what does the Lacanian subject have to do with thinking anyway, if it is
not the subject of consciousness? In an early revision of the “cogito ergo sum,”
Lacan wrote “I am thinking where I am not, therefore I am where I am not
thinking,” and “I am not, where I am the plaything of my thought; I think about
what I am where I do not think I am thinking.”\textsuperscript{28} The point of these rewrites is to
register the effects of what Lacan takes to be one of Freud’s basic claims about the
unconscious: that it thinks. Thus, there is a thinking (in or of the unconscious)
in which, or with respect to which, the I of consciousness does not situate or
find itself. For Lacan, it should be clear, something crucial about our being is in
the unconscious: it is the site of our most fundamental desires, identifications,
fantasies, enjoyments, and so on, and since there is something like thinking that
goes on there, it is also the case that we “think about what we are” there in the
unconscious where we “do not think we are thinking.”

With these revisions, Lacan can contrast his theory of the subject not only
to the Cartesian cogito but to Hegelian philosophy as well. On this view, any

\begin{itemize}
\item \textsuperscript{24} \textit{Ibid.}, 860.
\item \textsuperscript{25} \textit{Ibid.}, 875.
\item \textsuperscript{26} \textit{Ibid.}, 163.
\item \textsuperscript{27} \textit{Ibid.}, 864–5.
\item \textsuperscript{28} \textit{Ibid.}, 517.
\end{itemize}
becomes suspect: “The promotion of consciousness as essential to the subject in the historical aftermath of the Cartesian cogito is indicative, to my mind, of a misleading emphasis on the transparency of the I in action at the expense of the opacity of the signifier that determines it.” As Lacan said in 1964, leading the subject back to its “signifying dependence” is at the root of the difference between a philosophical approach to the subject and a psychoanalytic one. The subject dependent on signifiers, caused by signifiers, is opaque to itself, and is not leading the charge as far as psychic organization goes. Thus, the Lacanian subject is properly seen as a split subject, as the gap or difference between these two ways of thinking about the unconscious and consciousness.

V. THE REAL, SEXUALITY, GENDER

Yet this is just one way to address how the subject is split. To put it briefly, this first way of discussing it posits the split subject as the aftermath of the inscription of the symbolic (which is not just language but also what Claude Lévi-Strauss had in mind with social structures) on the human individual, which renders us opaque to ourselves. But there is another way to express the split, and this is equally due to symbolic inscription or insertion, yet it involves what one would assume is important to any psychoanalytic orientation: the real and sexuality.

It is common to periodize Lacan’s work according to the three basic categories – the imaginary, the symbolic, and the real – that he uses to understand symptoms and many other things about psychic life. It is oversimplified to describe his work this way, but in some sense the early Lacan focused on the imaginary, the middle on the symbolic, and the late on the real. He first articulated these three terms and their interrelations in a paper given in 1953, right at the beginning of his seminar project. These terms can also be used as an easy way to think about the differing philosophical orientations Lacan had throughout his career, with the imaginary corresponding to his phenomenological period, the symbolic to his structuralist period, and the real corresponding to a period whose name is perhaps yet to be determined (poststructuralist would not be quite right for it, not least because it is not a term Lacan ever used for his thinking).

The imaginary in Lacanian theory should not be understood as a reference to imagination. Rather, it refers to images and their influence on consciousness and perception. The imaginary tinges psychic life with a kind of transitivity, a blurring of the boundaries between self and other. Yet it is also in the imaginary that others are seen as rivals as well as others with whom we identify. The symbolic,
by contrast, is obviously affiliated with language, but also social structures and institutions. It tends to have more dialectical and individuating connotations.

Lacan’s thinking about sexuality is found in his discussions of a notion that ultimately prevents his theory from being characterized as a kind of linguistic idealism: the real. As a general heading under which a variety of different concepts can be placed – such as the Thing, the drive, jouissance (which is not simply enjoyment and pleasure, but more like a displeasurable pleasure or a pleasurable displeasure) – the real marks an insistent, obtrusive element in psychic structure. The real is something like what is left over from symbolic inscription, yet it too is modified by and influenced by language. For this reason, some commentators have argued for a distinction between the real that precedes language and the real that persists after the onset of language, as an “insistence” and as an impasse in and for signifiers.

One of Lacan’s early forays into this dimension is found in a discussion of what he called “the Thing.” The Thing is described as the “first outside” and as the “absolute Other of the subject.” It becomes the object pursued by desire, and yet it is not exactly a lost object: “although it is essentially a question of finding it again, the object indeed has never been lost.” It is not exactly a lost object because of the structural place it possesses in the psyche. Lacan spoke of the intimate exteriority or ‘extimacy,’ that is the Thing,” an extimacy he initially thought of along the lines of a vacuole in cellular biology: an empty space, originally part of the outside, that is included in the structure. Lacan continues to work with this idea in subsequent seminars, through more complicated figures such as tori, cross-caps, Klein bottles, and Möbius strips, and even the empty set in set theory. All of these are intended to model a psychic structure in which inside and outside are mutually implicated in each other, which is supposed to reflect the way in which the real itself is included/excluded in psychic organization.

Understanding the strange status of the real in psychic structure is critical for understanding the nature of the drives and sexuality in Lacanian theory. Lacan hypothesizes that the earliest experiences with sexuality are traumatic, in large part, because of their resistance to or otherness to symbolization. It is interesting to note that according to Lacan there is no subject of jouissance (which is arguably a sexual satisfaction). It is an “acephalic” enjoyment, which can be understood in a few different senses. For one thing, there is no consciousness involved in it; but for another thing, it is something that is not “subjectified” – the subject does not come to be there where jouissance is. Nevertheless, symbolic repair

31. Ibid., 58.
32. Ibid., 139.
work is needed with respect to it, and this occurs in a variety of ways, such as the development of a “fundamental fantasy” and also in the form of sexuation. What this will mean is that sexual difference itself is an attempt to, roughly, make sense of the impasse that sexuality itself represents for psychic structure.

On the topic of gender (often called sexuation by Lacanian theorists), Lacan is a nonessentialist. Masculine and feminine subject-positions are independent of biology. They are defined by their relation to the phallus, which, again, is symbolic and not real. The masculine subject-position identifies with possession of the phallic signifier: having, rather than being, the phallus. This position is also defined by what Lacan calls a “phallic jouissance,” a jouissance focused on the sexual organ: again, this is a subject-position that may obtain for both males and females. The feminine subject-position relates not only to the phallus as a signifier (identifying with “being” it rather than “having” it) but also to what Lacan writes as the signifier for the Other’s desire. This double relationship opens up for the feminine subject a dimension of jouissance that is not phallic. Lacan calls this a “feminine” or “Other” jouissance. Consequently, Lacan calls woman “not all,” in the sense that “not all” of her enjoyment is phallic; there is, additionally, an enjoyment that involves a different relation to language and the symbolic in general.

VI. MODELS OF THE CURE

Lacan’s early discussions of the cure portray it in Heideggerian and Hegelian terms as much as Freudian ones: either as a confrontation of the individual with his or her being-toward-death or as a recognition or realization of desire; finding oneself in an identification that was disavowed, or in a desire that was not acknowledged. In the early 1960s, after his initial arguments for the primacy of the signifier for psychic structure had been worked out, Lacan’s view of the cure starts to change. In a discussion of Sophocles’s Antigone that has been widely commented on, Lacan argued that Antigone remains a figure of fascination for audiences because of her status “between two deaths,” her impending real death and her “symbolic” death (in the sense that she is condemned and as it were symbolically excluded from the community, and not yet really dead). The appeal of her persistence in her desire to bury her brother despite Creon’s orders not to gets Lacan thinking about desire, transgression, betrayal, guilt, and their roles in the cure. A slogan from the end of this seminar has been taken by many

commentators to be an adequate expression of Lacan’s ethic at this time: do not cede on your desire. Yet it is questionable whether this was meant to express the ethic of psychoanalysis and the goal of the cure. Lacan claims rather that the feeling of guilt, so common in neurotics, is connected to having ceded on desire. Antigone is fascinating then precisely because she is someone who has not ceded on her desire (to bury her brother, and/or to remain faithful to her family’s curse), thus making her into an attractive figure of transgression, and hence an ideal to neurotics.

For this reason, her position is not necessarily the position to be attained at the end of analysis. Lacan finds that another model for the ethic of the cure (for neurosis anyway) is found in a series of plays by Paul Claudel (1868–1955) called the Coûfontaine trilogy, which tracks the history of an aristocratic family in the aftermath of the French Revolution. The initial character, Sygne, clearly does give way on her desire, by marrying the man who destroyed her family. The symbolic burden of this sacrifice is not resolved until we meet her granddaughter Pensée de Coûfontaine, whom Lacan speaks of as a “thought of desire.” Blind, and apparently an object-cause of desire for many, she has identified with lack and loss, and in this manner provides a model for the end of the psychoanalytic cure.

A later view of the cure that has had an influence on philosophers, especially in ethical, social, and political theory, is Lacan’s articulation of the psychoanalytic act in the mid-1960s. If the subject’s relative determination by signifiers is understood in terms of the fundamental fantasy – a basic orientation or grid that structures relations to others, objects, and enjoyment itself – then the psychoanalytic cure could be thought of as the progressive uncovering of the fantasy, leading the analysand to the point where a choice can be made with respect to it: perhaps an identification with the fantasy, or a “traversing” of the fantasy in what Lacan calls the psychoanalytic act. This notion has been attractive to scholars in ethics and political philosophy because of its resemblance to the topic of authenticity in existential philosophy, and also because of its proximity to ideology critique, according to which the act resembles a classic revolutionary gesture.

VII. LACAN AND PHILOSOPHY

References to philosophers are widespread in Lacan’s seminars and writings, and the following discussion is inevitably incomplete. Lacan’s references to Pascal’s wager are a regrettable absence. Major discussions of Plato’s Symposium in his

eighth seminar and Aristotle’s ethics in his twentieth are also noteworthy for philosophers, but omitted here. The following will focus only on Lacan’s relations to Heidegger, Sartre, and Merleau-Ponty.36

In 1956, Lacan translated the first part of Heidegger’s “Logos” essay and published it in his school’s journal. Heidegger’s text is about the famous Greek concept, which could be taken to refer to language or “the word,” yet Heidegger reads it in such a way that it means letting beings be as they are: a rephrasing of the famous phenomenological principle “to the things themselves!” Heidegger’s essay also discusses listening, and this might account for Lacan’s interest in publishing it for analysts in training: listening is, of course, something an analyst is expected to do well. Here, the lesson to be gained from Heidegger’s text would be learning to listen to the text of the analysand’s speech, or letting that text speak itself without presumptuous interpretations, prejudices, and so on.

Considering this translation, as well as Lacan’s modeling of the cure as a realization of being-toward-death in his 1953 Rome Discourse, and scattered, passing references to Heidegger’s idea that humanity inhabits language, rather than vice versa, it would seem that Heidegger was a major influence on Lacan. Lacan even visited Heidegger, accompanied by Jean Beaufret (1907–82), in 1955, and invited Heidegger to stay at his country house during the 1955 Cerisy conference on Heidegger that Beaufret and Kostas Axelos (1924–2010) had organized.37 But apart from what seems to have been a genuine respect for the philosopher, there does not seem to have been much in the way of real influence. Once Lacan had developed a vocabulary of his own for the expression of his key concepts, he no longer couched them in Heideggerian terms. Thus, in retrospect, Lacan’s use of Heideggerian terminology was perhaps simply faute de mieux. He did make several references to Heidegger’s view of truth as alētheia, which informs his own view that truth can only ever be “half-said.” Yet this is arguably also a Hegelian or Freudian insight.

Lacan’s references to Sartre are usually unflattering, yet there seems to have been something more of an influence in this case, albeit of a negative kind. Sartre’s notion of a subject transparent to itself (for Sartre, consciousness was always also self-consciousness) was antithetical to Lacan’s orientation, and many of Lacan’s statements about the subject of psychoanalysis are articulated on purpose as strong contrasts to what Sartre posits. It would seem that Sartre represents for Lacan the pinnacle of the basic philosophical error about the subject. Also, Sartre’s vigorous defense of freedom was held up for ridicule by Lacan. He

*36. Heidegger is discussed in essays in The History of Continental Philosophy: Volumes 3 and 4; Sartre and Merleau-Ponty are discussed in essays in The History of Continental Philosophy: Volume 4.

wrote that “I am not one of those recent philosophers for whom confinement within four walls merely helps us attain the ultimate in human freedom.” And in 1956 he linked the “discourse of freedom” – probably thinking of Sartrean existentialism – to delusion. However, Lacan did find Sartre’s discussion of the gaze helpful for setting up his own theory of the gaze as one mode of “object a” in his eleventh seminar.

After the publication of the Écrits, Lacan would be asked in interviews about his relation to Sartre, and he was usually vexed by this question, protesting that there was no relation. Sartre had been critical of what he called Lacan’s “decentering” of the subject, and raised concerns about the possibly ahistorical theory Lacan was developing, a concern Sartre had about structuralism in general. Lacan in turn pointed out that “Sartre’s entire philosophy wants the subject and consciousness to be indissolubly linked. Well, in Freud this connection is broken.”

Lacan was generally less critical of Maurice Merleau-Ponty’s philosophy than of Sartre’s, finding more room for the unconscious in it. A rather detailed discussion of Merleau-Ponty’s late texts “Eye and Mind” and The Visible and the Invisible is found in Lacan’s eleventh seminar. Lacan also wrote an essay on Merleau-Ponty for publication in a special issue of Les Temps modernes. It seems that Lacan, while appreciative of Merleau-Ponty’s more nuanced view of consciousness, still found him to be essentially a philosopher, which again for Lacan means someone for whom consciousness was still too central, someone who was inclined to underplay the primacy of the signifier in psychic life.

41. Interview, Le Figaro Litteraire (December 29, 1966).
The situation is slightly different for philosophers who emerged in the 1960s. In an essay called “Freud and Lacan” from 1964, Louis Althusser was drawn to Lacan’s promotion of psychoanalysis as a “science of the unconscious” rather than a hermeneutics. The return to Freud by Lacan was also taken by Althusser to be much like his own return to Marx: a return, as he puts it, to the “maturity” of the thinker apart from early influences. Paul Ricoeur (1913–2005) attended Lacan’s seminars for several years, although he later professed that he did not get much out of them. When his *Freud and Philosophy: An Essay on Interpretation* was published, Lacan was dismayed to find that his work did not receive more attention in it.

Gilles Deleuze (1925–95) credits Lacan in *Difference and Repetition* for providing a helpful way of thinking about the distinction Deleuze was making between real objects and virtual objects. In *Logic of Sense*, there is a similar discussion of Lacan’s work, referring this time to something Deleuze calls “Lacan’s paradox,” in which it is possible for an object to “lack in its place.” According to Deleuze this means “the paradoxical entity is never where we look for it, and conversely … we never find it where it is.” Of course, Deleuze would later be rather critical of psychoanalysis in general, and even though Lacan is still extended some credit in *Anti-Oedipus* for having “saved psychoanalysis from the frenzied oedipalization to which it was linking its fate,” Lacan’s frequently unnamed “disciples” are strongly criticized. In what is often thought to be a very anti-Lacanian text, it is even said there that “it is certain that he [Lacan] does not enclose the unconscious in an Oedipal structure.” And in fact Lacan “was the first … to schizophrenize the analytic field.” Michel Foucault (1926–84) attended a few sessions of Lacan’s seminar in 1966 after the publication of *Les Mots et les choses* (translated as *The Order of Things*). Lacan had taken up his own study of the painting by Velazquez, *Las Meninas*, at the time and was giving his own spin on it, inspired by Foucault’s discussion.

---

*44. For discussions of the work of the French philosophers mentioned in the following paragraphs, see the essays in *The History of Continental Philosophy: Volume 6*.  

Luce Irigaray’s (1930– ) discussions of Lacanian psychoanalysis in such works as *This Sex Which Is Not One* and *Speculum of the Other Woman* are concerned with the adequacy of Lacan’s attention to sexual difference, especially in Lacan’s claims about the status of feminine *jouissance* and women in general. Irigaray finds Lacan’s discussions of feminine sexuality rather patronizing in her “Così Fan Tutti,” especially for positing her enjoyment as unspeakable and inscrutable.55 Her project of uncovering a language specific for each gender is nevertheless heavily influenced by Lacanian theory. Julia Kristeva’s (1941– ) work is also very significantly informed by Lacanian theory. She has questioned Lacan’s emphasis on the symbolic over what she calls the semiotic, and his neglect of the importance of the pre-Oedipal stages.

When his seminar started to be held at the École Normale Supérieure, Lacan found a different audience, and his impact on intellectual life in Paris became much greater. A group of students, many of whom were contributors to the journal *Cahiers pour l’analyse*, took Lacan’s work in a different direction, linking it to ideas in set theory and Marxism. Thinkers such as Alain Badiou (1937– ), Jacques-Alain Miller (1944– ), and Jean-Claude Milner (1941– ), whose works would not strongly influence anglophone readings of Lacan until the 1980s, were members of this group.56

Lacan travelled to the UK after the war, visiting a clinic run by Wilfred Bion (1897–1979), which inspired him to write a paper on groups.57 But his influence on intellectual life in anglophone countries really began in the 1970s, with

---

56. For a discussion of these and other thinkers associated with *Cahiers pour l’analyse*, see the essay by Patrice Maniglier in *The History of Continental Philosophy: Volume 7.*
some of the first studies of his works coming from literary and film theorists and continental philosophers. Early translations of Lacan’s works focused on selections from the *Écrits*, a few selections from Seminar XX and other later seminars, and Seminar XI. Lacan made two trips to the US. He was invited to speak at a conference on structuralism at Johns Hopkins University in 1966, and he spoke at Yale University and Columbia University in 1975. With the ethical turn that much of continental philosophy took in the 1980s and 1990s, Lacan’s reading of Antigone, and related topics on desire and identity, were influential. In the 1990s, readings of Lacan emerged that began to take note of the centrality of clinical experience for his theory. Departing somewhat from the early emphasis on Lacan’s readings of literary texts, his accounts of gender also received closer study, and his work began to be appropriated into social and political theory, for example by Slavoj Žižek (1949–) and Ernesto Laclau (1935–).

Lacan’s work has a strange status for philosophers. It attracts philosophical inquiry because of the presence of obviously philosophical themes in it, yet it also repels such inquiry because of its completely nonphilosophical and nonacademic goals, which are to develop a doctrine for the training of psychoanalysts and models for the psychoanalytic cure. From a philosophical perspective, it is also hard to discern whether his work offers, on the one hand, a very flexible and inventive set of concepts that gives a unique and important perspective on contemporary psychic life, or whether, on the other hand, it is a more rigid system, pigeonholing the multiplicity of human life into strict types (neurotic, psychotic, perverse) in very simplistic, reductive terms (real, symbolic, imaginary). In addition, the potentially universalizing and ahistorical aspects of the theory may seem to render it insensitive to cultural and historical differences, unless the formalism of the theory is precisely its strength, allowing it to be applicable to a variety of contexts. It is fair to say that there may turn out to be something reminiscent of Hegel about Lacan’s status and legacy for philosophers (Badiou has even called Lacan “our Hegel”), at least in the following sense: just as readings of Hegel’s work are still divergent (is it an atheistic philosophy or not, for example), the status of Lacan’s work will probably be similarly up in the air for some time to come. Aspects of Lacanian theory have already proved useful to philosophers of different stripes. The precise challenge Lacan thought psychoanalysis presents to philosophy – namely, its alternative theory of the subject, one whose status would have to fall outside the legacy of philosophical idealism – is still to be thought through.

---

*58. For a discussion of this ethical turn, see the essay by Robert Eaglestone in *The History of Continental Philosophy: Volume 7*. 

279

Volume 5
MAJOR WORKS

Developments in Anglo-American philosophy during the first half of the twentieth century closely tracked developments that were occurring in continental philosophy during this period. This should not surprise us. Aside from the fertile communication between these ostensibly separate traditions, both were responding to problems associated with the rise of mass society. Rabid nationalism, corporate statism, and totalitarianism (Left and Right) posed a profound challenge to the idealistic rationalism of neo-Kantian and neo-Hegelian philosophies. The decline of the individual – classically conceived by the eighteenth-century Enlightenment as a self-determining agent – provoked strong reactions. While some philosophical tendencies sought to reconceive the relationship between individual, society, and nature in more organic ways that radically departed from the subjectivism associated with classical Cartesianism, other tendencies sought to do just the opposite. This is one way of putting the difference between the two major movements within Anglo-American philosophy that I shall be discussing in this essay.

American pragmatism, which achieved the pinnacle of its popularity prior to 1940, traces its lineage back to empiricism as well as German idealism. With the exception of William James, who is best known for his defense of radical empiricism, the other two important twentieth-century pragmatists, John Dewey (1859–1952) and George Herbert Mead (1863–1931), embraced a post-metaphysical version of Hegelian dialectics that was starkly antithetical to both Cartesian rationalism and atomistic empiricism. By contrast, logical positivism, which maintained a lively hold on Anglo-American thought as late as the 1960s, reacted against Hegelian philosophy in all its forms, and accordingly resurrected both the Cartesian method of conceptual (logical) analysis as well as its atomistic ontology.
In this respect, positivism is closer in spirit to Husserlian phenomenology and French structuralism, while pragmatism is closer in spirit to Heideggerian existentialism and its French progeny (the outstanding exception being Sartre’s early Cartesian existentialism). As a general rule, the pragmatists’ embrace of methodological holism served as counterpoint to the positivists’ endorsement of methodological individualism. However, in contrast to their continental counterparts, pragmatists and positivists shared the naturalistic approach to philosophical explanation that had been the hallmark of Anglo-American philosophy since Francis Bacon.

I. PRAGMATISM

In order to understand the complex relationship between Anglo-American philosophy and continental philosophy during the interwar years, we would need to trace the genealogy of logical positivism and American pragmatism back to their late-nineteenth-century continental antecedents. This dimension has been so thoroughly explored by others that little need be said here about this fascinating chapter in Western philosophy.1 Aside from some notable exceptions – such as Husserl’s positive reaction to some of William James’s earlier ideas concerning experiential psychology (including James’s notion of an experiential “fringe,” which Husserl credits as a precursor to his own notion of “horizon”) – the reception of American pragmatism by English, German, and French philosophy in the early decades of the twentieth century was clouded by a prejudicial misunderstanding that was partly abetted by the very philosopher who gave this movement its name. The German translation of James’s Pragmatism: A New Name for Some Old Ways of Thinking (1907) by Wilhelm Jerusalem in 1908 catapulted pragmatism into the central topic of discussion at the World Philosophical Congress held at Heidelberg that very same year. James’s assertion in that book that “the true … is only the expedient in the way of our thinking”2 – led many of his German contemporaries to dismiss this “new fad in philosophy … from the land of the dollar” as (in the words of one critic) a degradation of “the truth to the level of expediency, just as in days gone by, a similar way of thinking was imported to us from the land of shopkeepers [i.e. Britain] preaching the reduction of morality to utility.”3 The crassest misrepresentations

of pragmatism spawned by this untimely reception have been the subject of a withering critique by Hans Joas. These include the view that pragmatism reduces truth to utility; endorses Cartesian subjectivism; and represents a mishmash of Ernst Mach's empirico-criticism, Friedrich Nietzsche's perspectivalism and will to power, and German Lebensphilosophie.

These misconceptions about pragmatism continued to inform German philosophy for the next four decades, as can be seen from Max Scheler’s and Max Horkheimer’s unsympathetic comments. Strikingly absent from this reception is any mention of the profound impact of Charles Sanders Peirce on James’s thought. Indeed, Peirce’s signal contribution to the social philosophies of James’s most prominent successors in the pragmatist tradition (most notably Mead and Dewey) consists in his anti-Cartesian, antiphenomenalist linkage of meaning and knowledge to action. More precisely, it was Peirce’s genetic linkage of instrumental action undertaken by a single intelligent being to social action undertaken by a community of knowers that would later inspire the progressive politics of Mead and Dewey. So central to the thought of Mead and Dewey (and, to a lesser extent, Karl Popper) is this linkage of reflective natural adaptation and social community that it would later ground their view that free and fully inclusive democracy is central to the full development of the kind of creative intelligence that is so necessary for progressive problem-solving of any kind.

Peirce expressly derived his notion of “pragmaticism” from Kant’s use of pragmatisch in the Critique of Pure Reason (II, ch. 2, sec. 3) and the Foundations of the Metaphysics of Morals (sec. II), where Kant equates it with instrumental (prudential) action guided by hypothetical (conditional) rules, in contrast with

4. Joas, Pragmatism and Social Theory, 99.
5. In his book “Erkenntnis und Arbeit” (1926), Scheler reduced pragmatism to a “knowledge of productivity,” which he distinguishes from a knowledge of culture (Bildungswissen) and a knowledge of redemption (Erlösungswissen). More tellingly, he equated this knowledge of productivity with a “knowledge of domination” that in his mind was largely indistinguishable from the kind of narrow instrumentalism that characterized positivism. Scheler’s interpretation of pragmatism served as the dominant reference point for Horkheimer’s dismissive treatment of Dewey’s philosophy in Eclipse of Reason, written almost twenty years later. Although Horkheimer takes note of the “many schools of thought” that have criticized pragmatism, he himself cites only Hugo Münsterberg’s Philosophie der Werte and Scheler’s “Erkenntnis und Arbeit,” in Scheler’s Die Wissenformen und die Gesellschaft (Max Horkheimer, Eclipse of Reason [New York: Oxford University Press, 1947], 42).
moral (practical) action guided by categorical (unconditional) imperatives. Peirce himself was mainly interested in showing how the meanings of many if not most general ideas (or signs) could be interpreted in terms of general (counterfactual) conditionals. Such conditionals prescribe the performance of an indefinite number of instrumental (experimental) actions that achieve definite consequences. Thus, the meaning of “this diamond is hard” would be explicable by a statement of the sort “If one were to scratch, illuminate, etc., this substance, then consequences such as failure to scratch, darken, etc. would occur.”

Especially important for later pragmatists is the way in which Peirce connects this account of meaning to an account of knowledge, truth, and logical probability. According to Peirce, the meanings of our words are constant because they signify fixed beliefs. These beliefs are acquired and confirmed in experimental situations in which the outcomes are at best statistically probable but not absolutely certain. Probability, in turn, designates a relative frequency, the average deviation from which diminishes in proportion to the number of trials. The upshot is that the constancy of a sign’s meaning is also relative to experimentally confirmed statistical frequencies produced over time. Indeed, so is truth. For on Peirce’s account, it is the experimental method – not tenacity, authority, or a priori reasoning – that enables us to approximate a lasting consensus in the fixation of belief and thereby eliminate deviations that produce doubt. More importantly, it is the experimental method as applied by an indefinite ideal community of inquirers that gradually enables us to approximate (if not reach) a true and lasting consensus over time regarding all of our beliefs, moral as well as cognitive.

Peirce’s insights regarding knowledge and meaning proved seminal for Dewey and Mead. Dewey began his career as a Hegelian. During the period from 1890 to 1900, his embrace of Hegelian idealism, with its notion of conceptual holism and conceptual dialectic (or development) traversing stages of contradiction (analytic opposition and distinction) and resolution (synthetic unification and identification), underwent a profound naturalistic transformation. Under the influence of Darwin’s theory of evolution, Dewey translated this dialectic into the idiom of biological organism and growth as a progressive process of environmental adaptation and change. His deeper exposure to Peirce’s and James’s pragmatism around the turn of the century added a third element to this equation: instrumentalism (or “experimental idealism” as he then formulated it). As we shall see, Dewey’s instrumentalism bears a striking resemblance to certain aspects of Martin Heidegger’s existential phenomenology in its emphasis on the holistic and situational nature of human understanding (or inquiry, as Dewey dubbed it). For Dewey, human understanding involves an embodied attunement to an environment that is already meaningful (circumscribed by language and community) but never determinately so, thereby calling forth an ongoing
process of active interpretation (reconstruction) in light of new questions, new problems, and new possibilities.

While Dewey was interested in working out the implications of instrumentalism for a theory of democracy and education, Mead was chiefly preoccupied with applying Peirce’s anti-Cartesian insights about the communal genesis of knowledge and meaning to the new fields of developmental and social psychology. As with Dewey’s pragmatism, Mead’s symbolic interactionism, which he also called social behaviorism, owes a great deal to Hegel’s dialectical philosophy, especially its account of self-certainty, conceived as a process of acquiring recognition from (internalizing the viewpoint of) another. For Mead, one becomes a full self – an “I” who as subject can reflectively relate to itself as object, or “me” – only in the course of proceeding through progressive stages of social and symbolic interaction. As socialization proceeds, so does individuation. Ultimately, the capacity of the self to internalize the impersonal and abstract linguistic perspectives of first-, second- and third-person – signified by the human community (or generalized other) – enables the self to critically free itself from the particular social roles constitutive of itself as a nexus of social habits (or “me”), thereby enabling it to become a uniquely creative inventor of its own values and beliefs – in short, of its own identity as an “I.”

II. GEORGE HERBERT MEAD

Mead’s entire career was informed by the Hegelian insight that “the whole is more concrete than the part.”8 The rather meager corpus of essays and fragments that constitute Mead’s oeuvre, most of which have been posthumously published in various collections, repeatedly attest to the power this idea had on his thought. Once again, it is Peirce’s notion of a community of interpretation as pivotal for understanding meaning and belief that links this idealistic notion to an account of social behavior. Darwin’s Expression of the Emotions in Man and Animals provided Mead with an evolutionary model for understanding the

7. George Herbert Mead (February 27, 1863–April 26, 1931; born in South Hadley, Massachusetts; died in Chicago) received his BA from Oberlin College (1879–83) and began doing graduate work at Harvard in 1887, although he never wrote a dissertation. In 1893 he was appointed professor of philosophy at the University of Chicago, where he served in that capacity until his death. His main intellectual influences included Darwin, Hegel, and Adam Smith. Among his most important books are The Philosophy of the Present (1932); Mind, Self, and Society (1934); Philosophy of the Act (1938); Selected Writings: George Herbert Mead (1964); and The Individual and the Social World: Unpublished Work of George Herbert Mead (1982).

Volume 5
rudimentary social psychology of animal behavior. Meanwhile, Dewey’s im-
portant work on the reflex (stimulus response) arc, which in many ways anticipated
Gestalt psychology as well as the phenomenology of perception and behavior
developed by Maurice Merleau-Ponty a half-century later, provided him with
a nonatoministic (nonmechanistic) model of organic behavior, understood as an
interpretative response that internalizes and reconstitutes a stimulus within a
learning arc.⁹

Mead is chiefly concerned to show how mind and self emerge in the course of
traversing logical phases in the development of social and symbolic interaction.
The most primitive phase – “the conversation of gestures” – can be observed
in animals, as when a dog growls in order to ward off another dog. Darwin
regarded such gestures as expressions of inner emotional states, not as forms
of social interaction. For Mead, the gesture possesses significance for the dog
toward whom the gesture is directed. The gesture’s capacity to stimulate behavior
causally depends on its being significant to its recipient. As with Dewey, the stim-
ulus becomes effective only by being constituted and interpreted as significant.
Here, however, the significance in question is established socially, as a type or
pattern of response (coordination) that comes to be shared.

So construed, there need not be anything like a “consciousness of meaning”
on the part of the dogs in question regarding the significance of their growling.
Meaning and language first emerge when the gesture becomes a “significant
symbol.” That happens when the dogs learn how to use their growling gestures
purposefully. The gesture of growling becomes mutually meaningful once each
dog “internalizes” the fact that growling calls forth a specific behavior in the other
dog. In order for this to happen, each dog must take the attitude of the other dog
toward his own behavior. That is, as a dog I imagine myself being the other dog.¹⁰

In imagining myself thus, I learn to respond to my own act, to reflect on myself.

Mead’s fascinating account of infantile role-playing connects the interactive
genesis of meaning with the social, moral, and cognitive development of the self.
In play a child imagines herself playing the roles of her parents or other signifi-
cant others. She conducts a conversation with herself, playing different roles,
the meaning of which she herself more or less freely constitutes (albeit, with the

⁹. In 1942 a committee of seventy psychologists named Dewey’s “The Reflex Arc Concept in
Psychology,” Psychological Review (1896) the most significant contribution ever published in
the journal.

¹⁰. Mead’s reference to the act of seeing oneself through the eyes of the other not only paraphrases
Hegel’s famous account of self-consciousness in the Phenomenology but also recalls Adam
Smith’s belief that in moral matters “[w]e suppose ourselves spectators of our own behavior,
and endeavor to imagine what effect [our own passions and conduct] would, in this light [i.e.
as regards our feelings of approval or censure] produce upon us” (Adam Smith, The Theory of
guidance of some incipient models). When play becomes a game involving other children, the child has less freedom to improvise, for here the roles have to be negotiated and agreed on. In order to do this, the child has to learn to take up the attitude of all her playmates. The game of tag, for example, only works if the child who is "it" simultaneously adopts the attitude of all the other players (in effect, playing out their assumed roles in the interiority of her mind).

It is this reflexive role-playing and attitude-taking competence that founds the ability to participate in all other social groups, from the most local of neighborhood clubs to the most all-inclusive humanity. In becoming social, the child learns to adopt the standpoint of the \textit{generalized other}. Ultimately, it is by internalizing the attitude of the community in which she belongs that she internalizes the moral responses of that community and becomes a “principled” person. But the self does not lose its individuality in becoming so socialized. On the contrary, the capacity to adopt an abstract point of view (that of the community or of humanity at large) enables one to critically objectify and freely distance oneself from the multitude of particular roles one has internalized as “me.”

Individuals, then, are the outcome of freely reconstituting and reinterpreting the various habituated social roles within their repertory. \textit{Qua “me,”} the individual is a unique (and in that sense individual) confluence of sedimented social roles that one can recall to memory (as a part of one’s already scripted autobiography). However, once recalled to memory and made an object to oneself through adopting the attitude of a \textit{second-person}, the “me” can be set in dialogue with a more abstract aspect of the self, which is formed by taking the role of a \textit{third-person} observer: the \textit{generalized other} (representing the attitude of the social group taken as a whole).

In contrast to the “me,” which is the unconscious repository of social norms, the “I” represents that part of the self who reacts almost impulsively against (or toward) the attitude of the community and tries to change it. Unlike the “me,” the “I” cannot be reflectively known as an object from the perspective of the second-person. Instead, as a kind of instinctual or imaginative spontaneity, it deploys the critical admonitions of the conventional generalized other (the superego, in Freudian parlance) and projects these on to the image of an ideal, utopian community in which the “I” along with all other “I”s achieves perfect freedom and fulfillment. So construed, the “I” is the source of two kinds of moral demands: a demand for \textit{moral autonomy}, which finds expression in the individual’s assertion of its rights against the conventional norms and laws of the community, and a demand for \textit{self-realization}.

In sum, the self is a dialectical movement, in that it becomes increasingly free and individuated only to the extent that it expands the circle of recognition from the second-person to the third-person, and from the conventional third-person to the ideal (universal) third person. In this respect, individuation
and socialization mutually condition one another through the inextricable identity linking social dependency and individual autonomy. Society and individual realize one another.

III. JOHN DEWEY

Although logic and epistemology form the core of Dewey’s pragmatism, they acquire a distinctive social and political significance in his writings that recall Mead’s analysis of the ideal trajectory of socialization and individuation, embeddedness and emancipation. For Dewey, inquiry necessarily involves a process of critical evaluation that engages all aspects of our social being. As with Peirce, experimental inquiry is a communal activity whose full potential is realized only in democracy, understood as a critical, egalitarian communication of the experimental inputs of each and every member of the community. So construed, community and democracy primarily function as social instruments for problem solving.

A brief glance at some of Dewey’s major works – Logic: The Theory of Inquiry (1938), Art as Experience (1934), Democracy and Education (1916), Experience and Nature (1925) – confirms this assessment. What Dewey means by logic is a general theory about the rules governing the formation of concepts, judgments, and inferences in experimental situations; it is a complete theory of human thought and reasoning conceived in instrumental terms. From an evolutionary point of view, instrumental activity is the means by which humans adapt to and change their environment (and thereby change themselves). Phenomenologically speaking, humans are not just spatially inserted into the world as if they were things. Rather, they constitute the world they inhabit; that is, their interests and concerns provide selective reference points for interpreting their surrounding situation as a contextual, meaningful whole. Inquiry is initiated when the situation no longer presents itself as a determinate and coherent whole. Biologically speaking, the human organism experiences a disruption of adaptive functioning, a disequilibrium with respect to its environment as well as with respect to itself. Re-establishing harmony requires reconstituting the situation (and therewith

11. John Dewey (October 20, 1859–June 1, 1952; born in Burlington, Vermont; died in New York) received his BA from the University of Vermont (1875–79) and received his PhD from Johns Hopkins University in 1884. He was appointed Professor of Philosophy at the University of Michigan until 1894, when he accepted an appointment at the University of Chicago. He finished his career at Columbia University in New York City (1905–39). Peirce (whose lectures on logic he attended while at Johns Hopkins) and the neo-Hegelian idealism of George Sylvester Morris were early influences during his graduate studies. Later influences included James and his colleague at the University of Chicago, Mead.
oneself and one’s experience) in a logical succession of developmental stages. Stage one involves reinterpretation (thoughtful redescription) of a problematic situation that determines what might or might not be relevant; stage two consists in formulating solutions to the problematic situation that take the form of instrumental hypotheses; stage three concretizes (further determines and delimits) the range of possible solutions by sifting through factual observations that in turn suggest new “ideas” or ways of resolving the problem; stage four deploys “reasoning” to articulate and define ideas in relationship to one another by means of propositions and inferences; and the fifth and final stage culminates in an experimental testing of the ideas so developed. If they prove successful, then we are warranted in asserting them as “true” judgments just so long as they continue to effect an operationally successful (existential) correspondence between the questions posed by the situation and the answers posed by the inquirer.

The nature of inquiry not only incorporates critical evaluation of what, in a problematic situation, is important to us – relative to our needs, desires, feelings, and interests – but also provides a mechanism for reconstituting these very concerns. In other words, inquiry constitutes the very contents of our moral life, and it constitutes them within a continuous process of education and growth. The reference to growth has teleological import: indeed, for Dewey, “growth itself is the only moral ‘end.’”12 The proper aim of education is thus to facilitate growth, by enabling the formation of intelligent habits of thought and behavior. These, in turn, are teleologically directed toward the resolution of conflicts – social as well as natural. While complete integration with one’s environment is never achievable, it does point to the importance of joining with others in peaceful democratic community in furthering the social and political conditions that conduce to mutual growth. Social and political arrangements that are premised on a false individualism (or false totalitarianism) violate these conditions; as do any arrangements that generate social inequalities and conflicts (or authoritarian solidarities).

Dewey’s own faith in a new liberalism reconstructed along the lines of a democratic and scientific socialism recalls Mead’s discussion of the “emancipatory” trajectory of genuine socialization. In many respects, Dewey’s liberalism – as developed in Liberalism and Social Action (1935) and Individualism: Old and New (1929) – harks back to John Stuart Mill’s appeal to Wilhelm von Humboldt’s romantic paean to “individuality,” which in turn recalls the Feuerbachian Hegelianism of the young Marx that proved so compelling to members of the Frankfurt School of critical theory. Central to this understanding is a belief that traditional liberalism and theoretical science are caught up in a “dialectic of enlightenment,” to use Theodor Adorno and Horkheimer’s

expression. According to Dewey, the classical liberalism of Locke emancipated the individual from absolutist forms of government, but only at the expense of dissolving the individual into an “atomistic” ego, whose liberty was seen as an innate endowment cut off from society. Such atomistic individualism informed the second, utilitarian wave of nineteenth-century liberalism, where, following Bentham’s teachings (adopted from Adam Smith), it entrenched itself in the form of *laissez-faire* economic liberalism. The result, correctly diagnosed by Marx, was a contradiction between a socially and scientifically organized form of industrial capitalism, on one side, and an individualistic legal conception of private property, on the other. Here, the individual is but an alienated, fragmented, and truncated self: a mere cog in a capitalist machine that operates according to an equally one-sided (socially detached and anarchic) instrumental rationality, dominated by scientific, technological, and managerial specialists who have no connection with the “social whole.”

In Dewey’s opinion, the emergence of a new corporate (industrial) capitalism signals a crisis of liberalism, in which the full flowering of liberalism’s own ideals of freedom, individualism, and reason run up against a new form of economic, political, and social domination. Exit from this crisis will come from neither piecemeal reform nor violent revolution. Salvation, for Dewey, will rather come from harnessing the older method of democratic discussion to the newer method of scientific experimentation, now conceived as an all-inclusive activity of social intelligence. Properly conceived, social science does not merely discover and apply timeless social laws for purposes of prediction and control, but clarifies concrete social problems with the aim of critically evaluating and altering existing social patterns. Its criticism of social ideologies (old habits and prejudices) serves to raise social consciousness and enlighten transformative democratic practice. Reconstructed as a radical social(ist) democracy, the new, scientifically enlightened liberalism will critically integrate and reconstitute the material needs of producers and consumers in the direction of fulfilling higher-order social and spiritual needs.

**IV. POSITIVISM**

Given Rudolf Carnap’s dismissal of Heidegger’s philosophy and Bertrand Russell’s negative caricature of German philosophy *in general* (not to mention his sharp criticism of James’s philosophy), we might be forgiven the all too easy temptation to oppose logical positivism and analytic philosophy to pragmatism.13

---

290

Volume 5
Yet, despite the fact that positivism and pragmatism have somewhat different pedigrees (British empiricism versus German idealism), methods (individualism versus holism), and projects (analyzing abstract concepts with universal scope versus interpreting concepts against the background of concrete historical practices, establishing the indubitable certainty/truth of beliefs versus describing their social and historical genesis), their respective practitioners share much in common. Both embrace some form of naturalism; preferring scientific and logical approaches, they disdain the use of transcendental methods of philosophical introspection that proved so indispensable to their continental counterparts. They also incline towards experimentalist accounts of meaning and knowledge. Given this convergence, we should not be surprised that positivist and post-positivist thinkers such as Ludwig Wittgenstein, Karl Popper, Wilfrid Sellars, Nelson Goodman, and W. V. Quine characterized themselves (or were characterized by others, such as American pragmatist Charles W. Morris) as pragmatists. Indeed, Dewey himself coedited a book with several noted logical positivists and even contributed an article to that volume;14 and as they migrated to the United States, logical positivists tried to enlist Dewey’s philosophy in their own cause.

Logical positivism is an expression coined by Herbert Feigl and A. E. Blumberg in 1931 to describe the ideas of the Vienna Circle, whose most important associates – including Carnap, Feigl, Otto Neurath, Hans Reichenbach, and Gustav Bergmann – later immigrated to England (where they were sympathetically received by the reigning analytic philosophy made popular by Wittgenstein, Russell, and A. J. Ayer) and the United States (where they transformed or undermined the prevailing pragmatist ethos). Logical positivists were strongly motivated by a quest for logical clarity and epistemic certainty. These logical and empirical concerns were brought together under a single program: the so-called “verificationist” theory of meaning that had been advanced by Wittgenstein in his *Tractatus* (1921). Wittgenstein intended his theory as a criticism of any philosophy that deviates from the narrow logical task of “showing” how our language means, or “pictures,” a world of “atomic facts,” but its immediate effect was to condemn all nonfactual propositions (propositions whose truth or falsity could not in principle be verifiable by observation) as “meaningless.” The results were deeply disturbing and paradoxical: not only were the evaluative and expressive statements of ethics, religion, metaphysics, and aesthetics suddenly consigned to practical irrelevance, but (as Wittgenstein ironically noted) so were the propositions of philosophy that asserted the verificationist theory of meaning. Indeed, the specter of Hume’s skepticism regarding induction that the school had sought to exorcise reappeared with a vengeance once it became clear that the general

lawlike propositions of science whose truth, as pragmatists had taught, could never be fully verified, were equally meaningless on this account.

Despite the challenges that verificationism posed to philosophy and science (see below), logical positivists believed that the nomological method of causal explanation and the inductive method of causal discovery were, taken together, the only methods for grounding knowledge and meaning. Consequently, they subscribed to a reductive, unified view of knowledge that sharply contrasted with the logical distinction between natural and human sciences that neo-Kantians such as Dilthey had popularized a generation earlier. In short, positivists maintained that the historical, sociological, and psychological sciences must not deviate from the experimental and nomological (or “covering law”) methods of causal explanation exemplified by the natural sciences on pain of being rendered totally “unscientific” and meaningless.

Verificationism and reductionism – the two shibboleths of logical positivism – would eventually come under attack from philosophers, such as Wittgenstein, Popper, Sellars, Goodman, and Quine – who had considered themselves to be sympathetic to some aspects of the positivist cause. Carnap and Neurath had argued (against Moritz Schlick) that scientific laws were not merely inferential rules connecting singular factual statements but were themselves factual claims subject to potential verification or falsification. But how? Were such generalizations verified (falsified) by experience, as many positivists thought? As Neurath (followed by Sellars and Quine) pointed out, only a proposition can verify (justify) a proposition. Were such generalizations then translatable

---

15. Wilfrid Sellars (1912–89) firmly rejected epistemological foundationalism. One of the first philosophers to integrate Anglo-American analytic philosophy and Austro-German logical positivism with American pragmatism and Hegelian thought, he devoted much of his life to reconciling the naturalist, “scientific image” of reality with the common-sense (or “manifest”) image of the same held by average persons. Key to this attempt was his distinction between the (naturalistic) space of causal experience and the (linguistic or propositional) space of belief formation and reasoned justification.

Nelson Goodman (1906–98) made significant contributions to mathematic logic, the theory of induction, and aesthetics. He held, against Hempel, that causal (lawlike) generalizations could not be distinguished from accidental generalizations (thereby reformulating the Humean problem of induction), at least in everyday contexts in which the use of predicates is not sharply fixed by formal stipulation. Finally, Goodman’s most famous work – in the area of aesthetics – showed how art and the aesthetic could be understood as creating new ontological worlds (or vocabularies for perceiving and describing reality) in a way that converged with Heidegger’s own views about the ontological import of the work of art.

Willard Van Orman Quine (1908–2000) is most famous for attacking the analytic–synthetic distinction and, with it, the verificationist theory of meaning, the two pillars of logical positivism (see below). His most important books include From a Logical Point of View (1953), Ontological Relativity and Other Essays (1969), and The Ways of Paradox and Other Essays (1976).
as sets of first-person observation statements (protocol statements), as Carnap suggested? If these statements were formulated as dated observations of physical objects, such as tables and rooms, then such reports would be an unreliable basis for confirmation or falsification, since it might be doubted whether these observations were veridical. On the other hand, if they were formulated as dated observations of private sensory experiences (“here, now, blue” as Schlick insisted), then their subjective certainty would be purchased at the cost of their untranslatability into objective statements.

V. POST-POSITIVISM

For post-positivists such as Quine and Popper, the paradoxes surrounding verificationism were best resolved by jettisoning the theory. Like the pragmatists, they argued that scientific generalizations are not constructed out of particular experiences (induction) but are experimental hypotheses formulated by prior theories, which are themselves the products of imagination. Quine’s attack on the analytic–synthetic distinction in “Two Dogmas of Empiricism” (1951) was especially effective in undermining the positivist distinction between necessary (analytic or identity) statements concerning logical meaning and contingent (synthetic or empirically informative) statements concerning experience and behavior, a distinction Dewey himself had vigorously criticized many years earlier in his 1938 *Logic*, where he observed that “[w]hen a linguistic form is separated from the contextual matter of problem inquiry it is impossible to decide of what logical form it is the expression.”16 Accordingly, the dogma of a theory- (concept- or meaning-) independent experience that could stand as an independent standard for constructing and testing a theory was laid to rest.

VI. KARL POPPER

For his part, Popper held that induction could not confirm scientific hypotheses because (as Peirce had seen) they refer to an indefinite number of counterfactual tests. The “necessary connection” that distinguishes causal relations from non-necessary but relatively invariant correlations of past events – the problem of induction diagnosed by Hume – can be articulated only when such hypotheses are formulated as counterfactual conditionals of the form: “Had y not happened, z would not have happened.” Because scientific hypotheses are counterfactual, they cannot be definitively verified by past and present experiences (events) but

can be falsified only with reference to present and future experiences. Hence, for Popper, the true test for the meaningfulness of a scientific theory is its capacity to generate potentially falsifiable hypotheses. But this attempt to save positivism – by replacing verification with falsification – also fails, since as Quine later argued (and Popper himself conceded), disconfirming tests do not suffice to falsify a given hypothesis so much as place in doubt a system of interconnected supporting hypotheses. Which hypothesis we choose to eliminate in order to restore coherence is thus not determined exclusively by our observations. Our epistemic commitments – for instance, how central a hypothesis is within the web of our otherwise workable belief system – also play a role. This pragmatic insight would later inspire Thomas Kuhn’s conception of scientific revolutions, in which changes in scientific paradigm are stimulated by anomalous test results only when a potentially more fruitful (if inarticulate and as of yet unconfirmed) paradigm has gained support from most of a scientific community.

Popper’s criticism of verificationism did not extend to positivism’s other defining postulates: unificationism and fact–value dualism. Along with Carl Hempel, he insisted that the historical and social sciences yield meaningful hypotheses only insofar as their explanation of events and actions are capable of being framed in terms of general (or statistical) laws of behavior. Such causal explanations could be useful to the formation of public policies aimed at piece-meal social reform. In contrast with these hypothetical technical predictions, the grandiose revolutionary experiments undertaken by such totalitarian movements as fascism and communism are not guided by scientific knowledge, despite contrary claims offered by their proponents.

Popper’s two-volume magnum opus *The Open Society and Its Enemies* (1945), and his shorter treatise *The Poverty of Historicism* (1957), link this narrow scientific claim to a broader conception of morality, action, and politics in a manner that merits closer scrutiny. To begin with, Popper argues that the laws of historical development and social evolution that defenders of total revolution advocate – what he referred to as “historicism” – are ultimately meaningless, since they do not yield falsifiable hypotheses. Such laws as inform Marx’s historical materialism, which ostensibly postulates an inevitable progression of social formations (modes of production) culminating in communism, Plato’s views about the inevitable decline of well-ordered polities into tyranny, or fascist doctrines about the fateful struggle and victory of master races are all examples of unscientific (and

18. Popper’s notion of historicism must not be confused with the concept of historicism that was used by Husserl, Dilthey, and other (mainly neo-Kantian) thinkers at the turn of the century, for whom the term referred to a kind of historical relativity in the understanding of distinctive historical epochs and cultural worldviews.
irrational) ideologies. The architects who use such ideologies to construct their revolutionary societies cannot allow any actions that deviate from the predicted outcome, so they insist on totalitarian controls that transform modern societies that are otherwise open, liberal, and democratic (or on the cusp of becoming so) into societies that are primitive, closed, and tribal.

According to Popper, the critical rationalism inherent within science demands an open society. Persons must be free to imagine new hypotheses; ultimately, the values (moral and nonmoral) that guide the inventive formulation of hypotheses are themselves the outcome of existential decisions that are entirely unpredictable. The fact that the consequences and meanings of actions transcend the intentions of actors and that the latter are themselves critically generated and revised within the context of multivocal and open-ended conversations means that the predictions of predetermined outcomes made by revolutionary social engineers must come to naught. As another contemporary Kantian, Hannah Arendt, astutely noted in her criticism of totalitarianism, the revolutionary spirit underlying utopian moral idealism inevitably shatters against the hard fact of moral freedom.

VII. THE CONTEMPORARY INFLUENCE OF AMERICAN PRAGMATISM AND LOGICAL POSITIVISM

As I noted earlier, once logical positivism became transplanted on to American soil by German and Austrian émigrés fleeing Nazi Germany it was vigorously promoted as a more analytically rigorous – and ostensibly superior – way of doing philosophy than its pragmatist counterpart. Hence the virtual disappearance of pragmatism in major PhD-granting philosophy departments during the 1950s and 1960s. There is also some anecdotal evidence, assembled by John McCumber, that political motivations may also have contributed to this change.19 Although positivists such as Carnap and Neurath had left-wing sympathies, their philosophy had the distinct merit of being untainted by the left-leaning, social progressivism that marked Mead’s and Dewey’s pragmatism. Limiting philosophy to the singular task of conceptual clarification and epistemological foundationalism, logical positivists eschewed normative ethics altogether in favor of metaethical ruminations on the meaning of “ought,” “good,” and the like. As a worldview that promoted skepticism of any holistic or global historical (or totalizing) understanding of social and economic structures, even

Popper’s critical rationalism could at best promote piecemeal reform of a system that was largely taken for granted.

During the McCarthy era, Popper’s relatively weak vision of an open society of free inquirers was not to be found among American philosophy departments. Yet despite the near total eclipse of pragmatism, post-positivist tendencies that drew from (or otherwise replicated) ideas developed by pragmatist philosophers gradually supplanted positivist shibboleths. The Anglo-American world was thus well prepared for the renaissance of neo-pragmatist thought that was ushered in by Richard Rorty’s *Philosophy and the Mirror of Nature* in 1979 and alternatively taken up by such notable philosophers as Hilary Putnam and (more recently), John McDowell and Robert Brandom.²⁰

Oddly, despite the affinities between pragmatism and continental philosophy – notably Heideggerian phenomenology and Frankfurt School neo-Marxism – there was virtually no productive interchange between these currents of thought until the 1970s. I mentioned the utter failure of Horkheimer and other first generation critical theorists to read the works of Dewey seriously.²¹ Therefore, in concluding this essay, I would like to recall how the Frankfurt School’s own struggle with positivism led it to eventually recover the legacy of American pragmatism well before it became fashionable in the English-speaking world.

The positivist postulates of scientific unificationism and fact–value dualism were strenuously resisted by philosophers influenced by the linguistic philosophy of the late Wittgenstein and, on the continent, by critical theorists. Critical

---

²⁰. These developments are discussed in several essays in the following volumes. See the essays by David R. Hiley in *The History of Continental Philosophy: Volume 6*, José Medina in *The History of Continental Philosophy: Volume 7*, and John Fennell in *The History of Continental Philosophy: Volume 8*.

²¹. Dewey is the philosopher most often mentioned by Horkheimer in *Eclipse of Reason*. Yet James Schmidt (“The Eclipse of Reason and the End of the Frankfurt School in America,” *New German Critique* 34 [Winter 2007]) points out that Horkheimer’s discussion of Dewey and pragmatism in the second of the Columbia University Lectures he gave in 1944 that would later form the core of his book was an afterthought. Indeed, Horkheimer was prompted to correct the interpretation of pragmatism contained in the lecture only when he wrote his manuscript, which was critically reviewed by C. Wright Mills, who believed that Horkheimer had grasped pragmatism “in a rather vulgar form” and without apparent familiarity with the primary texts. Although Horkheimer told Leo Löwenthal that he felt he had become “an expert” on American pragmatism, having read “not a few of these native products” (M. Horkheimer, Letter to Löwenthal, December 21, 1944 [Folder 20], bMS Ger 185 [47]; from the Leo Löwenthal Papers, Houghton Library of Harvard University; cited by Schmidt, “The Eclipse of Reason,” 65), his belief that pragmatism and positivism were virtually indistinguishable, save for the latter’s “phenomenalism” (“sensualistic idealism”), belies this judgment. In Horkheimer’s opinion, pragmatism, no less than positivism, identifies philosophy with scientism, which by its very nature is subjectivistic in that “true judgments on objects, and therewith the concept of the object itself, rests solely on ‘effects’ upon the subject’s action” (Horkheimer, *Eclipse of Reason*, 45).
theorists such as Adorno and Horkheimer saw positivism (including Popper’s critical rationalism) as fundamentally uncritical and reactionary. The positivist dismissal of evaluative language, its insistence on defining truth and meaning in terms of correspondence with atomic facts or subjectively given sense experiences – in total abstraction from the broader historical, economic, political, and sociocultural context conditioning perception, thought, and language – struck them as a false and ideological affirmation of the status quo. While they did not deny the epistemic value of predictive and technically useful knowledge within the behavioral sciences, critical theorists regarded such knowledge as but a subordinate aspect within social science taken as a whole, the proper aim of which, they maintained, was not instrumental prediction and control of human behavior but the critique of “naturalizing” ideologies that depict society as a realm of rigid, unchanging laws.

The so-called “positivist dispute” of the early 1960s that pitted Popper and his followers against Adorno and his former assistant Jürgen Habermas brought the issue of “critical social knowledge” into stark relief. Popperians defended a unified scientific method as the only empirically responsible approach to social critique and impugned the holistic hermeneutical methods of critical theorists as an uncritical recrudescence of Hegelian dialectical metaphysics. Critical theorists responded that social scientists could not causally explain human behavior without first interpreting it as meaningful and norm-governed in a way that referred to interests, ideas, and utopian ideals that simultaneously corresponded to and conflicted with the laws of capitalist accumulation. Furthermore, they briddled at the fact–value distinction upheld by the Popperians, which consigned critical evaluations to the irrational status of existential decisions. This was a “decisionism,” they believed, that could all too easily degenerate into a resolute acquiescence to the powers that be, as exemplified by the illustrative fate of Carl Schmitt and Heidegger.

Habermas enlisted none other than Wittgenstein himself in arguing against the unified science postulate maintained by the Popperians. Wittgenstein’s late philosophy of language, the most mature of expression of which is expounded in his posthumous work Philosophical Investigations (1953), develops a pragmatist account of meaning that is completely antithetical to the positivist view he had earlier developed in the Tractatus.22 In the mature work, Wittgenstein argues that the meaning of language is holistic and contextual (syncategorematic) and linked to observable use rather than to ostensive reference. Language games comprise speech acts that, in the parlance of Wittgenstein’s follower John Austin, accomplish illocutionary (social-action-oriented) aims and have perlocutionary

*22. For a discussion of Wittgenstein’s turn against his own earlier views in the Tractatus, see the essay by Bob Plant and John Fennell in The History of Continental Philosophy: Volume 3.
(behavior-modifying) effects. Such games, in turn, circumscribe rule-governed “ways of life” that are inherently public and shared.

As developed by Peter Winch in his pioneering manifesto *The Idea of Social Science* (1958), the implication of this Wittgensteinian theory of meaning for explaining human action was nothing less than momentous, in that it reaffirmed the dualism between natural and human science that formerly had been defended by neo-Kantians. According to Winch, meaningful action is distinguished from brute behavior in being essentially structured and identified by the intentions of the actor. Such intentions are therefore not discrete psychic causes that precede physical action as Popper, Hempel, and other advocates of the so-called “covering law” model of social and historical explanation had maintained. On the contrary, intentional actions cannot be causally explained with reference to social laws but can only be understood and interpreted within the context of a rule-governed language game, or way of life. More precisely, the intentions of the actor – what it is he or she intends to do by his or her action – implicitly refers to norms of speaking and acting. To explain an action is therefore to understand it as a meaningful instance of a norm that could, in principle, be creatively applied or even violated.

The Wittgensteinian revolution in philosophy of language proved pivotal for the development of later critical theory. It enabled the most notable exponents of this theory, Karl-Otto Apel and Habermas, to recover the lost insights of the pragmatist tradition, above all Peirce’s operationalist theory of meaning and Mead’s social behaviorist account of mind, in the 1960s and 1970s – well in advance of the renaissance of Anglo-American neo-pragmatism. This appropriation of classical pragmatism has continued apace under third generation critical theorists Axel Honneth and Joas, whose use of Dewey and, above all, Mead, to develop new theories of recognition and democracy has taken critical theory more deeply into the heart of social progressivism.

In the hands of Habermas and Apel, pragmatism was used to construct a transcendental theory of knowledge-constitutive interests as an alternative to positivist “objectivism.” Following Habermas’s formulation of this new program

---

23. Apel’s epochal introduction of American pragmatism (principally Peircean semiotics) to the German public appeared in his two-volume study *The Transformation of Philosophy* (1973), which also displays a great debt to the neo-Kantian tradition of Dilthey and the post-positivist philosophy of the late Wittgenstein. Habermas’s indebtedness to Peirce is evident in his earlier work, *Knowledge and Human Interests* (1968), while his use of Mead later appears in the second volume of his *Theory of Communicative Action* (1981).

24. For discussions of these developments in the second and third generations of critical theorists, see, respectively, the essays by Christopher F. Zurn and James Swindal in *The History of Continental Philosophy: Volume 6*, and Amy Allen in *The History of Continental Philosophy: Volume 7*.
of critical pragmatism, different interests that have emerged in the course of the natural history of the human species determine distinctive frameworks of action and knowledge. Corresponding to a technical interest in controlling nature-like processes is instrumental action – articulated in experimental methods – that serves to stabilize successful beliefs about cause and effect. Corresponding to a practical interest in understanding ourselves and (reaching) understanding (with) others is communicative action – articulated in historical interpretative methods – that serves to stabilize right beliefs about identities, norms, values, and ends. Corresponding to an emancipatory interest is critical reflection – articulated in psychotherapeutic methods combining causal explanation and holistic understanding – that serves to expose distortions in self-understanding caused by the effects of domination.

Since the late 1970s, Habermas’s critical theory has evolved into a full-blown theory of communicative action whose debt to pragmatism – especially to Mead and Wittgenstein – is evident in the name he gives his philosophy of language: universal pragmatics. If anything, the newer generation of critical theorists has sought to wrest the materialist spirit of pragmatism even further from the Kantian dualisms that still define Habermas’s theory. Needless to say, all of this testifies to the continuing impact of pragmatism on the future of German critical philosophy.

“Continental philosophy” is itself a contested concept. For some, it is understood to be any philosophy after 1780 originating on the European continent (Germany, France, Italy, etc.). Such an understanding would make Georg von Wright or Rudolf Carnap – respectively, a Finnish-born philosopher of language and a German-born logician who taught for many years in the US – a “continental philosopher,” an interpretation neither they nor their followers would easily accept. For others, “continental philosophy” refers to a style of philosophizing, one more attentive to the world of experience and less focused on a rigorous analysis of concepts or linguistic usage. In this and the accompanying seven volumes in this series, “continental philosophy” will be understood historically as a tradition that has its roots in several different ways of approaching and responding to Immanuel Kant’s critical philosophy, a tradition that takes its definitive form at the beginning of the twentieth century as the phenomenological tradition, with its modern roots in the work of Edmund Husserl. As such, continental philosophy emerges as a tradition distinct from the tradition that has identified itself as “analytic” or “Anglo-American,” and that locates its own origins in the logical analyses and philosophy of language of Gottlob Frege. Whether or not there is in fact a sharp divergence between the work of Husserl and Frege is itself a contested question, but what cannot be contested is that two distinct historical traditions emerged early in the twentieth century from these traditions’ respective interpretations of Husserl (and Heidegger) and Frege (and Russell). The aim of this history of continental philosophy is to trace the developments in one of these traditions from its roots in Kant and his contemporaries through to its most recent manifestations. Together, these volumes present a coherent and comprehensive account of the continental philosophical tradition.
that offers readers a unique resource for understanding this tradition’s complex and interconnected history.

Because history does not unfold in a perfectly linear fashion, telling the history of continental philosophy cannot simply take the form of a chronologically organized series of “great thinker” essays. And because continental philosophy has not developed in a vacuum, telling its history must attend to the impact of figures and developments outside philosophy (in the sciences, social sciences, mathematics, art, politics, and culture more generally) as well as to the work of some philosophers not usually associated with continental philosophy. Such a series also must attend to significant philosophical movements and schools of thought and to the extended influence of certain philosophers within this history, either because their careers spanned a period during which they engaged with a range of different theorists and theoretical positions or because their work has been appropriated and reinterpreted by subsequent thinkers. For these reasons, the volumes have been organized with an eye toward chronological development but, in so far as the years covered in each volume overlap those covered in the subsequent volume, they have been organized as well with the aim of coordinating certain philosophical developments that intersect in a fashion that is not always strictly chronological.

Volume 1 begins with the origins of continental philosophy in Kant and the earliest responses to his critical philosophy, and presents an overview of German idealism, the major movement in philosophy from the late eighteenth to the middle of the nineteenth century. In addition to Kant, the period covered in the first volume was dominated by Fichte, Schelling, and Hegel, and together their work influenced not just philosophy, but also art, theology, and politics. This volume thus covers Kant’s younger contemporary Herder, and his readers Schiller and Schlegel – who shaped much of the subsequent reception of Kant in art, literature, and aesthetics; the “Young Hegelians” – including Bruno Bauer, Ludwig Feuerbach, and David Friedrich Strauss – whose writings would influence Engels and Marx; and the tradition of French utopian thinking in such figures as Saint-Simon, Fourier, and Proudhon. In addition to Kant’s early critics – Jacobi, Reinhold, and Maimon – significant attention is also paid to the later critic of German idealism Arthur Schopenhauer, whose appropriation and criticism of theories of cognition later had a decisive influence on Friedrich Nietzsche.

Volume 2 addresses the second half of the nineteenth century, in part as a response to the dominance of Hegelian philosophy. These years saw revolutionary developments in both European politics and philosophy, and five great critics dominated the European intellectual scene: Feuerbach, Marx, Søren Kierkegaard, Fyodor Dostoevsky, and Nietzsche. Responding in various ways to Hegelian philosophy and to the shifting political landscape of Europe and
the United States, these thinkers brought to philosophy two guiding orientations – materialism and existentialism – that introduced themes that would continue to play out throughout the twentieth century. The second half of the nineteenth century also saw the emergence of new schools of thought and new disciplinary thinking, including the birth of sociology and the social sciences, the development of French spiritualism, the beginning of American pragmatism, radical developments in science and mathematics, and the development of hermeneutics beyond the domains of theology and philology into an approach to understanding all varieties of human endeavor.

Volume 3 covers the period between the 1890s and 1930s, a period that witnessed revolutions in the arts, science, and society that set the agenda for the twentieth century. In philosophy, these years saw the beginnings of what would grow into two distinct approaches to doing philosophy: analytic and continental. It also saw the emergence of phenomenology as a new rigorous science, the birth of Freudian psychoanalysis, and the maturing of the discipline of sociology. Volume 3 thus examines the most influential work of a remarkable series of thinkers who reviewed, evaluated, and transformed nineteenth-century thought, among them Henri Bergson, Émile Durkheim, Sigmund Freud, Martin Heidegger, Edmund Husserl, Karl Jaspers, Max Scheler, and Ludwig Wittgenstein. It also initiated an approach to philosophizing that saw philosophy move from the lecture hall or the private study into an active engagement with the world, an approach that would continue to mark continental philosophy’s subsequent history.

The developments and responses to phenomenology after Husserl are the focus of the essays in Volume 4. An ambiguity inherent in phenomenology – between conscious experience and structural conditions – lent itself to a range of interpretations. While some existentialists focused on applying phenomenology to the concrete data of human experience, others developed phenomenology as conscious experience in order to analyze ethics and religion. Still other phenomenologists developed notions of structural conditions to explore questions of science, mathematics, and conceptualization. Volume 4 covers all the major innovators in phenomenology – notably Sartre, Merleau-Ponty, and the later Heidegger – as well as its extension into religion, ethics, aesthetics, hermeneutics, and science.

Volume 5 concentrates on philosophical developments in political theory and the social sciences between 1920 and 1968, as European thinkers responded to the difficult and world-transforming events of the time. While some of the significant figures and movements of this period drew on phenomenology, many went back further into the continental tradition, looking to Kant or Hegel, Marx or Nietzsche, for philosophical inspiration. Key figures and movements discussed in this volume include Adorno, Horkheimer, and the Frankfurt School,
Schmitt, Marcuse, Benjamin, Arendt, Bataille, black existentialism, French Marxism, Saussure, and structuralism. These individuals and schools of thought responded to the “crisis of modernity” in different ways, but largely focused on what they perceived to be liberal democracy’s betrayal of its own rationalist ideals of freedom, equality, and fraternity. One other point about the period covered in this volume is worthy of note: it is during these years that we see the initial spread of continental philosophy beyond the European continent. This happens largely because of the emigration of European Jewish intellectuals to the US and UK in the 1930s and 1940s, be it the temporary emigration of figures such as Adorno, Horkheimer, Lévi-Strauss, and Jakobson or the permanent emigration of Marcuse, Arendt, and Gurwitsch. As the succeeding volumes will attest, this becomes a central feature of continental philosophy’s subsequent history.

Volume 6 examines the major figures associated with poststructuralism and the second generation of critical theory, the two dominant movements that emerged in the 1960s, which together brought continental philosophy to the forefront of scholarship in a variety of humanities and social science disciplines and set the agenda for philosophical thought on the continent and elsewhere from the 1960s to the present. In addition to essays that discuss the work of such influential thinkers as Althusser, Foucault, Deleuze, Derrida, Lyotard, Irigaray, Habermas, Serres, Bourdieu, and Rorty, Volume 6 also includes thematic essays on issues including the Nietzschean legacy, the linguistic turn in continental thinking, the phenomenological inheritance of Gadamer and Ricoeur, the influence of psychoanalysis, the emergence of feminist thought and a philosophy of sexual difference, and the importation of continental philosophy into literary theory.

Before turning to Volume 7, a few words on the institutional history of continental philosophy in the United States are in order, in part because the developments addressed in Volumes 6–8 cannot be fully appreciated without recognizing some of the events that conditioned their North American and anglophone reception. As has been mentioned, phenomenologists such as Alfred Schutz and Aron Gurwitsch, and other European continental philosophers such as Herbert Marcuse and Hannah Arendt, began relocating to the United States in the 1930s and 1940s. Many of these philosophers began their work in the United States at the University in Exile, established in 1933 as a graduate division of the New School for Social Research for displaced European intellectuals. While some continental philosophy was taught elsewhere around the United States (at Harvard University, Yale University, the University at Buffalo, and elsewhere), and while the journal Philosophy and Phenomenological Research began publishing in 1939, continental philosophy first truly began to become an institutional presence in the United States in the 1960s. In 1961, John Wild (1902–72) left Harvard to become Chair of the Department of Philosophy at Northwestern University. With a commitment from the provost of the university
and the Northwestern University Press to enable him to launch the Northwestern Series in Phenomenology and Existential Philosophy. Wild joined William Earle and James Edie, thus making Northwestern a center for the study of continental philosophy. Wild set up an organizational committee including himself, Earle, Edie, George Schrader of Yale, and Calvin Schrag (a former student of Wild’s at Harvard, who was teaching at Northwestern and had recently accepted an appointment at Purdue University), to establish a professional society devoted to the examination of recent continental philosophy. That organization, the Society for Phenomenology and Existential Philosophy (SPEP), held its first meeting at Northwestern in 1962, with Wild and Gurwitsch as the dominant figures arguing for an existential phenomenology or a more strictly Husserlian phenomenology, respectively. Others attending the small meeting included Erwin Straus, as well as Northwestern graduate students Edward Casey and Robert Scharff, and today SPEP has grown into the second largest society of philosophers in the United States. Since those early days, many smaller societies (Heidegger Circle, Husserl Circle, Nietzsche Society, etc.) have formed and many journals and graduate programs devoted to continental philosophy have appeared. In addition, many of the important continental philosophers who first became known in the 1960s – including Gadamer, Ricoeur, Foucault, Derrida, Lyotard, and Habermas – came to hold continuing appointments at major American universities (although, it must be mentioned, not always housed in departments of philosophy) and, since the 1960s, much of the transmission of continental philosophy has come directly through teaching as well as through publications.

The transatlantic migration of continental philosophy plays a central role in Volume 7, which looks at developments in continental philosophy between 1980 and 1995, a time of great upheaval and profound social change that saw the fruits of the continental works of the 1960s beginning to shift the center of gravity of continental philosophizing from the European continent to the anglophone philosophical world and, in particular, to North America. During these years, the pace of translation into English of French and German philosophical works from the early twentieth century as well as the very recent past increased tremendously, and it was not uncommon to find essays or lectures from significant European philosophers appearing first in English and then subsequently being published in French or German. In addition, the period covered in this volume also saw the spread of continental philosophy beyond the confines of philosophy departments, as students and faculty in centers of humanities and departments of comparative literature, communication studies, rhetoric, and other interdisciplinary fields increasingly drew on the work of recent continental philosophers. Volume 7 ranges across several developments during these years – the birth of postmodernism, the differing philosophical traditions of France, Germany, and Italy, the third generation of critical theory, and the so-called
“ethical turn” – while also examining the extension of philosophy into questions of radical democracy, postcolonial theory, feminism, religion, and the rise of performativity and post-analytic philosophy. Fueled by an intense ethical and political desire to reflect changing social and political conditions, the philosophical work of this period reveals how continental thinkers responded to the changing world and to the key issues of the time, notably globalization, technology, and ethnicity.

The eighth and final volume in this series attempts to chart the most recent trends in continental philosophy, which has now developed into an approach to thinking that is present throughout the world and engaged with classical philosophical problems as well as current concerns. The essays in this volume focus more on thematic developments than individual figures as they explore how contemporary philosophers are drawing on the resources of the traditions surveyed in the preceding seven volumes to address issues relating to gender, race, politics, art, the environment, science, citizenship, and globalization. While by no means claiming to have the last word, this volume makes clear the dynamic and engaged quality of continental philosophy as it confronts some of the most pressing issues of the contemporary world.

As a designation, “continental philosophy” can be traced back at least as far as John Stuart Mill’s On Bentham and Coleridge (1840), where he uses it to distinguish the British empiricism of Bentham from a tradition on the continent in which he sees the influence of Kant. Since that time, and especially since the early twentieth century, the term has been used to designate philosophies from a particular geographical region, or with a particular style (poetic or dialectical, rather than logical or scientistic). For some, it has been appropriated as an honorific, while for others it has been used more pejoratively or dismissively. Rather than enter into these polemics, what the volumes in this series have sought to do is make clear that one way to understand “continental philosophy” is as an approach to philosophy that is deeply engaged in reflecting on its own history, and that, as a consequence, it is important to understand the history of continental philosophy.

While each of the volumes in this series was organized by its respective editor as a volume that could stand alone, the eight volumes have been coordinated in order to highlight various points of contact, influence, or debate across the historical period that they collectively survey. To facilitate these connections across the eight volumes, cross-referencing footnotes have been added to many of the essays by the General Editor. To distinguish these footnotes from those of the authors, they are indicated by an asterisk (*).

CONTRIBUTORS

David F. Bell is Professor of French at Duke University. His last book, Real Time: Accelerating Narrative from Balzac to Zola (2004), deals with the creation of the culture and expectation of speed before the advent of the railroad. Circumstances: Chance in the Literary Text (1993) explored how theories of chance in science and mathematics at the end of the eighteenth and beginning of the nineteenth centuries influenced narrative. He has published essays on Paul Virilio, Michel Serres, Jacques Rancière, and Clément Rosset, and is presently at work on an extended essay about the notion of tact and a second essay analyzing social networks in Balzac.

Rosi Braidotti is Distinguished Professor in the Humanities at Utrecht University in the Netherlands and founding Director of the Centre for the Humanities at Utrecht University. She was the founding Chair and Professor of Women’s Studies in the Arts Faculty of Utrecht University (1988–2005), Scientific Director of the Netherlands Research School of Women’s Studies (1995–2005), set up the Network of Interdisciplinary Women’s Studies in Europe (NOI&SE) within the Erasmus Programme in 1989, and has been elected to the Australian Academy of the Humanities. She has published extensively in feminist philosophy, epistemology, poststructuralism, and psychoanalysis, and is the author of several books, including Patterns of Dissonance (1991), Nomadic Subjects: Embodiment and Sexual Difference in Contemporary Feminist Theory (1994), Metamorphoses: Towards a Materialist Theory of Becoming (2002), and Transpositions: On Nomadic Ethics (2006).
Claire Colebrook is Edwin Erle Sparks Professor of English at Pennsylvania State University. She has written on literary theory, feminist theory, visual culture, contemporary music, and continental philosophy. Her most recent book is Milton, Evil and Literary History (2008), and she is currently completing a book on William Blake.

Wayne J. Froman teaches philosophy at George Mason University, where he served as Department Chair from 1989 to 1999. He has published numerous articles on phenomenology and related fields, as well as Merleau-Ponty: Language and the Act of Speech (1983). He has also coedited a number of volumes, including Thresholds of Western Culture (2003), and Merleau-Ponty and the Possibilities of Philosophy: Transforming the Tradition (2009).

Samir Haddad is Assistant Professor of Philosophy at Fordham University. He has published articles on Derrida, Arendt, and topics in political philosophy, and is currently completing a book on Derrida and democracy.

Sara Heinämaa is Senior Lecturer in Theoretical Philosophy at Uppsala University, Sweden, and holds a lectureship in theoretical philosophy at the University of Helsinki, Finland. At the moment, she works as Academy fellow and docent at the Helsinki Collegium for Advanced Studies, University of Helsinki. She has published several articles on phenomenology of embodiment, personality, intersubjectivity, and sexual difference, is the author of Toward a Phenomenology of Sexual Difference: Husserl, Merleau-Ponty and Beauvoir (2003), and has coedited Consciousness: From Perception to Reflection (2007) and Psychology and Philosophy: Inquiries into the Soul from Late Scholasticism to Contemporary Thought (2008). Her forthcoming publications include three chapters on mortality and futurity in Birth, Death, and Femininity: Philosophies of Embodiment, edited by Robin May Schott.

David R. Hiley is Professor of Philosophy at the University of New Hampshire. His philosophical interests include the history of philosophy and social and political philosophy. He is author of Philosophy in Question: Essays on a Pyrrhonian Theme (1988) and Doubt and the Demands of Democratic Citizenship (2006). He is coeditor of The Interpretive Turn: Philosophy, Science and Culture (1991) and Richard Rorty (2003).

Mary Beth Mader is Associate Professor of Philosophy at the University of Memphis. She is the author of Sleights of Reason: Norm, Bisexuality, Development (2010), and articles on the work of Luce Irigaray, Foucault and Kofman. She translated Luce Irigaray’s The Forgetting of Air in Martin Heidegger (1999).
Warren Montag is a professor of English and Comparative Literature at Occidental College in Los Angeles. He is the author of *Louis Althusser* (2003) and *Bodies, Masses, Power: Spinoza and his Contemporaries* (1999), and coeditor, with Ted Stolze, of *The New Spinoza* (1997). His areas of specialization are contemporary theory and eighteenth-century literature and philosophy.

Jeffrey T. Nealon is Liberal Arts Research Professor in the English department at Penn State University. He has published widely on contemporary literary and cultural theory, and is author of *Double Reading: Postmodernism after Deconstruction* (1993), *Alterity Politics: Ethics and Performative Subjectivity* (1998), and *The Theory Toolbox* (with Susan Searls Giroux; 2003), as well as coeditor of *Rethinking the Frankfurt School* (2002). His latest book is *Foucault Beyond Foucault: Power and Its Intensifications since 1984* (2008).

Timothy O’Leary teaches philosophy at the University of Hong Kong. His major research interests are in the fields of ethics and aesthetics in the European tradition (including literature and film). He has published *Foucault and the Art of Ethics* (2002) and *Foucault and Fiction: The Experience Book* (2009). He is coeditor of *Foucault and Philosophy* (2010) and *A Companion to Foucault* (forthcoming).

Derek Robbins is Professor of International Social Theory in the School of Humanities and Social Sciences at the University of East London where he also is Director of the Group for the Study of International Social Science. He is the author of *The Work of Pierre Bourdieu* (1991), *Bourdieu and Culture* (2000), and *On Bourdieu, Education and Society* (2006); the editor of two four-volume collections of articles on Bourdieu in the Sage Masters of Contemporary Social Thought series (2000, 2005) and of a three-volume collection of articles on Lyotard in the same series (2004); and the editor of the special issue of *Theory, Culture and Society* on Bourdieu (23[6], November 2006). He is currently writing *The Internationalization of French Social Thought, 1950–2000*.

Alan D. Schrift is the F. Wendell Miller Professor of Philosophy at Grinnell College. In addition to his many published articles or book chapters on Nietzsche and French and German twentieth-century philosophy, he is the author of *Nietzsche and the Question of Interpretation: Between Hermeneutics and Deconstruction* (1990), *Nietzsche’s French Legacy: A Genealogy of Poststructuralism* (1995), and *Twentieth-Century French Philosophy: Key Themes and Thinkers* (2005). He has edited five collections on a variety of topics, including *The Logic of the Gift: Toward an Ethic of Generosity* (1997) and *Modernity and the Problem of Evil* (2005). In addition to serving as general editor of the
eight-volume *The History of Continental Philosophy*, he serves as general editor of *The Complete Works of Friedrich Nietzsche*, the Stanford University Press translation of Nietzsche’s *Kritische Studiengabe*.

**Daniel W. Smith** teaches in the department of philosophy at Purdue University. He is the translator of Gilles Deleuze’s *Essays Critical and Clinical* (with Michael A. Greco; 1997) and *Francis Bacon: The Logic of Sensation* (2003), as well as Pierre Klossowski’s *Nietzsche and the Vicious Circle* (1998) and Isabelle Stenger’s *The Invention of Modern Science* (2000). He has published widely on topics in contemporary philosophy, and is currently completing a book Gilles Deleuze.

**James Swindal** is Associate Professor and Chair of the Department of Philosophy at Duquesne University. He has published in the fields of German idealism, critical theory, and action theory. He published *Reflection Revisited: Jürgen Habermas’ Discursive Theory of Truth* (1999) and has coedited volumes on ethics, Habermas, critical theory, and Catholic philosophy.

**James Williams** is Professor of European Philosophy at the University of Dundee. He has published widely on recent French philosophy. His most recent books include *Gilles Deleuze’s Logic of Sense: A Critical Introduction and Guide* (2008) and *The Lyotard Reader and Guide* (with Keith Crome; 2006). He is currently working on a book on Gilles Deleuze’s philosophy of time. Until 2010 he served as an investigator on the Australian Research Council Discovery Project “Analytic and Continental: Arguments on the Methods and Value of Philosophy.”

**Christopher F. Zurn** is Associate Professor at the University of Massachusetts Boston. His research interests include theories of democracy, constitutionalism, philosophy of law, critical social theory, recognition, and social movements. He is the author of *Deliberative Democracy and the Institutions of Judicial Review* (2007), and coeditor of *New Waves in Political Philosophy* (with Boudewijn de Bruin; 2009) and *Anerkennung/The Philosophy of Recognition: Historical and Contemporary Perspectives* (with Hans-Christoph Schmidt am Busch; 2009).
INTRODUCTION
Alan D. Schrift

The 1960s was a period of social and cultural transformation in many areas of the world: the erection of the Berlin Wall (1961), the end of the Algerian War for independence (1962), the Cuban Missile Crisis (1962), the assassinations of John F. Kennedy (1963), Robert Kennedy (1968), and Martin Luther King (1968), May '68 in Paris, the Prague Spring (1968), student unrest throughout the US and Europe, the Vietnam War and Chinese Cultural Revolution. It was also a period of significant transformation in continental philosophy, marked in France by the end of existentialism, the emergence and decline of structuralism as a dominant philosophical position, and the beginnings of a new post-structuralist philosophy that would dominate continental philosophy for the remainder of the twentieth century. In Germany, the 1960s saw a changing of the guard and the emergence of two dominant philosophers – Hans-Georg Gadamer and Jürgen Habermas – who would continue while at the same time transforming the hermeneutic and critical theory traditions heretofore most closely identified with Martin Heidegger and Theodor Adorno and Max Horkheimer.

The years on which this volume focuses – 1960 to 1984 – are for many, especially in the English-speaking philosophical world, the “golden years” of continental philosophy. During this period, both classic and contemporary works of French and German philosophy began to appear in English translation with increasing frequency. Journals devoted to the dissemination of continental philosophical scholarship were founded, and professional societies such as the Society for Phenomenology and Existential Philosophy\(^1\) (SPEP, whose

---

\(^1\) SPEP was the brainchild of John Wild (1902–72), who, armed with a commitment from the Provost of the university and Northwestern University Press to enable him to launch the
first meeting took place October 26–7, 1962, at Northwestern University) and the International Association for Philosophy and Literature (IAPL, established in 1976) were created. It was also a period where a new generation of significant philosophical thinkers came to the fore, as Derrida, Deleuze, Foucault, Lyotard, Bourdieu, Irigaray, Serres, Ricoeur, Habermas, and Gadamer joined Hegel, Husserl, Heidegger, Sartre, and Merleau-Ponty as major figures in continental philosophy.

The goal of this volume is not only to discuss many of these important thinkers individually, but also, as with the other volumes in this History of Continental Philosophy, to highlight certain themes that operate throughout the period and to situate the work of these and other thinkers with respect to these themes. To that end, in addition to the essays on individual philosophers, this volume includes essays that examine: the emergence of Nietzsche as a philosophical reference in France; the “linguistic turn” in continental thinking; developments in philosophical hermeneutics in France and Germany; the influence of and reflection on psychoanalysis; the emergence, especially in France, of feminist thought and a philosophy of sexual difference; the renewal of the critical theory tradition in Germany; the importation of continental philosophy into literary theory; and, in the figure of Richard Rorty, the first significant attempt to bridge the gap between the analytic and continental philosophical traditions. The aim of this introduction is more humble: to provide some historical context for the emergence of the broad themes that dominate this period, and to highlight several of those themes that can be seen at work in a wide range of thinkers: sustained reflection on the relationship between language or discourse and thought; renewed attention to history and thinking the event; rethinking the question of the subject; and the attention to difference.

Northwestern Series in Phenomenology and Existential Philosophy, left Harvard University in 1961 to become Chairperson of the Department of Philosophy at Northwestern. Wild’s interest in continental philosophy dates back to his Guggenheim Fellowship in 1931, which he spent at Freiburg University attending lectures by Husserl and Heidegger. He returned to Harvard and introduced courses on their philosophies, the first time that such courses had been taught at Harvard. Wild had already discussed with his colleagues and graduate students at Harvard the need for a new society devoted to the examination of continental philosophy, and at Northwestern he set up an organizational committee with his colleagues William Earle and James Edie, George Schrader of Yale, and Calvin Schrag (a former student of Wild’s at Harvard, who was teaching at Northwestern), to establish such a professional society. At that first SPEP meeting at Northwestern, Wild and Aron Gurwitsch were the dominant figures, arguing for an existential phenomenology and a more strictly Husserlian phenomenology, respectively. Other topics presented for discussion at that first meeting included the phenomenology of perception (indicative of the rising interest, at the time, in Merleau-Ponty), Husserl’s return to the Lebenswelt, Sartre on human emotions, and existentialist aesthetics. I would like to thank Calvin Schrag, Edward Casey, and Robert Scharff, all of whom were at Northwestern at the time, for sharing their recollections of the formation of SPEP.
In both France and Germany, one of the striking features of philosophical discourse in the 1960s is its engagement with developments in the human or social sciences. In France, the emergence of structuralism as a dominant intellectual paradigm in the late 1950s was in part a response to the existentialist emphasis on subjectivity and individual autonomy – personified in the work and person of Jean-Paul Sartre – and in part a reflection of the rising influence of research in the human sciences. There are a number of stories that might be told about the rise of structuralism, but I would like to highlight one: namely, that structuralism rose in popularity proportionate to the fall from hegemony within the French academic and intellectual world of philosophy as the master discourse. For many, two events in 1960 serve iconically to mark the year that existentialism came to an end as a living philosophy in France: Albert Camus’s death in a car accident on January 4, and the publication by Sartre of *Critique de la raison dialectique*, a work Sartre himself described as a “structural, historical anthropology.” But the hegemony of structuralism as the dominant epistemological paradigm was already well established by 1960, in part through the influence of Maurice Merleau-Ponty, who was arguably the most influential philosopher in the French academy. Merleau-Ponty’s untimely death in 1961 contributed further to the waning influence not just of existentialism but of philosophy in general. Another factor, of no small significance, was the establishment in 1958 of an independent degree program in sociology in the French universities, which allowed both undergraduates and doctoral students to work outside the disciplinary constraints of departments of philosophy.

The emergence of structuralism as a dominant intellectual force can be tied to many factors, not least a number of political and historical events – the end of the Second World War and the beginnings of the Cold War, the Soviet invasion of Hungary (1956), colonial unrest in Vietnam and Algeria – that left many politically active students dissatisfied with the relatively ahistorical and other-worldly reflections of the academic philosophers. Some, following a path taken

3. For a much more detailed account of the rise of structuralism, which holds to the same basic chronology as I do, see François Dosse, *History of Structuralism*, Deborah Glassman (trans.) (Minneapolis, MN: University of Minnesota Press, 1997).
5. For a discussion of Merleau-Ponty’s role in the introduction of structuralism in France, see my *Twentieth-Century French Philosophy*, 45–7.
6. According to Pierre Bourdieu and Jean-Claude Passeron, ten years after the creation of the licence (undergraduate degree) in sociology, there were “in Paris as many students registered for this new degree … as there [were] candidates for the Degree in Philosophy” (“Sociology and Philosophy in France Since 1945: Death and Resurrection of a Philosophy Without a Subject,” *Social Research* 34[1] [1967], 193).
earlier by Claude Lévi-Strauss, left philosophy altogether. Others, intrigued by the seminars and figure of Lacan, thought a psychoanalytic understanding of language and the unconscious could make better sense of events than traditional philosophical reflection.

In addition, there was also an important philosophical development that facilitated the emergence of structuralism in France, one that had its analogue in the previous emergence of existentialism in the 1930s and 1940s. Just as the discovery of three German philosophers – Hegel, Husserl, and Heidegger – prompted the transformation from spiritualism to existentialism in the 1920s and 1930s, a philosophical opening for structuralism was provided by the rediscovery of three other German thinkers, those named by Paul Ricoeur in 1965 the “masters of suspicion”: Marx, Nietzsche, and Freud. While these thinkers are more commonly associated with French philosophy after structuralism, it was really the structuralists’ desire to locate the underlying structures of kinship, the unconscious, or society that led them to read Marx, Nietzsche, and Freud as kindred spirits who sought to decipher the superstructural world in terms of underlying infrastructural relations of economic forces and class struggle, relations of normative forces and wills to power, and relations of psychic forces and unconscious libidinal desires, respectively.

What united structuralist theorists such as psychoanalyst Jacques Lacan (1901–81), anthropologist Claude Lévi-Strauss (1908–2009), literary theorist Roland Barthes (1915–80), and philosopher Louis Althusser (1918–90) was less a shared set of philosophical theses than a shared set of methodological assumptions and a willingness to work with the concepts of Saussurean linguistics. Drawing on the four binary oppositions central to Saussurean linguistics – signifier (signifiant) and signified (signifié), langue and parole, synchronic and diachronic, infrastructure and superstructure – and privileging in their analyses the former term in each binary pair, the structuralists were able to develop theories that diminished the role of the individual subject or agent while highlighting the underlying relations that govern social and psychic practices. In particular, the methodological privileging of structure – the underlying rules or “general laws” – over events led the structuralists to place emphasis on synchronic relations rather than historical developments. The social scientific emphasis on

---

9. Saussurean linguistics is discussed in the essay by Thomas F. Broden in *The History of Continental Philosophy: Volume 5*. 
structures also led the structuralists to downplay the role of consciousness, which figured so prominently in existentialism and phenomenology, and this deflation of the importance of consciousness and subjectivity – the so-called “death of the subject” – can be seen in all the structuralists’ work.10

Highlighting the death of the subject and the downplaying of the event is important for understanding the emergence of a distinctly post-structuralist philosophical view in France, whose announcement can be located in the philosophical events of 1966–68: Michel Foucault published *The Order of Things* in 1966; Jacques Derrida presented “Structure, Sign, and Play in the Discourse of the Human Sciences” in October 1966 at the critically important conference at Johns Hopkins University on “Languages of Criticism and the Sciences of Man,”11 and published his triumvirate *Of Grammatology, Writing and Difference, and Speech and Phenomena* in 1967; and Gilles Deleuze’s *Difference and Repetition* and *Spinoza and the Problem of Expression* were published in 1968. These works each, in their own way, respond to the structuralist treatment of both the subject and the event and, in so doing, what they collectively announce is the posting of structuralism, that is, a distinctly philosophical response to the challenge posed to philosophical thinking by the emergence of structuralism as the dominant intellectual paradigm. Collectively they set the philosophical agenda for “French philosophy” for most of the remainder of the twentieth century.

Highlighting these events of 1966–68 should not be taken to imply that the “announcement” of a post-structuralism announced at the same time the “end” of structuralism, nor should 1966 be understood to function vis-à-vis structuralism in the way that 1960 marked the end of existentialism. Not only was Lacan’s *Écrits* – one of the major texts of structuralism – first published in 1966, but 1966 also saw the founding of the important journal *Cahiers pour l’analyse*, created by Althusser’s students at the École Normale Supérieure with the intention of examining the epistemological implications of psychoanalysis within the context of structuralism.12 In addition, while structuralism emerged as a rejection of many of the foundational assumptions of existentialism, poststructuralism emerges less as a renunciation of structuralist assumptions than as a corrective to some of its theoretical excesses. But as a corrective, those philosophical writers in France who come into prominence in the late 1960s and early

10. While this is less the case in Lacan than the others, Lacan too rejects the privileging of the subject associated with existentialism and phenomenology.

*11. The importance of Derrida’s presentation at this conference is a focus of the essay by Jeffrey T. Nealon in this volume.

12. In addition to several essays by Lacan, the ten issues of *Cahiers pour l’analyse* also include essays by Foucault, Derrida, and Irigaray, among others. [*] For a discussion of the importance of the *Cahiers*, see the essay by Patrice Maniglier in *The History of Continental Philosophy: Volume 7*. 
1970s both recognize their intellectual debt to structuralism and recognize the need to move beyond structuralism.\textsuperscript{13}

While not wanting to overlook the important differences between the French philosophers and theorists who follow structuralism, there are nevertheless certain themes and trends that do emerge in various ways in their work. In some cases, as just mentioned, these should be understood as correctives to the excesses of structuralism, in other cases as various ways in which these thinkers were to give expression to the Nietzschean–Freudian–Marxian spirit of the times, and in still other cases as a way of retrieving themes from some of the French traditions that had fallen out of favor during the scientistic orientation of the 1950s and early 1960s, in particular the return of certain ethical, spiritual, and religious themes, along with some positions associated with phenomenology and existentialism. What cannot be denied, and should not be underestimated, is that the hegemony of structuralist social scientific thinking in the late 1950s and early 1960s was followed by the reemergence of the value of specifically philosophical thinking.

One way to understand their specifically philosophical orientation is to note that while the poststructuralists, like their structuralist predecessors, drew heavily on the ideas of Marx and Freud, unlike the structuralists they drew at least as much from the third so-called “master of suspicion” – Friedrich Nietzsche. As I discuss in my essay on “French Nietzscheanism,” it is important to note the role Nietzsche plays in those central texts of 1966–68 mentioned above, as Foucault sets out his position by opposing Nietzsche to Kant, Derrida does much the same by opposing Nietzsche to Lévi-Strauss, and Deleuze does so as well by posing Nietzsche as the alternative to Hegel. Nietzsche’s critique of truth, his emphasis on interpretation and differential relations of power, and his attention to questions of style in philosophical discourse thus became central motifs within the work of the poststructuralists as they turned their attention away from the human sciences and toward a philosophical-critical analysis of writing and textuality (Derrida); relations of power, discourse, and the construction of the subject (Foucault); desire and language (Deleuze); questions of aesthetic and political judgment (Lyotard); and questions of psychoanalysis and sexual difference (Irigaray, Kristeva, Cixous). And so, while the structuralist theorists had turned away from philosophy, many of the theorists

\textsuperscript{13} See, in this regard, Deleuze’s important essay, written in 1967, entitled “How Do We Recognize Structuralism?,” in Desert Islands and Other Texts: 1953–1974, David Lapoujade (ed.), Michael Taormina (trans.) (New York: Semiotext(e), 2004), which he opens by commenting that this question is important because it has “some bearing on work actually in progress” (ibid., 170) and closes by commenting that critics of structuralism cannot prevent it “from exerting a productivity which is that of our era” (ibid., 192).
following structuralism readily identify themselves as philosophers and/or draw unapologetically from philosophical resources. This is not surprising when one remembers that most of the poststructuralist philosophers “came of age” in an intellectual environment dominated by Sartre’s existentialism and they all studied and were profoundly influenced by both Merleau-Ponty’s thinking on language and corporeality as well as Heidegger’s critique of the history of metaphysics. But unlike most philosophical thinkers in France who preceded the rise of structuralism, French philosophers after structuralism also learned from their structuralist teachers and colleagues and they engage in philosophical reflection and analysis while taking account of the institutional and structural forces that inform philosophical thinking itself.¹⁴

Turning now to Germany, the situation there, while for different reasons, bears some striking similarities to what was happening in France. Although not dominated by structuralism, tensions between philosophy and the social sciences also mark the intellectual landscape in Germany and both Gadamer’s and Habermas’s important early works – Gadamer’s *Truth and Method* (1960), and Habermas’s *On the Logic of the Social Sciences* (1967) and *Knowledge and Human Interests* (1968) – intended to intervene in that debate. Also, while the young French philosophers initially struggled to escape the dominating presences of Sartre, Lévi-Strauss, and Lacan, the Germans had their own dominating figures to overcome – Heidegger, Horkheimer, and Adorno – all of whom died between 1969 and 1976.

But the German scene also differed from the situation in France, in part because while there was a sense in which almost all the French thinkers came out of the same educational system and had very similar philosophical formations, German philosophy was marked by longstanding animosity between the Heideggerian and critical theory traditions. The tension between these two traditions was apparent in Habermas’s and Gadamer’s respective approaches to the Enlightenment, with Habermas aligning himself with the Enlightenment commitment to critical reason and emancipation from prejudice, while Gadamer’s appeal to tradition and authority as well as his cultural conservatism left him much less comfortable with the Enlightenment commitments to progress and critique. This tension came to the fore in a “debate” between Gadamer and Habermas, initiated by Habermas’s 1967 review of *Truth and Method*, over

¹⁴. This is seen clearly not only in Foucault’s notion of the *epistēmē*, but also in Jacques Derrida’s many essays that examine the institutional setting of philosophy and philosophical instruction; see in particular, Derrida’s *Du droit à la philosophie*, much of which is translated in *Who’s Afraid of Philosophy? Right to Philosophy 1*, Jan Plug (trans.) (Stanford, CA: Stanford University Press, 2002) and *Eyes of the University: Right to Philosophy 2*, Jan Plug et al. (trans.) (Stanford, CA: Stanford University Press, 2004).
their respective claims for the universality of hermeneutics and the necessity of critique.\textsuperscript{15}

Ironically, while many of the French philosophers of the period were turning for inspiration to a number of German philosophers – Marx, Freud, Nietzsche, and Heidegger – the Germans themselves were to some degree turning away from their own tradition and, in the case of Gadamer, going back to Plato, while Habermas and other critical theorists, as James Swindal’s essay chronicles, looked increasingly to English language philosophy and social science.\textsuperscript{16} Even so, it is important to note that at least in the case of Habermas, his most important work of the 1960s – \textit{Knowledge and Human Interests} – shares more with what was happening in France than his later work would lead one to expect. With chapters on Marx, Freud, and Nietzsche, and criticisms of positivism and scientism, Habermas closed \textit{Knowledge and Human Interests} with a discussion of the emancipatory value of the “critically-oriented sciences.” Exemplified in earlier times by Marxist ideology-critique and psychoanalysis, Habermas concluded that the best modern representative of a critically oriented science would be a critical social theory committed to the value of philosophical reflection.

Although it is impossible to locate any set of themes that unite all the philosophers discussed in this volume, it is certainly possible to take note of certain motifs that appear frequently in their writings. One obvious theme at work in much of the philosophical reflection in Europe during the 1960s–1980s is an attention to questions of language, power, and desire that emphasizes the context in which meaning is produced and makes problematic all universal truth and meaning claims. As Claire Colebrook’s essay on the “linguistic turn” in continental philosophy makes clear, a sustained reflection on language is one of the dominant themes that runs through the work of all of the philosophers discussed in this volume. Whether in Christopher F. Zurn’s discussion of Habermas’s discourse ethics, Sara Heinämaa’s discussion of Kristeva on the “semiotic” and “speaking subject,” Wayne J. Froman’s discussion of Gadamer’s and Ricoeur’s hermeneutic theories, David R. Hiley’s discussion of Rorty’s interpretations of Sellars, Quine, and Davidson, or Samir Haddad’s or Jeffrey T. Nealon’s discussions of Derrida and deconstruction, each of the essays here attests to Foucault’s observation in \textit{The Order of Things} that the \textit{epistêmê} of the twentieth century erupted with the question of language as “an enigmatic multiplicity that must be

\textsuperscript{15} The “debate” is discussed below in the essays by Christopher F. Zurn and Wayne J. Froman. Many of the documents of the debate can be found in Gayle L. Ormiston and Alan D. Schrift (eds), \textit{The Hermeneutic Tradition: From Ast to Ricoeur} (Albany, NY: SUNY Press, 1990).

*\textsuperscript{16} For a brief discussion of German philosophy in this period, organized around three “schools” associated with Heidegger, the Frankfurt School, and Joachim Ritter, see the essay by Dieter Thomä in \textit{The History of Continental Philosophy: Volume 7}.
mastered.” One should also note, in this regard, the attention paid to literary language, not only by Barthes and Blanchot, but by Cixous, Deleuze, Derrida, Foucault, Gadamer, Kristeva, Ricoeur, and Serres, as well as the significant impact on literary studies of the work of many of these authors, not least the importance of Deleuze’s book for Proust studies and Serres’s for Zola studies. It is also easy to see that a concern with history and the event characterizes many of the thinkers whose work is addressed in this volume. There is no single reason behind this, nor a single form in which they seek to think time, temporality, or history. In Germany, this is seen most clearly in the dialogic approach of Gadamer’s hermeneutic theory, in which what is of greatest interest is the dialogue we have – or more accurately, the dialogue we are – between our present situation and the tradition. For Gadamer, the object to be analyzed hermeneutically – the “hermeneutical event proper” – is “the coming into language of that which has been said in the tradition: an event that is at once assimilation and interpretation.” The task of hermeneutics thus has to do with overcoming the distance between where we are and what confronts us from the past. Following Heidegger in ontologizing the hermeneutic relationship, we do not engage the tradition as a subject confronting something alien; rather we, as human beings, are the mediating relation – the dialogue – between the present and tradition. If one construes understanding dialogically as a process of question and answer – what Gadamer calls the “hermeneutical Urphänomen” – then one realizes that understanding is not a subjective apprehension of a given “object” but the appropriation of its “effective history.” Hermeneutic consciousness, as Froman discusses in his essay, is wirkungsgeschichtliches Bewusstsein – which could be translated equally well as “historically effected consciousness,” “consciousness effected by history,” and “consciousness of the effects of history” – which means that consciousness is always already at once “affected by history” and “open to the effects of history.” Gadamer’s philosophical hermeneutics thus preserves Heidegger’s central insight in Being and Time that the understanding

19. Thinking the event is not, of course, restricted to the thinkers addressed in this volume, as is clear from the discussion of Alain Badiou in Bruno Bosteels’s essay in The History of Continental Philosophy: Volume 8.
of oneself and one’s possibilities as a being in the world is temporal and situated historically.

In France, on the other hand, where the structuralists sought to understand the extratemporal functioning of systems (whether social, psychic, economic, or literary), thinkers such as Foucault, Derrida, Deleuze, or Lyotard – in a corrective to the overemphasis on synchrony that one finds in structuralist writing – attend to the historical unfolding of the phenomena they choose to examine. In part, the attention to time, temporality, and history can be viewed as a consequence of the intellectual resources to which these thinkers appeal, resources that were not necessarily central to the work of their structuralist predecessors. Foucault, for example, draws on the study of the history of science and scientific change in the work of Georges Canguilhem and Gaston Bachelard, while Deleuze returns to Bergson’s theories of time and durée (duration). For Derrida, it is primarily Heidegger’s focus on Being and the history of philosophy as a history of the forgetting of the ontological difference (the difference between Being and beings) that leads him to think in terms of the history of metaphysics as a history of logocentrism and onto-theology. For many of these thinkers, the move in Heidegger’s thought from the thinking of Being (Sein) to the thinking of Ereignis – the event of appropriation – can be seen to inspire, whether directly or indirectly, their respective attempts to develop a philosophy of the event, just as the attention to Nietzsche in the late 1960s and 1970s, and in particular to his notion of the eternal recurrence, led many to rethink traditional notions of temporality and history.

For example, we find Foucault’s entire philosophical oeuvre deeply inflected with an attention to history. The guiding thesis of his early work was that there exists, at any given time, an order of things that makes the social functioning of the time possible. This order operates within the fundamental codes of a culture: those governing its language, its schemes of perception, its techniques, exchanges, values, and so on. Unlike Kant’s transcendental project, a project with which the work of Lévi-Strauss is quite compatible, as Ricoeur noted when he referred to Lévi-Strauss’s anthropological theory as “a Kantianism without a transcendental subject,” for Foucault this order is a historical a priori: neither transcendental nor universal, this order is a historically specific constellation that exists prior to experience. But it is at the same time prior to reason insofar as the standards of rationality at work at any particular historical moment are

22. This should not be taken to imply that none of the structuralists drew at times on similar resources; for example, in this case, we might note that Althusser also appealed to Bachelard with his notion of “epistemological break.”
themselves determined on its basis. This order also establishes the basis on which knowledge and theory become possible, as Foucault argued in *The Order of Things* and, based on this order, certain ideas appear, certain perceptions, values, and distinctions become possible.

For many, this idea of a *historical a priori* is simply a contradiction in terms. For Foucault, however, experience is thoroughly historicized: one’s experience is “constructed” from the *a priori* – one might even say “structural” – rules that govern experience and social practices at a particular point in history. At other times, there were other *a priori* rules that governed social practices, and people’s experiences were, as a consequence, constructed differently. This historical *a priori* is ultimately what determines the “order of things,” by which Foucault’s French title – *Les Mots et les choses* – meant the relation between words (conceptual understandings) and things (reality as experienced).

One finds this attention to time and history in much of the important work done by the major figures in French philosophy after structuralism. For example, Pierre Bourdieu criticizes the objectivist accounts of gift exchange, such as that of Lévi-Strauss, for collapsing the relationship between gift and counter-gift into a relation of reciprocal equivalence, thereby failing to understand the socially necessary, albeit individually and collectively misrecognized “time-lag” between gift and counter-gift that stands as the condition for the possibility of the gift.24 For Deleuze, on the other hand, time is a constant theme, running through his reflections on Bergsonian duration, Nietzsche’s eternal return, and his theory of cinema (the second volume of which is *The Time-Image*). In fact, one could claim that in his two major texts, *Difference and Repetition* and *The Logic of Sense*, Deleuze is offering us a new way to think about time in order to think the logic of events. One could also here cite Jean-François Lyotard’s *post*-modernism and the thinking of the event of the post, as well as his reflections on the *arrive-t-il?* – the is-it-happening? – of the *différend*. And for Derrida, to take one final example, insofar as a central dimension of his philosophical project was the deconstruction of logocentrism as a metaphysics of presence that invariably privileges the temporal present, reflecting on time, history, and the event have also been recurring themes throughout Derrida’s writings. For example, in his presentation at the 1966 colloquium at Johns Hopkins University on “Languages of Criticism and the Sciences of Man,” Derrida opened ironically with the remark that “perhaps something has occurred in the history of the concept of structure that could be called an ‘event,’” noting that it was precisely the function of structuralist discourse to reduce or suspect the meaning of this

---

“loaded word.” 25 Or his coining of the neologism *différance* to situate at the foundation of deconstructive analysis an attentiveness to both meanings of the French verb *différer*: to defer in terms of delay over time and to differ in terms of spatial nonidentity. Insofar as *différance* names the movement of both temporal deferring and spatial differing, it stands as the transcendental condition for the possibility of differentiation, which is to say, *différance* is what makes differences possible. 26 What all these examples make clear is that philosophy in France from the 1960s onward has been marked by a renewed concern with thinking historically and, in particular, thinking the event.

A third significant theme in this period, especially in France, is the attempt to resituate the subject. While thinkers such as Derrida, Foucault, or Deleuze were never comfortable with the subject-centered thinking of the existentialists or phenomenologists, they were equally uncomfortable with the straightforwardly antihumanist rhetoric of structuralist thinkers such as Althusser or Lévi-Strauss. Thus Derrida could reply, to a question that followed his presentation at Johns Hopkins concerning the “death of the subject”:

> The subject is absolutely indispensable. I don’t destroy the subject; I situate it. I believe that at a certain level both of experience and of philosophical and scientific discourse, one cannot get along without the notion of the subject. It is a question of knowing where it comes from and how it functions. 27

Even Foucault, who can arguably be associated with the rhetoric of the “death of the subject” in his works of the early 1960s, can at the same time be shown to have been thinking about the question of the construction of the modern subject throughout his *oeuvre*. But here a distinction must be drawn between the “end of man” and the “death of the subject.” For while there is no question that the subject named “man” in philosophical discourse, from Descartes’s Archimedean *cogito* to Kant’s autonomous rational moral agent, is a concept toward which Foucault has little sympathy, it is equally clear that Foucault’s desire to deflate the subject as epistemically and discursively privileged is not conjoined with an

26. This is why Derrida can say that “*différance*, in a certain and very strange way, (is) ‘older’ than the ontological difference or than the truth of Being”; see Jacques Derrida, “*Différance*,” in *Margins of Philosophy*, Alan Bass (trans.) (Chicago, IL: University of Chicago Press, 1982), 22.

attempt to eliminate the subject entirely. Instead, Foucault seeks to analyze the subject as a variable and complex function of discourse and power, which, he writes, means to ask not “How can a free subject penetrate the density of things and give it meaning?” but “How, under what conditions, and in what forms can something like a subject appear in the order of discourse? What place can it occupy in each type of discourse, what functions can it assume, and by obeying what rules?”²⁸ In fact, by the end of his career, as his attention turned specifically to sexuality and the construction of the ethical subject, Foucault himself came to see that the transformation of human beings into subjects of knowledge, subjects of power, and subjects to themselves had been “the general theme of [his] research.”²⁹

For feminist thinkers writing after structuralism, the question of the subject was also central to their work as they sought to challenge both philosophical and psychoanalytic assumptions concerning the subject as sexed or gendered male or masculine. Although there are important differences, as the essays in this volume by Mary Beth Mader and Sara Heinämaa clearly indicate, between the theoretical positions of Cixous, Irigaray, or Kristeva, insofar as these “difference feminists” argue for sexual difference and the significant and important differences between male and female desire, they had to argue that there were important differences between male and female subjects. To make this argument required that they refuse to follow the structuralist project of entirely eliminating the subject. Luce Irigaray, to take one example, is uncomfortable with giving up the possibility of occupying the position of the subject insofar as this is a position that women have heretofore never been able to occupy. She thus notes that she would prefer to see the “culture of the subject … evolve in the direction of a culture of a sexed/gendered subject and not in the direction of a heedless destruction of subjectivity.”³⁰ Moreover, she suggests that insofar as the circulation of women as objects of social–sexual exchange has been foundational to the Western patriarchal social order, we should not underestimate the possibilities for radical social transformation if women were to finally emerge as “speaking subjects.” The “speaking subject” is, of course, also

a central focus of Julia Kristeva’s work, as she defined her project of analytical semiology or semanalysis, in part, as the “insertion of subjectivity into matters of language and meaning.”31 Such a subject would not, of course, be a Cartesian or Husserlian subject, who could function as a pure source of meaning. Rather, following the discoveries of Freud, Lacan, and structural linguistics (Saussure, Benveniste), the “speaking subject” will always be a “split subject,” split between conscious motivations and the unconscious, between structure and event, and between the subject of the utterance (sujet d’énonciation) and the subject of the statement (sujet d’énoncé), who would be “posited as the place, not only of structure and its regulated transformation, but especially, of its loss, its outlay.”32 Elsewhere, in Revolution in Poetic Language, this subject is developed as a subject-in-process/on-trial (sujet-en-procès), a dynamic subject at the intersection of the semiotic and the symbolic, making itself and being made, but a subject nonetheless.

In Germany, on the other hand, both Gadamer and Habermas share with these French philosophers a certain resistance to a classical philosophy of the subject. For Gadamer, coming out of the Heideggerian tradition, there was never much sympathy for the strong subjectivism associated with existentialism, and challenging the subjectivist account of understanding is a central component of the hermeneutic theory he puts forward in Truth and Method. For Habermas, on the other hand, while sharing with the French a desire to displace the subject from a position of epistemic and semantic centrality, he thinks much French philosophizing goes too far in the opposite direction. As Zurn puts it in his essay, “there is an alternative path out of subject-centered philosophy: namely, the thoroughly intersubjectivist theory of communicative reason that sees reason and subjectivity as fully situated and immanent in everyday practices.” There is, however, with respect to the question of the subject, a third important voice in Germany, that of Dieter Henrich. Turning away from the Heideggerian critique of the subject and returning to classical German philosophy – and most especially Kant and Fichte – Henrich explores the primordial structure of self-awareness as a form of “being-a-self” and, pace Habermas, argues for the primacy of subjectivity over intersubjectivity.33

A last theme to note is the attention paid to difference rather than a focus on identity or the Same. One of the essential themes of Saussurean linguistics was

32. Ibid., 24.
*33. For further discussion of Henrich, see the essay by Dieter Thomä in The History of Continental Philosophy: Volume 7.
that “in language there are only differences without positive terms.”34 By this, he meant that language functions as a system of interdependent units in which the value of each constituent unit results solely from the simultaneous presence of other units and the ways each unit differs from the others. While the structuralists all took note of this theme, emphasizing in their analyses relations rather than things, the emphasis on difference did not become truly dominant until after the structuralist paradigm began to wane. For example, sexual difference is a theme that almost all the feminist thinkers after structuralism have addressed, as the essays by Mader and Heinämaa clearly demonstrate. Indeed, Irigaray goes so far as to suggest that, if Heidegger is right in thinking that each epoch has but a single issue to think through, then “sexual difference is … the issue of our age.”35 Hélène Cixous, on the other hand, sees the rigid conceptualization of sexual difference as what supports the identification of the male/masculine with the Same, while the female/feminine is rendered Other. For Cixous, the way out of this patriarchal system is not via the elimination of difference but through escaping the dominant logic of difference as hierarchal opposition to a new logic of difference in which “difference would be a bunch of new differences.”36

We have already noted how Derrida has emphasized différance in his deconstructive project. But more generally, the attention to difference is a move one finds in almost all recent French philosophers. For Deleuze, in particular, difference has been a central and constant focus of his thinking. His Nietzsche and Philosophy (1962), which read Nietzsche against Hegel, looks to difference as one way to mark this opposition. In place of Hegel’s “speculative element of negation, opposition or contradiction, Nietzsche substitutes the practical element of difference, the object of affirmation and enjoyment.”37 Where the dialectic is engaged in the “labor of the negative,” according to Deleuze, Nietzsche offers a theory of forces in which active force does not negate or deny the other but “affirms its own difference and enjoys this difference.”38 Nietzsche’s notion of will to power is, for Deleuze, a theory of forces in which forces are distinguished in terms of both their qualitative and quantitative differences. In fact, what Nietzsche names with the “will to power” is “the genealogical element of force, both differential

34. Ferdinand de Saussure, Course in General Linguistics, Charles Bally and Albert Sechehaye with the collaboration of Albert Riedlinger (eds), Wade Baskin (trans.) (New York: Philosophical Library, 1959), 120.
38. Ibid.
and genetic. The will to power is the element from which derive both the quantitative
difference of related forces and the quality that devolves into each force in this relation.39 And, given the importance that difference plays in Deleuze's reading, it is not at all surprising to find him concluding that what returns eternally is not the Same or the identical; rather, what returns is the repetition of difference.

Deleuze develops these themes much further in Difference and Repetition, a work that reflects the “generalized anti-Hegelianism” of the time in which “difference and repetition have taken the place of the identical and the negative, of identity and contradiction.”40 Hegel is not the only culprit, however; rather, from Plato to Hegel, the metaphysical tradition sees the different in opposition to and derivative on the one, while Deleuze sets out to develop an ontology of difference in which “it is not difference which presupposes opposition, but opposition which presupposes difference” and treats it as the negation of identity.41 Deleuze's project in this work is nothing short of reversing the tradition that privileges identity by showing identity to be an optical effect produced “by the more profound game of difference and repetition.”42

As this brief review of the ways in which questions of language, the subject, history, and difference emerge in the work of the thinkers discussed in this volume indicates, there are important intersections between what was happening philosophically in Germany and France during the 1960s, 1970s, and 1980s. And although the much anticipated encounter between Habermas and Foucault never took place,43 and the encounter between Gadamer and Derrida did take place,44 but was so marked by their respective failures to understand one another that one might argue that this encounter too “did not take place,” these thinkers

39. Ibid., 50.
41. Ibid., 51.
42. Ibid., xix.
43. Following Habermas's lecture series at the Collège de France in May 1983, which was later expanded in The Philosophical Discourse of Modernity, Foucault invited Habermas to a private conference that was to take place in the US in November 1984 with some of their American colleagues (Hubert Dreyfus, Richard Rorty, Charles Taylor), to discuss questions of modernity provoked by Kant's famous essay “What is Enlightenment?” The conference was cancelled following Foucault's death. Habermas discusses this in “Taking Aim at the Heart of the Present,” in Jürgen Habermas, The New Conservatism: Cultural Criticism and the Historians' Debate (Cambridge, MA: MIT Press, 1989).
as well as the others discussed in the essays that follow made an indelible mark on European philosophy, one that can be seen to have set the agenda for philosophical thought on the continent and elsewhere from the 1960s to the present, as the essays in Volumes 7 and 8 of *The History of Continental Philosophy* clearly demonstrate.
1

FRENCH NIETZSCHEANISM

Alan D. Schrift

As an artist one has no home in Europe, except Paris …

(Ecce Homo, “Why I Am So Clever,” §5)

When philosophers think of “French Nietzscheanism,” they tend to associate this development with the 1960s. But French Nietzscheanism has, in fact, a long history in which one can locate three particular moments: first among writers of both the avant-garde Left and neoroyalist Right from the early 1890s until the First World War; then among nonconformist intellectuals in the years before and after the Second World War; and finally among philosophers in the 1960s and 1970s. Nietzsche himself was drawn to France and his works found there an early and welcome home. Richard Wagner à Bayreuth, the first translation of any of Nietzsche’s works, appeared in French in January 1877, barely six months after it first appeared in German. And by the time Nietzsche’s first works appeared in English (Thus Spoke Zarathustra and The Case of Wagner were published in 1896), Henri Albert already had plans to publish a translation of Nietzsche’s complete works through Mercure de France, a project he completed in 1909 with the French translation of Ecce Homo. But this initial enthusiastic reception of

2. The fourth and final of Nietzsche’s Untimely Meditations, Richard Wagner in Bayreuth was published in July 1876 by Verlag Ernst Schmeitzner. Schmeitzner also published Richard Wagner à Bayreuth, translated into French by Marie Baumgartner.
3. Louis Pinto suggests these plans were envisaged as early as 1894; see Louis Pinto, Les Neveux de Zarathoustra (Paris: Éditions du Seuil, 1998), 25 n. By contrast, the first English translation of the complete works, edited by Oscar Levy, was published between 1909 and 1911.
Nietzsche’s works in France should not obscure the fact that the association of Nietzscheanism in France with the emergence of poststructuralism in the 1960s is not mistaken, because it was not until the late 1950s that Nietzsche’s work was taken seriously by French philosophers as philosophy. Before we examine this uniquely philosophical moment of French Nietzscheanism, therefore, a few comments on the two earlier moments are in order.

Early in the twentieth century, there was considerable interest in France in Nietzsche’s thought, but this was located primarily outside the university and, when in the university, outside the faculty in philosophy. Professor of German Literature Henri Lichtenberger (1864–1941) taught the Sorbonne’s one full-year course in German language and literature in 1902–1903 on Nietzsche, and Lichtenberger’s La Philosophie de Nietzsche, first published in 1898, was already in its ninth edition by 1905. Charles Andler (1866–1933), also a professor of German literature, published a magisterial six-volume study of Nietzsche between 1920 and 1931. Outside the university, from the 1890s into the early twentieth century, Nietzsche was widely read by and associated with the literary avant-garde, most notably André Gide (1869–1951) and his circle, many of whom studied with Andler at the École Normale Supérieure and were later associated with La Nouvelle Revue Française. There was also an attraction to Nietzsche among certain literary and political circles associated with the Right that began in the 1890s and was later associated with Charles Maurras (1868–1952) and the Action Française, and which continued until the approach of the First World War, when their nationalistic and anti-German attitudes

5. Henri Lichtenberger, La Philosophie de Nietzsche (Paris: Félix Alcan, 1898). In 1910, this work was the first French text on Nietzsche to be translated into English, as The Gospel of Superman: The Philosophy of Friedrich Nietzsche.

6. Charles Andler, Les Précurseurs de Nietzsche (Paris: Bossard, 1920); La Jeunesse de Nietzsche: Jusqu’à la rupture avec Bayreuth (Paris: Bossard, 1921); Le Pessimisme esthétique de Nietzsche: Sa philosophie à l’époque wagnérienne (Paris: Bossard, 1921); Nietzsche et le transformisme intellectualiste: La Philosophie de sa période française (Paris: Bossard, 1922); La Maturité de Nietzsche: Jusqu’à sa mort (Paris: Bossard, 1928); La Dernière philosophie de Nietzsche: Le Renouvellement de toutes les valeurs (Paris: Bossard, 1931). Andler’s first two volumes were sent to the publisher Félix Alcan in 1913, but publication at that time was impossible because of the war (see Le Rider, Nietzsche en France, 84). The six volumes were published together in three volumes as Nietzsche, sa vie et sa pensée (Paris: Gallimard, 1958).
made it impossible for them to any longer look on Nietzsche with favor. While
the literary Left welcomed Nietzsche as a philosopher-poet who challenged
the strictures of contemporary morality, the philosophical establishment was
dismissive of Nietzsche's stylistic transgressions, his "irrationalism," and his
"immoralism." Where Gide promoted his association with Nietzsche in his
*L'Immoraliste*, published in 1902, Alfred Fouillée's *Nietzsche et l'immoralisme*,
one of the few works on Nietzsche written by a philosopher during this period,
also appeared in 1902, went through four editions by 1920, and was extremely
critical of Nietzsche, questioning why any serious philosopher would attend
to his thought. In fact, Nietzsche was so closely identified with "immoralism"
that the term was introduced and defined as "Nietzsche's doctrine" in the presti-
tigious philosophical dictionary *Vocabulaire technique et critique de la philos-
ophie*, compiled from 1902 to 1923 by members of the Société Française de
Philosophie, under the direction of their General Secretary André Lalande.

The near total failure by university philosophers to acknowledge Nietzsche's
work from 1890 through the First World War and beyond is less the result of
unfamiliarity with his work than a consequence of their decision to "profes-
sionalize" philosophy both by emphasizing its logical and scientific rigor and by
distinguishing sharply between philosophy and literature. During this period,
although there were serious antagonisms between the three dominant "schools"
within French academic philosophy – the positivists, neo-Kantians, and spiri-
tualists – the university professors were united in thinking that the university
was the only space for "serious" philosophical discussion. As a consequence,
Nietzsche's popularity among so-called philosophical "amateurs" was taken as

---

period, see Christopher E. Forth, *Zarathustra in Paris: The Nietzsche Vogue in France 1891–
1918* (DeKalb, IL: Northern Illinois University Press, 2001); for a discussion of Nietzsche's
appropriation by the Action Française, see Reino Virtanen, "Nietzsche and the Action Fran-
ceaise: Nietzsche's Significance for French Rightist Thought," *Journal of the History of Ideas* 11
(April 1950).

9. The members of the Société Française de Philosophie met regularly to discuss the meanings
of key philosophical terminology, and they published their proceedings in two issues each
year of the *Bulletin de la Société Française de Philosophie*. Lalande collected and annotated
these proceedings and published them with Félix Alcan in a single volume in 1925–26. The
*Vocabulaire*’s eighteenth edition was published by Presses Universitaires de France in 1996.

10. Pinto makes this point in *Les Neveux de Zarathoustra*, 38ff. One might relate the university
philosophers' hostility to Nietzsche to the similar animosity philosophers at the Sorbonne
and École Normale Supérieure showed to the work of Henri Bergson.

11. I discuss the tensions between these "schools" and their leading representatives – Émile
Durkheim, Léon Brunschvicg, and Henri Bergson, respectively – in the opening chapter of
evidence of his philosophical unworthiness within the academy.\footnote{The general point of the hostility between "professional," that is university, philosophers and philosophical "amateurs" is discussed in Jean-Louis Fabiani, “Enjeux et usages de la 'crise' dans la philosophie universitaire en France au tournant du siècle,” \textit{Annales ESC} (March–April 1985).} Even after the First World War, although Nietzsche remained a canonical figure within German studies\footnote{Beginning in 1903, Nietzsche appears roughly every four or five years on the \textit{Programme} of the \textit{agrégation d'allemand}, even through the Second World War, appearing on the \textit{Programmes} in 1940 and 1942. For further information on the French institution of the \textit{agrégation}, see note 25.} and was very much a part of the cultural debate between the Right and the Left, there was almost no philosophical scholarship on his thought.

From the 1930s to the 1950s, Nietzsche continued to be ignored by the university philosophers.\footnote{In 1946, the Société Française d'Etudes Nietzschéennes was founded by Armand Quinot and Geneviève Bianquis and its eight founding members were all Germanists with the exception of the philosopher Félicien Challaye. The society continued until 1965 and eventually included among its members the philosophers Jean Wahl, Angèle Kremer-Marietti, Gilles Deleuze, Richard Roos, Pierre Boudot, and Jacques Derrida.} But during these years, the “second moment” of French Nietzscheanism took shape as his thought emerged as an important reference for avant-garde theorists who would, in the 1960s, become associated with philosophers. The most significant figure here was Georges Bataille,\footnote{For a discussion of Georges Bataille and the Collège de Sociologie, see the essay by Peter Tracy Connor in \textit{The History of Continental Philosophy: Volume 5}.} for whom Nietzsche was a constant object of reflection from the foundation of the journal \textit{Acéphale} in 1936 through his \textit{Sur Nietzsche}, published in 1945.\footnote{Georges Bataille, \textit{Sur Nietzsche} (Paris: Gallimard, 1945); published in English as \textit{On Nietzsche}, Bruce Boone (trans.) (New York: Paragon House, 1992). Vincent Descombes regards Bataille as the central figure in Nietzsche’s "second French moment.” See Vincent Descombes, "Nietzsche’s French Moment,” Robert de Loaiza (trans.), in \textit{Why We Are Not Nietzscheans}, Luc Ferry and Alain Renaut (eds) (Chicago, IL: University of Chicago Press, 1999). While I do not share Descombes’s unsympathetic view of Nietzsche’s third, "philosophical" moment, my chronology here basically agrees with his.} Through Bataille, Pierre Klossowski, and others, including the philosopher Jean Wahl, Nietzsche was a constant presence in the activities of the Collège de Sociologie. Two features distinguish Bataille’s approach to Nietzsche: his attempt to read Nietzsche in relation to Hegel, and his desire to challenge the association of Nietzsche’s thought with fascism and National Socialism. These features come together in Bataille’s framing Nietzsche as “the hero of everything human that is not enslaved,”\footnote{Georges Bataille, “Nietzschean Chronicle,” in \textit{Visions of Excess: Selected Writings}, 1927–1939, Allan Stoekl (ed. and trans.) (Minneapolis, MN: University of Minnesota Press, 1985), 203.} and as he develops these features, Bataille emphasizes, more than earlier French readings, the place of the eternal return in Nietzsche’s thought. Bataille and his collaborators at \textit{Acéphale} were all influenced by Karl Löwith’s
Nietzsche's Philosophie der ewigen Wiederkehr des Gleichens, which appeared in 1935 and was reviewed by Klossowski in the second issue of Acéphale (January 1937). For Bataille, where Hegel's philosophy is directed by an unaltering teleology, Nietzsche's thought of eternal return affirms the immanence of each moment as an unmotivated end in itself. And where Hegel's dialectic of determinate negation leaves nothing to chance, Nietzsche's emphasis on the death of God and the immanent, excessive possibilities of the moment leaves everything to chance. By attending to the will to chance at the core of the eternal return, Bataille deemphasized the significance of the will to power, which he saw as central to the fascists' willful misappropriation of Nietzsche and which he criticized for being motivated by an instrumental rationality that mistakenly reduced all value to use-value instead of affirming the transvaluation of all values that opens the future to the possibility of the new.

The other significant work on Nietzsche written during this period, sociologist Henri Lefebvre's Nietzsche, shares with Bataille the desire to read Nietzsche against the fascists, arguing that “The Nietzschean idea of the future is not fascist. ‘Surpass! Overcome!’ This Nietzschean imperative is precisely the contrary of the fascist postulate, according to which conflicts are eternal and human problems don’t have solutions.” But unlike Bataille, Lefebvre also sought to emphasize both Nietzsche's existentialism and his compatibility with Marx. A committed Marxist and member of the Parti Communist Français until he was expelled in 1958, Lefebvre opens his text with an epigraph from Marx's 1844 Manuscripts, and goes on to argue that Nietzsche's account of human alienation raises important themes that are insufficiently addressed by Marx's exclusively economic account of alienation. At the same time, he argues that Nietzsche lacks a coherent theory of alienation, which would require that he see the alienation of thought from life “as the result of social differentiation and the division of labor” (144). Because Lefebvre finds Nietzsche's revaluation of values easy to “integrate with the Marxist concept of man,” he concludes that “it is absurd to write [as Drieu la Rochelle did in his Socialisme fasciste (1934)] Nietzsche contre Marx” (164). Lefebvre's Marxist vision drifts toward existentialism as he notes that in Nietzsche's magnificent future, “the men of our epoch will, suffer, despair, and always return to hope. And it is this which gives their life its unique

---

character” (*ibid*.). Even the eternal recurrence squares with Lefebvre’s existentialist Marxist vision of the future, as the eternal recurrence gives rise to the Nietzschean Imperative, “an imperative that gives existence an infinite density: ‘Live each moment in a way that you will to relive it eternally’ [‘Vis tout instant de sorte que tu veuilles toujours le revivre’]. There doesn’t exist an eternity and a pre-existent truth that fatalistically determines us. On the contrary: we create eternity, our eternity!” (87).22

Somewhat surprisingly, given Nietzsche’s early association in the English-speaking world with existentialism, the second Nietzschean moment in France, while emerging at the same time as French existentialism, is not particularly associated with that movement. Sartre, Merleau-Ponty, and Beauvoir were no doubt familiar with Nietzsche’s works, but Nietzsche’s thought did not play nearly as influential a role in existentialist philosophy as that played by Hegel, Husserl, or Heidegger. Even Wahl, who was the figure at the Sorbonne most closely associated with contemporary German philosophy, devoted far more time to Kierkegaard than to Nietzsche during these years. The existentialist who was most comfortable appealing to Nietzsche was Albert Camus,23 but he did so more from the perspective of a literary rather than philosophical writer. Sartre, on the other hand, was quite hostile to the idea of Nietzsche’s philosophical importance. In an essay on the work of Brice Parain, Sartre wrote that “We know that Nietzsche was not a philosopher.”24 And Sartre follows this comment about Nietzsche not being a philosopher with the following: “But why does Parain, who is a professional philosopher, quote this crackbrained nonsense?”

In contrast to the two earlier moments, what distinguishes the third Nietzschean moment in France is precisely that Nietzsche’s thought is for the first time taken up by professional philosophers. Nietzsche’s philosophical moment in France begins in 1958, when *La Généalogie de la morale* appeared on the reading list in French translation for the *agrégation de philosophie.*25

---

25. The *agrégation de philosophie* is a competitive annual exam that certifies students to teach philosophy in secondary and postsecondary schools. Appearing on the Programme, or reading list, for the *agrégation* insures that all students taking the examination, normally taken on completion of one’s studies at a grande école or university, will spend the year reading one’s work; in addition, a significant component of the teaching corps will offer lycée or university courses that address figures and texts on the annual reading list. I discuss the history and
Appearing again in 1959, these were Nietzsche's first appearances on the examination since 1929, and they began a series of his appearances over the next two decades. In precisely those years when Nietzsche's *Genealogy* was one of the required texts (1958–59), Deleuze was beginning his university career at the Sorbonne, where he taught as *Maître-assistant* in the history of philosophy from 1957 to 1960, and where he offered a course on the *Genealogy* in the fall of 1958, which surely explains why the *Genealogy* plays such a central role in Deleuze's *Nietzsche et la philosophie*. To appreciate the novelty of Nietzsche's *philosophical* moment, consider the following: in 1959 and 1961, Wahl gave the first lecture courses on Nietzsche ever offered by a professor of philosophy at the Sorbonne, and during precisely these years, 1958–62, we see appear the first six articles on Nietzsche ever to be published in France's prestigious philosophical journals. And to appreciate the novelty of Deleuze's 1962 publication of *Nietzsche et la philosophie*, consider that there were only three books on Nietzsche published in France by philosophers in the preceding four decades.

Influence of the *agrégation de philosophie*, examining in detail the role it played in the emergence of French Nietzscheanism, elsewhere; see “The Effects of the *Agrégation de Philosophie* on Twentieth-Century French Philosophy,” *Journal of the History of Philosophy* 46(3) (July 2008).

27. I thank Giuseppe Bianco for providing me a copy of a student's notes from Deleuze's 1958 course, which offered a “*Commentaire de ‘La Généalogie de la morale.’*”

28. Published in English as *Nietzsche and Philosophy*, Hugh Tomlinson (trans.) (Minneapolis, MN: University of Minnesota Press, 1983). Among the other philosophers who are on the *Programmes* for the written examination or French explication while Deleuze taught at the Sorbonne are Bergson, Kant, and the Stoics (1957), and Spinoza, Hume, and Kant (1958, 1959). Deleuze published on all of these figures in the following decade.

31. For another indication of how French scholarship has changed since the early 1960s, consider that Wahl’s 1963 review of *Nietzsche et la philosophie* in *Revue de métaphysique et de morale* begins by saying that Deleuze's book belongs alongside the most important books on Nietzsche, which he then names: those of Jaspers, Heidegger, Fink, and Lou Salomé.
Two of these were introductory texts written by philosophy teachers at the Lycée Condorcet: Félicien Challaye’s *Nietzsche* (1933), and André Cresson’s *Nietzsche, sa vie, son œuvre, avec un exposé de sa philosophie et des extraits de ses œuvres* (1942). It is not until much later, in Angèle Kremer-Marietti’s *Thèmes et structures dans l’œuvre de Nietzsche* (1957), that Nietzsche’s work receives a more philosophically sophisticated treatment.32

Along with Nietzsche’s appearance on the agrégation, Deleuze’s book, and the German publication of Heidegger’s two-volume *Nietzsche* in 1961,33 the emergence of French Nietzscheanism is marked by two major conferences. The first, at which Nietzsche was treated for the first time in France as a serious philosopher, was held at the Abbey at Royaumont, July 4–8, 1964, and this conference played a significant role in legitimating Nietzsche’s philosophical reputation.34 Organized by Deleuze and presided over by the distinguished historian of philosophy Martial Guéroult,35 in addition to papers by younger philosophers (Gilles Deleuze, Michel Foucault, Gianni Vattimo36), and literary or avant-garde writers (including Klossowski), presentations were also made by distinguished senior academic philosophers Jean Wahl, Jean Beaufret, Karl Löwith, Eugen Fink, and Henri Birault, the prestigious nonacademic philosopher Gabriel Marcel, and Giorgio Colli and Mazzino Montinari, the editors who were just beginning work on a new critical edition of Nietzsche’s works.37 In his

---

32. Another indication of Nietzsche’s position within the academic philosophical world can be gleaned from Armand Cuvillier’s *Manuel de Philosophie à l’usage des Classes de Philosophie et de Première Supérieure* (Paris: Librairie Armand Colin, 1944), a preparatory text for students studying for either the baccalauréat or the entrance examinations for the grandes écoles, including the École Normale Supérieure. Cuvillier’s text mentions Nietzsche only four times in over 650 pages, and does not include any of Nietzsche’s texts in a list of one hundred “Important Works Published since 1870” (ibid., 668).

33. Heidegger’s *Nietzsche* was not translated into French until 1971, in two volumes, by Pierre Klossowski and published by Gallimard.

34. The proceedings were published as *Nietzsche: Cahiers de Royaumont* (Paris: Éditions de Minuit, 1967).

*35. For brief discussions of Guéroult, see the essay by Derek Robbins in this volume, and the essay by Simon Duffy on French and Italian Spinozism in *The History of Continental Philosophy: Volume 7*.

*36. For a discussion of Vattimo, see the essay by Silvia Benso and Brian Schroeder in *The History of Continental Philosophy: Volume 7*.

37. Colli and Montinari’s original edition was to appear in Italian, published by Adelphi Edizioni, and French, published by Gallimard, and edited by Foucault and Deleuze. Montinari had been trying unsuccessfully since 1961 to get a German publisher to agree to publish a German edition; conversations at the Royaumont conference with Karl Löwith led him to intervene and persuade de Gruyter to acquire the rights from Adelphi and Gallimard to publish the Colli–Montinari edition in its original language. I discuss this in a history of the English translation of the Critical Edition, which I am currently editing, in my “Translating the Colli–Montinari Kritische Studienausgabe,” *Journal of Nietzsche Studies* 33 (2007).
own presentation, as was customary for the organizer of a conference, Deleuze gave a closing address in which he surveyed the presentations of the preceding days.38 He noted five themes that were addressed throughout the papers and discussions: Nietzsche's masks and the necessity of interpretation; the will to power as that which remains behind the masks; relations of affirmation and negation; the Dionysian affirmation in eternal return; and Nietzsche's relations with other thinkers (Dostoevsky, Hesse, Marx, and Freud, among others). What Deleuze could not say, but what became clear soon after, was that the conference at Royaumont marked the confirmation of Nietzsche's philosophical reputation in France as he took his place in the philosophical canon, an event affirmed by the fact that his name made its initial appearance on the written examination of the *agrégation de philosophie* in 1970, reappearing three more times in the following seven years.39

Where the Royaumont conference acknowledged Nietzsche's place in the canon, the second major conference, for ten days at Cerisy-la-Salle in July 1972,40 placed Nietzsche at the center of contemporary French philosophy. Under the title *Nietzsche aujourd'hui* (Nietzsche today), the Cerisy conference included presentations by several of the participants who were at the Royaumont colloquium (including Deleuze, Fink, Klossowski, and Löwith). In addition to presentations by scholars associated with Nietzsche's work such as Eugen Biser, Eric Blondel, Pierre Boudot, Richard Roos, and Paul Valadier, it also included a significant presentation by Jacques Derrida, “La Question du style,” which would later be revised and published as *Spurs: Nietzsche's Styles*, as well as presentations by a number of younger scholars associated with Derrida, including Sarah Kofman, Philippe Lacoue-Labarthe, Jean-Luc Nancy, Bernard Pautrat, and Jean-Michel Rey.41 And while some presentations, like the vast majority of presentations at

---

39. When a philosopher is named on the reading list for the written examination, this means that candidates preparing for the exam will be expected to know the entirety of that philosopher's corpus. It also assures that this philosopher will be the focus of a wide range of university and lycée courses in philosophy. This further suggests a link between Nietzsche’s first appearance on the written *Programme* in 1970 and the organization of the Cerisy conference for the summer of 1972.
40. Over eight hundred pages of presentations and subsequent discussions from this conference were published in two volumes as *Nietzsche aujourd’hui* (Paris: Union Générale d’Éditions, 1973).
41. Many of these philosophers participated in the open seminar Derrida directed at the École Normale Supérieure, in the winter of 1969–70, devoted to a “Theory of Philosophical Discourse” with a particular emphasis on “The Status of Metaphor in Philosophy.” Both Pautrat and Kofman note that preliminary drafts of their first books on Nietzsche – Bernard
}

“French Nietzscheanism” refers to more than the production of an enormous amount of French philosophical scholarship on Nietzsche, however, and to discuss “French Nietzscheanism” in its third moment is, I would argue, to go to the heart of poststructuralist philosophy because in many ways it was in their appropriation of Nietzschean themes that the dominant poststructuralist philosophers – Foucault, Deleuze, and Derrida – distinguished themselves both from the structuralists who preceded them and from the more traditional philosophical establishment in France, whose authority they sought to challenge. As Pierre Bourdieu has noted, although the influence of philosophy had declined within French academic institutions in the wake of the structuralists focusing their critical attention on the discursive and analytic practices of the human sciences, Nietzsche’s appeal to the new generation of philosophers lay to a large extent in his having been overlooked, as we saw in the preceding discussion of Nietzsche’s first and second French moments, by the more “traditional” university philosophers.48 It was precisely Nietzsche’s “marginal” status as a philosopher that made him, according to Bourdieu, “an acceptable philosophical sponsor” at a time – the late 1950s and early 1960s – when it was no longer fashionable in France to be a “philosopher.”49

It was, in other words, by virtue of their appeal to Nietzsche that this new generation of philosophers both “escaped” from philosophy and returned to philosophy. Both Deleuze and Foucault acknowledge explicitly the emancipatory role Nietzsche played at the time. In a 1983 interview, for example, Foucault commented that:

The actual history of Nietzsche’s thought interests me less than the kind of challenge I felt one day, a long time ago, reading Nietzsche for the first time. When you open The Gay Science after you have been

---

trained in the great, time-honored university traditions – Descartes, Kant, Hegel, Husserl – and you come across these rather strange, witty, graceful texts, you say: Well I won’t do what my contemporaries, colleagues or professors are doing; I won’t just dismiss this. What is the maximum of philosophical intensity and what are the current philosophical effects to be found in these texts? That, for me, was the challenge of Nietzsche.50

Deleuze says something similar, confessing that he “belongs to a generation, one of the last generations, that was more or less bludgeoned to death with the history of philosophy,” adding that within philosophy “the history of philosophy plays a patently repressive role.”51 But, he continues, “It was Nietzsche, who I read only later, who extricated me from all this. Because you can’t deal with him in the same sort of way.”52

While Bourdieu’s observation of the poststructuralists’ desire to keep their distance from “the philosophical high priests of the Sorbonne”53 is important, it should not obscure the fact that for all the rhetoric concerning the “end of philosophy,” one of the most obvious differences between the discourses of the structuralists and those of the poststructuralists is the degree to which the latter remain philosophical. The role Nietzsche plays in this renewal of philosophical discourse is not insignificant. Unlike the rigid, scientistic, and constraining systems of structuralism, Nietzsche appeared to his new readers to be both philosophically inspired and philosophically inspiring. Derrida, for example, provides the following list of themes to look for in Nietzsche:

the systematic mistrust as concerns the entirety of metaphysics,
the formal vision of philosophical discourse, the concept of the philosopher-artist, the rhetorical and philological questions put to the history of philosophy, the suspiciousness concerning the values of truth (“a well applied convention”), of meaning and of meaning of Being, of “meaning of Being,” the attention to the economic phenomena of force and of difference of forces, etc.54

And in Of Grammatology, he credits Nietzsche with contributing:

52. Ibid., 6.
54. Derrida, Margins of Philosophy, 305.
a great deal to the liberation of the signifier from its dependence or
derivation with respect to the logos and the related concept of truth
or the primary signified, in whatever sense that is understood [by
his] radicalizing of the concepts of interpretation, perspective, eval-
uation, difference ...\textsuperscript{55}

Moreover, by addressing questions concerning human existence without
centering his reflection on human consciousness, Nietzsche indicated how one
might respond to structuralism’s sloganistic “death of the subject” by showing
a way to raise anew questions of individual agency without succumbing to an
existentialist voluntarism or subjectivism. At the same time, the poststructural-
ists saw in the notion of eternal recurrence\textsuperscript{56} a way to again entertain questions
of history and historicity, questions that had been devalued within the struc-
turalists’ ahistorical emphasis on synchronic structural analyses.\textsuperscript{57} That is to say,
where the structuralists responded to existentialism’s privileging of conscious-
ness and history by eliminating them both, the poststructuralists took from
structuralism insights concerning the workings of linguistic and systemic forces
and returned with these insights to reinvoke the question of the subject in terms
of a notion of constituted-constitutive-constituting agency situated and oper-
ating within a complex network of sociohistorical and intersubjective relations.
In this way, Nietzsche’s emergence as a philosophical voice played an unparal-
leled role in the development of poststructuralism as a historical corrective to
the excesses of both its predecessor movements.

Nietzsche’s philosophical importance for the emergence of post-structuralist
French philosophy becomes apparent, as I indicated in the Introduction, above,
when one considers the way Foucault plays Nietzsche against Kant in The Order
of Things, Deleuze plays Nietzsche against Hegel in any number of his works,
and Derrida plays Nietzsche against Lévi-Strauss in “Structure, Sign, and Play
in the Discourse of the Human Sciences,”\textsuperscript{58} first presented in October 1966 at
the conference at Johns Hopkins University on “Language of Criticism and the

\textsuperscript{57} In their introduction to Post-structuralism and the Question of History, Geoff Bennington and
Robert Young also make this point, noting that where structuralism sought to efface history,
“it could be said that the ‘post’ of post-structuralism contrives to reintroduce it” (Derek
Attridge, Geoff Bennington, and Robert Young [eds], Post-structuralism and the Question

\textsuperscript{58} This essay is discussed in detail in the essay by Jeffrey T. Nealon in this volume.
Sciences of Man.” What these appeals to Nietzsche announce is the posting of structuralism, that is, a distinctly philosophical response to the challenge posed to philosophical thinking by the emergence of structuralism as the dominant intellectual paradigm in the late 1950s, and collectively they set the philosophical agenda for much of what we, outside France, refer to as “poststructuralism.” Rather than speak, then, in generalities about French Nietzscheanism, as is often done by its critics, we can explore the dimensions of this Nietzscheanism by looking at its instantiation in the work of these three dominant figures in French philosophy during the period of Nietzsche’s third French moment.

I. FOUCAULT

If I wanted to be pretentious, I would use “the genealogy of morals” as the general title of what I am doing. It was Nietzsche who specified the power relation as the general focus, shall we say, of philosophical discourse – whereas for Marx it was the productive relation. Nietzsche is the philosopher of power, a philosopher who managed to think of power without having to confine himself within a political theory in order to do so.

(Foucault, “Prison Talk,” 1975)

Michel Foucault is perhaps the clearest example of how Nietzschean themes were integrated into the core of French philosophizing in the 1960s and 1970s insofar as Foucault consistently inscribed his thinking in a space opened by Nietzsche. Foucault first read Nietzsche in 1953 “by chance,” having been led to him by his reading Bataille. But as he was to say later, “curious as it may seem,” he read Nietzsche “from the perspective of an inquiry into the history of knowledge – the history of reason.” It was, in other words, his effort to “elaborate a history of rationality,” and not his interrogation of power, that first led him to read Nietzsche. Reading Nietzsche made possible one of the decisive events

60. See, for example, the essays in Ferry and Renaut (eds), Why We Are Not Nietzscheans.

61. While I will focus on Foucault, Deleuze, and Derrida, one could also look, in this context, at the work of Maurice Blanchot or Luce Irigaray.

in Foucault’s development insofar as Nietzsche showed the way beyond the phenomenological, transhistorical subject. Nietzsche showed, in other words, that “There is a history of the subject just as there is a history of reason; but we can never demand that the history of reason unfold as a first and founding act of the rationalist subject.”

Although Nietzsche is usually associated with his genealogical works – *Discipline and Punish* and *The History of Sexuality, Volume One* – Foucault himself acknowledged that his archaeological project “owes more to the Nietzschean genealogy than to structuralism properly so called.” For example, in *The Order of Things*, Nietzsche figures prominently as the precursor of the epistēmē of the twentieth century, the epistēmē that erupted with the question of language as “an enigmatic multiplicity that must be mastered.” For Foucault, it was “Nietzsche the philologist” who first connected “the philosophical task with a radical reflection upon language” (OT 305); it was Nietzsche, in other words, who recognized that a culture’s metaphysics could be traced back to the rules of its grammar, and who recognized that, for example, Descartes’s proof of the cogito rested on the linguistic rule that a verb – thinking – requires a subject – a thinker – and that the very same linguistic prejudice leads to the metaphysical error of adding a doer to the deed. Insofar as the structuralists all based their theories on the view of language as a system of differences, we can therefore understand why Foucault could regard the question of language as the single most important question confronting the contemporary epistēmē.

And insofar as Nietzsche viewed our metaphysical assumptions to be a function of our linguistic rules (grammar as “the metaphysics of the people”), and he understood both our metaphysics and our language in terms of the difference between forces, one can understand why Foucault traces the roots of the contemporary epistēmē, which no longer views man as the privileged center of representational thinking and discourse, back to Nietzsche.

In much the same way, Foucault discovers in Nietzsche the first attempt at the dissolution of man:

---

65. Ibid.

Perhaps we should see the first attempt at this uprooting of Anthropology – to which, no doubt, contemporary thought is dedicated – in the Nietzschean experience: by means of a philological critique, by means of a certain form of biologism, Nietzsche rediscovered the point at which man and God belong to one another, at which the death of the second is synonymous with the disappearance of the first, and at which the promise of the superman signifies first and foremost the imminence of the death of man. (OT 342)

When speaking of the “disappearance” or the “death” of “man,” Foucault means something quite specific, and it is a mistake to equate the referent of “man” in these early remarks with what Foucault means in general by the “subject.” This is precisely what he indicated when he noted that it was Nietzsche who showed that there is a “history of the subject.” This is to say, there is no question that the subject named “man” in philosophical discourse, from Descartes’s Archimedean cogito to Kant’s autonomous rational moral agent, is a concept toward which Foucault has little sympathy. But this subject named “man” functions in this context as a technical term, the name for a certain conceptual determination of human being that serves to stabilize the increasingly disorganized representations of the classical epistēmē and that, as such, comes to be the privileged object of philosophical anthropology (see OT 312–13). The passage quoted above, relating Nietzsche to the uprooting of anthropology, follows by one page a reference to Kant’s formulation in his Logic (1800) of anthropology – which asks the question “What is Man?” – as the foundation of philosophy. Only by understanding Foucault’s talk of “man” as designating a foundational concept of Kantian anthropology can we make sense of his provocative claim that “man is a recent invention, a figure not yet two centuries old” (OT xxiii; see also 308, 386–7). While “man” has been privileged in the discourse of the human sciences since Kant, Foucault locates the beginning of this end of man in Nietzsche’s doctrines of the Übermensch and eternal return, as we see clearly in Foucault’s final reference to Nietzsche in The Order of Things, where he couples Nietzsche’s death of God with the death of man: “Rather than the death of God – or, rather, in the wake of that death and in profound correlation with it – what Nietzsche’s thought heralds is the end of his murderer; … it is the identity of the Return of the Same with the absolute dispersion of man” (OT 385).

Turning from Foucault’s early work to his genealogical period, we again see the Nietzschean inspiration at the heart of Foucault’s thinking about truth, power, and the subject. For Foucault, Nietzsche was the first to address a certain kind of question to “truth,” a question that no longer restricted truth to the domain of epistemic inquiry nor took the value of “truth” as a given. By posing ethical and political questions to “truth,” Nietzsche saw “truth” as an ensemble
of discursive rules “linked in a circular relation with systems of power which produce and sustain it, and to effects of power which it induces and which extend it.”

When Nietzsche claimed, in *On the Genealogy of Morals*, that philosophy must for the first time confront the question of the value of truth, he recognized that “Truth” was not something given in the order of things, and in so doing, Foucault credits him with being the first to recognize “truth” as something produced within a complex sociopolitical institutional regime. “The problem,” Foucault writes:

is not changing people’s consciousness – or what’s in their head – but the political, economic, institutional regime of the production of truth. … The political question, to sum up, is not error, illusion, alienated consciousness, or ideology; it is truth itself. Hence the importance of Nietzsche.

Throughout his career, Foucault drew inspiration both from Nietzsche’s insights linking power, truth, and knowledge (“Knowledge functions as an instrument of power”), and from his rhetoric of will to power, which drew attention away from substances, subjects, and things, and focused that attention instead on the relations of forces between these substantives. For Foucault, “power means relations,” and where Nietzsche saw a continuum of will to power and sought to incite a becoming-stronger of will to power to rival the progressive becoming-weaker he associated with modernity, Foucault saw power relations operating along a continuum of repression and production, and he drew attention to the multiple ways that power operates through the social order and to the becoming-productive of power that accompanies the increasingly repressive power of that normalizing, disciplinary, carceral society we call “modern.” Foucault shares with Nietzsche an emphasis on the productivity of power: contrary to the “repressive hypothesis” that functions as one of the privileged myths of modernity, Foucault argues that power relations are not preeminently repressive, nor do they manifest themselves only in laws that say “no.” They are also productive, traversing and producing things, inducing pleasures, constructing knowledge, forming discourses, and creating truths.

72. Friedrich Nietzsche, *The Will to Power*, §480; *Kritische Studienausgabe*, vol. 13, 14[122].
fundamental ambivalence between repression and production that led Foucault to conclude that resistance is internal to power as a permanent possibility.\textsuperscript{75}

The final dimension of Foucault’s Nietzscheanism we will examine is his thinking on the subject, which as we saw above was what first led him to read Nietzsche. Foucault’s desire to deflate the subject as epistemically and discursively privileged is not conjoined with an attempt to eliminate the subject entirely. Instead, Foucault seeks to analyze the subject as a variable and complex function of discourse and power. What this means, and what has been largely misunderstood by many of Foucault’s critics, is that his so-called “anti-humanism” was not a rejection of the human \textit{per se}; it was instead an assault on the philosophically modern idea that sought to remove “man” from the natural world and place him in a position of epistemic, metaphysical, and moral privilege that earlier thought has set aside for God. This is why Foucault ends \textit{The Order of Things} by associating the “death of God” with the “end of man,” as the passage cited above suggests. But this was not to be Foucault’s final position on this matter. While Foucault has no sympathy for the phenomenological-existential and, in particular, the Sartrean subject,\textsuperscript{76} he does retrieve a more ambivalent subject whose constitution takes place within the constraints of institutional forces that exceed its grasp and, at times, its recognition.

This is the subject whose genealogy Nietzsche traced in \textit{On the Genealogy of Morals} (Essay I, §13). In an analysis that Foucault discusses in his important early essay “Nietzsche, Genealogy, History,” Nietzsche focuses not on the valorization of origins (\textit{Ursprung}) but on a critical analysis of the conditions of the subject’s emergence (\textit{Entstehung}) and descent (\textit{Herkunft}). Pursuing this genealogy, Nietzsche locates the subject not as a metaphysical given but as a historical construct whose conditions of emergence are far from innocent. The “subject” is not only a superfluous postulation of a “being’ behind doing,” a “doer” fictionally added to the deed. In addition, the belief in this postulate is exploited by slave morality both to convince the strong that they are free to be weak – and therefore are accountable for their failure to be weak – and to convince the weak that they are, in reality, strong and should therefore take pride in having freely chosen – by refraining from action – to be weak. For Nietzsche, “the subject (or, to use a more popular expression, the soul) … makes possible to the majority of mortals, the weak and oppressed of every kind, the sublime self-deception that interprets weakness as freedom, and

their being thus-and-thus as a merit.”77 For this reason, Nietzsche directs his genealogical gaze to the life-negating uses made of the principle of subjectivity in the service of a “hangman’s metaphysics” that invented the concept of the responsible subject in order to hold it accountable and judge it guilty.78

This account of the subject inspires Foucault to link the modern form of power with subjects and subjection:

It is a form of power that makes individuals subjects. There are two meanings of the word subject: subject to someone else by control and dependence, and tied to his own identity by a conscience or self-knowledge. Both meanings suggest a form of power which subjugates and makes subject to.79

In *Discipline and Punish*, his most Nietzschean text, Foucault notes the link between power and the subject while arguing that the history of the micro-physics of punitive power would be an element in the genealogy of the modern “soul.”80 Foucault addresses this soul most explicitly in the discussion of the construction of the delinquent as a responsible subject, arguing in Nietzschean fashion that there is a subtle transformation in the exercise of power when punishment no longer is directed at the delinquent’s actions (his “doing”), but at his very person, his “being” as (a) delinquent.81

By the end of his career, as his attention turned, in the second and third volumes of *The History of Sexuality*, specifically to sexuality, his thinking moved from the constitution of the subject as an object of knowledge and discipline to the ethical practices of subjectivation (*assujettissement*) and “the kind of relationship you ought to have with yourself, rapport à soi, which [he calls] ethics, and which determines how the individual is supposed to constitute himself as an ethical subject of his own actions.”82 In thinking about the construction of the ethical subject, Foucault himself came to see that the question of the subject, or

81. Foucault repeats this argument at a crucial moment in *The History of Sexuality, Volume One*, noting the point at which the homosexual, no longer simply the performer of certain “forbidden acts,” emerges as a subject with a “singular nature,” a new “species” (*ibid.*, 43).
more accurately, the question of subjectivation – the transformation of human beings into subjects of knowledge, subjects of power, and subjects to themselves – had been “the general theme of [his] research.”\(^3\) Even here, however, as his thinking turned to the Greeks and his overt references to Nietzsche diminished, I would argue that Foucault continued to see his own trajectory framed by the Nietzschean project of creatively constructing oneself through giving style to one’s life.\(^4\)

**II. DELEUZE**

It is clear that modern philosophy has largely lived off Nietzsche. (Deleuze, *Nietzsche and Philosophy*, 1)

Like Foucault, the degree to which Deleuze brings Nietzschean themes to bear within his work is extensive. For example, a recurrent theme throughout Deleuze’s works is the desire to remain within the plane of immanence and refuse any move to a transcendental or theological plane that takes us away from bodies and what they can do. On several occasions, he addresses this point by noting a distinction between ethics and morality. In a 1986 interview, Deleuze put the distinction this way:

> Morality presents us with a set of constraining rules of a special sort, ones that judge actions and intentions by considering them in relation to transcendent values (this is good, that’s evil …); ethics is a set of optional rules that assess what we do, what we say, in relation to the ways of existing involved.\(^5\)

This distinction, which Deleuze also sees in Foucault and Spinoza,\(^6\) he sees first and foremost in Nietzsche. Deleuze opens *Nietzsche and Philosophy* by addressing this point, as he recasts Nietzsche’s distinction between “Good and Bad” and “Good and Evil” – the ostensible topic of *On the Genealogy of Morals*.

---

\(^3\) Foucault, “The Subject and Power,” 327. This is reflected as well in the titles Foucault gave to the last two courses he taught at the Collège de France for which he completed the required resumé: “Subjectivity and Truth” (1980–81) and “The Hermeneutic of the Subject” (1981–82).

\(^4\) See the reference in this context to *The Gay Science* §290 in Foucault, “On the Genealogy of Ethics,” 292.

\(^5\) Deleuze, *Negotiations*, 100, translation modified.

First Essay – by distinguishing between the immanent, ethical difference between noble and base that grounds evaluative judgments on one’s “way of being or style of life,” and the transcendent moral opposition between good and evil that grounds evaluative judgment on an absolute and otherworldly ideal.\(^{87}\) When Deleuze returns to this point later in the text, he distinguishes “good and bad” from “good and evil” precisely in terms of the distinction between the ethical and the moral: “This is how good and evil are born: ethical determination, that of good and bad, gives way to moral judgment. The good of ethics becomes the evil of morality, the bad has become the good of morality” (NP 122).

Deleuze’s book, we should recall, is not titled *Nietzsche’s Philosophy* but *Nietzsche “and” Philosophy*, and in addition to providing an interpretation of Nietzsche, it highlights what Nietzsche offers to philosophy: on the one hand, a “new image of thought” and, on the other, an understanding of a body as any relationship of forces. This new image of thought is put forward in contrast to the “dogmatic image of thought” that has dominated philosophy and that Deleuze summarizes in “three essential theses” (NP 103):

1. Thinkers, *qua* thinkers, want and love truth.
2. We are diverted from the truth by forces foreign to it, in particular, the body, passions, and sensuous interest.
3. The way to ward off this diversion into error is through a method.

That Nietzsche would be Deleuze’s guide out of the dogmatic image of thought is not surprising, given that the questioning of the “will to truth” is perhaps his most consistent task in his mature, post-*Zarathustra* writings. According to Deleuze, for Nietzsche meaning and value precede truth, and for that reason it is not so much our “truths” that are of interest to Nietzsche; what interests him instead are the values that give rise to the truths that have meaning for us, which is why the epistemological question of truth leads directly to a genealogy of values. The question of value takes us out of the realm of metaphysics and confronts us with the problem of a genealogy of forces. Where the question that guides metaphysics is “what is?” and the answers that are sought take the form of essences, genealogy, on the other hand, is guided according to Deleuze by the question “which one?” (*qui*?), and the answers sought take the form not of metaphysical essences but relations of forces and capabilities, that is, what this one can do.

---

87. Deleuze, *Nietzsche and Philosophy*, 1; cf. 121–2. Hereafter cited as NP followed by the page number.
This leads us directly to Nietzsche's second contribution to contemporary philosophy: understanding a body as any relationship of forces, with forces understood as either dominant/active or dominated/reactive. Relations of forces are, for Deleuze, one of the two great axes in terms of which Nietzsche's philosophy is organized (NP x). In fact, Deleuze notes that Foucault and Nietzsche share a conception of force in terms of "the relation of force with other forces that it affects or that affect it." Nietzsche's originality, for Deleuze, is located in part in his "delineation of a genuinely reactive type of forces" (NP x) that has taken the form of the man of *ressentiment*, in whom reactive forces have come to prevail over active forces (NP 111).

Power is, for Deleuze, the second axis along which Nietzsche's philosophy is organized, and the one that is most misunderstood insofar as the question of power is thought to result in a politics, while in Nietzsche it "forms an ethics and an ontology" (NP x–xi). What Nietzsche means by "will to power," according to Deleuze, is not the desire to have something – power – but the having of this power in order to act on the world. Life, for Nietzsche, is the incessant process of acting on and being acted on, which is expressed in terms of the forces of strength and the forces of weakness. In order to mark the difference between Nietzschean affirmation and Hegelian negativity – and one should never lose sight of the fact that Deleuze's Nietzsche book is written in part to challenge the dominance in the early 1960s of Hegelianism in French philosophy – Deleuze reframes this distinction between the forces of strength that Nietzsche associates with the noble and the forces of weakness he associates with the slave in terms of the forces of action and reaction: where the noble actively and affirmatively differentiates himself from his rivals, the slave reactively opposes all that is other than himself. Hegel's dialectic of the master and the slave thus emerges in this context as an example of the triumph of reactive forces, of the becoming-reactive of active forces, insofar as Hegel's master, no less than his slave, is capable only of reaction in the struggle for recognition.

Deleuze uses this distinction throughout his work to advance the cause of immanence and, true to his affirmative spirit, Deleuze refuses the negative, and replaces it with critique, a critique that confronts the triumph and reign of the base in which the triumphant reactive forces, now separated from what they can do, both deny active forces and turn against themselves. The goal of critique is not to negate but to transmute these reactive forces: only through transvaluation, through the becoming-active of reactive forces, will critique succeed and will force, now active, take its place as force that affirms its difference and makes its difference an object of enjoyment and affirmation (NP 61). In other words, while Nietzsche's critique might look dialectical, he departs from Hegel and

---

the Hegelian tradition precisely here. In place of Hegel’s “speculative element of negation, opposition or contradiction, Nietzsche substitutes the practical element of difference” (NP 9). Where the dialectic is engaged in the “labor of the negative,” and seeks to sublate all difference and alterity, Nietzsche offers a theory of forces in which active force does not negate or deny the other but “affirms its own difference and enjoys this difference” (NP 9).

For Deleuze, when Nietzsche interrogates history in terms of a history of nihilism, he is examining history from the perspective of the triumph of reactive forces, and we see Deleuze mobilize this Nietzschean critique of reactive forces not only in his critique of Hegelianism but also in his and Guattari’s critique of the philosophical and psychoanalytic tradition’s view of desire as lack, which assumes that desire is derivative, arising in reaction to the perceived lack of the object desired or as a state produced in the subject by the lack of the object. For Deleuze and Guattari, on the other hand, desire is a part of the perceptual infrastructure: it is constitutive of the objects desired as well as the social field in which they appear. It is, in other words, what first introduces the affective connections that make it possible to navigate through the social world. This is to say that desire, like Nietzsche’s will to power, is productive – it is always already at work within the social field, preceding and “producing” objects as desirable.

In contrast to the view of desire as lack, Deleuze and Guattari understand desire as the willing of power. In *Anti-Oedipus*, they introduce the desiring machine as a machinic, functionalist translation of Nietzschean will to power: insofar as a desiring machine is a functional assemblage of a desiring will and the object desired, they are able to avoid the personification/subjectivation of desire in a substantive will, consciousness, ego, unconscious, or self. They are also able to escape the problem of interiority that gives rise to the understanding of desire as lack.

---

*89. For further discussion of this point, see my essay with Rosi Braidotti in this volume.
90. Viewing desire in terms of lack is not exclusive to the psychoanalytic tradition; rather, it has dominated the Western philosophical and psychological tradition since Plato’s *Symposium* (200a–d), where Socrates remarks that one who desires something is necessarily in want of that thing. Rejecting this understanding of desire as lack is a view shared by several of Deleuze’s contemporaries; see, for example, Jean-François Lyotard, *Économie libidinale* (Paris: Éditions de Minuit, 1974), published in English as *Libidinal Economy*, Iain Hamilton Grant (trans.) (Bloomington, IN: Indiana University Press, 1993); and Hélène Cixous, “Sorties,” in Hélène Cixous and Catherine Clément, *La Jeune née* (Paris: Union Générale d’Éditions, 1975), published in English as *The Newly Born Woman*, Betsy Wing (trans.) (Minneapolis, MN: University of Minnesota Press, 1986). I discuss the Deleuzian critique of “desire as lack” in more detail elsewhere; see my “Spinoza, Nietzsche, Deleuze: An Other Discourse of Desire,” in *Philosophy and the Discourse of Desire*, Hugh J. Silverman (ed.) (New York: Routledge, 2000).
as lack because insofar as desire and the object desired arise together, connections with the outside are always already being made. “Who, except priests,” Deleuze remarks, “would want to call [desire] ‘lack’? Nietzsche called it ‘Will to Power’ … Those who link desire to lack, the long column of crooners of castration, clearly indicate a long resentment [ressentiment] like an interminable bad conscience.”92 The psychoanalyst thus appears in Anti-Oedipus as the latest incarnation of the ascetic priest,93 and to Nietzsche’s account of the “internalization [Verinnerlichung] of man,”94 Deleuze and Guattari add man’s Oedipalization: Oedipus repeats the split movement of Nietzschean bad conscience that at once projected onto the other while turning its hostility back against itself, as the failure to satisfy the desire to eliminate and replace the father is accompanied by guilt for having such desire.

Transforming Nietzsche’s will to power into a desiring-machine, Deleuze and Guattari’s affirmation of desiring-production emerges as a post-Freudian repetition of Nietzsche’s affirmation of healthy will to power. And as Nietzsche sought to keep will to power multiple so that it might appear in multiple forms, at once producer and product, a monism and a pluralism, so too Deleuze wants desire to be multiple, polyvocal, operating in multiple ways and capable of multiple and multiplying productions.95 While Nietzsche encouraged the maximizing of strong, healthy will to power, he acknowledged the necessity – indeed, the inevitability – of weak, decadent will to power. Similarly, Deleuze and Guattari advocate that desire be productive while recognizing that desire will sometimes be destructive and will sometimes have to be repressed, while at other times it will seek and produce its own repression. Analyzing this phenomenon of desire seeking its own repression is one of the goals of Deleuze and Guattari’s schizoanalysis, and the Nietzschean inspiration for this analysis is revealed in the structural similarity between desire desiring its own repression and Nietzsche’s “discovery” in On the Genealogy of Morals of the meaning of ascetic ideals: the will would rather will nothingness than not will.96

93. See, for example, Deleuze and Guattari, Anti-Oedipus, 108–12, 269, 332–3; see also Gilles Deleuze and Félix Guattari, A Thousand Plateaus, Brian Massumi (trans.) (Minneapolis, MN: University of Minnesota Press, 1987), 154. I have discussed Nietzsche’s influence on Deleuze and Guattari’s critique of psychoanalysis elsewhere; see my Nietzsche’s French Legacy: A Genealogy of Poststructuralism (New York: Routledge, 1995).
III. DERRIDA

On what we are speaking about at this very moment, as on everything else, Nietzsche is for me, as you know, a very important reference. (Derrida, *Positions*)

We have already seen, in broad strokes, the range of issues that Derrida locates as the Nietzschean themata within French thought in the 1960s. In addition, he makes numerous other remarks concerning Nietzsche’s rhetorical strategies and multiplicity of styles, the *différence* of force and power, the playfulness of interpretive multiplicity, and what Derrida calls “the axial intention of [Nietzsche’s] concept of interpretation”: the emancipation of interpretation from the constraints of a truth “which always implies the presence of the signified (aletheia or adequatio).” When one looks more specifically for the Nietzscheanism within Derrida’s own work, one theme stands out: the Nietzschean roots of his deconstruction of the philosophical binarism at the heart of the Western metaphysical tradition.

The “typical prejudice” and “fundamental faith” of all metaphysicians, Nietzsche wrote, “is the faith in opposite values.” Throughout his critique of morality, philosophy, and religion, Nietzsche attempted to dismantle such oppositional hierarchies as good/evil, truth/error, being/becoming. This refusal to sanction the hierarchical relations among those privileged conceptual oppositions transmitted within the Western metaphysical tradition was pervasive in French philosophical writing in the 1960s and 1970s, and the critique of binary, oppositional thinking is, in particular, an essential component in Derrida’s critical project. For Derrida, the history of philosophy unfolds as a history of certain classical philosophical oppositions: intelligible/sensible, truth/error,

---

100. See, for example, Lyotard’s remark that “oppositional thinking … is out of step with the most vital modes of postmodern knowledge,” in *The Postmodern Condition: A Report on Knowledge*, Geoff Bennington and Brian Massumi (trans.) (Minneapolis, MN: University of Minnesota Press, 1984), 14.

*101. This is discussed in this volume in the essay on Derrida by Samir Haddad.*
speech/writing, literal/figurative, presence/absence, and so on. These oppositional concepts do not coexist on equal grounds, however; rather, one side of each binary opposition has been privileged while the other side has been devalued. Within these oppositions, a hierarchical “order of subordination”\textsuperscript{102} has been established and truth has come to be valued over error, presence has come to be valued over absence, and so on. Derrida’s task is to dismantle or deconstruct these binary oppositions. In practice, their deconstruction involves a biphasic movement that Derrida called “double writing” or “double science.” In the first phase, he overturns the hierarchy and values those poles traditionally subordinated by the history of philosophy. Although Derrida is often read as privileging, for example, writing over speech, absence over presence, or the figurative over the literal, such a reading is overly simplistic, as Derrida realizes it is the hierarchical oppositional structure itself that is metaphysical. Therefore, when overturning a metaphysical hierarchy, one must avoid reappropriating the hierarchical structure if one wishes to avoid reestablishing the closed field of these binary oppositions.

To view deconstruction as a simple inversion of these classical philosophical oppositions ignores the second phase of deconstruction’s “double writing”: “we must also mark the interval between inversion, which brings low what was high, and the irruptive emergence of a new ‘concept,’ a concept that can no longer be, and never could be, included in the previous regime.”\textsuperscript{103} These new “concepts” are the Derridean “undecidables” (e.g. “différence,” “trace,” “supplément,” “pharmakon”): marks that in one way or another resist the formal structure imposed by the binary logic of philosophical opposition while exposing the optional and contingent character of those choices that the tradition has privileged as dominant. Throughout Derrida’s early work, we find as a recurrent motif his charting the play of these undecidables: the play of the trace, which is both present and absent; the play of the pharmakon, which is both poison and cure; the play of the supplément, which is both surplus and lack.

Returning now to Nietzsche, we can see this same critique of oppositional thinking in his assessment of traditional values, as he often proceeds by disassembling the privileged hierarchical relation that has been established among the values in question. Nietzsche’s disassembling, like Derridean deconstruction, operates in two phases.\textsuperscript{104} The first phase overtops the traditionally privileged relation between the two values while the second seeks to displace the opposition

\textsuperscript{102} See Derrida, “Signature, Event, Context,” in Margins of Philosophy, 329.
\textsuperscript{103} Jacques Derrida, Positions, Alan Bass (trans.) (Chicago, IL: University of Chicago Press, 1981), 42; see also Margins of Philosophy, 329.
\textsuperscript{104} For a more detailed discussion of the methodological affinities between Nietzschean genealogy and Derridean deconstruction, see the first chapter on Derrida in my Nietzsche’s French Legacy, 9–32.
altogether by showing it to result from a prior value imposition that itself requires critique. For example, regarding the genealogy of the will to truth, we find Nietzsche inverting the traditional hierarchy of truth over falsity. Investigating the origin of the positive value placed on truth, Nietzsche finds that it is simply a moral prejudice to affirm truth over error or appearance. To this, he suggests that error might be more valuable than truth, that error might be a necessary condition of life. His analysis does not stop here, however, as Heidegger assumed when he accused Nietzsche of “completing” the history of metaphysics through an “inversion” of Platonism. By adopting a perspectival attitude and denying the possibility of an unmediated, noninterpretive apprehension of “reality,” Nietzsche displaces the truth/falsity opposition altogether. The question is no longer whether a perspective is “true” or “false”; the sole question that interests the genealogist is whether or not a perspective enhances life. This same critical strategy operates in the closing stage of the famous chapter of Twilight of the Idols where Nietzsche traces the history of the belief in the “true world”: “The true world we have abolished: what world then remains? The apparent one perhaps? … But no! with the true world we also abolished the apparent one!” We have abolished the apparent world because it was defined as “apparent” only in terms of its opposition to the “true” world. Without the “true world” to serve as a standard, the designation “apparent” loses its meaning and the opposition “true versus apparent” itself loses its critical force. In other words, the traditional (de)valuation of “appearance” depends on its being the negation of that which the tradition has affirmed as “truth,” and, like Derrida, Nietzsche is not satisfied with simply inverting the traditional valuation of truth over appearance but wants instead to dismantle the entire hierarchical opposition between truth and appearance.

Nietzsche discovers a certain faith in binary thinking at the center of philosophical discourse. By genealogically uncovering the will to power whose imposition of a certain value gave rise to the two poles of the opposition in question, genealogy obviates the force the opposition is believed to have. The clearest example of this strategy is his deconstruction of the good/evil opposition. Nietzsche moves beyond good and evil precisely by showing that both “good” and “evil” owe their meaning to a certain type of will to power: the slavish, reactive will to power of herd morality. To simply invert the values of slave morality, making “good” what the slave judges to be “evil,” is no less reactive than the original imposition of value by the slave, who judges all that differs from himself to be “evil” and defines the good in reactionary opposition to what

105. See Nietzsche, Beyond Good and Evil, §34.

107. Nietzsche, Twilight of the Idols, "How the 'True World' Finally Became a Fable."
is other than himself. A reading of Nietzsche as an “immoralist” or “nihilist” remains at this level of mere inversion, failing to acknowledge Nietzsche’s insight that by conforming to the oppositional structure, one inevitably confirms its validity and its repressive, hierarchizing power. But a reading of Nietzsche as the “transvaluer of values” locates a second movement in the Nietzschean critique of morality. This second movement flows from the active imposition of new values arising from a healthy will to power that has displaced the hierarchy of good/evil altogether. In rejecting the binary structure of moral evaluation, Nietzsche’s transvaluation inauguraes a playful experimentation with values and multiplication of perspectives that previews Derrida’s own approach to deconstructive reading, which he contrasts sharply with the textual doubling of commentary.108 Nietzsche’s affirmation of perspectival multiplicity thus emerges as the life-enhancing alternative for those with a will to power sufficient to go beyond the reactive decadence of binary morality, and this life-enhancing multiplicity continues to function within Derrida’s own interpretive practice in his call for a productive style of reading that does not merely “protect” but “opens” texts to new interpretive possibilities.109

***

That the twentieth century would be marked by three distinct moments of “French Nietzscheanism” would not have displeased Nietzsche, as he felt a special kinship with both the French language and French culture,110 and he included the French among his “most natural readers and listeners.”111 While these moments, and in particular the latest one, have not been universally regarded as a good development for French philosophy, as the work of both Jürgen Habermas and the French neo-conservatives Luc Ferry and Alain Renaut attest,112 there can be little doubt that the intense engagement with Nietzsche’s thought by French philosophers from the late 1950s through the early 1980s is one of the defining features of what has come in the English-speaking world to be known as French poststructuralism.

108. See Derrida, Of Grammatology, 157–64.
109. See ibid., 158ff.
110. See, for example, Beyond Good and Evil, §§253–4; Twilight of the Idols, “What the Germans Lack,” §4; The Wanderer and His Shadow, in Human, All Too Human: Volumes One and Two, §214.
As recently as the first five years of the twenty-first century, it was widely held that the work of Louis Althusser\(^1\) could best be described as an example of “structural Marxism,”\(^2\) a curious – and particularly Parisian – hybrid of structuralism and Marxism, and therefore a product of the 1960s, whose intellectual fashions had come and gone. Accordingly, in the decade following his death in 1990, a number of commentators suggested that were it not for the publication of his autobiographical text, *The Future Lasts Forever*, the central event of which was Althusser’s murder by strangulation of his wife in 1980,\(^3\) there would be little interest in his “dated” philosophical work.\(^4\) The subsequent publication of a mass of material, already larger (and still growing) than the body of work published during his lifetime, has rendered these assessments irrelevant. Not only has an

1. Louis Althusser (October 16, 1918–October 22, 1990; born in Birmandries, Algeria; died in Paris, France) was educated at the École Normale Supérieure (1939–48), and received a *doctorat d’état* from the University of Picardy. His influences included Bachelard, Canguilhem, Epicurus, Lucretius, Machiavelli, Marx, and Spinoza, and he held an appointment at the École Normale Supérieure (1948–80).
3. On November 16, 1980, Althusser strangled his wife, Hélène Legotien, at their apartment at the École Normale Supérieure. He was determined to be unfit to stand trial for reasons of insanity and spent most of his remaining ten years in psychiatric hospitals. Althusser had suffered from severe mental illness for most of his adult life and had been hospitalized prior to 1980 over thirty times. His autobiography, *The Future Lasts Forever*, attempts to explain the tragedy in the light of his life as a whole. While interesting, it is an extremely unreliable account of his life and works.
entirely new Althusser come to light, but the publication, above all, of his “late” writings – those written after 1980 – on what he called “aleatory materialism” or “the materialism of the encounter,” has succeeded in calling into question the meaning of Althusser’s work as a whole. Readers have been forced to resort to various expedients to explain not only the existence of the new Althusser, but even more, its relation to the old Althusser. Some readers, most notably Antonio Negri, have responded by locating a break or turn in Althusser’s thought at the end of the 1970s, which has the effect of completely dissociating the early and late Althusser. An examination of all the material so far published, some of which dates back to the 1940s–50s, however, problematizes any attempt chronologically to order and arrange Althusser’s work. Even the texts in which he explores the notion of an aleatory materialism cannot simply be set in opposition to the work of the 1960s. Instead, they illuminate aspects of well-known essays such as “Contradiction and Overdetermination” – where his discussion of Lenin’s theory of the conjuncture was simultaneously a discussion of Machiavelli, as well perhaps as Epicurus and Lucretius – that have been persistently overlooked by commentators. Further, while Althusser himself repeatedly invoked the name of Spinoza (and perhaps even more importantly wrote a book on Montesquieu), there was little sense of the importance of seventeenth- and eighteenth-century philosophy for some of his key concepts. We now possess his lecture notes on such figures as Hobbes, Locke, and Rousseau, the reading of whom contributed to the notion of ideological interpellation. The texts that constitute For Marx and Althusser’s contribution to Reading Capital, texts that were regarded by admirers and critics alike as presenting a finished theory (of society, history, the dialectic), now appear to exhibit the incompleteness, the unevenness, the rough edges of pieces of a puzzle. It is clear that they were part of a much larger set of inquiries that only now is coming to light.

Accordingly, only if we recognize that Althusser’s is an oeuvre that is still taking shape and undoubtedly still holds some surprises in store, can we begin to suggest a provisional way of reading it. Few of his contemporaries devoted as much thought as Althusser to the activity or practice of philosophy itself,

what it means, as it is said in French, to “do philosophy.” He caused a minor scandal when in the early 1960s he introduced the phrase “theoretical practice”; his many critics accused him of blurring the crucial distinction between practice and theory in order to elevate his theorizing to the status of action, as if there were no difference between a mass demonstration and the publication of an essay. In fact, the successive definitions of philosophy he offered in the period from 1963 to 1975 (philosophy is the theory of theoretical practices, philosophy is the activity of tracing lines of demarcation between the ideological and the scientific, and philosophy represents the class struggle in theory) all emphasized the material and historical existence of philosophy. To refer to it as a practice or activity was to deprive it of its spiritual, intellectual, or merely discursive character and to situate it in a field of operation where it might be evaluated not according to its truth but according to its real effects. Philosophy as a practice belonged to a specific historical moment, which it in no way transcended. To capture the nature of the moment, Althusser used the term, taken from the communist movement, of conjuncture: the historical moment is not a totality unified around a particular idea or zeitgeist, but is rather the product of encounter and combination, even of conflicting forces “locked,” as it were, together in their very struggle. The field in which philosophy exists and operates is thus a field of conflict in which a balance of forces exists: some ideas and doctrines are dominant over others and this domination is independent of the question of their validity or truth. Ideas are dominant neither because they are true nor because they are false. The relations of force that govern the theoretical conjuncture are a continuation of the relations of force in the social world around them. So, for example, ideas that might appear utterly bankrupt and unthinkable in a political conjuncture in which anticapitalist mass movements have the ascendancy might, when the balance of forces shifts in favor of capital, quite suddenly appear valid and true; the reemergence of methodological individualism and rational choice theory in the 1980s is a case in point. In the same way, arguments that previously were widely experienced as compelling are robbed of their force or emptied of their content. In fact, Althusser so firmly rejected any notion of the omnipotence of truth or any notion of philosophy’s role as an impartial adjudicator of arguments, that he runs the risk of reducing the effectiveness of philosophy to zero. How does one think, as well as act, against the dominant ideas? To do so requires strategic alliances and the

9. Althusser’s concept of philosophy as a practice left its mark on his former student Alain Badiou, whose concepts of intervention and event are in part derived from Althusser, even if Badiou’s project is in certain ways a reaction against Althusser, who rejected the very concept of ontology. See Alain Badiou, Being and Event, Oliver Feltham (trans.) (New York: Continuum, 2007). [*] For a discussion of Badiou, see the essay by Bruno Bosteels in The History of Continental Philosophy: Volume 8.
ability to assess and exploit the internal contradictions of the dominant theories. A philosophy adequate to such a conception can no longer be described as stating arguments or propositions. To describe the precise form of its activity Althusser used another term borrowed from the socialist and communist traditions: intervention.\textsuperscript{10} Philosophy enters into this conflict to modify the balance of forces if it can. Does Althusser here refer to an ideal of what philosophy, or perhaps a Marxist philosophy, should be? Absolutely not: he insists on the contrary that he has merely described what every philosophy does, even and especially when it does not conceive of itself in this way.

Such a view of philosophy may appear crude and reductive; it certainly deprives the monuments of its history of their universal truth. In fact, Althusser’s sense of philosophy renders the task of the philosopher very complicated. Once upon a time, a Marxist who was a philosopher might simply draw a line of demarcation between Marxist and non-Marxist philosophy, between the philosophy that declares its allegiance to Marxist thought and demonstrates this allegiance through its use of terms known to be Marxist and the philosophy that declares its opposition or perhaps only its indifference to Marxism and makes use of terms “foreign” to Marxism. This model, embraced by Communist parties for much of the twentieth century, represents a form of ideological trench warfare, what Antonio Gramsci\textsuperscript{11} called the war of position. Althusser, in contrast, insisted on the complexity of what, by the mid-1960s, he came to call the theoretical conjuncture, characterized by constantly shifting fronts necessitating a series of temporary alliances with otherwise opposing theories against a common enemy.\textsuperscript{12} To make matters even more complicated, the opposition between Marxist and non-Marxist theories was no longer decisive: some of the most conservative ideas might appear not against Marxism, but in the form of Marxism, emerging within it as a new theoretical development. Similarly, genuine allies in a struggle against particular doctrines might well appear as anti-Marxists. Thus, it was no longer possible to dismiss the intellectual world outside as “ideology.” Every tendency had to be understood and its effect in the current conjuncture precisely measured.

What was the theoretical conjuncture in which Althusser himself would attempt to intervene? In a philosophical version of Lenin’s “Letters from Afar”

\textsuperscript{11} For further discussion of Gramsci, see the essay by Christopher Thornhill in \textit{The History of Continental Philosophy: Volume 5}.

– in which he sketched out the political conjuncture that emerged after the fall of the Czar in February 1917 – Althusser delivered a talk in 1966 in which he gave a comprehensive account of the French intellectual scene. In his presentation, he described the complexity of the theoretical struggle and the tactics adequate to this complexity. “Front No. 1,” as he calls it, is the idealist tradition, still dominant, although in retreat, of “spiritualism,” those philosophies, frankly or covertly religious (often advancing in the mask of a certain Descartes, Husserl or Heidegger), whose objective is to secure the rights and the domination of consciousness, morality, Man, all the forms of transcendence that rob this world of its substantiality, sanctify the established order and ultimately block the activity of the sciences. Althusser identifies Merleau-Ponty and Ricoeur as the leading figures of this movement.

In opposing this reactionary tradition, however, Marxism fortunately does not stand alone; on the contrary, it has a number of powerful “objective allies” who, whether they want to or not, consciously or unconsciously, oppose and weaken the forces of spiritualism. Althusser labels this block, allied with materialism in this particular struggle but necessarily opposed to it in others, “rationalist and critical idealism.” Important among the forces that compose this block, for Althusser, are the philosophers who have led a “return” to the great texts of philosophy and who, simply by insisting on reading the texts line by line and by refusing to attribute to a given philosopher any idea not literally to be found in his work, have succeeded in neutralizing the spiritualist readings of Descartes, Spinoza, and Hegel (Althusser mentions in this connection Jean Hyppolite and Martial Guéroult). But perhaps the most important of the objective allies is the structuralist camp in its entirety, all those, from Lévi-Strauss to Barthes to Lacan, who through their relentless critique of consciousness and of humanism, have provoked the party of Spirit to expressions of impotent rage, opening a breach in the dominant philosophies through which authentic knowledge may pass.

But Marxist theory cannot be satisfied with the emerging victory on Front No. 1, the engagement with spiritualism. In fact, the communist tradition has for too long remained in an unprincipled alliance with rationalist-critical idealism,

as if the history of philosophy came to a halt in the eighteenth century, rendering the struggle between reason and faith, or naturalism and supernaturalism, the primary contradiction of our time. In fact, the weakening of spiritualist ideology can only have the effect of intensifying the conflicts previously latent in the anti-spiritualist camp, leading to the opening of Front No. 2. It is thus necessary to wage a struggle simultaneously on two fronts, on the second of which Marxist theory will wage war on those with whom it is allied on Front No. 1. The shift in the balance of forces in favor of structuralism means that “among the urgent tasks of Marxist philosophy” are:

the task of fundamentally criticizing the empiricist, formalist and idealist ideology that reigns over most of the human sciences, the task of distinguishing, in the human sciences, which are real objects and which imaginary, which are our objective allies, specialists who are de facto working on our side.17

The notion of the second front would seem to authorize an interpretation of Althusser’s relation to structuralism as nothing more than a temporary alliance with an otherwise hostile force against a common enemy, an alliance that would require a temporary cessation of hostilities and perhaps even the occasional exchange of pleasantries, but which, once the broader war stopped, would inevitably dissolve into conflict.

All of this makes it quite clear that, from his own perspective, Althusser did not freely choose the problems and themes that were to occupy him throughout his career, nor does this perspective allow us in any meaningful sense to speak of the linear development of Althusser’s thought, as if it were propelled by the emergence and resolution of its internal contradictions. As Pierre Macherey18 has remarked, Althusser was “intrepid,”19 exhilarated by the risks of theory (which for him was a “perpetual war”), willing to follow tracks without knowing where, if anywhere at all, they would lead. His philosophical motto was not Spinoza’s “Caute” (caution), but Napoleon’s “on s’engage et puis on voit” (“first you engage and then you will see” – a favorite of Lenin’s). His fearlessness was undoubtedly merely an aspect of madness, which gave him enormous energy even as it was destroying him. He wrote constantly: books, essays, letters, and

Louis Althusser

fragments of all three. How do we approach this mass of material, only a fraction of which has been published?

We can provisionally identify three series of questions and problems that occupied Althusser throughout his career (no doubt because they were the questions that dominated the conjunctures through which he lived): (i) the subject; (ii) structure; and (iii) origin.

I. THE SUBJECT

Althusser’s first sally into the “perpetual battle” of philosophy took place on a terrain that would be associated with him throughout his career: Hegel. While Althusser in a sense cultivated his image as an anti-Hegelian, at least in For Marx and Reading Capital, an overview of his work as a whole reveals that rather than simply rejecting Hegel – as if his entire oeuvre possessed such coherence that one was compelled either to accept or reject it as a totality – Althusser read Hegel in the same way he read every other text: “to read Hegel in a materialist way [en matérialiste] is to draw lines of demarcation within him.”20 After the posthumous discovery of Althusser’s diplôme d’études supérieures (roughly the equivalent of a Master’s thesis) on Hegel entitled “On Content in the Thought of G. W. F. Hegel,” written in a few months in 1947, a number of commentators argued that he had once been a Hegelian before becoming an anti-Hegelian, thereby again chronologizing the conflicts internal to Althusser’s thought.21 Reading not only this thesis but also two essays written around the same time, we can see that his philosophical career began with the very act of reading that he would codify later as the gesture of drawing lines of demarcation. Althusser made visible the humanist, subjective reading of Hegel by such important figures as Alexandre Kojève and Hyppolite,22 who, according to Althusser, turned such moments as the confrontation of consciousnesses in the master–slave relation or the unhappy consciousness into a Hegelian “Robinsonade”23 in a manner similar to existentialism: man is that night, that void the truth of which all his activity and accomplishment cannot but affirm. Althusser never argues that such readings are false or that such ideas are not to be found in Hegel; instead he attempts to

22. The young Althusser wrote a very sharp and in certain ways crude critique of Hyppolite, expressing a view at odds with later statements. See Althusser, The Spectre of Hegel, 175–84.
23. Marx’s phrase for the positing of the solitary individual – endowed, of course, with certain invariant characteristics – who, like Robinson Crusoe, stands outside and prior to society.
bring to light another, the other, Hegel. Marx himself in the preface to *Capital* had distinguished between the “mystified” and “rational” forms of the Hegelian dialectic, and for Althusser the rational form consisted of an objective critique of every notion of subjectivity, of man as Subject. Was not the *Phenomenology of Spirit* precisely the unmasking of consciousness as merely a moment in Spirit’s alienation from itself and would not the return of Spirit to itself in Absolute Knowledge mark the overcoming of any separation of consciousness and world?

The struggle against philosophical “Robinsonades” led to another encounter with contemporary philosophy: “the return to Hegel” as he called it was doubled by the return to Husserl, the second every bit as important as the first in the world of French Marxism. In 1955, Althusser published an essay cast as a letter to the prominent exponent of phenomenology, Paul Ricoeur: “On the Objectivity of History.” Here again, rather than simply reject Husserl, Althusser sought to explore his conflicting legacies. The occasion was Ricoeur’s critical review of a book on the possibility of historical knowledge by Raymond Aron. The latter had used Husserl’s concepts of lived experience and the *Lebenswelt* to advance the notion that the reality of the past as it was lived by real men (the “truth of history” according to Aron) remains inaccessible to the historian and thus limits his enterprise. Ricoeur, according to Althusser, defended the rationality and objectivity of historical inquiry by stressing the idea of knowledge against an inaccessible “lived experience.” He did so, Althusser argues, not by showing the mutual immanence of objectivity and knowledge, but by resorting to an originary act of consciousness, the intention to objectivity that must precede all knowledge as its origin and foundation.

It was undoubtedly the task of unmasking the apologetic and limiting functions of the notion of the subject that led Althusser to the field of psychoanalysis, a field that, up to the 1960s, was regarded with tremendous suspicion by French Marxists. In the academic year of 1963–64, he organized with his students (among them, Etienne Balibar and Jacques-Alain Miller) a seminar on psychoanalysis. The transcript of his two lectures was published posthumously as *Psychanalyse et sciences humaines: deux conférences*. It was from these lectures

24. For example, in Althusser, *The Spectre of Hegel*, 170–84.
27. The phrase “intention to objectivity” is Ricoeur’s and is cited by Althusser to show Ricoeur’s theoretical recourse to the will of a knowing subject. See Althusser, “Sur l’objectivité de l’histoire,” 23.
28. The work of Althusser’s students is discussed in the essay by Patrice Maniglier in *The History of Continental Philosophy: Volume 7*.
that he culled the material for his 1964 essay “Freud and Lacan,” an essay that brought psychoanalytic theory, and Jacques Lacan’s version of it in particular, to the attention of a new audience. Significantly, Althusser saw in Lacan a fellow combatant engaged in a struggle against the dominant ideas against which rational argument alone, no matter how true and self-evident, could never prevail. It was this fact that alone could explain the apparent difficulty and even intentional obscurity of Lacan’s language:

Hence the contained passion and passionate contention of Lacan’s language, unable to live or survive except in a state of alert and accusation: the language of a man of the besieged vanguard, condemned by the crushing strength of the threatened structures and corporations to forestall their blows, or at least to feign a response to them before they are delivered, thus discouraging the opponents from crushing him beneath their assault.

Lacan’s theoretical merit was to have shown the specificity of psychoanalysis, its irreducibility either to biology (instincts – or today, genes – determine all behavior) or to psychology, a discipline founded on the notion of the autonomous subject, a “science” of the individual soul. Althusser was especially interested in Lacan’s critique of “every philosophy that issues from the Cogito,” every variant of existentialism, of course, but also the individual subject assumed as a given by liberal theory. Lacan insisted from the beginning of his enterprise on the fact that the ego, the conscious part of which was often called “consciousness,” far from being governed by some reality principle, was founded on misrecognition, on a nearly delusional belief in its own independence. It was here that Lacan served as a point of attack on phenomenology for Althusser. For although Sartre insisted on an individual solitude so profound that solipsism became the fundamental philosophical problem, others, especially Merleau-Ponty, but also Trân Duc Thao, insisted that to read Husserl correctly was to arrive at the conclusion that the fundamental ground of human existence was intersubjectivity, a Mitsein, to use Heidegger’s expression, that was the element proper to humanity. Psychoanalysts in France were understandably attracted to

31. Ibid., 203.
*33. Trân Duc Thao is discussed in more detail in the essay by William L. McBride in The History of Continental Philosophy: Volume 5.
*34. Heidegger’s notion of Mitsein is discussed in the essay by Miguel de Beistegui in The History of Continental Philosophy: Volume 3.
this model, which allowed them to conceive of the unconscious as a product of this intersubjectivity, specifically the alterity immanent in any experience of the ego.

Althusser, perhaps surprisingly, did not regard the partisans of intersubjectivity as objective allies; rather, he saw this theory as perhaps the most sophisticated variant of the philosophy of the subject, a defense disguised as a critique. It not only left the individual subject intact, preserving the distinction between “the interiority of the subject and the exteriority of the objective world,” but posited an alterity that can be discovered or experienced only through an intentional act, the initiative of the subject (Levinas, whose work was apparently unknown to Althusser, would represent the most powerful example of such a position). Such theories essentially prevented any inquiry into causes: consciousness found its truth and identity in another consciousness in a circle of recognition. In opposition, Althusser from early on insisted that the origin of the subject as conceived by philosophy and psychology was:

manifestly political: the subject is that which is submitted to an order, which is submitted to a master and which is at the same time thought in psychology as being the origin of its actions. This means that it is a subject of imputation, i.e., that it is he who must account to a third party for his own actions, his own conduct, his own behavior.  

The subject of imputation, the subject to whom freedom of thought and action is imputed, is the individual who has consented to the domination of those who have sovereignty over him, thereby rendering that sovereignty legitimate. The subject of imputation is also the individual who, being master of his actions, is held responsible and punishable for them: he must own them before both God and man. This is the first form of one of Althusser’s most important contributions: the interpellated subject.

As Althusser began to explore the notion of ideology, so essential to Marxist explanations of domination and exploitation, he quickly arrived at the notion that “the category of the subject is constitutive of all ideology” and correlatively that “all ideology has the function (which defines it) of ‘constituting’ concrete individuals as subjects.” In contrast to the treatment of ideology in “Marxism and Humanism,” which stressed its existence as “a system of representations” through which individuals “live” their social existence, Althusser, beginning in

38. Louis Althusser, ”Marxism and Humanism,” in *For Marx*, 221–47.
“Three Notes on the Theory of Discourse” (1966) and “On Feuerbach” (1967), moved to the theory that the definitive function of ideology was not deception or misrepresentation (no matter how functional in a given society) but the work of transforming individuals into free and responsible subjects. While Althusser himself seemed to suggest in *Psychanalyse et sciences humaines* that such a notion was historically determined, linked to the rise of liberal philosophy in the seventeenth century, he soon came to regard the constitution of the subject as “the formal structure of ideology.” Thus, the legal subject who has always already consented to his domination or exploitation by another is a variant (and not a secularized version) of an ideological structure that has no history because it is contemporaneous with social existence.

To illustrate his thesis in “Ideology and Ideological State Apparatuses,” Althusser will choose an example whose origins precede not only capitalism but feudalism as well: “Christian Religious Ideology,” an example, he says, “accessible to everyone.” Here the passive voice of the phrase “the individual is interpellated as a subject” is modified by the identification of the agent of interpellation: subjects (plural and lower case) are constituted in and by the Absolute Subject, whose function is to set each one apart and to grant each the ability to obey or refuse the Subject’s commandments. In this way the subjects are subject in a double sense: they are subjects in the sense of agents, authors of thought and action, but also subjected beings who are declared free in order voluntarily to subject themselves to the Subject. The relation of Subject to subjects is a specular one in which each recognizes the other recognizing him, and recognizes himself in the other. This recognition (the Hegelian origins of which should be clear) acts as a guarantee of the individual’s status as subject in the double sense. Althusser illustrates this very schematic outline, which might appear Lacanian in inspiration, but in fact draws far more on Hobbes, Spinoza, Kant, and Hegel, with an allegorical reading of Scripture. In Exodus 3, God calls out “Moses, Moses,” interpellating, recruiting Moses in order to endow him with the power to accept or refuse his commands. When Moses responds to the call, he in turn asks by what name he should refer to God when he discloses this revelation to his people, and God answers: “I am that I am,” constituting himself as subject. This allegory allows us to see other variants of the same model: the earthly sovereign who constitutes the individuals under his authority as subjects in the double sense (Hobbes), the empirical and transcendental subjects (Kant).

41. Ibid.
It is at this point that a crucial question emerges for Althusser: if the interpel-
lation of the individual as subject is the central function of ideology, how exactly
is this function carried out? The term *ideology* in Marxist theory usually refers,
as the name suggests, to the system of ideas that expresses the economic devel-
opment and relations of a given society or historical period. The system of ideas
expresses a certain social reality in the sense that it is its effect and that it reaf-
ffirms or reproduces it. Ideology would then work on minds or consciousness,
creating certain beliefs that subjects would then act on: beliefs in the justice or
merely the inevitability of the master–slave, or worker–employer relation. As
Marx explained in *The German Ideology*, it would not be enough to criticize
these ideas because they were held in place and put into practice by a set of
material relations and could not disappear or even be diminished except to the
extent that these relations changed. While such a position appeared to be mate-
rialist, connecting ideas to realities, even as it rejected the weapons of criticism
in favor of the criticism that issues from weapons (to cite Marx’s famous phrase),
Althusser regarded it as an idealist survival that promoted the dangerous illu-
sion that by changing property relations one would automatically change the
entire ideological edifice of society. In contrast, Althusser argued that “ideology
has a material existence” and that it exists in apparatuses, practices, and rituals.
Religion, for example, is not a matter of belief, but a set of institutions and prac-
tices: “kneel down, move your lips in prayer and you will believe.”

The individual is addressed not by God, but by those, his intermediaries, who occupy
certain positions in the apparatus of the church: the individual is declared free
so that he may be judged according to whether he has (freely) obeyed or violated
the commandments. To move out of the terrain of religion, we can recognize in
Foucault’s account of the panopticon another allegorical figure of the interpel-
lated subject. The anonymous agent of surveillance induces the effect of subjec-
tivity in the isolated individualities before it: they watch themselves as they are
watched (the simultaneity of surveillance and self-surveillance), what they do,
what they think, what they feel. Thus, for Althusser as for Foucault, the “autono-
mous individual” is the product of practices of constraint and coercion.

II. STRUCTURE

However stimulating and suggestive Althusser’s account of ideology remains,
especially insofar as it provokes a re-examination of the concept of the subject, it
raises one of the central theoretical problems in Althusser’s career: the problem
of structure. In referring to the “formal structure” of ideology of which there

are a number of variants, Althusser appears to draw on the linguistic model that was so important for the structuralist works of the 1950s and 1960s. In fact, and Althusser never confronted the effects of this essay, it is this text – “Ideology and Ideological State Apparatuses” – more than anything else he wrote that identified him in the minds of so many readers as a structuralist. Interestingly, a 1966 text that circulated widely but was never published during his lifetime, but which is now available, allows us to see that Althusser advanced a very sharp critique of Lévi-Strauss.\(^43\) He identified the two theoretical poles between which Lévi-Strauss's work never ceased to vacillate. The first was the linguistic model, the “formal combinatory,” consisting of elements whose combination was governed by certain rules, which necessarily existed outside of and prior to history and of which every given society was one possible variant. The second theoretical pole was based on a refusal to transcend any given society, regarding each as a collective, anonymous subject, which produced the means by which the end of its reproduction would be achieved: the functionalist explanation. What makes Althusser’s critical observations of particular interest is the fact that they apply at least as much to “Ideology and Ideological State Apparatuses” as to any work of Lévi-Strauss's. Indeed, what are the ideological state apparatuses in Althusser’s argument – the church, the school, the media – but the means by which a certain order reproduces itself and which come into existence for precisely that end. At the same time, Althusser insists that:

ideology is endowed with a structure and a functioning such as to make it a non-historical reality, i.e., an omni-historical reality, in the sense in which that structure and functioning are immutable, present in the same form throughout what we can call history in the sense in which the Communist Manifesto defines history as the history of class struggles, i.e., the history of class societies.\(^44\)

As we have already noted, Althusser fills the otherwise empty forms of this “immutable” structure with the speculary relation between Subject and subjects that, like the deep structures of language, can produce an infinite number of possible variations.

The “Ideology” essay that was extracted with great care and precision from a much longer and far less functionalist manuscript\(^45\) – a fact that places a great emphasis on the character of the version Althusser chose to publish – remains

\(^{44}\) Althusser, “Ideology and Ideological State Apparatuses,” 161.

by far the most widely read text in his corpus. The functionalism and even formalism of the essay has overshadowed Althusser’s other works, particularly those in which he subjects functionalism and formalism to a critique, and has certainly contributed to a sense of an epistemological break in Althusser’s work after 1975. It is all the more necessary then to understand the exceptional, even perverse, nature of this justly famous text (which is in no way reducible to functionalism). It is perverse in the same manner as his autobiography: it diverts our attention away from what makes Althusser’s work so strikingly original, and insinuates what the autobiography openly and repetitively states, namely, that Althusser is a derivative thinker who provides little more than elegantly written summaries of earlier perhaps invalidated theories.

In fact, the question of structure as it was posed in France in the 1950s and 1960s remained at the center of Althusser’s philosophical reflection from the very beginning. His book on Montesquieu – *Montesquieu, la politique et l’histoire* – ignored by critics and admirers alike, was an investigation of the contradictory concept of structure at work in Montesquieu’s theory of history. Montesquieu’s theory of law breaks with earlier notions; the laws he seeks to postulate are no longer the ideals towards which a society should, but may not, strive, nor are they essences of which a given society is a more or less faithful realization: the law is “immanent” in a given society, it is that which makes its very diversity and complexity intelligible. Althusser’s first book, then, allows us, through the mediation of an eighteenth-century thinker, to identify at least two opposing conceptions of structure insofar as it is applied to history: the first is structure as an “ideal order” that underlies the apparent disorder of surface phenomena and to which the act of knowledge must reduce these phenomena in order to obtain their meaning; the second is not an order at all, nor does it require a reduction of phenomenal disorder to an essential order. It is the immanent principle of a disorder and irregularity that are posed as irreducible.

A few years later, Althusser would confront the same problems as they existed in Marxist theory. By the end of the nineteenth century, the dominant current in Marxist thought had arrived at a theory of historical progress that differed only in its details from the “bourgeois” view sketched out by Adam Smith. History was a narrative of economic development, which in turn produced ever more “advanced” social and cultural superstructures: the free market “produced” the free society. The Marxist version only added to this scheme of progress another layer of complexity: the development of the means of production necessarily came into conflict with the existing relations of production. This conflict would increase in scope and severity until revolution (the violence of which was in inverse proportion to its inevitability) would restore equilibrium between the forces and relations of production. The contradiction between these two poles of opposition in a given society functioned as the origin and principle of
intelligibility for all its phenomena: law, religion, literature, art, and music. In *Reading Capital*, Althusser pointed out that this “Hegelian” (and “Smithian”) scheme was formally identical to any of the binary oppositions whose polarity defined a given field for structuralist inquiry. It was in this context that Althusser raised the “practical” notion of conjuncture to the level of theory: to seek to explain a given historical moment on the basis of a central contradiction as if its complexity were the ideal epiphenomena of a material kernel was not only to deny the irreducible reality of this complexity, but it was to ignore the actual character of Marxist practice. No party or organization capable of effecting change could afford the luxury of such denial: on the contrary, every antagonism, every conflict irrespective of its relation to the “central” conflict, had to be accounted for and, if at all possible, exploited. As Althusser explains in “Contradiction and Overdetermination” (1962), the fact of domination (like the fact of revolution) does not radiate from an economic relation, but depends on the coalescing of a series of absolutely heterogeneous relations of force: it is never determined but always overdetermined. Hence, Althusser’s recourse to the concept of conjuncture represents an attempt to theorize what already existed in a practical state. The present understood as conjuncture is absolutely original or singular, it is the expression of nothing transcendent to it. It is also irreducibly complex; it is a composite unity, the always temporary conjunction of forces and elements that crystallize to persist indefinitely.

Does this mean then that Althusser had, in the name of the conjuncture and therefore of specificity and singularity, lapsed into “hyper-empiricism,” content merely to describe historical phenomena without attempting to establish causal relations among them, as an early reader of “Contradiction and Overdetermination” had charged? Had Althusser renounced, without admitting it (perhaps even to himself), Marx’s key notion of mode of production and its determination of the economic forms internal to it? The questions that Althusser posed in his early work and to which he returned in the last decade of his life mark the limit of his thought. Limit but not limitation: the reaching of and therefore identification of a threshold that remains our threshold, not in a historicist sense that would lead us to hope for and expect the attainment of what lies beyond it, but a limit that runs across the history of philosophy. It is here that Althusser’s use of the term “structure” takes on its full significance; for if Althusser in certain texts employs the term “structure” to denote a system whose elements combine together according to certain rules to produce the real, in other texts the same term takes on a radically opposed meaning and function. If what exists, what is actual not only in the strong sense but in the only meaningful sense, is the conjuncture – that is, the composite unity of composite

unities, ad infinitum, the product not of an ideal order of which it would be an expression, but of, as Althusser will say in his last work, encounter and chance (including the chance outcome of struggles never decided in advance) – then mode of production can no longer be thought of as a transcendental system, the set of all possible social formations of which the present would be one. Instead, as Althusser suggests at the conclusion of his contribution to Reading Capital, mode of production could be understood only as an immanent cause, “a cause immanent in its effects in the Spinozist sense of the term … the whole existence of the structure consists of its effects.”

If it is true, as Balibar has argued, that structure and conjuncture represent the two opposing poles of Althusser’s thought, it is no less true that he never ceased to insist not simply on their unity but on their mutual immanence. This marks the threshold of Althusser’s thought and ours and it is no accident that the reference here is to Spinoza, whose philosophy, still relatively unexplored, represented for Althusser the detour that alone seemed to lead to a future.

III. ORIGIN (END)

The future: is philosophy then going somewhere? This is a more complicated question than might initially be thought. There is no question that much of Althusser’s work is devoted to rooting out every form of teleology, not only in Marxist thought, but in philosophy in general. We have just noted the way in which his notion of the overdetermined historical contradiction rules out any sense of the linear unfolding of history: the necessity of revolutions has nothing to do with the inevitable stages of progress towards an end. As Althusser argues in “The Underground Current of the Materialism of the Encounter,” capitalism itself did not arise automatically within feudalism as its internal contradiction, the birth of the new within the old. Capitalism, he tells us, might never have happened: it was the product not only of struggles whose outcome is always contingent, but of an encounter between processes that might easily never have taken place. In a highly overdetermined encounter, elements collided, took hold, and a world, a mode of production, was born and no internal principle of negativity establishes the time and place of its demise. While such a conception of the emergence of a mode of production is present in certain of Marx’s

writings (notably those on the period of “primitive accumulation” at the end of the first volume of *Capital*), the Marxist tradition in its various forms from the *Communist Manifesto* on, has tended precisely to cover it up with a far more reassuring communist “superstition,” that is, a teleology of modes of production, the initial phase of which at least will culminate in communism. Against the idea that the elements that combine to form a mode of production “do not exist in history so that a mode of production may exist,” Althusser claims instead that they “exist in history in a floating state prior to their ‘accumulation’ and ‘combination,’ each being the product of its own history and none being the teleological product of the others or their history.”

Marxist theoreticians have most commonly conceived these elements (the accumulation of money, technology, and a population without the means of subsistence) as if they were “from all eternity destined to enter into combination, harmonize with one another and reciprocally produce each other as their own ends.” It is surely significant that Althusser’s manuscript leaves off at this precise point: capitalism might not have come into existence, but was the product of an encounter that nothing predetermined. The next step in the argument, the step Althusser does not take, is the acknowledgment that a new, unprecedented mode of production will come about, if it does, as the result of an equally chance encounter between elements, requiring even to come into existence (to say nothing of being able to persist in time) the immense accumulation of the most diverse and unrelated conflicts and antagonisms that Althusser calls the overdetermined contradiction.

But as we have noted, Marxism in its “practical state,” as Althusser liked to say, was forced repeatedly to confront the radical instability, reversibility, and contingency of social and political existence. In fact, every one of its major defeats was in part a consequence of organizations believing in their own myths, the myths of inevitable progress, communism as a religion, with its own version of providence. Thus the demands of political practice never allowed Marxism to lapse completely into a teleology of history. The same cannot be said for most other philosophies, whose task was to discover the radical origin of things, the principle of intelligibility without which history or even nature would lapse into unintelligible disorder.

In a very important sense the postulation of an origin was, for Althusser, constitutive of philosophy as such and the number of philosophers who deviated from philosophy’s true path was tiny. Althusser consistently named Epicurus, Lucretius, Machiavelli, Spinoza, and Marx as the thinkers who definitively broke with “the philosophy of philosophy” and refused any notion of origin. The theological function of the concept of origin seems clear enough: the transcendental

50. Ibid., 198.
51. Ibid., 200.
cause of the world, the unity that precedes division, spirit before matter, is that in relation to which alone the world through a reduction to the truth external to it, its truth, can be known. Althusser however insists that the concept of origin is just as necessary to “secular” forms of philosophy, binding it in complex ways to theology and theology to it: it is the gesture of denial and concealment by which thought pretends to inaugurate itself: “The function of the concept of origin, as in original sin, is to summarize in one word what has not to be thought in order to think what one wants to think.”52 Althusser spent a good deal of time specifying what political liberalism (Hobbes, Locke, Rousseau) and classical political economy (from the physiocrats to Smith and Ricardo) had not to think in order to be free to conduct their inquiries. Everything not only does begin, but must begin with an anthropology: a given human subject, the individual as subject of right, subject of interest, subject of needs. This invariant human essence is both the beginning and the end of history: everything depends on our not looking “behind the curtain,”53 on our remaining spectators of this little production. To ask about the origin of the origin, which in this case is to pose the question of the historical emergence of different forms of subjectivity, would be to nullify the way of thought that has dominated the world for centuries. Hence the scandal of Althusser’s two favorite heretics – Spinoza and Marx – whose philosophies, Althusser maintained, contained all the ingredients necessary for a critique of philosophical anthropology.

But Althusser himself could not entirely resist the attraction of the concept of origin. In “The Underground Current,” his last substantial text, the posthumously published version of which was extracted from a longer unfinished manuscript by François Matheron, Althusser announces the inauguration of “aleatory materialism,” a materialism of chance and encounter, derived from Epicurus and Lucretius. Although it is not difficult to discern the existence of this “underground current” in Althusser’s earlier works, it must be acknowledged that at the end of his life he added something new: a philosophy of the void. Instead of refusing “the old question, ‘What is the origin of the world,’” as he once did, he accepts it and what is more provides an answer: “Nothingness.”54 He has thus shifted, however subtly, from the position that there is no origin to the notion that “in the beginning there was nothingness and disorder.”55 It turns out, however, that Althusser is less interested in the origin than in the end proper to it. If all that exists has emerged from primal nothingness, so to nothingness it will certainly return. The aleatory origins of capitalism (it might not have come

52. Althusser and Balibar, Reading Capital, 63.
53. Ibid., 163.
55. Ibid.
into existence) thus serve to guarantee its demise. At a time when socialism and communism suffered the greatest defeats since the time of their emergence, when the mass movements that nourished them were vanquished and dispersed, Althusser, at the end of his life, joined Walter Benjamin in a messianic hope for the transformation to come, impatient for an end that would not arrive on time.

**MAJOR WORKS**

Michel Foucault’s work has been of importance to scholars working in a wide range of disciplines. In fields ranging from politics to epistemology, from aesthetics to queer studies, from the history of medicine to the history of ethics, his writings, lectures, and interviews have given rise to new and fruitful directions of research. Despite his own philosophical training, however, for most of his career Foucault disputed the categorization of his work as philosophy. Most of his published books have the word “history” in the title and he preferred to see his work as historico-philosophy, which is to say, philosophy carried out through a historical investigation. This historical focus ties Foucault’s work closely to that of both Nietzsche and the French school of historical epistemology and philosophy of science, but also opens up new ways of asking questions about subjectivity and ethics. The wide range of Foucault’s interests, combined with the fluid multidisciplinarity of his approach, makes it difficult to tell a single story about his place in the history of European philosophy. He himself regularly gave changing assessments of the overall sense of his work, but also regularly rejected attempts to pin his work down to a single tendency.

1. Michel Foucault (October 15, 1926–June 25, 1984; born in Poitiers, France; died in Paris) was educated at the École Normale Supérieure (1946–49), and received a doctorat d’état from the Sorbonne (1961). His influences included Althusser, Bachelard, Canguilhem, Hadot, Heidegger, Kant, and Nietzsche, and he held appointments at the École Normale Supérieure (1951–53), the University of Upsalla (1955–58), University of Clermont-Ferrand (1960–66), University of Paris VIII–Vincennes (1968–70), the Collège de France (1970–84), and the University of California-Berkeley (1975–84).

2. For a discussion of this school, see the essay by Pierre Cassou-Noguès in The History of Continental Philosophy: Volume 4.
or school. He also developed a critique of the role of what he calls the “author-function” in modern Western discourse, and dreamed of a time when works of philosophy, as well as fiction, would be published anonymously.\(^3\) This dream, of course, has not come to pass, and Foucault the author is now firmly (at least for the moment) installed in the pantheon of postwar European philosophy. Not only is there a growing output of specialist monographs, a dedicated journal, and an official archive managed by an official society, but Foucault’s own oeuvre continues to grow with the ongoing publication of more than ten years of lecture courses from the Collège de France.

I. WHICH FOUCALUT?

There are now so many “Foucaults” (Foucault the post-Kantian philosopher, Foucault the theorist of power, Foucault the queer theorist, Foucault the historian of sexuality and ethics, etc.) that it is difficult to integrate these personae into a unified image. This is a situation that Foucault himself would probably have welcomed. After all, one of his earlier books begins with a plea that he not be subjected to the morality of a bureaucracy that would insist that our papers be in order. “Do not ask who I am and do not ask me to remain the same,” he warns his readers.\(^4\) And yet, he himself regularly provided overviews of his work in which he offered new ways of integrating its many strands – accompanied by warnings about how not to interpret them. Hence, in the late 1960s he went to great lengths to deflect suggestions that his work borrowed its methods from structuralism, while in the mid-1970s he began to reinterpret his entire work in terms of his focus on power, and in the early 1980s he again reinterpreted his work, but this time in terms of his new focus on subjectivity and ethics. In the meantime, on different occasions, he characterized his work as being simply an attempt to be Nietzschean (and therefore anti-Nietzschean) and also as being a continuation, albeit in a radically changed form, of Kantian critique. In one interview, he even remarked that, for him, the “essential philosopher” was Heidegger.\(^5\) What are we to do in the face of this plethora of conflicting ways of

---

understanding Foucault’s work? How are we to make even preliminary sense of the multiple twists and turns taken by his thought?

One option, which is suggested by Foucault himself and which we will broadly adopt here, is to see his work as involving three phases, each of which can be more or less neatly assigned to a decade: the 1960s, the period of interest in forms and practices of knowledge;6 the 1970s, the period of interest in practices of power; the 1980s, the period of interest in forms of subjectivity and ethics. Remembering that each new stage carries forward the concerns of the previous stage, we then get a picture of Foucault as motivated by an interest in three aspects of human reality: knowledge, power, and the self; or, put differently, the human sciences, politics, and ethics. Even as we adopt this model, however, we should bear in mind that any such characterization can only be provisional. This is something Foucault recognized, for example in one of his last books, published several months before his death. Here, in the opening pages of The History of Sexuality, Volume Two, he admits that despite his conviction that his work has moved on through several stages, he also looks back and imagines that he has actually been traveling in a spiral. He now finds himself, he says, “at the vertical” to himself, rather than farther away from himself; in other words, he finds that he is looking down on the earlier stages of his thought, having simply moved in a circle.7 This is a significant admission, given the importance that Foucault attached to the task of distancing ourselves from ourselves and succeeding in thinking “otherwise.”8 It seems to suggest that the apparently abrupt shifts in his work were really returns to aspects of his earlier concerns that had not yet been sufficiently explored. Beginning, then, with the idea that Foucault’s work can be divided into three phases, which would focus in turn on knowledge, power, and the self, let us take one of his earliest books and see to what extent it already addresses, or at least calls for, these later concerns.

II. MADNESS AND SOCIETY

In the French academic system prior to 1968, a doctoral candidate was expected to complete two dissertations. Foucault’s second or “complementary” thesis was a translation into French of Kant’s Anthropology from a Pragmatic Point of View, accompanied by an extensive interpretative essay that was to be the introduction.

6. The 1960s was also a period of intense interest in literature. See, for example, Michel Foucault, Death and the Labyrinth: The World of Raymond Roussel, Charles Ruas (trans.) (Garden City, NY: Doubleday, 1986).
8. Ibid., 9.
to the published edition of the translation. His major thesis, which was mostly written while he was director of the Maison de France in Uppsala, Sweden, comprised a history of madness in the period the French call the “classical” age. This was submitted at the Sorbonne in 1961, where Foucault’s examiners included Georges Canguilhem, a leading philosopher and historian of science, and Jean Hyppolite, then Director of the École Normale Supérieure. In the same year, the text was published as Folie et déraison: Histoire de la folie à l’âge classique (Madness and unreason: History of madness in the classical age).

In considering this book, it is important to bear in mind that Foucault’s early academic interests were as much in the fields of psychiatry and psychology as in philosophy. One of his undergraduate degrees, for example, was in psychology; his first academic position was as a tutor in psychology at the École Normale in Paris (1951); and his first full-time academic job was as Assistant Professor of Psychology at the University of Clermont-Ferrand (1960). In addition, not only did he undergo a short treatment for alcoholism in 1950, but he also underwent psychotherapy after two attempted suicides, and finally worked as a researcher in an experimental psychology laboratory at Saint Anne psychiatric hospital in Paris. Foucault’s interest in the relation between mental health and medicine, therefore, was both theoretical and practical and was informed by his experience as both patient and medical researcher.

This may help to explain why, of all Foucault’s works, this one has perhaps received the most tumultuous reception. It was initially adopted by the antipsychiatry movement of the 1960s (under the influence of David Cooper and R. D. Laing), even though Foucault himself

---

9. Unpublished for many years, this essay finally appeared as Emmanuel Kant, Anthropologie du point de vue pragmatique et introduction à l’Anthropologie, Michel Foucault (trans. and intro.) (Paris: Vrin, 2008), and was published in English as Michel Foucault, Introduction to Kant’s Anthropology from a Pragmatic Point of View, Roberto Nigro and Kate Briggs (trans.) (New York: Semiotext(e), 2008).

10. This is the period from, roughly, the early 1600s to the late 1700s; in other words, from the end of the Renaissance to the height of the Enlightenment.

11. This text has had a complicated history. Having been published in 1961, it was then republished in abridged form in 1964, dropping Folie et déraison from the title. It was this abridged version that was the basis for most translations of the book (including the first English translation, Madness and Civilization, in 1965). However, the complete book, with some small changes, was republished in French in 1972 as Histoire de la folie à l’âge classique. This edition was finally published in an English translation in 2006 as History of Madness.

13. Foucault studied with Ludwig Binswanger in Switzerland in 1953, and one of his first publications was a translation and introduction to Binswanger’s Traum und Existenz as Le Rêve et l’existence, published in English as Dream and Existence. His first book was Maladie mentale et personnalité, published in English as Mental Illness and Psychology.
did not see the work as contributing to that movement. Even more than his other books, it was subjected to virulent criticism by professional historians who disputed its findings at the levels of both methodology and historical evidence. And it was also the subject of an extended philosophical debate with the young Jacques Derrida, relating to the book’s account of Descartes’s discussion of the possibility of madness in his *Meditations*.

But what of the content of the book itself? In an interview published in the same year as the book, Foucault makes a comment that we can take as a summary of the work’s central contention: “Madness only exists in a society, it does not exist outside the forms of sensibility which isolate it and the forms of repulsion which exclude or capture it.” Several key ideas – ideas that were to inform his entire intellectual trajectory – are introduced here. First is the idea that an apparently natural and universal phenomenon such as madness is in fact a social construct, one which by implication has a specific history. Second is the idea that the procedures by which something like madness is generated involve both isolating (in order to investigate) and excluding (in order to differentiate). Third is the idea that any given society comprises forms of “sensibility” that largely determine the individual’s experience of phenomena such as “madness,” “sexuality,” and so on. In *History of Madness*, Foucault traces the emergence of this concept (and practice) of madness in the course of the seventeenth and eighteenth centuries.

Following a technique that he was to use in most of his works of history, Foucault contrasts the period under investigation with both the preceding and the succeeding periods – thus focusing in effect on two turning points, in this case the emergence of the classical experience of madness from the Renaissance era, and its subsequent dissolution at the beginning of the nineteenth century. One of the effects of this contrastive technique is that it tends to emphasize breaks and ruptures rather than continuities in historical developments. As a result, particularly in the 1960s, Foucault became known as a historian of discontinuities who was, consequently, faced with questions about how these

---

14. This continues to this day: when the complete English translation was published in 2006, a virulent attack on Foucault’s scholarship was published in *The Times Literary Supplement*.
16. This interview, published in *Le Monde* in 1961, is untranslated; see *Dits et écrits*, vol. 1, 169.
17. Foucault was, no doubt, influenced here by his teacher Althusser, who had developed the idea, originally introduced by Bachelard in the 1930s, of the importance of épistemological breaks in the history of scientific thought and method. Bachelard’s formulation of this idea was also a strong influence on the work of Thomas Kuhn.
radical shifts come about.¹⁸ For Foucault, however, it was not so much the rupture that was important (and he never pretended to be able to explain these large-scale shifts, except in terms of contingencies), but the simple fact that at any given time a certain structure is in place that comprises more or less unique forms of both exclusion and division. These forms, which operate at multiple levels of discourse and practice, constitute the limits of what can be known or thought at any given time. Later, when he comes to systematize his 1960s methodological approach under the term “archaeology,” Foucault will describe these forms as constituting a “historical a priori.”¹⁹

Hence, for example, in History of Madness, Foucault is sketching the elements that constituted what he calls the “experience” of madness in the seventeenth century. The most obvious of these elements were the great asylums that began to be built in Europe from the 1650s, but they also included a whole range of ways of thinking about, controlling, and understanding madness that drew on received ideas, scientific concepts, and judicial and police measures. One of the central aims of Foucault’s book is to trace the emergence and shifts in the forms of knowledge and, in particular, to trace their relation to concrete measures such as the incarceration of the “mad” alongside the homeless and the deviant. However, the point is not just that practices and forms of knowledge change, but that a new object – “madness” – is itself constituted as a concomitant to the knowledge and the practice. This is the basis for Foucault’s claim that madness cannot exist outside a society. While it is true that the first version of this book also suggested the existence of another, prediscursive form and experience of madness, one that lay below the scientific construction, in his subsequent histories Foucault gradually came to concentrate exclusively on the contingent and changing objects themselves.²⁰

---

¹⁸. Foucault himself, however, always disputed this characterization of his work. While at one stage he recognizes that his work may have “exaggerated, for pedagogical purposes,” the strength of historical discontinuities, he insists that his aim was to pose the problem of discontinuity in order to “resolve” or “dissolve” it. See Michel Foucault, “On Power,” Alan Sheridan (trans.), in Politics, Philosophy, Culture, Kritzman (ed.), 100.

¹⁹. Foucault, The Archaeology of Knowledge, 142–8. The concept of the “historical a priori” is closely related to the concept of the epistēmē that Foucault introduced in The Order of Things. In both cases, Foucault is indicating a set of rules and formations that determine which statements will be accepted as falling within a particular field of scientifi city: in other words, as being potentially true or false.

²⁰. The idea of a prediscursive madness is clearly suggested in the original preface to History of Madness, but this was toned down in the second French edition. However, both versions are included in the latest English translation.
Foucault’s *History of Madness* is a book that is motivated by a concern with the present, but that takes the form of an excavation of an earlier stage in the formation of a discourse, a practice, and an object that we now take to be universal and natural. It represents Foucault's first attempt to analyze historically a form of rationality that grounds a particular human science, while also investigating the complex set of relations between that form of rationality and the social and political practices around which it develops. Finally, it raises the question, in the present, of our constitution of ourselves as subjects who are defined as rational beings, in fundamental opposition to the unreason of madness. Even though, at least since the Romantic period, it is possible to attach a certain value to the cultural productions of those who are ostensibly mad (for example, Nietzsche or Van Gogh), Foucault insists that the space in which unreason is allowed to persist in contemporary society is as carefully circumscribed as it was in the asylums of the seventeenth century. Even at this early stage, therefore, in his first major book, we can begin to identify the three themes that, as we will see, come to structure Foucault's work: knowledge, power, and the self. And these themes are explored historically on the basis of a concern with the present that is characterized by a dual recognition: first, that the present forms of knowledge, power, and subjectivity exact a price – that they have, in some sense, certain costs associated with them; and, second, that these present forms are inherently fragile – that they are subject to transformation and possible erasure. So far as *History of Madness* is concerned, therefore, the important point for Foucault is the implication that our current forms of relating to madness (for example, through the science and pharmacology of psychiatry) are just as contingent, as impure, and as likely to disappear at some future moment, as the forms that characterized the seventeenth century.

This theme, of the contingency and fragility of current forms of knowledge and practice, is one that constantly reappears in Foucault's histories. Shortly after publishing *History of Madness*, for example, he declared, “One day, perhaps, we will no longer know what madness was.”21 In an even more famous prediction, he closed *The Order of Things* (1966) with the suggestion that “man” would soon be erased from history like a face drawn on the sand at the edge of the sea;22 while his *History of Sexuality, Volume One* (1976) ends with the prediction that one day we will no longer understand the grip in which we were held for so

21. The essay “Madness, the Absence of an Oeuvre” (1964) is reprinted as Appendix I in *History of Madness*; see esp. 541.

long by “the ruses of sexuality.”23 Part of the attraction of Foucault’s works is the way they combine this sense of future possibilities, often expressed in prose that is more captivating than humanities scholarship usually produces, with a painstaking attention to historical detail and documentary evidence. This can create an effect, as one commentator put it, of “a ballet dancer disguised as a librarian.”24 To follow Foucault’s thought, to allow it to have its maximum possible effect, we need to keep in mind all of these threads: first, a constant concern with the present that holds out the hope for a transformed future, but which requires a historical understanding of how we became what we are today; second, a slowly unfolding schema comprising three interrelated points of focus—forms of knowledge, systems of constraint, and modes of relation to the self; third, a series of investigations into diverse fields, each of which struggles to develop the methodological tools, such as archaeology and genealogy, that are proper to its own material. However, as has already been suggested, perhaps the most convenient way to get an overview of this complex web is through the prism of the division of Foucault’s oeuvre into three overlapping stages.

Foucault’s work in the 1960s can, as a whole, be characterized as investigating the historically contingent emergence of those sciences that take human beings and their behavior as their object. After History of Madness, he published The Birth of the Clinic (1963) which proclaims itself as an “archaeology of medical perception.”25 This book, which is one of Foucault’s least-read mature works, offers a history of the modern concept of illness as it emerges around the turn of the nineteenth century, that is, at the end of the classical age. In 1966, there followed the book that, at least in France, made Foucault an intellectual star. This book, The Order of Things: An Archaeology of the Human Sciences, is a monumental history of the shift that saw the sciences of general grammar, natural history, and the analysis of wealth emerge in the classical age and then give way to the modern sciences of linguistics, biology, and economics. The book was read at the time in the context of structuralist modes of analysis (including the work of Lévi-Strauss and Lacan), which were seen as disregarding the importance of individuals in favor of large-scale social and historical structures. Foucault’s final prediction of the imminent demise of “man” put him firmly in this so-called antihumanist group, but he always strove to distance his work from the scientific aspirations of structuralism. In fact, his next book, The Archaeology of Knowledge (1969), is an attempt, after the fact, to formalize the methodology he

had employed in the “archaeologies” of the 1960s, and one of its main targets is the assumption made by many readers that his method can be assimilated to structuralism. These debates have by now lost much of their urgency, and it can be admitted that Foucault’s work in the 1960s, like that of most of his contemporaries, had a complex relation to the work of thinkers such as Althusser, Barthes, Lacan, and Lévi-Strauss.26

IV. THE INTRUSION OF POLITICS

The first major shift in Foucault’s thought began to take shape in the final years of the 1960s. Although Foucault himself did not take part in the events of May 1968 (he was in Tunisia, teaching, for most of this period), he was becoming more involved in a range of political activities. While teaching at the University of Tunis, for example, he had given practical support to a group of students who were being tried for subversion. Toward the end of May, he returned to Paris, where he took part in various meetings and demonstrations up until the end of June. As part of a response to the student protests, the government decided to set up a new “experimental” university outside the city, at Vincennes. Foucault, at the invitation of Canguilhem, was asked to form the new university’s department of philosophy,27 and he also played a key role in the establishment of a department of psychoanalysis, under the direction of Serge Leclaire, that was independent from the department of psychology and provided academic support for Lacanian analysts. His most significant involvement in the politics of this time, however, was his role in the “Groupe d’information sur les prisons” (Group for Information on the Prisons; GIP). This organization was formally launched by Foucault in February 1971 and included as members or supporters Gilles Deleuze, Claude Mauriac, Hélène Cixous, and even Jean-Paul Sartre. Its aim was to respond to the growing unrest in France’s prisons by collecting and publishing information from people who tended to be silenced by the government bureaucracy: not only the prisoners themselves, but also their families, and groups of professionals working within the prison system. With regard to this work, Foucault always insisted that his task as an intellectual was to provide a channel

26. Althusser was one of Foucault’s intellectual mentors at the École Normale Supérieure; Barthes was a close friend; and he attended Lacan’s early seminars. [*] Structuralism and the work of Lévi-Strauss and Lacan are discussed in several essays in The History of Continental Philosophy: Volume 5.

27. Among those who accepted Foucault’s invitation to join the philosophy department were Gilles Deleuze, Alain Badiou, Étienne Balibar, François Châtelet, Jacques Rancière, René Schérer, and Michel Serres.
for silenced voices rather than to express his own expert opinion.\(^{28}\) The GIP would expose the “intolerable” and help to have the prisoners’ demands heard, but would not propose its own reform agenda.\(^{29}\) The work of the GIP made numerous connections with other political and intellectual movements of the early 1970s: for example, a growing concern over the disciplinary uses of psychiatry, struggles around the right to abortion, and the emerging gay liberation movement. This work led Foucault to participate in countless political demonstrations, to organize protests and sit-ins, and to face several prosecutions.\(^{30}\)

We can see this engagement with political activism as both complementing and motivating Foucault’s intellectual work at this time. During this period – the early 1970s – he was conducting the research that would turn his work toward more explicitly political themes, and one of the first indications of this shift came in his inaugural lecture as a professor at France’s most prestigious academic institution, the Collège de France. Foucault had been elected as “Professor of the History of Systems of Thought” (a title that he himself had coined) in 1969 and he gave his inaugural lecture in December 1970. In much the same way that we can read *History of Madness* as a key to the themes that unfold throughout Foucault’s work, this inaugural lecture can be read as a key to the particular themes of his work in the 1970s. The lecture, published in French as *L’Ordre du discours* (“The Order of Discourse”), has two explicit aims: to outline a series of future research projects that investigate and analyze the modes of ordering (both internal and external) that shape discourse; and to introduce the methodological principles that will order Foucault’s own discourse in the following years.\(^{31}\) One of the overriding concerns of the lecture is to turn our attention to discourse as encompassing a material, unpredictable, violent reality. For Foucault now, since multiple systems of constraint operate in the field of discourse, the issue of power becomes unavoidable.

From the very beginning, however, Foucault’s understanding of power was significantly different from the accounts that had informed traditional political philosophy. Influenced, no doubt, by Nietzsche’s idea that power is both a constraining and a generative force, Foucault rejected the idea that power

---

\(^{29}\) See, for example, the interview “Je perçois l’intolerable,” and the Preface to *Enquête des vingt prisons*. Neither has been translated, but both are included in Foucault, *Dits et écrits*, vol. 2.

\(^{30}\) See note 12, above.

can be identified exclusively with forms of repression. In his inaugural lecture, he distinguishes between two aspects of his future research projects: on the one hand, what he calls the “critical” (or, archaeological) part that will analyze the principles that order and govern discourses from within; and, on the other, the “genealogical” part that will analyze the way in which discourses produce domains of objects. This production constitutes what Foucault calls the “power of affirmation” of discourse: its capacity to generate objects about which one can then produce true or false propositions. This is the basis of Foucault’s later working out in detail of a theory of power that gave precedence to affirmation and production over negation and repression. And, even at this early stage, Foucault predicts that when we come to study the modern forms of sexuality we will find that prohibitions did not play quite the role that we used to imagine.

V. MODERN POWER

In the mid-1970s, Foucault published the two books that were the product of this new turn in his work: Discipline and Punish: The Birth of the Prison (1975) and The History of Sexuality, Volume One: An Introduction (1976). Of all Foucault’s books, these were arguably the two that had the most impact both in intellectual circles and in political movements. Discipline and Punish, contrary to its own subtitle, is much more than a history of the prison. It offers a history of the emergence, growth, and spread of a range of disciplinary techniques that can be taken to define the operations of power in modern societies. Foucault focuses on techniques of power (such as the timetable, surveillance, and military drilling) which operate at the micro level and, on his account, make possible the large-scale phenomena that we see on the macro level. This microphysics of power is resolutely focused on the productive and generative effects of these techniques. In the case of military discipline, for example, Foucault demonstrates how a whole range of techniques produced a human body (the body of the soldier) that possessed capacities that had not been seen before. After the eighteenth century, in fact, the soldier is no longer a natural type, but a form that is produced through training and exercise. We could equally cite examples of classroom discipline that produced new capacities in pupils, such as the crucial ability to sit at a desk for long hours.

As with his earlier work, this book involves an investigation of the emergence and transformation of certain key discourses: in this case, discourses around education, military training, and criminology. However, to this archaeology of

32. Foucault, “The Order of Discourse,” 73.
33. Ibid., 70.
knowledge, Foucault has now added a genealogy of power relations. And, in fact, he insists that no analysis of a discourse can be complete without considering its relation to forms of power: “there is no power relation without the correlative constitution of a field of knowledge, nor any knowledge that does not presuppose and constitute at the same time power relations.”34 It is these newly defined power–knowledge relations, rather than the individual knowing subject, that determine both the forms and the domains of knowledge. The really crucial step that Foucault takes in this book, however, is to suggest that not only are forms of knowledge determined by power–knowledge relations (“Truth is a thing of this world”35), but that the subject itself is also a product of such relations. In the context of the prison, Foucault argues that the history of modern techniques of surveillance, punishment, and discipline are part of the genealogy of the “modern ‘soul’” (DP 29). This soul, which we can take to be one form of modern subjectivity, is merely “the present correlative of a certain technology of power over the body” (DP 29). But, at this stage of Foucault’s work, it is by no means merely a correlative phenomenon. The “soul” is in fact the “prison” of the body: not only an effect of power and domination, but also its instrument.

Throughout Discipline and Punish, from its detailed exposition of the disciplinary regimes of schools and barracks, to its central analysis of Bentham’s blueprint for a total disciplinary institution (the Panopticon), the reader has a sense that Foucault is giving us not just a history of our distant past, but something that he himself calls a “history of the present” (DP 31). In other words, we are aware that what is being put under the microscope here is our own world: a world in which power operates through more and more subtle forms of surveillance, regulation, and control. As Foucault asks rhetorically, “Is it surprising that prisons resemble factories, schools, barracks, hospitals, which all resemble prisons?” (DP 228). Once we take the book to be a critique of contemporary society, however, an important question arises: on what basis can Foucault criticize these modern forms of power, and what basis does he have for proposing alternative forms? These are questions that have been most forcefully pushed by political philosophers, including, among others, Jürgen Habermas, Nancy Fraser, and Charles Taylor.36 The central problem for these critics is that Foucault

has no account of freedom that he can juxtapose to his account of power; and, similarly, he has no account of the essential human individual that he can juxtapose to his account of an individual that is produced by power. It is true that, in the mid-1970s, Foucault is adamant that the modern subject is a product of modern technologies of power, and a little later he will also try to uncover the way that freedom is constituted to work as an element of modern governmentality. Since the subject and freedom are both produced by and within a particular social context, therefore, it may be difficult to see how they could act as a critical fulcrum for an oppositional politics. However, the fact that Foucault rejects the kind of autonomous subject that these critics assume does not in itself mean that he cannot account for resistance.37

VI. SEX, SEXUALITY, AND THE BODY

One possible basis for critique that Foucault seems to favor at this stage is the body. In *Discipline and Punish*, for instance in the claim that the soul is the prison of the body, there is a suggestion that the body and its forces are, in a sense, the raw materials from which power produces forms of subjectivity. And it could therefore, one might imagine, function as both a source and a justification for opposition to certain effects of power. This idea is even more strongly present in *The History of Sexuality, Volume One*, which we will now look at in some detail. This is the first volume (which, in French, is titled *La Volonté de savoir* [The will to knowledge]) of a projected four-volume study of the emergence and transformation of the scientific, moral, and philosophical discourses that constitute sexuality – from classical Greece to the present.38 In this introductory volume, Foucault sets out to undermine the accepted idea – which he calls “the repressive hypothesis” – that, after a long period of repression, there is now (in the 1970s) occurring a liberation of sexuality from the hostile forces of social, medical, and political power. In effect, his book is an argument against the idea, common at the time, that sex and power are mutually opposed and that sexual liberation is an inherently revolutionary act. In making this argument,

38. The fourth volume (“The Confession of the Flesh”), which would have focused on medieval Christianity, was almost complete when Foucault died but has not been published. When combined with volumes 1–3, it would have completed a full overview of sexuality from classical Greece to the modern West, a project quite different from the initially projected six-volume *Histoire de la sexualité*, of which *La Volonté de savoir* was published in 1976 as the initial volume.
however, Foucault not only offers a new account of the relations between sexuality, sex, and the body, but also further develops the theory of power that had been the basis for *Discipline and Punish*.

What is the difference between “sex” and “sexuality”? For Foucault, if we take “sexuality” to refer to the complex web of discourses (medical, moral, political) that govern both our practices and our self-understandings in relation to sex acts, then it is relatively easy to set up an opposition between “sexuality,” on the one hand, and “sex,” on the other. And in that case, it would be easy to conclude that in order to free ourselves from Victorian prudery and repression (from a repressed sexuality) we would need to liberate “sex” from these constraints. The account that Foucault offers us, however, is one that investigates and problematizes not only our modern forms of sexuality, but also the idea of sex that is often taken to underlie it. Sex, he concludes, is not the presocial, ahistorical, biological ground of our sexuality; it is, rather, an invention of the discourses of sexuality that functions in a way that further tightens the grip of power. In other words, the idea of sex, he argues, is simply an “ideal point” made necessary by the deployment of sexuality (HSI 155). If we wish to break away from the modern constraints of sexuality then, it is not sex that offers us a way out. Instead, Foucault once again appeals to the body – this time, to “bodies and pleasures” – as a source and foundation for resistance. It is easy to see how this analysis of the politics of the body was able to resonate with movements such as feminism, gay rights, and (later) AIDS activists. And, in fact, we could say that this book – the shortest of all Foucault’s histories – had a greater impact than any of his other works. But the book was not important just for its contribution in the area of sexuality and the politics of the body; it also developed and advanced Foucault’s analysis of power and the forms of government in modern society.

### VII. FROM POWER TO BIOPower

If it is true that *The History of Sexuality, Volume One* can be read as something of a manifesto for a new sexual politics, it is also true that as a work of political theory it has a similar programmatic tone. In particular, in a central section devoted to “Method,” Foucault consolidates and advances the new approach to power that he had introduced in *Discipline and Punish*. He is concerned to reject one of the standard approaches to power, according to which power is embodied

in large-scale groups, institutions or centers (such as finance, industry, etc.). On this account, power is a substance that can be captured, exercised, abused, and conceded; and it is something that always works by subtraction or reduction – it forbids, limits, represses, and compels. For Foucault, however, power is something that exists only in relations between forces, and these relations are in a state of constant mobility and modification; any apparently settled structures that emerge are, he argues, always local and unstable; and, as we have already seen, it is something that is primarily positive (not in the sense of being morally positive, but being productive). Since power is present in all social relations, we can say that “power is everywhere”; power is neither a structure nor a strength we possess; it is simply “the name that one attributes to a complex strategical situation in a particular society” (HSI 93).

Foucault now proposes five principles that will govern his study of power. First, power is not a substance; it exists only as it is exercised in a constant, mobile play between unequal forces. Second, relations of power do not come after, or supervene on, other relations; they are immanent to those relations and they have a directly productive role. Third, “power comes from below.” This does not mean that power lies with the oppressed, but that it is the micro-relations that make possible the effects we see at a macro level. In other words, to understand the major forms of domination, we must begin with a microphysics of power. Fourth, “power relations are both intentional and non-subjective” (HSI 94). That is, power is exercised in accordance with a series of aims and objectives, but there is no individual or group who sets these aims or orchestrates these strategies. This implies that there is no “headquarters” of power in any society, and similarly that there is “no single locus of great Refusal, no soul of revolt” (HSI 95–6). Finally, where there is power, there is resistance, and this resistance is always in a position of interiority in relation to power. In other words, resistance is a built-in part of power relations. In fact, Foucault would come to use this as a way of distinguishing power relations from relations of domination: relations of domination are ones in which, for all intents and purposes, the space of resistance (or, freedom) has been eliminated.40

This first volume of *The History of Sexuality* is also significant for introducing a concept that has had growing importance in the reception of Foucault’s work in the fields of political theory and political science: the concept of biopower. In the final section of the book, Foucault makes a connection between the deployment of sexuality and a shift in the operation of power within Western societies from a negative, deductive “sovereign power” to a life-administering “bio-power”

As the administering of life came to have central importance for governments, beginning in the early nineteenth century, so sexuality took on a key importance as it was situated at the intersection of the two axes of this new biopower: on the one hand, anatomo-politics, or the disciplining of the individual body; and on the other, biopolitics, or the regulation of the population. Biopower is a concept that encapsulates the operations by which institutions and governments control, regulate, and direct large-scale populations conceived in terms of life. The target of government is the life of the population and the operations of power therefore require mechanisms that are capable of fostering life – for instance in the fields of health and reproduction. While discipline had targeted individual bodies, and attempted to normalize them, biopower targets the “biological processes of man-as-species” in order to ensure that they are “regularized.” It is not, however, the case that one type of power replaces the other; rather, the two forms of power – discipline and biopower – operate in tandem in modern society, that is, in societies that “function in the biopower mode.”

Part of the importance of this concept of biopower is its link to Foucault’s slightly later concept of “governmentality.” During the course of his lectures at the Collège de France in the late 1970s, Foucault explored various aspects of this modern biopower, but he also shifted towards discussing the larger phenomenon of modern, liberal government. For example, Foucault begins the 1977–78 course saying that his theme will be the phenomenon of “biopower,” but by the fourth lecture he suggests that in hindsight he would not have given this course the title “Security, Territory, Population,” because what he really wanted to undertake was a history of “governmentality.” What Foucault means by governmentality is both the set of institutions, procedures, and tactics that make possible the operation of biopower, and the tendency that has led to the preeminence of this form of power within Western societies since the eighteenth century. The suggestion, in other words, is that a particular form of power, which takes “life” as its object, has come to dominate in Western societies and that this process may be termed the “governmentalization” of the state. While this approach guided Foucault’s work for a number of years (especially in his courses at the

---

Collège de France), it was not to find its way into any significant book-length publications during his life. It has, however, inspired and guided a number of important studies by political theorists and historians of the social sciences.\footnote{See, for example, Graham Burchell et al. (eds), *The Foucault Effect: Studies in Governmentality* (Chicago, IL: University of Chicago Press, 1991); Nikolas Rose and Peter Miller, *Governing the Present: Administering Economic, Social and Personal Life* (Cambridge: Polity, 2008).}

**VIII. ETHICS AS SELF-CONDUCT**

For Foucault himself, however, there is one element in his approach to governmentality that gives a link to the next and final phase of his work, in which he turns toward ethics. The idea of government, which Foucault sometimes formulated as “the conduct of conduct,” is not only a matter of subjects being governed by exterior forces; it is also a matter of self-government, or “the government of self and others.”\footnote{See, for example, Foucault, “The Subject and Power,” 341; and the title of Foucault’s 1982–83 course at the Collège de France, *The Government of Self and Others: Lectures at the College de France, 1982–1983*, Graham Burchell (trans.) (New York: Palgrave Macmillan, 2010).} In order to understand any phenomenon, then, we need to consider the role that is played by techniques of self-government. Hence, in addition to the axes of knowledge and power, in his work in the 1980s Foucault adds a third axis: the axis of the self, subjectivity, or ethics. In this turn, Foucault went on to introduce several themes (such as work on the self and aesthetics) that have enriched traditional approaches to ethics. These themes are explored most thoroughly in the context of the history of sexuality project. In 1984, shortly before his death, the second and third volumes of this history were finally published: *Volume Two: The Use of Pleasure* and *Volume Three: The Care of the Self*. During the eight-year gap between the first and second volumes, this project had undergone a major transformation; first, in terms of this addition of a third axis of analysis, but even more importantly as a result of its re-orientation toward ethics per se. The second and third volumes make explicit something that was perhaps implied in the first volume: that the project of a history of sexuality could be accurately described as one element of a “genealogy of ethics.”\footnote{See Michel Foucault, “On the Genealogy of Ethics: An Overview of Work in Progress,” in *The Essential Works of Foucault, 1954–1984. Volume 1: Ethics: Subjectivity and Truth*, Paul Rabinow (ed.) (New York: New Press, 1997).}

The historical period covered by these two volumes stretches from classical antiquity (including the work of Plato) up to the early centuries of the current era (including the work of Epictetus and Marcus Aurelius). This history was to be completed, as we have already noted, with a volume that would cover the Christian era up to the early modern period. In these two volumes, Foucault is
interested in showing how a certain relation to the self that characterizes ethics emerges within a framework of practices and techniques that initially focus on the bodily pleasures – including those that we would call sexual. Indeed, this idea of the cultivation of a certain kind of relation to the self, a relation in which we take aspects of our own behavior as material to be molded, is seen by Foucault as being central to the very possibility of ethics. In an important methodological distinction, he differentiates between morality and ethics by defining ethics as the realm of actions carried out on the self – or the realm of self-government – and morality as the realm of prescriptions and prohibitions that may or may not be obeyed in our everyday behavior. From the point of view of a historian – or a genealogist – it is the ethical dimension that is of interest, because it is here that we see historical transformation occur. The suggestion is that the prohibitions – such as against murder, theft, and so on – change little, but the reasons why we subject ourselves to those prohibitions, and the way we do so, has undergone a rich and important history.

This field, the field of ethics, is analyzed by Foucault in terms of four aspects: the ethical substance, the mode of subjection, the practices of the self, and the mode of being toward which the ethics aims.49 The first aspect, ethical substance, is the part of oneself or one’s behavior that is taken as the material of moral conduct; in the case of sexual ethics in classical Greece, this was the *aphrodisia*, or the pleasures (hence the title of volume two). The second aspect, mode of subjection, is the way one conceives the authority of the code; for example, does it rest on a divine command, or, as in classical Greece, does it arise from a free, personal choice to give one’s existence a certain nobility and beauty? The third aspect, practices of the self, comprises the techniques used in bringing oneself to follow the code: techniques such as memorization of precepts, examination of conscience, cultivation of abstinence, and so on. The fourth aspect, the *telos* toward which one aims, could be conceived as, for example, a state of tranquility, purity, or salvation; or, as in classical Greece, it could be seen as a mode of self-mastery that entitled one to mastery over others. In an allusion to Aristotle’s fourfold account of causation, Deleuze points out that Foucault’s four aspects of ethics can be seen as the four causes (material, formal, efficient, and final) of subjectivity as a mode of relation to the self.50

The importance of this approach to ethics, for Foucault, is not just that it gives him a framework for a historical analysis, but that it allows him to conceive of ethics (today) in a way that connects it up with questions about government (in

the broadest possible sense) and with aesthetics (also in the broadest possible sense). This introduction of the idea of ethics as a transformation of the self that takes place within a complex web of governmental practices is one that challenges much Western thinking about ethics. If government is the art of the conduct of conduct, then ethics, conceived as the ways in which individuals come to conduct themselves, or to “bring themselves” (se conduire) to obey moral precepts, is essentially an issue of self-government. And, reciprocally, government in the more common sense is as much an art of conducting the self-conducting of subjects as it is a science of the management of societies. This broadened concept of government, which would reinsert ethics into the heart of political analysis, has had a growing impact, as noted above, in the field of political theory. This impact has been particularly strong in the wake of the publication of Foucault’s courses at the Collège de France: in this case, in particular, the course from 1978, “Security, Territory, and Population.”

On the other hand, Foucault’s conception of ethics also comprises the possibility of reconnecting ethics and aesthetics in a way that was marginalized through much of modern philosophy. Particularly in modern Western philosophy, ethics has not been thought of as involving a work of self-transformation, especially not a work that would appeal to aesthetic principles. However, if ethics was, at one time, thought of as a freely chosen practice that would give one’s life a certain form and beauty, then Foucault suggests that perhaps this idea can help us today to emerge from the impasses into which we have been led by the modern search for objective grounds for morality and duty.51 If morality today can no longer be conceived as obedience to a code of rules, then, Foucault suggests, “to this absence of morality corresponds, must correspond, the search for an aesthetics of existence.”52 This is not to say that we must return to a Greek practice of ethics, but that we should consider the possibility of alternative ways of thinking about, and doing the work of ethics. Some examples of this work, which Foucault discusses in a series of late interviews, are the practices of community, friendship, sexual relationship, and politics that emerged in gay groups in the 1970s and 1980s.53 There is a growing number of theorists today, as we have seen, who expand these insights to a consideration of “queer” ethics, where queer is understood to comprise a whole range of nonmainstream modes of life (gay, lesbian, transgender, etc.). For Foucault, the central idea here is, first, to recognize that both ethics and government call

forth and direct certain practices of the self and, second, to mobilize the transformative potential that such practices themselves contain. Hence, rather than presenting a picture in which power ruthlessly produces “docile bodies,” we now have an image of subjects whose forms of relation to the self offer the potential for self-transformation and, consequently, the transformation of social and political realities. It is the complex relations between these modes of government (of self and others) that make up what Foucault begins to call “subjectivation.”

IX. SUBJECTS AND TRUTH

It is now possible, having traced Foucault’s trajectory through three decades, to see how, at each turn of his thought, he endeavored to incorporate his earlier phases. From the perspective of this final turn, before his death in 1984, Foucault now characterizes his work as having been an investigation of the ways in which subjects are produced – through procedures of objectivation and subjectivation – within Western societies. The first of these sets of procedures, which he had investigated in the 1960s, comprises modes of inquiry that objectivize, for example, the working subject (in economics) or the speaking subject (in linguistics). This investigation had given rise, for example, to The Order of Things. The second of these sets of procedures comprises the ways in which the subject is objectivized through “dividing practices”; that is, through divisions of sick from healthy, mad from sane, and law-abiding from delinquent. The investigation of these procedures had given rise, most notably, to Discipline and Punish. And third, there is a set of procedures through which human beings turn themselves into subjects through, in a sense, forms of self-objectivation. Foucault investigated these procedures in particular in the domain of sexuality, thus leading to the second and third volumes of The History of Sexuality.

The guiding thread that links together these diverse historical studies, a thread that perhaps only becomes clear at the end, is the question of the relation between the subject and truth. This is a question that, for Foucault, is given its significant modern form in the critical philosophy of Kant. One of Foucault’s earliest writings, as we have seen, was an essay on Kant’s Anthropology from a Pragmatic Point of View; and one of his last publications was a 1984 lecture on Kant’s essay “A Response to the Question: What is Enlightenment?” In another

54. This was a chapter title in Discipline and Punish and was often thought to encapsulate the picture of subjectivity that emerged in that book.
1984 text, Foucault suggests that if his work fits anywhere in the philosophical tradition, it is in the critical tradition of Kant. Foucault understands this tradition as questioning the mutual implication of the subject and the object of knowledge: What kind of subject does one have to be in order to have a certain kind of knowledge? And, how does something come to be constituted as an object of knowledge? What procedures of division, isolation, and selection are brought into play? It is from the interplay between these modes of subjectivation and objectivation that there emerges something that Foucault calls “games of truth”; these are the rules according to which something that counts as true or false can be said by particular subjects about a specific domain of objects. And, in an important departure from the Kantian model, it is the historical transformations of these games – with their subjects, objects, and rules – that Foucault's project aims to investigate. What he practices, therefore, is “historico-philosophy”: a kind of philosophy that seeks to understand the conditions of possibility of our present modes of subjectivity and knowledge; a search for the “historical a priori” of our present. And, crucially, this is a kind of philosophy that seeks to create the conditions in which these modes can be transformed. Why? Because every such historical configuration carries with it an attendant cost, in terms of the modes of subjectivity that were instituted and the domains of experience that were circumscribed. A philosophy is critical, therefore, to the extent that it can contribute to the loosening of these restrictions and to the opening up of a space of freedom in which the subject can experiment with new forms of subjectivation and objectivation. Practiced in this way, as a “historico-practical test of the limits that we may go beyond,” philosophy is at once a Kantian investigation of the limits of our present thought and a Nietzschean exploration of the horizons of our possible future.

MAJOR WORKS

57. Foucault, “Foucault,” 459. For a discussion of Foucault’s long and complex relation to Kantian philosophy, see Beatrice Han-Pile, Michel Foucault’s Critical Project: Between the Transcendental and the Historical (Stanford, CA: Stanford University Press, 2002).

Gilles Deleuze was one of the most influential and prolific French philosophers of the second half of the twentieth century. “I consider him to be the greatest contemporary French philosopher,” Michel Foucault once said, adding famously that “perhaps one day this century will be known as Deleuzian.” Despite such accolades, Deleuze remains difficult to classify as a thinker. The labels most frequently used to interpret contemporary French philosophy are inapplicable to Deleuze, since he was neither a phenomenologist, a structuralist, a hermeneutician, a Heideggerian, nor even a “postmodernist.” Whereas many French philosophers (Levinas, Ricoeur, Derrida, Lyotard) began their careers with studies of Husserl, Deleuze wrote his first book on Hume, and always considered himself an empiricist. Most dauntingly perhaps, his published oeuvre at first sight seems to be marked by a rather bewildering eclecticism, including constructive works such as *Difference and Repetition* and *Logic of Sense*, numerous monographs in the history of philosophy (on Hume, Nietzsche, Bergson, Kant, Spinoza, and

---

1. Gilles Deleuze (January 18, 1925–November 4, 1995; born and died in Paris, France) was educated at the Sorbonne (1944–48), and received a doctorat d’état there in 1968. His influences included Bergson, Heidegger, Hume, Kant, Lautmann, Leibniz, Maimon, Nietzsche, Sartre, Simondon, and Spinoza, and he held appointments at the Lycée d’Amiens (1948–53), Lycée d’Orleans (1953–55), Lycée Louis-le-Grand (1955–57), Sorbonne (1957–60), Centre National de Recherche Scientifique (1960–64), University of Lyon (1964–69), and University of Paris VIII–Vincennes-St. Denis (1969–87).

Deleuze's oeuvre is not always apparent, even to serious readers of his work. It is no doubt the singular nature of his work that is the most characteristic feature of Deleuze's philosophy. “Those who really brought something new [to contemporary philosophy],” Michel Serres has commented:

did not take the superhighways – for example, Gilles Deleuze. He disengaged himself from the traditional history of philosophy, from the human sciences, from epistemology – an excellent example of the dynamic movement of a free and inventive thought. … The greatest praise I can give to him is to say that philosophical thinking made him truly happy, profoundly serene.3

Deleuze was born in Paris, near the Arc de Triomphe, and lived there, except for a few interludes elsewhere, for the rest of his life. He was the second son of a conservative, middle-class engineer, and received his elementary education in the French public school system. When the Germans invaded France in 1940, Deleuze's family was on vacation in Normandy, and he spent a year being schooled there. Deleuze traced his own initiation into literature, at age fourteen, to a curious encounter on the beaches at Deauville with a teacher named Pierre Halbwachs (son of the sociologist Maurice Halbwachs), who introduced him to writers such as André Gide and Charles Baudelaire. He completed his baccalauréat in 1943 at his neighborhood school in Paris, the Lycée Carnot, and began to read philosophy during the “términale” year, under the influence of his professor, M. Vial. Early on, he recalled, philosophical concepts struck him with the same force as literary characters, having their own autonomy and style. He soon began to read philosophical works with the same animation and engagement as literary texts, and decided that philosophy would be his vocation. During the Occupation, Deleuze’s older brother Georges, then a student at the military school St. Cyr, was arrested by the Nazis for resistance activities and deported; he died on the train to a concentration camp.4

---
4. Deleuze never referred to his brother’s death in any of his writings, and it does not seem to have had a great influence on his later political views. François Dosse, in Gilles Deleuze et Félix Guattari: Biographie croisée (Paris: La Découverte, 2007) discusses Deleuze’s complex personal reaction to Georges’ death. On the one hand, Deleuze felt his brother’s loss deeply:
After the Liberation, Deleuze immersed himself in his university studies. He undertook his *khâgne* (an intensive year of preparatory studies) at the prestigious Lycée Henri-IV, and then studied the history of philosophy at the Sorbonne under the tutelage of Jean Hyppolite and Ferdinand Alquié (“two professors I loved and admired enormously”5), as well as Georges Canguilhem and Maurice de Gandillac. He was immediately recognized by both his teachers and peers to be an exceptional student, and easily excelled in his studies.6 In 1947, he received his *diplôme d'études supérieures* from the Sorbonne with a thesis on Hume, directed by Hyppolite and Canguilhem. In an era dominated by phenomenology and “the three H's” (Hegel, Husserl, Heidegger), Deleuze's decision to write on empiricism and Hume was already a provocation, early evidence of the heterodox tendencies of his thought. A revised version of the Hume thesis would be published in 1953, as Deleuze's first book, under the title *Empiricism and Subjectivity: An Essay on Hume's Theory of Human Nature*. In 1948, Deleuze passed the *agrégation* examination in philosophy, along with Louis Althusser and François Châtelet, and was assigned to a teaching position at the Lycée d'Amiens.7 At the time, like many of his peers, he was as influenced by the writings of Jean-Paul Sartre as he was by his academic mentors; he devoured *Being and Nothingness* when it appeared in 1948. When Sartre refused

---

6. François Châtelet, in his autobiographical text, *Chronique des idées perdues*, relates the following story about Deleuze's audacity as a student: “I preserve the memory of a reading by Gilles Deleuze, who had to treat I don't know what classic theme of Nicholas Malebranche's doctrine before one of our most profound and most meticulous historians of philosophy and who had constructed his demonstration, solid and supported with peremptory references, around the sole principle of the irreducibility of Adam's rib. At the expression of this adopted principle, the master turned pale, and obviously had to keep himself from intervening. As the exposition unfolded, the indignation was changed into incredulity, and then, at the moment of peroration, into admiring surprise. And he justly concluded by making us all return the next week with our own analysis of the same theme” (*Chronique des idées perdues* [Paris: Éditions Stock, 1977], 46). The teacher Châtelet is referring to was probably Henri Gouhier (I would like to thank Alan Schrift for this identification).

the Nobel Prize in 1964, Deleuze would pen a moving tribute to him entitled “He Was My Teacher.”

Deleuze, however, quickly rebelled against the academic training he was receiving in the French university system, with its emphasis on close readings of classical canonical texts. “I belong to a generation,” he later recalled:

one of the last generations, that was more or less assassinated by the history of philosophy. The history of philosophy plays an obvious repressive role in philosophy, it is a properly philosophical Oedipal complex: “All the same, you dare not speak in your own name until you have read this and that, and that on this, and this on that.” Many members of my generation never broke free of this; others did by inventing their own particular methods and new rules, a new approach.

Deleuze’s own way of breaking free took a variety of forms. He tended to seek out and retrieve forgotten figures, such as Bergson, who had faded into obscurity and disrespect by the postwar period. He read and championed lesser-known figures, including both contemporaries (Lautmann, Simondon, Ruyer) and historical

---

11. Claude Lévi-Strauss gave voice to a widespread opinion when he joked that Bergson had “reduced being and things to a state of mush in order to bring out their ineffability,” and Deleuze said that even friends laughed at him for writing on Bergson. (The quote from Lévi-Strauss appears in Richard Rorty’s review of Deleuze’s Nietzsche and Philosophy “Unsoundness in Perspective,” Times Literary Supplement.) Deleuze lamented that “they have no idea how much hatred Bergson managed to stir up in the French university system at the outset, and how he became a focus for all sorts of crazy and marginal people” (Deleuze, Negotiations, 6, translation modified). Deleuze’s 1964 book Bergsonism is now credited with having almost single-handedly brought about a revival of interest in Bergson’s work.

12. Gilbert Simondon (1924–89), a French philosopher whose work focused primarily on the issues of individuation and technology, was the author of L’Individu et sa genèse physico-biologique (The individual and its physical-biological genesis). Albert Lautmann (1908–44), a French philosopher of mathematics, shot by the German authorities in Toulouse as an escaped prisoner of war, was the author of Essai sur les Notions de Structure et d’Existence en Mathématiques (Essay on the notions of structure and existence in mathematics). Raymond Ruyer (1902–87), a prolific French philosopher, known for his work in the philosophy of
figures (Bordas-Demoulin, Hoënë-Wronski, Maimon, among many others13). He created novel sequences in the history of philosophy, reading Stoic logic in conjunction with Lewis Carroll’s work, for example, or linking Duns Scotus’s concept of univocity with the work of Spinoza and Nietzsche. Most importantly, perhaps, he read even the major figures of the tradition in new ways. “I suppose the main way I coped with things at the time,” he explained in an oft-cited text:

was to see the history of philosophy as a kind of buggery or (it amounts to the same thing) an immaculate conception: I saw myself as taking an author from behind, and giving him a child that would be his own, yet monstrous. It was very important that the child was his own, because the author had to say everything I was making him say. But it was also necessary for the child to be monstrous, because it had to pass through all sorts of decenterings, slidings, dislocations, and secret emissions that gave me much pleasure.14

Yet this seemingly flippant remark should not obscure the respect and admiration Deleuze had for all the authors he worked on. “My ideal, when I write about an author,” he later added, “would be to write nothing that would cause him sadness, or if he is dead, that might make him weep in his grave.”15

In order to write and think, Deleuze explained, he needed to work with “intercessors” with whom he could enter into a kind of becoming (past philosophers were intercessors of this type, as was Félix Guattari, in the present).16 When

---

13. Salomon Maimon (1752–54?–1800), a German philosopher, born of Jewish parentage in Poland, was one of the earliest and most profound critics of Kant’s critical philosophy and the author of the Versuch über die Transcendentalphilosophie (Essay on transcendental philosophy), which attempted to ground post-Kantian philosophy on a Leibnizian reinterpretation of the calculus. Józef Maria Hoënë-Wronski (1778–1853), a prolific Polish mathematician who developed a messianic and mystical system of philosophy, is best remembered for his theory of infinite series as developed in works such as Philosophie de l’infini (Philosophy of the infinite) and Philosophie de la technie algorithmique (Philosophy of the algorithmic technique). Jean Baptiste Bordas-Demoulin (1798–1859), a French philosopher who attempted to reconcile Christianity with modern civilization, was the author of Le Cartésianisme ou la véritable rénovation des sciences (Cartesianism, or the true rejuvenation of the sciences), in the context of which he offered a Platonic interpretation of the calculus. reading Deleuze’s monographs, one literally enters a “zone of indiscernibility” between Deleuze’s thought and the philosopher he is writing on (free indirect discourse): there is a becoming-Deleuze of Leibniz, for instance, as much as there is a becoming-Leibniz on Deleuze’s part. This accounts for the complexities one encounters in reading Deleuze’s texts: one moves from a fairly straightforward explication of the thinker at hand, to a more specifically Deleuzian interpretation, which often makes use of concepts incorporated from the outside (for instance, Deleuze interprets Spinoza in terms of Duns Scotus’s concept of “univocity,” and Leibniz in terms of the mathematical concept of “singularities,” even though neither of these terms appears in Spinoza’s or Leibniz’s texts); and finally, one reaches a creative point where Deleuze pushes the thought of the thinker at hand to its differential or immanent limit. Despite his occasional use of such language, it is impossible to categorize figures in the history of philosophy simply as Deleuze’s “friends” or “enemies”: he was as indebted to Kant (a supposed enemy) as he was critical of Bergson (a supposed friend).

It is sometimes joked that “continental” philosophers pretend they have read everything, whereas “analytic” philosophers pretend they have read nothing. In Deleuze’s case, this caricature comes close to the truth: Jean-François Lyotard once called him “the library of Babel.”17 His writings are not only strongly grounded in the history of philosophy, but are also dotted with references to numerous nonphilosophical domains, including differential calculus, thermodynamics, geology, molecular biology, population genetics, ethology, embryology, anthropology, psychoanalysis, economics, linguistics, and even esoteric thought. But this erudition was never in the service of a mere acquisition of knowledge or the mastery of a discipline, but rather a kind of passage to the limit: the conditions of thought, Deleuze liked to say, must always be drawn, not from the model of knowledge, but from the process of learning.

We write only at the frontiers of our knowledge, at the border which separates our knowledge from our ignorance and transforms the one into the other …. To satisfy ignorance is to put off writing until tomorrow – or rather, to make it impossible …18

One always speaks from the depths of what one does not know.19

Deleuze and Guattari would almost elevate this link between erudition and ignorance into a principle of their writing: “We claim the right to a radical laxity,

---

19. Deleuze, Negotiations, 7, translation modified.
a radical incompetence.”20 “We would like to speak in the name of an absolute incompetence.”21 The novelist Michel Tournier, who studied with Deleuze at the Sorbonne, recalled in his memoir that, even as a student, Deleuze already manifested this ability to transmute the thoughts he incorporated from others: “He possessed extraordinary powers of translation and rearrangement: all the tired philosophy of the curriculum passed through him and emerged unrecognizable but rejuvenated, with an air of freshness, undigestedness, and raw newness, utterly startling and discomfiting our weakness and laziness.”22

During the decade between 1953 and 1962, Deleuze published little, and moved among various teaching positions in Paris and the provinces. He later referred to this period, somewhat glibly, as “a hole in my life,” but in fact it was a period of intense study and activity, during which Deleuze was quietly pursuing his own unique path in philosophy. During the 1956–57 academic year, for instance, he gave a hypokhâgne course at the Lycée Louis-le-Grand entitled “Qu’est-ce que fonder?” (What is grounding?), which already included much of the material that would later appear in *Difference and Repetition*.23 In August 1956 he married Denise Paul Grandjouan (“Fanny”), who became the French translator of D. H. Lawrence, and with whom Deleuze would have two children, Julien (b. 1960) and Emilie (b. 1964). In 1962 his groundbreaking study *Nietzsche and Philosophy* – an anti-Hegelian polemic that reads Nietzsche in the context of the post-Kantian tradition – was published to considerable acclaim, cementing Deleuze’s reputation in academic circles.24 During the remaining years of the 1960s, Deleuze published a book a year, each of them devoted to the work of a particular philosopher or literary figure: Kant (1963), Proust (1964), Nietzsche (1965), Bergson (1966), Sade and Masoch (1967), and Spinoza (1968). Deleuze later considered these to be years of apprenticeship: the books were preparatory sketches for the great canvases of *Difference and Repetition* and *Logic of Sense*.

In 1962, shortly after the publication of *Nietzsche and Philosophy*, Deleuze met Foucault in Clermont-Ferrand, at the home of Jules Vuillemin, who had just been elected to the Collège de France. Foucault had suggested that Deleuze might replace Vuillemin at the University of Clermont-Ferrand; Deleuze instead

Volume 6
received an assignment at the University of Lyon, where he taught from 1964 to 1969. But the meeting marked the beginning of a long and respectful intellectual friendship.\textsuperscript{25} In 1970, Foucault wrote an influential article on Deleuze, entitled “Theatricum Philosophicum,” which was instrumental in introducing Deleuze’s work to a broader public;\textsuperscript{26} Deleuze would later declare Foucault to be “the greatest thinker of our time.”\textsuperscript{27} When Foucault’s life was cut short in 1984, Deleuze devoted a year of his seminar to Foucault’s writings, and the resulting book, he said, was written “out of necessity for me, out of admiration for him, out of my emotion at his death, at this interrupted work.”\textsuperscript{28}

The years 1968 and 1969 were pivotal in Deleuze’s life. In 1968, Deleuze presented and defended his \textit{thèse de doctorat d’état}: his principal thesis was \textit{Difference and Repetition}, directed by Gandillac, considered by many to be Deleuze’s \textit{magnum opus}; his secondary thesis was \textit{Spinoza and the Problem of Expression}, directed by Alquié. These were followed, in 1969, by \textit{Logic of Sense}, an analysis of the concept of sense oriented around a reading of Lewis Carroll and Stoicism. Some time during this period, Deleuze contracted a recurring respiratory ailment that would plague him for the rest of his life; he underwent a major lung operation for the condition in 1969, and although he said that the disease never seriously affected his ability to work, he was frequently absent from his courses in later years because of his illness.\textsuperscript{29} In the same year, he met Félix Guattari, a militant psychoanalyst, with whom he would write his most famous and well-read books, the two volumes of \textit{Capitalism and Schizophrenia} (1972, 1980). The first volume, \textit{Anti-Oedipus}, was an overtly political text written in the wake of the ferment of May 1968; it became a bestseller in France, and thrust Deleuze and Guattari into the limelight as public intellectuals. Deleuze was teaching in Lyon when the events of May 1968 erupted, and he was an immediate and unrelenting supporter of the student movement. “For my part,” he later recalled, “I made a kind of passage into politics around May ’68, as I

\textsuperscript{25} See Eribon, \textit{Michel Foucault}, 136–8, for a brief account of the Foucault–Deleuze relationship. Deleuze and Foucault did not see each other after 1977, for reasons that were circumstantial (Foucault was teaching in Berkeley) as well as political. James Miller discusses the reasons for the supposed “break” in his biography, \textit{The Passion of Michel Foucault} (New York: Simon & Schuster, 1993), 297–8; both Foucault and Deleuze were protesting Germany’s request that France extradite Klaus Croissant, a lawyer for the Baader-Meinhof gang, but whereas Foucault “couched his own position in terms of right,” Deleuze went much further, and wanted “to protest what he regarded as Germany’s ‘state terrorism,’ implicitly endorsing the image of the government held by the Baader-Meinhof gang itself” (\textit{ibid.}, 297).

came into contact with specific problems, through Guattari, through Foucault, through Elie Sambar [founder of the Revue d’études palestiniennes].”

During the 1970s, Deleuze would become politically active in a number of causes, including the Groupe d’information sur les prisons (formed by Foucault, among others), and he had an engaged concern with homosexual rights and the Palestinian liberation movement. Late in 1969, he took up a position at the University of Paris VIII–Vincennes, which was created as an “experimental” campus after the events of May 1968. Foucault, Châtelet, Serres, Étienne Balibar, Jacques Rancière, and Alain Badiou were all teaching there, although Foucault was named to the Collège de France the following year, and Serres left for the Sorbonne soon afterwards. Jean-François Lyotard joined the faculty in 1972, and he and Deleuze would collaborate on several projects (including writing a public letter condemning the dismissal of Luce Irigaray in 1974 from the Department of Psychoanalysis). The Vincennes facilities were razed by the government in 1978, and the faculty was transferred to a campus at Saint-Denis, a suburb north of Paris, where Deleuze remained until his retirement in 1987, holding weekly seminars every Tuesday morning. He never took up a joint appointment at an American university, as many of his contemporaries did, and he tended to shun academic conferences and colloquia, insisting that the activity of thought took place primarily in writing, and not in dialogue and discussion. Like Kant, he traveled little: France was his Prussia, and Paris his Königsberg. The only trip that ever counted for him, he said, was a trip to Florence, “perhaps”, his sole trip to the United States took place in 1972, when he participated in a conference at Columbia University, organized by Sylvère Lotringer, on Anti-Oedipus. “If I don’t travel,” he explained, “I’ve taken motionless trips just like everyone else…. Some voyages take place in situ, they are trips in intensity.”

In 1980, the second volume of Capitalism and Schizophrenia appeared, entitled A Thousand Plateaus, a highly experimental text, organized in a series of “plateaus” rather than chapters, which pushed Deleuze and Guattari’s production of concepts (rhizome, becoming, the refrain, the war machine) to an entirely new level. In the 1980s, Deleuze and Guattari pursued their writing careers separately, with Deleuze’s attention increasingly turned toward the arts: he published a book on painting (Francis Bacon: The Logic of Sensation; 1980), a two-volume study of the cinema (The Movement-Image; 1983; and The Time-Image; 1985),

an analysis of the Baroque (The Fold: Leibniz and the Baroque; 1988), and a collection of essays on literature (Essays Critical and Clinical; 1993). Deleuze’s final collaboration with Guattari, What is Philosophy? was published in 1991. Guattari died of a heart attack in 1992; by 1993, Deleuze’s pulmonary illness had confined him severely, making it increasingly difficult to read or write; he took his own life by defenestration, on the night of November 4, 1995. Since then, additional material from Deleuze’s corpus has come to light. Two volumes of Deleuze’s occasional texts and interviews were collected and edited by David Lapoujade, a former student, and published as Desert Islands (2002) and Two Regimes of Madness (2003). Richard Pinhas, another former student, is in the process of making transcriptions of Deleuze’s seminars available at webdeleuze.com, which is an invaluable resource for those interested in the development of Deleuze’s philosophy.

***

In What is Philosophy? Deleuze and Guattari famously define philosophy as “the art of forming, inventing, and fabricating concepts,” although this creation of concepts always takes place under the constraint of changing problematics that are as much historical and social as they are philosophical.34 For Deleuze, concepts are the medium within which philosophers work – just as painters work with lines and colors, filmmakers work with images, and musicians work with sounds – and his work was marked throughout by an extraordinary conceptual inventiveness. Deleuze rejected the Heideggerian theme of the end of metaphysics, and much of his own conceptual production was aimed at developing a metaphysics adequate to contemporary mathematics and science: a metaphysics in which the concept of multiplicity replaces that of substance, event replaces essence, virtuality replaces possibility, and so on. “I feel myself to be a pure metaphysician,” he noted, “Bergson says that modern science hasn’t found its metaphysics, the metaphysics it would need. It is this metaphysics that interests me.”35 But Deleuze’s metaphysics is a resolutely post-Kantian metaphysics in that it refuses to admit the three “transcendent illusions” criticized by Kant in the Critique of Pure Reason: God, the World, and the Self. Although Deleuze’s early work is often read as a reaction against Hegel, Deleuze’s more general project can be seen as a reassessment of the then-dominant post-Kantian tradition in philosophy. Kant’s genius, for Deleuze, was to have conceived a

purely *immanent* critique of reason: a critique that did not seek, within reason, “errors” produced by external causes, but rather “illusions” that arise internally from within reason itself by the illegitimate (transcendent) uses of the syntheses of consciousness. Deleuze characterized his own work as a philosophy of immanence, but argued that Kant himself had failed to fully realize the immanent ambitions of his critique, for at least two reasons.

First, Kant made the immanent field immanent to a transcendental subject, thereby reintroducing an element of transcendence, and reserving all power of synthesis to the activity of the subject. Deleuze’s first book, on Hume, had pointed to an empiricist reversal of this relation: whereas Kant’s question had been “How can the given be given to a subject?” Hume’s question had been “How is the subject (human nature) constituted within the given?” Deleuze would later characterize his own position as a “transcendental empiricism”: the determination of an impersonal and pre-individual transcendental field in which the subject is itself the result or product of passive syntheses (of the body, habit, desire, the unconscious). Just as there is no universal reason but only historically variable processes of “rationalization” (Max Weber), so there is no universal or transcendental subject, but only diverse and historically variable processes of “subjectivation.” Deleuze summarized his empiricism in terms of two characteristics: (i) the abstract does not explain, but must itself be explained; (ii) the aim of philosophy is not to rediscover the eternal or the universal, but to find the singular conditions under which something new is produced (creativity).

Second, Kant had simply presumed the existence of certain “facts” (knowledge, morality) and then sought their conditions of possibility in the transcendental. But already in 1789, Salomon Maimon, whose early critiques of Kant helped generate the post-Kantian tradition, had argued that Kant’s critical project required a method of *genesis* – and not merely a method of conditioning – that would account for the production of knowledge, morality, and indeed reason itself – a method, in other words, that would be able to reach the conditions of *real* and not merely *possible* experience. Maimon found a solution to this problem in a principle of difference: whereas identity is the condition of possibility of thought in general, it is *difference* that constitutes the genetic and productive principle of real thought. These two Maimonian exigencies – the search for the genetic conditions of real experience and the positing of a principle of difference – reappear like a leitmotif in almost every one of Deleuze’s early monographs. *Nietzsche and Philosophy*, for instance, suggests that Nietzsche completed and inverted Kantianism by bringing critique to bear, not simply on false claims to knowledge or morality, but on true knowledge and true morality, and indeed on truth itself: “genealogy” constituted Nietzsche’s genetic method, and the will to power was his principle of difference. In *Bergsonism*, on the other hand, Deleuze argues that Bergson’s concepts of duration, memory, and
élan vital constitute the differential and genetic dimensions of the multiplicities of the real. Against the “major” post-Kantian tradition of Fichte, Schelling, and Hegel, Deleuze in effect posited his own “minor” post-Kantian trio of Maimon, Nietzsche, and Bergson. In rethinking the post-Kantian heritage, Deleuze would also retrieve the work of a well-known trio of pre-Kantian philosophers – Hume, Spinoza, and Leibniz – although from a decidedly post-Kantian viewpoint.

Deleuze’s historical monographs were, in this sense, preliminary sketches for the great canvas of Difference and Repetition, which marshaled these resources from the history of philosophy in an ambitious project to construct a metaphysics of difference. Normally, difference is conceived of as an empirical relation between two terms each of which have a prior identity of their own (“x is different from y”). In Deleuze, this primacy is inverted: identity persists, but it is now a secondary principle produced by a prior relation between differentials (dx rather than not-x). Difference is no longer an empirical relation but becomes a transcendental principle that constitutes the sufficient reason of empirical diversity as such (for example, it is the difference of potential in a cloud that constitutes the sufficient reason of the phenomenon of lightning). In Deleuze’s ontology, the different is related to the different through difference itself, without any mediation. Although he was indebted to metaphysical thinkers such as Spinoza, Leibniz, and Bergson, Deleuze appropriated their respective systems of thought only by pushing them to their “differential” limit, purging them of the three great terminal points of traditional metaphysics (God, World, Self).

Deleuze’s subsequent work was, to some degree, a further working out of the metaphysics developed in Difference and Repetition. “I believe in philosophy as a system,” Deleuze once wrote, “For me, the system must not only be in perpetual heterogeneity, it must be a heterogenesis, which, it seems to me, has never been attempted.” Heterogenesis: this means that the system itself must entail the genesis of the heterogeneous, or the production of the new (a dynamic and open system), which in turn means that the concepts themselves are dynamic and open. “It is not a question of bringing things together under a single concept, but rather of relating each concept to the variables that explain its mutations.”

Consider, for example, the notion of intensity: in Difference and Repetition, it is linked to a notion of depth; in Logic of Sense, it is linked to the concept of surface; in Anti-Oedipus, it is what takes place on a body without organs; in What is Philosophy? it marks the nature of the components of a concept.

---

consistency of a concept, in other words, has as its necessary correlate the variability of the concept. For these reasons, it is impossible to summarize Deleuze’s system, but we can at least give a sense of the problems that generate it by considering five philosophical domains that more or less parallel those laid out in the architectonic of Kant’s Critiques: dialectics, aesthetics, ethics, politics, analytics.

1. Dialectics (Theory of the Idea). Difference and Repetition attempts to formulate a theory of Ideas (dialectics) based on neither an essential model of identity (Plato), nor a regulative model of unity (Kant), nor a dialectical model of contradiction (Hegel), but rather on a problematic and genetic model of difference. Ideas are what define the “essence” of a thing, but one cannot attain an Idea through the Socratic question “What is …?” (which posits Ideas as transcendent and eternal), but rather through “minor” questions such as “Which one?” “Where?” “When?” “How?” “How many?” “In which case?” “From which viewpoint?” – all of which allow one to define the spatiotemporal coordinates of Ideas that are immanent and differential. Kant posited Ideas as “regulative” notions that serve to unify and systematize the operations of the understanding: concepts find the ground of their maximal experimental use only insofar as they are related to Ideas, which Kant defines as foci or horizons that lie outside the bounds of experience. But an object outside experience can be represented only in a problematic form: it can neither be given nor known, but must be represented without being able to be directly determined. This undetermined object of the Idea marks neither an imperfection in our knowledge nor a lack in the object: it is a perfectly positive and objective structure that allows us to represent other objects (those of experience) which it endows with a maximum of systematic unity. In Kant, then, Ideas present three aspects: they are undetermined with regard to their object, but nonetheless determinable with regard to the objects of experience, and bear the ideal of a complete determination with regards to the concepts of the understanding.

Because he held fast to the point of view of conditioning, however, two of these three moments remain as extrinsic characteristics in Kant. In Difference and Repetition, Deleuze aims to develop a theory of problematic Ideas that is genetic and not merely conditioning, following Maimon’s contention that the duality between concepts and intuitions can be bridged only by positing ideas of difference within sensibility itself. The formal criteria Deleuze uses to define Ideas are largely derived from Leibniz and the model of the differential calculus, which provides a mathematical symbolism for the exploration of the real: things or beings are virtual and problematic multiplicities composed of singularities-events, which are prolonged in converging and diverging series, forming zones of indiscernibility where the multiplicities enter into perpetual becomings. Drawing on the work of Jules Vuillemin and Albert Lautman, among others, in
the philosophy of mathematics, Deleuze defines the three moments of the Idea in a purely intrinsic and differential manner: (i) it implies elements that in themselves are completely undetermined \((dx, dy)\); (ii) these elements are nonetheless determinable reciprocally in the differential relation \((dy/dx)\), which (iii) defines their complete determination as a singular point (values of \(dy\) and \(dx\)). For Lautman, the conditions of a problem are constituted by the nomadic and virtual distribution of these singular points, and the solution appears only with the integral curves that constitute the actualization of certain singularities. Deleuze thus defines the problematic structure of an Idea as an internal multiplicity, a system of multiple, nonlocalizable connections between differential elements, in which difference is related to difference through difference. The genesis takes place in time, not between one actual term and another, but between the virtual and its actualization, that is, it goes from the condition of the problem to cases of solution, from the differential elements and their ideal connections to the actual terms and diverse real relations that constitute the actuality of time. Whereas Kantian Ideas are unifying and conditioning, Deleuzian Ideas are differential and genetic.

Perhaps Deleuze’s most famous – and most misunderstood – concept is that of the virtual, which has nothing to do with an alternate or transcendent reality (as in the notion of “virtual reality”). Rather, it is a concept Deleuze utilizes in order to designate the modal status of problematic Ideas, and which he systematically contrasts with the concept of the possible: an Idea is not a locus of possibilities, but a field of virtualities. We tend to think of the possible as somehow “pre-existing” the real, and we think of the real as something more than the possible, that is, as the possible with existence added to it. But the drawback of this conception of the possible is that the identity of a thing is already given in the concept, and simply has existence added to it when it is “instantiated” or “realized.” This process of realization, Deleuze suggests, is subject to two rules: resemblance (the real resembles the possibility that it realizes) and limitation (in the process of realization, some possibilities are repulsed or thwarted, while others “pass” into the real). But this is where the sleight of hand becomes obvious: if the real is supposed to resemble the possible, is it not because we have retrospectively “projected” a fictitious image of the real back into the possible? In fact, it is not the real that resembles the possible, but the possible that resembles the real. For this reason, the concept of the possible can never grasp the production of the new, or the genesis of difference. Deleuze’s proposal, therefore, is to replace the possible–real couple with the virtual–actual couple. The reality of the virtual is the reality of the problematic, that is, the reality of the Idea, while the rules of actualization are not resemblance and limitation, but differenciation or divergence (creation). The concept of the virtual is synonymous with the Deleuzian notion of differen-t/c-iation: a problematic is completely differeniated (by its
differential relations and singularities), while every actualization of a problem is a movement of differenciation, that is, the production of a new difference. As such, the concept of the virtual fulfills the demands of a philosophy of difference: difference is related to difference through difference itself.

2. Aesthetics (Theory of Sensation). What are the implications of a principle of difference for aesthetics? Kant had dissociated aesthetics into two halves: the theory of sensibility as the form of possible experience (the “Transcendental Aesthetic”), and the theory of art as a reflection on real experience (the “Critique of Aesthetic Judgment”). In Deleuze’s work, these two halves of aesthetics are reunited: if the most general aim of art is to “produce a sensation,” then the genetic principles of sensation are at the same time the principles of composition for works of art; conversely, it is works of art that are best capable of revealing these conditions of sensibility. Deleuze’s writings on the various arts – including the cinema (Cinema I, Cinema II), literature (Essays Critical and Clinical), and painting (Francis Bacon: The Logic of Sensation) – must be read not as works of criticism, but rather as philosophical explorations of this transcendental domain of sensibility. Deleuze locates the conditions of sensibility in an intensive conception of space and a virtual conception of time, which are necessarily actualized in a plurality of spaces and a complex rhythm of times (for instance, in the nonextended spaces and nonlinear times of modern mathematics and physics).

Deleuze’s interpretation of Leibniz’s famous theory of perception provides a useful example of his method. Leibniz argued that a conscious perception must be related not to objects situated in space and time, but to the minute perceptions of which it is composed. I apprehend the noise of the sea or the murmur of a crowd, but not the sound of each wave or each voice of which it is composed. These unconscious perceptions are related to conscious perceptions, not as parts to a whole, but as what is ordinary to what is remarkable or singular: a conscious perception is produced when at least two of these elements enter into a differential relation that determines a singularity. Or consider the color green: yellow and blue can be perceived, but if they reach a point where they become indiscernible, they enter into a differential relation that determines the color green \( \frac{db}{dy} = G \); in turn, yellow or blue, each on its own account, may be determined by the differential relation of two colors we cannot detect \( \frac{dx}{dy} = Y \). These unconscious perceptions constitute the “ideal genetic elements” of perception, or what Maimon called the “differentials of consciousness.” It is such a virtual multiplicity of genetic elements, and the system of connections established between them, that constitutes an Idea: the relations are actualized in diverse spatiotemporal relationships, just as the elements are actualized in diverse perceptions and forms. Rather than perception presupposing an object capable of affecting us, it is the reciprocal determination of differentials \( \frac{dx}{dy} \)
that entails both the complete determination of the object as perception and the determinability of space-time as conditions. Space-time ceases to be a given in order to become the totality or nexus of differential relations in the subject, and the object ceases to be an empirical given in order to become the product of these relations in conscious perception.

3. Ethics (Theory of Affectivity). Deleuze has similarly developed a purely immanent conception of ethics, an “ethics without morality.” If morality implies an appeal to transcendent values as criteria of judgment (as in Kant’s moral law), ethics evaluates actions and intentions according to the immanent mode of existence they imply. One says or does this, thinks or feels that: What mode of existence does it imply? This is the link Deleuze establishes between Spinoza and Nietzsche, his two great precursors as philosophers of immanence: each of them argued, in his own manner, that there are things one cannot do or think except on the condition of being base or enslaved, unless one harbors a ressentiment against life (Nietzsche), unless one remains the slave of passive affections (Spinoza); and there are other things one cannot do or say except on the condition of being noble or free, unless one affirms life or attains active affections. The transcendent moral opposition (Good/Evil) is in this way replaced by an immanent ethical difference (good/bad). A bad or sickly life is an exhausted and degenerating mode of existence, one that judges life from the perspective of its sickness, that devalues life in the name of higher values. A good or healthy life, by contrast, is an overflowing or ascending mode of existence, capable of transforming itself depending on the forces it encounters, always opening up new possibilities of life, new becomings.

For Deleuze, modes of existence can be evaluated according to the purely immanent criteria of affectivity, that is, by their capacity to affect and to be affected – a capacity that is not a simple logical possibility but is necessarily actualized at every moment, thus fulfilling the demand for a genetic principle of the real. If the greatness of Nietzsche’s theory of nihilism was to have analyzed the process of becoming-reactive, the aim of Spinoza’s Ethics was to outline the process of becoming-active. These two processes, however, necessarily coexist in any mode of existence, and for Deleuze the aim of ethical theory is to determine, not universal grounds or normative foundations, but rather the conditions under which the attainment of active affections is possible – or more precisely, the conditions under which the production of new modes of existence is possible, since the “activity” of a mode is defined by its ability to affect or transform itself. In his later work, Foucault, under a Deleuzian inspiration, coined the term “subjectivation” (“subjectivation”) to define the means through which modes of existence are produced. In the later volumes of The History of Sexuality, Foucault analyzed the variable forms these affective processes took in the Greek
4. Politics (Socio-Political Theory). This immanent conception of ethics leads directly into Deleuze's political philosophy, which he developed most fully in the two volumes of *Capitalism and Schizophrenia*, coauthored with Guattari. *Anti-Oedipus*, under the guise of a critique of psychoanalysis, is in effect an immanent reworking of Kant's theory of desire in the *Critique of Practical Reason*. For Deleuze, the link between ethics and politics is redefined as the link between desire and power: *desire* (the difference between active and reactive forces in a given mode of existence) never exists in a spontaneous or natural state, but is always “assembled” (*agencé*) in variable but determinable manners in concrete social formations, and what assembles desire are relations of *power*. Deleuze remains a “Marxist” in that his social theory is necessarily tied to an analysis of capitalism, which he defines by the conjunction or differential relation between the virtual quantities of labor and capital. What he calls “schizophrenia” is an absolute limit that would cause these quantities to travel in a free and unbound state on a desocialized body: this is the “Idea” of society, a limit that is never reached as such, but constitutes the ideal “problematic” to which every social formation constitutes a concrete solution. For Deleuze, the central political question concerns the means by which the singularities and states of difference of the transcendental field are assembled in a given socius. *Capitalism and Schizophrenia* consequently outlines a typology of four abstract social formations—“primitive” or segmentary societies, states, nomadic “war machines,” and capitalism itself—that aims to provide the conceptual tools for analyzing the diverse dimensions of concrete social structures: How are its mechanisms of power organized? What are the “lines of flight” that escape its integration? What new modes of existence does it make possible? These types of social formations are not to be understood as stages in a progressive evolution or development; rather, they sketch out a topological field in which each type functions as a variable of coexistence that enters into complex relations with the other types.

5. Analytics (Theory of the Concept). Finally, Deleuze's dialectic (the constitution of problems) leads directly into his analytic (concepts as cases of solution), which he presented in his late book *What is Philosophy?* Deleuze defines philosophy as the creation of concepts, as knowledge through pure concepts. But for Deleuze, the highest concepts are not *a priori* universals applicable to objects of...
possible experience (categories), but singularities that correspond to the structures of real experience. What Is Philosophy? defines philosophical concepts in terms of three components:

(i) *Endo-consistency.* A concept is composed of a finite number of heterogeneous and singular components that it renders consistent in itself; concepts have no extension, but only what Deleuze terms “intensive ordinates.” For example, the Cartesian concept of the cogito presents three components – doubting, thinking, and being – each of which has certain phases (perceptual, scientific, obsessional doubt) and between which there are zones of neighborhood (myself who doubts, I cannot doubt that I think).

(ii) *Exo-consistency.* Concepts enter into determinable relations of consistency with other concepts, both internally (a concept’s components can be considered as concepts in their own right) and externally (concepts create their own bridges or links with other concepts). In Descartes, the idea of infinity provides an external bridge leading from the concept of the cogito to the concept of God, a new concept having three components that form the “proofs” for the existence of God.

(iii) *Self-referentiality.* Finally, concepts have no reference, but posit both themselves and their object in being created. When Kant “criticized” Descartes by introducing time as a component of the cogito, he effectively created a new concept with a new object.

More than most of his contemporaries, Deleuze insisted on the autonomy of philosophy as a discipline, arguing forcefully for the irreducibility of philosophical concepts to scientific functions or logical propositions. Deleuze contrasts the reference of functions with the consistency of concepts: what Deleuze calls a “function” is always defined in relation to an actualized virtual (which finds its reference in a state of things, an object, or lived experience), whereas philosophical concepts are defined by the consistency they give to the virtual as such. Consequently, philosophical concepts are not propositional, and do not form a discursive whole; they are rather fragmentary totalities with irregular contours that “freely enter into relationships of nondiscursive resonance.”

Taken together, these five rubrics, although certainly not exhaustive, nonetheless serve to present the broad outlines of a systematic philosophy of difference as it appears in Deleuze’s work. Critics have posed objections in each of these domains: How can a differential “logic of sensation” imply a theory of art without first addressing the conceptual question “What is art?” – a question Duchamp’s

works threw down like a gauntlet to the twentieth century? According to what criteria can one assess the validity of a philosophical concept if it creates its object simply by being posited, and has no “referent”? Does not a differential ethics amount to a kind of moral nihilism in which all differences are in turn affirmed as equally valid (as Jürgen Habermas has charged), or an aestheticism in which ethics is reduced to a private search for autonomy or self-invention (as Richard Rorty claimed)? Such criticisms, and others like them, can be summed up in the reproach that a philosophy of difference seems unable (or unwilling) to put forward normative criteria of judgment in any domain, and in this sense it fails in the “critical” task that Kant himself assigned to philosophy. In response, Deleuze insisted that one of the significant consequences of a philosophy of difference is its shift in emphasis away from the universal toward the singular and the new: only a principle of difference is capable of providing a rigorous response to the question of heterogenesis: “What are the conditions for the production of the new?” (artistic creation, conceptual innovation, social change).40

MAJOR WORKS

---

40. This essay is dedicated to the memory of François Zourabichvili, who was both a great friend and a great philosopher, and whose writings on Deleuze set such a high standard of rigor and insight that those of us who follow in his wake can only vainly hope to emulate it.

Jacques Derrida was born in El-Biar, near Algiers. While Derrida’s school and university education ultimately followed a path similar to that of other prominent French philosophers of his generation, it was marked by many interruptions and delays. Local policies restricting Jews during the Vichy period led to his expulsion from school in 1942, and he failed his first attempt at the baccalauréat in 1947. After moving to Paris in 1949 to attend the highly regarded Lycée Louis-le-Grand, it was only on his third attempt, in 1952, that Derrida passed the entrance exam to the École Normale Supérieure (ENS). At the ENS

during this time, notable faculty were Louis Althusser, Michel Foucault, and Jean Hyppolite, and Derrida’s fellow students there and at Louis-le-Grand included Pierre Bourdieu, Michel Deguy, Louis Marin, Pierre Nora, and Michel Serres. In 1953 Derrida conducted research at the Husserl Archive in Louvain and in 1954 he submitted his diplôme d’études supérieures (more or less equivalent to a Master’s thesis), *The Problem of Genesis in Husserl’s Philosophy,* written under the direction of Maurice de Gandillac. Derrida passed his agrégation (qualifying him to teach philosophy in secondary schools) on his second attempt in 1956, spent time researching Husserl at Harvard University in 1957, taught French and English in Algeria in 1957–59 to fulfill his military service, and held a post at a lycée in Le Mans from 1959–60. From 1960 to 1964 Derrida taught at the Sorbonne, and in 1964 he returned to the ENS where he taught until 1983. It was only in 1980 that Derrida was awarded his doctorat d’état, a prerequisite for holding a professorial Chair in a French University (he received his doctorat du troisième cycle, roughly equivalent to a PhD, in 1967 for *Of Grammatology*). This was granted for ten previously published works, and the title “The Inscription of Philosophy: Research on the Interpretation of Writing,” named what was in fact the third topic for which Derrida had registered; he had abandoned the first topic, registered in 1957 under the title “The Ideality of the Literary Object,” and the second, registered in 1967 on Hegel’s semiology. Derrida’s travels through established institutions of education in France were completed in 1983 with his move to the École des Hautes Études en Sciences Sociales, where he taught until his death.

Presented thus, the narrative of Derrida’s academic itinerary tells a slightly erratic and less than stellar journey through some of France’s more prestigious institutions. But it is less than half the story, and two further histories of engagement greatly enrich the picture. First, throughout his career Derrida was actively involved in less traditional “institutions” in France. From 1965 to 1970, he was one of several prominent intellectuals to publish frequently in the avant-garde journal *Tel Quel,* linking him to figures such as Philippe Sollers, Julia Kristeva, and Roland Barthes. As a result, and taking into account the several essays appearing in the similarly hard to classify *Critique,* the venues of Derrida’s publications from the 1960s divided evenly between established journals of philosophy (such as *Revue de métaphysique et de morale*) and other journals more readily associated with literature and the human sciences. In 1975 Derrida helped form Le Groupe de Recherche sur l’Enseignement Philosophique (GREPH; other

---

Jacques Derrida members included Sarah Kofman, Michèle Le Doeuff, and Jean-Luc Nancy), a group that combated proposed cutbacks to the philosophy curriculum in French schools and undertook research examining broader issues in philosophical education. At the invitation of the French government, in 1982 Derrida cofounded with François Châtelet, Jean-Pierre Faye, and Dominique Lecourt the Collège Internationale de Philosophie, a non-degree-awarding institution that promotes cross-disciplinary philosophical research not possible within the academy. Finally, among other politically oriented commitments, in the 1980s Derrida was active in groups campaigning against apartheid, and throughout the 1990s he supported the rights of refugees, immigrants, and undocumented workers through involvement with organizations such as SOS-Racisme and the International Parliament of Writers.

The second necessary supplement to Derrida’s institutional history concerns the United States. Certainly, the United States was not the only country outside France relevant to Derrida’s biography, for he taught, lectured, and received honors across the globe. Nevertheless, it occupies a privileged place in that Derrida – unique among French philosophers in this respect – had a continuous association with American universities that spanned virtually the entirety of his career. Bracketing the early visit to Harvard mentioned above, the story begins at the conference held at Johns Hopkins University in 1966, “The Languages of Criticism and the Sciences of Man.” Alongside prominent participants including Hyppolite, Barthes, and Jacques Lacan, Derrida made a notable impression in his challenge to the then prevailing structuralist discourse. It was also here that he first met Paul de Man, beginning a long and fruitful friendship that would be responsible for the rise of deconstruction as an academic movement. The centers of this movement mirrored the visiting positions that Derrida subsequently held in the United States, most notably at Johns Hopkins (1966–75), Yale University (1975–86; this was the most famous site of deconstruction, where Derrida’s colleagues included de Man, J. Hillis Miller, and Geoffrey Hartman*), and the University of California at Irvine (1986–2004). Other institutions at which Derrida was a visiting professor included Cornell University, New York University, and the New School for Social Research. With the exception of the New School, these appointments were in departments other than philosophy – the humanities, French, English, and comparative literature.

These institutional facts go beyond biographical interest, and are significant for reflection on the meaning and legacy of Derrida’s work. For after his initial training, Derrida’s publishing and professional affiliations, both in France and the United States, were predominately located at philosophy’s margins, sometimes

*4. For further discussion of the “Yale School” and deconstruction, see the essay in this volume by Jeffrey T. Nealon.
occurring well outside its officially sanctioned boundaries. This suggests that one should not try too hard to claim that Derrida belongs in philosophy, at least as it is traditionally conceived. It is not only the case that he has inspired research in many other academic disciplines – including literary theory, gender studies, cultural studies, law, architecture, theology, and political theory – and in culture more broadly understood. Derrida actively pursued sites other than traditional philosophy in which to develop his work. Of course, this was often done with a view to challenging and transforming philosophy as it is standardly imagined and practiced, and I will discuss this further below in relation to Derrida’s reading of both philosophical and literary texts. But it remains that Derrida’s institutional profile cuts across more usual schemes of classification, a fact that is related to the claims he made in his work itself.

II. WRITINGS FROM 1962 TO 1972

Turning now to this work, Derrida’s first publication – a translation and long introduction to Edmund Husserl’s *Origin of Geometry* – appeared in 1962, and was followed in 1967 by the publication of three books, *Speech and Phenomena*, *Of Grammatology*, and *Writing and Difference*. These works made a strong impact in intellectual circles in France, and Derrida’s reputation as an important and original thinker was further enhanced when three additional books – *Margins of Philosophy*, *Dissemination*, and *Positions* – were published in 1972. The central targets of these writings of the 1960s and early 1970s were two of the dominant intellectual currents in France at that time: phenomenology and structuralism. Derrida challenged fundamental assumptions made in these movements through detailed readings of a number of thinkers, most notably Husserl, Martin Heidegger, and Emmanuel Levinas in phenomenology, and Ferdinand de Saussure and Claude Lévi-Strauss in structuralism. Discourses antecedent to these twentieth-century movements were also interrogated, with extended attention given to Plato, Aristotle, Jean-Jacques Rousseau, and G. W. F. Hegel. To characterize his claims at a very general level, Derrida argues that all of these thinkers privilege presence over absence, which he identifies as the central characteristic of metaphysical thinking, at the same time (in the case of the phenomenologists and structuralists) as they seek to move beyond traditional metaphysics. The valuation of presence goes together with a priority given to identity conceived as the unified self-presence of an entity, and any differences interrupting this self-presence are viewed as secondary. Crucially, Derrida does not then propose that one should avoid valuing presence and identity, and thus truly escape metaphysics. Many of the thinkers analyzed in fact try to do this, and Derrida shows how this precisely amounts to a reinstallation of the original
values. But nor does Derrida claim that one should go in the other direction to pursue a thinking of full presence and so completely embrace metaphysical thinking. Rather, he argues that neither option is viable. He demonstrates that privileging absolute presence and a completely unified self-identity is impossible, as is their full repudiation, and thinking remains caught in a negotiation of these two poles.

Even as it was one of Derrida’s targets, Heidegger’s work had a strong influence, in particular in the identification of presence as the fundamental value in traditional metaphysics and its exposure through the “destruction” (Destruktion) of the history of philosophy. Derrida first proposed the term “deconstruction” as a translation of both Destruktion and a related word in Heidegger’s and Husserl’s lexicon, “Abbau” (dismantling). Other important influences on Derrida’s thinking at this time were Friedrich Nietzsche and Sigmund Freud. Derrida appealed to the Freudian unconscious and to Nietzschean play at certain key moments in his readings of others, although one should note that these thinkers were themselves subject to scrutiny, with him arguing that even as some of their ideas show promise, they too are complicit with metaphysical thinking. Finally, Derrida uncovered further possibilities for challenging the limits of traditional thinking (again never suggesting that a complete break was possible) in several early essays devoted to reading a number of modernist and avant-garde literary authors, including Antonin Artaud, Georges Bataille, Edmond Jabès, and Stéphane Mallarmé.

“Deconstruction” began as a term of translation, but it was not long before Derrida used it in relation to his own work. He insists that deconstruction should not be thought of as a method, as this suggests a procedure or set of rules that one applies to a text from the outside. Rather, he describes it as a “strategy” or “intervention” that could be said to be already at work within a text, where “text” is to be understood not simply as literal writing on a page, but extended to any structure involving inscription and repetition understood in a very wide sense, including institutions, consciousness, and experience. There has been much debate concerning the appropriateness of using deconstruction in reference to Derrida’s work. He himself expressed reservations toward the term on a number of occasions, and took pains to distance himself from many of its more popular associations. Nevertheless, he consistently referred to it across his career in order to describe what he was doing. Given his continual use of the term, even

*6. Nietzsche’s and Freud’s influence on Derrida are discussed in this volume in the essays by Alan D. Schrift, and Rosi Braidotti and Schrift, respectively.
with the occasional hesitation, deconstruction thus remains a reasonable term to invoke when describing Derrida’s writings.⁷

While deconstruction cannot be reduced to a set of rules or a simple definition, there are several recognizable patterns that recur in the interventions Derrida performed in his writings. In his early works, the most prominent involves the overturning and displacement of binary oppositions. Derrida gave a famous description of this strategy in an interview in 1971, republished in Positions.⁸ Here he speaks of the negotiation I mentioned above, whereby deconstruction avoids “both simply neutralizing the binary oppositions of metaphysics and simply residing within the closed field of these oppositions, thereby confirming [the closed field].” Instead, Derrida argues that “it is necessary [il faut] to proceed using a double gesture.”⁹ The first half of this gesture is termed a “phase of overturning.” Binaries, Derrida contends, are never innocent or neutral – they form “a violent hierarchy” as one of the terms is always valued higher than the other. For example, one opposition to which Derrida gave much attention in the 1960s is that between speech and writing. He argues that the metaphysical tradition is “logocentric” – a term derived from the Greek work “logos” meaning, among other things, “word,” “speech,” “reason,” and “principle” – in that philosophers from Plato to Heidegger invariably have understood writing to be a mere copy of speech, a secondary representation that has no originality of its own. These two terms thus form a hierarchy, with speech valued more than writing. The phase of overturning challenges the opposition by inverting the hierarchy, in this case giving writing a greater value than speech. However, such a move on its own is not sufficient, for if this were all deconstruction involved then there

---

⁷ One of Derrida’s most common strategies for dealing with deconstruction’s resistance to a definition was to multiply its associations, leading him to equate it with terms as various as “hospitality,” “that which happens,” “justice,” “the im-possible,” and “America,” to name just a few. Such statements were almost always proposed hypothetically or in the conditional, and almost always withdrawn, suggesting that they serve more as provocations to further thinking than definitive answers to the question “What is deconstruction?”

⁸ Jacques Derrida, Positions, Alan Bass (trans.) (Chicago, IL: University of Chicago Press, 1981), 41–2, translation modified; originally published as Positions (Paris: Éditions de Minuit, 1972), 56–8. A more detailed account of this strategy also appears in his Dissemination, Barbara Johnson (trans.) (Chicago, IL: University of Chicago Press, 1982), 3–7; originally published as La Dissémination (Paris: Éditions du Seuil, 1972), 9–13. Dating Derrida’s texts can be confusing, since while most were published first in French, on occasion they appear originally in English, or, more rarely, in another language. Further, many texts were published in journals or collections prior to their reprinting in the book that is most commonly referred to in the secondary literature (as in the present case – commentators refer exclusively to Positions rather than the journal in which this interview was first published). To give the most accurate sense of Derrida’s itinerary, the dates I mark throughout this chapter refer to the first publication of the text in question, regardless of its language or location.

⁹ Derrida, Positions, Bass (trans.), 41; Positions, 56.
would remain a metaphysical opposition, the only difference being that the term previously devalued now has the upper hand. Writing would be higher than speech, but the terms would still be opposed. There is thus a second phase to the strategy, involving “the irruptive emergence of a new ‘concept,’ a concept that can no longer be, and never could be, included in the previous regime.”\textsuperscript{10} The second phase acknowledges that through the initial inversion there arises a new “concept,” something that exceeds what was previously ordained. The particular name of the third term depends on the context, and in the analyses of speech and writing some of the more common names appealed to were “archi-writing,” “supplement,” and “\textit{pharmakon}.” These names were all formerly associated with the devalued term – writing – but in the inversion, they come to stand for the generalized traits that are shown to underlie both elements of the original opposition. Derrida described this part of his strategy as “\textit{paleonomy} … the occasional maintenance of an old name in order to launch a new concept,”\textsuperscript{11} and it is a necessary step in the transformation taking place. Coming from within, the third term exceeds the original structure without thereby passing completely beyond it.

The outcome of this deconstructive intervention is thus a displacement of the opposition, where the two original terms are shown to share a relation to a new “concept” that exceeds them both. Concerning this strategy, there are several points to note. First, it is a mistake to see these two phases as ordered chronologically or indeed cleanly separated. The hierarchy is not first inverted, and then followed by the generation of a third term that displaces the oppositional structure. Rather, the two phases operate simultaneously, for it is the third term that motivates the overturning in the first place. Otherwise put, Derrida does not just claim that writing is superior to speech; he demonstrates it by showing how a generalized understanding of writing is presupposed by the supposedly more original term. Second, when describing the third term as a “concept,” Derrida places it in scare quotes in order to mark its undecidable status. Derrida refers to these terms as “undecidable” because they cannot be reduced to either term in the original opposition; they mark a remainder that falls outside existing frameworks of understanding. They cannot, therefore, be properly called “concepts” in any clear sense. Third, Derrida stresses that this strategy is not to be understood dialectically, either as understood by Hegel or in the form practiced by Derrida’s Marxist contemporaries. It neither relies on a logic of contradiction nor seeks to fully overcome the binary opposition, aiming instead for a nonoppositional displacement that maintains an unresolved tension. In the interview just cited, Derrida distinguishes the kind of difference here theorized from the

\begin{itemize}
\item \textsuperscript{10} Derrida, \textit{Positions}, Bass (trans.), 42; \textit{Positions}, 57.
\item \textsuperscript{11} Derrida, \textit{Positions}, Bass (trans.), 71; \textit{Positions}, 95–6.
\end{itemize}
Hegelian conception by referring to his neologism “différence.” This term, built from the French verb “différer” which means both to differ and to defer, marks a spatial difference and a temporal deferral that cannot be recuperated into a stable identity, and is proposed as a third term underlying the opposition identity/difference. Derrida developed its logic most fully in the essay “Différence” (1968; reprinted in Margins of Philosophy), but it appears throughout his early works and reappears across his oeuvre as a whole as a provisional name for the relation arising within and between concepts in deconstruction.

Without prior exposure to Derrida’s writings, the above description of deconstruction may well be opaque, and even if the strategy is clear one might still wonder what is at stake in such an intervention. Further, traditional philosophical inquiry does not consider the opposition between speech and writing to be central or even interesting, suggesting that if this was one of the main themes of Derrida’s writings in the 1960s, these writings would be more or less irrelevant to broader philosophical questions. Needless to say, this is not Derrida’s view, and to demonstrate why he thinks the opposition between speech and writing is important, as well as to give a richer account of his early strategy of intervention, I will now present one example in some detail.

In “Plato’s Pharmacy” (1968, reprinted in Dissemination), Derrida analyzes the relationship between speech and writing in Plato’s work, producing a reading that has strong similarities to the deconstructions of these terms previously undertaken with respect to Rousseau, Saussure, and Lévi-Strauss (in Of Grammatology). Derrida’s essay centers on the closing discussion of Phaedrus (274b–279c) where, after a long exchange distinguishing acceptable from nonacceptable rhetoric in the art of speeches, Socrates and Phaedrus turn to the question of writing. Socrates begins by recounting an Egyptian myth in which the god Th euth, the inventor of writing, seeks approval for his invention from the God-king Ammon. Th euth presents writing as follows: “This discipline, my King, will make the Egyptians wiser and will improve their memories: my invention is a recipe (pharmakon) for both memory and wisdom” (274e; 75/85). Th euth thus proposes that writing is a desirable aid to the mind. In his response, however, Ammon denies this, stating:

The fact is that this invention will produce forgetfulness in the souls of those who have learned it because they will not need to exercise

---

---
their memories, being able to rely on what is written, using the stimulus of external marks that are alien to themselves rather than, from within, their own unaided powers to call things to mind. So it’s not a remedy (pharmakon) for memory, but for reminding, that you have discovered. And as for wisdom, you’re equipping your pupils with only a semblance of it, not with truth … (275a; 102/116)

Ammon thus judges that writing is not a remedy for the mind, but a poison, for it encourages a laziness in thinking that can produce only a semblance of the truth. True thought from inside the mind produces knowledge, while writing only ever reminds one of what is already known.

After recounting this myth, Socrates affirms Ammon’s position, and adds to it a second argument that condemns writing’s inability to adapt to particular contexts, for it repeats the same thing no matter who is reading or what questions it is asked. Writing is said to be:

truly analogous to painting. The painter’s products stand before us as though they were alive, but if you question them, they maintain a most majestic silence. It is the same with written words … And when it is ill-treated and unfairly abused it always needs its parents to come to its aid, being unable to defend itself or attend to its own needs. (275d–e; 136, 143/156, 165)

Socrates then consolidates writing’s inferiority through a comparison with a different kind of discourse, “the sort that goes together with knowledge and is written in the soul of the learner, that can defend itself, and knows to whom it should speak and to whom it should say nothing.” Phaedrus confirms this as “the discourse of a man who really knows, which is living and animate,” of which written discourse is “only a kind of ghost” (276a; 148/171).

Socrates thus condemns writing for being not only a copy of living speech, but a poor copy at that, corrupting the mind’s powers and lacking its own power of response and adaptation. A hierarchy is thereby established opposing speech to writing. If Derrida’s intervention is to follow the pattern outlined above, an inversion of this hierarchy together with the emergence of a third term that exceeds this system must take place. The inversion occurs in underlining Socrates’s recourse to the figure of writing in describing the true, living discourse, as it is said to be “written in the soul of the learner.” This might seem an arbitrary choice of words, a metaphor irrelevant to the intended meaning, but Derrida maintains that it is in fact a necessary consequence of Plato’s metaphysics. Through an extensive reading that goes far beyond Phaedrus, including analyses of passages from Laws, Republic, Philebus, and Timaeus, Derrida argues
that Plato always appeals to scriptural metaphors when he accounts for irreducible difference, and that difference is inescapable given the relationship set up between the original and its copies. In short, Plato requires that the intelligible and the true be capable of being repeated, a capability that precisely characterizes writing. Plato must therefore appeal to something like writing when he describes the good repetition necessarily performed by the man with knowledge. As a consequence, Derrida argues that “the conclusion of the Phaedrus is less a condemnation of writing in the name of present speech than a preference for one sort of writing over another” (149/172). The valorized term should thus be writing, not speech, for writing is fundamental. Writing encompasses both speech and writing in the original opposition.

Put in these terms, one sees the need for what was described as the second phase of the intervention, namely the emergence of a third term. For it makes no sense to say that writing encompasses both speech and writing, if “writing” is here taken to designate the same thing. The term that Derrida here highlights as more appropriate is the Greek word “pharmakon.” “Pharmakon” means both “remedy” and “poison,” and so any description that appeals to it is fundamentally ambivalent, requiring an interpretive judgment to decide whether it is of benefit or harm. Perhaps the most accurate translation of “pharmakon” in contemporary English is “drug,” a term marking both the most demonized substances in society that carry death and destruction as well as the most valorized substances that promise long life and happiness. In the passage cited above, Theuth presents writing as a “recipe (pharmakon) for both memory and wisdom.” His surrounding words suggest that he thinks it is a good recipe, one that “will make the Egyptians wiser and will improve their memories,” but note that on its own the word “recipe” need not be valued in this way. It is through exploiting this ambivalence that the King delivers his judgment: “it’s not a remedy (pharmakon) for memory, but for reminding, that you have discovered.” As a remedy for reminding (and here the translator could have preserved “recipe,” but “remedy” brings out more clearly the positive valuation that Ammon is contesting), writing is in fact a poison, so still a pharmakon, but not understood in the sense Theuth proposed. In first identifying writing as a pharmakon, Plato makes possible the contest over value that then takes place between the King and Theuth.

This excerpt from Phaedrus appears to fix the pharmakon’s value as negative, but Derrida’s reading demonstrates that this word and other terms related to it (such as “pharmakeus [magician]”) are used equally across Plato’s dialogues to describe valorized terms, including Socrates himself and the method of dialectic that is said to lead to truth.13 Thus both the so-called living speech that

13. Important in Derrida’s reading is the word “pharmakos [scapegoat].” While Derrida notes that Plato does not himself use “pharmakos” in any of his writings, he justifies his appeal to it by
would be closer to the truth and the writing associated with error and death are presented as *pharmaka*, and so *pharmakon* emerges from this deconstruction as the third term: fundamentally ambivalent, both poison and cure, the *pharmakon* exceeds the Platonic system. Its ambivalence can be arrested at any given moment through an act of interpretation, a determination of it as here good and there bad, but the possibility that it would be its opposite remains in reserve, always threatening to turn any such determination on its head. The *pharmakon* cannot be mastered once and for all.

This is a very brief account of the extremely dense reading Derrida offers in “Plato’s Pharmacy,” and I have picked out only one theme among the several Derrida explores (other prominent motifs include the relationship between the inside and the outside, inclusion and exclusion, life and death, the functioning of memory, and the familial tropes at work in the text). But it provides some idea of the kind of reading that Derrida performed early in his career and for which he became renowned. One point to note is what one might call the “immanence” of this reading. Plato’s claims are not contrasted with Derrida’s own. Rather, all of the claims advanced, both those consolidating the opposition between speech and writing and those working toward its displacement, come from the Platonic text. This explains Derrida’s hesitation in characterizing deconstruction as a technique that one applies to a text. It is just as appropriate to say that Plato’s text stages its own deconstruction as it is to claim that Derrida deconstructs it. As the deconstruction does not depend on the appeal to the *pharmakos*, one might wish to resist such a move “beyond” the Platonic text. But Derrida himself uses this move as evidence for the claim that there does not exist “in all rigor, a Platonic text, closed upon itself, complete with its inside and its outside” (130/149). This reminds the reader that the “text” being deconstructed is not simply the literal words on the pages united under the signature “Plato,” but a whole field of ideas and relations with which these pages are associated. This field is constituted both by the Greek language in which Plato was writing, as well as a whole tradition of interpretation, translation, and inheritance of Plato. This is always the case in Derrida’s writings; his target is not just the words of a text, as if one could isolate these in their purity, but also the resonance of these words with the language in which they are written, along with the accepted institutional interpretations of the thinker in question.

 claiming that Plato’s text cannot avoid communicating with this word through its close relation to the other terms from the same family. As the deconstruction does not depend on the appeal to the *pharmakos*, one might wish to resist such a move “beyond” the Platonic text. But Derrida himself uses this move as evidence for the claim that there does not exist “in all rigor, a Platonic text, closed upon itself, complete with its inside and its outside” (130/149). This reminds the reader that the “text” being deconstructed is not simply the literal words on the pages united under the signature “Plato,” but a whole field of ideas and relations with which these pages are associated. This field is constituted both by the Greek language in which Plato was writing, as well as a whole tradition of interpretation, translation, and inheritance of Plato. This is always the case in Derrida’s writings; his target is not just the words of a text, as if one could isolate these in their purity, but also the resonance of these words with the language in which they are written, along with the accepted institutional interpretations of the thinker in question.

14. In “Plato’s Pharmacy,” Derrida maintains a singular focus on texts signed by Plato, but he did not always restrict himself in this way. In other essays, he juxtaposed several authors in order to draw out tensions that inhabit a tradition more broadly understood. Thus, for example, surrounding the concentrated reading of Saussure in Part I of *Of Grammatology* is an engagement with a long list of figures including Gottfried Leibniz, Hegel, Nietzsche, Freud, Husserl, Heidegger, Roman Jakobson, and Louis Hjelmslev. Even in texts such as this, where a whole tradition is shown to be in deconstruction, it remains that all of the claims advanced come from the works being read, rather than from an external position that one might readily identify as Derrida’s own view.
deconstruction begins in a seemingly marginal location – the apparently frivolous opposition speech/writing discussed briefly at the end of one dialogue – but in fact appeals to statements from across Plato’s corpus. As a consequence the target here is not just one binary in one dialogue, but fundamental elements of the Platonic system as a whole, in particular Plato’s belief in the purity of the Forms and his account of truth.

As I have already noted, in the same period as “Plato’s Pharmacy” Derrida provided readings of the opposition between speech and writing in several other authors. This was not the only binary he investigated, for, as is suggested in the reading of Plato, it is related to a whole series of oppositions that govern traditional schemes of thought including presence/absence, identity/difference, signified/signifier, same/other, life/death, father/son, inside/outside, seriousness/play, nature/culture, and peace/violence. Each time Derrida intervened into a text that promoted such hierarchies he followed a strategy resembling the one just outlined, although it is important to note that these readings were not identical. The third term in each case depends on the particular context, and other emergent words include archi-writing, trace, grammē, différance, supplement, spacing, and iterability. None of these have the status of a master-term, governing the rest, for Derrida’s readings aim to show precisely why there can be no pure position of governance, no position immune to all corruption. All identities are constituted through a repetition open to difference, and this applies to the new “concepts” that emerge out of these analyses. A further difference among Derrida’s essays of this time can be seen when comparing his readings of philosophical and social scientific texts against those of works of literature. In general, Derrida’s readings of the former tended to follow the strategy just detailed, challenging their attempt to maintain systematic coherence through the demonstration of singular eruptions from within. By contrast, Derrida chose to read literary authors who seem to display no pretension to systematicity. His interventions in these texts consist more in simply highlighting isolated moments that share much in common with the singularities disrupting philosophical texts. Thus, while Derrida called into question the traditional distinction between philosophy and literature, he did so in a very particular manner. Works of philosophy are shown to exhibit certain features of literature, but one does not find the symmetrically corresponding phenomenon of literature being corrupted by philosophy. Philosophy is called into question in a way that literature is not.15

---

15. It is interesting to note in the context of this distinction that in Spurs (1976), and indeed throughout his writings, Derrida reads Nietzsche more as a literary author, insofar as he privileges the resistance to systematicity contained in Nietzsche’s writings. This is in part a response to Heidegger’s attempt to characterize Nietzsche as a metaphysical thinker.
While Derrida never again matched the extraordinarily prolific output of the 1960s and early 1970s, he continued to publish at a steady rate on an ever-increasing number of thinkers and topics. Commentators have proposed various schemes for characterizing different stages in Derrida’s oeuvre, but none have proved satisfactory and all have been resisted by Derrida himself. Nonetheless, it is the case that Derrida’s strategies of intervention and the topics most prominently addressed changed as time passed. After 1972, structuralism and phenomenology ceased to be the main sites of engagement, and the relation between speech and writing disappeared from explicit view. Further, several thinkers who received extended treatment in the early work – most notably Husserl, Saussure, Rousseau, Mallarmé, and, after the exhaustive reading in Glas (1974), Hegel – were rarely mentioned in subsequent texts.\textsuperscript{16} Instead, in the 1970s Derrida engaged more thoroughly with several other intellectual movements and figures that would remain important to him for the rest of his career. Psychoanalysis came under increasing interrogation, with Derrida giving extensive readings of Freud and Lacan in The Post Card (1980) (later texts devoted to Freud and psychoanalysis include Archive Fever [1995] and Resistances to Psychoanalysis [1996]), and Freud was often invoked in the course of readings of other thinkers. Derrida also developed a sophisticated account of mourning out of the psychoanalytic work of Nicolas Abraham and Maria Torok. This began in Glas, was thematized at length in “Fors” (the preface to Abraham and Torok’s The Wolf Man’s Magic Word [1976]\textsuperscript{17}), and was revisited in later works, especially in texts devoted to honoring lost friends such as Memoires for Paul de Man (1986) and the many essays gathered together in The Work of Mourning (2001). Derrida examined philosophy’s treatment of femininity and sexual difference in several works, beginning with a reading of Nietzsche in Spurs (first delivered at the 1972 Cerisy conference on Nietzsche, then published in a quadri-lingual edition in 1976), followed by engagements with Levinas (“At this very Moment in this Work Here I am,” [1980; reprinted in Psyche, Vol. I]), Heidegger (“Geschlecht: Sexual Difference, Ontological Difference” [1983; reprinted in Psyche, Vol. 2]), as well as a famous interview entitled “Choreographies” (1982;\textsuperscript{18})

\textsuperscript{16} Among these, Husserl is a partial exception, since late in his career Derrida did engage with his work in On Touching (2000; a long book devoted to Jean-Luc Nancy that also contains readings of several phenomenologists) and in the second essay of Rogues (2003).

reprinted in Points\textsuperscript{18}) that discussed the rise of feminism in the academy. J. L. Austin’s speech act theory first received Derrida’s attention in the 1972 essay “Signature, Event, Context” (published in Margins of Philosophy, then again, together with the long exchange with John Searle from 1977, in Limited Inc [1988]), and the distinction between performative and constative utterances was a regular point of reference in subsequent writings, even as its ultimate coherence was always contested. With the formation of GREPH in 1975, Derrida started to focus on issues in philosophical education, and over the following decade and a half published over a dozen essays examining the writings of past philosophers on related topics as well as the functioning of existing educational institutions (these are collected in Du droit à la philosophie [1990]). Derrida also continued to offer readings of works of modernist and avant-garde literature, beginning in the 1970s an extended engagement with the work of Maurice Blanchot (most of these essays are gathered in Parages [1986]). Other authors to whom he devoted substantial attention in the following years included Jean Genet, Francis Ponge, James Joyce, Paul Celan, and Hélène Cixous. These writings generally followed Derrida’s earlier practice of focusing on concentrated moments that displayed inassimilable singularities at work within the texts. Aesthetics became a new concern, with essays in the 1970s on Immanuel Kant, Heidegger, and the artists Valerio Adami and Gérard Titus-Carmel gathered in The Truth in Painting (1978). Derrida also regularly wrote on or collaborated with numerous artists and architects in the subsequent years, including Artaud, Jean-Michel Atlan, Simon Hantaï, Colette Deblé, and Peter Eisenman, and in 1990 published Memoirs of the Blind, the book accompanying the exhibition for which he was curator at the Louvre.

Finally, it is worth recognizing that unlike some other thinkers prominent in Derrida’s early work, Heidegger never ceased to be of central importance and remained a constant point of reference. Every few years Derrida published an essay engaging Heidegger’s thought, and particular themes, in addition to art and sexual difference already mentioned, included the latter’s understanding of time (in “Ousia and Grammê” [1968; reprinted in Margins of Philosophy]), the distinction between the human and the animal (in “Geschlecht II: Heidegger’s Hand” [1987; in Psyche, Vol. 2], Aporias [1996], and The Animal That Therefore I Am [2006; the text of a long lecture from 1997, one chapter of which concerns Heidegger]), Nazism (in Of Spirit [1987]), and friendship (in “Heidegger’s Ear: Philopolemology [Geschlecht IV]” [1993]). Other works that contain important discussions of Heidegger even as he is not their central focus include “The Ends

of Man” (1968; first published in *Margins of Philosophy*), *The Post Card* (1980), *Given Time* (1991), *Specters of Marx* (1993), “Faith and Knowledge” (1996), and *Rogues* (2003). These texts are fascinating to read, not least because of Derrida’s attempts to distinguish himself from Heidegger in the face of his unique proximity to Heidegger’s thinking. The need to always return to Heidegger and explore new themes in his work suggests that he remained the most important and challenging of Derrida’s influences, one with whom Derrida perhaps never fully came to terms.

In the 1980s, Derrida focused his work more explicitly on ethical and political themes, an interest that expanded in the 1990s to also encompass religious topics. It is inaccurate to conclude from this that Derrida thereby became political, ethical, or religious, both because (as he himself always insisted) these themes were already at work in his earlier writings and because such a view wrongly suggests that he began to advocate a particular politics, ethics, or religion. Rather, what was new was that Derrida provided more direct analyses of a large number of normative concepts coming from these fields. Thus in “The Laws of Reflection: Nelson Mandela, in Admiration” (1986; reprinted in *Psyche, Vol. 2*), Derrida began examining the relationship between justice, the law, and responsibility, a theme he then pursued at length in “Force of Law: The ‘Mystical Foundation of Authority’” (1990), which also encompassed a long analysis of Walter Benjamin’s “Critique of Violence.”19 These themes were taken up in *Specters of Marx* (1993), where Derrida provided an extended reading of the figure of the ghost in Karl Marx’s writings (alongside a reading of *Hamlet*) in order to deconstruct some of the metaphysical assumptions at work in Marx’s thought (and indirectly in French Marxism). This text also introduced the notion of the messianic, which Derrida interrogated alongside faith, religious violence, sacrifice, and salvation in “Faith and Knowledge” (1996). Nationalism, National Socialism, and European identity were examined in *Of Spirit* (1987), “Interpretations at War: Kant, the German, the Jew” (1990; on the German-Jewish identities of Hermann Cohen and Franz Rosenzweig, reprinted in *Psyche, Vol. 2*), and *The Other Heading* (1991; on European identity in Paul Valéry). *Politics of Friendship* (1994) expanded Derrida’s political investigations further by examining the connections between friendship, fraternity, and democratic citizenship in the history of Western thought (with a special emphasis on Aristotle, Montaigne, Nietzsche, and Carl Schmitt). Democracy was also the central theme, together with sovereignty, of *Rogues* (2003). In *Given Time* (1991), Derrida analyzed the concept of the gift in the work of Marcel Mauss and

Charles Baudelaire, and this continued in readings of Jan Patočka, Kierkegaard, and Levinas in *The Gift of Death* (1992), which also focused on the notions of sacrifice, responsibility, and decision. And hospitality was subject to deconstruction in *Adieu to Emmanuel Levinas* (1997), “On Cosmopolitanism” (1997; also discussing, as the name suggests, cosmopolitanism), and seminar transcripts from 1996 and 1997 published as *Of Hospitality* (1997; reading the figure of the foreigner in Plato and Sophocles’s *Oedipus at Colonus*) and “Hostipality” (2002; reading hospitality and forgiveness in Levinas and Louis Massignon).

This list – and it is not exhaustive – testifies to the wide range of Derrida’s analyses of normative concepts. Among the theorists engaged, Kant and Levinas deserve special mention. The ethical frameworks of these two thinkers loom large in Derrida’s writings of this period, constituting both his greatest resource and thus the views whose insufficiencies he demonstrates most forcefully. Derrida argues that while Kant’s understanding of duty and the law is a necessary element in any normative structure, it fails to reckon with the dimension of incalculability required by any satisfactory account of responsibility. In his emphasis on alterity, Levinas goes much further in addressing responsibility, yet his position too is shown to be inadequate as it presupposes a humanism that undermines the coherence of the otherness involved and fails in its goal of articulating an ethics beyond violence. As always, Derrida does not propose to remedy these faults by offering an alternative approach that would avoid such errors. Rather, he underlines the insufficiencies as characteristic of the inevitable complexities faced by all theorizations of normativity.

As with his early work, while Derrida’s later writings involve multiple approaches and styles of intervention, one strategy does emerge across several contexts and themes. All of the normative concepts mentioned above involve inherited injunctions: prescriptive commands that are passed down across the Western tradition. One of Derrida’s most persistent claims is that for any given notion, the inherited injunctions that constitute it are multiple, and these multiple prescriptions conflict with one another at the very same time as they rely on one another. Derrida argues that such a division is both necessary for the coherence of the norm in question and makes possible its perversion and transgression. The concepts thus cannot successfully function as norms in a manner that would render them immune to all danger or corruption. For example, hospitality is tied to a series of prescriptions concerning the welcome of visitors in all sorts of situations, and these prescriptions are embedded in customs and traditions. Through reading a number of texts in the “Abrahamic” tradition (designating Judaic, Christian, and Islamic cultures, including their secular derivations), Derrida argues that these prescriptions divide into two regimes. The first consists of a single, unconditional law of hospitality that mandates an openness to all, regardless of who or what may come, and without
limitations on what the welcomed might thereby do. The second regime consists of the many conditional laws of hospitality, laws that determine which actions are appropriate in which situations and to whom, thereby articulating limits beyond which hospitality need not be offered. These two regimes of law are in tension with one another – one commands to welcome unconditionally, the other to welcome according to certain conditions – but Derrida argues that they nonetheless rely on one another. The unconditional law, he claims, is impossible. Hospitality cannot be given without condition, if only in order to master the space within which another is welcomed. As impossible, this law thus calls for the determination of conditions and in this way is tied to the conditional laws of hospitality. Now if this were all that Derrida proposed, then there would be no tension here, since it suggests that hospitality does not involve an unconditional law at all. For this reason, it is essential to Derrida’s argument that he show a relation of dependence in the reverse direction. This he does by arguing that a purely conditional understanding could never qualify as one of hospitality, since it would be reduced to a system of exchange; hospitality would be granted only at the price of certain conditions being met. Derrida thus claims that the conditional laws, if they are to be laws of hospitality and not simply rules for an economic transaction, must gesture toward that which exceeds them, namely, the openness beyond all limits that the unconditional law decrees.

The legacy of hospitality thus consists of a divided injunction, and the very meaning of hospitality depends on such a division. To be hospitable is to engage with the dual imperatives of conditionality and unconditionality. At the same time, this structure shows that the norm of hospitality is linked to its own failure or perversion, in at least three senses. First, since this norm requires a continuing engagement with contradictory laws, no single attempt to be hospitable can ever fully succeed. Second, this structure inscribes the possibility of co-opting the norm of hospitality for other ends, since one can always appeal to the necessity of conditional hospitality as an alibi for the limits imposed in any given instance. Third, the reliance on unconditional hospitality means that every welcome opens itself to danger, since it decrees that one be open to both the friend and the enemy, the chance and the threat. Thus, in addition to making possible what are often seen as desirable outcomes – such as increased inclusion and a greater acceptance of difference – the attempt to be hospitable also calls forth the greatest dangers. For this reason it does not follow from Derrida’s analyses of hospitality that one should do one’s best to approximate unconditional hospitality, even as it is impossible. Such an action is not inherently desirable and has no guarantee of safety: being more open means also being more open to what can come in and destroy the host. The unconditional law of hospitality thus does not function as a regulative ideal or a form of the highest good. Rather, if
Derrida is correct, what is required is the constant negotiation with both regimes of law, the unconditional and the conditional. In some situations, one might well choose to promote a greater conditionality in the attempt to bring about what is considered to be a better state of hospitality.

This final claim is not always advanced in work commenting or building on Derrida’s analysis of hospitality. Indeed, the opposite view – that Derrida’s work implies the constant promotion of a greater openness – seems to be supported by Derrida’s own appeals to the unconditional law of hospitality when criticizing current limits in the immigration policies of First World nations, particularly when it is a question of admitting individuals from less privileged regions of the world. However, these discussions are themselves highly conditioned, and one can easily think of situations in which the same politics would advocate greater closure. Should one, for example, demand that Third World countries open their borders further to First World investment? And to First World armies? A politics aiming to approximate unconditional hospitality must say yes, for this is what the simple goal of greater openness requires. To respond by saying that of course one needs to decide each case separately is precisely to recognize that unconditional hospitality is not the guiding ideal. It is also worth recalling in this context that Of Hospitality closes with an extremely violent example, where Lot offers his daughters to be raped by the Sodomites in order to protect the angels he has welcomed.20 Greater openness need not coincide with, or even approach, what is considered to be good.

Across his later writings, Derrida argued that similar structures were functioning in several other normative concepts. On some occasions, such as in his work concerning the gift and forgiveness, he explicitly invokes the language of unconditionality and conditionality in order to diagnose conceptual configurations virtually identical to the one just outlined. More often, most notably in his analyses of democracy, national identity, responsibility, law and justice, friendship, and the decision, the same vocabulary is not always literally used, but the structures articulated share much in common, always involving dual regimes of injunction that are in tension even as they require one another. As a result, Derrida demonstrates how norms cannot serve as the basis for an ethics, politics, or religion that would be beyond the threat of destabilization. All are threatened by perversion from within. In addition, Derrida’s writings from this period also consistently drew attention to the impurity of these domains themselves. He underlines the ways in which ethics, politics, and religion are always entwined, arguing at length that the priority of one over another cannot be sustained in

any given instance. The legacy of Derrida’s later work thus does not consist in the emergence of a thinker advocating ethical, political, and religious principles or beliefs, a thinker who was somehow more ethical, more political, or more religious than before. Rather, these texts bequeath a profound demonstration of how fraught and unstable the central concepts and boundaries of the fields in question really are.

IV. LEGACY

Turning to the question of Derrida’s legacy as a whole, one is struck by the transdisciplinary impact of his work, noting at the same time that this impact is unequally distributed. With respect to the traditional institution of philosophy in France, his influence has been minimal. Several French philosophers owe much to Derrida’s writings, including Kofman, Nancy, Philippe Lacoue-Labarthe, Catherine Malabou, and Bernard Stiegler, but while he gained some recognition within the traditional academic system, most philosophers in France seem more or less untouched by his thought. Derrida’s influence on anglophone philosophers has been even more reduced, and outside those that focus on continental philosophy, most departments of philosophy in the English-speaking world would reject outright the possibility of teaching courses on his work. The situation is different within anglophone continental philosophy, where Derrida is generally recognized as an important figure and, in addition to his work being studied in its own right, his readings of other thinkers remain key points of reference in many ongoing debates.

However, it would be wrong to conclude that Derrida thus failed to transform philosophy in a wider sense, for since the 1970s there has been a rapid growth in the prevalence of philosophical thinking. This thinking has more often than not appeared in English-speaking countries under the name of “theory,” usually preceded by an adjective – architectural, critical, feminist, film, literary, postcolonial, queer, race, and so on – and its practitioners are located in academic departments across the humanities. Taking these new regions of academic inquiry into account, philosophy now unfolds in a variety of guises. The unprecedented response to Derrida’s death – over 5,000 signatories honored his memory in response to the dismissive obituary of The New York Times, and since 2005 at least twenty-five academic journals have published special issues dedicated to his work – is evidence of the importance he holds in the wider academy. This importance reflects the choice, discussed earlier, that Derrida made to occupy and develop theoretical and institutional spaces at the margins of – and outside – philosophy as a discipline. In locating himself thus, Derrida encouraged an engagement with philosophy and its history in areas far outside
its institutional borders, and in doing so he played no small part in the birth and development of theory as it exists today.\(^{21}\)

As with any legacy, Derrida’s remains to unfold in the future, and any pronouncement on its status will necessarily need revision.\(^{22}\) But it cannot be doubted that his writings and teaching have already made a profound impact, one that is unique among the thinkers of his generation.

**MAJOR WORKS**

---

\(^{21}\) Charting the extension of philosophy beyond its traditional disciplinary boundaries in the years following the emergence of poststructuralism is the focus of the essay by Judith Butler and Rosi Braidotti in _The History of Continental Philosophy: Volume 7_.

\(^{22}\) There are plans to publish transcripts of all of Derrida’s seminars, the first of which to have appeared are _The Beast and the Sovereign, Volumes 1 and 2_. If the currently available seminars are any guide, these are likely to contain extensive readings of many more thinkers and texts than are found in the works published during Derrida’s lifetime.

The Work of Mourning. Edited and translated by Pascale-Anne Brault and Michael Naas. Chicago,
Jean-François Lyotard was one of the great philosophical essayists of the twentieth century. It will be argued here that he contributed to a renewal of the essay form and wrote on a series of important questions with subtlety, humor, and style. His choice of the essay form, from his early political essays, through his important books on the role of figure in discourse, on the libidinal and on the importance of radical difference, and on to his many later essays on art, philosophy, and politics, reflects two key aspects of his work: a suspicion of theories that encompass a multitude of different themes and positions under a single unifying account; and a sense that how something is argued – its aesthetic form and emotional charge – is as important as its logical structure. The essay form and the production of many different essays on varied topics are then one of his ways of resisting a return to a totalizing philosophy.

If the lasting value of his work is to be recognized, the distinction drawn between philosophical arguments and essays is essential. Two commonplace questions often asked of philosophers determine an approach to Lyotard’s work that fails to do it justice: “What is your main idea or concept?” and “Can you describe your key philosophical concern and method?” Both questions set up

what he came to call a “differend” with his approach, that is, a difference or opposition that cannot be bridged on terms that are just toward both sides of an argument. If the views or position defined by one side are imposed on the other, there is in Lyotard’s terms a “tort,” a wrong that cannot be rectified according to a system of justice set up by the side that does the wrong. In misrepresentations of his work, the wrong comes partly from the reasonableness of the questions. Why not inquire about a philosopher’s main idea, key concern, and method? Would it not be suspicious were the thinker unable or unwilling to answer? Would this not be a clue to a failing in the thought, perhaps a basic lack of clarity or a malign desire to confuse issues? In response to these questions, I will show how Lyotard seeks to use the flexibility of the essay form to allow historical events and aesthetic works to demand our attention, but also to appear free of any conceptual reduction, in particular in relation to the intractable differences at play in their conflicts or material richness.

Much of his emphasis on historical events and their social and political consequences can be drawn out of Lyotard’s biography, although any simple equation of life and work would be far too abrupt, since the works seem to prefigure and go beyond events rather than merely follow them. Lyotard’s earliest works describe the effects of the Second World War and, in particular, the Holocaust on young postwar thinkers. He argues that neither orthodox Marxism, nor liberalism, nor techno-scientific rationalism can allow us to comprehend and do justice to those events. It is not that reason and socialism are not necessary; they are and will continue to be for Lyotard, but they are not enough. After passing his agrégation, he taught in the early 1950s at a lycée in Constantine, Algeria. This experience led directly to his involvement, from 1954 to 1963, in the French revolutionary group Socialisme ou Barbarie, seeking to encourage revolution and independence for Algeria. Algerian independence was won in 1962 after a long and bloody conflict but, according to Lyotard’s analyses, revolution failed. Later, after teaching at both the Sorbonne and Nanterre, he took up a university post at the University of Paris VIII–Vincennes, where he worked with Gilles Deleuze, Alain Badiou, and many other key French academics of the time. While at Nanterre, he played an active role in the May ’68 student revolts, but again, this revolution was betrayed according to Lyotard’s reading, in particular in the way socialist principles were diluted by the French socialist party when it took power in the 1980s. Later, Lyotard helped form the Collège International de Philosophie (with Jacques Derrida and François Châtelet, among others). He then took on the role of an international academic and intellectual with a series

2. Many of his essays for the group are collected in Jean-François Lyotard, Political Writings, Bill Readings and Kevin Paul Geiman (trans.) (Minneapolis, MN: University of Minnesota Press, 1993).
of posts and lecturing assignments around the world, notably the University of California-Irvine and Emory University.

The early critical reception of Lyotard’s work has often concealed the deep value of his essays: their multifaceted sensitivity and balance. A thinker who sought to avoid generalization found himself at the center of a widely followed and denigrated truism. Lyotard’s “main” idea was never that we now live in a postmodern age characterized by postmodern artworks and politics – where modern would mean united and responsible for unity, and postmodern would mean disjointed and cynically celebratory of fragmentation. Only a very limited reading of his *The Postmodern Condition* and a failure to read, for example, his *The Postmodern Explained: Correspondence 1982–1985* would allow such conclusions. One of his claims was indeed that we live in an epoch of fragmentation marked by the failure of “grand narratives.” These narratives are accounts of history and of progressive development that bring together many strands of human effort into a single vision of a better future. This utopian focus emerges out of a past that it makes sense of but also repudiates in favor of a new beginning. Some of the more simplistic Marxist and liberal democratic commentators fit this description (for example, Francis Fukuyama’s famous thesis on “the end of history” in capitalist liberal democracy). However, Lyotard never claimed that the failure of these grand and totalizing visions should simply be celebrated and accomplished in a postmodern art, politics, and philosophy associated with a particular epoch.

Owing to this erroneous ascription of satisfaction with late-capitalist postmodernity, Lyotard is accused of being a poor philosopher with a weak grasp of key forms of argumentation and with a typically postmodern unwillingness to broach key ethical and political aims in a clear, consistent, and principled manner. This critical argument is found in its most strident form in Luc Ferry and Alain Renaut’s *La Pensée 68*, a denunciation of French left-wing thought around and after the revolutionary events of May 1968. Lyotard strove to renew the energy and rigor behind philosophical forms of justice, but free of the crudeness and violence of certain types of modern thought and politics. This was never to be achieved once and for all in a postmodern epoch or in fragmented works; instead, a creative philosophical resistance had to draw on resources found at all times, on the margins and in the avant-garde, but also in “canonical”

---

works. These resources themselves demand to be drawn out in new forms, rather than as critical overviews or judgments. Far from defending fragmentation, his philosophy is much closer to a view of an ongoing transformation of works taken as “difficult wholes.” This transformation is guided by a resistance to wrongs and has the goal of testifying to differends, that is, to enduring differences that are unjustly hidden or eliminated.

I. BEYOND THE MODERN AND THE POSTMODERN

There is then something of the modern and of the postmodern in Lyotard. His work reflects notions of difficulty and complexity that combine a modern desire for unity and a postmodern sense of fragmentation. This combination extends into his understanding of the roles and forms of argument and position-taking in philosophy. Style and form must reflect the paradoxes and contradictions necessary for the expression of multiple positions that cannot be reduced to one another. Ethical and political concerns cannot lead to final categorical truths, but rather must lead to testimonies to the need for further varied thoughts eschewing exclusive positions, while trying to do justice to many positions and to the richness of the matter at hand.

Lyotard’s work therefore consists of a series of essays – some of them book-length – as opposed to a series of philosophical positions or arguments. The essays are experimental attempts to think round a problem or challenge, while at the same time drawing our attention toward a wide set of delightful but also shocking and puzzling aspects of a topic. They are artworks with a style, originality, and complexity that resist simple reductions to primary ideas and methods. They are also crafted political interventions, philosophical because designed to prompt and guide thought, yet resistant to a definition of philosophy as, essentially, a clearly argued form of problem-solving and bridge-building. This resistance is not perverse or willfully obstructive; rather, it stems from the intuitions that, first, the problems at hand cannot be truly resolved through simple methods and concepts and, second, that the matter encountered by artists and thinkers of all kinds deserves a rich and expressive medium, rather than any reductively clear categorization or definition. Broadly, this is because events exceed any conceptual apparatus designed to present them and because matter demands a rich expressive medium capable of conveying that excess and of overcoming our tendency to become satisfied over time that an established medium is in fact satisfactory for giving a full presentation of events and matter.

*7. Lyotard is discussed in the context of postmodernism in the essay on this topic by Robert Eaglestone in The History of Continental Philosophy: Volume 7.
Lyotard comes closer, in French philosophical lineage, to the tradition that includes Montaigne, Voltaire, Diderot, Alain, and Barthes, rather than Descartes, Fourier, Comte, and Bergson. His work updates the essay form because he adapts it to a series of features that have determined the twentieth century, without being exclusive to it. Lyotard’s thought is deeply marked by the events of his century and by the relation of those events to a set of philosophical ideas, methods, and thinkers. In parallel, it is also marked by a long series of aesthetic works, primarily in literature and painting, but also in architecture and film. The first source means that his work is an ongoing attempt to intervene politically and philosophically within key trends and events, but with an acute awareness of the failings of many forms of thought in the face of events. This failure can be explained by the roles that thought has played in the event – although these need not be central or active. Lyotard belongs to the set of thinkers troubled by the relation of ideologies, including rationalism and Marxism, to catastrophic events. However, he is again misunderstood if the conclusion is drawn that there is a necessary connection between ideology and violence. When we read him as an essayist, we move from an emphasis on the necessity of that relation to an understanding of his work as charting cases of it, in all their complexity, but also as resistant to any debilitating fatalism or exclusive judgments.

II. RESISTANCE IN ART AND PHILOSOPHY

A key companion intuition to Lyotard’s connection of events to the failings of ideology is that this flaw is avoided by some artworks, or more precisely, by the relation of artwork, matter, and affect. So the second main source of his thought provides a counterpoint to the first. This is because artworks are seen as reflecting the necessity of failure while refusing to allow it to smother them. He is then attempting to pass somewhere between the thwarted desire to change the world forever for the better and the despair at the impossibility for success. Lyotard is aware of the value of the desire, but he is equally aware of its historical attraction to violence and to nihilism as a loss of values and of belief in political reform. Art can express its own limits in the attempt to grasp matter, but that expression becomes an affirmation of matter in its capacity to stun and to energize. This power is a counter to a threefold cause for despair after historical events: first, events cannot be represented while still doing justice to what has

8. Lyotard’s philosophy of events differs from those of Badiou and of Deleuze. For Lyotard, the event is a radical break, while for Deleuze, as set out in The Logic of Sense, the event is a disjunction in a series. And in contrast with Badiou, who in Being and Event and Logiques des mondes sees the event as open to a positive presentation and acts of fidelity, for Lyotard, the event is unpresentable and a moment of profound passivity. [*] For a discussion of
occurred in them; second, events are signs of the impossibility of final reconciliations; third, they occur beyond any predictive logic. In its combination of expression, limitation, and productive materiality, art can provide testimony to events while avoiding representation and the reduction of fault lines to false resolutions. It is important for Lyotard that this materiality be seen as elusive in terms of linguistic descriptions and theories.

Lyotard’s life and career follows cycles of dispiriting events that he later identified through a series of names (Auschwitz, Budapest, 1968). His writing is then a form of struggle against discouragement but with a determination not to resort to false consolations or to inaccurate images of the past, the present, or even the future. His essays use the historical and contemporary resources of philosophy, but in an ironic manner, thereby creating literary assemblages rather than works of pure theory (this irony comes out most strongly in the collection *The Inhuman*). So, in parallel to events, we find a series of theoretical focus points corresponding to different stages in his output. These range from a very early and popular critical introduction to phenomenology (*Phenomenology*) through an engagement with structuralism and psychoanalysis (*Discours, figure*) to reflections on Marx and Freud (*Dérive à partir de Marx et Freud; 1973*) and a Nietzsche/Klossowski-inspired dynamic philosophy (*Libidinal Economy*). These are then followed by a turn to ancient philosophy and a revival of paganism (*Instructions païennes; 1977*), then developed into works that draw on Kant and Wittgenstein around questions of justice and incommensurability (*Just Gaming, The Differend*). After these, Lyotard’s most mature period of essay writing begins with the important collections *The Inhuman* and *Postmodern Fables*. Although his output was very great, it is arguable that it was still cut short since his most beautiful essays, on Malraux (*Signed, Malraux and Soundproof Room: Malraux’s Anti-aesthetics*), are followed by important posthumous works on Augustine (*The Confession of Augustine*) and *Misère de la philosophie*.9

*Misère de la philosophie* is Lyotard’s last collection of essays. It connects to nearly all of the work that precedes it, not only in terms of content but also through its styles and reflection on earlier ideas. For instance, the allusion to Marx in the title is a reprise of the frequent engagements with Marx and Marxist themes throughout Lyotard’s career, not only in the early works for *Socialisme ou barbarie* and in *Dérive à partir de Marx et Freud*, but also in the

later *The Differend*. This latter discussion is important because it shows how Lyotard remained committed to thinking through Marx but in ways consistent with the developments of Lyotard’s thought: “This is the way in which Marxism has not come to an end, as the feeling of the differend.”¹⁰ This connection is not surprising given the consistency of issues and ideas throughout his philosophy. This is not to say that there are a few lines that draw his work together, but rather that there are many different ones, present in each essay in different ways and to varying degrees. The late collection is then a good example of the transformation of the essay form achieved by Lyotard. Theory and conceptual innovation become key components of the form, but are not allowed to dominate it. Instead, an ironic juxtaposition of style, theoretical argument, aesthetic moments, and careful autonomous descriptions of “external topics” (such as artworks or historical cases) forms an unstable unity where none of the subparts is allowed to dominate, but where all work together as a critical and creative ensemble. The essay form then moves beyond the model of an open discussion, or of an aesthetic intervention, to become a “transformer” and “resistor” on the margins of other forms of pure theory, artworks, historical cases, philosophical argument, and social commentary. The concepts of the transformer and of resistance allow us to understand Lyotard’s political positions in their relation to art and to aesthetics. The artwork as transformer disrupts structures through the introduction of novel intensities or feelings, thereby prompting the emergence of different structures in tension with the earlier ones. He used the former in a short essay on Duchamp and, among others, Kant: *Duchamp’s TRANSformers*. The latter is one of the dominant themes of the works on Malraux through Lyotard’s sense that Malraux’s life (and any well-lived life) is an ongoing resistance to infamy.

### III. NARRATIVE AND THE UNCONSCIOUS

Narrative is one of the main concepts transformed and resisted by Lyotard, because an overarching narrative is one of the main ways in which different positions and tendencies can be reduced to a single account. His work studies what he sees as the necessary but not sufficient role played by narratives in the constitution of selves, communities, political groups, and social movements. This necessity comes from the way identity grows out of a primary flux that unfolds over time and requires organization and limits. Identity is then a form of narrative order and selection over a much larger and disparate set of events.

---

individuals, and characteristics – as well as their multiple and varying relations. The insufficiency of narratives comes from the way in which events exceed their attempts to give them shape over time. A narrative brings order to a matter that it depends on but cannot control. This matter is not only what we could term the external event (what happened and how it was perceived) but also the internal matter (the language that has to be bent into a narrative shape). Both of these decay and renew themselves in ways that go beyond the original attempt to capture and to express.

Unlike philosophers who stress conceptual or ideal identity in a Leibnizian or Platonic vein, where a sense of definition comes from a set of conceptual predicates or an independent idea (“I or we are X”), Lyotard is interested in the way a story or account draws together and relates some elements while also excluding others. Lyotard is wary of the conceptual model because it does not have the capacity for flexible patterns and evolutions offered by a narrative, where many different and contradictory strands, some present and others defunct, can be held together without having to be sifted for consistency and ultimate order. Thus, the narrative “My past runs through Y and leads to my present X” is opposed to the conceptual “I was X, but now I am Y.” It can be argued, following Lyotard’s study of discourse in Discours, figure, that conceptual clarity always hides a minimal narrative in the conjunct of the “but,” which introduces a form of narrative account into the present concept through the story of how one becomes what one is. Moreover, the bald statement “I am X” cannot escape the subtext “But I was Y,” unless it denies any historical development, thereby plunging identity into a series of atomic moments rather than a development through time. Concept-formation assumes narrative, which in turn assumes a struggle of narrative with excessive events, as well as the inevitable occurrence of new events in each later attempt to narrate earlier events. Narrative provides a conscious line of identity, but it hides an unconscious line that it cannot legitimately ignore and yet cannot finally include in the conscious line.

Grand narratives, as described in The Postmodern Condition, maintain a relation between a drive toward a better future and a past that remains a threat and a lesson, for example, in the thought “Never that again.” This relation is then allied to an account of how the tools necessary for achieving the passage from past to future came into being (for instance, in the edifying narrative of Enlightenment as able to draw us out of obscurantist dogmatism thanks to reason deployed in the sciences and ethics). In The Differend, Lyotard explains how political communities emerge from a founding definition of their values and principles, for instance, in the signing of a constitution. This founding moment is then narrated so that later parts of the community can both interpret it and feel they belong. For him, simply having an idea of Enlightenment values or a concept of a constitution is not sufficient for the emergence of identity because those
original sources are themselves divided and divisive. On a territory inhabited by many different groups, with a history of many different social and political systems, a single nation emerges through a narrative that always imposes unity. In a community formed around a constitution, where there does not appear to be quite such an imposition, Lyotard is concerned with the problem of how the few signatories of a constitution are connected to the many who are signed up to it by proxy. They must be made to belong and this belonging comes from a narrative that explains how “we” are represented by “them,” or are continuous with “them” in some way.

In a parallel manner, he sees how the many stages of an individual self require a narrative that connects the very different aspects of childhood, adolescence, and adulthood, not only in terms of maturity but also in terms of the individual tensions that run through any life. This contributes to the acuity of his Signed, Malraux and The Confession of Augustine because Lyotard can both describe those tensions and the difficult attempts to reconcile them in autobiographical fictions. It also contributes in Lectures d’enfance (1991) to his interest in childhood as a positive state detrimentally hidden in adulthood. However, this requirement to narrate always has a cost, because the continuity and integrity of a recounted life are built on a series of exclusions. These are the necessarily unconscious aspects of a life that each narrative generates as it tells the life. He is particularly concerned with the form and extent of this cost for two reasons: the exclusions beget injustices that cannot be righted easily insofar as the exclusion banishes one outside the law, for example, by denying a right to be heard; and the exclusions can involve forms of violence that are hard to render visible, such as the denial of roots and culture. The function of Lyotard’s essays is then often to reveal the unconscious exclusions behind narratives and the theories dependent upon them.

IV. EXCLUSION AND INJUSTICE

Lyotard’s concern with narratives of identity, whether communal or of the self, is that they necessarily involve exclusions both in terms of their external borders – those or that which does not belong – and in terms of their internal construction – that which is at work in the founding moment or process but not avowed. These exclusions lead to differences to which justice cannot be done in terms of the original narrative. Contemporary cases of this kind of exclusion might take in those rejected in tales of the emergence of an intrinsically “superior” set of values based on gender, religion, or ethnicity, but they could also take in those banished through an appeal to a narrative about original owners of a land, or those expropriated because unable to make “reasonable” claims to original
ownership, or those discriminated against for failing to be “rightful” heirs to a religious tradition or authority, or those excluded or mistreated because they fail to recognize the “validity” of a dominant economic or social discourse, or market values, or certain forms of liberal democracy. This process should be seen not only as one of unjust exclusion, but also one of unjust inclusion. Lyotard’s point is not only that narratives leave something out, but also that they construct a false identity. There is never a pure inside that others are excluded from; rather, both sides of the process are based on an illegitimate obscuring of more complex and irreducible differences at the outset. This is why his account also extends to the self, where the narrative that accompanies the emergence of a given self-identity creates a false view of the self because it necessarily fails to take account of all aspects behind this emergence.11

I wish to raise three possible objections to Lyotard at this point. (i) Is he committed to an amoral position where all narratives are equally at fault in terms of illegitimate exclusions and inclusions? (ii) What alternatives does Lyotard propose to narrative and, if he fails to have any, is he not offering us a council of despair? (iii) Is it not possible for some narratives to respond sympathetically and positively to what they have excluded or failed to include properly? The first two questions allow for simple answers in Lyotard’s defense. He does not believe that all narratives are equal in the violence of their exclusions. On the contrary, certain narratives are viewed as paradigms of violence and wrongdoing, hence his denunciation of Holocaust deniers in The Differend and his continued critique of racism and colonialism that began in his essays on Algeria. The view that all narratives involve exclusions does not imply that all narratives are the same in the violence or scope of that exclusion. The notion of paradigmatic wrongs or exclusions does not commit Lyotard to an overarching tale that allows him to relate different narratives. Instead, the cases he takes as exemplary are determined by the extreme nature of the wrong, when taken from the point of view of how to do them justice. Attempts to put witnesses to the Holocaust in the purportedly impossible position of providing irrefutable evidence as to exact numbers of dead when traces were so systematically erased, denials of humanity in racism, and the eradication of cultural history in colonialism are therefore recurrently attacked in his work because of the call to testify for those who cannot express a wrong done to them.

11. Lyotard’s approach at this point is close to Derrida and to deconstruction. His work can be interpreted as an extended dialogue with Derrida, starting with the explicit adoption of deconstruction in Discours, figure, through a more severe critical stance in Libidinal Economy, and then back, in The Differend, to a detailed interaction with Derrida on questions of how to pursue ethics and politics, once philosophy opens itself to the call of an absolute otherness and to the necessity of viewing text and narrative as unavoidably beyond clear signification.
Nor does Lyotard think that there are no alternatives to narrative. Rather, his argument is that there are no positions standing completely above and beyond narrative and its power to bequeath identity. Narratives must therefore be supplemented by critical accounts that show exclusions and illegitimacy in order to replace and improve on given positions. These critical moves cannot finally "win." Nevertheless, we are rightly driven to continue to testify to injustice and to wrongs even if this cannot be in the context of an overall grand narrative or of a reliable improvement determined by stable and enduring principles and values. It is not nihilistic to think that violence and its causes will return and cannot be replaced by some utopian peace, so long as motivations remain for reforming and just action. Nor is it nihilistic to claim that such action is relative, not only in its own capacity for injustice, but also in its failure to have external and inviolable principles. This relativity must not be confused with claims to equivalence with respect to different moral acts. The relativity concerns the necessary persistence of some exclusions and false inclusions, rather than the equivalence of specific exclusions across different cases. There are always illegitimate exclusions, but some are worse than others. The assumption that there will always be new exclusions does not imply that it is not worth struggling in the name of particular injustices. It means that we should never be satisfied that a social situation, political theory, or philosophical methodology are finally good and therefore beyond reproach.

The third objection is more difficult to answer. It is in connection to it that Lyotard turns to many different interpretations of the role of the unconscious in narrative and to philosophical concepts that define experiences, events, and feelings as approachable through narrative and discourse but as never fully captured by them. The fact that he develops such concepts could be seen as a contradiction, since he would be providing a conceptual argument for nonconceptual things, but this serves only to emphasize the importance of his work as an essayist, where concepts and methods cannot be separated from a form of communication that adds expression, style, and feeling to them in order to deny both that all we have is the concept and that the concept can stand independent of emotion. Indeed, this emotion or affect is Lyotard’s link to the unconscious in all his works. This explains the variety and persistence of accounts of the relation of feeling, structure, and unconscious drives in his works, from the role of figural events in discourse in *Discours, figure*, to intensities dissimulated in dispositions in *Libidinal Economy*, to the feeling of the sublime undoing and yet also feeding into Ideas of reason in *The Differend*. It also explains his deep impatience with the accusation of "performative contradiction" in his rational defense of the irrational. Lyotard’s defense was never simply rational nor a simple appeal to reason. The argument never accepted the far too simple dichotomy drawn between reason and that which lies beyond it.
dynamism are inextricably linked and their separation is an illusion, a temporary conjuring trick, rather than a permanent achievement of argument and analysis. Narratives can and should attempt to address what they have excluded, but Lyotard’s point is that this will not stop further unconscious exclusions. Moreover, there are some aspects of narratives which give rise to such profound differences, differends, that we can only surmount them by changing to a new narrative, rather than inflecting the old one.

V. TIME AND THE LIMITS OF KNOWLEDGE

Lyotard’s study of time (for example, in “Emma,” in Misère de la philosophie) reveals a series of arguments as to why certain events necessarily escape narrative and why he thinks of this in terms of the unconscious through a critical reading of Freud. The first and perhaps most important argument is about the nature of time in narrative or, more precisely, the limits that time sets for narrative in its relation to feelings and affects. Lyotard divides time into a series of diverging but also interfering lines. There is not a single and united time, but many timelines running alongside each other with points of contact and capacities to transform one another. One line, the one we are most familiar with, stands for the way conscious recollection can return to earlier events. Such conscious recollections follow one another in the familiar linear manner, that is, according to a straight line passing from past, through present, to future. The forward momentum of this line, its “passing away” and “moving toward,” describes a loss or insufficiency and a counter possibility for novel creation. This is because, when we remember earlier events, we do so in a manner that is necessarily limited, that is, the early event can never be entirely and accurately brought back. Instead, the earlier event has to be renewed in the present through a narration (this is what happened …). However, another line departs from the same early event and drifts away from the straight line of successive conscious recollections and narrations. This other line describes the unconscious life taken on by aspects

12. Given this connection of time and narrative, it is worth recalling that Lyotard worked with Paul Ricoeur in the 1960s and that there are many connections to Ricoeur’s work in Discours, figure, notably his work on hermeneutics and on Freud. Later, Lyotard does not mention the author of Time and Narrative (Vols I, II, III) very much, perhaps because he had already covered much of the same ground in Discours, figure while developing a very different position, but also perhaps because of their opposed sides during the events of May 1968 when Ricoeur was dean at Nanterre. Lyotard made severe comments on what he saw as Ricoeur’s compromises with political authority and repression in his essay “Nanterre, Here, Now,” reproduced in Political Writings, 46–59. For a discussion of Ricoeur’s Time and Narrative, see the essay by Wayne J. Froman in this volume.
that escaped consciousness at the time of the event but that were nonetheless inscribed unconsciously. A very simple example of this would be cases of missed insults and slights. At the time of the initial injury we consciously perceive no sign of malevolence and hence have no evidence for later cognitive analysis or associated narration. We cannot say “she did it to hurt,” because there is no it. To all intents and purposes nothing happened. But something did happen, and it returns unexpectedly, this time signified not by the actual injurious fact, but by a disturbing feeling (Hold on a minute! What did she say exactly?) This feeling occurs on the familiar conscious line but sets it in relation to another unconscious one, where the unconscious event has bubbled away independently of our blithe conscious thoughts.

It could be assumed from the distinction drawn between conscious and unconscious times that we have only two lines and that the second can be folded back on to the first, but an important feature of the difference between the two times is that it sets up a wider fragmentation and incommensurability. This is because, first, each time the lines interfere they set off new divergences and, second, because different aspects of the original event lie on different unconscious lines. For example, an original meeting may involve an unconscious slight (immature fool – she thought), but also an unconscious attraction (the reddening in his cheeks betrayed his attraction and revolted her all the more). These may return to the conscious line in different and incompatible manners, setting up interferences between each other and with the conscious line. The attraction and the insult bubble along independently of one another; they are triggered to return into consciousness at different times; and when they do they set off new relations to one another (for example, the attraction becomes doomed and hence even more troubling when we realize the slight). An event fans out into a set of time lines, which then fold back on to one another. Time therefore unfolds in a complicated manner, not as a simple stream, but as a series of connected but unpredictable whirls and eddies.

Lyotard denies that conscious reflection or narratives can somehow regain full control of unconscious processes. He accepts that these processes must reappear in perceivable and knowable forms, but he points out that this return is particularly troubling and disruptive. The reappearance of something hidden involves an undoing of control through the disruption of current conscious lines of knowledge, understanding, and narration in their relation to the past. This is why he is interested in Freudian psychoanalysis through its studies of deep-seated neuroses triggered by the return of twofold past events. An event in the past is twinned with another later event and this twinning explains the particularly troublesome return in the present. It is not that a new fact occurs to be added to a set of ongoing accounts. It is rather that two combined and hitherto concealed events return to question and undermine those ongoing
processes. So the unconscious returns with the power of a betrayal rather than as an innocent discovery. This return is doubly difficult to handle because it disrupts the accounts we have formed for our conscious recollections and resists further incorporations through its dual nature. We do not only have to handle one returning event but two apparently incompatible ones.

This series of unconscious lines and their power to disrupt chaotically yet with great intensity is detrimental to the claims of narrative. Our conscious tales have the role of setting up identities over time against the necessary failure and waning of memory, but these narratives are themselves prey to different aggressions and failures in relation to unconscious events and timelines. It is crucial to note that throughout his work, Lyotard viewed this fragility in relation to the return of the unconscious as a positive platform for the resistance to false inclusions and exclusions. Narrative is reminded of its necessary limitations and injustices through the affects and feelings that express what has been unconsciously concealed. His philosophical essays can be seen as repeated efforts to conduct this unconscious power, not only in the name of justice, but also for the renewal of creative narratives themselves. This explains his concern with Freudian psychoanalysis and its work on suggested recollection or anamnesis, but it also explains why he criticizes and adds to this sense of recollection. Lyotard agrees that anamnesis is necessary, but once it is set as a specific practice with a set psychoanalytic theory, then it is constricted and misunderstood. There can never be a final theory of the unconscious, but only essays that attempt to express why there could be no such finality. This is not a dishonest attempt to “say what cannot be said.” It is rather an attempt to think through the nature of our sources of knowledge and identity, to work out their limits, and therefore to see how we may begin to reflect on how to remind ourselves of those limits, given the precise nature of necessary forms of exclusion and forgetfulness.

VI. AFFECTS AND MATTER

This return of a forgotten or repressed unconscious is described in terms of figural events in *Discours, figure*, of libidinal ones in *Libidinal Economy*, of sublime ones in *The Differend*, the *Inhuman*, and *Postmodern Fables*, and of emotion-laden bodily events in Lyotard’s last works. In each guise, he also constructs theories of how these events erupt into economic, narrative, and cognitive structures. The political point of these constructions lies in the way they make space for further events and creations designed to allow us to be reminded of what has been left out, necessarily and unknowingly, in our current forms of understanding and valuing of the world, of others, and of ourselves. His essays then have the task of giving voice to that which is not and cannot
be known. This is not a simple contradiction. It is a paradox that lies behind the emotive and aesthetic style of his work: to write in order to make space for events, rather than close them off; to write in order to do justice to wrongs that have not been recognized; to write in the awareness that philosophy often sets itself goals inconsistent with this sense of otherness and injustice.

The aesthetic and political power of events is frequently described by Lyotard in terms of the combination of matter and affect. This connection is designed to answer the problem of how consciousness and unconscious events come into contact and can be worked with. It allows him to subvert and transform oppositions drawn between a scientific and naturalistic view of matter and a more aesthetic, phenomenological view of emotions. For him, affects are transforming and disturbing bodily events; they should not be identified with standard feelings, sensations, or emotions in relation to a form of intentionality – although they can overlap with them. Instead, an affect combines a cognitive challenge, in the sense that something occurs that resists knowledge yet registers as something that has an effect on our structures of knowledge or intention. For example, an affect could be the occurrence of a strange background distaste that does not fit with our current senses of taste but changes their value and status. This distaste is an affect, since it transforms our senses in relation to our knowledge of them while resisting incorporation, but also registering a longer-term and troublesome event (meat lost its savor, after the stench of the abattoir).

The importance of affects is twofold. First, they are Lyotard’s way of convincing us of the limits of knowledge and of established narratives. This conviction is a matter not of argument, but of providing a framework of concepts and ideas for readers to either sense that they have also undergone such affects, or recognize that they have not. Again, the essay form of his writing, as well as his work through art and artists, is important here. Lyotard has to enact and dramatize affects and their occurrence as events in order to transmit their possibility to readers (this is done particularly well in Libidinal Economy through literary descriptions, or in his later ironic use of dialogue in The Inhuman and Postmodern Fables, or in his late poetic style in Soundproof Room). Second, affects are a way round the problem of having to present something that resists identification. Lyotard often describes this as the challenge of having to “present the unpresentable” and he connects it to his deep interest in Judaism, for instance, in Heidegger and “the Jews” or the late “D’un trait d’union” in Misère de la philosophie. For him, the ineluctable demand in Judaism to testify but without representing connects to the demand to follow on from an affect but with the impossibility of accurately representing it. Thus, for Lyotard, the demand to bear witness to the Holocaust is necessarily without end because the affect that drives the demand can never be assuaged yet must always be answered. This state of being “beyond measure” is important for his treatment of affects, since measure
would allow for cognitive treatments and comparisons of affects. This does not mean that we should eschew knowledge; on the contrary, it means that knowledge must be supplemented by testimony to the event. Justice requires knowledge and affect.

Affects are material events. They happen in the body and in relation to other material occurrences (the taste happens in response to an external prompt, a smell or a foodstuff). However, as much as affects resist ordered representation so does the prompting matter (sounds, visions, things touched, things read). So Lyotard is committed to a view of matter as different from objects or any scientific determination of objective reality, because the matter that accompanies affects must allow for their capacity to resist identification and knowledge. This view recurs through his work and allows him to counter forms of naturalism, but it also lays him open to criticisms concerning a form of dogmatism with respect to material reality. Lyotard would appear to have a nonscientific and in principle unverifiable definition of matter, because he claims that matter is not solely determined by the natural sciences nor defined through philosophical definitions of objective reality. Yet this is not the case, because he resists offering a definition counter to naturalistic ones. Instead, he seeks to convince us that we should allow for the moving nature of matter on the evidence of the occurrence of affects and in addition to scientific accounts. Lyotard does not offer a pure theory about the form of matter, but a combination of descriptions of what matter must be given the occurrence of affects and given our creative responses to them (where we create new forms with them rather than seek to represent and identify them within established frameworks).

VII. ART AGAINST RECUPERATION

The connection of matter and affect comes out most strongly and is explained best in Lyotard’s studies of art and artists. He describes artists as working with a matter that drives them to experiment through affects. The artist is then both working through an affect, in an echo of Lyotard’s work on Freudian anamnesis, and creating new affects by allowing matter to stand as something that is not simply an object of knowledge. For example, in his many references to Cézanne, Lyotard describes the painter as attempting to create colors that “vibrate” in such a way as to trigger sensations in the viewer beyond sensations of specific colors. The colors go beyond their objective frame; they are not the colors of something. They also go beyond set meanings and narratives; they do not carry a specific sense but call for new ones. So although we have scientific definitions of matter, we must also have ones that leave a space for matter that drives artistic creation, provides a material for it, and becomes its effect. So when he speaks of
the importance of “motion” for Cézanne, this must supplement objective and
psychological approaches to motion with a sense of matter and affect as disrup-
tion, including the disruption of exclusive claims to understanding.

The sensitivity and precision of Lyotard’s work comes out well in this discus-
sion of painting. He is not saying simply that there are emotions beyond our
understanding, nor that the artist “sees” differently, nor that we can have a
romantic view of nature beyond a scientific one. Instead, his point is that there
is a cycle of affects prompted by and carried through matter, where the artist is
both driven by a material event and creator of one. Matter in the artwork must
be thought of in conjunction with affects, so there is never simply matter, nor
simply affect. All the relations are essentially circulating and driven onward on
a cycle of physical demands and creative replies. This is a “donation,” a given to
and a given by art as affect and matter, where neither of them nor any of their
combined individual instances can be separated out as the grounding moment
for true knowledge or true ungraspable feeling:

It is not the search for the condition, impersonal or not, of the given
which immobilized Cézanne before his mountain; it is the search
for its donation. Phenomenology cannot reach donation because,
faithful to the philosophical tradition of the Occident, it is still a
reflection on knowledge, and the function of such a reflection is to
absorb the event, to recuperate the Other in the Same.13

In parallel to this resistance to the desire to recuperate the otherness of matter
and affects into knowledge, Lyotard’s essays resist recuperation into final theo-
ries or argument, ideas or visions. This is not out of any preciousness or elitism,
much less out of a desire to fool readers or to adopt a false depth. Rather, his
essays lead us to the connection of fields with their “Others,” that is, with that
which is supposed to be kept outside them, or lies unconscious within them,
denied but at work in strange and unpredictable ways. Like the art he spends
so long describing and interacting with (much longer than any other topic),
his works repay greater attention to their detail rather than a focus on their
final points or arguments. Detail here means a combination of material with
sensation: how an ironic style can connect distant arguments by revealing and
triggering strange yet accurate sensations. So The Differend, for instance, can
be read as a thesis about certain types of legal and extra-legal conflicts, but
its aphoristic style is also suited to a retracing of influences and consequences
between multiple political desires and philosophical positions. This is not in

13. Lyotard, “Discours, Figure,” in The Lyotard Reader and Guide, Keith Crome and James
order to finally condemn any single position, but to get a better sense of what it presupposes and leads to, of which political desires and dreams and with which commitments about the resolution – the false resolution – of underlying disputes and claims it may commit us to. Lyotard’s works are therefore deliberately suggestive in a sense taken from Freudian anamnesis. Yet, even in this link to Freud as key influence, we learn little from Lyotard if we think of him as Freudian or anti-Freudian. He is a critical, constructive, and inventive essayist in his own right, always helping us to read in ways that point us toward unexpected omissions and rich associations. This should not be seen as a luxury, something we can afford only when all goes well – that is – never. It is rather a necessity driven by the requirement to remind ourselves of what we have excluded illegitimately, triggered by an affect we cannot ignore, that we must attempt to testify to, while never letting ourselves rest with the illusion that we have succeeded with a final just outcome: “The articulated phrase and the affect-phrase can ‘meet’ only in missing each other. From their differend, there results a wrong. If articulation and inarticulation are irreducible to one another, this wrong can be said to be radical.”

MAJOR WORKS

Pierre Bourdieu1 is normally considered to be primarily a sociologist, but he was trained philosophically and developed a philosophy of sociological practice that deserves attention. The purpose of this essay on Bourdieu is, first, to consider the philosophical origins of Bourdieu’s “negative philosophy”; second, to discuss the development of his philosophy of social science; third, to follow his articulation of a conceptual framework that he then applied to understand a range of kinds of social behavior; and, finally, to return to Méditations pascaliennes and other texts to discuss the way in which this framework was applied to the practice of philosophy. This is both a chronological sequence and a thematic progression.

On leaving the École Normale Supérieure, Bourdieu taught philosophy at a provincial lycée before he was conscripted to serve in the French Army in Algeria in the early years of the Algerian War of Independence (1956–58). On returning to France in 1961, he became secretary to the research group that had been established by Raymond Aron: the Centre de Sociologie Européenne, Paris. During the 1960s, he carried out research in relation to student life, their studies, and culture. In the same decade, he also carried out research on cultural production and reception. As a result of the translations into English of his educational research, he was at first primarily associated with the sociology of education, but the analyses of photography and art museums were the prelude to work on aesthetics and taste that was most clearly presented in his Distinction: A Social

Critique of the Judgement of Taste. It was this work that most firmly established his reputation as a sociologist of culture. From 1975, he edited his own journal – *Actes de la recherche en sciences sociales* – and, briefly (1989–97), an international review of books entitled *Liber* that was initially published simultaneously as a supplement to five European newspapers.

From the mid-1990s until his death, Bourdieu was an influential public figure in France and his disposition to favor the cause of the underprivileged gained for him a following in an international political context as well as in the field of international social science. His socioanalytical method and his political engagement were both demonstrated in the project that he directed that was published as *The Weight of the World: Social Suffering in Contemporary Society*. To these last years belong engaged texts such as *Acts of Resistance*, but it was his last course of lectures as professor at the Collège de France, *Science de la science et réflexivité*, that best represents the balance of his intellectual and social project.

Late in his career, in April 1997, just less than five years before his death, Bourdieu published his *Méditations pascaliennes*. There had been little overt reference to the work of Pascal in his earlier texts. Only hindsight enables us to detect “nuances” or “influences.” There was, of course, the suggestion, implicit in the title, of a revision or tacit critique of Husserl’s *Cartesian Meditations*, but the significance of the positive choice of Pascal is not to be ignored and Bourdieu devoted the introduction to his book to an explanation of this choice. There Bourdieu claimed that, when questioned about the relation of his thinking to Marx, he had for a long time adopted the habit of replying that “all in all, if I really had to affiliate myself, I would say I was more of a Pascalian.”

For Bourdieu, the supreme indication of his sense of affinity with Pascal was that Pascal had been “concerned …, devoid of all populist naivety, for ‘ordinary people’ and the ‘sound opinions of the people’” and, inseparably from this, had always sought:

> the ‘reason of effects,’ the *raison d’être* of the seemingly most illogical or derisory human behaviors … rather than condemning or mocking them, like the “half-learned” who are always ready to “play the philosopher” and to seek to astonish with their uncommon astonishments at the futility of common-sense opinions. (PM 2)

The corollary of this shared distrust of academic, or scholastic, or intellectual interpretations of ordinary experience was that Bourdieu was “convinced that Pascal was right to say that ‘true philosophy makes light of philosophy’”

---

In truth, Bourdieu always had a philosophical urge to disclose truths but always exhibited ruthless skepticism about the capacity of the institutionalized discourse of Philosophy, with all its accumulated autonomous traditions, to effect that disclosure. In writing *Méditations pascalienes*, he became aware of “the strangeness of my project, a kind of negative philosophy that was liable to appear self-destructive” (PM 7), but he was cautiously confident that his lifetime of social scientific inquiry would empirically suggest ongoing answers to ongoing questions about evolving humanity that would not be revealed in the self-referential speculation about transcendental human values of socially disengaged philosophers:

I do not know if I have succeeded, but I have in any case acquired the conviction that the social world would be better known, and scientific discourse about it would be better understood, if one were able to convince oneself that there are not many objects more difficult to understand, especially because it haunts the brains of those who try to analyze it, and because it conceals under the most trivial appearances, those of daily banality for daily newspapers, available to any researcher, the most unexpected revelations about what we least want to know about what we are. (PM 8)

As the title given to an interview of 1985 with Axel Honneth and others implies, Bourdieu’s commitment was to “Fieldwork in Philosophy.”

Before gaining entry to the École Normale Supérieure in Paris, where he studied from 1950 to 1954, Bourdieu had first been sent away from the rural environment of his childhood to board at the lycée in Pau, the main town of the Béarn in southwest France. His early social trajectory embodied a tension between the indigenous cultural influences of his family and the culture that he needed to acquire in order to succeed educationally and to compete effectively in the market of Parisian intellectual exchange. This cultural schizophrenia was reinforced linguistically, so Bourdieu himself claimed, between the spheres of deployment of the Béarnais dialect and French. There was, therefore, an experiential source for Bourdieu’s subsequent intellectual interest in the relationship between affective and cognitive understanding. In short, his intellectual endeavor came to focus somewhat incestuously on the nature of its own account of preintellectual feeling.

---

I. BOURDIEU’S EARLY PHILOSOPHICAL INFLUENCES

In the 1985 interview to which I have already referred, Bourdieu tried retrospectively to define his intellectual situation during his student years. Bourdieu mentioned the influence on him of Gaston Bachelard, Georges Canguilhem, Henri Gouhier, Martial Guéroult, Alexander Koyré, Jules Vuillemin, and Eric Weil. Elsewhere, he added Pierre Duhem to this list. He commented:

All these people were outside the usual syllabus, but it's pretty much thanks to them and to what they represented – a tradition of the history of the sciences and of rigorous philosophy … – that I tried, together with those people who, like me, were a little tired of existentialism, to go beyond merely reading the classical authors and to give some meaning to philosophy. (FP 4)

In the same interview, Bourdieu remarked that “When I was a student in the fifties, phenomenology, in its existentialist variety, was at its peak, and I had read Being and Nothingness very early on, and then Merleau-Ponty and Husserl” (FP 3). In summary, therefore, we can say that Bourdieu’s retrospective view in 1985 was that there were two main strands of influence on his thinking in the early 1950s: one derived from his knowledge of the work of professors specializing in the history and philosophy of science and the other derived from his reading of phenomenology. There is no space here to explore in detail the likely impact of all of these acknowledged influences on the development of Bourdieu’s thinking. But some key points can be made regarding, first, Bourdieu’s familiarity with the history and philosophy of science by reference simply to the work of Guéroult, and, second, Bourdieu’s comments about phenomenology with respect to the French reception of Husserl in the period after the Second World War. I shall suggest that Bourdieu’s early knowledge of Leibnizian rationalism and of interpretations of that rationalism in the history and philosophy

6. Martial Guéroult (1891–1976) was among the leading historians of philosophy of his generation. He taught at the University of Strasbourg from 1933 to 1945, held the Chair in the History of Modern Philosophy at the Sorbonne from 1945 to 1951, and was elected in 1951 to the Chair in the History and Technology of Philosophical Systems at the Collège de France, which he held until his retirement in 1962. In addition to his work on Leibniz, Guéroult wrote texts on Descartes, Berkeley, Malebranche, Spinoza, and Fichte. [†] Guéroult’s work on Spinoza is discussed in the essay by Simon Duffy in The History of Continental Philosophy: Volume 7.
of science led him toward what he was later to call a “constructivist” theory of science and away from the positivist philosophy of social science that was the legacy of the Durkheimians. Acquaintance with the work of Husserl consolidated this sense of the philosophical inadequacy of positivist empiricism and reinforced Bourdieu’s consistent opposition to any form of psychologism, but it was only the “discovery” of the orientation of the late Husserl in the post-Second World War period that enabled Bourdieu to reinsert a kind of empiricism and to reconcile his philosophical interests with the practice of social science.

II. THE INFLUENCE OF THE HISTORY AND PHILOSOPHY OF SCIENCE

We know that Bourdieu produced, under the supervision of Gouhier for a diplôme d’études supérieures in 1954, a dissertation that was a translation of, and a critical commentary on, Leibniz’s Animadversiones in Partem Generalem Principiorum Cartesianorum. Unfortunately, it seems likely that no copy of this study is extant and we can, therefore, only speculate about the nature of its content in relation to the development of Bourdieu’s thinking. Speculation is helped by Bourdieu’s recollection, in the “Fieldwork in Philosophy” interview, that while at the École Normale Supérieure, he had followed the classes of, among other philosophers of science, Guéroult at the Collège de France. In his Esquisse pour une auto-analyse, Bourdieu especially highlighted Guéroult’s Dynamique et métaphysique leibniziennes as one of the two great works – the other being Vuillemin’s Physique et métaphysique kantiennes – that enabled him to resist the influence of existentialism. Guéroult’s text was written quite specifically to reopen discussion of the relationship between dynamics and metaphysics, or, more generally, between science and philosophy in the work of Leibniz. The classical thesis had been that Leibniz’s philosophy followed exclusively from his science whereas the scholarship of the first decade of the twentieth century, notably that of Russell in his The Philosophy of Leibniz, translated into French in 1908, and that of Couturat’s La Logique de Leibniz (1901), had argued the reverse: that Leibniz’s metaphysics had followed completely from his logic and, above all, from his mathematical research.

---

7. For a discussion of Durkheim, see the essay by Mike Gane in The History of Continental Philosophy: Volume 3.
8. Henri Gouhier (1898–1994) taught at the University of Lille from 1929 to 1940, then came to the Sorbonne where, in 1948, he became Chair of the History of Religious Thought in France since the Sixteenth Century, a position he held until he retired in 1968. Gouhier published many texts on the history of French philosophy, including several books on Descartes as well as books on Malebranche, Pascal, Rousseau, Maine de Biran, Comte, and Bergson.
Guéroult’s text followed in detail the development of Leibniz’s philosophy of science. In his earliest works, of the 1670s, Leibniz opposed modern physicists such as Galileo and Wren who supposed that laws of motion could be deduced from the simple observation of the movement of bodies. For the early Leibniz, abstract, *a priori* laws of motion make possible the understanding of sensible movements. Although he was inclined to oppose crude empiricism, he nevertheless realized that there often appeared to be a disparity between the laws of abstract and concrete physics. As Guéroult puts it, Leibniz tried to overcome this disparity by arguing that:

> to pass from abstract laws to the concrete world, we have to suppose the intervention of the wisdom of God who creates an economy in the world such that the proximate effects of abstract laws are modified by their distant effects, so much so that there result entirely different real effects which are sensible phenomena.\(^\text{10}\)

This hypothesis enabled Leibniz to advocate the discovery of the causes of current phenomena by regarding them as distant enactments of their abstract origins. However, Guéroult shows that this conception did not enable Leibniz to understand the conservation of motion in the world and he was led to posit not just a principle of prime movement but, rather, a principle of ongoing participatory motion.

However, the consequence of Leibniz’s transposition of God from abstract, metaphysical prime mover of the material world to immanent spiritual presence in the physical world had the effect of liberating a vitalist, nonmechanical physics from metaphysics. To re-establish the unity of metaphysics and physics following this dissociation, Guéroult suggests that there were two possible ways of thinking available to philosophers. The first, he claims, was the way to be taken by Kant in his *Attempt to Introduce the Concept of Negative Magnitudes into Philosophy* (*Versuch den Begriff der negativen Grössen in die Weltweisheit einzuführen*) of 1763, whereby the opposition of forces in the physical world are taken to be the basis for rethinking metaphysics, whereas the second was the reverse way taken by Leibniz in his mature philosophy of locating physical opposition in the purely rational.\(^\text{11}\)

There are two important points to make here with respect to the influence of this history of the philosophy of science on the development of Bourdieu’s philosophy of social science. The first is that Leibniz rejected the empiricism of

---

his contemporaries, but also rejected the Cartesian separation of mind and body, of thought from extended matter. Leibniz struggled to advance the idea of an immanent, participatory logic involved in suffusing physical and metaphysical explanation as well as suffusing physical and metaphysical forces. For Leibniz, there were separable truths of reason and truths of fact, but the two constantly interrelated. The second point is that Guéroult’s text on several occasions explicitly cites Leibniz’s Animadversiones in evidence that Leibniz, by the time that it was written in 1692, had articulated clearly his view of the inadequacies of Cartesianism. Following Guéroult’s reading of Leibniz’s Animadversiones, the formal and substantive dimensions of Bourdieu’s intellectual activity were to be deliberately anti-Cartesian, on the one hand opposing the intellectual detachment of Sartre’s supposed political “engagement” and, on the other, attacking the biologically a priori status of Chomsky’s “generative grammar.” Leibniz’s project of reconciling individual freedom with logical and theological necessities thus provided the model for Bourdieu’s notions of agency and habitus, whereby, like “monads,” individuals interact neither wholly mechanistically in predetermined ways, as was suggested by the class determination of crude Marxism, nor wholly finalistically, dictated by goal-setting objectives. Instead, individuals act strategically by constantly making fluid adjustments to changing situations that balance mechanism and finalism pragmatically.

III. VARIETIES OF PHENOMENOLOGICAL INFLUENCE

As far as the influence of Husserl is concerned, we can revert to the passage quoted above in which Bourdieu commented that during his student days, “phenomenology, in its existentialist variety, was at its peak.” As stated, his comment also suggests that he was led back toward the work of Husserl by first reading Sartre and then Merleau-Ponty. Asked by his questioners whether he had ever been interested in existentialism, Bourdieu replied later in the same interview:

I read Heidegger, I read him a lot and with a certain fascination, especially the analyses in Sein und Zeit of public time, history and so on, which, together with Husserl’s analyses in Ideen II, helped me a great deal – as was later the case with Schutz – in my efforts to

analyze the ordinary experience of the social. But I never really got into the existentialist mood. Merleau-Ponty was something different, at least in my view. He was interested in the human sciences and in biology, and he gave you an idea of what thinking about immediate present-day concerns can be like when it doesn’t fall into the sectarian over-simplifications of political discussion … (FP 5)

Notice here that Bourdieu specifically highlights Husserl’s *Ideen II*, which were only first published in German in 1952, rather than *Ideen I*, which had been first published in German in 1913 and translated into French in 1950. This point is important because it indicates that Bourdieu was influenced by the “late” Husserl. There is a great deal of debate in Husserl studies about whether Husserl’s representation of phenomenology remained essentially consistent from his earliest work of the 1890s to the late and posthumous publications of the late 1930s. There is one view that insists that throughout his life Husserl experimented with different ways of saying the same thing, always searching for new ways of “introducing” phenomenology. There is another view that argues that there was an important shift in his thinking in the 1930s, partly in response to the divergent thinking of Heidegger and partly as a result of the mediation of his disciples and editors. I do not want to enter into this debate, but I do want to try to outline some of the differing responses to Husserl’s work in France and these differences do relate to the different textual sources for the representation of the meaning of “Husserl.” To summarize rather brutally, Husserl began by opposing the view that our knowledge is dependent on our psychological makeup. Instead, he emphasized the importance of logic and seemed to be searching for the universal characteristics of logic. This seemed to be a form of *a priori* idealism or transcendental phenomenology. The influence of Heidegger was to move toward an emphasis on Being rather than knowledge or consciousness. Husserl seemed to go some way in that direction but, in the

14. I emphasize this because the English translation of this passage published in *In Other Words* wrongly footnotes the English translation of *Ideen I*.
15. See, for example, the discussions of Husserl in the essays by Thomas Nenon and Diane Perpich in *The History of Continental Philosophy: Volume 3*.
1930s, emphasized the view that logic is grounded in our experience of the social world, or what he called the “life-world.”

In the 1930s and early 1940s, there were three dominant tendencies in the French reception of Husserl’s thought. The first was a tendency to consider Husserl’s work as a form of modern scholasticism. Bourdieu had no interest in the content of this pre-existential or neoscholastic strand of Husserl interpretation nor, formally, in its appropriation of the phenomenological movement for academic philosophy. The second response to Husserl’s work sought to constitute existentialism out of phenomenology, and pushed further the ontological interpretation of phenomenology advanced by Heidegger. Levinas, Sartre, Merleau-Ponty, and Ricoeur are the French thinkers most associated with the existentializing of Husserl that followed from the publication of Heidegger’s Sein und Zeit in 1927. There is often a whiff of Sartrean influence in Bourdieu’s early work, particularly, for instance, in Bourdieu’s rejection of the self-expressive nature of artistic creation in favor of a view, outlined in “Intellectual Field and Creative Project,” that artists constitute themselves and their works through encounters within a field of production. However, Bourdieu did not want to produce a philosophy of identity construction but, instead, to analyze encounters sociologically. Although he would have been sympathetic to Sartre’s rejection of the essential self, Bourdieu was not interested in developing an existential psychology in opposition to Freudianism.

The third tendency, which can be called “epistemological” insofar as it treated Husserl as a logician and philosopher of science, was led by Jean Cavaillès, who had a profound influence on some of the figures specifically mentioned by Bourdieu (Canguilhem, Vuillemin, and Merleau-Ponty). Before his conscription to the army, Bourdieu was about to register to carry out research under the supervision of Canguilhem on “the temporal structures of affective life,” which most likely would have reflected the interest of Canguilhem and Merleau-Ponty in physiology and medicine rather more than the phenomenology of “emotions” offered by Sartre in his Outline of a Theory of the Emotions. Bourdieu related to the work of Merleau-Ponty in two ways. The first way, I suggest, is

18. Full bibliographic information for the various essays by Bourdieu mentioned in what follows can be found in the Bibliography.
19. Jean Cavaillès (1903–44) was a philosopher of mathematics and science whose interest in logic led him to Freiburg to study with Husserl in 1929. He taught at the École Normale Supérieure and the Sorbonne. One of the founders of the French Resistance, Cavaillès was captured by the Nazis and executed. [*] Cavaillès’s work is also discussed in the essay by Pierre Cassou-Noguès in The History of Continental Philosophy: Volume 4.
21. For Bourdieu on Canguilhem, see Esquisse pour une auto-analyse, 40–45.
that he was influenced by Merleau-Ponty in the way he developed the notions of *hexas* and *habitus*, the mechanisms of cultural adaptation adopted by people. These concepts became parts of Bourdieu’s analytic apparatus but, at the same time, he was also influenced by Merleau-Ponty’s response to Husserl in being inclined to favor noncognitive responses to social reality: where Merleau-Ponty was to elevate perception above scientific explanation, Bourdieu’s use of photography was, arguably, an experiment in trying to bypass science in representing social phenomena.

Ricoeur published a translation of Husserl’s *Ideen I*, with a detailed translator’s introduction, in 1950 – the year in which Bourdieu commenced study at the École Normale Supérieure. Ricoeur’s philosophical exegesis was an attempt to distinguish Husserl’s transcendental idealism both from Cartesian *apriorism* and from Kantian transcendental idealism. Ricoeur argued that:

Husserl’s ‘question’ … is not Kant’s; Kant poses the problem of *validity* for possible objective consciousness and that is why he stays within the framework of an attitude which remains natural. … Husserl’s question … is the question of the origin of the world …; it is, if you like, the question implied in myths, religions, theologies and ontologies, which has not yet been elaborated scientifically.23

At the same time that Bourdieu was reading discussions of the implications of Kant’s critical philosophy for the elaboration of a philosophy of science, Ricoeur’s exposition opened up the possibility, of which Bourdieu would have been aware, that Husserl’s work could help in attempting to analyze the foundations of Kantian *apriorism*. Phenomenology was not to be understood as another philosophy but as a method for analyzing all modes of thought, including *philosophical* thought. This is the origin of Bourdieu’s “reflexivity,” or, better, his use of Bachelard’s idea of “epistemological break” to expose the social origins of all “objective” accounts of the social. It was this interpretation of Husserl – found in Lyotard’s introduction to phenomenology of 1954 (to which Bourdieu never

---

22. Bourdieu took many photographs in Algeria. These have been exhibited internationally since his death. Some are reproduced in Bourdieu, *Images d’Algérie: une affinité élective*, which also contains a discussion of the use of photography as a research instrument in social science. Bourdieu’s discussion of photography was sustained in Pierre Bourdieu et al., *Un art moyen: Essai sur les usages sociaux de la photographie* (Paris, Éditions de Minuit, 1965).

referred in print)\textsuperscript{24} – that enabled Bourdieu to make a link between the legacy of Husserl and the influence on the theory of scientific method of Bachelard’s “historical epistemology.” This integration was most evident in \textit{Le Métier de sociologue}, which Bourdieu published in 1968 in collaboration with Jean-Claude Passeron\textsuperscript{25} and Jean-Claude Chamboredon. Subsequently, in the 1970s, it was the kind of differentiation between Husserl and Kant made by Ricoeur that enabled Bourdieu to deploy Ernst Cassirer’s philosophy of symbolic forms to develop a sociology of culture.\textsuperscript{26}

With the posthumous translation of Husserl’s \textit{The Crisis of European Sciences and Transcendental Phenomenology} and \textit{Experience and Judgment}, subtitled \textit{Investigations in a Genealogy of Logic}, published in German respectively in 1954 and 1948, the view developed that Husserl’s thought was an attempt to articulate the prelogical foundations of logical systems. Two articles by Jean Wahl, both published in 1952, emphasized this reading.\textsuperscript{27} The first offers some notes on \textit{Experience and Judgment} and the second goes further in arguing that \textit{Experience and Judgment} highlights a potentially empirical dimension to Husserl’s late work. According to Wahl, Husserl argues in \textit{Experience and Judgment} that

\textsuperscript{24.} I refer here and later to Lyotard’s introduction to phenomenology (\textit{La Phénoménologie} [Paris: Presses Universitaires de France, 1954]; published in English as \textit{Phenomenology}, Brian Beakley [trans.] [Albany, NY: SUNY Press, 1991]), because it provides a useful indicator of reactions to Husserl for Bourdieu’s generation at the date when Bourdieu was completing his studies at the École Normale Supérieure. I have no evidence to suggest that Bourdieu read or used the Lyotard text, and Bourdieu’s attitude toward Lyotard was subsequently affected adversely by the association of Lyotard with “postmodernism,” which, as a movement of thought, Bourdieu disliked. Nevertheless, Lyotard taught at a lycée in Constantine, Algeria, during the 1950s and there are points of connection with Bourdieu’s thinking, in that they were both influenced by phenomenology and by the tangible complexity of the Algerian War of Independence to become skeptical about the claims of Marxism to provide universal explanations of the nature of capitalism and of the potential for revolution of the proletariat. Comparison between the work of Bourdieu and Lyotard is fruitful if we transcend crude differentiations between “modernism” and “postmodernism.”

\textsuperscript{25.} Jean-Claude Passeron was a contemporary of Bourdieu at the École Normale Supérieure and, like Bourdieu, served in the army in Algeria. On returning to France in the early 1960s, he became research assistant to Raymond Aron and worked with Bourdieu in the Centre de Sociologie Européenne. They ceased their collaboration in 1972 and Passeron’s main publication since that date is \textit{Le Raisonnement sociologique} (Paris: Nathan, 1991).

\textsuperscript{27.} Jean Wahl, “Notes sur la première partie de \textit{Erfahrung und Urteil},” \textit{Revue de métaphysique et de morale} 57 (1952), and “Notes sur quelques aspects empiristes de la pensée de Husserl,” \textit{Revue de métaphysique et de morale} 57 (1952).
“intentionality” is grounded in a sphere that precedes judgment. Wahl sees this as a form of realism that can be exposed in a form of empirical inquiry. Interest in Husserl, therefore, shifted toward an interest in the sociohistorical production of forms of knowledge. In terms of the interpretation of Husserl, the issue in relation to this fourth, “empiricist,” response to his work, neither scholastic nor existential nor epistemological, relates to the debate about the development of Husserl’s thought to which I have referred. However, the important point for understanding Bourdieu is to realize that his involvement in empirical social science inquiries throughout his career was an involvement that did not take the claims of empiricism at face value but, instead, situated them within a framework of thinking that was a consequence of working through the progression of Husserl’s thought.

Quite possibly, Bourdieu (and Lyotard) were also both directed toward a new way of grounding social science by a book published in 1946 by Jules Monnerot, entitled Les Faits sociaux ne sont pas des choses. As the title suggests, this was an attempt to use phenomenology to expose the formula of positivist social science advanced by Durkheim in The Rules of Sociological Method, first published in 1895. For Monnerot, there was an important distinction to be made between the understanding and the explanation of social phenomena. Durkheim’s work enabled us, instead, to see sociological explanation as one form of understanding that can itself be understood sociohistorically. This use of Husserl enables us to understand Bourdieu’s uneasy relationship to the sociological tradition as outlined in his Le Métier de sociologue (1968). When, in 1950, Aron reprinted the book he had written in 1933 after a research visit to Germany, entitled La Sociologie allemande contemporaine, in which he gave the first detailed exposition in French of the work of Max Weber, he inserted a reference to Monnerot’s book as a footnote. Differentiating the work of Weber from that of Durkheim, Aron wrote in his original text: “To grasp the distinction between [Weber’s philosophy] and the philosophy of Durkheim, shall we say that, thanks to understanding, the world of history is no longer a collection of things [choses], but human lives in a state of becoming.”29 Aron added a footnote here, commenting that “J. Monnerot has taken up these suggestions in his book, Les Faits sociaux ne sont pas des choses.” But Monnerot was not taking these ideas up in a way that was favorable to the Weberian philosophy of social science, as Aron was wanting to imply. Instead, Monnerot’s text

pointed toward the kind of participatory social critique of sociological explanation, based on a phenomenological orientation, that was to be the basis of Bourdieu’s efforts to understand social phenomena.30

IV. THE EARLY TENSION BETWEEN SOCIOLOGY AND PHILOSOPHY

Bourdieu gained a reputation as a social scientist and was appointed to the Chair of Sociology at the Collège de France in 1981, but it is crucial to understand that his social research should never be seen as a detached, Cartesian, observation of social reality, but, rather, as the activity of a participatory social agent, deploying various explanatory languages to seek to establish their socially constructed prepredicative limits. Bourdieu’s understanding of the relationship between social science and philosophy, as well as the rationale for his attempted social scientific critique of philosophy, can be clarified with the help of Lyotard’s representation of phenomenology. In his consideration of “The Relation of Phenomenology to the Human Sciences” (Phenomenology, ch. IV), Lyotard argued that phenomenology “was led inevitably, by the very fact that it is not a metaphysics but a philosophy of the concrete, to take hold of sociological data in order to clarify itself, and equally to put into question the procedures by which sociologists obtain this data, in order to clarify sociology.”31 Similarly, Lyotard wrote that “Phenomenology’s discussion of its own historical meaning can be pursued indefinitely, since this meaning is not fixable once and for all.”32 Like Lyotard, Bourdieu was not interested in becoming a phenomenological philosopher, but, unlike Lyotard, Bourdieu chose to relate to the contingency of philosophical thought by subjecting it to a form of social scientific analysis that was simultaneously aware of its own philosophical shortcomings.

The tension between philosophy and sociology had already been apparent in Bourdieu’s first book, Sociologie de l’Algérie. Bourdieu’s intention was to transfer his philosophical interest in the phenomenological analysis of emotions and intersubjectivity to the larger issues of crosscultural adaptation that he witnessed

31. Lyotard, Phenomenology, 75. This could be taken as an anticipation of the position that Bourdieu articulated in “Thinking about Limits.”

32. Lyotard, Phenomenology, 133.
in relation to the Algerian response to French colonial intervention in North Africa. He needed to establish a status quo ante of Algerian cultures in order, subsequently, to analyze processes of cultural adjustment. This was the motive forcing Bourdieu to find ways of describing the traditional organization of Algerian tribes. A descriptive sociology was a necessary instrument to develop a descriptive phenomenology of acculturation processes. Bourdieu’s accounts of the original social organization of the Algerian tribes were mainly of interest to him inasmuch as they could be regarded as objectifications of the putative subjective values of those people whom he was to interview in their new situations in Algiers. The accounts were discursive exercises. Although the first edition of the book was entitled Sociologie de l’Algérie, the English translation of 1962 was entitled The Algerians, by which time, also, the findings were differently presented. By 1962, Bourdieu, back in France, had attended some of the research seminars of Lévi-Strauss and the English text contains diagrammatic representations of the social/spatial organization of a Kabyle house that anticipate “The Berber house or the world reversed.” This was Bourdieu’s most “Lévi-Straussian” article, but it subsequently became clear that there was no more conviction on Bourdieu’s part about this ethnological gloss than there had been in his use of Weberian discourse in Sociologie de l’Algérie to describe the Islamic fundamentalism of the Mozabite tribe. What we see in Bourdieu’s own critique of some of his earlier Lévi-Straussian pieces in the first part of Esquisse d’une théorie de la pratique is not so much the discovery of a new methodological position but the articulation of a position that was able to accommodate the artificiality of the explanatory discourses that he had exploited in his formative intellectual apprenticeship in North Africa.

After returning to France from Algeria, Bourdieu first lectured at the University of Lille before establishing himself as a lecturer in the École des Hautes Études en Sciences Sociales and as a researcher in Aron’s research group, the Centre de Sociologie Européenne. He undertook studies of the experience of students in French higher education, particularly students of philosophy and sociology, at the University of Lille when he was teaching there. The same mixture of concerns was present in this work as had been present in the Algerian research. Les Héritiers, les étudiants et la culture, coauthored with Passeron, focused on the curriculum as a mechanism of acculturation and Bourdieu published the results of questionnaires that attempted to generate a profile of the cultures of students prior to their academic studies.

In the mid-1960s Bourdieu was involved with a project on photography and photographic clubs that resulted in the publication of Un art moyen: Essai sur les usages sociaux de la photographie in 1965 and also involved in a project analyzing the attendance at French, and then selected European, museums/art galleries that resulted in the publication of L’Amour de l’art in 1966. That year
also saw the publication of “Condition de classe et position de classe” and “Une sociologie de l’action est-elle possible?,” both of which were essentially theoretical, the former in relation to structuralism and the latter in opposition to Alain Touraine, but there had been very little reason to anticipate the developed argument of “Champ intellectuel et projet créateur” – neither the articulation of the concept of “field” nor the application to cultural history. Bourdieu argued – against writers such as Lucien Goldmann – that the sociology of knowledge in general and of artistic production in particular should not be predicated on the autonomization of historical producers studied in relation to a currently imposed construction of their supposed social contexts. Rather, it should be founded on the analysis of those impersonal, objective systems within which communication takes place and within which meanings are immanently established. “Sociology and Philosophy in France since 1945: Death and Resurrection of a Philosophy without a Subject,” published with Passeron in 1967, was an attempt to bring together the two perspectives in relation to their own scientific practice. Within the article, they attempted to provide an objective social history of intellectual relations in France between 1945 and 1966 from a systematically sociological perspective adopted at the end of this period, while, at the same time, they endeavored to contextualize their own intellectual agency during those years. In Les Héritiers, Bourdieu and Passeron had already inspected the social contingency of the student selection of these subjects of study and it could be said that they were now analyzing the social contingency of how these subjects were themselves constituted for student consumption. It was an approach that anticipated the abstract discussion of the “arbitrariness” of curriculum content in La Reproduction, but the constant, tacit frame of reference

33. Alain Touraine (1925– ) is a leading French sociologist who has been mainly concerned with the analysis of social movements. He founded the Centre d’Étude des Mouvements Sociaux in the École des Hautes Études en Sciences Sociales, Paris. Bourdieu criticized what he took to be a determinist philosophy of social action, linked with a Marxist view of history, that he found in Touraine’s Sociologie de l’action. Bourdieu needed to make clear that his developing theory of practice implied a completely different view of social agency. Since the 1960s, Touraine has written numerous books, few of which have been translated into English. His political and intellectual position shifted somewhat, but there was never any other direct confrontation between Bourdieu and Touraine. For a comparison between the research methodologies of Bourdieu and Touraine, see Jacques Hamel, “Sociology, Common Sense, and Qualitative Methodology: The Position of Pierre Bourdieu and Alain Touraine,” Canadian Journal of Sociology 22 (1997).

34. Lucien Goldmann (1913–70) was an influential Marxist literary critic, sociologist, and philosopher, particularly in the 1950s and 1960s. His Le Dieu caché: Étude sur la vision tragique dans les Pensées de Pascal et dans le théâtre de Racine (The Hidden God: A Study of Tragic Vision in the Pensées of Pascal and the Tragedies of Racine) is useful background reading in relation to Bourdieu’s Méditations pascaliennes.
was Bourdieu’s own position-taking between the two intellectual disciplines: the one within which he was trained and the other that he was employed to transmit.

Having initially dabbled with Lévi-Straussian thinking in the early 1960s, Bourdieu had then been tempted, in seeking to present himself as a sociologist, by American quantitative methods. The detailed statistical appendices to *L’Amour de l’art* suggest this temporary temptation. This was the period in which Bourdieu developed the conceptual framework, or interlinking explanatory system, on which much of his reputation as a sociologist depends. The core concept was the “habitus” by which, in his own words, he meant:

> The conditionings associated with a particular class of conditions of existence produce *habitus*, systems of durable, transposable dispositions, structured structures predisposed to function as structuring structures, that is, as principles which generate and organize practices and representations that can be objectively adapted to their outcomes without presupposing a conscious aiming at ends or an express mastery of the operations necessary in order to attain them.35

Many of the components of Bourdieu’s model of social reality are contained within this dense sentence. He advocated a “soft” determinism: human behavior is semi-conditioned by class background but everyone has a degree of freedom (and the extent of that degree of freedom is a function itself of class position) to exercise choice by which that semi-conditioned original can be modified. We all inherit the parameters of cultural disposition, which we can modify by making our own subsequent cultural choices throughout our lives. Bourdieu distinguished between class “condition” and class “position” and suggested that we all seek to modify our originating condition by deploying the status of objective symbols to alter our social positions. We start life with an originating “cultural capital” derived from our family backgrounds and we then construct our social trajectories by absorbing the social significance of a range of objects such as artifacts or educational qualifications. These objective symbols themselves only possess the capacity to influence individual social trajectories because status differentiation is itself constructed within a market or competition of values. The cultural capital we acquire that modifies our inherited cultural capital derives its value from its own recognition within “fields.” We find our ways through life by acting strategically to assimilate values and attitudes that are latently present at our disposal in a range of competitively self-fulfilling and self-validating objective fields of discourse or activity. If, for instance, we are brought up in a disadvantaged inner city and choose to join a golf club and move out to the country or

---

to a suburb to live, we are deploying the socially constructed estimation of golf club membership and suburban living to modify our originating social status.

V. BOURDIEU’S EMERGING RECONCILIATION OF SOCIOLOGY AND PHILOSOPHY

This framework of thinking developed as if it were an adequate, or at least debatable, sociological account of social reality. However, by 1966/67, Bourdieu was committed to establishing a new reconciliation between philosophy and sociology that would underpin the empirical practice of the research group that he was to lead from 1968. These were very productive and significant years for Bourdieu. In 1967 he published his translation into French of Erwin Panofsky’s *Gothic Architecture and Scholastic Thought*, concluding with a “postface” whose argument is, in part, repeated in “Systèmes d’enseignement et systèmes de pensée.” Panofsky was a disciple of Cassirer and Bourdieu was clearly interested in Cassirer’s thought throughout this period. Not only did he cite Cassirer’s “Structuralism in Modern Linguistics” and his “Sprache und Mythos” in articles but, as general editor of the “Le Sens Commun” series for Éditions de Minuit, Bourdieu was responsible for organizing the translations into French of five works by Cassirer between 1972 and 1977, notably the three volumes of *La Philosophie des formes symboliques* (1972) and *Substance et fonction: Eléments pour une théorie du concept* (1977). In collaboration, Bourdieu produced *Le Métier de sociologue* in 1968. This was subtitled “Epistemological preliminaries” and was intended as the first of several volumes that would be of practical value to research students. It offered a blueprint for the theory of sociological knowledge that he was counterposing against structuralism. Indeed, this was the title of an article – “Structuralism and Theory of Sociological Knowledge” – that appeared in 1968 in *Social Research*, almost as a companion piece with “Sociology and Philosophy in France since 1945.” In 1970, Bourdieu and Passeron published *La Reproduction: Éléments pour une théorie du système d’enseignement*. The following year Bourdieu published both “Une interprétation de la théorie de la religion selon Max Weber” and also “Genèse et structure du champ religieux.” There were other significant texts in these years but I want to highlight the section of the first chapter of *Esquisse d’une théorie de la pratique,*

---

*36. For a discussion of Cassirer, see the essay by Sebastian Luft and Fabien Capeillères in *The History of Continental Philosophy: Volume 3.*
38. This article was never published in French.
39. See note 30.
précédé de trois études d’ethnologie kabyle, which was published separately in translation in 1973 as “The Three Forms of Theoretical Knowledge.” Bourdieu positioned himself within sociology by reference to a perceived inadequacy of Weber’s methodology. Weber’s use of “types” was an artificial or arbitrary imposition on phenomena that possessed inherent systemic meaning. In defining the boundaries of sociological explanation, however, Bourdieu was aware that sociological explanation as such represented a discursive imposition that was as artificial or arbitrary as “typological” imposition within the discourse. Necessarily, therefore, Bourdieu was forced to “situate” his own explanatory model of social action and to recognize that explanation is a form of action that is susceptible to analysis as much as what it purports to explain.

In spite of Bourdieu’s criticism of Merleau-Ponty in “Sociology and Philosophy in France since 1945,” Bourdieu had only strategically renounced his earlier phenomenological interests. The philosophical influence of Merleau-Ponty’s La Structure du comportement (1942) was particularly evident in “Célibat et condition paysanne” and in Bourdieu’s development of the concepts of habitus and hexis. And Merleau-Ponty’s La Phénoménologie de la perception was reworked in Bourdieu’s “Eléments d’une théorie sociologique de la perception artistique,” in which Bourdieu’s inclination was to relate varieties of art perception to the social positions of perceivers and, therefore, to “sociologize” phenomenological insights in a way that anticipated the detailed analysis of Distinction.

At the same time that Bourdieu was defining the limits of social scientific explanation, he was also reflecting on the prelogical, ontological realities that social science purported to describe. The framework of Le Métier de sociologue was based on an adoption of Bachelard’s emphasis on the need to make epistemological breaks so as to understand the social conditions of production of scientific explanation. It appeared, therefore, to advocate a sociology of sociology or a reflexive sociology as a necessary procedure for constructing and verifying sociological findings. The epistemological breaks were presented as the means by which sociological explanation could be refined. However, by the time that Bourdieu published “The Three Forms of Theoretical Knowledge” in 1973, the epistemological breaks were serving a broader purpose. They were functioning to allow the sociological analysis of sociological objectivism to become a means by which ontic realities might be disclosed. The first epistemological break advocated by Bourdieu in “The Three Forms of Theoretical Knowledge” – away from the knowledge possessed in primary experience – enables objectivist scientific knowledge, but the objectivism remains within the domain of Husserlian “natural” attitudes. The second epistemological break, however, enables a different perspective entirely to be achieved in relation to all natural attitudes. The second break requires a sociological analysis of the grounds of all kinds of objectivism, including sociological objectivism. It liberates what,
for a short while, Bourdieu called “praxeological” knowledge. This third form of knowledge is enhanced because it is the consequence of continuing dialectical encounter between primary and objective knowledge. By this reconciliation or synthesis of a philosophy of science derived from Bachelard and the process of phenomenological reduction derived from Husserl, Bourdieu was able to maintain a strictly subjectless or antihumanist methodology of social science while allowing for the agency of beings within a life-world. Bourdieu’s criticism of Merleau-Ponty and Lévi-Strauss had been that they both allowed their philosophical positions to distort the truly positivist scientificity of sociological investigation. Bourdieu’s accommodation of philosophy and sociology allowed for a clear demarcation between the possible achievements of sociology and ontology. Bourdieu’s second epistemological break is therefore not a meta-scientific posture within the field of sociology. Instead, it represents a sociological path to phenomenological reduction. Bourdieu’s insistence that “tout est social” enabled him to identify ontological and sociological analysis such that he tried to subject all discourses to sociological reduction without privileging the sociological practices of the natural attitude.

VI. BOURDIEU’S DUAL DEPLOYMENT OF SOCIOLOGY AND PHILOSOPHY

Bourdieu’s dual use of sociological inquiry has to be clearly stated. In the 1960s, he played the game of the dominant sociological discourse, behaving as if explanation corresponded with an objective reality. By the end of the decade, he was finding ways to distance himself from this kind of scientific objectivism and began to emphasize a theory of practice that would include an analysis of the practice of the observing scientist. By the 1980s, Bourdieu was willing to move thoroughly away from a still detached analysis of the social action of others toward a reflexive analysis of his own situation as an immanent component of phenomena-to-be-observed. His *Homo Academicus* was an attempt to offer a sociological analysis of the intellectual field that generated Parisian social science within its higher education institutions in the 1960s and this attempt included a reflexive account of his own position. In the same decade he wrote an account of the genesis of his own conceptual framework, making it clear that the concepts that he had developed in the 1960s had been instruments that had engaged with social reality and had not been statically representative of it. Bourdieu was prepared to understand his own social trajectory sociologically.

---

and also to recognize that his concepts were sociohistorically contingent. Similarly, he recognized that the established fields of intellectual discourse, including that of sociology, had to be analyzed relative to the historical conditions of their production. This ambivalence about the status of sociological explanation explains the way in which Bourdieu throughout his career sought to shift intellectual perspective between differing public discourses or fields, sometimes presenting himself as an anthropologist, a sociolinguist, a cultural sociologist, or philosopher, without relinquishing his fundamental commitment to a sociological approach.

The same ambivalence was displayed in relation to philosophical discourse. We have seen that Bourdieu used reference to Pascal as a way of defining his own position in relation to philosophy. Earlier he had attempted a sociological analysis of the work of Heidegger that constitutes an objective case-study of the confrontation of the claims of sociology and philosophy that Bourdieu experienced subjectively throughout his career. Although *L’Ontologie politique de Martin Heidegger* was published as a book in 1988 – probably stimulated by the Parisian “Heidegger debate” at that time in which contesting positions were held about whether Heidegger’s philosophy was inextricably associated with and contaminated by his involvement with Nazism – it was nevertheless only a modified version of an article that Bourdieu had published in an early number of his own journal in 1975. Although *L’Ontologie politique de Martin Heidegger* was published as a book in 1988 – probably stimulated by the Parisian “Heidegger debate” at that time in which contesting positions were held about whether Heidegger’s philosophy was inextricably associated with and contaminated by his involvement with Nazism – it was nevertheless only a modified version of an article that Bourdieu had published in an early number of his own journal in 1975. Given that I argue that Bourdieu’s use of sociological explanation was pragmatic and subordinate to his phenomenological agenda (which he tried to carry out by deploying sociology at a different level), the discussion of Heidegger is particularly interesting in that Bourdieu was attempting a criticism of one strand of phenomenological work from a position that he had developed in response to an alternative strand.

The ambiguity of Bourdieu’s relation to the work of Heidegger is apparent and has to be understood in the context of Bourdieu’s thinking in the 1970s, between *Esquisse d’une théorie de la pratique* and its English “translation” as *Outline of a Theory of Practice* in 1977, and, in particular, in the context of several articles of the period on language, such as “La Critique du discours lettré,” and others that were collected in his *Ce que parler veut dire*. In 1975, Bourdieu was analyzing Heidegger’s use of philosophic language only as a case-study of the use of language in all objectivist discourse. Bourdieu’s contention tended to

---

43. It is important to look at the relationship between these two texts rather than to regard *Outline* as simply a translation of *Esquisse*. In the five years that separated the original from the translation, Bourdieu clearly moved from articulating dissatisfaction with “structuralism” toward arguing positively for a methodology that might be called “poststructuralist,” and this shift is reflected in the way the text was transformed and altered.
be that in order to secure effective detachment, scientific language has to be a self-contained, technical language, adhering to the rules of its own game. The ideal, extreme form would be mathematical language. He accused Heidegger of appropriating the language of everyday experience (that, at the time, was laden with volkisch sentiments) and importing it into the language of philosophical discourse. He argued that Heidegger gave everyday fascist expressions an academic philosophical respectability and betrayed the capacity of scientific discourse to acquire a socially, historically, and institutionally constructed detachment from everyday prejudice. Bourdieu’s solution to the problem of the relationship between the language of primary experience and the language of science/philosophy was that both should remain discrete and that the deployment of language in science should be scrutinized sociologically. For Bourdieu, Heidegger destroyed the pragmatic autonomy of science/philosophy precisely by manufacturing a “pure” philosophy out of vulgar prejudice. Heidegger had transgressed the boundaries between Pascal’s “orders” as Bourdieu was to reformulate them. The tension, for Bourdieu, was that although he was sympathetic to Heidegger’s ontological orientation, he thought that Heidegger had perverted the function to be served in society by the reflexive exercise of reason.

Bourdieu exploited phenomenology while rejecting its transcendental pretensions. In effect, phenomenological reduction was, for Bourdieu, a heuristic device within the natural attitude that owed its pragmatic results to claims of transcendence that he did not accept. We can conclude that Bourdieu’s relationship to the classical tradition of western European sociology was unique but also that in seeking to maintain an instrumental integrity for a reflexively delimited sociological orientation, Bourdieu tried to establish an equally unique relationship with the classical tradition of western European philosophy.

**MAJOR WORKS**

Michel Serres’s career began at a moment when structuralism was becoming an important intellectual paradigm in France. His mathematical approach to the question set him apart from those who came to structuralism from a more linguistic or phenomenological perspective. He quickly developed a broader research agenda that concentrated on the cross-disciplinary potential suggested by structuralism. Communication emerged as a crucial concept, opening on to the broader question of how order emerges from disorder (just as a message emerges from background static in a communicational channel). Serres has by no means been a “technical” philosopher in the mode of phenomenologists or language philosophers. A rereading of Lucretius allowed him to imagine an intellectual method that could combine philosophy, history, and literature, ultimately prompting him to claim that the literary text creates knowledge that is as crucial as that produced by philosophical work or scientific discovery. A key essay on Émile Zola developed this insight by describing a Zola who wrote at the crossroads of nineteenth-century science and technology. Moreover, Serres’s broad view of the vocation of the philosopher reconnected in productive ways with the project of the encyclopedia as first imagined in the eighteenth century and led to his editorial and collaborative participation in a number of projects aimed at presenting the state of knowledge in a variety of fields.

Although it can be said of any philosopher that his or her intellectual perspective is the product of a particular, personal biography, Michel Serres’s work regularly reminds us explicitly of the importance of a philosopher’s life experiences and thus gives real substance to this notion, since Serres’s philosophical writing could be characterized in part by the way he weaves personal anecdotes,
moments, and memories into the very fabric of his arguments. “My peasant memories recall this vanished culture. Animals and humans lived together in a convivial space, the barnyard, day and night in all four seasons,” he comments in *Hominescence*, as he describes the end of the culture (in the broadest sense) of an agricultural mode of existence, brought about by technologies that redistribute human societies in a different pattern. In the first pages of *Les Cinq sens: Philosophie des corps mêlés – 1*, an anecdote about a fire aboard a ship on which Serres was serving provides a narrative of the sensations provoked by this dangerous lived experience and transforms the particular of a biographical incident into a striking preface to an argument about how the senses connect human beings to their world.

Innumerable similar moments occur in other essays, but the two different periods of Serres’s life to which the preceding examples allude, his rural upbringing and his subsequent experiences as a naval officer in the 1950s, are particularly exemplary. It would not be stretching things too much to say that the rural landscape and the marine seascape are the domains of predilection for Serres’s thinking and that they represent, not unexpectedly, two of his principal analytical tendencies: on the one hand, a fascination for the details, asperities, irregularities, in short, the seemingly stochastic disorder of the lay of the land if it is adhered to infinitely closely, and, on the other hand, the abstract geometry of the navigator, an absolutely indispensable mathematical perspective for successful travel in a realm of sameness (the sea) upon which a burgeoning, even infinite, number of possible paths make the abstract, precise calculations of the navigator essential. The irregularities of the land in a rural environment preclude immediate and broad abstraction, while the implacable sameness of a marine environment invites it.

Small wonder that the tutelary deity chosen by Michel Serres to symbolize his work has always been Hermes, messenger of the gods and thus intrepid traveler and guide of travelers (navigator), god of ruse and trickery, of commerce (inventor of weights and measurement) and of exchange, but also god of shepherds (the rural and the pastoral) and inventor of the first musical instrument

1. Michel Serres (September 1, 1930– ; born in Agen, France) was educated at the École navale (1949) and École Normale Supérieure (1950–55), and received a *doctorat ès lettres* from the Sorbonne in 1968. His influences include Bachelard, Brillouin, Canguilhem, Dumézil, Foucault, Girard, and Monod, and he has held appointments in philosophy at Clermont-Ferrand (1958–68), in philosophy at the University of Paris VIII–Vincennes (1968–69), in history of science at the University of Paris I–Sorbonne (1969–96); in French and Italian at Stanford University (1984– ); and at the Académie Française (1990– ).
(the father of Pan).³ It is worth mentioning that one of Jacques Derrida’s foundational essays, “La Pharmacie de Platon” (“Plato’s Pharmacy,” in La Dissémination [1972]), is centered on the Egyptian deity Thoth, whom the Greeks associated with Hermes.⁴ Philosophers of the same generation in the French higher education system, and classmates at the École Normale Supérieure, Serres and Derrida gravitate toward a mythological figure who is at the heart of the invention of measurement and knowledge.⁵ Characteristically, however, their interests in this mythological divine figure diverge radically. Whereas Derrida chooses to emphasize Thoth’s activities as inventor of writing, thereby constructing an analysis that is all about the origin of writing and how this origin undercuts the notion of original meaning, Serres’s references to Hermes mobilize the gamut of the deity’s potential as a creator of passages – among geographical spaces, domains of knowledge, or social communities. Derrida’s article is about the end of philology; Serres’s aim in returning regularly to Hermes is a sustained narrative about reconfiguring disciplinary knowledge and establishing connections that the confines of traditional disciplines have prevented us from making.

I. SERRES’S EARLY WORKS

The geometry and topology of Hermes’s itineraries lead us inevitably to mathematics, a discipline at the heart of Serres’s endeavors from the beginning. His first book, his doctoral thesis entitled Le Système de Leibniz et ses modèles mathématiques, appeared in 1968, the same year as the first volume of the Hermès series.⁶ The focused argument of Le Système de Leibniz doubtless meant that it would always be reserved for a relatively small number of specialists, but its central concern with mathematics carried over into Hermès and well beyond. The first Hermès volume appeared at the height of the structuralist period in France. Serres weighs in on the structuralist method in the introduction to the volume, in which he argues that a mathematical approach offers the only way to conceptualize structure in a formal manner: “The notion of structure is a formal notion. … A structure is an operational set with an undefined meaning … grouping elements, of any number, whose content is unspecified, and a finite

⁴ For a detailed discussion of Derrida on this point, see the essay by Samir Haddad in this volume.
⁵ The first volume of Serres’s five-volume Hermès series, Hermès I: La Communication, appeared in 1968.
⁶ The five Hermès volumes are collections of essays loosely tied together by Serres’s themes of predilection and published between 1968 and 1980.
number of relations whose nature is unspecified.”

The formal and mathematical nature of the definition of structure proposed here emphasizes the fact that the operational set at stake, defined within its own domain, is imported elsewhere without a content (the term “importation” is used explicitly by Serres himself) and brings with it mainly the relations that construct its coherence in its original domain. The mathematical abstractness of the structuralist model is what separates a structure from an archetype: the archetype always brings with it a baggage of meaning that anchors it in its original context and limits its portability. Lévi-Strauss’s analysis of myth was the central conceptual act of the structuralist revolution, and later, in Hermès IV (1977), Serres will call Lévi-Strauss’s method an algebra: “Today the richest methods concerning myth in general are ordered by an algebra, more precisely, a combinatory algebra.” This is an allusion to the Liebnizian Ars combinatoria explored by Serres in his earlier essay on Leibniz. To see structuralism as the confluence of the mathematical notions of relation and of combination is the best way to understand the explanatory power that its abstractness allowed in reasoning about cultural productions.

Importation is one example of a series of terms Serres will use to describe the circulation of knowledge and of models of knowledge: “communication,” “interference,” “translation,” and “distribution” grace the covers of the first four volumes of Hermès as subtitles. “Distribution” parallels – but simultaneously radically diverges from – Derridean “dissemination.” The notion of distribution is a means of expressing the way domains of knowledge are related to one another in a world marked by disorder: “Disorder precedes order and only the first is real. … Laws, series, order are always exceptions, something like miracles.”

What the nineteenth-century development of the scientific theory of thermodynamics and of the complex mathematics of topology taught us, Serres suggests, is not only that time is irreversible, but also that stochastic systems, characterized fundamentally by disorder and a broad tendency toward entropy, do nevertheless give rise to ordered systems. Those ordered systems are like islands in a sea of disorder, and to think their relation in the absence of the abstraction characteristic of classical reason is our challenge. Deprived of the fundamental principles of classical epistemology – fixed points and the simplicity and clarity of geometrical relations – the nineteenth century found itself plunged into a new context of thermodynamics and entropy in which epistemology had to

---

find different ways of expressing the relation between the aleatory moments and places when ordered systems occur: “Under the empire of fire [the rise of thermodynamic theory in the nineteenth century] ... the irreversible was born ... and then the stochastically aleatory.” One should note that in the series of terms used by Serres to express the transporting of concepts carried out when knowledge circulates among different domains, the term “metaphor” is conspicuously absent, although the philosopher does not back away from it when Bruno Latour proposes it in *Éclaircissements*.

Unlike critics and thinkers who imagine this transporting as a textual or linguistic operation, Serres regularly insists on the fact that such transformations can be methodologically and rigorously justified and are operational. The term “distribution” points to this sort of conceptual work and has an altogether different ring to it than the Derridean notion of “dissemination,” which, one might argue, is a key notion in Derrida’s project to reveal the ruse of metaphor.

The importance given to the epistemological change provoked by the rise of thermodynamic thinking in Serres’s presentation of the nineteenth century ought to remind his readers that the philosopher studied with Michel Foucault and began his university career as Foucault’s colleague in the same French university (Clermont-Ferrand). Foucault argued in *Les Mots et les choses* (1966) that historical periods are characterized by certain discursive configurations establishing the conditions of truth in the given period. He calls the discursive configuration producing such truth the “*epistēmē*” of the period. It organizes thought over time, but there are moments when a break between configurations is discernible, after which the *epistēmē* of the following historical period differs significantly from the preceding one, providing a context in which different truths are expressed. This highly schematic description of Foucault’s propositions in his 1966 text is meant simply to suggest that Serres’s view of the nineteenth century, increasingly colored during the 1970s by his fascination with the rise of nineteenth-century thermodynamic theory, bears more than a passing resemblance to the Foucaultian perspective on epistemology. For Serres, thermodynamics is clearly some form of new *epistēmē*, and its rise represents a break from the Laplacian synthesis that marked physics and mathematics at the end of the eighteenth and the beginning of the nineteenth centuries. One should

11. Ibid., 32.

13. Pierre Simon de Laplace (1749–1827) was a French mathematician and astronomer who developed and furthered Newtonian classical mechanics in his five-volume *Celestial Mechanics* (1799–1825). This was a crucial synthesis of classical mechanics published just as the first theories of classical thermodynamics were being developed.
not gloss over the debt that both Foucault and Serres owe to Gaston Bachelard,\textsuperscript{14} moreover, who first coined the term \textit{coupure épistémologique} (epistemological break), which he conceptualized in his \textit{Le Nouvel esprit scientifique} (1934) and \textit{La Formation de l'esprit scientifique} (1938). In Bachelard’s view, an epistemological break occurred as the modern conception of scientific thinking was formulated, allowing this new kind of thinking to correct what Bachelard termed the errors of preceding modes of thought – thereby breaking with them definitively.\textsuperscript{15} Both Foucault and Serres scoff at the notion of error as Bachelard wields it, but nonetheless a perspective that identifies moments of rupture between modes of thinking surely owes something to Bachelard.

The importance of mathematics and its history in this first phase of Serres’s career cannot be overestimated. In a brief but very suggestive essay in \textit{Hermès I}, the philosopher makes an argument about Platonic dialogue that connects it to the founding moment of mathematics in Greek culture. He maintains, in essence, that one would not have appeared without the other. In this 1963 essay, Serres points out that writing is not the only pathology of communication (\textit{pace} Derrida): in fact, all communication is characterized by background noise, jamming, interruptions, and the like; in other words, noise is essential to communication. Given this theoretical perspective on communication, Platonic dialogue can be seen, precisely, as a way of conceptualizing the elimination of noise: “To dialogue is to posit the existence of a third person and to seek to exclude him; successful communication is the exclusion of this third term.”\textsuperscript{16}

In a similar way, the invention of the mathematical concept occurs when two parties agree that a form is the same in the abstract, no matter how imperfect its concrete realizations, in other words, when they agree to set aside the interference and imperfections that are necessarily introduced when forms are actualized in reality by drawing them, for example (Serres has geometry principally in mind here). Platonic dialogue, the founding philosophical form, and geometry, the founding mathematical form, are produced in more or less the same cultural

\footnotesize
\begin{itemize}
  \item \textsuperscript{14} For a discussion of Bachelard, see the essay by Pierre Cassou-Noguès in \textit{The History of Continental Philosophy: Volume 4}.
  \item \textsuperscript{15} In important ways, Thomas S. Kuhn (1922–96) remained more faithful to Bachelard in \textit{The Structure of Scientific Revolutions} than did either Foucault or Serres. Kuhn argues that the development of scientific theories is not linear, but is characterized by what he calls “paradigm shifts,” which abruptly reorganize fields. The relation of this perspective to the Bachelardian “\textit{coupure épistémologique}” is evident.
  \item \textsuperscript{16} Michel Serres, “Le Dialogue platonicien et la genèse intersubjective de l’abstraction,” in \textit{Hermès I}, 41. Serres’s view of communication is clearly related to the one pioneered by Claude Shannon and Warren Weaver as they theorized communication, particularly by giving it a mathematical basis, during and after the Second World War. Shannon and Weaver’s \textit{The Mathematical Theory of Communication} popularized their mathematical approach to communication, incorporating Norbert Wiener’s work on probability.
\end{itemize}
moment in ancient Greece, because they represent the same sort of intellectual operation at the basis of the structure of communication, namely, the attempted exclusion of noise.

II. COMMUNICATION: ORDER FROM DISORDER

This perspective on communication resonates richly in Serres’s work. His 1980 essay, *Le Parasite*, is an extended reflection on the notion of noise and its relation to communication, as well as to the emergence of systems from stochastic disorder. The philosopher profits from the rich semantic field contained in the term *parasite* in French, which refers not only to the cultural (the person who lives off someone else) and the biological/ecological (organisms needing and using other organisms to sustain their own existence), but also to the static and background noise in a communicational channel. This confluence of meanings allows Serres to expand the suggestive analysis of Platonic dialog in *Hermès I* and to claim more broadly that in all communication, whether it be narrowly defined as the relation between two entities established along a channel or the richly complex communicational interweaving that characterizes emerging relations in communities – human, animal, microbial – noise and parasites are necessary elements that cannot be defined negatively as impurities simply to be excluded, but are, in fact, fundamental elements to be integrated into the definition of any relational system. One can see Serres moving past the earlier structuralist definition of relational constellations, in which the relation remained a relatively abstract concept, to a different perspective from which the relation takes on a centrality and complexity of its own.

*Le Parasite* begins with a reading of La Fontaine’s fable, entitled “The City Rat and the Country Rat,” in which the country rat visits his city cousin, only to be dismayed and ultimately chased away by the noises of the city, which seem to threaten danger at every turn. In the course of a humoristic, even ironic, reading of the fable, the philosopher demonstrates crucially that the very parasites themselves, the rats, are also the victims of parasites and thus that every relational structure is a parasitical one, in an endlessly cascading series. There is no relation at the origin without noise, that is, no relation before parasites

---

17. The work of Francisco Varela and Humberto Maturana illustrated by their coauthored *Autopoiesis and Cognition: The Realization of the Living*, was beginning to suggest methods of conceptualizing the auto-organization of systems that escaped the dead end of Wiener’s cybernetics – and Serres was certainly aware of their work.

18. Jean de La Fontaine (1621–95) was among the most widely read French poets of the seventeenth century.
inserted themselves into the circuit. Third parties are, by definition, always present, siphoning off for themselves part of whatever is produced (messages, food, energy). Every system falls prey to this logic. Serres uses the fable to argue ultimately that the Cartesian method, meant to be a recipe for starting over again at the beginning, eliminating all the noise of custom and history in order to retain only the pure abstractness of a chain of reasoning moving from one stage to the next without deviation or distraction, is a gesture akin to burning down a house to chase away the rats. Inevitably, as the house is rebuilt, the rats return, because they were always already there. In a broader sense, then, this argument goes in the same direction as Serres’s description of the revolution of thermodynamic thinking of the nineteenth century: disorder is at the origin, not order.

This period in Serres’s career was also marked by the publication of *La Naissance de la physique dans le texte de Lucrèce*, in which the philosopher reminds us that Lucretius’s physics is a suggestive source for understanding the emergence of order from stochastic chaos. Lucretius argues that the universe is composed of atoms in laminar flow and that at a certain moment and in a certain place, turbulence in the laminar flow creates a disturbance that gives rise to a system. The “inclination” in the flow that creates the turbulence is the famous Lucretian *clinamen*. Serres’s reflections on Lucretius introduce a complexity into the conception of the history of science that leads Serres away from the Foucaultian mode. Lucretian physics has always been presented as absurd, an example among many others of a prehistory of science that could be left behind only by the Galilean break. Only because readers of Lucretius refused to envisage his argument from a perspective other than a physics of solids did they find it absurd. If one takes the notion of “flow” seriously in the context of a physics of liquids, then the validity and vitality of the theory become evident. Serres thus takes to task the notion of the epistemological break, suggesting instead that the history of science may just as well be envisaged as the reconstruction of the epistemological context of preceding arguments, a circular or spiral trajectory, looping back to incorporate pieces of its past into new constructions. This suggestive proposal finds its full expression in *Les Origines de la

---

19. One cannot resist thinking about Jacques Derrida when reflecting on this analysis in *Le Parasite*. In some sense, Serres’s argument is also all about the absence of the purity and identity of an origin.

20. Gilles Deleuze’s argument in *Différence et répétition* (1968) that difference, not identity, is at the origin is clearly related to Serres’s argument here.

21. Serres treats the historian’s obsession with historical breaks with irony here and qualifies it as ideological: “Ideologies, of the religious or any other sort, are recognizable by their calendar pathos: before or after the birth of Christ, before or after the foundation of Rome … before or after the Galilean break” (*La Naissance de la physique dans le texte de Lucrèce: Fleuves et turbulences* [Paris: Éditions de Minuit, 1977], 9).
géométrie, in which Serres tackles the history of mathematics as a sort of test case of the history of science. Mathematics clearly has a certain unity that precludes the forgetting of its origins and first steps, but how is this ancient knowledge incorporated into the body of mathematics as the field gains complexity and precision over time? The notion of the epistemological break is supplanted by an attempt to describe an evolution of knowledge that recuperates past syntheses at certain unpredictable intervals and stages of reorganization in a spiraling movement quite different from linear teleology. In a passage of Éclaircissements, Serres compares historical time to the baker’s map in dynamical or topological systems: as a flat surface is folded, points that were originally far apart suddenly find themselves close together. The refusal to conceive of history as linear and the suggestion that history “percolates” in such a way as to bring vastly different historical moments together in surprising ways puts Serres at odds with historians who insist on sequencing history on a linear trajectory.

III. LITERATURE AND SCIENCE: A COMPREHENSIVE PHILOSOPHICAL PERSPECTIVE EMERGES

Serres’s interest in Lucretius is not simply in the abstract outlines of the physics of liquids, but arises more fundamentally from the fact that Lucretius’s philosophy is simultaneously mathematical/scientific and cultural/social. The comprehensive nature of Lucretius’s endeavor, a view of the world one might say, makes of Lucretius a literary figure and an anthropologist, as well as a philosopher, and thus in some sense a model for Serres himself. Serres’s own epistemology refuses to draw boundaries between domains and disciplines, relentlessly attempting to position itself as comprehensively as possible within the whole field of creative and inventive thought. Take the use of La Fontaine’s fable in Le Parasite: the exemplary position occupied by the fable in Serres’s argument is not simply the result of an “appreciation” of the literary text, but of a veritable opening toward the literary and toward aesthetics that is a fundamental characteristic of his thinking. Literature is a cultural production in which precise and valid epistemological thought – scientific and philosophical – is essayed. Given the place of the literary in Serres’s project, one must recast the question of Bachelard’s influence by remarking that Serres implicitly defined himself at a certain point in his career as deeply anti-Bachelardian. Bachelard had a double intellectual career: on the one hand, he was a philosopher and philosopher of science, writing about the advent of the rational epistemology of science, while, on the other, he was writing essays about the poetics of space, about dreams, or about the

four elements the Greeks considered to be fundamental. In Bachelard’s case, however, there is a near total disconnect between his own more phenomenological and literary musings and the philosophical and epistemological dimensions of his work on scientific thinking. It is almost as if Serres set out in his career, at the very Sorbonne where Bachelard had taught – after having written his mémoire d’études supérieures with Bachelard – to prove that this disconnect was theoretically untenable. “Bachelard consummated the break … between the sciences and the humanities: the waking, working mind, on the one hand, and, on the other, the material, sleeping imagination, dream and illusion – a traditional and definitive way to bury the humanities in the slumber of reason,” he comments in his conversations with Latour.

The defense and illustration of this position appeared in 1975, when Serres published a long essay entitled Feux et signaux de brume: Zola, on Émile Zola’s Les Rougon-Macquart series of twenty novels, published from 1871 to 1893, about a family under the Second Empire in France. The title of Serres’s essay, rather difficult to render in English, simultaneously alludes to fire (feux), the central energy source in thermodynamic theory, and to the signals – foghorns or lights – broadcasted by ships or lighthouses during periods of thick fog (signaux de brume). Coupled in this title, therefore, are the two centers of interest that mark Serres’s thought throughout the 1970s and early 1980s: thermodynamics and the dynamics of communication. The essay opens by suggesting that the relation between science and literature has not been properly appreciated, although, Serres insists, literary works are produced in the same intellectual and cultural context as the science of any given historical period. The structuralist approach had led to a productive exploration of the relation between the human sciences (les sciences humaines: history, sociology, economics, geography, psychology) and literature, but this was the easiest cluster of disciplinary relations to establish and explore. The success of the structuralist method came at a price: it exacerbated the separation between human sciences (now to include literature) and what we often call hard or exact sciences. The history of literature and the history of science, however, are not separate. The methods and perspectives of science in a given historical period are also to be found in the

24. Roughly equivalent to a Masters thesis, Serres’s mémoire was on the difference between the Bourbaki algebraic method and the method of classical mathematicians.
25. Serres, Conversations on Science, Culture, and Time, 31 (translation modified); Éclaircissements, 50.
literature of the period: “Contrary to what has been claimed, science does not render non-science null and void.”

This remark could not be more bluntly anti-Bachelardian: literature occupies an important place in helping to formulate the structures of rigorous, scientific thinking within any historical period. It is impossible to understand the richness of Zola’s text if one does not know the history of science from which it emerges:

I am not saying that the *Rougon-Macquart* series … constitutes a set of purely scientific results. I am only saying, but this is already enormous, that the theses, the method, the epistemology that I discover here are faithful to what is best, to what we judge to be the best, in the scientific work of the period.

The fact that Zola manipulates the concepts of thermodynamics and genetics with the best of the scientists of his time means that his work had as much to do with bringing those concepts into the cultural mainstream as the scientific treatises of his day.

The fact that *Feux et signaux de brume* became and has remained an important touchstone in Zola studies illustrates the very thing that the book’s argument had set out to prove: the disciplinary barriers that specialists have erected to divide the continuum of knowledge are impermanent and meant to be overturned. Just as Zola roamed freely through key areas of the exact sciences of his own period, Serres himself does not hesitate to range beyond the scientific and philosophical and into the literary. In fact, literature ultimately becomes much more a home for the philosopher than the domain of purely philosophical reflection, too technical and prone to specialized language and its elaborate constructions: “In some respects, a well-told story seems to me to contain at least as much philosophy as a philosophy expressed with a profusion of technical means.”

Most of the attention of readers of Serres’s essay on Zola has been focused on the seductive and convincing exploration of thermodynamics and genetics that Serres reveals to be at the heart of the novelist’s project, but afterwards, in his reflections about the successes and failures of his own interpretive perspective, Serres saw that certain complex and recurring spatial structures had not been incorporated into his argument. This discovery led to a further and somewhat

---

27. Ibid., 39–40.
28. Zola’s novels explored the implications of scientific concepts in ways related to what Robert Musil and Thomas Pynchon would do for their respective generations in the twentieth century.
different claim, namely, that narrative – and particularly the narrative of myth – could be viewed as an operation whose principal effect is to join together disparate spaces. As Serres puts it, *discours* (discourse) is, in fact, a *parcours* (an itinerary across spaces – the wordplay allowed by the common root of the two words in French is missing in English). In a short essay published in *Hermès IV*, entitled “Discours et parcours,” the philosopher reads the myths of Oedipus and of Ulysses as exemplary cultural productions in which the Greeks invented the uniformity of a single type of space, Euclidean in nature, by connecting and weaving together the numerous spatial varieties encountered in the myths, thus creating a seamless space by means of the very narrative gesture that juxtaposes varieties and then enacts the bridging of their disconnectedness. In fact, he claimed, this operation was successful enough to relegate the question of space to a minor and secondary role in Western philosophy for centuries, making the question of time the crucial philosophical problem. Serres then hinted at a further hypothesis, namely, that the return of the importance of myth in the second half of the nineteenth century, evident in Zola, Nietzsche, the French Parnassian poets, and in many other thinkers and writers of the period, accompanies the development in mathematics of a new theory of space, namely, topology.30 Thus the Lévi-Straussian algebra of myth, corresponding to Leibniz’s *Ars combinatoria*, needs to be supplemented by Leibniz’s *Analysis situs*, “what we call topology, which is the sister science of [algebra].”31

**IV. SPACE AND THE SENSES: CRITIQUE OF PHENOMENOLOGY**

This suggestive outcome of Serres’s reflections on his Zola project reemphasized the philosopher’s interest in varieties of space and set an agenda for his reflections that has remained particularly active since the Zola book. The subtitle of the fifth *Hermès* volume, *Le Passage du Nord-Ouest*, is extremely emblematic from this perspective. Fascinated by the project that has preoccupied every navigator who has sailed from the Atlantic to the Pacific, Serres reflects on the extremely complex geometry of any possible itinerary across the polar reaches of the North American continent: “It opens, closes, twists across the immense, fractal arctic archipelago, along an extravagantly complicated maze of gulfs, channels, basins, and sounds … Aleatory distribution and strongly ordered constraints, disorder and its laws.”32 The Northwest Passage is a perfect emblem

30. Serres has in mind the work of Georg Cantor (1845–1918), Henri Poincaré (1854–1912), and, later, Maurice Fréchet (1878–1973).
of a world in which order arises out of disorder and in which one has to find itineraries through the disordered distribution of territories, joining together the islands of order one might encounter. Serres reformulates his own intellectual project by means of this image, “I have navigated for thirty years in these waters.”

Faced with a disciplinary world in which two cultures oppose one another – science on the one hand, history and the arts on the other – questions such as the following one arise: “Can one imagine that literature is a reserve of science and not its exclusion?”

How, then, to find passages between and among cultural productions that seem disparate or even opposed?

Reflection on the notion of space is not simply a means used by Serres to describe his own philosophical itinerary: space ultimately becomes one of the principal objects of his thinking, a choice explicitly made to bring it back to the center of philosophy and thus to remedy its long neglect since the Greeks. One might well describe *Les Cinq sens* as an attempt to reposition the body in the multifaceted spaces of the senses. The complexity of the body’s surface, covered by an extremely intricate organ of touch – the skin – is poorly explained by a geometry of fixed points and straight lines. The information the skin brings to the organism is collected along a meandering surface, and that information is ordered only at an abstract level, at a distance from the particularities characteristic of the immediate structure of the organ of touch itself – countless asperities, whorls, crevasses, wrinkles, and so on. Taste, smell, and hearing are hardly less complicated.

If *Les Cinq sens* insists on plunging the body into the mixed varieties of spaces in which it lives, this gesture also confronts and rejects a philosophical tradition that accuses the senses of deceiving and classically defines the task of philosophy as an attempt to overcome and move beyond the immediacy of sensations. For Serres, the senses are, on the contrary, an indispensable interface between the “hard” domain of the material environment in which the body is located and the “soft” domain of signals, figures, languages that arise from the experience of the material world. The sensory system ultimately occupies a mediating position similar to that of music in aesthetics, because music has always been simultaneously the most sensual of the arts and the most mathematically abstract: “Sensation has the same standing as music.”

Music, like the senses, mediates between the immediate sensations and the abstraction of the patterns that eventually emerge through repetition and become a sort of

---

“language” (in the sense that they can be captured in musical notation and establish quasi-mathematical relations). To write about the senses must be understood as one in a series of deliberate choices Serres has made against Jean-Paul Sartre and against phenomenology as an extremely technical philosophical thinking, yielding, he suggests, only meager results despite its complicated vocabulary and exceedingly abstract method: “Why such highly technical means for so little?” The sustained rebuttal to the legacy of Sartre results from what Serres judges to be Sartre’s incapacity to incorporate scientific thought into his philosophy, thus seriously compromising its validity and usefulness in the twentieth century, the very century during which the intellectual and social importance of science was confirmed. The absent philosopher in this polemic, however, is Maurice Merleau-Ponty, whom Serres fails to mention by name and thus to whom he never explicitly refers. Merleau-Ponty’s phenomenology of perception is not without close correlation with Serres’s positions, especially in his insistence on the relation between perception and language. Yet without Merleau-Ponty’s description of perception as an interface between sensation and abstraction, it is difficult to imagine how Serres would have come to the project set forth in *Les Cinq sens*.

The concentration on Sartre’s version of phenomenology, however, allows Serres also to criticize Sartre’s fascination with the German philosophy, which he championed and which became pervasive in French philosophical circles after the Second World War, dominating relentlessly through the end of the twentieth century. Lost in the aftermath of Sartre were thus the originality of French philosophy and its sustained dialogue – through several centuries – with scientific thinking. In response to this forgetting, Serres formed an editorial group, and with help from the French government, he undertook a project to publish editions of French philosophical texts that were out of print and difficult to find even in libraries, the *Corpus des œuvres de philosophie en langue française*. Serres’s 1995 essay, *Éloge de la philosophie en langue française*, served as an introduction to the collection and a statement of principle: “Authentic philosophy

---

36. The background presence of the tutelary Hermes, inventor of the first musical instrument, is discernible here. Hermes constantly returns in Serres’s reflections as a source of inspiration when passages between differences must be bridged.  
38. Merleau-Ponty is discussed in detail in the essay by Mauro Carbone in *The History of Continental Philosophy: Volume 4*.  
39. French philosophy’s more recent dialogue with scientific thinking is discussed in the essay by Patrice Maniglier in *The History of Continental Philosophy: Volume 7*.  
40. Published by the Librairie Arthème Fayard in Paris beginning in 1984, the collection now contains editions of nearly 120 works by French philosophers from the sixteenth through the twentieth centuries.
is based on the encyclopedia, understood as the totality, without exception, of human knowledge and practice ... Failing that demanding obligation, [philosophy] slides toward ideology. Instead of building an inhabitable world, it dreams and chats.” Sartre is once again the obvious target of this remark, because his philosophy, by ignoring science, cannot adhere to the notion that philosophy must be encyclopedic and exclude nothing that is within the purview of human thinking.

V. FROM THE ENCYCLOPEDIA TO ECOLOGY

The encyclopedic bent of Serres's own work is strongly underscored by two other projects brought to fruition between 1989 and 1997, during the same period when he wrote Éloge and was directing the publication of the Corpus, namely, the edited volumes Éléments d’histoire des sciences and Le Trésor: Dictionnaire des sciences (coedited with Nayla Farouki). Serres has never been a philosopher-specialist confined to an austere academic world, unable to reach out to a wider interested public, but, rather, he has always made it a goal to instruct: Éléments and Dictionnaire des sciences attest to this, as does his essay on the notion of instruction, Le Tiers instruit. One might add to this encyclopedic bent – a pure product of the notion of the encyclopedia that was at the heart of the Enlightenment – Serres's fundamental belief that the only interesting philosophical questions are about basic human experience and phenomena, not rarified technical considerations that occupy much of the philosophical tradition.

If, as argued earlier, Serres has demonstrated a particular interest in exploring the idea of space, his 1990 essay Le Contrat naturel brings that reflection to a new crossroads. Contemplating photographs of the earth shot from satellites at night, he remarks that the lights of the large European population conglomerations bleed into one another, suggesting that the distance between them is almost nonexistent: “[Man] exists as a whole group, greater than the local and spreading out over immense plates.” Moreover, a global communication and information system bridges the gaps between the local and the global, bringing discrete localities into instantaneous communication with one another, as he contends in Atlas (1994), an essay in which he further develops the insights of Le Contrat naturel: “Here is the unexpected revolution: in the past, work and its products, with rare exception, touched only on the local, but Hermes changes the global; Angels, who are the operators and workers of the universe,

41. Michel Serres, Éloge de la philosophie en langue française (Paris: Fayard, 1995), 64.
are weaving together another world.”

Hermes and angels are figures for a global communication and information network that links the world so tightly and in such a dense and complex network that works and acts propagate instantly and everywhere – and thus no longer have a “place” in the classic sense of the term. The global planet, with its links and passages, finds a model for its organization in the kind of knowledge that can allow us to negotiate our presence in it, namely, science. The advent of scientific thinking put definitively to rest the notion of the individual subject confronting an object, ceding its place instead to “a tacit contract … [that] binds scientists together.”

Scientific knowledge is the product of collaborations – over distance and time – of researchers who share an agreement about what it means to produce knowledge: “By definition and its actual functioning, science is a continued relation between the contract that binds scientists together and the world of things.”

If in the history of Western society Rousseau’s conceptualization of the social contract has occupied center stage as a resolution of the Hobbesian dilemma of domination and total war, the unique success of the scientific approach is the result of the other contract, which is the acceptance by those who want to be researchers that they are part of a community with an agreement about what it means to produce knowledge in the scientific domain. This is what Serres calls the natural contract. The natural contract implies as well a collaboration with nature, rather than a mastery of it, and thus Serres pursues the idea of a post-Baconian science: a science not of mastery, but of cooperation. In a real sense, the disaster of the atomic bomb dropped on Hiroshima represents for him the ultimate aberration of a will to scientific mastery over nature, the outcome of which is to turn science against humanity, thus thwarting the very collaboration among scientists that is the basis of scientific knowledge.

Striking as well in Le Contrat naturel is a return to the question of time. Serres points out that the French word le temps has two meanings: time but also weather. In other words, it refers to the long cycles of weather patterns just as

---

43. Ibid., 128.
44. Ibid., 41.
45. Ibid., 43.
46. Although he never references their work, Serres’s proximity here to American pragmatism should be noted. For a discussion of pragmatism, see the essay by Douglas R. Anderson in The History of Continental Philosophy: Volume 2.
47. One should point out that Serres knew and appreciated an important essay by Ilya Prigogine and Isabelle Stengers, La Nouvelle alliance: Métamorphose de la science. Prigogine and Stengers had argued that the mastery of nature, which was the fundamental ambition of Baconian science, created a relationship of mastery with nature that was untenable in the long run and that modern science needed to find less destructive, more collaborative ways of interrogating nature. [*] Prigogine and Stengers’s work is discussed in the essay by Dorothea Olkowski in The History of Continental Philosophy: Volume 8.
much as it does to the fractional division of time down to nanoseconds. Since 
the peasant and the sailor no longer occupy central positions in our society, the 
two major figures who depended on and predicted weather patterns have disapp-
peared, and our perspective – from an artificial interior no longer exposed to the 
elements – has neglected the pattern of longer cycles that belong to the domain 
of weather. We thus have had no qualms about disturbing them. This reflection 
about long time cycles leads Serres to the present phase of this philosophical 
project, represented most explicitly by his 2001 essay *Hominescence*. The title is 
a coined expression that points to a new phase in the development of humans, 
which needs to be distinguished from hominization, the term used by anthro-
pologists to describe the development of the characteristics of the human. Serres 
argues that especially since the Second World War, we are in a new relation to 
our body, one no longer marked by the pain and suffering of earlier periods, but, 
rather, by the increased longevity of life and by technologies that alleviate the 
suffering that disease brought with it before our historical period. More funda-
mentally, we have speeded up the process of evolution through our technologies. 
The body itself may still be in the cycle of slow evolution theorized by Darwin, 
but we are extending its capacities through various machines (hard and soft), 
and thus man’s imprint on the world has speeded up its transformation in a way 
that could not have been imagined prior to our period. Serres calls the means we 
are able to use to exceed the Darwin’s rhythms of evolution our “exo-Darwinian” 
capacity: “I call this original movement of organs towards the objects that exter-
nalize the means of adaptation exo-Darwinian. And thus, taken out of evolu-
tion by our first tools, we entered into a new exo-Darwinian time.”48 Far from 
decrying the effects of man’s capacity to exceed the boundaries of Darwinian 
evolution, as a conservative ecologist might, Serres calls on us to use these tech-
nologies to mitigate the disparities between rich and poor.49

VI. CONCLUSION

Serres’s philosophical itinerary has been a long and sustained one: from early 
theses on structuralism and mathematics through his most recent essays that 
formulate a certain neo-ecological perspective. His decision to stand apart from 
the philosophical tradition of the French university has been both a personal, 
biographical one and the result of two important methodological choices. 
First, a refusal to accept the notion that knowledge is only to be found in the

*49. For a discussion of this aspect of Serres’s work, see the essay by Jonathan Maskit in *The History 
of Continental Philosophy: Volume 8*..
philosophical-epistemological and the scientific domains. “Reason is statistically distributed everywhere: no one can claim exclusive rights to it.”50 Hence Serres’s propensity to range far and wide in the texts he studies and analyzes and to decline to be identified with a single domain of specialization. And second, a contested view of history, which eschews the linear and does not hesitate to put into proximity distant and disparate historical moments, disdaining all of the mediations that typical historians spend their careers developing. Here we circle back to the notion of mathematics, with which this presentation of Serres’s thought began. Raised intellectually in a context of mathematical demonstration, Serres has embraced it as a method for writing history: “Mathematics teaches a kind of rapid thinking … [There is] a speed characteristic of mathematical thinking, which plays on lightning quick shortcuts … The most elegant demonstration is the shortest one.”51 It is as if Michel Serres, fascinated by the striking nature of the juxtapositions he orchestrates, quickly loses patience, abandoning the difficult and elaborate construction of detailed mediations between historical moments to those who are less in a hurry to make new discoveries – and who turn out inevitably to be the “professionals” of university life, quick to condemn his unorthodox methods.

Michel Serres

This essay seeks to give an overview of the development, central themes, and main claims of Jürgen Habermas’s thought. Given its extraordinarily wide thematic range, its pervasive influence in both public and academic fora across diverse fields and disciplines, and the fact that it has taken many different twists and turns (and reversals) over its course, any comprehensive consideration of that body of thought will need to be selective. This essay selects through three schematics. First, it periodizes Habermas’s academic work into six phases that provide the essay’s organization. The section headings provide a rough summary of the focus of the periods: (i) present-oriented philosophy of history; (ii) epistemology via philosophical anthropology; (iii) the theory of communicative action; (iv) the discourse theory of morality; (v) the discourse theory of law and politics; and (vi) systematic philosophical consolidation. Second, the essay pays particular attention to the contexts of debate that have shaped Habermas’s thought in these periods. Finally, the essay attempts to trace three leitmotifs throughout Habermas’s philosophical career and corpus: a focus on communication as the immanent locus of the transcendental, an insistence on the achievements of reason without ignoring the ravages of modernity’s one-sided

1. Jürgen Habermas (June 18, 1929–; born in Düsseldorf, Germany) was educated at the Universities of Göttingen, Zürich, and Bonn (1949–54); and received his Promotion (~PhD) from the University of Bonn in 1954, and habilitation from the University of Marburg in 1961. His influences include Adorno, Dilthey, Durkheim, Freud, Hegel, Horkheimer, Kant, Marx, Mead, Nietzsche, Peirce, Schelling, and Weber, and he has held appointments at the Institut für Sozialforschung, Frankfurt (1956–59), University of Heidelberg (1961–64), University of Frankfurt (1964–71), Max-Planck Institute, Starnberg (1971–81), University of Frankfurt (1975–94), and Northwestern University (1994–2004).
employment of reason, and a conception of philosophy as critical theory, that is, as reflective interdisciplinary theory oriented toward human autonomy. The aim of the essay, then, is not so much to provide a systematic presentation of Habermas’s philosophy simpliciter as to provide an overview of some of its main themes, problems, and claims by putting them in biographical and interactive contexts.

I. PRESENT-ORIENTED PHILOSOPHY OF HISTORY

As a twenty-four-year-old student of philosophy, Habermas had his first impact not with a distinctive philosophical thesis or argument, but with a public intervention as a critic in the sphere of letters. In 1953, he published a short newspaper piece criticizing Martin Heidegger’s republication of his 1935 lectures, *Einführung in die Metaphysik*, which were not only soaked through with rhetoric celebrating “the inner truth and greatness” of National Socialism, but also attempted to align the question of Being itself with the ascendancy of German fascism. What shocked Habermas about these lectures was that they were republished with no expression of regret or explanation, no acknowledgment of the painful truth of the horrors of the Third Reich, no admitting of political mistake or moral remorse. He treated this silence not simply as a mark against Heidegger, but as indicative of a general, and quite troubling, amnesiac silence across postwar German culture, a constant evasion of “the problem of the prehistory of fascism.” The basic intellectual charge leveled in that short piece – that the underlying thought structure and content of Heidegger’s philosophy did not undergo a “turn” from the earlier to the later work motivated by internal philosophical reasons but rather only a rhetorical repackaging in response to contemporary politics – remained constant throughout Habermas’s published considerations of Heidegger’s legacy across the decades. This piece marks the

---

4. Heidegger’s “turn” is discussed in the essay on Heidegger’s later work by Dennis J. Schmidt in *The History of Continental Philosophy: Volume 4*.
end of Habermas’s time as a thoroughgoing follower of Heidegger’s thought,⁶ and signals his commitment to the Enlightenment ideals of “individualistic egalitarianism” and antinationalistic “cosmopolitanism.”⁷ By the time Habermas finished his 1954 dissertation on philosophical problems in Schelling’s account of the role of the absolute in history, a dissertation strongly influenced by Heidegger, he added a long “introduction setting late German Idealism in relation to Marx.”⁸

After the completion of his dissertation, Habermas worked for two years as a left-wing journalist writing on social issues before he became the personal assistant of Theodor Adorno at the Institut für Sozialforschung in Frankfurt. During the next few years, in addition to sociological work on such issues as postwar German university students and their political attitudes, Habermas was also occupied with philosophically comprehending and assimilating what he had encountered first from a narrowly political point of view: the Marxist project of a critical theory of society, especially as it had been transformed and updated in the Western tradition of Hegelian Marxism starting with Georg Lukács and continuing in the work of the so-called “Frankfurt School” of critical theory by, among others, Adorno, Max Horkheimer and Herbert Marcuse.⁹ What especially interested Habermas was the prospect opened up in the early Marx of continuing the critique of modernity set in motion by German idealism and Romanticism in the form of an account of a one-sided exploitation of the potentials of reason and rationalization. In quick succession appeared two books that would bring together the two already-expressed leitmotifs of a critical theory of society and an ambiguous attitude toward the promise and peril of modern reason, with the third motif of a focus on communicative interaction as the immanent locus of context-transcending ideals.

In the first, his Habilitationsschrift, completed in 1961 under Wolfgang Abendroth in Marburg, The Structural Transformation of the Public Sphere, Habermas pursued the sociohistorical study of a central organizing category

---

⁶ Elaborations of Habermas’s account of Heidegger’s philosophy and its influence can be found throughout The Philosophical Discourse of Modernity: Twelve Lectures, Frederick Lawrence (trans.) (Cambridge, MA: MIT Press, 1987).

⁷ In “Martin Heidegger: On the Publication of the Lectures of 1935,” Habermas claims that Sein und Zeit was “the most significant philosophical event since Hegel’s Phänomenologie” (191) and closes with the admonition to “Think with Heidegger against Heidegger” (197). In interviews from the 1970s and 1980s collected in Autonomy and Solidarity: Interviews with Jürgen Habermas, Peter Dews (ed.) (New York: Verso, 1992) he repeatedly refers to the centrality of Heidegger to his early philosophical development; see, e.g., 80, 147, 189, 192.

⁹ For discussions of Adorno, Horkheimer, Marcuse, and other members of the “Frankfurt School,” see the essays by John Abromeit and Deborah Cook in The History of Continental Philosophy: Volume 5.
of liberal capitalist societies: the “public sphere” of humane letters and opinion where an interested public of private citizens comes together to exchange reasons, ideas, and arguments coalescing into a determinate public opinion. It traced how the public sphere first arose in the eighteenth century, was anchored in new institutions such as widely distributed newspapers, coffee houses, salons, and civil associations, was then institutionally changed by the rise of commercial journalism in the early nineteenth century, and was finally permanently transformed by the development of mass welfare-state democracies into a realm dominated by the mass media as a platform for advertising to a culture-consuming public. In addition to being a historical investigation of the rise and degeneration of new forms of communicative interaction, the book is also a methodologically sophisticated interdisciplinary theory with emancipatory intent. By revealing both the normative ideals embedded in the historical practice of the political public sphere, and the ways in which those ideals became ever more ideological and false as the public sphere itself changed, Habermas showed that questions of political philosophy concerning the legitimacy of liberal democracy must be systematically connected to questions concerning the specific sociohistoric institutions and social arrangements in which those ideals are embedded. *Structural Transformation* introduced most of the themes that would form the backbone of the next five decades of Habermas’s work. *Theorie und Praxis*, a collection of essays appearing a year later, continued in the same vein, but approached its subject by reworking the themes of classical political theory – especially those of social contractarianism, natural law liberalism, and constitutional republicanism – from within the framework of an updated, but still recognizably Marxist, present-oriented philosophy of history.

II. EPISTEMOLOGY VIA PHILOSOPHICAL ANTHROPOLOGY

Habermas received his first professorship at Heidelberg in 1961, thanks in large part to the efforts of Karl Löwith and Hans-Georg Gadamer, two prominent

students of Heidegger. Even more important for his development, however, was the near simultaneous publication of two books that decisively influenced all his future work by re-orienting his considerations of everyday, ordinary human communication from being one among several interesting topics to being the absolute center of his philosophical thought – a position, even through many changes, that it has retained to this day. As he himself put it, Gadamer’s “Wahrheit und Methode, together with [Ludwig Wittgenstein’s] Philosophischen Untersuchungen which appeared at the same time, gave the stimulus to the thoughts which one could fully describe as the ‘linguistic turn of critical social theory.’” At the same time, his friend and frequent collaborator Karl-Otto Apel introduced him to American pragmatist thought, especially the work of Charles Sanders Peirce, John Dewey, and George Herbert Mead. He has remarked that “from the outset I viewed American pragmatism as the third productive reply to Hegel, after Marx and Kierkegaard, as the radical-democratic branch of Young Hegelianism, so to speak.”

The ten years from his Heidelberg appointment, through his double professorship in Frankfurt in philosophy and sociology (taking the place of Horkheimer) in 1964, to his resignation from that post in 1971, were extraordinarily fruitful and saw the development of a fully articulated, comprehensive research program for critical theory. In retrospect what is remarkable is that most of the major topoi of Habermas’s philosophical career – the critique and diagnosis of modernization processes, the aim to grasp the place and import of science and technology in our lifeworld, the methodological clarification of critical theory, the endeavor to update its substantive claims under changed historical conditions, the differences between communicative modes of sociation and market and bureaucratic modes, the import of a pragmatic consideration of language in its everyday use, the diversity of forms of reason and its claims to universal validity – were already broached during this period. Yet most of the specific content of his substantive claims, arguments, and theories concerning those topoi would undergo significant if not radical transformation in the next period. Given constraints, the treatment here of this period is especially selective.

One critical encounter during this period is Habermas’s Auseinandersetzung with hermeneutics, especially as powerfully formulated by Gadamer.
Habermas was an early and important defender of hermeneutic methods in the social sciences, and he agrees with many of the foundational ideas of Gadamer’s account of hermeneutics. What then separates the two? On the one hand, there is a basic difference of temperament: the more conservative Gadamer comfortable with the truths of tradition versus the more radical Habermas suspicious of accepting anything on the mere authority that it has been long accepted, the theorist of judgment versus the theorist of reflection, the contextualist versus the universalist, the humanist versus the enlightener. But there is also the more important issue concerning the status and scope of philosophical hermeneutics’ claim to universality. While Gadamer insists that no form of experience, no form of science or knowledge can be excepted from the methodological constraints of hermeneutics since the community of language and tradition simply is the medium of the human form of life, Habermas holds out for the possibility of modes of analysis that reveal systematic forms of constraint or distortion operating, as it were, behind the backs of ordinary language users. Thus while Gadamer insists on absolutizing the form of understanding theoretically articulated by hermeneutics, Habermas insists that insight can be gained from other forms of inquiry such as ideology critique, psychoanalysis, sociological functionalism, and materialist philosophy of history. In each case, Habermas does not want to renounce the potential insights of empirical social sciences that attempt to theorize causal mechanisms and generalize their results across various traditions in the name of a hermeneutic idealism that would insist on seeing all social phenomena in culturalist terms all the way down.

During this period, the same ideas of pointing out one-sided absolutizations of important insights and of insisting on the plurality of the uses and methods of reason were foremost in Habermas’s critical encounters with Popper’s positivism and other forms of scientism, as well as with their polar opposite, the critique and wholesale rejection of technocratic society. Against the scientific insistence

on hypothetical-deductive sciences’ exclusive claim to rationality, and against positivistic claims to the value neutrality of both science and the philosophy of science, he insisted that the domain of cognitive claims went beyond a narrowly delimited field of exact sciences and that scientific standards themselves cannot be justified independently of determinate human values. In fact, the false self-understanding of science as value-neutral also plays an ideological role in justifying antidemocratic forms of decisionism or of political control by experts. While these critical theses largely agree with the critiques of technocracy put forward by Heidegger and Marcuse that were then quite prevalent, Habermas insisted that the exact sciences and their technological offshoots were nevertheless unsurpassable achievements of modernity. They are not a mere historical accident, nor can they be disposed with, at least as long as humans seek increasing independence from material need. Thus while positivism has insights into the rationality of science and the critics of technocracy have insights into distorting dominance of means–ends rationality, both programs fail by insisting on the exclusive universality of their own preferred conceptions of reason.

Not content with the piecemeal critique of other theories, Habermas’s 1965 inaugural address at Frankfurt announced his intention to provide an epistemological foundation for an integrated, interdisciplinary theory with emancipatory intent, an intention that was brought to fruition in the masterful Erkenntnis und Interesse of 1968. Critically evaluating the epistemological programs of a diverse range of philosophers including Kant, Fichte, Hegel, Marx, Comte, Mach, Nietzsche, Peirce, Dilthey, and Freud, Habermas attempted to show how their insights and limitations could best be understood from a basic anthropological perspective. Rejecting the classical epistemological doctrine that pursuing practical interests is antithetical to achieving knowledge, he maintained that all forms of epistemic inquiry should be seen as motivated by one of three anthropologically basic, fundamental human interests: the technical interest in the prediction and control of the natural environment; the practical interest in the reproduction of the social form of life achieved through intersubjective communication; and the emancipatory interest in freeing our selves and our societies from all forms of falsely naturalized but changeable constraints. The audacious claims of the book were that these three interests operate as constitutive conditions of possibility in the organization of three different forms of inquiry – empirical-analytic sciences, historical-hermeneutic sciences, and critical sciences – where each form of inquiry is internally structured by its distinct underlying fundamental human interest and each interest in turn structures a central element of human social life: work, language, and power respectively. While modern science, technology, and social labor are all structured by the technical interest, the interpretive social sciences, the humanities, politics, morality, and language are all structured by the practical interest. Finally, according to Habermas, the
otherwise surprising structural similarities between psychoanalysis, ideology critique, and critically reflective philosophy are best understood by seeing that all three are forms of inquiry shaped by the interest in emancipation from falsely naturalized, but actually changeable, power relations not otherwise evident or obvious on the surface of psychological and social life.

Although *Knowledge and Human Interests* was greeted by an enthusiastic critical reception, by 1973 Habermas had significant reservations about the book and had attempted to resolve them – not by revising the project, but by developing a different research program that would attend to the earlier problems along the way.\(^\text{17}\) Among the most significant problems was a concern about the third form of epistemic inquiry: the status and aims of critical social theory itself. In the book’s attempts to revive the insights of the German idealist tradition of reflective self-critique, it suffered a systematic ambiguity in the use of the concept of reflection between the Kantian idea of reason’s reflection on its own necessary conditions of possibility and the young Hegelian\(^\text{18}\) idea of persons’ and societies’ reflection on otherwise inconspicuous forms of domination and power. While the first form of reflection aims at grasping the universal generative structures and rules of a particular use of reason, the second form aims at emancipation from systematically constraining, but unacknowledged forces and powers, whether intrapsychic, ideological, social, or material. But how can the same activity – critical social theory – both delimit the timeless necessary conditions of human inquiry and uncover the sociohistorically contingent features of modern life that impede the realization of freedom, at the same time and with the same tools? To advance beyond the epistemological prolegomena that was *Knowledge and Human Interests*, Habermas needed to develop a much clearer picture of the various components of a critical social theory, how they related to one another, and the status of their respective validity claims.

### III. THE THEORY OF COMMUNICATIVE ACTION

In 1971, the physicist and peace activist Carl Friedrich von Weizsäcker invited Habermas to be codirector of the Max Planck Institute for Research into the Living Conditions of the Scientific-Technical World in Sternberg, outside Munich, enabling Habermas, together with at least fifteen co-workers, the opportunity to reconstitute his research program on a new foundation, one

\(^{17}\) Jürgen Habermas, “A Postscript to *Knowledge and Human Interests*,” *Philosophy of the Social Sciences* 3(2) (1973).

\(^{18}\) For a discussion of the young Hegelians, see the essay by Lawrence S. Stepelevich in *The History of Continental Philosophy: Volume 1*, and the essay by William Clare Roberts in *The History of Continental Philosophy: Volume 2*. 
thoroughly grounded in the latest research in diverse domains of the social sciences. Having become suspicious of the heavy argumentative burdens his earlier program assumed in incorporating strongly Hegelian and metaphysical conceptions of notions such as truth, totality, and philosophy, Habermas sought ways to make critical social theory as he understood it much more receptive to empirical research and methodologically open to empirical fallibility. Turning away from epistemology as the royal road for critical theory, he sought to develop a substantive theory of society to show how communicative action is itself the immanent, practical locus of context-transcending reason and the impetus toward emancipation.

Continuing to exercise his apparently limitless capacities for assimilating, comprehending, and systematizing entire research programs across all fields of social-scientific and humanistic investigation – witnessed earlier in his productive interactions and debates with the varieties of Western Marxism, modern political philosophy, analytic philosophy of science, German idealism, various forms of phenomenology, Gadamer’s hermeneutics, American pragmatism, the varieties of psychoanalytic theory – Habermas in the late 1960s and accelerating into the early 1970s was busy coming to terms with a multiplicity of cutting-edge research, including: ethnomethodology and social phenomenology; the theory of a universal, generative grammar; analytic speech act theory; classical sociology; contemporary structural functionalist sociology and social psychology; and cognitive and moral developmental psychology.

The next decade saw a remarkable proliferation of work – including the influential 1973 book *Legitimation Crisis*, articles on cognitive and psychoanalytic psychology, on moral development, on ego identity, on social psychology, on evolutionary theories of history, on the reconstruction of historical materialism, on communicative competence, on systematically distorted communication, on linguistic and interactive pragmatics, on truth, and many on individual philosophers and social theorists19 – culminating in 1981 with the appearance of Habermas’s magnum opus: the two-volume *The Theory of Communicative Action*. Rather than work through all of this material historically, I will give an overview of the themes and central claims of the mature critical social theory developed in this decade, organized around three themes: the linguistic turn in critical theory, the integration of systems theory and attendant diagnoses of the present, and the debate with poststructuralists and postmodernists over the meaning of modernity.

---

The linguistic turn

The most important component of Habermas’s new version of critical theory – and the most recognizable one in its reception – is surely his focus on language, specifically on the basic structures evident in the use of language for purposes of intersubjective communication aimed at coordinating action. Taking off from John Austin’s and John Searle’s speech act theories, Habermas reconstructs the implicit yet highly developed know-how that competent linguistic communicators presuppose and rely on when they engage in communicative action. He aims, then, at developing a formal pragmatics of language use: a theory that articulates the pretheoretical knowledge, competences, and concepts employed by ordinary persons any time they endeavor to communicate with another person about something in order to coordinate their individual actions.

A starting-point for understanding the theory might be the distinction between two different ways in which one can employ language in order to achieve some intersubjective result. On the one hand, one might use language simply as a way to influence the behavior of others without at the same time seeking mutual understanding with them. In this case, Habermas claims, one is using language strategically, for example to express threat potential while bargaining or to intentionally coerce, manipulate, or deceive. On the other hand, one might use language to come to a mutual understanding with another person about something such as an objective state of affairs or a relevant social norm. Success in this communicative use of language hinges on the ability of a respondent to take up a “yes” or “no” position on another’s speech act offer, and we can speak of communicative action when the coordination of persons’ individual action plans is achieved through mutual agreement between them. Although Habermas has repeatedly revised and reworked his formal pragmatics since its initial development in the early 1970s, two crucial theses have remained constant: the communicative use of language is fundamental, whereas other uses of language – strategic, fictional, figurative – are parasitic on or derivative from the properties and structures of communicative action.

Communicative action is fundamentally intersubjective in the sense that each individual is assumed to be a competent actor who can assess the inherent validity claims made by others, and action coordination is achieved only when all involved come to a mutual agreement accepting the speech act offer.

Habermas distinguishes between four types of validity claims made in each and every speech act: (i) that the utterance is comprehensible (semantically and grammatically well formed); (ii) that the utterance is true; (iii) that the norms of social action invoked are right; and (iv) that the speaker is truthful or sincere in making the utterance. While the claim to comprehensibility is limited to the formation of the particular speech act, the other three types may be described as universal validity claims insofar as they involve an in-principle appeal to the notion that any competent agent would have to agree with the content of the claim, under suitable conditions for the evaluation and redemption of that kind of validity claim. Thus any time a speaker makes a communicative utterance, the speaker concomitantly makes four types of validity claims that are assumed to deserve intersubjective recognition – even if, as is usual, only implicitly – and the hearer of the speech act may challenge the speaker on any of the four registers. According to Habermas, it is precisely this intrinsic link between ordinary language use and the validity claims actors implicitly raise and accept that accounts for the illocutionary force of speech act offers, or what he often calls “the binding/bonding force” of language. Individuals who come to a mutual understanding on a speech act are rationally motivated to carry through on their action commitments because their own agreement to the content of the utterance is freely made on the basis of their own individual insight into the propositional truth, normative rightness, and subjective sincerity of its content.

Habermas’s claim that social order is produced and reproduced through the consensus formation witnessed in communicative action might seem highly improbable. After all, not only is such a consensus ever threatened by new problem situations, new experiences, differing perspectives of individuals, changing states of the world, and so on, but it is also fully contingent on the unforced agreement of social participants who can at any time refuse to say “yes” to a speech act offer. Here Habermas agrees with a host of twentieth-century theories – especially social phenomenology, hermeneutics, ethnomethodology, and ordinary language philosophy – that insist on the need for a massive background consensus to stabilize reciprocal understanding. He adopts Husserl’s concept of the lifeworld\textsuperscript{21} to explain how this unthematized background knowledge contains the shared meanings, beliefs, norms, and personality structures that absorb, as it were, the contingency built into communicative action. The lifeworld operates as a font of epistemic and practical certainties for interlocutors who can largely presuppose that others live “in the same world” that they

\textsuperscript{21} For a discussion of Husserl’s concept of the lifeworld, see the essay by Mauro Carbone in The History of Continental Philosophy: Volume 4.
Of course, when communicative interaction breaks down, it is possible for interlocutors to bracket ordinary interactions, explicitly focus on one, specific contested part of the lifeworld background, and engage in a distinctive kind of reflective argumentation that Habermas labels “discourse.” Here interlocutors suspend their ordinary purposive orientations in a collective, more or less disinterested search for the truth of the matter – or for the normative rightness of the standards invoked, or for the degree of sincerity of the speaker – and they engage in more demanding processes of reason-giving under the supposition that consensus can be achieved only according to the “unforced force of the better argument.”

While one might investigate the specifics of different societal lifeworlds, Habermas is interested in the deep, formal, and invariant structures of all lifeworlds. For whereas philosophers traditionally sought to identify and justify the ideals of reason through speculative metaphysics, he seeks to locate these ideals immanently in the very practices of communicative intersubjectivity. Formal pragmatics articulates the various idealizing pragmatic presuppositions competent social actors inevitably make when they engage in linguistic interaction: for example, that individuals share a common objective world or that, in the cooperative search for the truth, no competent persons have been excluded from the conversation. To be sure, all of these presuppositions are counterfactual in the sense that they are never fully realized in any concrete interaction, but they are nevertheless factually effective in structuring actual interactions. They can, in fact, be used normatively to critique any actually achieved agreement as deficient from the point of view of the very standards of reasonability built into the practice itself. The pragmatic presuppositions of communication and discourse function thereby as immanent standards of self-correcting learning processes. Formal pragmatics represents a flowering of what was previously an undertheorized concept in Knowledge and Human Interests, namely, the quasi-transcendental. For while the analysis aims at the conditions of possibility of fundamental communicative practices – and is in this sense a continuation of Kantian transcendental philosophy aimed at unavoidable, universal features of language – its claims are distinctly rooted in an empirical analysis of actual language use by ordinary speakers – and is in this sense an a posteriori endeavor fallibilistically subject like all empirical knowledge to evidentiary

22. For instance, one might note here the similarity to Pierre Bourdieu’s notion of doxa. While Habermas specifically develops Alfred Schutz’s social interpretation of the lifeworld, Schutz’s notion is clearly indebted to Husserl and Heidegger, as is, of course, Bourdieu’s, indicating their parallel development of this idea (as well as a host of others) via a shared set of forbears. [*] Schutz is discussed by Diane Perpich in her essay in The History of Continental Philosophy: Volume 3.
testing. If correct, formal pragmatics locates in linguistic intersubjectivity itself the immanent locus of context-transcending reason.

A substantive social theory can then be built out of elements of the theory of communicative action. The standard sociological distinction between culture, society, and personality can be clarified through formal pragmatics, since each is focused around one characteristic speech act type centrally thematizing one form of validity claim: constatives thematize truth claims, regulatives thematize normative rightness claims, and expressives thematize subjective sincerity claims. Furthermore, in modern complex societies, discourse itself has become reflective and taken on methodical institutional form in differentiated knowledge systems corresponding to the three universal validity claims: science and philosophy systematically investigate propositions according to the logic of truth claims, law and morality systematically investigate illocutionary content according to the logic of rightness claims, and art, literature, and criticism of taste investigate intentional and expressive content according to the logic of authenticity and sincerity claims.

From a historical perspective, Habermas claims that societal changes can be seen as developmentally progressive precisely to the extent to which rational accountability, rather than unthinking reliance on falsely naturalized authority or tradition, organizes ever more aspects of life. For instance, he puts forward a thoroughly intersubjectivist account of individual development in the Hegelian tradition: individuals become who they are only through socialization into linguistically structured social relations.23 As societies modernize, however, individuals are increasingly required to interact on the basis of defensible reasons rather than contingently presumed meanings, truths, conventions, and values, and so increasingly to become responsible for their own beliefs, actions, and individual forms of self-realization. Thus even though Habermas decisively rejects atomistic, empty, and individualistic accounts of the self characteristic of much Enlightenment rationalism, he is able to show how the ideals of individual rationality, autonomy, and authenticity are nevertheless not merely the ideological precipitates of contingent historical and social configurations, as many poststructuralists argue.

Modernization in cultural and social domains can also be seen as a process of rationalization, at least to the extent to which communicative action and formal discourse, rather than coercion or blind obedience, organize ever more
aspects of collective social life. Without getting into details, Habermas claims that we can retrospectively reconstruct historical changes in terms of a stage-sequential series of irreversible improvements in modes of consciousness that enable heightened problem-solving through openness to discursive testing and rational belief fixation.²⁴ The basic idea here is that structural changes in the lifeworld can be understood as learning processes – not only in increasing capacities for the scientific and technological control of the material world, but also in the universalization of open procedures for justification and decision in moral-practical domains. This ambitious set of sociohistorical claims is intended to show that the standards of rationality celebrated in contemporary Western societies are not merely contingent conceits of a particularistic worldview, but can lay claim to universal, context-transcending validity. The theory of communicative action and its resultant social theory can best comprehend the normative content of modernity: fallibilistic culture that is committed to critical testing of truth claims, social solidarity founded on collective will formation through universal discourse, and personal socialization aiming towards expanded individuation and self-realization. Beyond answering general skeptical doubts, this developmentalist defense of Enlightenment ideals answers a problem specific to the tradition of critical social theory: the inability of Horkheimer, Adorno, and others to give a coherent justification for the ideals of individual autonomy, substantive social equality, and an emancipated society that they employed in critiquing the pathologies of modernity.

Yet one should not confuse Habermas’s developmental claims with a Whiggish philosophy of history smugly justifying the present, or with a (right) Hegelian philosophical demonstration that the real is fully rational. The key here is to see that Habermas claims only to be reconstructing the logic of successive stages of lifeworld structures, while making no parallel claims about the dynamics of historical development. Societal change is dependent on contingencies concerning the material reproduction of society, and changes in these conditions are neither predictable nor developmentally progressive. In contrast then to the later Marx, there are no iron laws of history dictating a systematic progression through various modes of production. Yet it is possible to reconstruct, at a suitable level of abstraction, individual and sociocultural learning processes that are both irreversible and clear improvements over earlier stages.

The integration of systems theory and diagnoses of the present

If the contingent dynamics of historical change are distinct from its progressive structural logic, then what explains the former? Here Habermas employs contemporary sociological functionalism to explain the reproduction of the material conditions of life. In essence, historical dynamics are to be understood in terms of responses to systemic steering problems encountered in the functionally integrated domains of the economy and state administration. To understand this, we need to look at a critical encounter that began in 1971 and was decisive for Habermas’s mature social theory: his extended debate concerning the social systems theory that Niklas Luhmann developed by streamlining and radicalizing the functionalist theory of his teacher Talcott Parsons. Although much of the debate turned on technical matters of sociological theory construction, at least two of Habermas’s critical concerns are worth noting here. First, Habermas argued that systems theory runs into internal problems by putting forward radically functionalist accounts of all social phenomena. No matter how powerful functionalism proves to be for illuminating economic and bureaucratic control processes, it could only distort phenomena such as meaning and truth that are irreducibly tied to the rich symbolic resources of ordinary language and the communicative perspectives adopted by language users. Habermas’s second main reservation was straightforwardly normative and political. Luhmann advocated withdrawing decisions in many social spheres from the explicit oversight of democratic politics and the public sphere, in order to take advantage of the supposed complexity-controlling achievements of publicly unaccountable technocrats schooled in systems theory. In short, to the extent that a fully radicalized systems theory promotes a “counter-Enlightenment” social technology, Habermas rejected the practical realization of functionalist insights in the name of the dialogical, public exercise of critical reason and democratic self-government.

Although critical of Luhmann’s systems theory for its one-sided absolutization of the functionalist paradigm, Habermas made significant use of it in his 1973 *Legitimation Crisis*, a sociotheoretic study of modern “steering crises” in economics and administration. The book advanced, in a programmatic and provisional way, a bold set of diagnostic theses concerning the interrelations, in contemporary capitalist democracies, between economic performance, administrative rationality, the extent of perceived legitimacy of the government, and the degree to which individuals are motivated to participate in business and politics. The basic thesis of the book is that crises in individual social subsystems

---

25. Jürgen Habermas and Niklas Luhmann, *Theorie der Gesellschaft oder Sozialtechnologie – Was leistet die Systemforschung* (Frankfurt: Suhrkamp, 1971). Several further follow-up volumes in the Suhrkamp series have been published containing papers from others on this topic.
are “solved” by another subsystem, but only at the cost of opening up that other subsystem to its own crisis potentials. It thus raised questions about the sustainability of modern societies if they endemically shuffle steering problems between the economic, administrative, legitimization, and motivational subsystems. While the entire framework of this book is deeply indebted to systems theory, it also pointed to its limits with respect to functionally inassimilable cultural meanings, social norms, and individual identities. Habermas was apparently persuaded by systems theory’s power to illuminate the tremendous growth and success of contemporary capitalist economies and bureaucratic administrations, but had not yet settled on a way of integrating its insights while avoiding its limitations.

The basic methodological idea in *The Theory of Communicative Action* is to adopt a dual-perspective approach – lifeworld and systems – to investigate the social coordination and integration of individual actions, and thereby synthesize action-theoretic and functionalist forms of sociology. While the lifeworld perspective attends to communicative interactions oriented toward achieving mutual understanding, the systems perspective attends to actions purposively oriented toward the achievement of individual ends. Through the binding-bonding force of ordinary language agreements, lifeworld coordination fulfills the functions of cultural reproduction, social integration, and individual socialization. Through anonymous functional imperatives built into economic and administrative systems – that is, the rigid valorization of increasing profit and power – systems coordination achieves the material reproduction of society behind the backs, as it were, of individuals. When turned toward history, this dual perspective approach shows the complexity of processes of modernization. First, changes in lifeworld structures can be reconstructed as learning processes releasing the rationality potential inherent in communicative action, as described above. Second, economic and administrative systems become increasingly independent of lifeworld strictures, for instance when individuals are freed from traditional precapitalist norms and allowed to pursue unlimited profit maximization in market spheres. This “decoupling” of systems from lifeworld thereby enables systems to become increasingly complex, ever more responsive only to their own internal functional logics, and thereby more efficient in achieving the material reproduction of society. Yet third, increases in the scope of functional systems lead to the “colonization” of the lifeworld by systems: systemic forms of integration take over functions of social reproduction that can be achieved only through the symbolic resources of the lifeworld. Modern societies thereby surrender essential decisions to functionally organized institutions steered by the value-free media of money and power. Colonization is taken to lead, fourth, to lifeworld “pathologies” caused by systems overextending their reach: cultural loss of meaning (the assimilation of rich and meaningful
ordinary language to the hollowed-out “semantics” of money and power), social anomie (the breakdown of integrating social norms and values), and individual psychopathologies (including withdrawal of motivation, disorienting senses of the loss of freedom, and mental illness).

On this account of Western history, then, modernization processes are critically evaluated as fundamentally ambiguous: both progressive and regressive. Insofar as the lifeworld becomes rationalized and systems become more complex, modernization can be seen as both releasing the rationality inherent in ordinary language and solving endemic problems of material reproduction. Yet insofar as heightened systems autonomy decreases the scope for free, conscious activity in the light of intersubjectively justified norms and in fact causes lifeworld pathologies through colonization effects, modernization appears as a process of ever-proliferating, but socially caused, maladies.

When this tendency towards the uncoupling of system and lifeworld is depicted … the irresistible irony of the world-historical process of enlightenment becomes evident: the rationalization of the lifeworld makes possible a heightening of systemic complexity, which becomes so hypertrophied that it unleashes system imperatives that burst the capacity of the lifeworld they instrumentalize.26

With this grand synthesis of hermeneutic and systems theoretic approaches to sociology, Habermas claims to be able to better account for the social deformations that interested the great original sociologists of modernity – Marx, Durkheim, Weber, Lukács, Horkheimer, and Adorno – without either the socio-theoretic determinism or the one-sided cultural pessimism that often infects their theories.

Postmodernism and poststructuralism

With this understanding of Habermas’s ambiguous assessment of modernization, we can now appreciate his interaction with the concerns of poststructuralist and postmodern thinkers of the 1970s and 1980s. In The Philosophical Discourse of Modernity, treating the distinctive sense of time-consciousness expressed in philosophical theories of modernity, Habermas acknowledged the continental and worldwide importance of the radical critique of reason that had developed in contemporary French thought under the influence of a distinctive reception of Nietzsche’s and Heidegger’s thought. His thesis is

that one should understand French poststructuralism as the culmination of a long-running critique of the philosophy of consciousness, stemming from a rejection of Hegel’s grand attempt to reconcile modernity with itself through absolute knowledge. Habermas dedicates chapters to many variants of this radical critique of reason: Nietzsche’s and Heidegger’s complementary destructurations of subjectivist metaphysics, Horkheimer’s and Adorno’s negative dialectics of instrumental reason and domination, Derrida’s and his American acolytes’ deconstructionist transformation of philosophy into literature, Bataille’s surrealist celebration of the obscene, the impossible, and the taboo, and Foucault’s specific genealogies of the interconnections between modern power, the human sciences, and contemporary subjectivity. In each case, the relentless critique of abstract, utilitarian Enlightenment reason and its supposed incarnation in the sovereign, ratiocinating, decentered subject has been carried forward in the name of all of the impurities such conceptions of reason and the subject have left out: history, tradition, cultural specificity, power, desire, embodiment, rhetoric, metaphor, myth, narrative, ordinary practice, the unconscious, the irrational, the liminal, the non-identical, heterogeneity, contingency, idiosyncrasy, and so on. According to this radical critique, however, such impurities are not mere externalities, but are centrally and ineradicably constitutive of reason and subjectivity themselves.

Habermas’s response to French poststructuralism and its Nietzschean forebears is twofold. On the one hand, he agrees with their critique of the philosophy of the subject as a thoroughly exhausted philosophical paradigm that is doomed by both its internal contradictions and its idealizing disregard of the inevitably situated character of reason and subjectivity. Yet on the other hand he argues that the overly totalizing skeptical conclusions drawn from this critique are unwarranted. To begin, he argues that the radical critique of reason ends in its own aporias and paradoxes, particularly when it leads to relativistic conclusions. Whether making truth claims that it cannot redeem in the face of its relentless critique of the very idea of truth, or relying in a cryptic way on normative intuitions about autonomy and nondomination while arguing that normative standards themselves are nothing more than effects of contingent relations of power and domination, the radical critique of the philosophy of the subject runs up against self-referentiality paradoxes. According to Habermas, however, there is an alternative path out of subject-centered philosophy: namely, the thoroughly intersubjectivist theory of communicative reason that sees reason and subjectivity as fully situated and immanent in everyday practices, but also as intrinsically oriented toward context-transcendence by virtue of their connections to validity claims. This alternative path can reinterpret the foundational ideas of the Enlightenment – truth, individual autonomy, collective solidarity, and authentic self-realization – outside the monological
concepts that originally doomed their interpretation to the endless back and forth between subjectivism and objectivism. He also argues that many of the specific critiques of instrumentalist and functionalist employments of reason found in the earlier generation of critical theorists and in French poststructuralism (especially in Foucault) are better understood in the ambiguous theory of modernization developed in *The Theory of Communicative Action* than in the totalizing critique of postmodernity.

IV. THE DISCOURSE THEORY OF MORALITY

One of the most significant components of Habermas’s theory of communicative action concerns discourse theory: an account of the meaning of and justification procedures for the unconditional validity claims to truth, rightness, and sincerity that are made at least implicitly in any communicative use of language. This and the next section treat discourse theory as applied to issues of practical reason. The central organizing principle of Habermas’s normative theorizing – developed over the years in close connection with Apel – is summed up in a general criterion for practically establishing normative validity called the “principle of discourse”: “Just those action norms are valid to which all possibly affected persons could agree as participants in rational discourses.” The central idea here is that those affected by an action norm ought to be able to approve of it for themselves in order for it to gain their rational adherence. And the most plausible way of insuring this is to expose the proposed norm to public critical testing in the light of all relevant information, perspectives, and argument so that, in the end, an agreement concerning it can be expected to reflect only the weight of reason.

At this point, Habermas introduces the notion that there are different ways of employing practical reason, with claims of different scopes and types, and with distinct practical logics. Pragmatic questions concern the best means to

---

27. The discourse analysis of truth claims will be treated in the final section of this essay. There is comparatively little that can be said philosophically about sincerity claims that, although they claim to hold unconditionally, can only be justified in the light of particular information about the consistency or lack thereof of the speaker’s specific past behavior with the purported truthfulness of their current claim.

28. Jürgen Habermas, *Between Facts and Norms: Contributions to a Discourse Theory of Law and Democracy*, William Rehg (trans.) (Cambridge, MA: MIT Press, 1996), 107. Although the principles of discourse and of universalization were introduced first in *Moral Consciousness and Communicative Action* (originally published in 1983), and then further elaborated in *Justification and Application* (originally published in 1991), he revised both their specific formulations and, more importantly, his account of their relationship in *Between Facts and Norms* (originally published in 1992) and other later work.
adopt to realize some contingently given preferences or goals; ethical questions arise when these preferences become problematic and one asks what is good for one to do in the light of who one is; moral questions arise when one's actions in pursuit of the good may conflict with the interests of others such that one must ask what universally applicable norms of action might govern anyone's actions in the same situation. He next explains how the discourse principle – which is an intersubjectivist interpretation of the general idea of impartial justification – gets operationalized in rules of argumentation for the different employments of practical reason. According to Habermas, applying the discourse principle to the justification of moral norms generates the principle of universalization: “(U) For a [moral] norm to be valid, the consequences and side effects that its general observance can be expected to have for the satisfaction of the particular interests of each person affected must be such that all affected can accept them freely.” While the discourse principle can be operationalized in an appropriateness principle for moral application discourses and in a democratic principle for discourses justifying legal norms (discussed below), it can also be operationalized in technical/strategic calculations concerning pragmatic questions, and even in the nonprincipled employment of reflective judgment operative in the hermeneutic and appropriative discourses concerning ethical-existential and ethical-political questions about the good, character, and identity.

Habermas’s (U) offers a procedure for testing the moral rightness or validity of proposed norms that meets four demands: it explicates the binding character of moral “ought” claims, remains at the level of formal procedures, depends on the cognitivist practice of giving reasons, and provides a universalist moral theory that transcends concrete forms of life. Unlike Kant’s deontology or Rawls’s theory of justice, however, discourse theory insists that, since the interests of those actually affected are morally relevant, moral validity depends on the real consensus of participants in actual discourses. It is this latter element of intersubjectivity at the heart of Habermas’s theory that clearly sets it apart from other impartialist moral theories. The impartiality of the moral point of view can be secured only through actual reasoned dialogue, concerning consequences for individuals’ concrete interests, among all those affected. Thus (U) abstracts neither from the real world of consequences nor from the self-interpretation of the needs and interests of concretely situated persons. Hence moral practices constitutively involve the need for mutual recognition, reciprocal perspective-taking, listening to others’ claims, a willingness to learn from others, and a responsiveness and responsibility to others’ ultimate authority to agree or disagree with intersubjectively raised validity claims.

Whence comes the warrant for these ambitious claims concerning morality? Habermas combines a phenomenological account of the sense of normative obligation, a semantic account of the meaning of action norms, an anthropological account of our vulnerability to intersubjective misrecognition and harm, and a pragmatic analysis of the unavoidable presuppositions of engaging in practical justification (universal access to discourse, equal participation, noncoercion, decision on the weight of argument, and so on) in order to buttress his idealizing account of moral argumentation procedures. Moral philosophy, then, is another type of reconstructive science that attempts to elucidate the always-already presupposed, quasi-transcendental conditions that structure the actual moral discussions we already engage in. Philosophy itself can only elucidate the formal nature of the procedures of moral argumentation, however; it has no special access to or claim over which putative norms are actually morally justified. For in the end, this is a matter for actual agreement among the universe of persons, and a philosopher is just another participant in the universal conversation. Notably, morality in this “postmetaphysical” view is not grounded in a transcendent reality nor a particular ontological feature of the world, but rather is a thoroughly human, constructivist affair. There are no “facts of the matter” that operate as moral truth-makers; ideal warranted assertability before all affected simply constitutes moral validity.

Of course universalist deontological approaches to morality (and closely allied liberal approaches to justice) have come in for serious criticism during the same decades as Habermas developed his discourse theory; only the briefest indications of Habermas’s extensive work in addressing such criticisms can be given here. First, in response to cultural or historicist relativists, it should be evident that Habermas’s entire program is oriented toward rebutting relativism, mainly through combining quasi-transcendental formal pragmatics with a restriction of philosophy’s claims to the procedural features of moral discourses rather than the substantive first-order norms that different societies accept. Next, in response to the radical moral skeptic who doubts that there is any cognitive content to moral claims, Habermas appropriates an argument developed by Apel to the effect that the skeptic must either engage in argumentation concerning morality – and thereby performatively presuppose the very standards s/he denies theoretically (a “performative self-contradiction”) – or, on pain of psychopathology, withdraw from the sociocultural form of life itself. Habermas is also quite concerned to respond to neo-Hegelian, neo-Aristotelian, and communitarian objections to overly formalist and abstract accounts of persons’ concrete identities and the thick ethical space they are embedded in. Here he repeatedly makes the Hegelian point that morality in the narrow sense requires an accommodating form of ethical life that anchors, fosters, and sustains morality in cultural understandings, social interaction patterns, and individual motivational structures.
While agreeing that, in everyday life, ethical and pragmatic issues are often more pressing, salient, and difficult to resolve than moral issues, he insists on the priority of the right over the good, that is, on the way in which a small set of universally binding moral norms puts constraints on our individual and collective pursuit of context specific ethical goals and values. Finally, in response to feminist care theorists and other moral particularists who critique abstract, rule-based moralities for their insensitivity to our commitments to concrete others in nonsymmetrical relations of love, care, and concern, Habermas argues that such relationships can be morally comprehended in discourses of application that apply presumptively justified, abstract moral norms to concrete situations.

V. THE DISCOURSE THEORY OF LAW AND POLITICS

Nineteen ninety-two saw the publication of what might be considered Habermas’s third magnum opus – *Faktizität und Geltung* – a book dedicated to a simple but extraordinarily ambitious thesis: “the rule of law cannot be had or maintained without radical democracy.”30 It brings all of the tools developed over the years to the domain that is arguably most central to Habermas’s thought – politics – even though politics is investigated through its institutional infrastructure in modern nation-states: law. The reason for focusing on law is already announced in the title – literally *Factivity and Validity* – for modern, putatively legitimate law systematically presents a Janus face to the conflicting phenomena it simultaneously partakes in: claiming to be ideally justified and factually efficacious, addressing individuals as autonomous subjects and as objects of coercion, employing the communicative power of the people and yet simultaneously an administrative power over the people, and so on. Adopting the multidisciplinary, pluralist approach Habermas is famous for, the study combines three main analyses: a sociological and historical account of modern law, a political philosophy justifying constitutional democracy, and a normative-cum-empirical political theory explicating deliberative democratic politics.31

From the historical-sociological point of view, the rise of modern positive law can be seen as a response both to the disintegration of medieval worldviews with their totalistic and encompassing religiously cemented certainties and to the decoupling of economic structures from direct political (and clerical) control in the form of modern capitalism; for modern positive law makes direct, secular

31. For space reasons, I omit here a fourth analysis of the book: Habermas’s development of a dialogical jurisprudence aimed at comprehending the specific rationality of judicial adjudication.
claims of authority over the actions of individuals through the threat of coercive sanction for nonperformance, while at the same time unburdening individuals from some of the normative constraints of communicative sociation. Law thereby allows individuals, in delimited spheres such as the economy, to act rather as pure, strategic actors calculating the individual costs and benefits of various courses of action. Yet modern law cannot be legitimated through its monopoly on the coercive use of force alone, for it also makes claims to being a rational, normatively correct structuring of social interaction, claims captured in liberal and republican social contract theories and manifestly informing the eighteenth- and nineteenth-century bourgeois revolutions. To put it in the terms of The Theory of Communicative Action, modern positive law partakes simultaneously in communicative and systemic forms of social integration: law “talks” in terms of both ordinary communicative language and the specialized codes of media-steered subsystems.32 From the point of view of Habermas’s critical social theory, this is a remarkable development, for law now occupies pride of place as a potentially effective emancipatory mechanism. Through law, communicative action can counter-steer functional subsystems that have run amok without, however, losing the apparently irreplaceable efficiencies of capitalism and rationalized bureaucracy for material reproduction. In the central metaphor of the book, law is the “transmission belt” that transforms social solidarity and mutual recognition into binding controls over anonymous, functionally integrated economic and administrative systems.

Showing how law can be legitimate falls to a political-philosophical reconstruction of the social contract tradition, in particular of the normative core of constitutional democracy: the system of interlocked individual, political, and social rights, and the basic scheme for the separation of powers. These elements are interpreted in discourse-theoretic terms, such that the system of rights is grasped as exactly those rights individuals would need to legally grant one another if they wish to legitimately regulate their interactions through the medium of law, and the separation of powers is interpreted in terms of different ideal-typical employments of practical reason: legislation justifying legal norms, adjudication applying them, and administration making them pragmatically effective. When the discourse principle is operationalized in the domain of politics, it yields a principle of legitimacy for constitutional democracy: “only those statutes may claim legitimacy that can meet with the assent [Zustimmung] of all citizens in a discursive process of legislation that in turn has been legally

32. It should be noted that throughout the 1980s Habermas did not view law in these bridging terms, seeing modern positive law rather as itself a functionally integrated subsystem, with its own distinctive pathological form of the colonization of the lifeworld called “juridification.”
constituted.”33 This “principle of democracy” specifies a purely proceduralist understanding of legitimacy requiring democratic participation and deliberation structured according to legitimate legal norms ensuring publicity, openness, and accessibility. Notably, Habermas’s deliberative democratic account of constitutional democracy sides with the radical democratic element of classical republicanism stressed by Rousseau: citizens must be able to understand themselves simultaneously as the authors of the very laws they are subject to. But in order for such collective authorship to be legitimate, individuals, in accordance with the liberal tradition, would need to have strong individually guaranteed rights not only to political participation, but also to individual freedom and the social conditions necessary for the equal employment of their various rights. According to Habermas, this means that private and public autonomy are “equiprimordial”: individuals must have equal individual liberties but they themselves must deliberate and decide collectively about what is to be treated equally and what not. In a similar vein, democracy and constitutionalism are not antithetical ideals, but in fact mutually presuppose one another: democracy requires the rule of law to enforce procedurally required constraints, and the rule of law requires democracy to vindicate its inherent claim to normative legitimacy.

The third major analysis of law in the book concerns the institutional means by which communicative power is politically transformed into administrative power. Notable here is the extension and modification of the model of the public sphere developed in his Habilitationsschrift into a two-track model of politics. He now distinguishes between the informal public spheres of noninstitutionalized, heterogeneous, and relatively anarchic arenas of debate and discussion found throughout civil society, and the formal public sphere of state institutions justifying and applying legal rules, including parliamentary, administrative, and judicial bodies. Ideally, communicative power is formed in informal public spheres in response to felt problems; this communicative power is fed as public opinion into formal public spheres that, through the “sluice gates” of legislative processes, is transformed into law that can steer administrative power. When robust deliberation in the various public spheres can underwrite the expectation of rational outcomes from this circuit of power, the state’s use of coercive force can be seen as legitimate. Of course, as Habermas recognizes, this circuit is only an ideal, honored more in the breach. Normally, power flows from economic and administrative social powers into the legislative process, ensuing in laws responsive to special interests rather than public opinion. Accepting realistic limits to his radical democratic ideals, Habermas argues that, as long as an ideal circuit of power can be put to use by a mobilized citizenry in times of

33. Ibid., 110.
heightened concern, the normal counter-circulation of power does not delegitimize the actual practices of contemporary constitutional democracies.

Since the 1990s, Habermas applied the sociopolitical theory of *Between Facts and Norms* to any number of topics in both academic and broader public discussions: multiculturalism, collective identities, and social struggles for recognition; the future of nationalism and the possibility of a nontribalist constitutional patriotism; tolerance in the liberal state between religious believers and nonbelievers; the status and character of political philosophy; citizenship rules and immigration policies; the justification of and prospects for the international extension of human rights; terrorism and the criminal law; increasing global inequalities and the ideologies and mechanisms of economic neoliberalism; and the changing face of international relations from the fall of the Berlin Wall to the unipolar moment of hegemony of the US. For instance, in a 2003 piece notably cosigned by Jacques Derrida, he argues for a common European foreign and defense policy aligned with international law as a counter-hegemon to the lawless, unilateralist US war machine. This last topic of European unity has been central to Habermas’s latest political writings, as he argues for the adoption of a European constitution and the development of a European federalism that could realize the normative ideals of deliberative democratic constitutionalism on a transnational level.

Habermas has also devoted much attention to reconstructing and justifying the general outlines of Kant’s cosmopolitan project for a supranational or global order. His argument here is that the ideals of constitutional democracy are not best realized in a single global government but rather in the medium of law itself. Specifically, he argues for a constitutionalization of extant international law with an invigorated United Nations dedicated to securing human rights and promoting peace at the global level, while at the regional level, transnational blocs would adopt various modes of federation, with democratic legitimation fed through the already existing participatory mechanisms of nation-states. In essence, this proposal radicalizes an idea already in *Between Facts and Norms*, namely, a desubstantialized, proceduralist understanding of democratic sovereignty as no longer invested in a delimited set of citizens making up a bounded *demos*, but rather as resting in the very communicative structures and

democratic procedures that allow for decisions to be made only in the light of sustained public criticism and testing.

VI. SYSTEMATIC PHILOSOPHICAL CONSOLIDATION

Since 1990, in addition to work on the broad themes treated throughout his critical social theory, Habermas began to publish various pieces that might be considered more in the domains of traditional philosophy, specifically concerning ultimate questions of human meaning and concerning epistemology and metaphysics. Hence these years might be characterized as a kind of systematic philosophical consolidation, tying up various loose ends and addressing topics previously held slightly out of reach. In the domain of questions of ultimate human meaning, two topics deserve mention. First, Habermas has written increasingly on topics concerning religion: appreciative essays on prominent theologians, interviews and articles treating the Christian and Jewish origins of ideas and thought complexes close to his work, and a reassessment of Enlightenment modernism. Notable here was an exchange in 2004 with then-Cardinal Ratzinger (soon to become Pope Benedict XVI), which contained an apparent shift in tone, if not wholly in substance, from his sociological theory of modernity developed two decades earlier. For while The Theory of Communicative Action couched modernization as a learning process involving the progressive rationalization of lifeworld structures, it also couched these very same processes in classical sociological terms: as the disenchantment of religious-metaphysical worldviews and the loss of the authority of the sacred canopy. In the Ratzinger exchange and elsewhere, however, Habermas is more sensitive to what has been lost with the changes in consciousness that he interprets as the linguistification of the sacred and as unambiguously leaving us in a postmetaphysical condition. Thus he now stresses that secular reason – which he still staunchly defends – must apply the canons of reflexivity to its own thinking, and open itself to potential learning in which the irreplaceable symbolic and expressive potentials of religious experience are not wholly excluded, especially its sensitivity for diagnosing individual and societal losses, disfigurements, and pathologies. This idea is also evident in his intervention into debates, spurred by Rawls, concerning the public, political use of religious reasons where, in contrast to Rawls's endorsement of a restricted code of religiously cleansed

“public reason,” Habermas argues that religious reasons must be allowed in the informal political public spheres both for functional reasons and so that the special sensitivities of religious language for ethical deformations may be drawn on, as long as these reasons can be translated into secular reasons in the formal political sphere.

The other important work on ultimate questions of human meaning concerns Habermas’s intervention into bioethical debates, specifically concerning the ethics of liberal eugenics, that is, genetic interventions by potential parents aiming to improve or optimize their offspring in some way or another.37 Supporting the conclusion that we should not engage in liberal eugenics, he argues that various forms of genetic technology would, if employed, fundamentally alter our species-wide self-understanding of ourselves as individual beings who are authors of our own lives and responsible for that authorship. But this massive change in our species-wide ethical-existential understanding of ourselves would then undermine our moral self-understandings as responsible authors of our own lives. At the very least, in suggesting an altered understanding of the relation between ethical values and moral principles, whereby context-transcendent moral principles are taken to be embedded in a context-specific ethical worldview – admittedly a worldview that is allegedly species-wide – this argument will force a reconsideration of central meta-ethical issues in Habermas’s work.

In the 1999 Truth and Justification, Habermas has clarified and restated his epistemological and metaphysical views. His first serious go at a theory of truth was in the 1973 paper “Wahrheitstheorien,” where he laid claim to a “consensus” theory of truth: statements are true when they have been agreed to by all dialogue participants under ideally extended conditions of justification.38 He thereby rejected both correspondence theories of truth – for naively supposing linguistically and conceptually unmediated access to brute facts – and coherence theories of truth – for overinflating the significance of linguistic mediation to the degree that they ignore the responsiveness of truth claims to states of affairs. However, at least since 1999, Habermas has abandoned a purely epistemic theory of truth in terms of ideal assertability conditions in favor of a version he calls pragmatic realism. Here he is careful to differentiate truth and ideal warranted assertability in order to emphasize that, unlike in the case of justified moral and legal norms, truth is not constituted or exhausted by agreement under ideal conditions. There

is always the possibility that the empirical propositions we agree to, even under ideal conditions, could be false. We should thus acknowledge the different ways in which claims to truth function in everyday life and in reflexive discourses. In our everyday dealings with the world we are firm realists, convinced of the unconditionality and context-transcending validity of truth claims: “we do not walk onto any bridge whose stability we doubt.”39 Yet when we engage in reflective discourse about particular truth claims, for instance in scientific investigation, we realize that truth claims are epistemically tied to unavoidably linguistic practices of justification, are inherently fallible, and ultimately are only under ideal conditions redeemable to an unlimited communication community.

This change in the understanding of truth has led to the recognition of a need for a theory of reference, and here Habermas has largely endorsed Hilary Putnam’s theory of direct reference, thereby confirming what was always implicit: his epistemological realism. From the pragmatic point of view, our knowledge-gathering practices stem from problem-solving interventions in the world, interventions that make intersubjective learning processes possible through error correction and responsiveness to objections. Antirealist linguistic idealism cannot account for surprising experiences that outstrip our current linguistic frameworks, while hyperobjectivist faith in direct access to brute reality ignores ineliminably intersubjectivist practices of justification. In addition, he has sought to incorporate Robert Brandom’s inferentialist semantics as a natural complement to universal pragmatics even as he is wary of Brandom’s exclusive focus on representational uses of language to the exclusion of communicative uses.40 Finally, Habermas endorses what he calls a “weak naturalism” that treats both the natural and the sociocultural worlds as objective domains open to empirical investigation, yet rejects a reductivist “strong” naturalism. The normative self-understanding of competently speaking and acting subjects simply cannot be done justice to in a reformulated causal language of objectively observable events and states of affairs; the hermeneutic perspective is irreplaceable for comprehending the lifeworld, even as we need not thereby endorse hermeneutic idealism.

In the end, Habermas continues to defend communicative practices as the immanent locus of the transcendent, since the pragmatic presuppositions of linguistic interaction are themselves the point at which regulative ideals of reason become actually effective. Yet whether reconstructing the achievements of theoretic reason in terms of a Kantian pragmatism or acknowledging the

*40. For a discussion of Brandom and naturalism, see the essay by John Fennell in The History of Continental Philosophy: Volume 8.
losses and social deformations attendant to secularization, he continues to insist that we must attend not only to the ideals of reason but also to their potential illusions and misuse. The point, finally, of such an ambiguous assessment of reason and modernity is precisely to develop a robust critical theory, a systematic, interdisciplinary theory oriented toward human emancipation in all its forms.

**MAJOR WORKS**

Critical theory developed as an amalgam of various thinkers directly or indirectly associated with the Institute for Social Research in Frankfurt, Germany.\(^1\) In the 1930s, Theodor Adorno, Walter Benjamin, Erich Fromm, Max Horkheimer, and Herbert Marcuse, among others, reworked Marxist philosophy in order to provide an alternative to the positivist and neo-Kantian approaches dominant in social theory at the time.\(^2\) They combined theoretical interests with empirical research, collaborating on social and political analyses on an array of topics. Their overall aim was the abolition of political and social domination in all of its guises.

The rise of National Socialism, however, imposed a geographic dispersion on this mostly Jewish group. Adorno, Horkheimer, Fromm, and Marcuse all left eventually for the United States, while Benjamin died in transit to Spain. Many of their most influential works were produced in this subsequent time of exile. The second generation of critical theory emerged after the institute reopened in Frankfurt in the early 1950s. Karl-Otto Apel (1922– ), Jürgen Habermas (1929– ), Alfred Schmidt (1931– ), Albrecht Wellmer (1933– ), Oskar Negt (1934– ), and Claus Offe (1940– ) all became associated with the revived institute.\(^3\) But it was Habermas, named as Adorno’s assistant in the mid-1950s,

---

1. The institute was started in the 1920s. Among the earliest members were Friedrich Pollock (1894–1970), Felix Weil (1898–1975), and Carl Grünberg (1861–1940).

2. For a discussion of the first generation of the “Frankfurt School,” see the essays by John Abromeit and Deborah Cook in *The History of Continental Philosophy: Volume 5*.

3. Apel received his doctorate in philosophy at the University of Bonn, under Erich Rothacker. After teaching at the Universities of Kiel and Saarbrücken, in 1972 he took a position at the University of Frankfurt, where he taught until his retirement in 1990. Because Habermas’s
who bore the mantle of this second generation. Committed to the development of a critical theory of society consistent with the first generation’s work, Habermas adapted their prior theories to a host of new social, cultural, and political circumstances. He also began to explore new methodologies, such as the analytic study of language and speech pragmatics (Austin, Searle), discursive theories of truth (Peirce, Dummett), and systems theory (Parsons, Luhmann). He encapsulated aspects of all of these analyses in a wide-ranging theory of communicative action. These new viewpoints significantly expanded the scope of critical theory both geographically and intellectually.

This chapter will explore some of the major developments that these second generation figures, other than Habermas, contributed to the institute. Apel developed the theoretical framework for a discursive theory of truth and worked closely with Habermas in the assimilation of the insights of American pragmatism. Apel, a sociologist, analyzed contemporary administrative systems.

Schmidt studied philosophy and sociology with Adorno and Horkheimer at the University of Frankfurt, finishing in 1970. From 1972 until 1999, he taught at the University of Frankfurt. Wellmer did all of his graduate studies in philosophy at the University of Frankfurt. He was Habermas’s assistant for several years. His early work involved studies of Karl Popper and theories of explanation. In his early career, he taught in Toronto, New York, Starnberg (at the Max Planck Institute), and Konstanz, and then took a position at the Free University in Berlin. Negt received his doctorate in sociology in 1962, writing with Adorno on the sociology of August Comte. He was then Habermas’s assistant in Frankfurt for several years before securing a teaching position in sociology at the University of Hannover, where he stayed until his retirement in 2000.

Offe was a student of Habermas’s, receiving his doctorate in 1968. He then taught at the Universities of Bremen and Bielefeld. Currently he is professor of political science at Humboldt University in Berlin.

Others associated with the institute included Ralf Dahrendorf (1929–2009) and Ludwig von Friedeburg (1924–2010).

4. It is nearly universally conceded that Habermas is a member of the second generation. Peter Matussek, however, argues that Habermas’s discourse-theoretic orientation makes him a third generation figure. See his “Kritische Theorie,” in Orientierung Kulturwissenschaft, Helmut Böhme et al. (eds) (Reinbek bei Hamburg: Rowolt, 2000), 93. Nonetheless, Matussek sees a close continuity between second and third generation orientations. Others argue that Habermas, along with Schmidt, Dubiel, Wellmer, and Honneth, belongs to both second and third generations. See Klaus Scherpe, “Kritische Theorie,” in Reallexikon der deutschen Literaturwissenschaft, Harald Fricke et al. (eds) (Berlin: de Gruyter, 2000), 346.

5. Apel self-identifies as a member of the Frankfurt School. See his "Discourse Ethics' Before the Challenge of 'Liberation Philosophy," Philosophy and Social Criticism 22(2) (1996), 8. Moreover, in Habermas’s Time of Transitions (2001), when asked how the views of second generation critical theorists relate to the Cold War, the Enlightenment project, and the critique of the philosophy of consciousness, he replies, "I can't speak for the 'second generation,' only for myself – or perhaps also for Karl-Otto Apel – in what I am about to say" (Time
Wellmer was critical of much of Adorno's analysis of rationality, and prepared the groundwork for new models of rationality, aesthetics, and modernity. Negt wrote on social theory and collaborated with Alexander Kluge, a film producer, on extensive studies of the public sphere, media, and worker cooperatives. Schmidt did careful studies of the philosophy of history and philosophy of nature.

A few others who were more distantly associated with the second generation of the institute also bear mention. Ernst Tugendhat worked with Habermas and applied the tools of analytic philosophy to the general aims of critical theory. Herbert Schnädelbach developed a theory of rationality (inspired by Hegel’s philosophy of history) implicit in much of the theory of communicative action. Cornelius Castoriadis did extensive work on the interplay between psychoanalysis and social analysis. Michael Theunissen did historical analysis of Transitions, Ciaran Cronin and Max Pensky [eds and trans.] [Cambridge, MA: MIT Press, 2006], 161).

8. Tugendhat (1930– ) received his doctorate from the University of Freiburg in 1956. He then taught at the University of Heidelberg, before leaving and moving to Chile. On his return to Germany, he began teaching again at the Free University in Berlin. Combining critical theoretic insights with analytic philosophy, his best-known work is Selbstbewußtsein und Selbstbestimmung; published in English as Self-Consciousness and Self-Determination.

[*] Tugendhat's work is discussed in the essay by Dieter Thomä in The History of Continental Philosophy: Volume 7.

9. Schnädelbach (1936– ) studied with both Habermas and Adorno in the 1960s at the University of Frankfurt. He then taught in Frankfurt, before taking other positions at Hamburg and then Humboldt University in Berlin. He is best known for his work Reflexion und Diskurs: Fragen einer Logik der Philosophie, in which he examines the historical emergence of reason and normativity.

10. Castoriadis (1922–97) was raised in Greece and heavily influenced by Marxist thought. He later moved to France, where he wrote on a large number of psychoanalytic and economic issues. He placed particular emphasis on the inexplicability of social change, rendering analysis of change a function of imagination. A society can become autonomous if it realizes this. Much of this is described in his The Imaginary Institution of Society. He taught for many years at the Ecole des Hautes Études en Sciences Sociales in Paris.

11. Theunissen’s (1932– ) early work, Der Andere: Studien zur Sozialontologie der Gegenwart, published in English as The Other: Studies in the Social Ontology of Husserl, Heidegger, Sartre, and Buber, was a profoundly influential study of the development of theories of intersubjectivity in Husserl, Heidegger, Sartre, and Buber. He taught at Heidelberg and then the Free University in Berlin. He also did a great deal of work on the philosophy of religion.
of the philosophical foundations of social theory. This listing is by no means exhaustive.\textsuperscript{12}

\section*{I. THE DEFINING MOMENTS OF THE SECOND GENERATION}

It is difficult to give a complete characterization of each of the generations of critical theory, but there are what could be called “defining moments” of at least the first two. For the first generation, three such moments could be defined as the rise of National Socialism and the Second World War, the subsequent diaspora of the members of the institute, and finally the return of some members to reconstitute the institute in Frankfurt in the early 1950s. On their return to Germany they found themselves in a realm of economic prosperity coupled with a profound amnesia about the Nazi past.

The second generation emerged in the Cold War environment in Germany in the later 1950s. For this generation, critical defining moments were: (i) the student revolutions of the mid- and later 1960s (coupled with the untimely death of Adorno); (ii) the expansion of the philosophical reach of the institute’s research in the 1970s beyond the confines of the German intellectual environment (and the correlative emergence of a influential group of critical theorists in North America); and then (iii) the impact of the new world order emerging after the fall of the Soviet Union and its satellites in the late 1980s and early 1990s.

The student movement of the 1960s, in Germany as elsewhere, was constituted by a complex set of historical-cultural circumstances. According to Offe, the German students wanted not merely a radicalization of the public sphere, but also the destruction of political, economic, and cultural institutions.\textsuperscript{13} As early as May 1966, Marcuse, Negt, and Habermas were in attendance at an

\textsuperscript{12} Recently, a third generation of critical theorists has emerged. Their interests are even further wide-ranging than the second. Axel Honneth, who took Habermas’s Chair in Social Philosophy at Frankfurt in 1996, is arguably the central figure of this generation. The influence of Habermas still looms large for these thinkers, although they structure their analyses less exclusively on his thought than the second generation did. Third generation thinkers would include, among others, Ben Agger, Amy Allen, Seyla Benhabib, James Bohman, Micha Brumlik, Hauke Brunkhorst, Rüdiger Bubner, Susan Buck-Morss, Deborah Cook, Maev Cooke, Helmut Dubiel, Rainer Forst, Nancy Fraser, Josef Frücht, Klaus Günther, Joseph Heath, David Hoy, David Ingram, Hans Joas, Nikolas Kompridis, Cristina Lafont, Alfred Lorenzer, Thomas McCarthy, Christoph Menke, Johannes Metz, Gertrud Nunner-Winkler, David Rasmussen, William Rehg, Thomas Schmidt, Martin Seel, Günther Teubner, Georgina Warnke, Rolf Wiggershaus, Lutz Wingert, and Christopher Zurn. [*] For further discussion of this third generation, see the essay by Amy Allen in \textit{History of Continental Philosophy: Volume 7}.

antiwar rally held by the West German student opposition at the University of Frankfurt. The next year, more collaboration between critical theorists and the students occurred. In June, students organized a conference in Hanover and invited Habermas, who tried to define what the students’ revolutionary role should be. He saw a conflict: the students wanted to be a practical force for emancipation while ignoring the theoretical reflection requisite for it. He argued that they should discard any “fascist” leftist models and take on a reflective stance able to overcome the polarizations of their situation in order to forge a singular direction that could form strategic interventions to help the underprivileged and harmed of society. These overtures were generally gainsaid by the students, leading to a definitive break between them and the critical theorists.

In the midst of this confrontation, Adorno died in 1969. As Rolf Wiggershaus writes:

Adorno’s death was thus the end of a form of Critical Theory, no matter how disunified it had been, which had uniquely centered on the Institute of Social Research, as its outward form, and on an urge for discovery that had its roots in anti-bourgeois sentiment and in a sense of having a mission to criticize society. The fact that the younger members of the Institute all left Frankfurt within two or three years only underlined the significance of the break that Adorno’s death represented.

Ludwig von Friedeburgh, who had been the head of the institute, became the Federal Republic of Hesse’s minister of culture, Negt went to Hanover, and Habermas transferred to the Max Planck Institute for Research on Living Conditions in the Scientific and Technological World in Starnberg. Only Schmidt remained in Frankfurt, eventually becoming the administrator of the Horkheimer estate.

Shortly after their dispersal from Frankfurt, critical theorists were collectively accused of fomenting support for terrorist actions, such as those carried out by the Red Brigade in Italy in the 1970s.

15. Ibid., 654.
16. Similarly, Antonio Negri (1933– ) is an Italian Marxist philosopher whose political activism led him to be falsely accused of participating in terrorist acts of the Red Brigade in Italy in the 1970s.
by the Baader-Meinhof Gang17 and their sympathizers. In 1972, Willy Brandt, together with the prime ministers of the Federal States, passed a ban on “radical teachers” that was meant to target critical theorists among others. Five years later, two heads of Republics, Hans Filbinger of Baden-Württemberg, and Alfred Dregger of Hesse, declared the Frankfurt School to be one of the causes of terrorism.18 Wellmer strongly refuted such accusations. He argued that the causes of terrorism stem from the terrorists’ own delusions. These revolutionaries suffered from an “internal loss of experience and community” and showed contempt for the very peoples who were supposed to be liberated by them.19 The terrorists’ strategies of refusal were only “a reflex of the ideological function these norms perform in society.”20 Eventually the public criticisms of the Frankfurt School eased.

In the 1970s, critical theorists expanded their range of research both topically and geographically. While in Starnberg, Habermas appropriated much Anglo-American thought. Apel studied many of the classical American pragmatists, particularly Charles Sanders Peirce and George Herbert Mead, as well as other contemporary figures such as Emmanuel Levinas, Hilary Putnam, and Enrique Dussel. Other second generation figures followed suit. In 1998, Offe coauthored a work with Jon Elster, utilizing some of the latter’s rational choice paradigm. He also studied American political, social, and economic thinkers such as David Easton, Albert Hirschman, Seymour Lipset, and Peter Winch. Negt worked closely with Kluge. Wellmer did work on truth and politics that involved reference to a host of non-German thinkers: John Rawls, Michael Walzer, Charles Taylor, Richard Rorty, Donald Davidson, Jacques Derrida, Jean-François Lyotard, Jean Baudrillard, Gilles Deleuze, Michel Foucault, and even Samuel Beckett. Schmidt read a number of non-German philosophers of praxis, such as Gaston Bachelard, Louis Althusser, and Antonio Gramsci.

Finally, with the breakup of the Soviet Union in the late 1980s, critical theorists were forced to weigh in on the future of Marxist thinking and practice.

---

17. The Baader-Meinhof Gang was a group of militant left-wing activists who were also known as the Red Army Faction. Their aim was to overthrow, by specific acts of resistance, the West German Republic. The group, which described itself as a band of “urban guerillas,” operated from the 1970s through the 1990s.
18. Dregger employed a social philosopher, Günther Rohrmoser, who claimed that “Marcuse, Adorno, and Horkheimer were the terrorists’ intellectual foster parents, who were using cultural revolution to destroy the traditions of the Christian West” (Wiggershaus, The Frankfurt School, 657). He claimed they fomented a “terrorism of political convictions such as has never existed before, even under Nazi tyranny” (ibid.).
20. Ibid., 292.
In the face of the continuing inability of postwar Marxist regimes to develop a “transparent production and distribution economy,” second generation critical theorists were motivated to construct with even greater intensity the emancipatory potential of Marxism.21

Given this brief overview of the second generation, we can now examine some of the general topics with which they worked: (i) their idea of critical theory; (ii) the ethical, social, and political issues they examined; and (iii) their theories of truth and aesthetics.

II. THE IDEA OF CRITICAL THEORY

Critical theory took its initial theoretical impetus primarily from Horkheimer’s work in the 1930s. It was to be a critical theory of society—assisted by insights from sociology, psychology, economics, history, and philosophy—able to furnish resources for human emancipation. It soon evolved into a thoroughgoing critique of instrumental reason and, after the war, moved into specific analyses of Marxism, aesthetics, religion, and politics.

Schmidt did extensive metatheoretic work on Marxist theory in the late 1960s and early 1970s. He was strongly influenced by Johann Droysen’s materialist critique of structuralist views of history. Schmidt claimed that Lenin’s separation of theoretical and structural from historical questions prepared the way for the problematic separation between Marx’s twentieth-century structuralist interpreters, such as Althusser, Bachelard, and Nicos Poulantzas, and his historicist interpreters, such as Gramsci and Georg Lukács.22 Neither side could do justice to both aspects present in Marx’s work. By demonstrating Marx’s unique interweaving of both aspects, Schmidt hoped to retain him as a viable critique of political economy.

Schmidt endorses Adorno’s project of working off the past.23 But he wants to include a working through toward the future as well, and he looked for such resources in Hegel, Marx, and Nietzsche. Schmidt thinks that Marx preceded Adorno in defending the nonidentity of knowledge between object and thought. Marx had accepted Hegel’s critique of empiricism as inadequate to the understanding of concrete universals emerging from historical events, but criticized Hegel for determining that the knowing self is an unfolding of

22. Schmidt does indicate, though, that Althusser denied being a structuralist. See Schmidt, History and Structure, 82.
23. Schmidt, History and Structure, 2–3. As he argues, in an Adornoesque vein, it was Hegel who had given “voice to the object” (ibid., 11).
“itself out of itself.” For Hegel, the science of the concept originated from an empirical ground that afterwards can then be discarded. But he had come close to providing a framework that could illuminate Marx’s subsequent fusion of systematic presentation (Darstellungsweise), on the one hand, and historically guided inquiry (Forschungsweise), on the other. Marx showed how history is not merely narrated, as Hegel thought, but also materially constructed in relations of production.

Marx retained from Hegel the realization that a system is both constituted by conscious acts of individuals and yet can oppose them. Marx was a critical theorist in the sense that he held that the hitherto unconscious forces of system can be modified by the critical thought of the individuals involved. He was convinced, Schmidt argues, that:

just as the idealist system of philosophy, once rounded off and self-defined, left its historical premises behind, like a shed skin, so the bourgeois relations of production appearing in the money form of capital constituted a system “in process” whose functioning must be explained through rigorous conceptual labor.

This hermeneutic key opens up an explanation of much in Capital. It explains why Marx began the text with his analysis of a commodity. As Schmidt explains, “Like a Leibnizian monad, the commodity reflects in itself the whole world conditioned by its structure, a point to which Lenin drew particular attention.” Marx followed the analysis of the commodity with an analysis of the money form and then of capital, while his historical analysis, outlining the primitive accumulation needed for the development of capital, was left until chapter 24. Schmidt argues that Marx thus considered capitalism the high point in universal history, serving as a principle of explanation of past and future development. Structurally Marx prioritized the present as the fulcrum for his historical analysis, and historically he showed the development of individuation over time. Combining these analyses, he then understood concepts, such as labor and capital, not in an immediate but only in a mediated manner, as “slices of abstraction” in an “intensive totality.”

Offe’s analytic model of critical theory is modeled on Marx’s crisis theory. But he adopts Habermas’s claim that the diagnosis and repair of crises stems

24. Ibid., 40.
25. Ibid., 98.
26. Ibid., 47.
27. Ibid., 48.
29. Schmidt, History and Structure, 68.
not only from the distinction between labor and capital but from the distinction between social and system interaction. Capitalist economies integrate social and system interactions in problematic ways: their practice of private ownership separates system integration from private will formation, and their reliance on the causal mechanisms of the market (although markets require a framework of roles established by the state) problematizes the formation of societal and moral norms needed for social integration. Such critical analyses can inform social meliorization.

Wellmer is less optimistic than Offe about the value of Marx's analysis for critical theory. He claims that Marx’s conceptual analysis lost its luster because his theories of crisis and revolution “proved false.” Marx properly understood emancipation as the negation of the negation but he could not work out its dialectical details. Wellmer turned rather to the methodological arguments that Habermas had formulated in On the Logic of the Social Sciences. Like Habermas, Wellmer criticizes Popper’s inability to give an account of meaning on the part of the subjects of social analysis. Although he applauds Peter Winch’s (1926–97) linguistic turn in social analysis as able to account for cultural meanings, he criticizes it for its inability to provide an adequate theoretic level of analysis. Wellmer claims that Habermas makes up for this deficiency by developing a critical social theory that is both practical and historically oriented. Wellmer defines critical theory as that which analyzes the historical embeddedness of the notion of the good life. Critical theory acknowledges the value of each individual so as to oppose all forms of social domination. It works not on Hans-Georg Gadamer’s (1900–2002) model of hermeneutic dialogue, which emerged from the work of Martin Heidegger (1889–1976), but on the basis of criticism of actual traditions. The proof of this emancipatory force is the experience of freedom it unleashes.

30. Habermas makes approving reference to this, noting that Offe “has returned to the conceptual duality of ‘social versus system integration’ in order to comprehend imprecise phenomena that do not readily conform to the frameworks of Marxist, Weberian, or functionalist theories of development” (Habermas [ed.], Observations on “The Spiritual Situation of the Age,” 22).
34. Winch was a British philosopher who wrote extensively on the issues of the foundations of the social sciences. He criticized positivist views that saw sociology as a natural science, and instead endorsed a Wittgensteinian view of society as a grouping of forms of life understood via language games. One of his most influential works was Idea of a Social Science and its Relation to Philosophy.
Wellmer criticizes Horkheimer’s and Adorno’s analysis of Marx in *Dialectic of Enlightenment*. The text:

no longer tries to identify the “objective” historical and social tendencies and mechanisms which point toward the emergence of a liberated post-capitalist society. Thereby it avoids the bad “immanentism” (objectivism) of Marx’s theory. However, by stressing the radical discontinuity rather than the historical continuity between the history of class society and the liberated society, it obviously risks ending up with a new form of utopianism.35

This future orientation is related to the present by an abstract negation. But for Wellmer, critical theory should balance a positive dialectic of liberation with a negative dialectics of reification (Weber). It ought to promote an idea of reason as the “harmonious unity of the collective life process” that can overcome the oppositions between individual and collective will and between reason and sensuous nature.36 Marx was naive to measure bourgeois society:

by a norm of justice that is not its own, with the implication that his critique as a whole is perhaps subject to Hegel’s verdict on such material postulates of justice, namely that they are spawned by an ‘empty understanding’ and seek to usurp the formal postulates of equality of abstract right, which alone are meaningful.37

The second generation’s ambivalent view of the value of Marxian social analysis reflects some of the same ambivalence the first generation felt toward Marx. Each generation clearly realized, though, the importance of continued reflection on its own set of theoretical presuppositions.

III. ETHICAL, SOCIAL, AND POLITICAL ISSUES

*Modernity and postmodernity*

Since the era of Benjamin’s “Theses on the Philosophy of History” and Horkheimer and Adorno’s *Dialectic of Enlightenment*, critical theorists have been

36. Ibid., 46.
intensely interested in the philosophy of history. But while Horkheimer and Adorno voiced strong skepticism about the emancipatory potential of modernity, Habermas praised the project of the Enlightenment for giving grounds for the emancipatory resources of democracy and personal autonomy. He did so in contradistinction to critics of modernity such as Horkheimer and Adorno, on the one hand, and advocates of postmodernity, such as Foucault and Derrida, on the other.

Second generation critical theorists generally defend Habermas’s positive assessment of modernity. Offe envisions a modern state aimed toward freedom, reciprocity, and equality. But he discards the democratic/capitalist or welfare/socialist alternatives in favor of a model that focuses on “secondary rules of selection” that allow for the coexistence of “variegated horizons of options.”38 He also believes, with Habermas, in the pervasiveness of modernity. For example, when postmodernists side with emancipative movements – such as women’s rights or the ecological movement – they do not give up on modernity as such but are merely selective about which modern values they endorse.39

Unlike Offe and Habermas, Wellmer refuses to endorse either modernity or postmodernity. Rather, he relates them dialectically, and concludes that postmodernity is the radicalization of modernity. Since postmodernity is a perspective, it cannot but have a sense of its own position in the present. It develops from a Kantian dialectic of representation and conceptualization. It guides social change by negating the rules established by previous constructions. Modernity, on the other hand, tends to work within itself to check its own deviations. For example, the Romantic movement aimed to rectify the extreme rationality that early modernity had developed. Similarly, Wellmer maintains that Adorno’s idea of reconciliation was developed as a counter to modernity’s “reification, alienation, and identitary reason.”40 Adorno endorsed art as a way to open up and dissolve boundaries imposed on the subject. Wellmer concludes that postmodern worries about ultimate justification are legitimate, but they provide an impetus not to dismiss reason but to work towards its “self-transcendence.”41

The public sphere

It is within this general endorsement of modernity that Habermas, in the 1960s, developed his well-known and influential thesis regarding the public sphere.

41. Ibid., 93.
He stipulated that the public sphere emerged with the development of bourgeois culture in the eighteenth century and its emblematic free press. But in the current welfare state environment, it has expanded beyond the bourgeois sphere.\(^{42}\) What was earlier exclusive to the bourgeois sphere has remixed with the sphere of the state. This has caused a “refeudalization” of the public sphere.\(^{43}\) Its critical function is weakened: it stands in need of revitalization.

Negt and Kluge modified significantly Habermas’s notion of the public sphere, which they envisioned as a new analytic sociological category, alongside those of family, state, and marketplace. While Habermas had utilized the typical liberal strategy of analyzing the public sphere as a singular cluster of activities oriented ultimately toward democratic decision-making, they exhibited how it has become a distorting and expropriative organization of social experience. It has thus spawned its own oppositional sphere, the proletariat sphere, which is a “collective production process, the object of which is coherent human sensuality.”\(^{44}\) Thus they shifted the terrain of the public sphere from a historic-transcendental Enlightenment idealization to a plurality of discourses, experientially constituted.

Negt and Kluge underwrote their “material” theory of public spheres by means of Adorno’s micrological analysis of the nonidentical grounded in the history of the proletariat’s resistance to capitalism.\(^{45}\) Adorno had analyzed history not by means of its large social movements or political ideologies, but rather in terms of the ruptures and discontinuities evident in particular techniques (e.g. the media) and concrete events. Negt and Kluge understood experience dialectically, relative to the experience of time. In contrast to the uniform timelessness of commodity exchange, Adorno’s understanding of the primacy of the object had revealed the ways in which actual social conditions “necessitate quite specific rhythms of experience.”\(^{46}\) For example, in current capitalism the stratifications of temporality and memory are suppressed in the productive sphere, but are shifted into nonproductive activities, such as entertainment, education, and even child rearing, rendering these activities hyper-time conscious.

\(^{43}\) Ibid., 141.

\(^{44}\) Wiggershaus, *The Frankfurt School*, 658. In *Geschichte und Eigensinn*, Negt and Kluge responded to Foucault’s microphysics of power by analyzing the opposite pole of capital power: the power of living labor power.

\(^{46}\) Oskar Negt and Alexander Kluge, *Public Sphere and Experience: Toward an Analysis of the Bourgeois and Proletarian Public Sphere*, Peter Labanyi et al. (trans.) (Minneapolis, MN: University of Minnesota Press, 1993), 18.
Proletariat experience, according to Negt and Kluge, changes with each situation, and thus lacks the generalizability of commodity relations. It emerges not from control over products but from the qualitative “experience of production itself.”47 But it is also shaped by those developments in technology, particularly in microelectronics, that replace one’s everyday lived experience of reality (Lebenszusammenhänge) with a kind of second reality. These experiences form a range of public spheres in contexts that are not usually recognized as such. These include activities such as labor strikes, football matches, and even the routines of family life. These public spheres exist and operate outside the usual parameters of institutional legitimation. They respond to the contingent needs of all of the groups whose self-expression is blocked from the usual arenas of public discourse.

Negt and Kluge take up the Freudian concept of fantasy as a new analytic category for analyzing twentieth-century capitalism. On the one hand, fantasy is that by which commodities can be concretely perceived by the individual. Advertising in contemporary capitalism links commodities to individual wishes, desires, and worldviews. This is the mediation by which commodities take on the character of a public sphere.48 On the other hand, fantasy is also the result of the productive activity that covers up the shock effects of alienation. But in its “unsublated” or inverted form it merely expresses a subject’s alienation as a kind of dream. Yet, even so, it keeps a space within the proletariat sphere that cannot be subsumed into capitalist valorization. Ironically, the “consciousness industry’s” domestication of fantasy (as in films and television) can also allow for its freer existence.49

The bourgeois public sphere, however, remains dominant. It modifies all real needs so that it can classify them within its abstract system. Norms and laws hamper whatever would disturb or nullify bourgeois production. Moreover, the proletariat public sphere utilizes bourgeois organization forms; for example, proletariat marriages are modeled on the bourgeois family – all of which maintains the status quo. But bourgeois society does not actually require the public sphere to operate: competition and law alone would suffice. Its declining need for the public sphere is evidenced in, for example, the “insipid character of public ceremonies.”50 So, why do the oppressed classes still participate in public spheres that exclude their vital interests?

Following Adorno, Negt and Kluge suggest that the media, by weakening given public spheres, actually serves to proliferate new but less critical spheres.
Since its production process is not visible on the screen, television exhibits “suggestive immediacy” and completeness instead of developing the viewer’s awareness of the production process.\textsuperscript{51} There is no medium for a proper critical perspective. This is due to a difference in “social tempo between lived existence, which is to a certain extent not yet industrialized, and the broadcasting output of a highly industrialized medium.”\textsuperscript{52}

In a later work, \textit{Geschichte und Eigensinn} (History and originality), Negt and Kluge construct a critical reading of history from the viewpoint of labor. Such a descriptive project is required to unleash emancipative possibilities. They are particularly interested in the development of the proletariat labor from its peasant origins in precapitalist times. Like Benjamin, they believe that collective narratives not only reveal a people’s experience but also serve to form their productive lives.\textsuperscript{53} Given this presupposition they claim, for example, that fairy tales, emergent from medieval cultures, were fundamental to the development not only of peasant laborers but of the capitalist nation-states, particularly the German, that emerged from them. They use such analyses to expose what they take to be the dominant social consciousness of their time: depoliticized mass consumerism.

\textit{The welfare state and the risk society}

Second generation critical theory thus analyzes a culture whose critical resources for emancipatory praxis are highly compromised. But there is also a structural issue that overshadows this situation: the continued transformation of modern society from a strict capitalist to a welfare state. The state now acts as an agent that attempts to counteract the unintended and undesired side-effects of exchange and profit.

Offe takes up an analysis of the contradictions involved in the very idea of a welfare state. It is in crisis, precisely, because it brings in its wake “ungovernability.” Conservatives argue that to combat the negative effects of the welfare state the culture needed to promote values such as self-restraint, discipline, and community spirit. But Offe argues that such reform would be possible only if the requisite basis of consensus were successfully consolidated. To do so, the mechanisms of social integration would have to be expanded.\textsuperscript{54}

\textsuperscript{51.} \textit{Ibid.}, 103.
\textsuperscript{52.} \textit{Ibid.}, 118.
\textsuperscript{54.} Offe, “Ungovernability,” 74. In his assessment of Offe’s arguments, Habermas thinks that the solution lies in the exposition of various normative orientations: a respect for modernity, a post-traditional understanding of law and morality, and an affirmation of the “fragile autonomy” of moral-practical and aesthetic-expressive rationality. Interestingly he mentions
In a later writing, Offe takes up Ulrich Beck’s structural analysis of the current “risk society” (Risikogesellschaft). He accepts Beck’s claim that we no longer can understand either social conflict simply as a class conflict between exploiters and the exploited or freedom simply as the result of causal interventions against the exploited by the exploiters. Like Habermas and Castoriadis, he claims that crises are primarily no longer economic, but legitimational, motivational, or administrative. What is operative in the risk society is neither a positive sum nor a zero sum game, but rather a negative sum game: in many cases, no party can gain advantage in a given exchange. So, the only path for a society is to minimize overall harm. The best way to manage this is through practices of self-restraint. But this restraint is motivated not by governmental prohibitions, but only by an array of piecemeal interactions. As Habermas argued, the lifeworld of actual structures and institutions needs to meet our moral insights only “halfway” (Entgegenkommen). It does so by “associative relations,” such as the division of labor and procedures of conflict resolution. Offe argues that discourse ethics is one such associative relation of procedural self-controls.

Wellmer also adopts a halfway strategy with regard to the reform of bourgeois culture. On the one hand, the bourgeois virtue of “delayed gratification” has lost its plausibility. Its endorsement of capitalist labor destroys the exist- ential meaning of family and profession. Women are generally more burdened than men with its many contradictory sets of roles. Many bourgeois constraining norms are in conflict with the values of participatory democracy. Nonetheless, Wellmer thinks that the challenge to today’s leftist thinkers is not to abandon but to find “the progressive and emancipatory content” of liberal democracy.

---

57. Ibid., 68. Like Elster, Offe appeals to the figure of Odysseus as a confirmation of this rationality of self-restraint. Odysseus tried to forge a reasonable response to irrationality, yet found that a rational curbing of destructive instinct was all that was possible. Joseph Schumpeter astonishingly argued that these “braking” mechanisms, to be found in as diverse places as cartels and monopolies, were actually helpful to capitalism as static inefficiencies that actually promoted dynamic efficiencies. Offe dismisses this as contradictory, since one simply cannot rationally desire inefficiencies (ibid., 74).
59. Ibid., 305.
Discourse ethics

Starting in *Legitimation Crisis*, Habermas developed a cognitive theory of ethics, later termed discourse ethics. Its metaethical foundations stem from a view of ethical universality premised on finding which individual human interests are in fact able to be verified as intersubjectively valid, and thus as able to guide will formation. Habermas considers his work on discourse ethics – and discourse theory as applied generally to law and politics – one of his crowning achievements. This was an area in which he received a great deal of collaboration from fellow second generation members, particularly Apel.\(^6^0\)

Apel’s methodology begins with a preliminary definition of ethics and its foundations, and then reconstructs the cultural evolution of discourse ethics hermeneutically. Apel rejects both rational choice and contractualist theories. Like Horkheimer, he argues that a rational choice theory, as instrumentalist, simply cannot posit ends. Contractualist theories, for their part, fail to determine what motivates anyone to maintain a contract. This deficit cannot be made up for by any theory of deontological justification. Owing to these failures, Popper was led to conclude that no ethical foundations are possible; one can rely only on decisionism. Rejecting Popper’s solution, Apel historically reconstructs the conditions and procedures of ethical legitimation in order to discover in the present the grounds for a “non-contingent” form of discourse able to guide a democratic praxis.\(^6^1\) He finds a double *a priori* that lies at the foundation of discourse ethics: a real *a priori* considers the connection of norms and values to a pregiven substantive morality; an ideal *a priori* sets forth a principle guiding consensus among all affected. This double foundation yields one overarching duty: to imagine a progressive course of history working towards universal goals. But this teleological claim prescribes not a unified form of a good life, but rather only equal rights and equal coresponsibility and the means towards attaining them.\(^6^2\)

To this point, Apel’s version of discourse ethics meshes almost seamlessly with Habermas’s. But there are differences. First, while Habermas is interested in a strict distinction between the discourses of justification and application, Apel

\(^6^0\) Offe is a possible exception. He defines morality as pertaining to “the reasons with which someone justifies and defends his or her action, not the action itself.” See Claus Offe, *Varieties of Transition: The East European and East German Experience* (Cambridge, MA: MIT Press, 1997), 108–9. Since this view locates morality primarily in the individual, with no reference to exogenous conditions such as discursively achieved consensus, it could hardly be farther from Habermas’s view. Like Habermas, Offe uses the analysis of duty and consequence as intertwined in moral decisions; but he takes it as axiomatic that no abstract duty of justice could ever apply in all cases. There are “substantive” tests for this (*ibid.*, 109).

\(^6^2\) *Ibid.*, 75.
focuses on a prior issue: how one proceeds when there are no actual discourse partners for either type of discourse in a given situation. This leads him to posit a necessary supplement to discourse: an ideal reciprocity that reflectively functions when sufficient discourse partners are absent. Apel also supplements Habermas's thought by including a moral demand for self-surrender: “all participants in a practical discourse have to surrender their interests” in the process of translating them into validity claims.

Apel also differs from Habermas in his understanding of political discourse. Apel maintains that discourse ethics has a double function as an ethics of coresponsibility: it must both implement its own application to the lifeworld “through the system constraints of strategic self-maintenance,” and provide regulative principles for a critique of all political self-maintenance systems. On this ground, Apel endorses the market system because it can more efficiently supply a maintenance level of goods and services than socialism can. Yet, while it can give proper power to demands, it is admittedly less successful in providing for the needs of those who lack participation.

Third, Apel has been more willing than Habermas to use the insights of postmodern philosophies to elucidate discourse. For example, Apel considers the relationship of discourse ethics to liberation philosophies, particularly that of Latin American philosopher Enrique Dussel. Dussel shows parallels between the ideal communication community in discourse ethics and a communal ideal of a philosophy of liberation permeated by everyday confrontations with the “interpellation of the Other.” Borrowing from Levinas, Apel finds in the cry of the oppressed an intersubjectively binding validity claim. But Apel worries about the normative grounding of this fundamental claim to justice. He rejects Dussel’s assertion of an a priori responsibility toward the Other prior to any discursive argumentation. Rather, he argues that the a priori of the difference between the real and the ideal communities inaugurates nonviolent counter strategies:

[T]he demand to solve all morally significant conflicts of interest by means of practical discourses about validity claims, in which violent strategic practices are neutralized, can be realized approximately only if a constitutional state is established that has a monopoly on

63. See, also, Wellmer, *Endgames*, 143.
67. For a discussion of Dussel, see the essay by Eduardo Mendieta in *The History of Continental Philosophy: Volume 8*.
violence and can thus effectively relieve its citizens from the burden of having to fight for the justified interests on their own.\textsuperscript{69}

Wellmer also agrees with the basic intuitions of discourse ethics. But he rejects both Apel’s project of finding absolute grounds for it and Habermas’s projection of an ideal future agreement. Instead, he develops a “fallibilistic” model that emerges from three criticisms of their discourse model. First, while they think that Kant’s ethics was strictly monological, Wellmer argues that Kant’s negative formulation of the categorical imperative – that I would be unable to will x as a universal law – actually entails that the collective We would also be unable to do so.\textsuperscript{70} Second, Wellmer criticizes Habermas’s (U) principle of universalization for effectively assimilating moral to legal problems. Habermas wants to give a deontological grounding to moral claims by using (U), but he ends up giving them only a legal grounding since discourse is effectively a kind of democratic procedure seeking consensus.\textsuperscript{71} Third, he claims that discourse ethics cannot resolve the problem of determining the consequences of the imposition of universal norms on specific individuals in specific situations. This leads him to criticize the very possibility of a real consensus. Habermas, however, later responds to Wellmer by arguing that application discourses give “operational” meaning to universal norms by both taking into account the time of their application and dealing only with interests that are foreseeable.\textsuperscript{72}

The post-1989 transition

The liberation movements with which the second generation was most closely associated involved those of the former Soviet Union and its satellites. These movements, though, certainly did not follow the script of Marx’s understanding of socialism and revolution. Although critical theorists had long since given up on any exclusive reliance on a Marxist model of social change, their sustained critiques of capitalism had included some positive assessments of socialism. Soon after the Soviet collapse, in fact, Habermas worried that if the transition continued too rapidly, it could harm both the former bloc and the Western nations that surrounded it. Subsequent events have confirmed at least some of his pessimistic prediction.

\textsuperscript{70} Wellmer, \textit{The Persistence of Modernity}, 153. Moreover, every moral reflection is, after all, monological in nature (\textit{ibid.}, 156).

\textsuperscript{71} For an explanation of (U), see the essay on Habermas by Christopher F. Zurn in this volume.

\textsuperscript{72} Habermas, \textit{Justification and Application}, 36.
Shortly after the fall of the Soviet Union, Offe brought to bear moral, historical, sociological, and legal models that could frame a rationally guided model of transition for the former socialist states. While one might presuppose that his critical sensitivities would render him sympathetic to the goals of the former planned economies, the opposite is the case. Similarly to Apel, he praises both the consensus formative powers and innovations of market economies. Capitalist societies are pluralistic, and show a dynamic of openness to change; socialist economies, on the other hand, try to anticipate change but fail. The macro planning of state-controlled economies renders anarchy at the micro level of the individual laborers, diminishing productivity. Yet Offe also notes the irony of the fact that queues in capitalist economies are found in the front of unemployment offices, while those in socialist countries are found in front of butcher shops. But capitalism’s advantage is that it desists from making moral claims. In fact, the crucial defect of the East German republic was not an economic but a moral flaw: it restricted the rights, prosperity, and the mobility of its working population.

Offe points out that the recent transitions to capitalism were imposed by emergency measures. Thus a revolution took place with neither historical precedent nor guiding ideology. Moreover, it was carried out before the economic processes were in place to make it function properly. In this respect, he disagrees with Habermas, who thought the transitions were just a matter of premodern Eastern bloc systems “catching up” (nachholen) to modern societies. Offe argues that similar impositions occurred in both Japan and Germany after the Second World War. Rights and market mechanisms, when first introduced, are ordinarily not recognized by the will of the people. Paradoxically, although a market system requires the development of a democracy (although not vice versa), only in a developed free market society with a high level of wealth can a democracy work. So Offe concludes that the impositions were a form of “primitive accumulation”: an external intervention that causes the mutually presupposing prior conditions to actualize at once.

IV. THEORIES OF TRUTH AND AESTHETICS

Truth theories

In contrast with the first generation of critical theory, Habermas has long been concerned with the philosophical analysis of the problem of truth. He

73. Offe, Varieties of Transition, 3.
74. Ibid., 19.
75. Ibid., 32.
famously has changed his theory from a strict verificationism, as evidenced in his “Wahrheitstheorien” (1973), to a deflationary semantic theory of truth combined with a postmetaphysical realism in Truth and Justification (2003). His verificationism had been forged in concert with Peirce’s claim that an ideal consensus guides communities of inquirers regarding theoretical, practical, and even aesthetic claims. But the later impact on him of Donald Davidson and Michael Dummett was decisive, urging him to see the truth predicate semantically in a nonreferential sense.

Apel and Habermas have long worked in tandem on the assimilation and assessment of pragmatist views of truth. Apel endorses a Kantian “transcendental reflection by the subject of knowledge on the subjective conditions of the constitution of objects.” This reflection grasps both the pragmatic context of causal inquiry and the language game to which it belongs. But he rejects both Kant’s and Husserl’s philosophy of the subject of consciousness in favor of a “transcendental semiotic” of the language pragmatics able to grasp “contextual conditions.” These conditions are the performative presuppositions of communication – such as the fact that one cannot communicate successfully without trying to convince another by reasons. He famously calls them first principles on the basis of which knowledge can be determined. Habermas affirms the holism of Apel’s theory – its claim to guide all forms of argumentation – but denies its reconstruction of first principles.

From this viewpoint of truth, Apel and Habermas posed a serious challenge to Gadamer’s philosophical hermeneutics. According to Gadamer, no truth claim can ever transcend the historical tradition – the prereflective conditions of understanding – within which it emerges. A fusion of horizons between the interpreter and the interpreted is possible, but the horizons of what is interpreted and of the interpreter nonetheless remain distinct. Apel acknowledges that Gadamer’s philosophical hermeneutics is an improvement over both the subjectivism of the early Heidegger’s existential hermeneutics and the objectivism of the later Heidegger’s disclosure and withdrawal of Being. Both render impossible the function of social sciences, a problem that Gadamer worked to

77. Verificationism is generally the principle that the meaning of a sentence or claim is determined by its mode of verification. Many logical positivists held to this principle. For example, “red” means what one sees when one looks at a red object. Habermas in Wahrheitstheorien uses a form of verificationism in which a claim is true when it has passed a test by which it has been verified. For example, “this house is red” is true when observers (or experts) agree, under specific conditions of agreement, that it is indeed red. He later abandons the claim that agreement makes it true, but he still affirms the necessity of finding agreement on all matters of truth and rightness.

rectify. But Apel claims that Gadamer’s philosophical hermeneutics disallows the possibility for a sufficient distance from tradition required by any proper critical evaluation of it. Apel’s transcendental pragmatics is able to evaluate a claim not simply on the basis of its origins, but also on the basis of its very conditions of expression.

Wellmer also rejects much in Apel’s transcendental pragmatic view of truth. He starts instead with the common distinction between verificationism and objectivity, and concludes that this difference constitutes an “antinomy of truth.” Following Rorty, Wellmer rejects the way in which Apel utilizes idealizations and convergence as a way of mediating between these poles. Wellmer claims that it is licit to understand idealizations only in a “localizing” sense. These are the performative assumptions needed to make our language understandable. They make no assumptions about the future. He thinks that Habermas changed his earlier strong idealizational stance to a localizing weaker sense. Wellmer realizes that this inclusion of the context of experience, practice, and reflection opened the door to the possibility of ethnocentrism. But he defends Habermas’s dialectics of context-immanence and context-transcendence. It furnishes not a substantive but a procedural model of truth that fosters liberal ideals and institutions.

Wellmer gives his weak idealizational validity theory of truth an aesthetic variant. The validity claims that we raise are both context dependent and capable of transcending context. But the idealized understanding that is presupposed in communication must not be misunderstood as the prefiguration of an ultimate, transparent meaning: an ultimate reconciliation. Such a view would be like Kant’s intelligible realm, a realm beyond nature. Rather, for Wellmer the opposition must emerge within the intelligible subject itself: at once insignificant and sublime. In this way, art’s transformation of the terror of the unintelligible into aesthetic delight expands “the frontiers of communicatively shared meaning.”

In the final analysis, Wellmer clings to an objectivity about truth. He is not utterly a deflationist, but maintains that the truth predicate refers to a state of affairs that is not dependent on verification processes. Along with Cristina Lafont, Wellmer convinced Habermas that although there is an unavoidable epistemological connection between truth and justification at the level of discourse, this does not amount to a conceptual connection between truth and

81. Ibid., 140–41.
82. Ibid., 144. Wellmer, surprisingly, affirms Derrida’s claim that these localizing idealizations are, simply, impossible.

84. Wellmer, Endgames, 177.
rational assertibility under ideal conditions. If it did, “we could not take truth to be a property of propositions that they ‘cannot lose.’” Thus he convinced Habermas to retain a delicate balance between idealizational verificationism and a realism about truth.

**Aesthetics and communication**

Habermas argues that aesthetics not only renew our interpretations of the internal needs by which we perceive the world, but also influences our interpretations of what we perceive and the normative expectations we have of the world. In early works, he claimed that the aesthetic realm is rational inasmuch as its claims are subject to discursive evaluation. He proposed the possibility of aesthetic validity claims, able to be raised relative to specific artistic expressions. But in response to Wellmer’s criticisms of this, he eventually abandoned the possibility of such discourse about art and instead reconsidered the hermeneutical claim, associated with Heidegger’s aesthetics, that art is world disclosive and not subject *per se* to formal critical evaluation. Yet Habermas never developed a full blown, formalized theory of aesthetics.

Unique among second generation critical theorists, Wellmer did develop aesthetic theory comprehensively and in multiple directions. Influenced by Adorno, he argued for the centrality of aesthetics in our experience of the world and our actions. Art transforms “those traces of meaning that are scattered throughout our everyday experience, lending duration to the ephemeral and fleeting, giving voice to the ineffable, rendering visible that which has never been seen.” It accomplishes this through a negation of the traditional understanding of representation and meaning in art. For Wellmer, this negation actually results in an expansion of the boundaries of meaning and of the subject.

Wellmer critically appropriates several of Adorno’s claims about aesthetics. He begins with Adorno’s claim that aesthetics is the only realm left for rationality because it avoids the repressive logic of identifying thought and vouchsafes the

86. Jürgen Habermas, *Truth and Justification*, Barbara Fultner (trans.) (Cambridge, MA: MIT Press, 2003), 37–8. See also Wellmer, *The Persistence of Modernity*, 245 n.52. Wellmer argues that if consensuses are infinitely repeatable, as Habermas argued, then *ipso facto* no specific consensus could ever be falsified: a conclusion Habermas nonetheless wanted to draw. The consensus is really now a way of “showing” the truth. See *ibid.*, 165.
particular. The work of art reveals the irrational and false character of existing reality while prefiguring an order of reconciliation. Lyotard had claimed that a picture “is not a pure picture in the sense of an aesthetic object. In so far as it is representative, art is still participating, so to speak, in a discourse which it is its purpose to overcome and leave behind.” Wellmer agrees with Lyotard that genuine art cannot sustain a model of dialogue that recognizes each participant simultaneously as an individual and an equal. But he is intrigued by Adorno’s claim that the artist speaks as a “we.” Yet Wellmer thinks that Adorno’s collective subject still speaks with only one voice, to itself. For Wellmer, Adorno’s form of aesthetic rationality can express only a transhumanism, not a “life form of speaking and interacting individuals.”

For Adorno, art fails to understand the semblance to which it succumbs. It does not understand how it points to a nonbeing. Thus philosophy must come to its assistance: “only philosophy can decipher the mirror-writing of the absolute in the semblance of artistic beauty and thereby articulate the truth, contained in the work of art, as that which is incommensurable to the immediacy of the aesthetic experience qua experience.” Philosophy and sublime art can work together to glimpse “the weak traces of a nonillusory absolute.” For Wellmer, only in this aporia between art and philosophy can these weak traces be detected and the aporia inherent in artistic production be grasped.

Wellmer is particularly interested in Adorno’s thesis regarding the explosion of metaphysical meaning in modernity. A crisis of subjectivity ensues when metaphysics cuts the subject off from reconciliation. But Wellmer argues that we operate not under the dialectics of subjectification and reification, as characterized by Adorno, but rather the subject’s loss of objectively assured systems of meaning. Yet he thinks that Adorno sets up the possibility for a link between the negativity of aesthetics and the positivity of communicatively shared meaning. Adorno did not develop a sufficient conception of the intersubjectivity of language to link disenchantment to a gain in communicative rationality as Habermas did. Yet Adorno’s “spiritualization,” the revolt against limits, did correspond to an “opening up of ordinary discourses” in the communicative rationalization of the lifeworld. For Wellmer, the nonidentical becomes communicable by virtue of becoming intersubjective and thus “alienated from its own private nature.” This in turn fosters an increasing “individuation” that

can counteract the disenchantment we face. He agreed with Hannah Arendt’s (1906–75) descriptions of the way in which technology increasingly infused itself into aspects of everyday life, including politics. He urged an “enlightened democratic praxis” in the political realm whereby the dream of uniting art and industry can be imagined.\(^97\)

Wellmer still finds that Adorno’s sublime withstands the negativity of the world. The point of entry for the sublime in modern art was the disappearance of the absolute. “Between the being and the nonbeing of the absolute there remains an infinitely narrow crack through which a glimmer of light falls upon the world, the light of an absolute which is yet to come into being.”\(^98\) Adorno’s hope-based redemption of metaphysics still operates within the modern philosophy of the subject’s attempt to establish a metaphysical bulwark against skepticism and domination. For Wellmer, Adorno’s aesthetics was “a hesitation on the threshold of postmodernism” – but once this threshold is passed, then humanity can hope for liberation from the terror of “all encompassing meaning.”\(^99\)

V. CONCLUSIONS

Without a doubt, the second generation of critical theorists has operated in the shadows of Habermas’s dominant influence. Yet Offe’s assessment of contemporary political structures, Apel’s description of processes of liberation, Negt’s brilliant analysis of the impact of the media on public life, and Wellmer’s wide-ranging reconstruction of Adorno’s aesthetics are all unique and original analyses in their own right.

The sheer existence of a second generation of critical theory indicated two things. First, it revealed the staying power of critical theory. In the work of these thinkers, critical theory was shown to be adaptable to radically new circumstances across generations and cultures. Second, their work revealed that critical theory was indeed a “school”: a loosely affiliated group of thinkers who demonstrated the ability to learn from each other, criticize each other, and work together on a common projection of an emancipative future for humankind.

It remains to be seen what the legacy of this generation of thinkers will be. While Habermas’s impact on the future is virtually without question, the other figures of this era of the Frankfurt School will have to vie for attention based on the quality of their more modest contributions. But their willingness to lay bare the social and psychological evils of their times in the hopes of bettering

humankind cannot but give courage to future generations of social theorists to follow in their collective path.\footnote{100}

In the 1960s, hermeneutics became a leading field of philosophical interest. This was due in large part to the major contributions made by Hans-Georg Gadamer in Germany and by Paul Ricoeur in France. Gadamer, who was a student of Martin Heidegger, had characterized his own earlier study of Plato’s work as a “phenomenological reading,” and Ricoeur had characterized his own initial project as phenomenology of volition, rather than phenomenology of perception such as can be found both in Edmund Husserl’s or in Maurice Merleau-Ponty’s work. This study of the contributions to the field of hermeneutics made by Gadamer and by Ricoeur will pay particular attention to the legacy of phenomenology that figures in those contributions. Both Gadamer and Ricoeur faced challenges from other contemporary philosophical currents. In regard to Gadamer, the challenge came from critical theory, as represented, in particular, by Jürgen Habermas. In regard to Ricoeur, the challenge came from poststructuralist philosophical work, as represented, in particular, by Jacques Derrida’s “deconstruction.” The responses by Gadamer and by Ricoeur to these challenges respectively help to elucidate crucial features of their hermeneutical thought. This study will include analyses of those responses.

I. HERMENEUTICS IN TRUTH AND METHOD

Hans-Georg Gadamer’s first published book was Plato’s Dialectical Ethics: Phenomenological Interpretations Relating to the Philebus, which appeared in 1931.

1. Hans-Georg Gadamer (February 11, 1900–March 13, 2002; born in Marburg, Germany; died in Heidelberg) was educated at the University of Marburg (1919–28), receiving a Promoviert
Plato’s thought remained of lifelong interest to Gadamer. The book for which he became most widely known, however, is his second book, *Truth and Method*, first published in German in 1960. The book became widely regarded as the most significant German philosophical work since Heidegger’s 1927 *Being and Time*. This work would remain Gadamer’s primary philosophical contribution, indispensable for fully understanding Gadamer’s readings of the philosophical tradition, particularly Greek and German philosophy, as well as his readings of poetic texts. It is a major work in the history of hermeneutics, crucial for understanding the development of philosophical hermeneutics over the past hundred years.

In *Truth and Method*, the field of art serves as a point of departure for Gadamer. The target here is “aesthetic consciousness,” understood as that activity or mode of consciousness, where the subject matter is artworks, and artworks alone. Gadamer specifies that philosophically, the distancing, if not divorce, of art from theoretical knowledge is found in Kant’s analysis, in his *Critique of Judgment*, of judgments of taste with regard to beauty. Such judgments, which concern nature and art, derive from the interplay of our subjective faculties. The harmonious interplay of those faculties is a basis for an affirmative judgment with regard to beauty. According to Kant, there is a universality that pertains to these judgments, but it is a “subjective universality” that concerns our common faculties and not an “object of knowledge” in the sense in which this figures in matters of theoretical knowledge according to Kant’s analysis in his *Critique of Pure Reason*. The “subjectivizing” of art displaces art from the full field of our experience. In the extreme, the setting apart of art from questions that concern truth will mean that the museum alone is the place for the proper display of art, where it becomes the occasion for an “aesthetic consciousness,” directed exclusively to works of art, and where art takes on the function of providing temporary pleasurable respite from the difficulties of everyday life.

Heidegger,\(^2\) in his 1948 lecture “The Age of the World-Picture,” identified the relegation of art to the domain of the aesthetic as a defining feature of the modern age. Another defining feature is the prevalence of the notion of

---

\(^2\) Heidegger’s work is discussed elsewhere in *The History of Continental Philosophy: Being and Time* is discussed in the essay on Heidegger by Miguel de Beistegui in Volume 3; Heidegger’s late work is discussed by Dennis J. Schmidt, and Heidegger’s aesthetics is discussed by Galen A. Johnson in their essays in Volume 4.
culture, to which all nonscientific activities are assigned. While almost totally absent from Heidegger’s 1927 *Being and Time*, art becomes a crucial concern in Heidegger’s later work. When Heidegger’s *The Origin of the Work of Art*, based on a lecture dating from 1935, is published in 1959, Gadamer writes the introduction. Gadamer is struck by the fact that whereas in *Being and Time* Heidegger sought to reopen the question concerning Being by inquiring into our own ontological structure insofar as we are intrinsically concerned with this question, in *The Origin of the Work of Art*, Heidegger addresses the question concerning Being via an inquiry into the ontological import of art. This constitutes, in effect, a step in Heidegger’s de-struction of the tradition of metaphysics, and here the specific target is aesthetics insofar as it is bound up with the sense of subjectivity as ground, a modern version of the metaphysical identification of being and presence that Heidegger’s thought calls radically into question. The ontological import of artworks means, as Heidegger accentuates in *The Origin of the Work of Art*, that truth is at issue in artworks. Gadamer’s negative assessment of “aesthetic consciousness,” in *Truth and Method*, is clearly consistent with and reinforces this finding.

Ultimately, what “aesthetic consciousness” misses altogether, where artworks are concerned, is that artworks have something to say. The way that artworks address us is what inaugurates a hermeneutical dynamic. We respond by way of our available presuppositions for understanding what we encounter. Certain of these presuppositions will facilitate a more integral understanding of the artwork, while the artwork will resist others. The resistance of the artwork brings forward other approaches on our part. This sets in motion a type of play over which we do not have control. Also, this play is such that the rules are not given in advance but rather take shape as play proceeds. This radical play is such that a type of buoyancy takes effect whereby the play is lifted from the initial context in which the artwork is encountered. Important in addition to the hermeneutical dynamic between spectator and artwork, there is also a hermeneutical dynamic of this character in motion between the artist who initially paints, or sculpts, or composes the work, on the one hand, and the work, on the other. Gadamer emphasizes strongly that the artist’s intent does not govern the artwork’s meaning. Furthermore, as an artwork travels through historical time, more of its meaning may be disclosed. Gadamer characterizes this as an “increase in being.”

Gadamer's description of the dynamic that operates in understanding artworks serves as a point of departure for crucial elements of philosophical hermeneutics as Gadamer understands this. First, methodology is definitely not the ultimate court of appeal when it comes to understanding what artworks mean. This is not to rule out a role for methodology in the study of artworks, but ultimately methodology pertains to what we bring to the artwork and, like any and all presuppositions, it is subject to modification by virtue of an artwork's resistance to our approach, by virtue of the play set in motion by our encounter with the work, and by virtue of the way we are addressed by the art. Further, understanding what artworks mean is not a matter of historically determining an objective context in which the artist first painted, sculpted, or composed the work, any more than it is a matter of determining the artist's initial intent. While what we may know of such context and such intent may be of help when it comes to understanding the work, this pertains, again, to what we bring to the work and is subordinate to what the artwork has to say. An integral understanding of a work of art takes place over and above what we do, and this marks the decisive limit of the pertinence of methodology.

While the field of art serves as a point of departure in *Truth and Method*, the background issue is the character and the status of the *Geisteswissenschaften*, the human or social sciences, and Gadamer now brings his findings from the analysis of "aesthetic consciousness" to bear on this. These questions had largely preoccupied Wilhelm Dilthey, who had first brought hermeneutics forward as an appropriate approach to the subject matter of the human sciences, which had taken shape in the nineteenth century, and in particular history. Dilthey advanced the study of understanding *per se*, which had become a central concern in Friedrich Schleiermacher's contribution to theology, the field in which hermeneutics was transmitted from the ancient world to the early modern world, and Dilthey brought this study to bear on the human sciences, distinguishing them from the natural sciences by virtue of the primacy of understanding in these fields, in contrast to natural science's ultimate interest in explanation. Gadamer, in addressing the issue of the human or social sciences, appeals to the humanistic tradition and, in particular, to its sense of the formation or the education (*Bildung*) of individuals via the study of what is inherited by the age in which they live. Gadamer's point is that it is not possible to understand any age, including our own, without addressing this primary process of learning. The point pertains both to the subject matter of the human sciences, and to the practitioner in those fields. In effect, the human sciences remain a type of battleground between natural science, on the one hand, and the humanistic

---

tradition on the other. Gadamer's point is not to undermine the natural sciences, but rather to establish their limitations where the subject matter of the human sciences is concerned. The pertinence of the natural sciences in their own domain is not Gadamer's concern here.

Where the human sciences are concerned, Gadamer's specific target is “historical consciousness,” in the sense that was developed in the nineteenth century. “Historical consciousness,” like “aesthetic consciousness” – the target of Gadamer's discussion of the dynamic of art interpretation and understanding – involves a debilitating abstraction. In the case of “historical consciousness,” the abstraction concerns the presupposition or presumption that historical contexts can in fact be specified objectively. What “historical consciousness” of this character misses is the working of history, its effective quality. What is at issue is what happens beyond what we do. Gadamer writes: “Understanding is to be thought of less as a subjective act than as participating in an event of tradition, a process of transmission in which past and present are constantly mediated.” History effects this mediation. Over and above methodologies employed in the study of history, our understanding comes by way of this effective character of history. We do not overreach the mediation if we try, for example, to grasp the Greek age in an objective way. Gadamer proposes “effective-historical consciousness” (wirkungsgeschichtliches Bewußtsein), in contrast to “historical consciousness,” as a characterization of consciousness involved in the interpretive dynamic that proceeds by way of the effective character of history.

Importantly, our own historical context cannot be specified objectively and consequently we do not leap over this in our understanding of earlier ages. This is to say, we do not first reach an objective understanding of our own historical context, alongside the objective understanding of earlier historical contexts, which we would then bring to bear in addressing specific issues that mark our age. It is instead by way of effective-historical consciousness that we reach an understanding of our own age. This marks the sense in which application is not a subsequent step but rather is intrinsic to the dynamic of “effective-historical consciousness,” for only if one were first to understand an earlier age objectively would one then need a subsequent step of applying what one understands to one's own age. This also marks the way in which Gadamer recovers a motivation for the initial practice of hermeneutics in the ancient world, both in

---

7. A key term in _Truth and Method_, _wirkungsgeschichtliches Bewußtsein_, most frequently translated as “effective-historical consciousness,” could also be translated “historically effected consciousness,” “consciousness effected by history,” or “consciousness of the effects of history.”
the Greek context as well as in the Judaic and Christian contexts, where interpreters’ contexts were understood in terms of primary texts, Homeric or biblical, that preceded them, sometimes by centuries. Gadamer appeals to the development of hermeneutics in the field of legal interpretation to illustrate how contemporary issues may be addressed in terms of laws framed at an earlier time when the issues in question did not figure in the historical context. Neither the perspective of an earlier age nor our own perspective governs the interpretive dynamic. Gadamer designates what happens by way of this dynamic as a “fusion of horizons” (*Horizontverschmelzung*), whereby the truth that supports us in our understanding of our own age gets transmitted from the past. Our age does not exhaust such truth. By virtue of the dynamic of effective-historical consciousness, our understanding has an event-character that exceeds any methodology that we might bring to bear in the study of our own age as well as in the study of previous ages. While Gadamer does not preclude a role for methodology in the study of the subject matter of history, he does not address comparative methodologies and he clearly subordinates methodology to the interpretive dynamic that defines that effective-historical consciousness by way of which truth is transmitted.

Gadamer’s description of the interpretive dynamic draws on Heidegger’s analysis, in *Being and Time*, of an interpretive dynamic that is intrinsic to understanding. Heidegger specifies there that understanding comprises: a “fore-having” (*Vorhabe*), which pertains, in effect, to the way that what we encounter in the world, we do so against a background; a fore-sight (*Vorsicht*), which pertains, in effect, to the way that we encounter what we encounter from a particular direction; and a fore-conception (*Vorgriff*), whereby, in effect, these features intrinsic to our understanding set conceptualization in motion. Crucially, Heidegger specifies that understanding, with its intrinsic interpretive dynamic, is a feature of our ontological structure, which is to say a feature of that mode of being specific to us, namely, being-in-the-world, or to-be-in-the-world (*in-der-Weltsein*). Accordingly, Gadamer sets his sense of hermeneutics apart from the sense of hermeneutics developed by Dilthey, which Heidegger assessed as ultimately psychological in character. Hermeneutics is not a methodology based on the

---

8. In addition to his debate with Jürgen Habermas, discussed below, Gadamer engaged in an important dialogue with Italian jurist and legal historian Emilio Betti (1890–1968), who criticized Gadamer’s reassessment of method for threatening the objective status of interpretation. For some of their important texts in the debate between Gadamer and Betti, see Gayle L.Ormiston and Alan D. Schrift (eds), *The Hermeneutic Tradition: From Ast to Ricoeur* (Albany, NY: SUNY Press, 1990).

structure of subjectivity that is then put at the disposal of the human sciences. The interpretive dynamic is an ontological feature of who we are.

While Heidegger’s description specifies that understanding does not commence subsequent to an encounter with what we find in the world at a point-zero, so to speak, Gadamer stresses the role that “pre-judgment” or “prejudice” (Vorurteil) plays in our understanding of history’s subject matter. This opposes Gadamer to the Enlightenment’s unqualifiedly negative assessment of prejudgment, from which stems our condemnation of any and all “prejudices.” Gadamer’s point is that the presuppositions or presumptions by means of which our understanding operates are not ipso facto obstacles between ourselves and truth but rather may, in fact, play an enabling role. This is not to say that these prejudgments will remain as is, or in place, as the interpretive dynamic proceeds. But understanding does not come about via an elimination of prejudgment. Between such prejudice, on the one hand, and the working of history, on the other, a circle takes shape. Heidegger specified this circularity of understanding in *Being and Time*, noting that eliminating this circle is not an option when it comes to understanding, but what is crucial is how we enter the circle, and this point in regard to the “hermeneutical circle” figures in Gadamer’s description of effective-historical consciousness. Heidegger was particularly wary of an overspatializing account of this dynamic of understanding. On Gadamer’s account, there is a definite sense in which the role of the circle accords with the role of play that Gadamer brought forward in his description of understanding art, particularly in regard to the fact that what happens by virtue of this circularity of understanding is not under our control.

The attribution of a potentially positive role for prejudice, the way in which it is, indeed, constitutive of understanding, reinforces the supportive or sustaining sense of tradition as understood by Gadamer, which in turn makes authority appear in a positive light, and all of this sets Gadamer apart from one of the prevailing features of modernity. To the extent that modernity establishes itself in opposition to all that precedes it, it can be understood only against that background. The “quarrel between the ancients and the moderns” must presuppose a commonality and it is that commonality of understanding that is primary for the dynamic of hermeneutics as Gadamer understands this. It is not the case that misunderstanding is the point of departure, as Gadamer finds in earlier studies in the field of hermeneutics such as Schleiermacher’s.

While the analysis of understanding in *Being and Time* is, on Gadamer’s account, a crucial turning point in hermeneutics, the thread that Gadamer follows from Heidegger’s earlier to his later work is the deepening inquiry concerning language. In *Being and Time*, discourse (Rede) is identified as a feature of our ontological structure, our being-in-the-world or to-be-in-the-world (in-der-Welt-sein). In his later inquiry concerning language, Heidegger stresses that it
is not the case, in any sense, that we possess language. It is language that has apriority where our speaking is concerned. There is always an “unsaid” that pertains to what is said. In his studies of preeminent thinkers of the tradition going back to the Presocratics, Heidegger sought the “unsaid” of the tradition. For hermeneutics, having a last word is not the issue. There is always something more to be said. In this regard, Gadamer recovers the contribution made by Augustine in a theological context, specifically that of biblical hermeneutics, concerning the relation between logos prophorikos, the spoken word, and logos endiathetos, the internal word. For human beings, the two always differ and it is precisely by virtue of this difference between the spoken word and the internal word that something always remains to be said. The hermeneutical dynamic is a “bringing into language.” But what is brought into language does not first have a character other than that of language. This is the sense in which the work of art or whatever is the subject matter for historical study first has something to say to us. Language is always the medium for understanding. Being that can be understood, Gadamer concludes, is language.10

Gadamer brings forward the exemplary status of the interpretation of texts for hermeneutics. He understands the dynamic here as basically dialogic, in the Platonic sense, and he further specifies that this can be understood along the lines of an “I–Thou” relation, in which a conversation is not driven by either participant but rather is guided by “die Sache,” which is to say, that which is at issue, the core, or the kernel point. Every such conversation is prompted by a question and this makes for the hermeneutic primacy of the question, as the ongoing alternation of question and response is the basic hermeneutical dynamic that allows for understanding. The interpretation of Plato’s dialogues, as understood by Gadamer, allows for participation in the dialogue by way of the question that prompted Plato’s composition of the text. The way in which truth is transmitted here via tradition, in a manner that is not driven by either participant, and that allows, at the same time, for further elaboration, suggests a dialectic that is Hegelian in character. But Gadamer, explicitly in order to accentuate human finitude, specifies language rather than Spirit as the medium.

The theme of finitude is taken up in two concluding points to Truth and Method. First, Gadamer identifies a speculative character of language. Language shows more than its propositional content. That it says what it does is dependent on both what it makes explicit and what it does not. In other words, language’s capacity to show more than its propositional content, on the one hand, and

10. Gadamer, Truth and Method, 474. In early modern science there was definitely a sense in which the issue was interpreting nature, understanding it. Historically understood, even science attests to the universality of hermeneutics, notwithstanding the effort at mathematizing science thoroughly, whereby what would be eliminated is, precisely, language.
human finitude, on the other, are indissociable. Finally, and directly pertinent to Gadamer’s ongoing reading of Plato, beauty, as discussed by Plato, marks an appearing of the Form of the Good, and this illumination, Gadamer points out, is closely related to the evident quality of what understanding understands. “Evident” here pertains both to the appearing and to a strong sense of truth. This evident quality is not at our disposal, and this is again a mark of our finitude. The sense of beauty provides means for addressing the issue of human finitude that exceed the modern epistemological context, and at the same time, guides Gadamer’s understanding of Plato’s dialogues. Given that being that can be understood is language, the question of the illumination of what understanding understands, its evident quality, leads to Gadamer’s final discussion in *Truth and Method* where he specifies that language is “the horizon for a hermeneutical ontology.” In other words, these suggestive discussions at the close of *Truth and Method* point in the direction of future hermeneutical work. At the same time, they underscore the philosophical import of Gadamer’s text beyond the context of issues pertaining to the subject matter and the mode of thought appropriate to the human sciences.

II. HERMENEUTICS, CRITICAL THEORY, AND THE LEGACY OF PHENOMENOLOGY

Appearing in 1960, *Truth and Method* prompted a debate, carried out over a period of exchanges in print, between a leading representative of the Frankfurt School of critical theory, Jürgen Habermas, and Gadamer. It began with a discussion of Gadamer’s work by Habermas in the latter’s 1967 *On the Logic of the Social Sciences*. Habermas would react favorably to the way in which hermeneutics can expose our presuppositions and presumptions, but Gadamer’s assessment of a positive role of prejudice that is crucial to the dynamic of the hermeneutical circle and the transmission of truth would not measure up to the standard that is ultimately demanded by critical reason. Habermas opposed the primary emancipatory interest of critical theory to Gadamer’s rehabilitation of prejudice, as well as both tradition and authority. Moreover, Habermas contested what he regarded as Gadamer’s overemphasis on how language figures in our historical context to the neglect of other factors, for example, labor, and

---

he argued that language can, in fact, dissemble problems that pertain to the way in which labor figures in our historical context.

Gadamer’s response, which culminated in the essay “On the Scope and Function of Hermeneutical Reflection,” pointed up, first of all, how the Enlightenment sense of critical reason itself pertains to the dynamics of tradition. The Enlightenment prejudgment against prejudice may not hold when it comes to addressing problematic features of our own age. Effective-historical consciousness pertains to how we address such problems, and this marks the way in which application is intrinsic to hermeneutics. Moreover, any understanding of such problematic matters cannot proceed somehow outside of language.

Habermas’s work would, in fact, subsequently undergo a “linguistic turn,” culminating in the major two-volume work *The Theory of Communicative Action*, first published in 1981. The issue of linguistic competence now gets firmly established as central for analyses of our sociopolitical context. Habermas elevates the democratic formation of consensus for coordinating action according to the norms provided by critical reason to the status of end or goal of communication. In so doing, he relies on a possibility of transparent universal consensus. On Gadamer’s terms, this sense of language according to a use or an instrumental character can only neglect what is not at our disposal when it comes to understanding, which is to say, its event character, which lies beyond the reach of critical reason and ultimately is not at all a matter of consensus.

The ontological character of hermeneutics as understood by Gadamer pertains directly to the role of Heidegger’s thought in Gadamer’s work and it is primarily in terms of this relation that the legacy of phenomenology in Gadamer’s understanding of hermeneutics must be understood. Where Husserl is concerned, Gadamer, in *Truth and Method*, specifies that phenomenology, as Husserl first developed it, by virtue of the manner in which it moves beyond a subject–object context, provided the means for working through Dilthey’s unresolved epistemological issue of legitimating “objective” knowledge in the human sciences. This allowed Heidegger, in *Being and Time*, to resume Dilthey’s endeavor directly as a question of fundamental ontology. Heidegger took exception to Gadamer’s

account of the significance of Husserl’s work for *Being and Time*, insofar as for Heidegger questions regarding knowledge are not questions that must be resolved first, but rather pertain altogether to a founded mode of comportment toward entities or beings that we encounter in the world. What comes first, then, is the analysis of our mode of being, which is to say, our “ex-istence,” or our being always already in-the-world, in a word, what Heidegger designated as our *Da-sein*, or our “being-there.” Relatedly, Heidegger took exception to addressing the issue of the historicity of our *Da-sein* in terms of consciousness, as Gadamer does in addressing “effective-historical consciousness.” Consciousness implies a point of departure that sustains, in effect, a subject–object context. On the other hand, Heidegger’s *Being and Time* had left open the question concerning the bearing of fundamental ontology on how the “ontic sciences” are to proceed, and the way that Gadamer addressed the human sciences is responsive to this. Gadamer’s work provides ongoing impetus and support for interpretive approaches in the human and social sciences, in contrast to a calculative approach associated with positivist social science. Gadamer characterized his description itself of the dynamic of effective history as phenomenological in character. Pertinently, it should be recalled that where Husserl was concerned, the methodological character of phenomenology was always subject to modification specifically in terms of the subject matter in question, and was, in fact, refined throughout the course of his work.

For Gadamer, departures from tradition, even one as radical as Heidegger’s reopening of the question concerning Being, were, nevertheless, to be understood in regard to tradition. In his later work, Heidegger did emphasize the importance of readings of preeminent texts from the tradition for preparing for the possibility of “another beginning in thought,” in contrast to the work of the *Being and Time* period where he sought to forge new paths directly from analysis of our existence. Still, Heidegger understood another “destining” of Being as a sudden occurrence. Gadamer maintained that all basic change occurs gradually via the dynamic of effective history. Relatedly, while Heidegger attentively sought another “word of Being,” one that could release us from the hold of the metaphysical identification of Being with presence, Gadamer maintained that what is crucial is how we take up the language of metaphysics again in our saying. It is interesting to note, in this regard, how Heidegger, in his later work, would rely more on standard terms in contrast to his earlier coinage of terms, and here the reappearance of the term “man,” notwithstanding its metaphysical background, where previously only *Da-sein* could possibly serve, is a significant case in point.\(^\text{13}\) Gadamer emphasized a supportive rather than restrictive sense

\(^{13}\) In *Beiträge zur Philosophie (Vom Ereignis) (Gesamtausgabe, Vol. 65)*, the unfinished manuscript of major proportions from the mid-1930s, published after Heidegger’s death, in which
of tradition, and as a result, he opened the way for rereadings of major historical figures without casting them, first of all, in terms, primarily, of a forgottenness of Being. For Gadamer, it was ultimately Plato’s work that called for such rereading, as evidenced by his career-long reading of Plato’s texts.

III. HERMENEUTICS AND ANOTHER COPERNICAN REVOLUTION

While beginning his career as a Husserl scholar, translating Ideen I as part of his doctoral thesis,14 Paul Ricoeur15 makes clear that in adopting a phenomenological approach in philosophy, he opted for existential phenomenology. Ricoeur’s first published book was in fact a comparative study of the philosophical work of Gabriel Marcel and Karl Jaspers. Furthermore, in essays from 1949 through 1957, published together in translation in 1967 along with an additional essay devoted to Husserl’s fifth Cartesian Meditation that was written for the volume Husserl: An Analysis of His Phenomenology, Ricoeur indicates his existential orientation via his critical reading of the transcendental character of Husserl’s work. In one of the essays in that volume, “Methods and Tasks of a Phenomenology of the Will,” first published in 1952, Ricoeur showed how existential phenomenology entails a study of volitional consciousness, in distinction from perceptual consciousness, which was analyzed extensively by Husserl, and then by Merleau-Ponty. The first volume of a projected three-volume work on the will, Freedom and Nature: The Voluntary and the Involuntary, published in

---

15. Paul Ricoeur (February 27, 1913–May 20, 2005; born in Valence, France; died in Chatenay Malabry) was educated at the University of Rennes (1933) and the Sorbonne (1934–35), and received a doctorat ès lettres from the Sorbonne in 1950. His influences included Augustine, Heidegger, Husserl, Kant, and Marcel, and he held appointments at the University of Strasbourg (1948–56), Sorbonne (1956–66), University of Nanterre (1966–80), University of Louvain (1970–73), and University of Chicago (1967–92).
1950, analyzes the dynamics in the polarity between freedom, on the one hand, and our bodily existence in a natural setting, on the other. This was followed by Fallible Man, the first of a projected three installments to comprise the second volume. In Fallible Man, drawing on both Greek and biblical accounts, Ricoeur specifies a certain fragility or vulnerability pertaining to human existence and marking what amounts to a fault, in the geological sense, which signals, in effect, an ontological sense of finitude.

In the second of the three projected installments, The Symbolism of Evil, Ricoeur analyzes traditional symbols and myths that express the sense of evil, and the focus here is on the biblical narrative in the book of Genesis. Ricoeur’s appeal, in The Symbolism of Evil, to the text of the Bible, was indicative of his constant and striking attentiveness to a Hebraic heritage along with a Greek heritage. The third and final installment of this second volume was where evil was to be addressed directly, and this was to be followed by a third volume addressing transcendance. But at this point, problems took shape that would precipitate a transition in Ricoeur’s work. By virtue of the limits of subjectivity already indicated by the critical analysis of the Husserlian transcendental ego, and because of the acknowledgment of the vulnerability pertaining to human existence, the self-understanding sought by way of an analysis of the will’s relation to evil could not proceed directly but would have to go by way of an analysis of those signs, symbols, and texts whereby we express a sense of evil. In fact, this is what Ricoeur had already done in The Symbolism of Evil and in Fallible Man. The shift was to issues concerning language and to hermeneutics. The question would be how phenomenology was to figure in the hermeneutical work that would follow. The final installment of the second volume of the Philosophy of the Will and the projected third and final volume would have to be postponed, and in fact, would never appear. The questions concerning evil and those concerning transcendance, which called, Ricoeur indicated, for “a poetics of the will,” would stay with Ricoeur throughout his work. A text that would address the issue in terms of a sense of human suff ering that is ineradicable – Evil: A Challenge to Philosophy and Theology – would be published much later.

The hermeneutical shift in Ricoeur’s work is very notably signaled by his observation at the conclusion of The Symbolism of Evil that “the symbol gives rise to thought.”16 The Symbolism of Evil would be followed by Freud and Philosophy. Ricoeur’s extensive analysis of Freud’s work brings forward the hermeneutic character of psychoanalysis. Philosophically, however, Ricoeur would characterize what Freud did as a “hermeneutics of suspicion,” a phrase with which Ricoeur would also characterize both Nietzsche’s and Marx’s work. In contrast

---

to interpretation that seeks to unmask unconscious drives, interests of power, or economic class interests beneath all forms of human expression, Ricoeur proposed instead to saturate the symbols operative in our field of awareness with intelligibility, while anticipating, or while wagering, that this would lead to enhanced self-awareness, and this was precisely what was at stake in addressing the biblical symbols of evil in *The Symbolism of Evil*.

In 1969, Ricoeur published *The Conflict of Interpretations*. Here Ricoeur addressed a number of contending intellectual projects at the time. In addressing the phenomenological project, Ricoeur endorses Heidegger’s finding, in *Being and Time*, regarding the priority of our being-in-the-world, in contrast to subjectivity, and Ricoeur affirms that the rejection of subjectivity as a ground is reinforced when, in his later work, Heidegger emphasizes that we do not possess language in any sense, and that language has apriority with respect to our speaking. This endorsement of Heidegger’s challenge to subjectivity is consistent with Ricoeur’s earlier critical analysis of Husserl’s sense of the transcendental ego. But Ricoeur stops short of endorsing Heidegger’s direct turn to ontology at this point, and the issue that takes shape here for Ricoeur pertains to language. Ricoeur opts for what he characterizes as the longer route, one that proceeds first via a phenomenological study of language. Ricoeur regards the step that he takes at this point as one that takes up a line of inquiry opened by Merleau-Ponty’s *Phenomenology of Perception*, specifically in the chapter “The Body as Expression, and Speech.”

Ricoeur finds that the intentional analysis of language along phenomenological lines reaches a point at which it must appeal to a scientific analysis provided by linguistics, and Ricoeur, like Merleau-Ponty, opts for the approach of structuralism, which had its beginnings in Ferdinand de Saussure’s contribution to linguistics.

In turning his attention to structuralism, the movement that had displaced existentialism as the most prominent intellectual movement in France, Ricoeur emphasized that structuralism provided a methodology specific to the human studies rather than derived, in one manner or another, from the natural sciences. This was of major importance in regard to Ricoeur’s understanding of hermeneutics. Dilthey, in broadening the field of hermeneutics from the earlier context of theology to the spectrum of the human studies, had been intent on establishing the integral character of those studies in their own right, in contrast to regarding them as dependent on the natural sciences. Accordingly, Dilthey drew a strong distinction between explanation and understanding, where the

*18. For a discussion of Saussure and structuralist linguistics, see the essay by Thomas F. Broden in *The History of Continental Philosophy: Volume 5*. 
former was appropriate to the natural sciences, and the latter was appropriate to the human or social sciences. Ricoeur regards this division, which he finds ongoing in both Heidegger’s and Gadamer’s contributions to hermeneutics, as debilitating for hermeneutics. This marks the point where Ricoeur’s own contribution shows up. While Gadamer stressed the event character of understanding, in order, in part, to offset the predominance of the subject-oriented methodological approach to the human sciences, Ricoeur explicitly brings forward a positive role for methodological explanatory work that pertains particularly to the development of structuralist methodology in the human sciences. Moreover, while Ricoeur found in both Gadamer’s and Heidegger’s readings of tradition an impulse toward reducing, if not eliminating, distanciation from the earlier points of origination by virtue of how we and those origins share in the same tradition, he characterizes distanciation as the other side of our appropriation of tradition, and thereby he accentuates a productive or a positive role that distanciation plays. As a result, the role of modern critical thought appears here in a strongly positive light. Ricoeur will retain the critical element of phenomenology as developed by Husserl even as his shift to hermeneutics takes place, as we see, for example, in the essay “Phenomenology and Hermeneutics,” where Ricoeur compares the role of distanciation in hermeneutics to that of the *epoché* in phenomenology. What is at issue in both instances is an indispensable critical moment.

Structuralism, Ricoeur found, contributes to our understanding by virtue of its methodological account of the “diacritical differences” at work among the elements of language, or the elements of myths, or the elements of social structures. It is in terms of such differences that these elements are related and, at the same time, distinct. An explanation in terms of “diacritical difference” gives full weight both to the dependency of elements in such systems on one another as well as to their distinctness. This dependency is not sublated, as is the case where the Hegelian dialectical methodology, in particular, is concerned, insofar as it proceeds by negating all negation, with the result that the distinctness of each of the elements is also compromised. The anthropologist Claude Lévi-Strauss, the

---

*20. The *epoché* is discussed in more detail in Thomas Nenon’s essay on Husserl in *The History of Continental Philosophy: Volume 3*.

*22. For a discussion of Lévi-Strauss, see the essay by Brian C. J. Singer in *The History of Continental Philosophy: Volume 5*.
preeminent structuralist at the time, would resist Ricoeur's philosophical characterization of structuralism as Kantianism without a transcendental subject. But ultimately, for Ricoeur, structuralism reaches its limit when it comes to the questions concerning sense or meaning that are pertinent to human existence in a world, and in this regard Ricoeur would cite Lévi-Strauss himself where he characterizes structure as responding, in effect, to aporetic features of human existence, which means, for Ricoeur, that if structuralism sets itself up as a philosophy unto itself, it remains truncated, in effect, by virtue of not addressing the aporetic character of those factors themselves.

Another of the contending intellectual projects addressed by Ricoeur in *The Conflict of Interpretations* is psychoanalysis, and here Ricoeur would take up themes from his book on Freud. Importantly, psychoanalysis provides a sense of the tensive or impulsive character of human existence. Psychoanalysis reaches its limit in what amounts to a semantics of desire. As developed by Freud, however, psychoanalysis took on the character of a science of nature, and, along these lines, Freud basically understood semantic contexts such as myths to operate as denials of the underlying truth of nature. When psychoanalysis gets understood not as a science of nature but rather as a hermeneutical study, semantic contexts such as myths figure more as expressive of our capacities than as symptomatic of the denial of our reality as utterly natural.

In *The Conflict of Interpretations*, Ricoeur also addresses hermeneutics in a theological context, specifically in the context of a theology of hope. Here Ricoeur draws on the text *Theology of Hope* by a leading Protestant theologian, Jürgen Moltmann. Ricoeur finds the closest philosophical analogue of faith's sense of hope, even in the face of death, in the role of the transcendental imagination as understood by Kant, and its operation according to the matrix provided by the schematism of the categories. There is an indication here of a possibility for understanding the negative sense of finitude in terms of a correlative sense of excess. Imagination, particularly productive imagination, which Kant, in the *Critique of Judgment*, distinguishes from reproductive imagination, lies close to the heart of hermeneutics as understood by Ricoeur, which

---

he characterizes as responsive to the need for another Copernican Revolution. While the critical element of knowledge acquisition plays an indispensable role here, the priority belongs, ultimately, to interpretation.

Ricoeur specifies an integral quality, within their respective spheres, to each of the projects that he addresses in *The Conflict of Interpretations*, so much so that there can be no governing trajectory leading to an absolute knowledge, and therefore the conflict noted in the title of the text does not cease. At the same time, however, Ricoeur makes a case for a “hermeneutic arc” that makes for an advance in self-understanding by way of the other interpretive projects. The way in which absolute knowledge is precluded ultimately leads, for Ricoeur, to a relinquishment of the Hegelian project, although Ricoeur casts this largely in terms of an issue for modernity rather than in terms of any damaging effects of Hegel’s sense of absolute knowledge and how we were to reach it.

Because hermeneutics is to proceed via the interpretation of the signs, symbols, and texts in which we express our sense of human existence, and particularly because distanciation plays a positive role with regard to appropriation for our self-understanding, texts have a status for Ricoeur that even exceeds their exemplary role in regard to the dynamic of effective-historical consciousness as understood by Gadamer. Ricoeur's next two major works, *The Rule of Metaphor* and the three-volume *Time and Narrative*, will address, respectively, metaphor considered as a “text in miniature” and narrative considered as the crucial element in longer texts that basically plays a role that makes it comparable to metaphor. Ricoeur’s point of departure in *The Rule of Metaphor* is Aristotle’s work, and he brings together Aristotle’s *Poetics* and *Rhetoric*. In doing so, Ricoeur draws a comparison between metaphor and mimesis, understood as representation, and makes a case thereby for moving away from a strictly lexical conception of metaphor in terms of word substitution. This analysis points out the two directions in which the following analyses will move. On the one hand, the analyses will move through larger and larger units in accounting for metaphor, which ultimately has to be understood within the context of discourse. Ricoeur found, accordingly, that his earlier analysis in terms of symbols was too restrictive. On the other hand, the analyses will make a case for a nonlinguistic element involved in metaphor. The fields of analysis in what follows include tropology, semiotics, semantics, rhetoric, and scientific modeling. Along the way, Ricoeur will draw on Anglo-American work in linguistic analysis and in philosophy of science, emphasizing how in analytic philosophy the basic unit is the sentence rather than the word, and how philosophy of science in the Anglo-American context moved away from an exclusively semantic account of the field of science. One of the issues that the text addresses pertains to structuralism. Ricoeur’s analysis of metaphor resists the current within structuralism that aims at smaller and smaller elementary linguistic units as a basis for the study of
language. At stake is the claim that a scientific study of language can be exhaustive and the implication that such study overtakes philosophy.

Metaphor allows us “to see as,” to see differently, to see all things “in act.” This “seeing as,” Ricoeur specifies, “is an experience and an act at one and the same time.”26 Along these lines, Ricoeur makes a case for “metaphorical truth.” He proceeds via the question of metaphor’s relation to philosophical discourse. A reading of Aristotle addresses the question concerning metaphor and the equivocity of being, and a reading of Thomas Aquinas addresses the question of metaphor and the analogia entis. Ricoeur’s hermeneutical findings indicate that a “relative pluralism” of forms and levels of discourse pertains to the relation between poetry and speculative philosophical discourse, and he contrasts this “relative pluralism” with a thoroughgoing sense of heterogeneous language games along Wittgensteinian lines. This sense of “relative pluralism” accords with the sense of relations among the various discourses that were addressed in The Conflict of Interpretations, where each retains an integral quality that is not compromised by a governing trajectory toward an “absolute knowledge,” while at the same time those discourses constitute a “hermeneutical arc” that marks an advance of self-understanding.

As he concludes his study of metaphor, Ricoeur takes exception to Heidegger’s assertion to the effect that metaphor operates only within the context of metaphysics.27 Given Heidegger’s understanding that the identification of Being and presence that serves as the basis of metaphysics is no longer tenable, the implication is that metaphor no longer serves as a vehicle for possible meaning, or in terms of the title of Ricoeur’s text, “living metaphor” is ruled out. In other words, metaphysical language has run its course and all metaphor has lapsed into a state of ordinary language. Ricoeur notes how Heidegger’s thought can, in fact, lead to silence. For Ricoeur, a recovery of a metaphor’s original context is not possible. Rather, at the point where our understanding of metaphor encounters metaphor’s descent into a state of ordinary language, new meaning comes about. Accordingly, Ricoeur takes exception to the all-encompassing character of Heidegger’s assessment of the tradition as metaphysics in the specific sense of a forgottenness of Being.

“Metaphorical truth,” Ricoeur finds, is to be understood in terms of a “split reference,” a phrase that Ricoeur adopts from the linguist Roman Jakobson.28

---

28. One of the most important linguists of the twentieth century, Roman Jakobson (1896–1982) was a leading figure in the Moscow Circle who eventually turned away from formalist and
Metaphor says both “is” and “is not”; it “preserves the ‘is not’ within the ‘is.’”29 The copula here is the challenge for an autonomous philosophical discourse. This brings us to the threshold of ontology, or as Ricoeur will put this at times, in biblical terms, to the point where, like Moses, we can see the promised land that we do not enter during our lifetimes.

Ricoeur’s three-volume work *Time and Narrative* furthers the analysis of texts, with the focus on fictional texts and written history. Ricoeur begins with the tension between two senses of time, a sense of cosmic time and a sense of human time, represented here by Aristotle, on the one hand, and Augustine, on the other. Narrative is responsive to this tension. Time, Ricoeur specifies, becomes human time to the extent that it is organized into a narrative. As does metaphor, narrative has a mimetic quality. Where narrative is concerned, it is a question of a mimesis of human action. This mimesis is threefold. First, there is a “prefiguration” in terms of the understanding of what makes for narrative that we bring to a text. Next, there is “configuration,” or the “emplotment” whereby events are related to one another in various ways. Finally, there is “refiguration,” which occurs via the act of reading and whereby new possibilities are opened up that enhance our self-understanding. The circle that operates here between narrative texts and life is hermeneutical.

Ricoeur concentrates next on configuration in literary works and this study includes readings of three novels: *Mrs. Dalloway* by Virginia Wolf, *Magic Mountain* by Thomas Mann, and *Remembrance of Things Past* by Marcel Proust. In each novel, a character addresses the tension between cosmic time and human time in a different manner. Ricoeur then brings fiction and history writing together in order to sort out what is common and what differs. There is considerable commonality, even overlap, first and foremost in terms of the narrative character, which is why fiction appeals to us as believable, and why history writing involves unactualized possibilities. By virtue of this overlap, reading either fiction or history leads to new possibilities in life. The difference between the two lies in the sense of “historical truth” that pertains to history. Ricoeur will address this sense of “historical truth” at length in the later work *Memory, History, Forgetting*.

*Time and Narrative* was followed by the publication of *Oneself as Another*, based on Ricoeur’s Gifford Lectures at the University of Edinburgh in 1986. Here, Ricoeur develops the sense of a “narrative identity,” which follows from the studies in *Time and Narrative*. “The fragile offshoot issuing from the union toward structuralist linguistics. He played a major role in introducing the basic principles of Saussurean linguistics to Claude Lévi-Strauss and Jacques Lacan. [*] Jakobson is discussed in the essay by Thomas F. Broden in *The History of Continental Philosophy: Volume 5*. 29. Ricoeur, *The Rule of Metaphor*, 24.
of history and fiction is the assignment to an individual or a community of a specific identity that we call their narrative identity.”

Here Ricoeur draws a distinction in terms of the two Latin words “idem” and “ipse,” where the former pertains to a “being the same,” and the latter pertains to a “self-sameness” that amounts to a certain constancy through a course of change. What is particularly important for Ricoeur is ipse identity: the narrative identity of a people in history or an individual in the course of a life. This narrative of an individual’s life concerns the actions of that individual and the narrative identity answers to the question of the “who,” which is to say, the agent of those actions. Narration, in this way, serves as an attestation of agency, and thereby, of responsibility. This sense of agency resonates in Ricoeur’s work all the way back to the initial project of the will and it marks the point at which the hermeneutics of texts leads to a philosophy of action. Instead of any unmediated self-awareness, there is a hermeneutical circle at work here between life and narrative, a circle that enhances self-awareness and, by virtue of the sense of responsibility, makes a demand on us regarding who we are to become. In this way, the hermeneutic circle involves a “call” to a higher ethical standard. In discussing this “call” by way of Heidegger’s sense of conscience in Being and Time, and Emmanuel Levinas’s sense of the demand on me that issues from my fellow human being, Ricoeur concludes that philosophy reaches a limit when it comes to determining whether such a “call” comes from oneself, or from “the other” (my fellow human being), or from God.

Ricoeur returns to the question of historical truth with his publication in 2000 of Memory, History, Forgetting. Here, after a phenomenological analysis of memory, Ricoeur carries out an extensive examination of the work of the historian, which consists primarily in assessing collective memory, supporting it, or refuting and correcting it. Historiography consists of three activities. First, there is the examination of traces of the past, among which, recorded testimonies are most significant. The historian addresses questions to these traces of the past and, in so doing, detects those facts with which the historian will work. The second activity is that of relating facts to one another in a way that makes the actions of the historical actors intelligible. The third activity is representing a part of the past in a text. The activities cross over into one another and the entire task is one of interpretation. Moreover, some factors are irretrievable. Only testimony and critical analysis of testimony lend the account credibility. The account cannot be certain. Rather, at best, it is likely. Still, when the work is done well, the account, while remaining subject to future change, does merit being regarded as truthful. When it comes to forgetting, Ricoeur’s analysis

points up that while forgetting is in opposition to memory, it plays, as well, a constitutive role in memory. This pertains to latencies that can be activated along the lines of “recognition,” a term of major importance in Plato’s thought. The critical element in history writing must not be taken to the extreme of eliminating such latencies.

The Course of Recognition, published in 2004, is the last book published during Ricoeur’s lifetime. The work culminates by returning to a point made in Oneself as Another in regard to how narrative shows that self-awareness always comes by way of involvement with others. At stake is the possibility for human beings, who are irreducibly different from one another, to recognize one another’s common humanity, which is characterized by capabilities and vulnerabilities (an issue that resonates all the way back to Fallible Man and the role of that text in the initial project of a Philosophy of the Will, now recast in terms of narrative and the possibility of enhanced self-awareness). Ricoeur’s study of the course of recognition, proceeding, as always, via reading of a vast historical literature pertinent to the topic, finds that when it comes to the issue of the mutuality of recognition, where Hegel’s work is particularly important, there is an asymmetry involved, similar to the asymmetry involved in a promise, and it accounts for the constancy of the struggle for recognition.

In essays that date from the 1990s and that were published by Ricoeur in two collections, Le Juste and Le Juste 2, as well as in Memory, History, Forgetting, Ricoeur took up questions in the field of political philosophy, with which he had first been concerned in the collection of essays History and Truth, published in 1955. The crucial issue is justice, and Ricoeur draws here on the work of John Rawls in his A Theory of Justice. The issue of justice brings with it an ethical concern. Justice entails abiding by the authority of a third party, the state, by virtue of which a judge, according to law, decides between parties. The state is the social organization that is to address the aspirations and the needs of the individuals who comprise it. Ricoeur underscores the right of state authority to grant pardon, out of humane considerations, to a party found guilty of violating law, and he makes a point of distinguishing pardon from amnesty, which, as the word literally indicates, amounts to forgetting in the form of a denial of memory or elimination from the historical record. The issues resonate in Ricoeur’s work all the way back not only to History and Truth, but to his early reflections on the question of evil as well, now recast in terms of his work on the hermeneutics of texts, narrative identity, and recognition. The hermeneutics of texts pertains to state constitutions as well, and the role of narration pertains to the identity of nations and recognition among them as well as to individuals. Ricoeur’s late work in the field of political philosophy appeared, importantly, in the wake of the fall of the Soviet Union and the communist world, and it addressed matters at stake in efforts toward European unification.
While on a political level, Ricoeur advocates against amnesty, and for the possibility of pardon, which does not expunge a historical record, on an individual level, he affirms that forgiving is possible. By virtue of its unconditional character, however, forgiving cannot be a matter of reciprocity, and in this regard, Ricoeur finds an “asymmetry [that] accompanies us like an enigma that can never be fully plumbed.” Nevertheless, he does find that means for the manifestation of good will can come about in the midst of the asymmetrical struggle for recognition when this struggle gets interrupted by gestures of generosity, such as occur, in particular, in symbolic contexts that are ceremonial or celebratory, where they constitute, in effect, a mode of indirect recognition that is peaceful in character.

IV. HERMENEUTICS, DECONSTRUCTION, AND THE LEGACY OF PHENOMENOLOGY

When Ricoeur, at the conclusion of *The Rule of Metaphor*, asserted the possibility of living metaphor in opposition to Heidegger's assessment that metaphor operates only within the context of metaphysics, and that by virtue of the forgottenness of Being that characterized the tradition as a whole, the language of metaphysics had now run its course, Ricoeur also characterized the work of Derrida as a more extreme version of this. Ricoeur relied here on Derrida's essay “White Mythology.” Derrida would respond that he was actually in agreement with Ricoeur with regard to the pervasiveness of metaphor in philosophy. What this meant is that philosophy, insofar as it would exclude metaphor, contains what would undo it, and this, in fact, is what sustains it. What Derrida calls into question is a binary distinction between living metaphor, on the one hand, and dead metaphor, on the other hand. Metaphor is an undoing within philosophy that sustains it, and this is how, in fact, philosophy’s “deconstruction” proceeds. A full-scale comparison between Derrida's work and Ricoeur's would require extensive analysis of their readings of work of major importance in the

philosophical tradition and extensive analysis of their work on a wide range of issues that pertain, for example, to myth, to psychoanalysis, to literature, to religion, to democracy, and to justice. There is a specific sense, however, in which the legacy of phenomenology is at stake here.

When the shift to hermeneutics was taken by Ricoeur, he described this as a graft of hermeneutics onto phenomenology. What makes them compatible is the hermeneutic importance of meaning and the role of interpretation in phenomenology, which Ricoeur associated specifically with the role of imagination in eidetic variation as described by Husserl. Phenomenology would have to undergo qualification with regard to a transcendental ego that sustains a sense of subjectivity’s immediate access to itself, and hermeneutics would have to meet the critical requirement that is intrinsic to phenomenology. It is in these terms that Ricoeur understood his hermeneutical work as philosophizing with both Heidegger and Gadamer, and after them, without forgetting Husserl.

At the point where the question of language takes shape by virtue of the graft of hermeneutics onto phenomenology, Ricoeur found that a scientific study of language was needed, and for this purpose, he turned primarily to structuralism. Derrida also drew on structuralism, particularly the distinction between signifier and signified and the sense of diacritical difference that came from Saussure. Derrida found, however, while structuralism, in effect, undermined subjectivity, it did so by virtue of the scientific presumption of the possibility of exhaustive knowledge of a system of signifiers, which, in effect, reinstates the sense of subjectivity’s full self-presence that is sustained by the dynamics of voice. Ricoeur found that structuralism reached a limit when it came to questions pertaining to a sense or meaning of our existence in a world. The self-awareness that this entails must be mediated by texts, where an author’s initial intent is not what governs. Derrida, for his part, found that when it comes to texts, what is required is a sense of language that does not involve apriority of speaking. It is here that a writing turns up that is not writing as derived from speaking, and, in effect, this is where the critical requirement of phenomenology actually led Derrida when it is brought to bear on phenomenology itself, understood in terms of bringing the phenomena into language. Ricoeur, for his part, found unacceptable the degree of distinctness ascribed by Derrida to writing.

Ricoeur understood a text as autonomous by virtue of a “world of the text,” within which what occurs in the text is possible. Metaphor and narrative sustain the world of the text. By virtue of the world of the text, a reader

34. By virtue of how he sustains a critical element in his thought while carrying out his transition to hermeneutics, Ricoeur found resources for proposing means for mediation between Gadamer and Habermas. See Ricoeur, “Hermeneutics and the Critique of Ideology,” in Hermeneutics and the Human Sciences, 63–100.

35. See, in particular, Ricoeur, “The Hermeneutical Function of Distanciation.”
discerns previously unavailable possibilities in the everyday world in a manner that involves an enhanced self-awareness and makes for the appropriation of meaning by the reader. This renders the distanciation of the text from its initial context productive. The way in which the world of the text makes for the text’s autonomy marks the phenomenological character of hermeneutics as understood by Ricoeur. Ricoeur also found that by virtue of his sense of the autonomy of the text, he did not lose contact altogether with the idealist element of the philosophical tradition. Ricoeur considered the sense of the world of the text his most innovative contribution to hermeneutics. By means of his graft of hermeneutics onto phenomenology, philosophical texts that are metaphysical in character, such as the historical texts of Aristotle, Augustine, and Aquinas, could be reread productively, a line for communication and debate between continental European traditions and Anglo-American philosophy that relies on the “linguistic turn” could be made available, and philosophical contact with religion could be reopened in a way that offers means for addressing the reappearance of religion on the world stage.

MAJOR WORKS

**Hans-Georg Gadamer**

Paul Ricoeur

We can define the linguistic turn, in general, as the rejection of any approach to meaning, value, sense, or concepts that would lie beyond linguistic systems; premodern philosophical problems – the nature of God, freedom, or reality – could not be approached other than through the vocabularies we use to denote such terms. It would no longer be legitimate to establish the true meaning or essence of an identity, and then correct ordinary usage, for meaning and identity are established through linguistic usage. Even if we accept the linguistic limit as the proper turn philosophy ought to take, away from speculative and ungrounded theorizing, there are still different senses one can give to the linguistic turn, and in many ways these senses define different modes of philosophy: whether one deems the limits of language to be a useful way of preventing fruitless philosophical inquiry, or whether one regards linguistic limitation as borders for thinking, borders that ought to be challenged or reflected upon.

Turning to continental philosophy, there are three ways in which we might address the linguistic turn as it pertains to the continental tradition. The first is in relation to analytic philosophy and concerns the branching out into two traditions following the early-twentieth-century attempt to ground philosophy on the purely formal sign systems of mathematics and logic. The second way of understanding the linguistic turn is as a response to phenomenology: from phenomenology’s attention to the instituting and constitutive acts of consciousness, language-oriented philosophy regarded meaning and experience as possible only through, rather than before, language. Finally, it is only now with the declaration that we occupy a postlinguistic paradigm that we can begin to assess the extent and validity of the linguistic turn.
I. CONTINENTAL AND ANALYTIC APPROACHES TO LANGUAGE

The distinction between continental and analytic philosophy – the bifurcation of two self-conscious traditions – occurs early in the twentieth century with different approaches to the problems of sense and language.¹ In response to late-nineteenth-century speculative philosophies, or philosophies that sought to look beyond individual experience and give some account of a prelinguistic absolute, European and Anglo-American philosophies sought to provide a more certain foundation that would be closer to the model of the sciences. Indeed, philosophers such as Bertrand Russell and Edmund Husserl thought that it was possible for philosophy, as logic, to provide a foundation for sciences such as mathematics.² It was the failure of this project – the impossibility of tracing formal sign systems back to some ultimate logical foundation – that led to the elevation of language as philosophy’s true object of investigation. Husserl’s Philosophy of Arithmetic (1891) argued for a form of psychologism: mathematical signs – for example, “2 + 2 = 4” – refer to a consciousness that intuits and then manipulates abstract quantities. By extension, all meaning and all signs referred back to embodied minds and their creation of sense.

It was Frege’s criticism of this notion of signs and meaning that prompted Husserl to revise his position.³ Frege argued that the meaning of such propositions could not be reduced to the acts of conscious subjects: “2 + 2 = 4” would be true and make sense regardless of what any subjects actually thought, and the sense of such formal sign systems was something discovered, not created, by consciousness. Again, this would have implications for languages beyond those of the formal sciences. If we want to understand the meaning of a sentence such as “Scott is the author of Waverley,” then we need to give it a logical form: first the positing of existence – there exists an object that answers to the term “Scott” – and then the predication of at least one feature of that object – it authored Waverley. The messiness of everyday language could be broken up into the positing of existing objects, and then the attribution of what is true or false regarding those objects. For analytic philosophy after Frege, there was first the

¹ See, for example, Michael A. E. Dummett, Origins of Analytical Philosophy (Cambridge, MA: Harvard University Press, 1994).
² See, for example, Edmund Husserl, Philosophie als strenge Wissenschaft (Frankfurt: Klossertermann, 1965); published in English as Phenomenology and the Crisis of Philosophy: Philosophy as a Rigorous Science, and Philosophy and the Crisis of European Man, Quentin Lauer (trans.) (New York: Harper & Row, 1965).
desire to trace everyday language back to some clear and distinct logical sense. Sentences that could not be broken down into such positing of truth and falsity did not have a proper sense. This led, eventually, away from the notion of tracing everything back to some ultimate logical foundation – the objects in the world and their predicates – and to, in its place, a linguistic foundation: what can and cannot be said in a language, and what linguistic formulations produce insoluble nonsensical or unverifiable problems?

Looking back on the linguistic turn, Richard Rorty noted that the turn to language allowed philosophers to argue that all philosophical disputes were really disagreements about language. We could, for example, see the problem of “substance” in Descartes and Spinoza, not as a metaphysical question about the ultimate nature of reality – Are mind and matter different substances or one substance with different attributes? – but as a linguistic question: How do we use the word “substance”? One philosopher might argue that it is better – that is, that philosophical language functions more effectively – without certain distinctions (say, between “mental” and “material” substance), or without certain terms. Perhaps concepts such as “mind” produce false problems by introducing a spurious entity behind language and action.

The turn to language, then, is often seen as a way of overcoming metaphysics. If we look at how language works, rather than at the supposedly prelinguistic world or truths that it labels, then we can clear away many of the false problems in philosophy. One of the most important philosophical maneuvers in relation to the linguistic turn, and to the relation between continental and analytic philosophy, occurs with Ludwig Wittgenstein’s own transition from a logical to a linguistic approach to truth. Initially, in *Tractatus Logico-Philosophicus*, Wittgenstein harbored the positivist ambition of grounding language on ultimate, prelinguistic, and clearly intuitable truths. This was referred to as the “picture theory” of meaning, and was later discarded by Wittgenstein in his *Philosophical Investigations*. Here, Wittgenstein made two key claims regarding language. First, the meaning of a term does not refer to some pre- or extra-linguistic experience, but instead is established through use. If we want to understand what a term means, then we need to see how it functions in a specific language: the meaning of the word “mate” functions one way in Australian

---

5. The attempt to overcome metaphysics via the turn to language is a central feature of the disagreement between Carnap and Heidegger, discussed by Friedman and Ryckman in their essay in *History of Continental Philosophy: Volume 3*, and as well as by David R. Hiley in his discussion of Rorty in this volume.

6. For a discussion of Wittgenstein, see the essay by John Fennell and Bob Plant in *The History of Continental Philosophy: Volume 3*. 

Volume 6
English (referring to a casual friend), another way in British or American English (referring to a more intimate, possibly sexual, relation). A linguist determines such distinctions by looking at the ways in which the word is exchanged, placed in sentences, linked with other terms, and so on. One way in which Wittgenstein used this notion of “meaning as use” within philosophy was to rule out certain types of questions: for example, instead of asking what is the real meaning of “substance” or “democracy,” we should look at the function such words perform, and also whether they perform a useful function. Many of philosophy’s terms, such as “mind,” “substance,” “essence,” or “reality,” might – it could be argued – create questions that cannot be usefully answered precisely because there is no recognized usage for such terms in ordinary language. Wittgenstein’s notion of language as a game had both ethical and (post)metaphysical implications. Ethically, if we see language not as a true or false labeling of the world, but as something like a game where we either know the correct ways to use terms or we do not, then we can treat ethics as an inquiry not into ultimate realities but into how communities or contexts establish linguistic conventions. While this might at first appear quite conservative, for we could say that there is no meaning to the term “justice” or “right” outside convention, Wittgenstein’s “language game” has been taken up by Jean-François Lyotard to argue that there can be competing and incommensurable games, such that one group uses a term that has no place or force in another language game. The differend, Lyotard argues, is this clash or incommensurability of phrases and forces us to confront the limits of our language.7

The second great contribution of Wittgenstein’s philosophy to the linguistic turn was the notion of the “family resemblance.” Tied to the primacy of use, this was another way of moving beyond metaphysics (or the idea that philosophy could grasp ultimate truths beyond conventions and contexts). Here, Wittgenstein insisted that one could not grasp a single self-present meaning for a term, but that words often functioned with overlapping senses. The word “party,” for example, shares the sense of a collection or gathering together in the terms “political party,” or “dinner party,” but shares the sense of festivity and celebration in the terms “party music” or “party frock.” It is in the nature of language not to have a single isolable sense, but to have multiple uses, determined by context, and functioning less like a substance or single essence, and more like a resemblance between members of a family. The attention to language as an ongoing conversation, with a sense that is achieved through usage, context, communication, and convention was at one and the same time a way of “cleaning up”

7. See Jean-François Lyotard, The Differend: Phrases in Dispute, Georges Van Den Abbeele (trans.) (Minneapolis, MN: University of Minnesota Press, 1988.) [*] For a discussion of the differend, see the essay on Lyotard by James Williams in this volume.
philosophy by ridding the discipline of unanswerable metaphysical questions (such as the ultimate meaning of terms or the ultimate nature of reality) and also a way of achieving postmetaphysical rigor. Thus, Jürgen Habermas has insisted that rationality is “communicative” and postmetaphysical.\(^8\) We do not engage in discussion and reflection in order to establish presocial or prelinguistic truths; instead, by virtue of the fact that all speech and action is with others (or intersubjective), we are always placed in a context of communication. Such contexts presuppose an ideal of agreement, for it would make no sense (or be a performative contradiction) to speak or act with others \textit{without} the aiming for consensus and agreement.

This sense of grounding philosophy on proper, legitimate, functional, or verifiable language use followed from an initial attempt to give philosophy a foundation in basic truths, such as logical atoms or the positive properties of the world, but ultimately led to a form of antifoundationalism, perhaps best articulated by Rorty in the wake of Wittgenstein and pragmatism. If we want to do philosophy, we should not try to get outside language, but should instead have disputes about what counts as a good move in a language game. Although Rorty began by discussing the linguistic turn in the analytic tradition, he was later to include continental philosophers, such as Jacques Derrida and Martin Heidegger, in this understanding of the linguistic turn.\(^9\) For Rorty, the value of Derrida’s philosophy was that it abandoned all sense of metaphysical foundations and instead considered philosophy as a kind of writing, and the value of Heidegger lay in the insistence that we are not subjects who perceive the world and who \textit{then} represent that world “in” language. Instead, the very existence of a world, along with a sense of self or mind, is given through language.

It needs to be noted here that Rorty’s recruitment of both Heidegger and Derrida as philosophers who rejected a philosophy \textit{of} language – an ultimate theory of meaning – needs to be contrasted with an entirely different way of reading Heidegger. Rorty’s Heidegger (and his use of post-Heidegger philosophers) is a Heidegger of pragmatism: in the beginning is the speaking, acting, and socially embedded human whose only mode of questioning must take place within a context, and who cannot transcend a context. Related to this tradition of pragmatism, or the idea that truth and language are grounded on their capacity to enable action and interaction, is the tradition of hermeneutics. The emphases of the hermeneutic tradition, though, are directed more to Heidegger’s notion of language as world-disclosive. While we may not be able to step outside

language, and while language is not something we humans possess but is the way in which both world and human existence are unfolded in relation to each other, Heidegger also insisted (as Rorty did not) that we could bear a more authentic relation to language. In poetry, for example, we no longer see language as an already-formed and manageable tool (a technical or instrumental idea of language); instead we see language in its capacity to illuminate and bring forth a world.

The hermeneutic tradition of philosophy that followed Heidegger, most notably in the work of Hans-Georg Gadamer, was less inclined to see language as a game or as a context that could be reconfigured only from within. Instead they thought it made sense to question the specific horizon or “life-world” that certain languages enabled, and thought it was possible to understand or interpret different cultures and historical periods through processes of understanding, which would be attuned to each language’s specificity. On the one hand, then, Heidegger’s criticism of the Cartesian idea of consciousness as some prelinguistic intuition that would then deploy language opened the way for a tradition of hermeneutics that would look at how different communities, life-worlds, or horizons were produced through language. Such approaches were pursued both in the continental tradition – for example, by Gadamer, who always stressed language as a form of conversation and world-disclosing “horizon” and who maintained that one could alter language through engagement with other traditions and styles of conversation – and in the analytic tradition, with Rorty insisting that the philosophy of Heidegger (and even Derrida) could be aligned with the pragmatist tradition of suspending any reference to truth outside ongoing adjustments of language. On the other hand, Heidegger could also be mobilized to argue against the idea of language as a construction, horizon, or mediation of the world. Instead, language would be the “dwelling” of Being, the manifestation of an event or disclosure that could not be reduced to some system through which the world was given. Language was not so much a construction, nor even the manifestation of a comportment or conversation, but closer to an event in its own right. This aspect of Heidegger’s work, which stressed “poetic” language (from poiesis as a production of a distinct object), marked a strand of philosophy that challenged philosophy’s own limits and its attention to reason and understanding. While Habermas saw this as a lamentable implication of Heidegger’s Nietzschean thought, leading to a form of irrationalism, others, such as Derrida, Jean-Luc Nancy, and Philippe Lacoue-Labarthe, wanted to extend the force of language beyond Heidegger’s recognition of poetic language’s potential to operate beyond human intentionality. This led to Derrida’s theorization of “écriture” or “writing in general” as a capacity for difference and variation that could occur beyond conversations, intentions, and consciousness, and led Nancy and
Lacoue-Labarthe to consider language's irreducibility to human history and traditions.\textsuperscript{10}

Although Rorty was a significant figure in bridging the gap between analytic and continental philosophy, and did so by looking at the ways in which Heidegger, Wittgenstein, William James, and Charles Sanders Peirce could all be read as pragmatists for whom it made no sense to ask about what lay beyond the limits of one's own language, his reading of Heidegger and Wittgenstein as compatible with American pragmatism was forced to ignore some of the most important aspects of their work. Heidegger, for example, not only insisted on language as the dwelling house of Being, so that there could be no sense of a being before or outside language, but also placed an emphasis on truth as \textit{alêtheia}, or unveiling. Language does not construct or constitute the world, but allows the world to disclose itself or unfold. This attention to the unfolding of language, which enabled those philosophers in the hermeneutic tradition to look at the ways in which interpretive communities were formed through modes of writing and reading, also led to a specifically continental (or more narrowly, French) way of reading Heidegger and phenomenology. The problem of genesis, or the emergence of language, which for pragmatists such as Rorty was an unanswerable question going beyond the limits of language, was one of the key concerns for French postwar thinkers such as Gilles Deleuze, Jacques Derrida, Maurice Blanchot, and Julia Kristeva. I would suggest, then, that the distinction between the linguistic turn for American philosophers such as Rorty and continental philosophy lies in the former’s refusal to consider any truth or reality beyond the limits of language, while the latter tradition pays attention to the limits or outside of language. That is, while analytic philosophy saw the linguistic turn as a way of overcoming false metaphysical problems concerning the outside of language (and was reacting against logical positivism’s attempt to \textit{ground} language), continental philosophy recognized that language could not have a simple outside but was nevertheless still interested in thinking about the ways in which the differences of a language were constituted.

Looked at this way, this question maintained the phenomenological problematic as outlined by Husserl: while all experience is meaningful, and while consciousness cannot be grasped as a simple “thing” within the world, it is still necessary to direct attention to the emergence of the relation between thinking

and being. The question of the relation between genesis and structure, between the conditions of emergence and the systems through which we understand emergence, or between the self who thinks and the languages within which the self thinks, opened on to the question of difference. In Heidegger the question of difference, relations, or the Zwiefalt – the opening up of a distinction between thinking and being – was not seen as a simple linkage of two distinct terms. Rather, difference, differentiation, or the production of relations to produce distinct terms led to a profound inquiry into the origin of sense and language and precluded the more straightforward pragmatist approaches that had decided to remain within the limits of language.

Whereas the post-Fregean analytic tradition saw language as a way of tidying up metaphysical pseudo-problems, the post-Husserlian tradition occupied itself with the genesis of language. Husserl responded to Frege's criticism by charting a path between psychologism – that the meaning of a sign is some mental act – and linguistics, or the idea that there is no truth or sense outside language. Husserl argued for a form of transcendental phenomenology, in which we should not simply accept systems of signs (be they mathematics, logic, geometry, or natural language) without intuiting the founding or instituting sense. For Husserl, understanding the meaning of, say, a mathematical proposition ultimately requires a grasp of the originating act or judgment. Thus to understand “2 + 2 = 4” does not mean we have to go back to the first actual person or worldly individual who thought or inscribed this judgment, but it does entail understanding that such signs formalize or give an ongoing stable sense to an act of consciousness that would be true for any subject whatever. Phenomenology,
as Husserl understood it, thus concerns itself with the genesis of signs and languages.\textsuperscript{15}

Although the distinction between analytic and continental philosophy is today being seen as less significant and possibly no longer relevant, it is still worth bearing in mind that there are different and opposed ways of considering the importance of language. Even though there is no longer, in analytic philosophy, a commitment to ordinary language and a refusal of nonconceptual contents of consciousness, there is nevertheless a marked distinction between those who see the extra-linguistic as grounded in human action and intentionality and those, in the continental tradition, who emphasize structures and processes beyond the human altogether. In the more analytic strands of philosophy, where there can now be an investigation of desires, emotions, nonconceptual content, and even judgment structures independent of specific languages,\textsuperscript{16} there has also been a widespread desire to “naturalize” phenomenology, which has resulted in reading both Heidegger and Husserl as philosophers concerned with the status and limits of language rather than ideal structures or being.

However, in continental philosophy, there is still a need to account for structures and processes (including language) that have a historical, material, ideal, social, political, or archival existence beyond human understanding. For Husserl, it made sense to mark a distinction between consciousness – with its acts of judgment, its “syntheses” of the flow of experience into manifolds bearing a certain identifiable quality, and its scientific progress toward an ever more certain knowledge of the world – and the signs and formal systems that indicated or expressed consciousness. It was Heidegger who began to problematize this distinction between, on the one hand, experiencing consciousness, and the language that indicates or expresses that consciousness, on the other. In \textit{Being and Time} (1927), Heidegger wrote disparagingly of idle chatter or \textit{Gerede}, arguing that for the most part we use language in an unthinking manner, without a sense of the ways in which language emerges from a being-in-the-world. Language emerges \textit{not} as the creation of some distinct or presocial “mind,” “subjectivity,” or “consciousness.” Instead, we are “thrown” into a world that is already meaningful, already experienced as bearing a definite and determinate sense. The notion of mind or subjectivity as a being that is distinct from a lived and meaningful world only emerges when we forget that the world is first given to us through our engagement with it – or what Heidegger referred to as “care” (\textit{Sorge}).

\textsuperscript{16} On nonconceptual content, see Gareth Evans, \textit{The Varieties of Reference} (Oxford: Oxford University Press, 1982).
In his later work, Heidegger focused ever more intently on language, insisting that the world is first given in “saying” and that the logical point of view – the notion of some truth or presence outside all language – is possible only if we forget the original disclosure of the world through language.¹⁷ For Heidegger this also meant that the experience of poetry, where we once again see the ways in which language allows the world to be presented as a world, helps us to overcome a notion that there would be some pure experience of presence that philosophy might grasp beyond the ways in which the world is lived. Heidegger’s later turn toward poetic language focused on the relationship between saying and thinking; far from expressing a pragmatist commitment to language as the way in which we create and activate truths, with truth being decided by convention and efficacy, Heidegger saw the poetic word as possessing being distinct from our present ways of thinking. Through a meditation on language we could once again understand the emergence or unfolding of the world. Heidegger drew here on etymology – for example, the connection between the German words dichten (to create poetically, to poetize), denken (to think), and danken (to thank) – to emphasize that language, and especially poetic language, is not a tool “we” use, but a gift through which thinking is made possible and for which we should be grateful. Indeed, Heidegger begins to question whether there is any “we” or “self” who would be the owner of language, instead suggesting that it is language that “speaks” and in doing so opens up a “clearing” in which being is revealed. For phenomenology, language was not only the way in which the world was lived or constituted as a world; it was also possible through attention to literary and poetic language to understand distinct modes of the world as it is lived.

II. THE LINGUISTIC TURN AFTER PHENOMENOLOGY

It was this attention to the lived, even if the lived was no longer Husserl’s “consciousness” but Heidegger’s “being-in-the-world,” that became an object of critique for the next generation of philosophers who were to take language far more seriously. As we have seen, for Heidegger, language was a mode of “dwelling”: we should view language not as a logical system that we formulate to express thoughts, but as that which allows a world to appear. There are not subjects who experience a world and then use language; rather, there is a “saying” that allows the world to appear, and we only have a sense of ourselves and a world that appears as other than ourselves, through the event of language. This gives language a founding and original role, as we see in Heidegger’s

¹⁷. See, for example, the essays collected in Martin Heidegger, Poetry, Language, Thought, Albert Hofstadter (trans.) (New York: Harper & Row, 1971).
reading of the history of philosophy, when he would often begin with a reflection on the origin of significant philosophical terms, and look at their mutation through time. For example, he would examine terms such as “technology” or “logic” (now understood as abstract systems) and look at how they originally referred to distinctly engaged and creative ways of being in the world. Thus, technology derives from technē, which is any practice that takes on a regular stability through time; before there is a system of technology, there are forms of human action that make their way in the world and attend to the ways in which the world may be determined as the same through time. Before there is the system of logic that we manipulate and master through symbols, there is a logos or act of speech that allows the world to be revealed in some specific and identifiable manner. We could refer to this aspect of Heideggerian phenomenology as “etymologism,” or the idea that abstractions may always be referred back to some originally active and intending consciousness. To assume, with phenomenology and hermeneutics, that structures are capable of interpretation is to assume that we are not merely located within sign systems, for – according to the Husserlian commitment to genesis – we can always retrieve and intuit a system’s original sense. While postphenomenological philosophers such as Derrida, Deleuze, Michel Foucault, and Luce Irigaray were to maintain an attention to the genesis of language – and could therefore be distinguished from Anglo-American “philosophy of language” that saw the bounds of language as the bounds of sense – they complicated the project of genesis or emergence by recognizing another problem: the problem of structure.

Although structuralism was a distinct movement in linguistics (Saussure) and anthropology (Lévi-Strauss), its presence in continental philosophy was never straightforward. This can be seen most clearly in Derrida’s essay on Husserl “‘Genesis and Structure’ and Phenomenology,” and in his early criticisms of structuralism. Considered positively, and as a critical foil that would preclude a phenomenological grounding of language on consciousness, the key contribution of the notion of structure lay in its problematization of presence: could a sign or proposition be traced back to consciousness or lived experience as something present? Structuralists argued that a sign could only function as a

20. First delivered at a conference in 1959, the essay was published in French in 1965 as part of the conference proceedings Entretiens sur les notions de genèse et structure, Maurice de Gandillac et al. (eds) (Paris: Mouton, 1965), and then translated in Writing and Difference, Alan Bass (trans.) (Chicago, IL: University of Chicago Press, 1978), 154–68.
sign not by referring back to some self-present sense or object, but in relation to other signs. At the level of language, this argument is relatively straightforward. If I use a word in a language that you do not understand and offer you an osten- sive definition – I utter the word “red” and point to an apple – then you cannot know the meaning of the word – does it name the object “apple” or the color of that object or the object’s shape, and so on? – or how it is properly used without further repetition. I could then point to, say, a red wheelbarrow and say “red” and you would begin to get a sense, through repetition, of what was being differentiated. One understands each term through its difference from others, and this can never occur in one self-present and autonomous act. Repetition estab- lishes each language’s relations of difference. Language is thus differential in two senses; it works by producing distinctions among sounds (such as the phonemes of a language) and differences among concepts (or the way in which language divides and organizes the flux of experience). This is apparent when we learn a new language, where we sometimes struggle with hearing and pronouncing new sounds, and we also have to understand differences of meaning that do not map isomorphically onto English – for example German has two words for experi- ence (Erfahrung and Erlebnis) whereas English only has one.

The structuralist argument that language takes the form of a system of differences without positive terms21 had a number of consequences, which ranged from the very simple notion that the meaning of any event or experience depends on an entire system, to more radical implications regarding the very nature of consciousness and being. The work of Roland Barthes in Mythologies, for example, analyzes a number of cultural forms – ranging from cooking to wrestling – but does so with the presupposition that any reading of cultural forms should not begin from what something is in isolation, or in its “natural” state.22 For Barthes, the presentation of something as natural or precultural is itself achieved through cultural signs. This, indeed, is his sense of “mythology,” which follows directly from an emphasis on the linguistic (or, more accurately, semiotic) limits beyond which we cannot think. Barthes was committed in his early work to a structuralist axiom concerning the “arbitrary” character of

21. Saussure makes this claim explicitly in his Course in General Linguistics, Charles Bally and Albert Sechehaye with the collaboration of Albert Riedlinger (eds), Wade Baskin (trans.) (New York: Philosophical Library, 1959), 120.

22. In the key essay of Mythologies, “Myth Today,” Barthes argued that myth was a form of “frozen” speech that would take historically complex events and present them as timeless and natural. One example is a picture on the cover of the Paris magazine Match, where a colonized black soldier salutes the flag. This seemingly innocent picture actually presents a series of assumptions, such as the joyous willingness of the colonized to respect authority, the flag as worthy of recognition, and the inclusion of colonized others in a world “we” all assume to be incontestable.
the signer, so that, for example, “whiteness” signifies “purity” not because of some essential or natural relation between a color and its meaning, but because of the ways in which any particular culture or fashion system creates differences. The meaning of any phenomenon can be decided only in relation to an entire system of meanings and differences. In linguistic terms this leads to more holistic notions of translation: if I want to translate the French “aimer” into English, I need to decide whether to use the English word “love” or “like,” but this would be possible only through understanding how the word works in its French context; there is never any one-to-one relation between sign and sense.

In Barthes’s own work, this eventually led him away from the analysis of how sign systems produced myths or seemingly inevitable relations among signs, toward the creation of texts that deliberately intensified the complexities, ambiguities, and multiple connections among signs. Barthes then characterized two ways of approaching texts: the “readerly” approach assumes that texts have a single sense that can be intuited or interpreted and that the desire for understanding leads to the fulfillment of a final meaning. In contrast, the “writerly” approach does not find a sense behind language but takes enjoyment in the play of language, no longer seeking consummation in some definitive meaning. Barthes’s The Pleasure of the Text argued for a radical commitment to the primacy of language that is intensely antihermeneutic: one approaches a text not to reduce the signs of language to some hidden and underlying meaning, but enjoys language as such and does so by happily abandoning any notion of a justification or fulfillment beyond the text. Not only did Barthes’s emphasis on the pleasure of the text lead to an approach to literary and visual texts that was directed against interpretation, but it also had consequences for the ways in which French philosophy was received in the English-speaking world. For example, Derrida’s concepts of “play,” “writing,” and “text” – which referred to structural conditions beyond language in the narrow sense – were often read as ways of reducing politics and reality to language.

More complex philosophical arguments followed the structuralist argument for the differential and arbitrary nature of signs. The most significant critique occurred in the deconstruction of the phenomenological commitment to transcendent subjectivity or the lived. In his early work on Husserl, Derrida argued that the condition for the possibility of what Husserl defined as the primordiality of lived experience was différence. This term followed from Derrida’s equal commitment to structuralist and phenomenological premises regarding

24. See, for example, David Lehman, Signs of the Times (New York: Poseidon Press, 1991).
language and meaning. If it is the case, as Husserl had insisted, that we can have an ongoing and lived world only because consciousness synthesizes experience into experiences of this or that identifiable manifold, then this also means that consciousness is never self-present. Consciousness is intentional, or directed toward a transcendent object that is always experienced as a determined and meaningful object (and this is so even if the intentional object is imagined, doubted, wished for, or later revised as having been an illusion). But intentionality, or the idea that consciousness is always consciousness of something other than itself, required (for both Husserl and Derrida) the retention of past experiences into the present, and the anticipation of future experience from the present. And because consciousness is irreducibly intentional, according to Husserl, consciousness never experiences a pure “now” in isolation.

Whereas for Husserl this led to the positing of a transcendental subjectivity that would be the basis for the synthesis of time, for Derrida one could not posit either a subject or even a system (such as language) as the ground of synthesis. According to Derrida, the synthesis of time, or the experience of a present that retains and anticipates, already relies on something that is neither present nor absent, neither human nor inhuman, neither linguistic nor prelinguistic. Derrida referred to this “quasi-transcendental” as différence, the trace, writing in general, and a series of other terms. Such terms are quasi-transcendental because they do not posit an explanatory condition before experience – either language or the subject – and this is because Derrida deconstructs the opposition between the self-present subject, on the one hand, and the system of writing, on the other. There can only be a subject who experiences herself as present if her experiences of a sequence of “nows” can be synthesized and recognized as having some ongoing identity through time; but in order for time to be experienced as the experience of a world by a subject, some process must mark in each now that which could be lived again beyond the present.

So, for example, to experience any present event as, say, an experience of redness, I already have to mark out what in this present could be repeated, or what in this experience is lived as this or that quality. The present or the now is never pure but requires a trace, or a marking out of some aspect that could be carried over from the past to the future. In this respect, even before we have a language strictly speaking, even before there are the actual signs of a natural language or cultural convention, consciousness or experience is already differential. That is, for consciousness to be consciousness of what is not itself, it must experience that otherness (or transcendence) as having an identifiable, repeatable, or what Derrida will call “iterable” character: something in the experience that is anticipated as continuing beyond the self-present. This means that the phenomenological commitment to genesis, or tracing all signs back to a founding and self-present conscious act, is impossible. For that very
phenomenon of self-presence, or the consciousness that lives the world as meaningful, requires a marking out of time: a tracing or inscription in which the “lived” is never fully self-present.26

Derrida regards neither structure (the system of signs) nor genesis (the founding act of consciousness) as adequate to account for meaningful language. Language is only possible, as meaningful, if a sign is the sign of something other than itself, such as an object or intended sense. In this respect, Derrida maintains phenomenology’s commitment to intentionality, or the idea that experience is always experience of some thing, some transcendence, or something toward which experience aims. But that very character of experience, or its aiming toward what is not yet fully present, both means that experience is essentially unfulfilled, always directed beyond itself, and that experience is traversed by a language, system, or structure that is not its own and that it cannot fully command.

Derrida’s departure from Husserl and phenomenology focused on these two problems – of presence and of structure – to produce the counter-method of deconstruction. First, the problem of presence: Derrida was part of a broader response to Husserl that was critical of a certain intellectualism. Husserl began his investigation into consciousness and its relation to signs by focusing on mathematics and logic: signs that in their pure formality would produce a truth that would pertain for any experience whatever, and that could be rendered fully present. Not only does this establish an “architectonic” ideal at the heart of philosophy – the ideal that philosophy should presume that experience in its proper form is experience that grasps its object adequately and with full certainty, and that one can always return to this certainty to ground all later claims – but it also presupposed a certain ideal of humanity.27 The mathematical, logical, or geometric sign orients itself toward a world as it would be for any subject whatever, a world that could always in principle be available at any time and any place if one were to repeat again the intuitions of (in the case of geometry) “space in general” or (in mathematics) “number in general” – an experience of purely formal truth. But to produce this pure formality, Husserl has to make a distinction between actual, living, concrete, and empirical human beings

26. Derrida makes this point clearly in his “Introduction” to Husserl’s Origin of Geometry. According to Derrida, Husserl’s “first geometer” who would intuit, in his self-present here and now, valid truths that would pertain for any subject whatever, is only possible if the present intends some future beyond itself by marking in the present that which would be true beyond the immediate experience of this lived “now.” And this possibility of maintaining a lived experience through time, beyond the pure “now,” is possible only through the structure of language.

who are located in the world and speak a specific, natural, and finite language, and the pure potential of transcendental subjectivity that regards the world as it would be for any other, regardless of worldly locale.

For Derrida there are two problems with the privileging of this purely formal aiming at apodictic evidence. First, it begins from a certain notion of a proper experience, the experience of pure truth and absolute presentation. By beginning his investigation with formal truth as the model of experience, Husserl privileges the attainment of pure and apodictic presence; other modes of presentation, such as imagining, wishing, promising, or hallucinating are then derived from this supposedly exemplary mode of judgment. In so doing, Husserl also assumes a primacy of a certain type of language – formal language – and a proper relation to language, whereby signs are mere tokens that ultimately refer us to original intuitions. The second problem of Husserl’s account of language genesis is its Eurocentrism and phoneticism: by arguing that signs could ultimately be traced back to a speaking and self-present subject, Husserl assumed the phonetic languages of Western culture (in contrast with Chinese ideograms, for example) and assumed a single, truth-seeking, self-recognizing, and unified historical community with one tradition of inquiry.

Emmanuel Levinas offered a similar criticism of Husserl; by beginning from logic, mathematics, and the ideal of certainty, Husserl would never be able to understand that experience is not primarily an aiming for certainty, which then includes others as those who would experience the world as also given in such and such a way.28 For Levinas, the commitment to “ethics as first philosophy” led him to argue that before knowledge, certainty, and an aiming at full presence, we are exposed to the other person, who is there before questions of knowledge and absolute truth. If for Husserl knowledge was the first question of philosophy, because philosophy was meant to be founded on certainty, those who followed Husserl offered other modes of experience and language as starting-points for philosophical questioning.

Levinas’s argument that the striving for ontology and certainty both precluded and violated the experience of the other person could also take on a more sexually political significance. Irigaray, for example, argued that the tradition of Western metaphysics was an aiming at pure presence, where what is other than the self occurs only as a medium or occasion for thought to master its own processes of representation.29 What cannot be admitted, Irigaray insisted, is a thinking that would relate, not to material or substance available for representation, but

to another speaking and embodied being, who could never be presented as a complete object of knowledge. Irigaray therefore argued for distinct styles of writing, speaking, and conversing that would not be those of a self-present subject returning to her own represented truths, but of two embodied beings whose speech would be manifestly different or sexually marked. There would no longer be “a” language or formal system, whose single origin “we” might discover through processes of retrieval and interpretation. Instead, we would acknowledge the textual “scene” in which different voices and styles of speech and writing create distinct positions in relation to each other.

Kristeva, in her early work, also contrasted the “thetic” position of judgment, in which the world is presented as so much representable, conceptualizable, and linguistically mastered material (what she isolates as the “symbolic”), with a “semitic” position in which the world was not yet fully objectified and in which language was not yet a purely formal system but could be experienced as sound, rhythm, sonorous vibration, or nonsense. Kristeva’s early criticisms of Husserl were also, implicitly, critical of the deconstructive account of language.30 Derrida insisted that no pure experience or self-presence was possible, for any presence can be given only through a process of traces – something like “writing in general” – that would create the minimal distinctions required for language in a narrow sense. For Kristeva, however, these “traces” from which language systems emerged were founded on embodiment and relations.31 It may not be possible to have some pure position outside language, some pure grasp of a preedipal plenitude, but there is a stage between the absolute silence of infancy and the attainment of formal language structures. This “semitic” position is the stage when the infant makes articulated sounds, gasps, cries, and sonorous expressions that are not yet translatable or referential. This allows us to think of what Kristeva termed the “chora.” If there are systems of formal signs that allow us to think of ourselves as subjects in relation to the world, then such formal systems must also have a materiality. The chora is that spectrum of sound and matter from which distinct bodies and languages are generated.32 Kristeva argued that we could never, as rational subjects, simply step outside all difference and linguistic determination – this would be psychosis – but she did suggest that from within language we could experience moments of rupture or the intrusion of sound, rhythm, and musicality that intimated the far less formalized matters from which symbolic systems derive. This disruption of language by the sounds and rhythms of poetry and avant-garde literature would be both revolutionary,

---

in its disturbance of systems, and incestuous in its flirtation with the maternal plenitude of nonmeaningful traces from which we have distinguished ourselves.

This notion of a point where subject and object, or human beings as speaking animals and the world as matter to be ordered, breaks down dominated critical responses to the phenomenological elevation of language as a system that gives meaning and order to the world. Perhaps one of the most important texts for the critique of both phenomenology’s and structuralism’s attention to language was Foucault’s *The Order of Things* (1966), whose French title, *Les Mots et les choses*, pointed directly to the relations established between “Words and Things.” Here, Foucault argued that phenomenology’s attention to the founding acts of consciousness and structuralism’s insistence on the linguistic mediation of all life both assumed “man” as an “empirico-transcendental double.” That is, man was at once the effect of conditions within the world, for we become human and cultural through language and its historical developments, while at the same time, man was the being who could recognize himself as empirically conditioned. It was against this notion of man as the privileged point of convergence between worldly conditions and the intuition of those conditions that Foucault set another project of considering the “shining but crude being of language.” Rather than see language as the medium or condition through which consciousness is effected and retrieved, Foucault argued for a “positive” account of language, in which its “density” or “shining” would be considered. In other words, we should not see words either as simple labels that allow us to communicate conscious content nor as structurations or conditions of experience. On the contrary, what Foucault referred to as “discourse” has its own consistency and density. So, for example, while there is a discourse of sexuality that allows for the study of desires, pathologies, perversions, the libido and heterosexuality and homosexuality, discourse also facilitates the corporeal structuring of bodies in marriages, families, psychoanalytic sessions, brothels and schoolrooms. Neither formation is reducible to the other: experience is not structured by language and language is not a mirror or doubling of experience. Literary language in particular, Foucault argued, was not an expression or mediation of some unfolding human destiny, but demonstrated all the ways in which language operated with its own forces, resistances, and relations. Here, Foucault was both extending the Heideggerian notion of poetic language as being more than a mere supplement to consciousness, and taking part in a much broader turn to language less as a medium or paradigm and more as a disruptive force that consciousness could never master.

34. Ibid., 339.
Instead of the Husserlian notion that we order the world by experiencing it as meaningful and identifiable through time, and then have language as the embodiment or systematization of that lived sense, philosophers as diverse as Derrida, Irigaray, Kristeva, and Lyotard questioned the notion of a mind or consciousness that gives sense to the world through language. The world was not already present, awaiting the articulation of sense-bestowal through language. Instead, the opposition between self and other, mind and world, language and sense, or signifier and signified, harbored moments of undecidability. This was because underlying the difference between the system of signs and the world which that system presents and formalizes was a more general and ungraspable process of difference. A world can only be experienced as present, and the subject only understand itself as a subject, if some differentiation between mind and world, presence and absence, subject and object, or sign and sense has already been instituted. “Before” the presence of the world, then, there will have been a differentiation. The notion of an original presence, or an instituting structure or system of signs, must therefore be displaced by a more fundamental question of difference.

It is because experience is only possible through differences that there can be no prelinguistic presence to which consciousness might return. Therefore, a central feature of the linguistic turn as it pertains to continental philosophy is to regard the idea of language as a positive phenomenon that enables experience and that cannot (as Husserl would have it) be reduced to or founded on experience. This is why the experience of literature is so important, and why language cannot be seen – as structuralism would have it – as a system of signs that one might use or analyze without broader questions of sense or presence. What Derrida referred to as the “metaphysics of presence” – philosophy’s commitment to grounding language or any other system on an always presentable truth – is always open to deconstruction precisely because philosophy has had to rely on textual systems in order to posit its supposedly pretextual origin. Deconstruction or poststructuralism therefore posits a quite specific relation between philosophy and literature that differs from the less radical claims that one can attend to literary features in a philosophical text, or look at philosophy’s uses of language and metaphor. Having recognized that all our experience is linguistically mediated – that is, that there is no pure or prelinguistic reality – literature after the linguistic turn emerges as a practice that foregrounds the constitutive power of language. Literature and art would be modes of reflection, ways in which we remind ourselves that the world that appears before us as present is really a re-presented world, enabled by language and figures that literature can then intensify, refigure, or illuminate. But if it is the case that language is not a system or structure within which mind orients itself, but has a being or positivity of its own, then we would need to regard language not as flowing from
a speaking self, nor as some system that organizes the world, but as a force that disrupts or “silences” consciousness, sense, and presence.

This, indeed, is how many philosophers saw language. Maurice Blanchot (1907–2003), whose work on literature intersected with the work of Derrida, Foucault, Deleuze, Bataille, and others, insisted on the silence and malevolence of language. Blanchot was at once a literary critic, a short story and fiction writer, and perhaps one of the most important figures for extending the notion of the limits of language beyond its structuralist and phenomenological themes of world-constitution. Blanchot’s understanding of the specificity of literary language was marked by three key themes: silence, space, and disaster.35 Whereas phenomenology and hermeneutics sought to read all language as the expression of an original intentionality or practical relation to the world, and often defined literature as the foregrounding of language as world-disclosive, Blanchot regarded literary language as distinct from speech, communication, representation, and meaning. In literature, language separates itself from a speaking subject; the author creates a literary work, but once created the work is poetic – a detached and distinct object. Literature therefore bears a silence at its heart, not only because there is no longer the presence of an author or speaker, but because words are placed into a space of their own, released from practical, instrumental, and communicative intent. The literary experience, for Blanchot, is in many respects beyond experience; for once we confront language as bearing its own being, which cannot be reduced to human usage or intent, then we are placed beyond knowledge, mastery, and meaning, and brought up against something that is at once radically alien to consciousness, and yet the only way in which consciousness can have any being. Blanchot did not, therefore, see literature as a way of bringing us back to the forming power of language; instead literature was a process of estrangement or alienation.

The ethical consequences of this separation or space of literature were spelled out in Blanchot’s notion of community. In contrast with hermeneutic or Habermasian ideas that we are necessarily oriented toward (ideal) agreement because we are linguistic beings subjected to communication, Blanchot regarded our situation within language as a form of common separation. Because we speak with one another we never have a world or “intersubjectivity” in common, and community is not some ground or context within which we speak and think. Instead, we are bound to each other through a language that is never our own, that has no underlying sense, and that can only signal a community-in-process,

or a “community without community,” a “coming community.” Language is not the effect of a speaking or intending subject but has its own material positivity or “shining” that cannot be seen as merely the expression or efflorescence of an intending conscious life. Involved with the surrealist movement, Blanchot’s work could be seen as a valorization and consecration of a specifically modernist notion of language. It is when language approaches the condition of sound or physicality (rather than semantic reference) that we see language in its own right, not as a medium through which we speak and intend, but as necessarily fragmented, or existing with a being of its own beyond our intent, reference or life. Rather than seeing literature as a way of referring back to language as a constitutive or constructive condition, Blanchot regards literary writing as in some respects sacrificial in its destruction of a stable, cognizing subject set over against the world. For this reason, literature – all literature and not just apocalyptic literature – is a premonition of disaster: not the destruction of this or that presupposition, but an annihilation of all the categories, systems, and frameworks that synthesize experience into a continuous order.

III. AFTER THE LINGUISTIC TURN

Recent theory has witnessed a return to life and living systems and has done so with the sense of having come to the end of the linguistic paradigm or linguistic turn. Manuel De Landa, in A New Philosophy of Society: Assemblage Theory and Social Complexity, has insisted that we should examine bodies, both human and nonhuman, and their material milieux, and not privilege language or meaning-systems as the grounding forms of relation through which social life is constituted. Seeing himself as part of a broader movement that has overcome the linguistic paradigm, De Landa is indicative of a postlinguistic approach to philosophy and literature. Two broad trends that began in the late 1960s and 1970s might be considered in order to understand this recent shift: the theorization of the body – largely associated with feminist thought – and a new form of vitalism and turn to “life” (the “affective turn”37) – largely associated with the work of Deleuze.

In philosophy, Evan Thompson has used the work of Husserl and Merleau-Ponty to argue for enactive, embodied, dynamic, and distributed modes of

37. There has been a much hailed “affective turn,” critical of the supposedly linguistic nature of Derridean poststructuralism and Derrida’s criticism of auto-affection. See, for example, the essays in Patricia Ticineto Clough with Jean Halley (eds), The Affective Turn: Theorizing the Social (Durham, NC: Duke University Press, 2007).
cognition in *Mind in Life: Biology, Phenomenology, and the Sciences of Mind*. Cognitive scientists Francisco Varela and Humberto Maturana had, decades ago, criticized the notion of mind as bearing a representational relation to the world, insisting that the organism’s world is always given meaningfully as a range of potential responses to quite specific perturbations.\footnote{See Francisco J. Varela and Humberto Maturana, *The Tree of Knowledge: The Biological Roots of Human Understanding* (Boston, MA: New Science Library, 1987).} Cognitive science has also been critical of Cartesian “top-down” or informational notions of cognition, drawing on the work of Heidegger to insist on the primacy of engagement and being-in-the-world, with cognition being an abstraction from an initially coupled mind–body relation.\footnote{See, for example, Michael Wheeler, *Reconstructing the Cognitive World: The Next Step* (Cambridge, MA: MIT Press, 2005).} In turn, philosophers have re-read Heidegger, through cognitive science, to argue for new theories of mind and cognition as extended, distributed, enactive, and dynamic.\footnote{See Andy Clark, *Being There: Putting Brain, Body, and World Together Again* (Cambridge, MA: MIT Press, 1997).} Philosophy of science now regards the development of nonlinear systems theory as enabling a new alliance between human organisms and nature that would be more attuned to nature's own duration, rather than imposing a single Cartesian system.\footnote{See Ilya Prigogine and Isabelle Stengers, *Order Out of Chaos: Man’s New Dialogue with Nature* (New York: Bantam, 1984). [\*] For a discussion of Prigogine and Stengers’s work, see the essay by Dorothea Olkowski in *The History of Continental Philosophy: Volume 8*.} This turn back to life, deemed to be a correction to the overly linguistic nature of philosophy, has been preceded by a decade or more of feminist theorizing that had long been critical of structuralist and poststructuralist inattention to the body.

“Corporeal feminism” has a long history in continental philosophy, going back to Irigaray’s criticism of the supposedly disembodied subject who represents the world as mere matter for his own self-understanding, and even further back to Simone de Beauvoir’s claim, in *The Second Sex*, that while men might experience themselves as subjects who have no essence other than their freedom or capacity to negate existing being, women are more mired in their factical being. It is in the 1980s, however, following the perceived domination of continental philosophy by language-based approaches, that embodiment becomes a much more intense and complex issue. Phenomenology had always paid attention to the body, most notably with Merleau-Ponty\footnote{For a detailed discussion of Merleau-Ponty’s concept of the embodied subject, see the essay by Mauro Carbone in *The History of Continental Philosophy: Volume 4*. See also the essay by Sara Heinämaa in this volume for a discussion of the legacy of phenomenology within French feminist philosophy.} insisting that one only has a world because there is an initially embodied (and not yet fully conceptualized) comportment toward what is not oneself, with this otherness from oneself
alway being given in relation to corporeal capacities. Moving beyond the perspective of Merleau-Ponty, the new sense of the body that starts to operate critically in continental philosophy from the 1980s onward is inflected by, and responds to, the problem of language. It is neither the case that there is a bodily comportment on which language is founded, nor that there is a language that then constructs or enables a sense of one’s body. Indeed, the idea that there are physical bodies on the one hand, and a constructing language or culture on the other, merely repeats the mind–body split that poststructuralist approaches to language had set out to undermine.

In contrast, a new way of thinking about the body has emerged in which the body is understood not simply as matter that is imprinted by mind or language but is always experienced both through the ways in which we apprehend other bodies (in sight and touch) and through the image we have of our own corporeality (again both in sight and touch). This led to a theorization of the Imaginary, and the related problem of morphology. Feminist thinkers such as Irigaray took up the concept of the Imaginary as it was first articulated by Jacques Lacan, for whom our production within language as subjects was supplemented by the image of a unified body that grants an imaginary illusion of unity. For Irigaray, though, this Imaginary is sexualized: that is, it is not just “a” unity or body-image that gives us a sense of self in addition to our constitution as subjects within language or the Symbolic. Our sense of ourselves is also inflected by the morphology of our bodies. That is to say, our image of our own bodies is never the apprehension of a simple object but takes on a certain form inflected by our sexuality, our social, cultural, and historical sense of our physical being. This means that the body is never a brute thing, nor a simple medium through which we act, but bears a certain morphology: to refer to corporeal morphology is to see the body as shaped by, and shaping, our visual, tactile, and spatial relation to the world.

For Irigaray, then, there are at least two, sexually different, relations between the Imaginary and the Symbolic. Lacan already had two formulae for sexual difference. The masculine subject is subjected to the symbolic order and therefore posits that there must be a prohibited object, which he is denied, that exists beyond the realm of represented desires, an unthinkable “woman” who would be

44. This point is discussed by, among other thinkers, Rosi Braidotti in *Patterns of Dissonance: A Study of Women in Contemporary Philosophy*, Elizabeth Guild (trans.) (New York: Routledge, 1991), and Elizabeth A. Grosz in *Volatile Bodies: Toward a Corporeal Feminism* (Sydney: Allen & Unwin, 1994).

*45. For a more detailed discussion of the Imaginary and Symbolic, see the essay on Lacan by Ed Pluth in *The History of Continental Philosophy: Volume 5*. 
different from the women to whom he has access. The feminine, by contrast, is imagined as one who is not subjected to the threat of castration, who is somehow outside the symbolic order, incapable of true speech. Thus Lacan argued that “woman does not exist,” and that the path to psychoanalytic authenticity was to “imagine there is no woman.” Now it is against this notion of either/or – either you are subjected to the law of the Symbolic or you remain mired in the shadowy identifications of the Imaginary – that Irigaray suggested an ethics of sexual difference. The Imaginary, or the way in which we figure our own body’s relation to the symbolic order and that is inflected by the body’s sexual morphology, may take the masculine form of imagining a feminine “beyond” that is always prohibited. Alternatively, if one speaks as a woman, one does not imagine what is other than the symbolic order as that which cannot be touched or addressed; sexual relations would be oriented to an other’s body, to a different mode of relations or morphology. The masculine subject regards himself as nothing other than a being who represents a world of passive and undifferentiated matter through language; he is a single and unified “I” for whom all otherness is a mere medium through which he understands, knows, and commands himself. The other sex that has never been represented explicitly in philosophy can be read in all the figures of the medium, matter, matrix, ground, or reflective surface through which “the” (always male) subject presents himself. The female morphology, for Irigaray, is thus not that of a unified, self-present, and self-constituting “I” but a relational, dispersed, and touching (rather than seeing or cognizing) body.

For both the phenomenological emphasis on the lived body as articulated by Merleau-Ponty and for the feminists of sexual difference, language is not the ultimate determinant, or even limit, of experience. Instead, certain bodies have a comportment or relation to the world, and even though this experience takes place in a world of language, cultural expectation, social convention, and history, corporeality has a positive and effective role. This is to say, as Moira Gatens argues in *Imaginary Bodies: Ethics, Power and Corporeality*, the body is not just a site of cultural inscription, nor something that we can only grasp after the event of, or as effected by, language. One of the simplest ways to consider the body positively, and as having a constitutive (rather than determined) relation to language, is through sexual difference. If philosophy has tended to figure all thought as taking place through a mind that is contingently housed in a body, and has also tended to regard that mind as a calculating, re-presenting and disengaged actor, this is perhaps because other types of bodies – those that give birth and are not fully detached from the claims of another’s body (to take just one possibility) – have not been considered by philosophers.

The Cartesian distinction between mind and body, which has been influential within feminist theory and its distinction between sex (biology) and gender (culture), can itself be seen to be gendered. To argue that there is a
brute biological sex that is then overlaid or mediated by cultural systems of gender maintains a dualism between disembodied/active mind and passive matter that has also been associated with a masculine reason on the one hand, and an embodied irrational femininity on the other. According to Genevieve Lloyd, there is nothing intrinsically feminine about embodiment nor masculine about reason, but the history of philosophy’s various definitions of reason have always aligned rationality with qualities associated with male identity; even when reason is expanded to include the passions or a moral sense, it is usually the male subject who is taken as the exemplar of this defining capacity. For both Lloyd and Gatens, then, we should not confine attention to language as the structuring symbolic capacity that then “constructs” the way we perceive bodies; for our bodily perceptions, actions, and affections and the way we understand the body’s relation to language vary historically and culturally. The idea of language, then, as “a” system that allows us to understand the world is once again criticized. This is not only because language is seen itself to have a body or materiality that cannot be reduced to the pure act of a mind that wishes to re-present itself, as Judith Butler argues in Bodies That Matter: On the Discursive Limits of “Sex”, but is also because the border between self and sign, or body and speaking subject, is itself a bodily relation.

It is this embodied or intense experience of physical sound that becomes increasingly important as continental philosophy focuses more and more on language in relation to living systems and the dynamism of bodies. Key to this movement away from language as a formal system, or even language as bearing a power or force that can shine with its own light in literature, was the increased interest in the philosophy of Deleuze. Deleuze’s work has been hailed (and condemned) as a new vitalism: as an overcoming of a linguistic paradigm that has limited thinking, and as an almost mystical turn to vital forces that go beyond the actual world as it is known and lived. Like Derrida, Deleuze had

48. This was the case for Kristeva, who argued that before language operates as a pure system of signs, it is experienced by infants as a form of physical noise. This “semiotic,” rather than symbolic, experience of language is evident as well in literary texts. The great modernist writers, such as Joyce or Celine, destroy language as a form of communication and signification and allow it to appear as sonorous, intense, and haptic, as the feeling and vibration of sound.
also completed work on language and the phenomenology of Husserl. In *The Logic of Sense*, Deleuze takes up the two Husserlian tasks of a dynamic genesis – whereby we trace the emergence of meaning from bodies and their relations – and static genesis, where we recognize that any emergence of meaning *through time* also relies on potentials that have a virtual existence that is fully real and does not exist within time but allows for the coming and going of time. Deleuze always maintained an interest in the genesis, not only of language and formal systems, but of systems in general. This would include the living system of the human body as an organism, and the systems of the social world and its disciplines. One of Deleuze and Guattari’s most significant maneuvers in relation to the linguistic paradigm was the rejection of the form–matter distinction in favor of the relation between form of content and form of expression. Unlike the usual notion of language (as form) that organizes the world (as matter), Deleuze and Guattari refused to grant any privilege to language, regarding language as one system among others, and one form of sign among others. We can begin to understand this maneuver by considering “form of expression” and “form of content” in relation to language narrowly construed. If it is possible, drawing on Foucault’s example from *Discipline and Punish*, to have the judicial language of the courts that refers to criminals, delinquents, sentences, and intentions, this is because of both a form of expression – all the meanings that make up the language of the legal system – and a form of content – for example, the human bodies and physical structures as they are arranged and arrange themselves in courtrooms and prisons. There is also a matter of expression – for legal language appears as vocal sounds and written tokens – and a matter of content – the physical bodies, machines, buildings, and technical apparatuses that enter into relation to constitute the form of the prison/legal system.

Instead of a formless and undifferentiated world that is then “divided up” by a structuring language, Deleuze refers to a process of “formed matters” that has at least two key features: language and world exist in reciprocal interaction (one does not cause the other); and language is not the only, or even most important system of relations. First, language is not a system that is detached from the world or imposed on the world, for the signs of a language – both the verbal sounds and marks of a language and the bodily inflections and expression – occur through processes of stratification. That is to say, matters or bodies have to enter into various forms of relation, thus creating a relatively stable order that can then be expressed by either a language or some other system. We could,

---

52. This is discussed in Gilles Deleuze and Félix Guattari, *A Thousand Plateaus*, Brian Massumi (trans.) (Minneapolis, MN: University of Minnesota Press, 1987), 75–110.
for example, see the affective signs of the body – blushing, grimacing, frowning, smiling – as expressions of the body’s visceral system. We could in turn see that visceral system as an expression or sign of the body’s genetic-biological tendencies. In any network of relations, one side of the stratification is expressive, not simply remaining within itself but presenting a gesture, sign, or surface that can enter into relation with another system. For example, a body’s metabolic relations can express themselves in feelings, which can then be (in turn) expressed as bodily movements. The other side of the strata faces the organized or formed matters, which can also enter into relations with other systems; for example, if my bodily affective system encounters a virus, or a neurological disorder, then the form of content (a body’s response system) might yield a new form of expression (a body that could no longer speak would require some new system of expression). Thus Deleuze and Guattari’s theory of stratification allows us to see language as one regime of signs among others, and as being the expression of other relations and systems.

Deleuze’s and Guattari’s attention to form of expression (the relations among gestures, linguistic signs, facial expressions, and symbols) and form of content (the way a body and its affects relate to other bodies) demotes language from the place it held following the linguistic turn, as language can no longer be seen as the sole medium that organizes the difference and sense of life. Despite this rejection of language as the limit and ground of meaning, Deleuze regards language as one of those points where the distinction between form of expression and form of content breaks down, and he sees this as potentially revolutionary. This is because, as he theorizes with Félix Guattari in *A Thousand Plateaus*, life is composed of various stratifications between form of expression and form of content. In the geological stratum, for example, the content of formed matters can be expressed in various shapes of crystal; in the organic stratum, the genetic code allows for expressions that move to different formed matters (as in cases of transduction when a virus can carry genetic expression across species); in the human stratum, it is language that allows for a higher degree of deterritorialization or *translation*, so that quite different forms of content – different languages, visual materials, music, gestures – can variously express the same content. For Deleuze this means both that language is one form of expression among others, and that what language expresses – a sense detached from any specific matter – is not reducible to language.

Earlier, in *The Logic of Sense*, Deleuze addressed this distinction in terms of language having one side turned toward the sense it expresses – where sense would be an incorporeal event between bodies and signs – and another side that is corporeal. Thus language is corporeal in the matter of sounds and signs

and in the states of affairs it refers to, for there are material differences among
the phonemes and marks of a language, and among the relations of bodies to
which it refers. But there is also an incorporeal dimension to both expression
and content, for the material sounds of language express a sense, as do the rela-
tions among bodies. There is no one-to-one correspondence between formed
matters (content) and the incorporeal plane of sense and expression, but the
two act in a relation of reciprocal determination. So, for example, a knife that
encounters flesh is a corporeal encounter between two bodies (blade and flesh),
but the sense of “cut” or “wound” is incorporeal and expresses an event, or what
has happened. Sense, for Deleuze, is not simply meaning – or what the words
and concepts of a language designate; sense is also tied to the event.

The corporeal world is a world of chronological time, so that bodies can
enter into relations and sounds and marks on a page can be formed, and pass
away. The incorporeal event is tied to time as *Aion*, so that the sense of “to cut”
expresses a potentiality that is actualized within time in this specific encounter
of flesh and blade, but could also occur in other times. The time of *Aion* is rad-
ically temporal: we can see clock time as a series of “nows,” as a series of move-
ments (hands on a clock, the discernible passage from day to night), but such
a time as a spatialized series is possible only because of time as *Aion*. Deleuze
ties this time to the infinitive: “to cut,” “to green,” “to think.” It is only possible
to have this world of subjects and predicates, or the chronological time where
changes and accidents occur to underlying stable subjects, because there is a
power to differ, or to become, which is captured by certain modes of language,
such as the infinitive where qualities are liberated from underlying stabilities.
To think of time as *Aion* is to consider becoming not as the alteration of some
being but all being as nothing other than becoming. This, in turn, leads Deleuze
to consider language not as the constitution or organization of an otherwise
undifferentiated matter, but as a production of sense: the infinitive allows us to
think not of objects located within time, but as potentialities that at any time
whatever (for all time, eternally) produce variation and creation. Language is
thus tied to the event not because language produces change but because the
thought of change is itself one of life’s always present (or eternal) powers of
becoming.

This understanding of the incorporeal nature of the event and the way in
which language as material can have an immaterial effect on bodies has politi-
cal implications. Paul Patton, for example, has made this point in relation to
the event of colonization. Long referred to as a “discovery,” the English inva-
sion of Australia deployed a form of speaking that precluded granting existence
to indigenous peoples. All this would change, of course, if we were to recog-
nize the entrance of the fleet as an invasion and were to consider other senses
– those given in Aboriginal languages – of the land now known as Australia.
When European bodies entered Australia and described the land as “terra nullius” (nobody’s land), there was a material relation of bodies. The incorporeal event of sense occurred when the indigenous peoples of Australia were now subordinated and not recognized as human or political agents because of a statement that expressed (and reciprocally acted on) relations of bodies.54

The word that enables the incorporeal event of sense to act on bodies also has a body of its own: the physical being of language that Deleuze frequently refers to as having the power of deterritorialization. When language “stutters” or when it is undecidably poised between being a sound that is heard as sonorous vibrating matter, or a sign that is the expression of a world of formed matters, we reach a point of “higher deterritorialization.”55 That is, it is not just the case that the sounds and movements of the body operate to express a system of meanings; with literary language we experience a language in its power of destroying the stratification between speaking body and expressed world. We are no longer placed before language as organized beings who re-present the world through signs. Instead, we experience the world or life in a relation of becoming: not the becoming of this or that form or matter, but the becoming of life into formed matters. Following Bergson, Deleuze and Guattari argue for what they refer to as a “passive” vitalism: this is not a life force that strives to maintain itself, for life is a power to create difference without any sense or intent that would direct that creativity.56 On the one hand, then, Deleuze’s philosophy, with its emphasis on one immanent life that expresses itself through various systems of formed matters, demotes language from its position of organizing structure. Indeed, Deleuze and Guattari regard the idea of “the signifier” as despotic, precisely because it maintains a notion of “a” system of relations through which matter is organized.57 In opposition to this linguisticism, they regard life as a potentiality for forming relations, with matter being the points of relative stability effected through systems of relation and interaction. On the other hand, Deleuze and Guattari also focus on deterritorializing moments of systems when the stabilization of relations or formed matters breaks down. Literature, with its tendency to treat language not as the sign of some external sense but as sonorous material, allows the matter or body of language itself to vibrate, thereby liberating us from the notion of a humanity who takes up language as some distinct tool.

57. See Deleuze and Guattari, A Thousand Plateaus, 117.
In many ways the idea that Deleuze and Guattari are theorists who take us beyond the “linguistic turn” and allow us to turn back to life without the mediation of language precludes us from understanding the full significance and complexity of the idea of language as it operated in twentieth-century continental philosophy. Many Deleuze scholars regard Derrida as a primarily critical philosopher concerned with the limits of language, while Deleuze allows us to think of the emergence of language.58 Derrida’s deconstruction of the speech/writing opposition was, however, not an argument that one can only have speech or expression if there is some system of differences or writing. Rather, all the features that are deemed to characterize writing, especially its technical, systemic, and nonliving materiality, already invade the supposedly living and self-present speaking subject. Deleuze and Guattari’s idea that the “signifier” is not the only system of differences, and that every organism is composed of living systems that are not subordinated to some central and conscious subject, is therefore not a movement beyond language and difference so much as an extension of the features of language to all life. Their “molecular revolution,” which would pay attention to differences, relations, and expressions that are not those of humanity and subjectivity, is therefore an extension and radicalization of the linguistic turn.

In this respect the current movements in philosophy, both analytic and continental, that see themselves as moving away from language-centered approaches back to the lived body of phenomenology could benefit from the critical approaches of poststructuralism that would not confine difference and relations to language systems. Theories of the “embodied mind,” the “extended mind,” or the “mind in life”59 have all argued that before language and cognition there are action-oriented and affectively attuned bodies, for whom language and cognition are subsequent and not constitutive features. Such approaches have turned to Merleau-Ponty and Heidegger to criticize logic-centered and language-centered notions of intelligence, but they have done so by paying less attention to the ways in which both Merleau-Ponty and Heidegger and the poststructuralists who followed them located systems of difference that were not intentional or organic at the heart of the lived body. The linguistic turn cannot simply be seen as a turn to language as some ultimate explanatory condition or medium, but is more appropriately understood as a problematization of the

self-containment of language. Indeed, as more recent work within the continental tradition has sought to demonstrate, the turn from language back to the embodied mind can already discern in the brain and its differential systems all those features of language – such as distribution, deferral, and nonpresence – that were once deemed to characterize the system of signifiers.\(^6\)

The relationship between psychoanalysis and philosophy has been fraught with structural contradictions and historical tensions from its very inception. The emphasis placed by Freud on the unconscious as a fundamental aspect of human cognition and understanding, as well as his appraisal of sexuality and desire as vital forces in the constitution of both the subject and of human culture – or civilization – is unsettling for philosophers. The discipline of philosophy and the psychoanalytic theory and practice of the unconscious as a fundamental structure of the subject have historically developed as parallel but divergent discourses that never quite came to a common focus.

Part of the difficulty resides with the vicissitudes of modern history, notably the Second World War and the Cold War that followed. The history of psychoanalysis is deeply caught up in these events and, in particular, with phenomena such as fascism, Nazism, and the extermination of the European Jews. This historical fact needs to be stressed in view of the amnesia – and the revisionist simplification – that struck postindustrial societies after 1989. The genocide of so many Jewish Europeans also marked a moral and intellectual suicide for Europe, insofar as it resulted in the departure of some of the best and the brightest scholars, scientists, artists, filmmakers, and thinkers, including Freud himself and the founding members of the first Psychoanalytic Society, all of whom, except Carl Jung, were Jewish.

Postwar Europe, consequently, was deprived of those very schools of thought – notably psychoanalysis and Marxism – that had been the strength

---

*1. For a more detailed analysis of this phenomenon, see Braidotti’s essay on European Citizenship in The History of Continental Philosophy: Volume 8.
of critical theory in the earlier part of the century. It is in the context of such discontinuities in the transmission of the psychoanalytic legacy and a politically polarized world order that the roads of renewed European interest in critical theory in the 1960s and 1970s lead to France. That it should have been France that acted as the motor for the regeneration of the continental tradition of critical philosophy\(^2\) has a great deal to do not only with the difficulties of Germany and eastern Europe dealing with its anti-Semitic recent past, but also with the high moral stature of France at the end of the Second World War. The role of Jean-Paul Sartre and Simone de Beauvoir in this regard is crucial, as is their connection to anticolonial philosophers such as Aimé Césaire and Frantz Fanon.

The philosophical movement of poststructuralism, however, is primarily responsible for the return of psychoanalysis into France and Europe.\(^3\) Louis Althusser and Jacques Lacan in the late 1960s heralded a “return” to the materialist roots of continental philosophy, via Marxism\(^4\) and psychoanalysis. It was not a straightforward return, of course, but rather a more complex phenomenon of rediscovering the fundamental texts of Marx and Freud by reading them independently of the official interpretations imposed respectively by the Communist Parties and the International Psychoanalytic Association. This rebellion against the official guardians of the radical texts and their dogmatic attitude coincided also with a change of generations. Also important here is the historical context of the Algerian anticolonial war and the political and social turmoil that surrounded it, which marked the political coming of age of a generation that had grown up in the long shadow of post-Second World War European guilt and that was determined to break the conspiracy of silence.\(^5\)

Psychoanalytic theory is, in many respects, at the core of these developments and the new historical conditions could not fail to affect the ways in which psychoanalysis impacts on the intellectual debates. In some ways poststructuralism writes a new chapter in the long dialogue between Marxism and psychoanalysis and in so doing moves beyond the starting premises of both

\(^2\) Other schools contributed, although to a lesser degree: the postwar Frankfurt School; the Yugoslav schools of Marxism and especially the Dubrovnik school of critical theory; and the southern European traditions, especially the Italian and the Spanish Marxist schools.

\(^3\) It is significant, for instance, that most of the authors who Foucault singled out as heralding the philosophical era of critical modernity (Marx, Freud, Nietzsche, Darwin) are the same authors who, with the exception of Nietzsche, the Nazis condemned.

\(^4\) For a discussion of Marx and Marxism, see the essay by Terrell Carver in *The History of Continental Philosophy: Volume 2*.

movements. The question of desire and unconscious identifications and counter-identifications – which is one of the fundamental principles of psychoanalysis – becomes linked directly to the political and ethical concerns for the responsibility of European philosophy in the making of fascism as well as colonialism. This led to an extensive interrogation of the role of European “high” culture in its own and other peoples’ destruction. Whereas the existentialist generation had conceptually sided with rationalism, the poststructuralists take much more seriously the effects and dynamics of the unconscious. They consequently raise a twofold line of inquiry: first on the limitations of reason as a self-correcting instrument of human liberation; second on the extent to which desire actually shapes the social field, which places the social imaginary and the political unconscious at the center of the agenda.

Lacan famously reconceptualizes the unconscious processes in terms of linguistic mediation. He also connects these processes more firmly, however, to the political economy of power and of symbolic domination that is prevalent in a social order organized around the principle of the paternal metaphor, and thus of a phallocentric symbolic system. In so doing, Lacan triggered a series of polemical debates in the centuries-old discussions of traditional philosophical questions to do with the structure of the social contract, the symbolic structures of social cohesion, the sources of knowledge, the political function of metaphor, and the nature of thought and the mind in structuring both subjectivity and power.

The role of desire as a political factor that constructs the social field is highlighted in the contexts of the events of May 1968 and reaches a peak in Deleuze and Guattari’s critique of the “micro-fascist” structure of the European subject of knowledge. They raise with equal importance the question of the role of philosophy, science, and intellectual production in paving the road for domination, rationalizing its necessity, and banalizing its consequences. If desire is intrinsically political, it follows that politics begins with our desires. This axiom positions psychoanalysis as a crucial link in philosophical debates about democracy, the state, and the possibility of political resistance.

This essay starts from these premises and explores some of their implications for philosophy. In what follows, we survey some of the most provocative and productive discursive intersections between philosophy and the psychoanalytic tradition in the 1960s through the 1980s in an effort to demonstrate the vitality but also the complexity of philosophical engagements with psychoanalysis in the continental tradition.

*6. For a detailed discussion of Lacan, see the essay by Ed Pluth in *The History of Continental Philosophy: Volume 5*. 
I. THE FREUDIAN EPISTEMOLOGICAL BREAK

Freud stated as the fundamental premises of his psychoanalytic revolution the concept of the unconscious and the redefinition of sexuality as libido. He also introduces a powerful revision of social theory in the so-called metapsychological papers, and calls into question the accepted vision of the subject as coinciding with his/her conscious, rational self. This de jure and de facto equation between subjectivity and consciousness, also known as “conscientialism,” is opposed almost structurally to the psychoanalytic insight that declares the subject as an effect of his or her unconscious structures and desires. Freud, however, was particularly cautious in stating the theoretical impact and ambitions of the new “science” of psychoanalysis. He does draw an analogy between philosophy, or at least metaphysics, and religion, but only in order to stress the delusional aspects of rationality, which nurture an illusion of omnipotence and totalizing unity on the part of the subject. Freud is also careful to point out that, by contrast, psychoanalysis is less about producing a counter-theory of the subject than revealing the subject’s structural incapacity to be the master in his own house. Freud thus relegates consciousness to a place and a status that is vital, but not determinant or central; that central place is reserved for the unconscious drives. The aim of Freudian psychoanalysis is to drive home this unwelcome truth and to supplement the theories of the subject with the discovery of the unconscious. The metapsychology phase produces a powerful analysis of the sexual origins of the social contract, to which we will return below.

The relatively humble relationship Freud had established between his empirical findings and the theoretical claims of psychoanalysis gets redefined in a radical manner in France throughout the late 1960s and 1970s. Lacan’s central thesis that the Unconscious is “structured like a language” indexed the constitution of the subject to a structuralist principle of signification. The primacy of the master signifier – the Phallus – is reiterated as the fundamental law of representation of and by the subject of the desire that constructs this subject while escaping its control. Lacan’s ambition, explicitly stated as the desire to

turn psychoanalysis into the new philosophy of the subject,\textsuperscript{11} alters the terms of the relationship between empirical practice and theoretical production, although not always for the better. In the context of the French poststructuralists’ rereadings of the status of the philosophical subject, about which more below, psychoanalysis contributes significantly toward debunking the pretensions of phallo-logocentrism that, according to Lacan, have sustained the subject since its Platonic beginnings. The “death of Man,” or “crisis of the subject,” indicates a serious decline of the self-evidence of the phallic metaphor and hence of paternal authority, for the philosophy of modernity. Psychoanalysis functions in this context as the discourse of the crisis of reason \textit{par excellence}. It targets philosophy as its favorite discourse because this master discipline has historically played the role of upholding a hierarchical systematization of human knowledge, norms, and values. Thus, Lacan, on the one hand, continues to pursue Freud’s insight that philosophy, as the emanation of this spirit of mastery, is delusional; but on the other, he also radicalizes the Freudian project by targeting philosophy as the discipline that most needs to undergo serious psychoanalytic criticism. In this respect, Lacan’s much-celebrated “return” to Freud is anything but a loyal continuation of the founding principles of psychoanalysis.

The central psychoanalytic notion is the corporeal roots of human subjectivity, plus the dynamic interaction that the unconscious guarantees between mind and body and the extent to which they alter the terms of philosophical discourse and practice. The revaluation of the feminine, which is central to Lacan’s project, is also an effect of the psychoanalytic exposure of the malaise that affects the masculine social and symbolic order, upheld by and as the Law of the Father or the Phallic symbolic. Lacanian psychoanalysis positions very centrally the idea of the necessity of replacing the unitary vision of the subject with a split or nonunitary vision. The fracture is introduced by the instance of the unconscious, which makes it imperative to move away from the transcendent or religious vision of consciousness by integrating the insights, the methods, and the ethics of psychoanalysis. Lacan thinks, however, that as the expression of the phallocentric symbolic system and discourse \textit{par excellence}, philosophy is incapable of including the dimension of the unconscious, except as its dialectical opposite within the same logocentric logic. This structural incapacity to become decentered is the tragedy of philosophy and the reason for its necessary downfall. As a radical misunderstanding of the subject, philosophy is locked in an either-or logic of exclusion of the very unconscious forces that

sustain it.12 Where the rationalist ego used to rule, the unconscious id is the subject to come.

II. THE HEGELIAN LEGACY

There is no mistaking the persistence of Hegel's influence in Lacan's thought.13 The Hegelian legacy within psychoanalysis rests on a number of interlocked concepts that constitute the core of the psychoanalytic theory of desire. We could sum them up by saying that it concentrates on desire as lack. This entails a negative notion of the mechanisms of desire, which is oppositional in the sense that it works by binary polarizations, be it masculine/feminine, young/old, active/passive, black/white, or whatever. This binary model of thinking moreover fuels an oppositional logic of confrontation that de facto establishes a hierarchical relationship between the terms involved in the dyad. Thus, we have simultaneously a theory about the mutual attraction of the sexual opposites and of their complementarity: we desire the sexual other because through that otherness fulfillment can be reached. Opposites therefore attract and fulfill each other, but also struggle to the bitter end for the upper hand in asserting the terms of their desire. This oppositional view supports the Hegelian dialectics of consciousness and inscribes it as the core of unconscious life. Hence Lacan's claim that “I is another,”14 which both indicates the relation of the ego to the unconscious and demonstrates his Hegelianism. The corollary of this conceptual move is that the point of desire is posited as the suppression of the longing for the object that had triggered it in the first place: the drive gets fulfilled by reaching its aim. This entropic theory of desire is central to Freud's theory of the death drive and it inscribes a logic of loss and self-extinction at the heart of the subject. Thinkers such as Georges Bataille15 and Maurice Blanchot will subsequently explore this paradox further, in a philosophy of excess and boundary-transgression that captures perfectly the entropy of desire and its bond to death.16

12. That Lacan has reason to come to this conclusion is evidenced by Sartre's rejection of the unconscious in his famous discussion of Bad Faith in chapter 2 of Being and Nothingness.
13. Lacan attended, and was influenced by, Alexandre Kojève's lectures on Hegel at the École Pratique des Haute Études, which ran from 1933 to 1939.
*15. For a discussion of Bataille, see the essay by Peter Tracy Connor in The History of Continental Philosophy: Volume 5.
16. The degree to which an exploration of the logic of excess and transgression runs throughout their writings explains, in part, the affinity Foucault felt toward the work of both Bataille and Blanchot.
The second element of Hegel’s philosophy to enter this discussion, notably through Lacan’s complex relationship to the French Hegelians—and especially Alexandre Kojève—is the isomorphism between psychic and social life. This assumes that the structures of the individual psyche are structurally infused by the same forces as the social effects that constitute the social order and regulate its functions. These involve the deployment of desire as lack and hence they locate an oppositional logic at the core of the contractual system that constitutes the social order. There is consequently a Hegelian legacy in the emphasis that is placed on structural violence as one of the forces that fuels the constitution of the social system. Central to this structural violence is the sacrificial ontology that positions the bodies of women as the object of exchange among warring males and hence as the holders of the keys to social peace. The metapsychological phase of Freud’s work is central to this aspect of a social theory that stresses the productive nature of violence and hence also its inevitability. Psychoanalysis radicalizes the Hegelian dialectical scheme by gendering it: the violence accomplished by the primitive horde against the archaic father is masculine, whereas the pacifying eroticized bodies that seal the social contract are female. A sacrificial ontology is consequently discovered at the heart of the social contract, which founds political authority on ritualized violence, symbolic murder, and interiorized guilt. This political economy of violence also instills the need for mourning and melancholia as binding factors in a community fraught with internal psychic fractures. Both the emphasis on hostility and violence and the sexualization of the opposition are crucial elements in the political theory of intersubjectivity introduced by psychoanalysis.

19. The persistence of this Hegelian legacy in the political theory of psychoanalysis can be detected today in the thought of post-Lacanian thinkers such as Slavoj Žižek, who implements Lacanian views of the signifier in studies of cultural production and the power of transference as a factor in social formations. The ethical philosophy of less belligerent psychoanalytic philosophers such as Étienne Balibar contest the negativity of this legacy when he refers to the social repercussions of unconscious processes in terms of “the other scene” of the political; see Étienne Balibar, Politics and the Other Scene (London: Verso, 2002). The limitations and flawed nature of the logic of sacrifice in Freud’s thought is central to the social...
As Lacan’s thought and practice became more authoritarian with the passing of time – witness the expulsion of Irigaray in 1974 from the school Lacan founded and directed and later the careful selection and editing of his seminars by his heir and son-in-law Jacques Alain-Miller – the resistance to his methods grew even in France, where Lacan himself enjoyed star status.20 Michel Foucault’s early work on the history of sexuality can be read as an oblique but consistent critique of the Lacanian premises that desire in our culture has to be subjected to the Law of the Father or master signifier. Foucault’s attempt to think sexuality outside the dominion of the Phallus, and outside the domain of Hegel, results in a renewed emphasis on the importance of pleasure – rather than desire.21 It also produced the radical moment in Foucault’s thought – his call for making an end to the sovereignty of sexuality and for debunking the notion that there can be such a thing as sexual liberation by the minorities: women, gays, and other “deviants.” This anti-sex liberation moment of Foucault’s thought – which included a critique of the Frankfurt School’s emphasis on the theory of repression – was partially obscured in the transatlantic appropriation of Foucault’s work as the inspiration for queer theory.22 More recently, however, this aspect has resurfaced23 and is casting an interesting new light on what can only be described as a perverse relationship between the Foucaultian project and the Lacanian corpus.

The most consistent and explicit philosophical critique of Lacan, and his underlying Hegelianism, is found in the work of Gilles Deleuze and Félix Guattari, who challenged both Lacan’s understanding of desire as lack, which designated the function of desire “as manque-à-être, a ‘want-to-be,’” and his theory of Giorgio Agamben (see Homo Sacer: Sovereign Power and Bare Life, Daniel Heller-Roazen [trans.] [Stanford, CA: Stanford University Press, 1998]), and also to Jean-Luc Nancy’s critique of Bataille’s re-elaborations of Freud, to which he opposes the binding force of love and friendship in The Inoperative Community, Peter Connor (ed.), Peter Connor et al. (trans.) (Minneapolis, MN: University of Minnesota Press, 1991).

21. See Michel Foucault, The History of Sexuality, Volume One: An Introduction, Robert Hurley (trans.) (New York: Vintage, 1980). See also Gilles Deleuze, “Desire and Pleasure,” Lysa Hochroth (trans.), in Two Regimes of Madness: Texts and Interviews 1975–1995, David Lapoujade (ed.) (New York: Semiotext(e), 2006). This “text” was actually a series of notes that Deleuze wrote in response to the publication of Foucault’s first volume of The History of Sexuality, which Deleuze asked François Ewald to deliver to Foucault, and in which he outlines his reasons for preferring the conceptual domain of desire over pleasure.

definition of psychoanalysis itself as being “engaged in the central lack in which the subject experiences himself as desire.”24 They put in its place an account of desire as productive that drew not on Hegel but on Spinoza’s conatus and Nietzsche’s will to power. Deleuze’s highly effective reframing of desire as plenitude in his own philosophy critiques the emphasis on the Phallus as a specific historical formation and aims to move beyond it.25 We will return to this below.

III. DERRIDA: DECONSTRUCTING THE MASTER SIGNIFIER

Of all the poststructuralists, Jacques Derrida is the one who entertains the longest and most fruitful dialogue with Lacanian psychoanalytic theory, in what can only be described as an intense and lifelong relationship to psychoanalysis.26 Derrida shares with his generation a deep-seated anti-Cartesianism, which by extension allows him to engage productively with the psychoanalytic criticism of rationalist assumptions in the exercise of philosophical reason. As a consequence, Derrida stresses quite subtly the proximity between the discourses of philosophy and psychoanalysis, as evidenced by their respective emphasis on the same kinds of human experience: desire, emotions, sexuality, life, death, suffering, and ethical relations with the world, culture, and society.

Although Derrida’s thought builds on the split subject introduced by psychoanalysis, he also operates a number of disjunctions. First, Derrida approaches the corpus of psychoanalytic texts as an archive in its own right.27 This removes

24. Jacques Lacan, The Four Fundamental Concepts of Psycho-analysis, Jacques-Alain Miller (ed.), Alan Sheridan (trans.) (New York: Norton, 1978), 29, 265. It is interesting to note that, for all their differences, Lacan’s position here is very close to Sartre’s, who was also influenced by Kojève’s interpretation of Hegel, and who identifies freedom, consciousness, and being-for-itself with desire as lack: “The for-itself is defined ontologically as the lack of being, and possibility belongs to the for-itself as that which it lacks … The for-itself chooses because it is lack; freedom is really synonymous with lack. Freedom is the concrete mode of being of the lack of being. … Fundamentally man is the desire to be, and the existence of this desire is not to be established by an empirical induction; it is the result of an a priori description of the being of the for-itself, since desire is a lack and since the for-itself is the being which is to itself its own lack of being” (Jean-Paul Sartre, Being and Nothingness, Hazel E. Barnes [trans.] [New York: Philosophical Library, 1956], 565).
25. Foucault was similarly, and explicitly, critical of institutionalized psychiatry and psychoanalysis. Like Deleuze, Foucault was heavily influenced by Nietzsche (who influenced Freud as well), and while he adhered to a (post)structuralism that was familiar with the Lacanian extension of signification to the subject, he sought to complicate, rather than contradict, it.
any sense of orthodoxy from his readings of these texts. This is significant for its implied criticism of the semi-sacred aura acquired by Lacan and the religious zeal with which his texts were received at the time. Derrida questions the very structure of the psychoanalytic archives and deconstructs it accordingly.

Second, Derrida stresses that the differences between psychoanalysis and philosophy are just as significant as their similarities: they run parallel to each other, one laboring under the rule of consciousness while the other is devoted to the interpretations of the unconscious. The meeting point between the two concerns the epistemological structure of what we could call “rational scientific knowledge” – phallogocentrism – and its limitations. Phallogocentrism designates the dominant image of the subject that, according to Derrida, equates Being with, but also doubles it up into, thought as the self-representation of mastery.28 Experiencing the self as coinciding with reason, power, and presence is the phallic delusion Derrida will labor all his life to dispel. Derrida takes the linguistic structure of the unconscious (following Lacan’s interpretation of Saussure) to mean that the textual instance is isomorphic with psychic processes. This is not to be confused with the intentional fallacy; the author’s psyche is not the point, but the structure of the sign and its psychic traces are. Derrida’s point is that philosophy is better equipped conceptually to pursue the critical analysis of the isomorphic relationship between the psychic and the social than is psychoanalysis. In other words, philosophy has the means both to critique the power effects of the phallogocentric hold over our psychic and social landscapes and to undo that hold by revealing its limitations.

The primary point of contention between Derrida and Lacan is the primacy of the Phallus and its productive role as master signifier, which is to say, ultimately, the psychic groundings for power formations themselves and the accompanying links between desire and power. Contrary to Lacan, Derrida is skeptical about the logical or moral necessity – let alone the credibility – of a master signifier or privileged term of reference. He sees in this a repetition of the transcendental arrogance of philosophy, that is, the existence of a transcendental point of origin that would somehow organize and govern the process of signification. According to Derrida this idea contradicts the basic Saussurean insight that all signifiers acquire a meaning in their differential relation to other signifiers. This “flat,” or nonhierarchical ontology clashes with the phallogocentric transcendence at work in Lacan’s thought.

A major point of convergence between Derrida’s deconstructive method and the psychoanalytic debunking of rationalistic presumptions is the structural role played by otherness in the constitution of the self. In this regard, Derrida engages

with some of the key concepts of psychoanalysis, for instance the primacy of transference, countertransference, and resistance in the psychoanalytic relationship. Derrida differs from Hegel, however, less on the emphasis he places on the importance of the other/otherness in the constitution of the subject, than on the apology of violence that is implicit in Hegel and explicitly rejected in Derrida’s work.\textsuperscript{29} Rejecting binary oppositions – starting from the false opposition between consciousness and the unconscious – means for Derrida recognizing the radical alterity of the self as an open and process-oriented entity and hence also the subject’s debt to the structural presence of others. This dependence on a structurally necessary other leads Derrida to assert also the elusive and incommensurable, but also positive structure of this other.\textsuperscript{30} This theme becomes central in Derrida’s later work and will be developed in his cosmopolitan ethics, in a constructive dialogue with both Freud and Levinas. Thus the point of convergence between Derrida and psychoanalysis – the ethics of otherness – also leads to a significant divergence about the possibility of ever reaching a genuinely ethical relation to others. And this, in turn, reveals that Derrida’s relation to psychoanalytic theory is deeply political.

In a recent assessment of Derrida’s legacy for psychoanalysis, Réné Major emphasizes the importance of his work on political subjectivity and cosmopolitan citizenship as an extension of the ethical position he articulates in, among other places, \textit{The Other Heading}, \textit{On Cosmopolitanism and Forgiveness}, and \textit{Monolingualism of the Other}.\textsuperscript{31} Major is also careful, however, to stress the enduring resistance that Derrida’s philosophy offers against any Kantian restoration of a moral universal. The instance of the unconscious, on the contrary, allows deconstructive philosophy to challenge the metaphysics of presence at all levels. This means that any presence is but a process of residual traces and that all appeal to a fixed origin is structurally delayed. This hiatus or deferred action is originary and it implies that everything begins in rewriting, in duplication, citation, and repetition. For both psychoanalysis and for deconstructive philosophy, Major argues, this duplication of traces without originals destabilizes the logocentric pretensions of sovereign reason without, however, falling into its dialectical opposite. It simply installs a new political economy of meaning in iterability, repetition, and a structural debt to otherness. The political force of deconstruction lies precisely in its critique of both the transcendentalism of the

philosophical subject and the coercive power of a Logos that functions through assignations to a subject position, a proper noun, and a steady place.

The Phallus as Law then emerges as an explicit concern for Derrida, whereas it was implicit in previous psychoanalytic debates. Derrida's critique of the transcendent claims of the Law and of its structural violence is part of this debate: he stresses both the violence and basic irrationality of the Law – with reference to Walter Benjamin – but also its resolute and non-negotiable presence. This position can be described as hysterical because it simultaneously asserts and denies the presence of the crucial instance of Phallic power – erasing with one hand what it is writing with the other. This position, which oscillates between recognition and disavowal, draws Derrida closer to the question of the feminine as the trace of writing as the simultaneous – and hence hysterical – assertion and disavowal of the power of the master signifier. Thus, Derrida takes from Lacanian psychoanalysis the emphasis on the feminine and on sexual difference, but he radicalizes them both.

The question of the feminine is endemic to psychoanalysis and it touches on the question of its very legitimacy as discourse. The indefinable nature of the feminine – its lack of frame, form, and focus – raises the question of the possibility of its representation, that is to say, of writing. Lacan opts to solve the problem by confining the feminine to symbolic absence and hence to unrepresentability within the Phallic symbolic system. Derrida, on the other hand, argues that the centrality of a master signifier/the Phallus allows for sexual difference to be conceptualized not as a symbolic absence, but rather as différence, that is to say, as incommensurably different, but in nonbiological terms. The feminine as the effect of a Law of signification that privileges the Phallus and the Logos as operators of meaning paves the way for active deconstruction of the master discourse itself. A woman is, in other words and pace Lacan, something other than either the dialectical opposite of a man or that for which there is no possible symbolic representation. She is other, in the full positivity of that radical otherness.

The position of the feminine is a crucial concept in Derrida's work: it is the location of a fundamental erasure or structural hiatus, in relation to the Phallic illusion of presence, without which there can be no thought and no production of meaning. The discursive strategy proposed by Derrida's deconstruction is to retrace the steps of this erasure in the texts and systems of thought, which

34. See, for example, Jacques Derrida, Positions, Alan Bass (trans.) (Chicago, IL: University of Chicago Press, 1981); Spurs: Nietzsche's Styles, Barbara Harlow (trans.) (Chicago, IL: University
results in a process of writing as resistance against the gravitational pull of the Phallic master signifier. Thus, the feminine as différance is the site of fundamental destructuring without which no affirmative politics is possible. It consequently is also the precondition for a nondespotistic and antitotalitarian theory and practice of political agency. In this respect, Derrida emerges as one of the sources of inspiration for the feminism of sexual difference and especially for the movement known as écriture féminine.35 Best expressed by Hélène Cixous and Luce Irigaray, this radical movement encourages writing as an experimental method to recover the traces of those subject positions for which there is no adequate representation within the Phallic master signifier.36 The central position granted to sexual difference and différance as a constitutive element for the constitution of the subject and the antiessentialist reading of difference are the key contribution of Derrida to feminist thought.37 And, as should now be clear, this Derridean contribution comes directly through his critical engagement with Freud, Lacan, and psychoanalysis.

IV. FEMINISM AND PSYCHOANALYSIS

Feminist theory provides one of the most productive sites and testing grounds for discussing and assessing the basic tenets of psychoanalysis and its relationship to critical thought. In Freud’s time, the problematic of the centrality of the paternal metaphor to the constitution of the social field led to disagreements about whether the libido is one, and masculine, in both sexes – also known as the penis-centered theory of psychic development – or whether there is sexual difference at the unconscious level. The latter results in the hypothesis of the specificity of both female libidinal development and hence of feminine sexuality, which challenges Freud’s patriarchal assumptions about the psychic consequences of the anatomical differences between the sexes.38

This was a point of vehement debate in the first psychoanalytic society among Freud’s early followers such as Karen Horney, Helene Deutsch, and Ernest

---

Jones, who, not unlike Irigaray forty year later, championed the cause of the specificity of female libidinal and psychic structures. Since those early debates, feminist psychoanalytic thinkers in Britain and the United States have picked up on psychoanalytic theories of various stripes: not only Freud and Lacan, but also Self Psychology (based on the work of Heinz Kohut [1913–81]), and the affect theory of Sylvan Tomkins (1911–91) have all received serious attention from, among others, Juliet Mitchell, Nancy Chodorow, Elizabeth Grosz, Teresa Brennan, Jessica Benjamin, and Judith Butler. In France, center stage is taken by Irigaray’s work, to which we will return.

The main themes that feminist philosophers took from psychoanalysis can be organized around the following cluster of ideas. The first is a renewed emphasis on “embodiment” in the sense of a postphenomenological understanding of the intelligence of the flesh. This idea, also rendered by terms such as “morphology,” positions embodiment as a process, not an essence, which links nature and culture in a new creative manner that contests both biological determinism and naive social constructivism. Psychoanalysis, through its theory of desire, allows for a process-oriented ontology of the body, which in turn redefines the terms of

39. Karen Horney (1885–1952) was born and educated in Germany, before relocating to the United States in 1930. A strong critic of the Freudian notion of penis envy, she was the first psychoanalyst to publicly criticize the psychoanalytic account of female psychological development. She remains highly regarded for her theory of neurosis and her pioneering work in feminine psychology.

Helene Deutsch (1884–1982) was the first psychoanalyst to specialize in women, and her Psychoanalysis of the Sexual Functions of Women (1925) was the first book by a psychoanalyst on women’s psychology. Born in Poland, she worked closely and remained close with Freud from 1916 to 1935, when she emigrated to the United States.

Ernest Jones (1879–1958), the first English-language psychoanalyst, worked closely with Freud from 1908 until Freud’s death in 1939. In addition to being Freud’s official biographer, Jones played a crucial role in the establishment of the American Psychoanalytic Association in 1911 and the British Psychoanalytical Society in 1919. He shared with Karen Horney the critique of Freud’s view that female sexuality was dependent on women’s recognition of their “inferior body” and, thus, derivative on male sexuality.

the relation to memory, cross-generational transmission, and other unconscious productions.

The second crucial cluster of ideas is related to the theory of desire outlined above and the extent to which that dialectical vision renews our understanding of power relations and of their productive function in psychic life and interpersonal relations. Feminists are quick to point out the unbalanced symbolic burden carried by both sexes in the constitution of the social field. More specifically, the role of the female body in the sacrificial ontology that founds the patriarchal social system through the primordial murder of the father becomes the focus of intense debates. Loyal to the isomorphic relation between the social and the psychic, feminists have also pointed out the prize women play in the ideology of love, the patriarchal structure of the family, and their symbolic absence from the phallocentric symbolic system. This has generated a rich debate \(^{41}\) on the structural role of violence in erotic fantasy and social life and on the enormous importance of heterosexual normativity as the implementation of a phallocentric social and symbolic contract that sacrifices the bodies of women on the altar of transcendental masculinity.

The third central cluster of ideas concerns the role of unconscious identifications, dominated by the phallocentric symbolic, in the constitution of identity. The notion of imaginary interpellations and their role in constructing the subject are important, but also highly contested. The instance of the unconscious as a structural element in political subjectivity is central to the feminist debates about sexed identities, alternative sexuality, homosexual, lesbian, and queer theories. \(^{42}\) The philosophical idea they relay is that political change and transformation requires shifts on the deep structures of the self and these cannot be activated by the standard mechanisms and protocols of political life. Another politics is required: one that activates affects and undoes or at least unveils unconscious formations.

Psychoanalytic feminism claims the importance of a theory of the subject to hold together the complex and internally contradictory structures of the self as a social and symbolic entity structured by unconscious processes. \(^{43}\) Social

\(^{42}\) For a further discussion of this issue, see the essay by Gayle Salamon in *The History of Continental Philosophy: Volume 8*.

instances and psychic processes need to be activated together for lasting changes to be enacted in the sexual and psychic life of human beings. This creates the need for a methodology based on psychoanalytic techniques of careful and staged repetition; choreographed re-enactments; positive deconstructions; and visionary blueprints for empowering alternatives.

One of the most influential schools of feminist psychoanalysis, however, does not pay any allegiance to Lacan, but rather refers to both Melanie Klein and the British school of Donald Winnicott.44 “Object relations theory,” as it is known, stresses the importance of the relationship to the mother and hence also of the maternal imaginary in the constitution of the subject. Focusing for instance on the primacy of the breast, object relations theory both emphasizes the specificity of female morphology and criticizes in Freud the penis-centered theory of human development. The focus on the mother–child/mouth–breast relation, which also proves influential for Deleuze and Guattari, casts a different light on the negative political economy that is central to Freud’s later thought. Klein stresses both the relevance of envy and psychological negativity to the process of human development, and also the potential for positivity through the pursuit of gratitude or the acceptance of melancholia as a productive mode of relation to the former object of love.

The popularity of object relations theory among feminists, as testified by the influence of the work of Chodorow and Jessica Benjamin, among others,45 is due to a number of factors that stress the need for more philosophical reflection. The first factor is that object relations theory suits the aims and the logic of social constructivist thought. Without falling into a sociological reduction of unconscious processes, this theory nonetheless offers dynamic possibilities for active interaction between social processes of change, for instance in labor relations, but also in models of parenting and alternative family structures, and the psychic life of individuals. Chodorow, for instance, is firm in arguing that different forms of child-caring and parenting by men will necessarily change

44. Melanie Klein (1882–1960) was born in Vienna, studied with Karl Abraham in Berlin, and was invited by Ernest Jones to London, where she worked from 1927 until her death. Klein was perhaps the first analyst to use traditional psychoanalytic techniques with young children. One of the innovators of “object relations theory,” she was and remains a significant influence on psychoanalytic technique and theory, especially in Great Britain.

Donald W. Winnicott (1896–1971) was born in Plymouth, England. A pediatrician and psychiatrist, he was trained in psychoanalysis by, among others, James Strachey and Klein. Focusing on infant and family therapy (among his key ideas are the “good-enough mother” and the “transitional object”), he was a major influence in the development of object relations theory and also an important influence on the “Middle Group” (today the “Independent Group”) of the British Psycho-Analytic Society, which developed as an alternative to the competing factions in the 1940s associated with Anna Freud and Klein.

both gender relations in society and the psychological models of masculinity. This profound optimism about history’s capacity to alter the patterns of unconscious repetition stands in sharp contrast to Lacan’s psychic essentialism and to the pessimism with which he viewed the possibility of radical transformations.

A second, less conceptual factor to explain the success of object relations theory in general is the fact that it is very compatible with the culture of human management and coaching, which has become so prevalent in the postindustrial era. Less abstract than Lacanian psychoanalysis, and less seduced by high philosophical concepts, object relations theory is a very applicable method of restructuring intersubjectivity and reframing violence and aggression. As such it plays a large role in epistemology (Fox Keller and Harding),46 in ethics (Benjamin), and in policy-making on gender equality and gender mainstreaming for politics and development.

While the preceding paragraphs indicate that feminist theorists have looked for resources in several different approaches within psychoanalysis, in the feminist debate between psychoanalysis and philosophy, the agenda has been set by the Lacanians. Foremost among them is Irigaray,47 who takes on Lacan’s indictment of the feminine as symbolic absence and turns it into a discursive and political strategy. She adopts as her starting premise the notion that the feminine as jouissance exceeds representation and that it is an act of Phallic violence to construct this generative force as a lack or a symbolic absence. The feminine falls outside the political economy of utterability in the Phallic system because of her too-much-ness, not because of lack: the problem is her infinite multiplicity, not her silence. Thus, precisely because of her capacity to evoke the necessary grain of unsaid or unspeakable presence, the feminine is for Irigaray the essential premise for the elaboration of alternative symbolic forms of representation.

Irigaray attempts to inscribe the feminine via psychoanalysis into philosophy, by a double strategy: first, not unlike Derrida, she detects the traces of the feminine, in texts and systems of thought, as the site of resistance to the power of the master signifier. Second, and unlike anyone else, she firmly attaches these explorations of the feminine to the lived existence and the embodied experience of women: individual entities embodied female and socialized as such. This strategic form of essentialism is crucial to Irigaray’s political project of exploring and creating alternative ways of expressing that which the Phallo-logocentric system has reduced to silence and represented as necessarily absent or silent. It is also the central concept in Irigaray’s feminist politics of sexual difference as

*47. Irigaray’s work is also dealt with elsewhere in this volume; see the essay by Mary Beth Mader.
the enterprise that aims at revolutionizing difference from within and at forcing social recognition of that which is given as devalued, or absent.\footnote{48}

In the earlier phase of her work, Irigaray defends sexual difference as the principle of non-one,\footnote{49} which aims at stressing the asymmetrical relationship between the two poles of sexual difference – the feminine and the masculine – and hence also their irreversibility. This results, as mentioned above, in a critique of the very conceptual premises of equality-thinking as a reactive and noncreative simulation of the dominant subject position. Whereas the early Irigaray is a thinker of complexity and openendedness, her later work evolves more in the direction of explorations with ways of empowering and enacting the metaphysical primacy of the heterosexual “Two”: two sexually opposed others united in equality at a profound ontological level. This project aims at redesigning a radical heterosexual politics that would be based on the symbolic equivalence of the two sexes and would reconstruct the world on this radical basis. In her first phase, the challenge is how to express the feminine of women – also known as “the other of the other”; in the second phase of Irigaray’s work,\footnote{50} the emphasis falls rather on the utopia of a heterosexual contract that would bypass and circumvent the sacrificial ontology of phallo-logocentrism and the symbolic elimination of the feminine that it entails. The conceptual backbone of Irigaray’s formidable \textit{oeuvre} remains sexual difference as a political project that aims at empowering the virtual potential contained in subjects sociosymbolically constructed as marginal.

This radical reading of Lacan contrasts sharply with the far more orthodox approach to Lacanian psychoanalysis in the work of Julia Kristeva, who unites the semiotic philosophy of language with the psychoanalytic view of the formation of the subject in language. Influenced also by Roland Barthes, Kristeva is very faithful to Lacan’s conceptual premises, but has produced her own account of how thought, affect, and representation come together in the making of the

49. See Braidotti, \textit{Metamorphoses}, esp. 46–7.

subject. While upholding the Lacanian scheme of the sovereignty of a trans- scendent Phallic master signifier, Kristeva manages nonetheless to highlight the specific features of the feminine.

The specificity of the feminine is linked to the maternal in several ways: first, because the preoedipal relationship to the mother is precisely what escapes capture by the sovereign master signifier. Kristeva’s emphasis on the “semi- otic” position can be seen not as the dialectical opposition to the power of the symbolic, but as the trace of the impossibility of a complete closure of the subject within the phallic signifier. The “chora” indicates for Kristeva the acoustic and prelinguistic traces of our originary belonging to a material maternal body. The maternal is both foundational and liminal at the same time, in that it traces the structural openness of the subject.\(^51\)

Second, this is linked to the idea of the maternal as abjection,\(^52\) that is to say, a structural organizing principle that marks the boundaries of representation and thinkability. The maternal is situated in a boundary-zone between life and death, time and space, being and becoming. In some ways it is the location where the fullness of meaning of these dichotomous concepts implodes and they get to coexist in uncomfortable proximity. This is a more helpful and more feminist position than Lacan’s reduction of the feminine to symbolic absence and structural unrepresentability. Contrary to radical feminists like Irigaray, however, Kristeva is not aiming at a redefinition of the maternal as a sort of prototype of alternative female subjectivity. She is satisfied with a humbler task, namely, that of reappraising the fundamental importance of the maternal. Like all traces, this fundamental bond is never fully lost but can rather be retrieved through the work of the poet and other creative spirits who escape total identification with the master signifier.

Striking a cautionary note that becomes more conservative in her later work, Kristeva is concerned by facile utopias that lead the subject to believe that she/he can just step out of the order of the symbolic law. Following the isomorphism between the psychic and the social dear to Lacan, Kristeva argues that the willful elements of many political ideologies are delusional and can be seen both as symptoms of psychosis and as the threat of social anarchy.\(^53\) This approach results in an interesting methodology in Kristeva’s later work: a sort of psycho-pathological mapping of social events and phenomena. Although this often

---

52. See Kristeva, *Powers of Horror*.

results in issuing strong warnings about the dangers of radical politics and deep social and psychic upheavals, it also brings to the fore significant insights about the processes of transformation themselves. This position is perfectly ethical for the practicing psychoanalyst that Kristeva has become, and it does justice to the resurgence of symptoms in our advanced societies also and especially among its radical elements.

This results in due course in significant social and cultural analyses of depression, mourning, and melancholia as aspects of the increasing friction between the psychic and the social in advanced capitalism.54 They are the price one must be prepared to pay for engaging in radical processes of resistance against the dominant norms. On the affirmative side, Kristeva also develops an original methodology to assess the specific contribution of more moderate women to culture in general and to philosophy in particular. This becomes evident in her trilogy about female genius55 and by the rather surprising rapprochement to the egalitarian politics of Beauvoir, which is surprising in light of the very radical positions originally taken by Kristeva on feminist politics in her Maoist youth,56 a position that had made her dismissive of all egalitarian politics.

Prolific as a writer and firmly established in the English-speaking academic world, Kristeva remains an influential thinker. The growing normative dimension of her work, however, which stresses the ethical component of the psychoanalytic experience and cautions against political change, shows clear signs of political conservatism. This is made explicit in her firm stand against the decline of the paternal metaphor, the crisis of the traditional family, and the rise of gay parenthood. This position, compounded by her increasing nationalism and anti-Islamic militant secularism, makes Kristeva’s approach to psychoanalysis problematic for many contemporary feminists.

V. DELEUZE AND GUATTARI, OR THE UNCONSCIOUS IN THE THIRD MILLENNIUM

The single most important conceptual critique of psychoanalysis in itself, and also in relation to the institutional and disciplinary practice of philosophy, is

elaborated by Deleuze and Guattari in a series of texts that constitute the most incisive contribution to the contemporary debate in this field. Taking their distance from the linguistic turn, the theoretical arrogance of the Lacanians, as well as the Hegelian legacy of their thought, Deleuze and Guattari enact a genuine conceptual return to Freud, Klein, and the early psychoanalytic insights. They do so by stressing the corporeal – rather than linguistically mediated – structure of the self; by disengaging the body from any suggestion of inert matter; and by attacking the notion of desire as lack. We shall refer to these respectively as: transcendental empiricism, nomadic embodiment, and the positivity of desire or “epistemophilia.”

As suggested above, Deleuze and Guattari take issue with the Hegelian legacy that highlights the structural function negativity plays in our psychic life. The Freudian theory of the libido harnessed the drives back on to a system that indexes desire on a dialectical structure of competing consciousnesses in the pursuit of recognition and their respective libidinal fulfillment. This admittedly does inscribe alterity – the structural presence of others – as a necessary and vital presence, but it also marks it as the limit or necessary threshold of negativity at the core of the desiring subject. This negative view of otherness and the dialectical struggle of competing consciousness – which Jessica Benjamin has articulated so eloquently as “the bonds of love” – produce insights into the rationality of domination and its ruthlessly logical function in the political economy of love and hate in the Western world. Central to this is the notion of the death drive, which Deleuze and Guattari analyze not only as a major concept in psychic life, but also as a political concept that explains the self-destructive logic of capitalism. Coherent in their pursuit of the isomorphism between the psychic and the social, but opposed to the dualistic logic of oppositions, Deleuze and Guattari turn to Spinoza’s philosophical monism in order to undo this constitutive violence.

The theory of the death drive has a number of important implications. The first is that the libidinal drive or energetic charge is neutral in terms of normative content: it merely marks a quantitative level of energy. The second is that the death drive functions by withholding or subtracting energy. It does not dispose of any libidinal energy of its own, but merely prevents, deviates, or defers the libido itself. Hence the need to bring in forms of mediation that account for that which becomes subjected to the negativity of the death drive. It is important to note, here, that the libido or life force is the one genuine vital force, whereas the death drive disposes of no energy of its own. The third implication is that of the entropic curve, or the idea that the function of desire is to fulfill itself and then get extinguished. The drives aim only at self-fulfillment, but paradoxically their

fulfillment means returning to the zero level of energy, that is to say, emptying out. This is consequently the primary definition of the death drive: returning to the zero degree of energy. Fourth is the emphasis on repression, denial, or psychic defense as a major category of human sexuality. The active desire is transposed by the subject into the fantasy of his/her being seduced. This shift from activity to passivity not only relinquishes the subject from his/her responsibility, but also prevents an adequate account of sexuality itself.

Deleuze and Guattari argue in *Anti-Oedipus* that while Freud “discovers” the productivity of the unconscious (and desire), his conservatism leads him to withdraw from the productive potential of this insight and trap desire in the Oedipal drama played out on a stage of representation, rather than playing out in terms of vital forces. Accordingly, confronted by the evidence that sexuality tends to be experienced as an invasion or a violation, as a disruption of the order guaranteed by the ego, that it aims at self-extinction by consuming the object of desire, Freud reinvests the model of rational consciousness as the organizing principle of order, unity, stability, and cohesion of the self. The theory of the drives is indexed on the centrality of the ego and the necessity of positing the authority of a willful subject. Deleuze and Guattari argue that we are confronted here by a lasting paradox: on the one hand, a notion of the libido as that which aims at its own death and, in opposition to it, the ego as that which longs for life and self-preservation. The paradox is that sexuality, which circulates through both, shares in the characteristics of the former rather than in the opaque stability of the latter. The implication is that the pleasure principle is not a vital, but rather a dissipative structure, a zero approximation machine that aims at shedding the very memory traces or ideational contents that it travels through. Sexuality is a perfect vampire, if you wish, or a viral infection that destroys the site that incubates it. Thanatos equals Eros via the flow of Libido.

Taking a stand against Freud’s and Lacan’s political conservatism, Deleuze and Guattari draw a very different set of conclusions from the psychoanalytic evidence that desire and death are tied together by a double knot in the Western psyche and its culture. Whereas Freud concludes from this the necessity of reasserting the biological organism as a necessary mediator, a store of energy ruled by the ego, Deleuze and Guattari resist both the humanizing affect and the humanistic influence of normative reason. They state that Freud downplays the far more forceful fact that this coagulation or stratification of forces that get bundled up as an organism, a self, an individual, or an ego, is merely a wrapper. The death drive is a principle of anti-life, a force that is both vital and dissipative, and that serves as the constitutive principle of libidinal circulation within the subject. In opposition to this dissipative force is the binding force, the libido, which, operated by the death drive, aims at reaching the state of pure movement discharging its affects as it goes, moving within the chain until it is
completely spent. Thus, the death principle that Freud says cannot be represented is relocated at the heart of the unconscious and hence of the subject, so as to become its most radical expression. By choosing to re-embrace standard morality, Freud leaves us a mixed legacy, because the “Life” that this morality venerates is in psychoanalytic terms the denial of the very libidinal force that is the source of the subject’s vitality. Deleuze and Guattari, on the other hand, reassert the primacy of “Life,” not as a logocentric “bios”-power, but rather as the raw force of “zoe,” the nonhuman or posthuman otherness that stands for the unassimilable outside of the human.58 Thus, a dynamic, nonessentialist form of vitalism comes to replace the mechanisms of the Freudian drives, the psychic essentialism of the Lacanian formulas, and their mutual Hegelian legacy.

The next step in Deleuze and Guattari’s argument is the shift of emphasis toward affirmation, which takes the form in A Thousand Plateaus of a switch to a Spinozist, rather than Freudian–Hegelian political ontology. Such a shift of paradigm means, among other things, that less emphasis is placed on dialectics of consciousness and more attention is paid to issues of relationality, processes of rhizomic interconnections, and an ethical project based on affirmation and the critique of the negative. The background to this shift is political: by the end of the second millennium in Europe, Freud’s metaphysics of death and desire, which inscribes loss and mourning at the heart of the human subject, came to be seen as a dated vision of the subject position and by extension of the shape of contemporary capitalism.59 Renewed stress is placed on the link that advanced capitalism has forged with hyperindividualism and the ego-indexed political economy of consumerism that goes with it. In different ways, political theory and cultural criticism turn their backs on the glory of the ego, the pathos of the ego, the obsession with “me, myself, and I” and hence also the binary “me–you/self–other/west and rest” that are constitutive of our social and symbolic space.

Contemporary thinkers echo Deleuze’s rhizomes and Guattari’s molecular politics in arguing for forms of social interaction by desiring subjects that are nomadic, not unitary; multirelational, not phallocentric; connective, not dialectical; simulated, not specular; affirmative, not melancholic; and relatively disengaged from a linguistically mediated system of signification. If we look at recent figurations of several major theorists and thinkers, they all attest to multilayered relationality: Negri’s multitudes; feminist critiques of scattered hegemonies by

Inderpal Grewal and Caren Kaplan; diasporic belongings by Avtar Brah; Donna Haraway’s cyborgs; Paul Gilroy’s conviviality; Jean-Luc Nancy’s hospitality; Butler’s queer subjectivity, and Braidotti’s nomadic subject.60 This shift of paradigm from classical psychoanalytic hermeneutics to more multilayered neomaterialist approaches, however, should not be allowed to obscure the relevance of psychoanalysis to contemporary concerns, but rather testify to its enduring legacy.

Contrary to the Hegelian tradition, alterity is no longer seen as a structural limit to the deployment of desire and hence to the constitution of the subject. It has rather become the condition of expression of affirmative, that is, nonreactive, alternative modes of desire. The other is, for Deleuze and Guattari, both a human and nonhuman threshold of transformative encounters.61 The “difference” expressed by subjects who are especially positioned as “other-than” – that is to say, always already different from – has a potential for transformative or creative becoming. This “difference” is not an essential given, but a project and a process that is ethically coded. This position in favor of the positivity of desire as complexity promotes consequently a triple shift. First, it emphasizes the radical ethics of transformation in opposition to the moral protocols of Kantian universalism. Second, it shifts the focus from unitary rationality-driven consciousness to a process ontology, that is to say, a vision of subjectivity propelled by affects and relations. And third, it disengages the emergence of the subject from the Hegelian logic of negation and attaches subjectivity to affirmative otherness – reciprocity as creation, not as the recognition of Sameness. This emphasis on affirmation, or the critique of the negative, results in affirmation as the politics of life itself, as “zoe,” or generative force.62

Thus, the Deleuzian critique of the transcendental fallacy of Lacan’s work brings psychoanalysis back to its more political edge. Desire is the driving force that constitutes the subject, in a constant process of social and symbolic negotiations with the dominant or majoritarian structures. Discourses about

61. See especially the chapter on “Becoming” in Gilles Deleuze and Félix Guattari, A Thousand Plateaus, Brian Massumi (trans.) (Minneapolis, MN: University of Minnesota Press, 1987).

affectivity, desire, and self–other relations are therefore positioned at the center of social theories about the social contract, the constitution of the social field, and the possible evolution of democracy. More importantly perhaps, by stressing a process ontology instead of a metaphysics of presence, nomadic philosophy develops the conceptual tools provided by psychoanalysis so as to help us refine our understanding of how power works through invisible *apparati* of capture/identification. It also renews our capacity for, and innovates our powers of, resistance accordingly.

**VI. CONCLUSION**

Squeezed between the trivialization of popular culture and the disdain of academia, the legacy of psychoanalysis remains a formidable historical and intellectual factor that continues to affect our understandings of the structures of subjectivity. The evidence is overwhelming to prove that mental distress, depression, stress, pathological behavior have not at all disappeared, but their symptoms have shifted. What sex-driven hysteria was in the nineteenth century, today is an epidemic of anorexia, bulimia, and other eating disorders mediated by visual culture.63 This points to the necessity of stating that the patient and rather humble task of coming to terms with the complexities of the unconscious processes and of connecting them to broader social phenomena contrasts with the hasty and often instrumental ways in which contemporary societies tend to deal with both psychic suffering and disorders and with issues of desire. Psychoanalytic insights can offer an alternative to the relief of psychopharmaceuticals on the one hand and the formidable advances of neurosciences on the other. They can also add both complexity and dignity to discussions about the structures and aims of desire as a fundamental human passion. The question of the lasting influence of psychoanalysis after the critical revisions brought on it by the poststructuralist and feminist generations and the refocusing they induced on some of the insights of psychoanalytic theory remains, therefore, high on the philosophical agenda.

---

The immediate, natural and necessary relationship of human being to human being is the relationship of man to woman. In this natural relationship of the sexes man's relationship to nature is immediately his relationship to man, and his relationship to man is immediately his relationship to nature, his own natural function. Thus, in this relationship is sensuously revealed and reduced to an observable fact how far for man his essence has become nature or nature has become man's human essence. Thus, from this relationship the whole cultural level of man can be judged.

(Karl Marx, Economic and Philosophical Manuscripts, 1844)¹

Luce Irigaray² is a French philosopher, linguist, psychoanalyst, activist, poet, and author of more than twenty books, many of which have been published in

---

1. Karl Marx, Karl Marx: Selected Writings, David McLellan (ed.) (Oxford: Oxford University Press, 1977), 88, emphasis added. The passage continues: “From the character of this relationship we can conclude how far man has become a species-being, a human being, and conceives of himself as such; the relationship of man to woman is the most natural relationship of human being to human being. Thus it shows how far the natural behavior of man has become human or how far the human essence has become his natural essence, how far his human nature has become nature for him. This relationship also shows how far the need of man has become a human need, how far his fellow men as men have become a need, how far in his most individual existence he is at the same time a communal being.”

2. Luce Irigaray (1930/1932?–; born in Blaton, Belgium) received a licence and Masters in philosophy from the University of Louvain (1954, 1955), a doctorat du troisième cycle in linguistics from Nanterre (1968), and a doctorat d’état in philosophy from the University of Paris VIII–Vincennes (1974). Her influences include Freud and Lacan, and she has held appointments
translation around the world. She is best known for her critique of the conceptual, practical, psychological, philosophical, spiritual, and political quasi-exclusion of women, and of things culturally coded as feminine, from the central institutions, customs, texts, and collective imagination of the canonical cultures of the West. Aside from this critique, her chief project has been to think out possibilities for the development of two sexuate cultures, and to craft proposals for specifically political innovations—in sexuate civil rights, for example—critical to the advent of a true culture of sexual difference. This aim reposes on the foundational charge that present cultures of the West are pseudo-heterosexual social orders. The claim is that they are essentially male monocultures that understand and imagine women and girls as deficient versions of a single human ideal, a standard that covertly is not neutral but is sexed and male. More precisely, thinking about the sexuate nature of human beings has only and always been carried out on the basis of a single sex that is allegedly already known: that of men and boys. Thinking of woman as identical, equal, complementary, opposite, or a declination of man is no better an approach. Instead of being a woman-being with a specificity, subjectivity, and identity of her own, woman has been thought only in relation to man. This means she has never been thought in true relation to man; strictly speaking, then, there is no *hetero*-sexuality unless there are first two *different* sexes to meet, exchange, and relate.

Irigaray does not employ the conceptual distinction between the terms “sex” and “gender” that is common to feminist and social thought in the anglophone world since the work of Margaret Mead. Her thought on the relation of culture and nature with respect to the question of sexual difference is rooted rather in the work of Hegel and Freud. Hers is the project of envisioning the spiritualization of the natural reality that is the sex dualism of the human species. In her view, to fail to cultivate this reality in thought and human culture is to let it founder in animality and to live in a false social order. A world democratic culture that respects many kinds of socially and politically salient differences must make the respect and cultivation of sexual difference its priority. On the basis of the lived phenomenological, ontological, genealogical, and relational realities of two sexed human kinds, a collective, ethical culture of sexual difference can be created, and two sexed subjectivities developed, for the first time in the history of Western societies.

---

3. Whether or not Irigaray would want to extend this charge to include non-Western cultures remains an open question, as she has almost entirely restricted her analysis to “Western cultures” and, more specifically, to “Europe.”
Irigaray’s writings are deeply and deliberately intertextual, addressing the thought of the chief figures of Western philosophy, psychoanalysis, anthropology, linguistics, political economy, and the tradition of philosophical reflection on Christianity. She treats these same thinkers and topics across the entirety of her corpus, although from changing angles and through different source texts. For these reasons, this chapter presents her thought in a thematic rather than chronological order. The chapter examines her views of the history of Western philosophy and of influential work in anthropological thought, psychoanalysis, deconstruction, philosophy of Christian modernity, feminist philosophy, and Levinasian ethics, as well as of individual figures from these traditions and movements: Aristotle, Marx, Feuerbach, Nietzsche, Freud, Heidegger, Lacan, Lévi-Strauss, Beauvoir, Levinas, and Derrida. The most important and influential aspect of her work, and our starting-point, is her thought on the history of Western philosophy.

I. IRIGARAY AND THE HISTORY OF WESTERN PHILOSOPHY

All our symbolic codes need to be reinterpreted as codes meant for the needs and desires of masculine subjects and for an economy of exchange among men.

(Luce Irigaray, “A Bridge Between Two Irreducible to Each Other”)4

Irigaray follows Heidegger in claiming that each age has a single, core philosophical question whose urgency demands an answer. For our age, Irigaray holds, this question is that of sexual difference. Sexual difference has been left to exposition by the empirical sciences despite the fact that it is an ontological question that requires answer, therefore, by philosophy and other nonempirical discourses. But it is not merely a question that demands a formulated reply. It is a query that requires a lived response, and above all, a collectively cultivated living rejoinder: it calls for the creation of a new culture, not for a set of true propositions or an abstract conceptual framework. Indeed, the gap between the theoretical and practical domains that structures much thought in the West is a result of the ethical and philosophical failures to think through and to create a culture of sexual difference.

Like Nietzsche and Heidegger, Irigaray offers a critique of the whole of Western philosophy. Her chief proposal, articulated in various ways in all of her many texts, is that the Western philosophical tradition is a reflective, speculative,

representational enterprise. Its ambition to seize all of reality in its reflective grasp ends in a great solipsistic oblivion of any authentic difference or alterity. True difference is never attained in such philosophical efforts, or difference is structurally occluded or excluded so as to create a kind of reflective knowledge. A project of reflecting the universe in thought ends up reflecting only the reflecting subject cut off from a supposed world of others.

Similar critiques of the various projects of representation found at the heart of Western philosophical efforts can be found in the works of Marx, Nietzsche, Heidegger, Levinas, Rorty, Deleuze, Derrida, Cixous, and many others. The distinction of Irigaray’s thought is to identify these homogenizing moves of Western philosophy, across the long shelf of its canonical texts, with the goals and desires of one human sex. Plenty of philosophers have noted the conceptual enclosure in which Western philosophy has trapped itself, but none before have identified that hermeticism as the product of a specifically sexuate will to power and knowledge. For Heidegger, the blind alleys of ontotheology and metaphysics are the outcome of a long and continuing forgetting of the meaning of being, as distinct from the availability of beings. Irigaray agrees with the language of oblivion, but provides alternate accounts of what is forgotten and of why this forgetting occurs. Her oft-repeated central charge is that Western philosophy rests on that which it excludes from its reflections – woman, nature, body, matter, and most importantly, sexual difference – but which, in its expelled status, serves as the sustaining condition for these reflections. Thus, the reason for Western philosophy’s failure to achieve a thought that goes beyond itself is that its fundamental motivation is to be man’s reflection. It is in fact achieving its aim, then: man’s wish to show himself to himself is a wish to show that he is purely of himself.

Here, Irigaray relies on a psychoanalytic framework. The psychoanalytic claim is that Western man truly seeks to be self-made. Continuing Aristotle’s valorization of self-sufficiency, the male subject in the West seeks to be the sole origin of himself, and the cultural productions of men in this tradition express an aversion to ontological dependency on a specifically sexuate other. Thus, the subject in the West is consolidated as such on a covertly sexuate basis. The subject as historical or genealogical receives its continuity and its integrity on the ground of a male monosexual reproductive order. Western projects of reproduction are projects of the reproduction of a uniquely male line of reason and being. They are most fundamentally the establishment of male identities through predation on a disavowed “feminine” matter. For Irigaray, this is a grave and perilous denial of the sexuate order of the natural and, therefore, of the human world. This denial requires countless torsions and distortions of reality: Western philosophy is a prime expression of this project of otherless male self-establishment. The sorts of femininity, womanhood, women’s identity,
feminine essence, or women’s spheres that are instituted by Western systems of thought are artifacts constructed for this reflective purpose of demonstrating to “Western man” his own self-sufficient, purely male origin. The tradition of femininity is a masculine creation that serves the psychic needs of “Western man.” “Woman” in this system is the repository of those human features that are feared, envied, or loathed by a fragile subject who cannot abide its dependency on a sexuate other, or on a capacious, surrounding, unmasterable natural environ.

Hence, it is not by chance that difference does not figure in Western philosophy; Western philosophy as it is structurally requires the founding denial and exclusion of sexual difference. How is this so? Is supposing that philosophy should address sexual difference like supposing that it should discuss a real but trivial or nonphilosophical phenomenon, something about which philosophy could and therefore should have nothing to say? Irigaray’s reply would be to specify the points at which the traditional terms and stakes of philosophy have precluded treatment of sexual difference in any sophisticated way. The foundational exclusion can be discerned in the basic ontological conceptions central to Western philosophy’s self-definition and self-delimitation in terms of its objects and matter. That is, its defining ontologies have not only described the objects of philosophy but in doing so have specified the proper reach of philosophy.

Chief among the pertinent ontological distinctions are those of universal and particular, matter and form, species and accident. Aristotle’s thought on these distinctions has prompted old and continuing debate. In De Interpretatione, Aristotle distinguishes universals from particulars. He explains that “man” is universal but “Callias” is particular. Typically, philosophy has taken its object to be the study of universals, according to Irigaray. She wishes to retain a notion of the universal but to limit it by another category, namely, that of sexed kind; in effect, she wishes to create a double universal. This would be a move inconsistent with Aristotle’s hylomorphic ontology, in which form consistently takes explanatory and causal precedence over matter. Aristotle makes this plain at many points, including in his discussion in Metaphysics of why female and male, although different and contraries, are not distinct species. His answer is that, like the paleness of a pale man, being a male or female animal is only a material and not a formal modification of the animal. “Matter,” he writes, “does not create a difference.” Hence, male and female are “modifications peculiar to ‘animal,’ … but in the matter, i.e., the body.”

the idea that being a sex must be an incidental or accidental modification of a species, and hence not an aspect of the human species that warrants more philosophical attention than that classification itself. Any philosopher who suspects that the distinction of sex in the human species may hold more as a subject for thought than this classification suggests must confront these powerful ontological categories. Irigaray’s thought challenges this ancient classification of sex as an incidental material difference, and the prioritization of form over matter, arguing at length that it leaves man severed from the natural world and from his own body. Derelict, he is invested in conceptions of these beings that warp and deform them precisely by compelling reality to assume form in order to ...

This logic of form’s priority is traced through the course of the history of Western philosophy. Irigaray argues that this preference for form, this morphologic, has meant that no sufficient ontology of fluids has been developed. The collective imagination of the West has granted full existence only to what appears as a solid form, as isomorphic with one erotic ideal of male sexuality. This means that the condition for the possibility of the appearance of solid form, namely, a fluid, accommodating medium or ground, against and in which the solid form stands out as such, is forgotten: air. The fluid elements remain unthought, even while they are necessary for any formal reality to exist and to appear. This critique is presented most extensively in Irigaray’s *The Forgetting of Air in Martin Heidegger*. Irigaray follows Heidegger’s meditation on the forgetting of being, the oblivion with which he charges the history of metaphysics, and appreciates his readings of Presocratic elemental philosophy. But she finds that even Heidegger’s later language of Being as a clearing or *Lichtung* does not achieve a fluid ontology of the nutritive elemental openness that she seeks. Instead, Heidegger uses metaphor to render air an ideal fluid. He does not acknowledge the elemental source for his naming of Being as clearing. Yet air has all the qualities he ascribes to the clearing, especially since it is an unobtrusive medium for the entry of all into presence and absence. Irigaray’s objection is ultimately about philosophy’s creation of various divisions: between material and ideal, sensible and transcendental, matter and form. After the split that creates mere materiality, its functions – to join, to permit belonging together, and to supply passage – are demoted or ignored. Irigaray’s appeal to the biological feature of mucous membranes, found throughout the body, evokes this facility to provide passage. It is the tribological properties of mucous membranes, rather than an abjecting Sartrean fascination with the viscous, that render them relevant to the development of an ontology of passage.

The Presocratic philosophers, although distant forbearers of modern science, did not make absolute distinctions between human, divine, and natural worlds. Irigaray finds their work fruitful sources, then, for her interest in reuniting the
split-off categories that emerge in the tradition thereafter. In particular, she examines the contemporary sciences from a perspective that differs greatly from the self-conceptions generally promulgated by scientific practitioners. But her training is not without its scientific components, including empirical work, if linguistics be classed as a science. In the collection of her linguistic works, To Speak is Never Neutral, the essay “In Science, Is the Subject Sexed?” takes aim at the professed sexuate neutrality and universal pretensions of psychoanalysis and of the physical, mathematical, biological, logical, and linguistic sciences. She questions the desires that move scientists, as well as the topics and solutions they propose. She wonders about the “imperialism without a subject” that characterizes political orders in which scientific results are used by political leaders but scientists themselves are anonymous participants in these uses. Irigaray can be said to be opposed to science only if science must by definition be incompatible with the preservation of the earth and the cultivation of subjectivity.

II. SEXED KIND

Irigaray argues for the development of “sexual identity,” or a “generic identity,” using the term genre sexué, which might also be translated as “sexed kind” or “sexuate kind.” She locates the ethical solutions to oppressive or violative extensions of subjective and unilaterally sexuate power at this level of “sexed kind.” It is belonging to a sexed kind, not simply being a subject of unlimited scope, or a human being among other human beings, that will allow a subject to conceive of itself as necessarily limited. A subject can escape autological hermeticism by belonging to a sexed kind, and since its sexed kind is one of two, it could never claim to be all of what it is to be human. I am precisely insufficient because I belong to this greater group of a sexed kind, and because in that generic identity, I can never embody human being in itself. This partiality is an ontological impasse on which limitations that make up the ethical modesty of the subject can be based. The sexed other is the real occasion for encountering an irreducible, free, mysterious subjectivity that is forever inassimilable by one’s own subjectivity. It is not, it should be added, that people of the same sexed kind are entirely reducible, unfree, or unmysterious in relation to each other. But comparing intrasexuate relations with relations between sexed kinds varies depending on whether we are considering contemporary ways that Irigaray critiques or her vision for those relations in an era of authentic sexual difference. For today’s men and women, such relations take place precisely without the benefits of nonpredatory generic identities. For Irigaray, there is no such thing, today, as a woman’s identity, created by women, but not modeled on a required set of necessary and sufficient conditions for womanhood. Nor is there
a non-monosexual version of male identity; what exists culturally for men and boys are reactive, phobic versions of masculinity that seek a fantastical world where women are only natural instruments for the housing of male bodies and desires, either as the servile mothers of sons or as the carnal homes for playing out a mechanical eros, an unconscious, unsublimated, uncultivated relation both to one’s body and to the body of others. In the imagination of this culture, then, there are no women, or men, since to be either, one must be in relation to a true sexuate other. Since women have been bowed to the demands of one sex’s need for sexual sameness, the culture has failed to collectively create the practices needed for meetings in love and respect between true sexuate others.

Although she calls for the cultivation of a people of women, or an “among-women,” this is an appeal to break with the models of identity, fraternity, sameness, and homogeneity that she thinks have customarily bound men in monosexuate, exclusionary solidarities. The species of solidarity that would purportedly obtain in a culture of sexual difference would differ from those presently operating on the bases of abstract imitation, resemblance, reproduction, or traditional laws of identity. Irigaray seeks a new notion of identity to supplant the version developed in the sexual monocultures to fend off the fact of sexuate difference. She lends special attention to the representations of female goddesses in Greek myth and tragic drama, especially where those depict mother–daughter relations, whose genealogical erasure in Western kinship systems she argues is pathological for women.

III. IRIGARAY AND ANTHROPOLOGICAL THOUGHT: LÉVI-strauss

In Lévi-Strauss’s account of kinship, sexuate difference is the fundamental opposition on the basis of which symbolization in a culture, and hence, a culture itself, can emerge. Relying primarily on interpretations of “primitive” societies, Lévi-Strauss famously argued that human culture is inaugurated by a system of

8. Nicole-Claude Mathieu, L’Anatomie politique (Paris: côté-femmes, 1991), 138 n.7, cites Nicole Loraux in “Sur la race des femmes et quelques-unes de ses tribus,” Arethusa 11(1/2) (1978), on the matter of women as a kind. According to Loraux, an ancient view of women as “a people, a gens, an ethnicity or a ‘race,’ and men as another (superior one)” (ibid., 44, my translation) can be found in Hesiod’s Theogony. The relevant Greek expression from this text is genos gynaikōn, the race, breed, people or kind of women – here, an accursed one. Mathieu claims that this is only one of many societies to class women and men as distinct peoples. Nowhere does Irigaray seek a return to this or any other ancient relation between men and women, or suppose that models from geographically and historically different cultures could be adopted in the cultures of the West.

symbolic exchange. The exogamous exchange of women between groups of men founds a culture and is one of its fundamental signifying activities. This idea of the exchange of women by men is Lévi-Strauss’s recasting of the incest taboo, which he contends fundamentally structures all societies. Instead of a prohibition on licit mating partners, as the language of “taboo” implies, the exchange of women is a positive injunction to a male member of a group to give women of his group – sister, cousin, daughter – to men of another social group.10 This takes place in a kinship system that tends to guarantee some sort of reciprocal giving of women, whether direct or indirect, immediate or deferred: hence, the language of “exchange.” The “synthetic” power of the bonds of alliance that women afford families or groups is the chief reason for the purportedly foundational value of women to “society.”11 Lévi-Strauss famously argues that unions of a man and woman are best regarded not as bonds between individuals but as alliances between the male givers of women in the families being joined. They are most essentially syntheses of male members of families; the important union is the groom’s linkage with his brothers-in-law and with other male relatives in the bride’s initial family.

In Sexes and Genealogies, Irigaray takes Lévi-Strauss at his word, matter-of-factly interpreting contemporary Western societies in the terms offered by his theory of “primitive” kinship. Irigaray’s analysis of the notion of the exchange of women makes explicit use of Marx’s concept of the general equivalent. In a process of the homogenization of economic objects under capitalism, a single commodity becomes the representative of all abstract labor, while it is excluded from circulating as a commodity itself; this is the function of money, the general equivalent. Irigaray notes that in the case of women-as-commodities, they have no value in themselves, but gain value because they can be exchanged among men, who compare them and regard them as equivalents. She suggests both that women as commodities can undergird a system of general equivalence, and that Lévi-Strauss’s theory of kinship implies that they serve as this noncirculating general equivalent measure for all other commodities. In “Commodities Among Themselves,” she contemplates the abandonment of markets that circulate objects according to a rule of general equivalence.12

10. “The prohibition of incest is less a rule prohibiting marriage with the mother, sister or daughter, than a rule obliging the mother, sister, or daughter to be given to others” (Claude Lévi-Strauss, The Elementary Structures of Kinship, Rodney Needham [ed.], James Harle Bell and John Richard von Sturmer [trans.] [Boston, MA: Beacon Press, 1969], 481).
11. “[T]he synthetic nature of the gift, i.e., that the agreed transfer of a valuable from one individual to another makes these individuals into partners, and adds a new quality to the valuable transferred” (ibid., 84).
Irigaray argues that kinship is the forgetting of sexed kind in the substitution of man for the species. By this she means (i) that the female sexed kind has been denied a nongenealogical identity and (ii) that it has been compelled to assume a genealogical identity that is bowed to the purposes of an emphatically male genealogy. Point (i) implies that relations between women who are not considered to be related genealogically have no cultural standing or representation. Point (ii) implies that women in the genealogical systems that she considers have only a punctual rather than a linear scope; each mother is the beginning and terminus of her “line.”

Further, she holds, sexed kind is subsumed into species, and more particularly into the sense of species as filiation, as distinct from its related sense of categorical, synchronic differentiation. She thinks that a people cannot be conceived without a prior conceptual elaboration of kind as sexed.13 If a people is defined as necessarily comprising a genealogical element, yet there is no recognition of sexual difference as a necessary component of that genealogical element, then a conceptual error and an ethical fault have taken place. Her view is that sexual difference is the self-perpetuating generative origin of the human sex dimorphism and, therefore, of human groups of individuals that are distinguished on the basis of this generative difference.14

IV. IRIGARAY AND PSYCHOANALYSIS: FREUD AND LACAN

Irigaray is a consistently and profoundly psychoanalytic thinker, a feature that has not prevented her from issuing critiques of psychoanalytic theory and prac-
Luce Irigaray

tics.\textsuperscript{15} Her most notorious assessment of the psychoanalytic record on the topic of sexual difference came in the 1974 work \textit{Speculum: De l’autre femme}. The English translation of this title, \textit{Speculum of the Other Woman}, might better read \textit{Speculum of the Woman Other} or \textit{Speculum of the Other as Woman}. The book’s sharp mockery of Freud and Lacan on the topic of female sexuality provoked Irigaray’s expulsion from a university post at the University of Paris VIII–Vincennes and a break with the \textit{École Freudienne}, the Lacanian school of psychoanalysis in which she had trained.

The book relentlessly questions the thought of Plato, Descartes, Freud, and Lacan, closely scrutinizing their own words, to bring out their roles in an allegedly specular project that reflects man the mirror-maker rather than an independent world. The creation of a mirror, a \textit{speculum mundi}, from beings treated as passive material – women, matter, elements, bodies, and the natural world – is identified at every turn in the texts examined. The title’s term, “speculum,” meaning that which pertains to a mirror, points to a complex of related senses. Irigaray argues that the thrust of man’s self-mirroring cultures has been to lend primacy to the visible and to prioritize the sense of vision over other senses, such as touch and hearing. This critique of the ocularcentrism of Western thought has its precedents in phenomenologists such as Merleau-Ponty and Levinas. But, following Derrida’s critique of the phallogocentrism of Western philosophy, Irigaray links this prioritization of vision to Freud’s emphasis on the visibility of male genitalia, and to Lacan’s account of the mirror stage\textsuperscript{16} as the period in which a child’s identity, language, and sociality emerge.

The influence of French philosopher Jacques Derrida’s practice of deconstruction on \textit{Speculum} is difficult to miss. This renowned strategy of reading texts is a generously skeptical immersion in a text that is directed by an extreme openness to the tensions between a text’s propositions and its implicit suppositions about those propositions. Language itself requires investment in unmasterable suppositions. Hence, any text can be read, and written about, so as to display the blind spots around which its propositions are organized; it will always contain discursive elements that must remain untreated by it. The relations between these untreated suppositions and the explicated propositions are the material for deconstructive readings. The renderings of the chief figures of the Western canon of thought offered in \textit{Speculum} are examples of deconstructive, psychoanalytic feminist readings.

\textsuperscript{15} Irigaray’s relation with psychoanalysis is also discussed in the essay by Rosi Braidotti and Alan D. Schrift in this volume. For a detailed discussion of Freud and his appropriation by continental philosophy in the twentieth century, see the essay by Adrian Johnston in \textit{The History of Continental Philosophy: Volume 3}.

\textsuperscript{16} Lacan’s mirror stage is discussed in the essay on Lacan by Ed Pluth in \textit{The History of Continental Philosophy: Volume 5}.
To make this textual blind spot appear is Irigaray’s task in “The Blind Spot of an Old Dream of Symmetry,” a chapter in *Speculum* on Freud’s essay “Femininity.” Freud’s formulation “The little girl is a little man” serves as neat summary of what Irigaray takes to be his psychology of sexual indifference. Again, Irigaray’s strategy is to take him at his word. Freud’s frustrated efforts to understand the specificity of female psychology and sexual development stem from an inability to conceive of a sexuate alterity that would not be reducible to or entirely translatable into a male set of experiences. Freud begins his account with boys and girls sharing a love object of the same sex, that is, a mother, only to struggle with how to account for the outcome of adult heterosexuality in women. Likewise, Freud supposes that children of two different sexes are autoerotically identical and then has the difficulty of explaining reproductive adult female eroticism. Moreover, Freud makes clear that as girls gradually come to the realization that relative to boys they are effectively castrated beings, their desire is to be genitally identical to males. Failing this transformation, they eventually seek to have children, who will psychologically substitute for the missing phallus that marks women as failed men. Irigaray exposes the numerous contradictions, reversals, and equivocations that Freud must include in order to retain the primacy of a phallic standard for sexuate identity and for eroticism. In particular, what must be repressed or omitted is the differential relation of boys and girls to their origin in the body of a mother. More precisely, Freud quite plainly judges the female version of this relation to be identical to that of the boy.

One of Irigaray’s foundational views is that these relations are not in fact identical. Rather, she claims, although children of both sexes have an existential puzzle to solve about their origins, their ways of resolving this puzzle must differ by sex. Girls, when they can grasp that they share a generative mode with their mothers, can emotionally settle the issue of their existential dependence on another for their being by envisioning their own potential future gestation, bearing, and birthing of a child. Boys, whose generative mode will not include gestation, bearing, and birthing a child, cannot solve this problem through such identification with the mother and anticipation of generating a child in the same way. Irigaray concludes that boys’ potential to beget a child cannot serve this purpose of putting to rest the antipathies raised by the realization of one’s existential dependence on a mother, and it is this differential relation to one’s dependence on a mother that grounds the differing relational identities that constitute

sexual difference. Boys have a much more difficult problem to solve than have girls, given that boys cannot rely on the resemblance of generational mode to mitigate their existential dependence on a being of another sex.

Irigaray alleges that the cultural achievements of male monocultures are failed and deluded strategies for resolving this puzzle. Efforts to enclose women in definitions that effectively create them as castrated beings, of inferior cognitive, creative, conceptual, logical, or rational faculties, are compensatory projects of sexuate resentment. Law and custom that restrict women to a domestic or private realm, or permit their circulation only as commodities, likewise seek reactively to enclose in reprisal the sex in whom all initially were held in body.

As with Freud, Irigaray takes Lacan at his word, considering that he expresses accurately the state of relations between men and women in his culture with his formulation: “There is no relationship between the sexes [Il n’y a pas de rapport sexuel].”¹⁹ This claim is part of a complex model of the relations of men and women worked out by Lacan first in the structuralist linguistic register and later in terms drawn from topology. In essence, he depicts a kind of structural deadlock of sexed subject positions that, as in Freud’s thought, implies that relations between men and women can never harmonize. Freud came to the conclusion that love relations between men and women would necessarily always be asynchronous, or out of phase, since heterosexual men pair with women who substitute for their mothers, their true love objects, while heterosexual women, thus, must be wives not to a substitute father but to a substitute son, that is, to a man whose primary identity is that of the son of a mother whom she must simulate. For Lacan, in the cultural imaginary that he exposes, men occupy the position of phallic, paternal lawgivers and have that power, whereas women occupy the position of the object desired by that power, and hence paradoxically show up its unacknowledged lack and fragility. As Slavoj Žižek writes: “Human sexuality is marked by an irreducible failure, sexual difference is the antagonism of the two sexual positions between which there is no common denominator.”²⁰ Irigaray follows Lacan’s topological idiom to show Lacan’s sexual indifference: the sexual relation as he conceives of it is doomed to fail since it is falsely dimensional. Like a Moebius strip or a Klein bottle, it manages to have fewer surfaces than it is

supposed to have.\textsuperscript{21} Irigaray rejects this dire scenario and locates the source of its dead ends in the philosophical presupposition that commonality is the necessary ground for desiring and ethical relations.

\section*{V. IRIGARAY AND THE DIVINE}

Irigaray draws on the work of Hegel, Feuerbach, Marx, Nietzsche, J. J. Bachofen, Mircea Eliade, and René Girard, among others, to argue that male monotheisms damage men and women, although in differing ways. The damage to men is that transcendence is always elsewhere, not in the sensible realm. Irigaray’s notion of the sensible-transcendental is a refusal of this split between an otherworldly, ideal, vertically transcendent and inhuman realm and a base, sensible realm to be overcome and surpassed in human achievement. “Sensible-transcendental” is a neologism that expresses this refusal but also implies the aim of re-fusing the separated realms that have placed the ideal of man’s telos beyond the sensible, material, and sexuate realm of embodied human life. But this transcendent male god has produced psychic benefits for human males. Echoing Feuerbach, Irigaray claims that to masculinize divinity is essentially to divinize masculinity. Hence, men and boys have a god made in their image, a divine horizon toward which to orient their earthly strivings.\textsuperscript{22} The monotheistic traditions she considers lack a female divine principle that might fill an analogous role of providing a divine ideal in the female mode.

Not only does Irigaray advocate the creation in the cultures she discusses of a mode of divinity that is female, but she proposes correction to the error of locating transcendence in an otherworldly beyond. This sort of transcendence is an escapist fantasy that can be corrected by attention to the inevitable, ubiquitous alterity of sexual difference: it is this horizontal transcendence between sexuate human beings here and now that ought to be the true site of transcendence. But orthodox interpretations of Christian texts in particular have specialized in denying the sexuate incarnation that marks human creatures. In \textit{Marine Lover: Of Friedrich Nietzsche} and other texts, Irigaray reads the Hebrew Bible and New Testament with an ear for the sensuous, embodied, carnal elements

\begin{footnote}
\textsuperscript{21} Irigaray also uses these topological phenomena to question the countability customarily applied to surfaces, and to question, along the lines of Bergson, Heidegger, and many others, both ancient and modern conceptions of homogeneous, denumerable, abstract space. In this use of the dimensional ambiguity of surfaces and spaces, she argues that distorting desires to enclose and entomb a maternal origin or its substitutes are the motive source for these questionable conceptions of space and place.

\end{footnote}
found in the meetings of divine and human presences. The strange and inhuman generations found in the creation story and in the story of the birth of Christ represent flights from the reality of the cooperation of male and female progenitors. These tales elevate paternal genealogies or debase the human, mortal origins of human beings. Of importance in them is the male creation of women (Eve), the paternal creation of sons (God’s paternity of Christ the son), the servitude of mothers of sons (Mary), virginal birth (God begets by Word, and Mary is a virgin), and the venerated, immortal mother (Mary does not die). None of this may suitably serve as the ideal for actual, mortal women, even or especially in their potentially maternal modes. The orthodox reception of these figures also tends to strictly identify being a woman with being a mother, an identification that Irigaray consistently opposes. The historical creation of genealogies in which generative power is so overwhelmingly male demands an explanation. Irigaray’s characteristic attempt at explanation is the psychoanalytic tale of relations differentiated by sex, on the basis of the allegedly different responses to being born of someone whose generative mode one shares, in the case of girls, or that one does not share, in the case of boys.

Irigaray also often gestures to an unarrived sort of divinity, one that would be mobile, unlocated, fundamentally open and enlivening, essentially linked to a natural order inherent in the cosmos, and celebrating and safeguarding the flourishing of the natural and human worlds. In Marine Lover, Christ, the god-man, divinizes carnality, the everyday with its rhythms, and the sociality of “living people” who share needs and desires.23 This divinity, so different from the sudden intrusion of the Greek gods, or the remote commands of a completed text, does not represent an “alien perfection.” Rather, “he is made flesh. Continues on in the flesh…. That can be affected by pathos – his own and that of others.” He is not the “master of truth or of morality” or the son obedient to a Father, but a mobile, multidimensional, ever-living, resurgent, body who is open and vulnerable. He is a loving becoming in the flesh, a version of the “Good News” of the incarnation that Christianity has repressed or forgotten. The “mania for All-Powerfulness” that creates orthodox conceptions of “man and the world” misses the idea that the divine desire to “dwell in the flesh” is the simplest of all of Christ’s messages.24 Nietzsche’s intimate and iconoclastic rereadings of Christian texts open the way for Irigaray’s own unfolding of such “simple” messages in these scriptural sources of Western self-understanding.

VI. IRIGARAY AND BEAUVOIR

The views of Irigaray and Simone de Beauvoir on how the sexes are two differ significantly.\textsuperscript{25} In fact, Irigaray describes her position on sexual difference as “in some way the inverse” of Beauvoir’s, even though she supports and admires Beauvoir’s efforts and successes in helping to institute liberal reforms in the area of economic and social justice and equality for women.\textsuperscript{26} Equality, however, is not a sufficient cultural goal for women, according to Irigaray, and to make it a goal constitutes a grave philosophical, ethical, and political error. Irigaray understands Beauvoir’s position so: Women have occupied the position of Other and man has made woman the Other. Women, however, are also complicit in their secondary status, which is a historically contingent status and can be changed. Escape from this subjection requires claiming the status of subject and emerging from the debased status of Other by becoming like the male subject. Assimilation to the male subject will eliminate the inferiority of woman indicated by the term “second” in the title \textit{The Second Sex}. There are no necessarily insurmountable barriers to that assimilation.

Irigaray understands the \textit{prima facie} liberating appeal of Beauvoir’s arguments, but she contends that the solution to the problem of women’s exploitation must take place \textit{in the terms of} that exploitation, namely, in terms of difference, not sameness. Comparing her views with those of Beauvoir, she writes: “Instead of refusing to be the other kind (l’autre genre), the other sex, what I ask is to be considered as really an other, irreducible to the masculine subject.”\textsuperscript{27} Irigaray rejects Beauvoir’s determination of woman’s sexual difference solely in relation to man, and her assessment of that difference as inferior. She claims that what is needed instead is an identification of woman’s sexual difference in relation to herself, and the cultivation of two irreducibly different sexed subjects. This sexual difference assumes the utmost priority for Irigaray, occupying for her the position that Heidegger reserves for ontological difference. She writes:

\begin{quote}
In order to get out of the all-powerful model of the one and the many, we must pass into the \textit{two}, a two that would not be one same repeated two times, nor one big one and one little one, but a two made of \textit{two} that are really different. The paradigm of this two is
\end{quote}

\begin{footnotesize}
\footnote{25. For further discussion of Beauvoir, see the essay by S. K. Keltner and Samuel J. Julian in \textit{The History of Continental Philosophy: Volume 4}, and the essay by Sara Heinämaa in this volume.}
\footnote{27. Irigaray, “La question de l’autre,” 40, my translation.}
\end{footnotesize}
found in sexual difference. Why there? Because it is there that two subjects exist who must not be situated in a hierarchical or genealogical relation, and because these two subjects have the task of preserving the human species and of developing its culture through respecting their differences.28

VII. IRIGARAY AND LEVINAS

Irigaray’s thought on those differences is deeply marked by Levinas’s ethics of alterity,29 his critique of Western philosophy’s traditional ranking of ontology over ethics, and his philosophical approach to the question of the divine. As explicated in Totality and Infinity, Levinas’s notion of the Other “as irreducibly and infinitely other” implies that alterity cannot be understood according to the categories of traditional Western ontology. A complete description of the relation of self and other would do violence to the alterity of both self and other. Self and other always exceed any theoretical attempt to grasp them, for the other is not an aspect of the self’s phenomenal field. “Western philosophy has most often been an ontology: a reduction of the other to the same by interposition of a middle and neutral term that ensures the comprehension of being.”30 Levinas opposes the notion of infinity to any effort to bring entities under the rule of the Same by means of a totalizing neutrality. While finite totalities are inherently violent, infinity precludes violence. It is the Other that is infinity, and hence, “absolutely limits my power.” The infinity of the Other is the origin of the ethical. In Levinas’s phenomenology of the advent of the ethical, the relation to the other is inescapably asymmetrical; ethics cannot be a matter of reciprocity, equilibrium, or equality based on sameness.

Irigaray addresses Levinas’s thought in Ethics of Sexual Difference and in “Questions to Emmanuel Levinas.”31 She clearly adopts the language of absolute alterity from Levinas, but predictably locates the crucial sort of alterity in sexual difference. Notably, Levinas cannot be charged with entirely overlooking the question of relations between men and women in his ethical philosophy. For this philosophy includes a depiction of erotic relations that gives a role to “the feminine.” Irigaray and others, including Derrida, will critique this account of

29. For a discussion of Levinas’s ethics, see the essays by Robert Eaglestone and Bruce Ellis Benson in The History of Continental Philosophy: Volume 7.
the feminine, arguing that Levinas reserves transcendence for the genealogical father–son relation while the erotic relation with the feminine implies a carnality that is always a “fundamental disorder” rather than a sensibility with potential for transcendence. Irigaray faults Levinas for depicting the sexual other as modeled always in terms of a male subject; when he attempts to discuss sexuality in terms of neutrality, it is always merely a masked masculinity. Moreover, the centrality of the father–son relation and the necessary detour through a paternal divine guarantor of human ethical life are questioned as, once again, blindly relying on the exclusion of women and girls from these relations.

But Irigaray wholeheartedly adopts the Levinasian approach to ethics by seeking an ethical limit to a potentially violent and invasive monadic ego. A constant in her work is the view that the cultivation of sexual difference is the necessary preventative to such ethical violation. Only sexual difference, she holds, can serve as the ubiquitous, invariant, insurmountable, and natural guard against the great and small imperialisms of which human beings have proven capable. Sexuate alterity is the inevitable human difference that issues the ethical command that, heeded, can open the way to our honoring all other forms of human differences that are the occasions of strife and oppressions today. Sexual difference in its futural, cultivated form is an absolute alterity, distinct from empirical or unsymbolized versions of natural sex difference.

VIII. IRIGARAY AND “FRENCH FEMINISM”

A number of works in philosophy produced by women in France have seen translation into English and attentive reception by anglophone academics. Among those whose writings have found early and regular dissemination in English are several quite different thinkers who have been classed together by some of their anglophone readership in a purely extranational grouping called “French Feminism.” Along with Julia Kristeva and Hélène Cixous, Irigaray is one of the thinkers to receive this classification. Yet, none of the three writers

33. Kristeva and Cixous are discussed in the essay by Sara Heinämaa in this volume.
resolutely claim the designation “feminist” for themselves or their work, and none were born in France, although all work in France and write in French. Moreover, in France, the term “French Feminism” does not refer to this triad of authors; if anything, it implies a host of activists, associations, editors, journals, and political figures that made up the general movement for the liberation of women that agitated for social and political change in the 1960s and 1970s. Or it brings to mind the influential work of Beauvoir, socialist and trade union feminists, or contemporary postcolonial feminists.

That such a grouping has been devised outside the French context is a problem if it is assumed by itself accurately to represent the chief trends in feminist thought and action in France. The variety of feminist thought in France is much greater than these three figures could represent. In addition, it is understandable that their work should have quite different receptions abroad than it has had at home, if one considers the differing intellectual and political contexts in which it has been read. All three authors employ or critique psychoanalytic thought, one of the reasons for which their approaches contrasted with the more empirical tendencies, or with work grounded in analytic philosophy of language, found in parallel anglophone feminist philosophy at the time of their initial importations. Their influences also include deconstruction, semiotics, phenomenology, the canonical figures of European philosophy at the time, especially German and French philosophers, and more broadly European linguists, anthropologists, historians, and literary authors.

Although all three address psychoanalysis and Western culture, generally, their positions differ significantly. Kristeva devises a psychoanalytic linguistic theory that seeks to rescue an ethics and a semiotics from traditional notions of maternity. For Kristeva, maternity must be partially reconceived to include the notion of a mother as a speaking social subject. She rejects a feminism that emphasizes sexual difference, such as Irigaray’s, since in her view it unacceptably risks sexual separatism and marginalization. Cixous is a prolific author of prize-winning novels and plays, as well as of more theoretical works that blur conventional genre classifications. Her emphasis on human psychic bisexuality accompanies her better-known proposals for the creation of an écriture féminine, an expression of female subjects’ experience that Western culture has suppressed. Thus, in comparison to Irigaray, the creation of a sexuate subjectivity, although part of Cixous’s aim, would take a different form for her, given the distribution of masculine and feminine traits across the sexes, an implication of her notion of bisexuality. They differ on many more points than these, but all maintain a constant engagement with the canonical figures and central problems of European thought. Their theoretical innovations are made

34. Irigaray was born in Belgium, Kristeva in Sliven, Bulgaria, and Cixous in Oran, Algeria.
alongside a fundamental allegiance to one or more starting-points set by that European tradition, whether it be psychoanalysis, deconstruction, or semiotics. Both the choice of allegiance and the degree to which these alliances are preserved are the targets of criticism from other feminists both in France and abroad.

**IX. IRIGARAY’S RECENT WORK**

Irigaray’s recent work advances specific political and cultural proposals for Europe. In *Democracy Begins Between Two*, she presents a vision of sexuate rights, democratic citizenship, secularism, and multiculturalism based on her notion of sexual difference. To harmonize the people of Europe, including arrivals from former European colonies, Irigaray suggests that a new civil status be crafted for a male–female couple that may be multicultural, multireligious, and multiracial. This couple would be secured by sexed civil rights, and its internal sexuate difference would be the basis for the protection and respect of its other possible differences of culture, religion, and race. The various forms of neutralizing and amalgamating traditional legal unions of male–female couples must be overcome by granting a specific sexed civil status to women and to men. *Between East and West* explores in a more poetic than political vein the relation of the breath to subjectivity, sensuality, perception, and sexuality. This work is inspired by the practice of yoga and by its understanding of the relation between mind and body, and between subject and nature. *I Love to You* experiments with the notion of a preserved interval of distance between two differently sexed subjects who love and respect each other precisely in virtue of that unbreachable gap. It offers a vision of dialogue between men and women that attends to their supposedly different ways of using language. Several of the later texts also emphasize the customary relation of women to the fertility of the natural world, and present this affinity as a feature of women’s history worth preserving, amplifying, and studying.

Luce Irigaray’s fearless and inventive philosophical voice resounds in social movements, and academia, as well as feminist, ecofeminist, psychoanalytic, political, religious, and aesthetic work around the globe. Critics of many sorts have found her vision startling, regressive, or imponderable while proponents find that she has cracked Western philosophy open to the failures that help compose it, and subjected it to a sexuate regard that it could not think existed.35

---

35. Irigaray is aware of resistances to her proposals. She writes: “Unfortunately, women are the first to say that woman does not exist and cannot do so. Which means that they refuse to accept a generic identity for the female. The denial eliminates the possibility of constituting
a culture of two sexes, two kinds. We remain in the horizon in which man is the model of human kind, and within this human kind, there are empirical women or natural entities without an identity of their own” (Luce Irigaray, I Love to You: Sketch for a Felicity within History, Alison Martin [trans.] [New York: Routledge, 1996], 65).
The concept of French feminism emerged in the USA and Britain in the 1970s when selections of the works of French theoreticians were translated into English. The writers included in this category are all feminists in the sense that they work to question traditional misogynistic conceptions of femininity and masculinity, women and men. They operate, however, with different theoretical and practical interests and within different disciplines: philosophy, psychoanalysis, linguistics, semiotics, literature, and history. The critical attacks of the French feminists are directed at the tradition of Western thinking and writing, at its androcentric concepts, metaphors, and questions, but these theorists also problematize the prevailing forms of feminist theory by historical and conceptual-critical inquiries.

The aim of this article is to clarify the concepts and methods that French feminist thinkers have used in analyzing, interpreting, and criticizing traditional philosophies of human existence and in developing new alternatives to these accounts. I will proceed in a systematic manner and study the central themes and arguments of three French feminist thinkers: Hélène Cixous, Julia Kristeva, and Michèle Le Doeuff. I will also compare their discourses to those of Luce Irigaray and Simone de Beauvoir, who are presented separately in this volume but who both are usually classified among the French feminists.

I will begin, however, by questioning the unity of the category itself and by arguing that French feminism cannot be pinned down by any necessary or sufficient features. Rather than forming a closed totality, French feminism functions as a family resemblance concept in Wittgenstein’s sense.
The best-known representatives of this category of feminist thinking are Cixous, Kristeva, and Irigaray, but often Le Doeuff, Sarah Kofman, Monique Wittig, and Catherine Clément are also listed among “the French feminists.” For example, Elisabeth Grosz’s early commentary, *Sexual Subversions: Three French Feminists* (1989), provides an interpretation of the philosophies of Kristeva, Irigaray, and Le Doeuff, whereas Toril Moi’s book *Sexual/Textual Politics* (1985) associates Kristeva and Irigaray with Cixous but bypasses Le Doeuff’s work. Kofman was added to the main representatives of French feminism by Nancy Fraser in a volume that she edited for *Hypatia* in 1989. When Penelope Deutscher introduced the second wave of French feminist philosophy to Anglo-American scholars in *Hypatia* in 2000, she referred to Fraser’s earlier selection – Beauvoir, Kristeva, Kofman, Irigaray, and Cixous – and proceeded to discuss the works of philosophers who are less familiar to the English-speaking audience, including Le Doeuff in the updated category.

In order to understand the theoretical and practical resources invested in the concept *French feminism* – and to be able to use the concept in an effective and responsible way – it is crucial to understand that the category is external to the works that it describes. The category betrays its artificial character in several ways.
related respects: doctrinal coherence, historical framing, strategic unity, and the shared language. Closer studies show that such connections are secondary and that they cover both more fundamental differences but also deeper philosophical alliances.

First, the category of French feminism suggests a doctrinal unity, when in fact the scholars and the scholarly works subsumed in the category are connected by multiple and partial links, which are not doctrinal but methodological and conceptual. The syntactic form gives the impression that the term “French feminism” would function in a similar, or comparable, way as the terms “British empiricism” and “German idealism.” In reality, however, it is closer in function to “Modern Aristotelianism”: rather than expressing a well-defined historical or metaphilosophical concept, it gathers together several philosophical approaches and theoretical interests. More precisely, French feminists do not share any theory or thesis about women or femininity. At most we can say that they take part in the same philosophical discussions aiming at solving fundamental problems concerning women’s relationship to being, knowledge, and language.

Second, the theses and arguments associated with and attributed to French feminists usually stem from sources other than their works. Kristeva and Irigaray, for example, are often identified as “deconstructive,” “poststructuralist,” and/or “postmodern” feminists, and thus classified among the successors of Jacques Derrida and Jean-François Lyotard. The classification is repeated despite the fact that both Kristeva and Irigaray work to develop alternatives to Derridean deconstruction and Lyotard’s post-Hegelianism. The neglect of these
distancing moves and critical interventions has led to even more misleading groupings in anglophone contexts: French feminists are lumped together with American postmodernists, such as Linda Nicholson, Donna Haraway, Linda Martín Alcoff, and Judith Butler, who in fact are influenced by and remain closer to classical American pragmatism (James, Dewey) and its antifoundationalism than to the transcendentalism of Heidegger and Derrida or their feminist critics.

Despite their disagreements and divergences, Derrida and his feminist interlocutors, Kristeva, Cixous, and Irigaray, share an interest in the transcendental constitution of being and reality as well as a radical attitude in their investigations of subjectivity and selfhood. In this tradition, truth is understood by the concepts of evidence and unveiling, and being is always related to some level or type of subjectivity – intellectual or affective, unitary or split, stable or processual – by which it discloses itself. For these fundamental reasons, the works of the French feminists should be kept apart from contemporary (post)pragmatism, which, despite its multiple manifestations, ultimately frames the problems

9. Butler frames her ontological and political arguments by readings of contemporary continental philosophers: Irigaray, Kristeva, Lacan, and Derrida. Despite these references, it seems to me that her overall strategy is more pragmatist than is usually realized. Most importantly, her vehement anti-foundationalism and anti-Cartesianism connects her not just to Foucault and Nietzsche but also to the tradition of James and Dewey. Moreover, her work also shows traces of her early engagement with Hegel. For an interesting attempt to combine Butler’s theory of performance with Irigaray’s discourse of sexual difference, see Alison Stone, Luce Irigaray and the Philosophy of Sexual Difference (Cambridge: Cambridge University Press, 2006). [*] Butler’s work is the focus of the essay by Gayle Salamon in The History of Continental Philosophy: Volume 8.

10. This difference has a historical background: The American pragmatists and naturalists share with their postmodernist successors a suspicion of all forms of Cartesian foundationalism. The continental transcendentalists, rather than rejecting or abandoning the Cartesian heritage, aim at radicalizing Descartes’s insight.

of knowledge, truth, and subjectivity by the ideas of use and practicality, functionality and efficacy.

Third, being based on external interests, the category *French feminism* cuts across methodological ties that connect French thinkers to their philosophical interlocutors, contemporary and past. As an effect of the selective operation, a certain methodological blindness characterizes Anglo-American commentaries and critiques of the works of the French feminists, as most commentaries neglect crucial connections to contemporary discussions and to relevant historical sources. The most harmful consequence of this mistaken perspective is that the French feminists are represented as antagonists of French existentialism and classical phenomenology, and they are considered to have abandoned the philosophical questions of Beauvoir, Maurice Merleau-Ponty, and Jean-Paul Sartre. 12 This is a fundamental misunderstanding, for even though the French feminists criticize their existential predecessors,13 many of them accept and retain the transcendental approach of the existentialists and the phenomenologists, and none propose a (re)turn to naturalism or empiricism.

13. Irigaray, for example, rejects Beauvoir’s existentialist thesis about woman’s becoming on the grounds that it implies an opposition between being and becoming, nature and culture: “It is not as Simone de Beauvoir said: one is not born, one becomes a woman (through culture); but rather: I am born woman, but I must still become this woman that I am by nature” (Luce Irigaray, *I Love to You: Sketch for a Felicity within History*, Alison Martin [trans.] [New York: Routledge, 1996], 107, translation modified; originally published as *J’aime à toi: Esquisse d’une félicité dans l’histoire* [Paris: B. Grasset, 1992], 168). In *Je, tu, nous: Pour une culture de la différence* (Paris: Éditions Grasset et Pasquelle, 1990), published in English as *Je, tu, nous: Toward a Culture of Difference*, Alison Martin (trans.) (New York: Routledge, 1993), Irigaray explains that her disagreement with Beauvoir concerns the ideal of equality and the role of psychoanalysis in the thinking of sexual identity (see “Égales ou différentes?,” 8–9; published in English as “A Personal Note: Equal or Different?,” 11; cf. *J’aime à toi, 168, I Love to You*, 107). These comments have led some commentators to conclude that Irigaray and Beauvoir occupy “dramatically oppositional positions” (Naomi Schor, “This Essentialism Which Is Not One: Coming to Grips with Irigaray,” in *Engaging with Irigaray: Feminist Philosophy and Modern European Thought*, Carolyn Burke et al. [eds] [New York: Columbia University Press, 1989], 62). It has also been argued that Cixous marks her divergence from Beauvoir’s existentialism by not mentioning Beauvoir’s work in “Le Rire de la Méduse” (“The Laugh of the Medusa”), which was first published in a special *Simone de Beauvoir* issue of *L’Arc* (1975). From a scholarly perspective, such conclusions are premature, as Cixous’s and Irigaray’s texts are appeals for *thinking*, not academic theses, and as French philosophers in general do not mention their sources but expect their readers to recognize the historical and conceptual links.
An additional effect of this blindness is that the methodological and conceptual innovations of the French feminists are seldom connected to the modernist tradition of European literature. Thus, the intellectual and poetic links to the works of female writers, such as Virginia Woolf, Marguerite Duras, and Colette, are seldom noticed by philosophical commentators.

Fourth, the theoreticians included in the category are French but only in the sense that they all live in France and write in the French language. Their ethnic backgrounds and their native languages as well as their intellectual genealogies vary greatly because they come from different communities and areas of Europe: Cixous from Algeria, Irigaray from Belgium, Kristeva from Bulgaria, and Le Doeuff and Kofman from France. The neglect of the heterogeneity of the origins of the French feminists has produced a number of misleading criticisms. One example here is the accusation of racial insensitivity, often voiced by American critics. In fact theoretical questions of ethnicity and racial discrimination are not forgotten or neglected by the French feminists, as so many commentators suggest. They are included in the continental tradition from the start, but in a different way than they appear in the theoretical disputes that have developed in the USA and Britain: “race” is not so much an issue of color in this tradition as it is an issue of ethnic, linguistic, and religious identity.

To summarize: it is important to notice that many of the criteria of categorical inclusions and exclusions do not emerge from the works of the French feminists but come from certain disputes that dominated the English-speaking academic community in the 1960s and 1970s. These disputes concerned the scientific character of metaphysics and the relation of philosophy to literature and the arts, on the one hand, and empirical sciences, on the other hand. The disputed problems were inherited from the positivist tradition of British philosophy and from its American successor in pragmatism and naturalism, and were

15. See, for example, Jane Flax, Thinking Fragments: Psychoanalysis, Feminism, and Postmodernism in the Contemporary West (Berkeley, CA: University of California Press, 1990), 171–7.
alien to continental thinkers. Neither the borderline between metaphysics and science nor the borderlines between philosophy and art, on the one hand, and philosophical and empirical inquiries, on the other, were regarded in the same manner on the continent as they were regarded in postwar Britain and the USA.

In the following, I will discuss four topics that both connect and separate the feminist thinkers that are subsumed under the category French feminism: embodiment, subjectivity, exclusion, and the imaginary. While focusing on these four topics, my aim is not to suggest any doctrinal unity nor to undermine the importance of any other themes, problems, or phenomena discussed by the French feminists. Rather, the aim is to open four perspectives that help to identify those alliances and divergences that are methodologically and conceptually significant and important for the development of feminist philosophy. Most importantly, I want to show how the different feminist projects proposed by “the French thinkers” relate to Beauvoir’s classical account of sexual difference and to the tradition of existential-phenomenological philosophy that lays the methodological basis for her work. I do this because I firmly believe that Beauvoir’s feminist arguments provide a forgotten ground for many contemporary projects that we find developed on the continent.17

II. EMBODIMENT: MATERNITY AND DESIRE

In the usual understanding, poststructuralist and deconstructivist French feminists – Cixous, Kristeva, and Irigaray – question and abandon two central assumptions of Beauvoir’s existential approach. First, Beauvoir is claimed to devalue or neglect those aspects of life that are specific to women and crucial for their creativity: embodiment, maternity, and desire. Second, Beauvoir is said to privilege those functions that are associated with masculinity: rationality, objectivity, autonomy, and transcendence. In this interpretation, Beauvoir argues that if women want to be emancipated they must downgrade their bodily functions and engage in male activities.

The poststructuralist French feminists, on the other hand, are presented as theorists of embodiment and female creativity. Focusing on certain topical

17. I have chosen not to focus on the psychoanalytic background of the French theorists, but instead want to clarify their existential-phenomenological starting-points. This is not to diminish the influence of Freud and Lacan, or Melanie Klein and Helene Deutsch, but to refine and correct the received view of the French feminists as “Lacanians.” Detailed accounts have been presented of the relation between French feminism and Lacanian psychoanalysis, already by early commentators, for example Jane Gallop, Feminism and Psychoanalysis: The Daughter’s Seduction (Ithaca, NY: Cornell University Press, 1982), and Elisabeth Grosz, Sexual Subversions: Three French Feminists (Sydney: Allen & Unwin, 1989).
connections, commentators argue that their accounts of sexual difference reaffirm and revalue women’s bodies and bodily functions, sexuality, and maternity. Moreover, French feminists seem to privilege these functions in their investigations of intersubjectivity and communality: Cixous questions the Kantian idea of moral law by reference to the creative feminine practice of Clarice Lispector,\(^\text{18}\) Kristeva suggests a new form of relatedness – “herethics” (l’héréthique) – that is built on or modeled by maternity,\(^\text{19}\) while Irigaray argues for an ethics of desire and love that affirms sexual difference.\(^\text{20}\) This has led many interpreters to claim that there is a clash between Beauvoir and her successors. Moira Gatens, for example, argues that “under the influence of deconstruction, both Irigaray and Cixous reverse de Beauvoir’s strategy by re-instantiating the female body and the feminine and treating both as sites for exploration in feminist politics.”\(^\text{21}\)

Despite repeated suspicions and accusations of “heterosexism,”\(^\text{22}\) French feminists are usually praised in Anglo-American contexts for their abandonment of Beauvoir’s androcentric universalism and naïve humanism, and for their

---

attacks on classical ethics and epistemologies that contrast mind with body, reason with emotion, intellect with sensibility, concepts with desire, and operate on a secret privileging of the masculine over the feminine.

This simple contrast between Beauvoir and her poststructuralist critics is, it seems to me, a fundamental misunderstanding and constitutes a main obstacle for the development of contemporary philosophy of gender relations and sexual difference. The contrast is not just historically mistaken; it also downgrades and hides certain systematic – conceptual and methodological – connections that are crucial for the understanding of the alternatives offered by contemporary French feminists. Moreover, the neglect of the Beauvoirian background of contemporary French feminism easily leads to false accusations of naturalism and essentialism. In order to clarify the relation between Beauvoir and her poststructuralist critics it is necessary to update and re-examine the received view of Beauvoir’s feminism and its philosophical starting-points.

The first thing to notice is that Beauvoir did not neglect the task of theorizing embodiment; on the contrary, she introduced and developed powerful conceptual distinctions that allowed her, as well as her French successors, to argue for the specificity of feminine experience. Her main contribution to the philosophy of embodiment is her argument against naturalistic and bioscientific (anatomical and physiological) conceptions of human sexuality. The first part of The Second Sex shows that biological concepts cannot provide a foundation for the philosophical understanding of the relations between the sexes. To account for these relations, Beauvoir claims, we must introduce the phenomenological-existential concepts of sensibility and lived embodiment. The Second Sex shows that radical feminist thinking cannot proceed unless it incorporates these concepts and bases its investigations of sexual difference on them.

The poststructuralist feminists accepted Beauvoir’s conceptual solution. Their accounts of feminine desire and maternity do not fall back on any naturalistic or biologistic conceptions of the human body and sexuality, but develop further the description and interpretation of the lived experience outlined by Beauvoir. More precisely, Cixous’s insistence on feminine desire, Kristeva’s inquiries into maternity, and Irigaray’s discourse of fluidity and the mucous membranes of the

23. Despite her critique of Cartesianism, Irigaray operates within the Cartesian tradition and, instead of rejecting its methods, works to radicalize them and turn them against the Cartesian doctrine. See, for example, Irigaray, Éthique de la différence sexuelle, 19–23, 75–84; An Ethics of Sexual Difference, 12–15, 72–82. On Irigaray’s relation to Descartes’s philosophy and Cartesianism, see my “Verwunderung und sexuelle Differenz: Luce Irigarays phänomenologischer Cartesianismus,” Silvia Stoller (trans.), in Feminist Phenomenology and Hermeneutics, Linda Fisher et al. (eds) (Würzburg: Köningshausen & Neumann, 2005).

24. For a detailed argument for this reading, see my Toward a Phenomenology of Sexual Difference: Husserl, Merleau-Ponty, Beauvoir (Lanham, MD: Rowman & Littlefield, 2003).
feminine body do not depend on any anatomic or physiological theories. Rather, they all describe the body as it is given in direct sense-perception, affection, and empathetic intuition. The body thus described is not a hormonal, neural, or genetic mechanism – all such mechanisms are scientific abstractions. The body at issue is a lived, experienced reality, constituted in sensibility and movement. As such, it is a dynamic and changing form, not a static entity or substance. Following from this understanding, all these thinkers inquire into the constitution of objects and values in the actions and passions of humans as bodily subjects.

To be sure, Beauvoir’s discourse involves highly negative claims about maternity, and this distances her from poststructuralist feminists. However, in order to understand the philosophical significance of this difference, two things must be emphasized. First, what is groundbreaking in Beauvoir’s analysis is not her evaluation of femininity but her new way of conceptualizing embodiment. Poststructuralist feminists follow Beauvoir in privileging the first-person perspective on experience and in rejecting all naturalistic accounts of embodiment and subjectivity. Second, Beauvoir’s negative descriptions of the maternal body do not constitute her final positions on these matters but belong to her critical argument about traditional ways of framing and representing women’s bodies. The Second Sex shows that the Western tradition has repeatedly identified the female body with the animal body and associated male existence with spirituality and rationality. Beauvoir questions these connections, and argues that human existence, in both variations – feminine and masculine – is a paradoxical condition and incorporates spirit with matter, and reason and understanding with emotion and embodiment. Cixous’s and Irigaray’s early critiques of the hierarchical oppositions of Western philosophy owe at least as much, if not more, to Beauvoir’s problematization of the sexual mythology as to Derrida’s and Heidegger’s de(con)struction of metaphysics.25

To see concretely the connections between Beauvoir and her poststructuralist and deconstructivist critics, let us compare their accounts of women’s experiences of maternity and desire. The following quotations make clear that all these thinkers share the idea that maternity and desire, as lived by women in the first-person singular, are particular modes of experience that challenge traditional androcentric representations of the human condition. At the end of The Second Sex, Beauvoir summarizes her argument by writing: “There is a whole region of human experience which the male deliberately chooses to ignore because he fails

to think about it: this experience woman lives.”26 Pregnancy and the intimate, paradoxical relationship with the child is one of such lived experiences:

[P]regnancy is above all a drama which is played within the woman herself. She feels it at the same time as an enrichment and as a mutilation. The fetus is part of her body, and it is a parasite that exploits the body. She possesses it, and she is possessed by it. It epitomizes the whole future and, by carrying it, she feels herself vast as the world. … But she also feels herself moved by obscure forces, tossed and violated. What is specific to the pregnant woman is that the body is experienced as immanent at the moment when it transcends itself. … The transcendence of … the man of action is inhabited by one subjectivity, but in the becoming mother the opposition between subject and object is abolished. She forms with this child from which she is swollen an equivocal couple overwhelmed by life.27

This mystery of a collar of blood that inside the mother’s belly changes into a human being is one no mathematics can put in equation, no machine can hasten or delay; she feels the resistance of duration that the most ingenious instruments fail to divide or multiply; she feels it in her flesh, submitted to the lunar rhythms, and first ripened, then corrupted, by the years.28

Kristeva develops Beauvoir’s description of the inner division of the maternal body in her well-known essay “Stabat Mater.” I quote a rather lengthy passage, in order to bring to the fore the similarity with Beauvoir’s text as well as the richness of Kristeva’s description:

The immeasurable, unconfinable maternal body.

First there is the separation, previous to pregnancy, but which pregnancy brings to light and imposes without remedy.

On the one hand – the pelvis; center of gravity, unchanging ground, solid pedestal, heaviness and weight to which the things adhere, with no promise of agility on that score. On the other hand – the torso, arms, neck, head, face, calves, feet: unbounded liveliness, rhythm and mask, which furiously attempt to compensate for the immutability of the central tree. We live on that border, crossroads

beings, crucified beings. A woman is neither nomadic nor a male body that considers itself earthly only in erotic passion. A mother is a continuous separation, a division of the very flesh. And consequently a division of language – and it has always been so.

Then there is this other abyss that opens up between the body and what had been its inside: there is the abyss between the mother and the child. What connection is there between myself, or even more unassumingly between my body and this internal graft and fold, which, once the umbilical cord has been severed, is an inaccessible other? My body and ... him. No connection.29

The French feminists are also well known for their celebration of feminine desire and enjoyment (jouissance). Cixous and Irigaray especially are presented as theorists of feminine desire and both are praised and criticized for their defense of the specificity of feminine experience and expression. Moreover, they are claimed to argue that feminine speech and writing – écriture féminine – emerge from the functions of the feminine body. This is often taken as a naturalistic argument that reduces women’s creative expressions to the biology of the female organism. Such readings involve several misconceptions. First, as we have seen, the feminine body, as described by the French feminists, is not any natural reality or substantial unity but is a dynamic form of motility and sensibility. Cixous can thus argue that also a writer that anatomically and socially is posited as male can express femininity.30 Second, feminine speech and writing has an origin in feminine bodies but this should not be taken in any causal or functional sense. Rather, the relation between verbal expression and embodiment is constitutive: the rhythmic kinaesthetic structures prepare the body for the constitution of linguistic forms. Thus we find Kristeva claiming that the primitive operations of breathing, swallowing, and tasting “provide a bed for words.”31 Third, bodily

structures are unique to individual subjects. This means that “femininity” is not used within this theoretical context as a name for an essence or an entity but for a style.

The specificity of feminine desire is not a new invention but has a long history in French literature and feminist writing. We find it thematized already in the writings of George Sand, Colette, and Duras. Beauvoir gave these descriptions a new critical and theoretical function by arguing that the dichotomous concepts of Aristotelian philosophy and Freudian psychoanalysis cannot capture the specificity of feminine desire. Feminine enjoyment and sexual pleasure cannot be described by the oppositional concepts of activity and passivity, action and reaction, attraction and repulsion, charge and discharge, means and ends. To express its original temporal form we must overcome all such dichotomies:

Feminine enjoyment radiates throughout the whole body; it is not always centered in the genital organs; even when it is, the vaginal contractions constitute, rather than a true orgasm, a system of undulations that rhythmically arise, disappear and re-form, attain at times a paroxysmal condition, become vague, and sink down without ever quite dying out. Because no definite term is set pleasure strives for infinity.

Irigaray’s This Sex Which Is Not One resonates:

But woman has sex organs more or less everywhere. She finds pleasure more or less everywhere. Even if we do not talk about the hysterization of her whole body, the geography of her pleasure is far more diversified, more multiple in its differences, more complex, more subtle, than is imagined – in an imaginary rather too narrowly focused on sameness.

35. Irigaray, This Sex Which Is Not One, 28, translation modified; Ce sexe qui rien est pas un, 28.
And in “Sorties,” we find Cixous arguing as follows:

She has never “held still”; explosion, diffusion, effervescence, abundance, she takes pleasure in being boundless, outside of herself, outside same, far from a “center,” from any capital of her “dark continent,” very far from the “hearth” to which man brings her so that she will tend his fire which always threatens to go out … She doesn’t hold still, she overflows. An outpouring that can be agonizing, since she may fear, and make the other fear, endless aberration and madness in her release. Yet, vertiginous, it can also be intoxicating.36

III. SUBJECTIVITY AND EXCLUSION

The relations of contemporary “French feminists” to Beauvoir’s existential feminism are not unitary or homogenous but different in each case. In this respect, Kristeva and Cixous can rightly be associated with Irigaray, as long as one remembers that they are not just poststructuralist thinkers but also are influenced by classical and existential phenomenology. However, one should also keep in mind that the relations that these three French feminists have to phenomenology are multiple and different.

Kristeva is a reader of Husserl and a theorist of subjectivity and selfhood. The philosophical significance of her concepts of the semiotic, the speaking subject, and the abject cannot be understood unless one takes into account their background in the phenomenology of pre-thetic and affective experiences, analyzed already by Husserl but also by Sartre and Merleau-Ponty. It is crucial to notice that in Revolution in Poetic Language, Kristeva defines her central concept of the semiotic not just by Lacanian but also, and equally importantly, by Husserlian concepts: the semiotic is what precedes all thetic (positing) activity.37 Thus defined, the semiotic processes belong to the level of prethetic, prepredicative, experience explicated by Husserl in Experience and Judgment. The subject of these experiences is very different from the subject of cognitive and judgmental acts conceptualized by Husserl in his early works: it is hidden, operative, and affective.38

In the essay “Ethics of Linguistics,” Kristeva explains how her own studies of *the speaking subject* are inspired by Roman Jakobson’s works, which combine historical-political sensitivity with theoretical rigor. The phenomenological background of this part of Kristeva’s work is in Merleau-Ponty’s discussions of the speaking subject and his distinction between “spoken language” and “speaking language.” Following Husserl and Merleau-Ponty, Kristeva reminds us of the necessity of subjectivity in all linguistic expression. She does not suggest that selfhood or subjectivity is an effect, a fiction, or an artifact, as some postmodernists do. Her caution is not against subjectivity as such, but against traditional attempts to unify or solidify the subject, to reduce it to the “punctual ego” of judgments, categorical perceptions, and propositional activity.

Kristeva’s main argument is that theories of expression fail if they neglect the multilayered, fractured, and dynamic character of the human being. The speaking subject has to be understood, not just as the guarantee of order and unity, but also as the locution of movement and change. This is not a rejection of transcendental subjectivity or the ego, as prejudged readings may suggest, but is a rejection of narrow and superficial notions of subjectivity.

Kristeva’s inquiries into abjection also have a phenomenological background. In *Powers of Horror: An Essay on Abjection*, Kristeva introduces her concept of the *abject* with reference to Freudian and Lacanian psychoanalysis, but she argues that the phenomenon challenges both versions of the analytic theory as it does not involve any representation of a desired object or any repression of an ambivalent content but is founded on an ambiguous distinction between inside and outside, own and alien. Kristeva ends the introductory section by writing: “This preliminary survey of abjection, phenomenological on the whole, will now lead me to a more straightforward consideration of analytic theory on the one hand, of the history of religion on the other, and finally of contemporary literary experience.” Her descriptions of abject phenomena and qualities substantiate her methodological claims: they question the concepts of psychoanalysis, Freudian and Lacanian, and develop further the phenomeno-
logical insight into affectivity presented by Sartre and Merleau-Ponty in the 1940s.\textsuperscript{44}

Cixous, on the other hand, works out her feminist insight in a close collaboration with Derrida, both being strongly influenced by Heidegger’s destructive approach to Western philosophy and his redefinition of subjectivity as \textit{Dasein}. Irigaray, for her part, takes issue with the whole philosophical canon – from Plato and Aristotle to Descartes and Spinoza, and to Nietzsche, Heidegger, Levinas, Sartre, and Merleau-Ponty – but her readings of classical texts are at the same time strongly informed by those of Heidegger, Levinas, and Merleau-Ponty. Thus her understanding of feminine subjectivity is closely connected to her critical discourse of spatiality, elemental being, and the futurity of human life.\textsuperscript{45}

In contrast, Le Doeuff starts her reading of Beauvoir, and the history of philosophy, not from any close encounters with phenomenologists, but from a harsh critique of all phenomenology. In \textit{Hipparchia’s Choice}, she explains that she rejects phenomenology for three related grounds: First, she claims that the transcendental ego discovered by the phenomenologists is cut off from the world and all empirical relations. Most drastically, and this is Le Doeuff’s second complaint, the ego lacks all relations with others; the best it can do is to constitute, within itself, the phenomenon of the alter ego, but such a creation is far from the concrete fleshly others that we encounter in our everyday dealings. Third, Le Doeuff claims that the phenomenological enterprise leads to skepticism about the philosophical relevance of the objective and natural sciences.\textsuperscript{46} Her argument is that Beauvoir’s uncompromising political commitment to women’s cause led her to question and finally to abandon the theoretical, epistemological, and ontological concepts of Sartre as well as those of Husserl and Heidegger. For Le Doeuff, the writer of \textit{The Second Sex} is not a theoretical philosopher but an ethical and political thinker. Thus, in her account, Beauvoir’s

\textsuperscript{44} Elisabeth Grosz explains this methodological and conceptual link by the fact that Kristeva was influenced by Mary Douglas who, in her \textit{Purity and Danger}, relies on Sartre’s existential psychoanalysis and his account of the vital values of being; see Grosz, \textit{Volatile Bodies}, 192–4.

feminism should be related and compared to Hannah Arendt’s political works rather than to Husserl’s epistemology or to Heidegger’s ontology.⁴⁷

But Le Doeuff’s reading of classical phenomenology, while not uncommon today, is not the one that Beauvoir accepted. While writing The Second Sex, Beauvoir was influenced, not just by Sartre and his early theory of the ego, but also by Merleau-Ponty, who in his Phenomenology of Perception presented a very different account of Husserl’s philosophy.⁴⁸ According to Merleau-Ponty, the Husserlian ego is not a transcendent object nor a formal element of consciousness; rather, it is a paradoxical subject that is connected to the world by its sensations, affections, and perceptions, but is also able to slacken these ties by reflective activity. Moreover, the fundamental relation that the ego has to the world is not cognitive but affective and sexual. Merleau-Ponty even argues that the affective perceptual relation lays the ground for all objectification and ultimately also for the objective sciences: “Let us try to see how a thing or a being begins to exist for us through desire or love and we shall thereby come to understand better how things and beings can exist in general.”⁴⁹ In Merleau-Ponty’s understanding, phenomenology does not develop in opposition to the sciences – natural, biological, or human – but in constant interchange with them. It retains its transcendental tasks but renounces the false hope of laying down the foundation of all sciences once and for all. On this point as well, Beauvoir seems to agree with Merleau-Ponty, as her discourse of the feminine condition combines transcendental-existential descriptions and analyses with empirical findings from the fields of history, anthropology, psychology, and the social sciences.

The feminist topic of Le Doeuff’s philosophical inquiries is women’s continuous exclusion from the institutions and practices of knowledge. Beauvoir’s work figures in these inquiries both as a case study and as a source of feminist insight and strategic guideline. The aim is to demonstrate and analyze the multiple forms of exclusion, its different mechanisms as well as the false justifications that cover them, and to recognize and counter its contemporary operations. These mechanisms include disparaging representations of intellectual women and women’s cognitive and creative contributions. Corresponding to these gender representations, Le Doeuff analyses the ways in which the process of knowing and its results are pictured by gendered metaphors. She does not claim that the exclusion of women would be total or complete; on the contrary, she shows

⁴⁸ For Beauvoir’s indebtedness to Merleau-Ponty’s understanding of classical phenomenology, see my Toward a Phenomenology of Sexual Difference, and “An Introduction to Beauvoir’s Review of Merleau-Ponty’s Phénoménologie de la perception,” in Simone de Beauvoir, Philosophical Writings, Margaret Simons et al. (eds) (Champaign, IL: University of Illinois Press, 2005).
⁴⁹ Merleau-Ponty, Phénoménologie de la perception, 180; Phenomenology of Perception, 154.
that it is always partial. Through centuries women have been allowed to occupy secondary positions in philosophical and scientific enterprises. Most of the intellectual women that we know have worked as intellectual helpmates or assistants for male inventors, or as teachers, defenders, and distributors of their doctrines. Women have been denied the positions of independent, self-governed cognitive agents. In other words, women have been, and still are, allowed to take part in auxiliary scientific tasks, they are allowed access to the subfields of philosophy (most easily ethics and history of philosophy), but they are not supported in their attempts to develop mastery of the complete field. On the contrary, all such attempts are jeopardized.

Le Doeuff’s thesis of exclusion is not a conceptual but an empirical claim. She does not argue that the concepts or meanings of femininity and knowledge would be oppositional or in conflict. Her claim concerns concrete women in real historical circumstances and the ways in which they have been treated by their contemporaries and by their successors, by colleagues and collaborators, by historians and philosophers. The exclusion that her work discloses consists of a multiplicity of particular actions and deeds performed by individual agents. For her, the androcentric order is a contingent historical formation. She explains: “Lacking any basis on the side of the involuntary (nature, economy, the unconscious), the phallic order must secure itself against every circumstance with the forest of props.”

Le Doeuff continuously argues and works for women’s intellectual independence. She questions theoretical obedience and doctrinal loyalty, that is, all limitations by which female or feminist thinkers confine themselves to this or that philosophical approach. But she does not suggest that intellectual independence would be an easy achievement. Rather, it is, in her analysis, a result of a painful and demanding work of separation and transference. Each thinker has to start by thinking together with a more advanced and established thinker. But no real thinker can remain in this infantile position. Female thinkers especially must struggle hard to break their way from theoretical(-erotic) couples – from teacher–pupil, professor–assistant, philosopher–writer dialogues – and find access to the open field of conflicting ideas and concepts:

The result of the imprisonment in such a [dual] relationship is that philosophizing women have not had access to philosophy but to a particular philosophy, which, it seems to me, is something very different. Their relationship to the philosophical is limited, from

outside the theoretical field, by the very relationship from which they could not possibly detach themselves.\textsuperscript{51}

Thus Le Doeuff connects the feminist topic of women’s exclusion to the great themes of Western philosophy: love of wisdom and independence of thought. Her analyses show that the institutions of Western philosophy have flattered themselves by attributing to themselves intellectual virtues – wisdom, objectivity, creativity, and self-critique – but in reality these institutions work for quite different values when they downgrade and neglect women’s intellectual capacities and when they take possession of women’s innovations and creations without acknowledging the debt.

This argument is different from Cixous’s and Irigaray’s concerns for the exclusion or subordination of the feminine in Western discourse and thinking. Whereas Le Doeuff studies how real women are excluded from the material and social institutions of knowing, in concrete spatiotemporal and sociohistorical situations, Cixous and Irigaray investigate how the \textit{meaning} or \textit{sense} of woman is constituted in Western philosophy. The shared claim of the latter is that the sense of woman has repeatedly been constituted in distinction from the primary sense of man. The idea is that Western discourse allows no independent meaning for (being) woman, but reduces, through different operations of negation, woman’s being to that of man. Thus woman is represented as an incomplete man, a child, or an animal, or she is pictured as man’s opposite, complement, or supplement.

This argument has roots in Beauvoir’s critical investigation of mythical thinking operative in religion, philosophy, and literature. While conceptualizing the exclusion of the feminine, Cixous and Irigaray are not just rephrasing Lacan or Derrida; more importantly, they reformulate and develop the argument that Beauvoir developed in \textit{The Second Sex}:

\begin{quote}
She is an idol, a servant, a source of life, a power of darkness; she is the elemental silence of truth, she is artifice, gossip, and falsehood; … she is man’s prey, his downfall, she is everything that he is not and that he wants to become, his negation, and the justification for his being.\textsuperscript{52}
\end{quote}

Beauvoir argued that this dualistic and oppositional construal of sexual difference is operative in contemporary human sciences and life sciences as well as in the philosophical tradition, from Aristotle to Heidegger and Levinas. Moreover,

\textsuperscript{52} Beauvoir, \textit{The Second Sex}, 175, translation modified; \textit{Le Deuxième sexe}, 242.
she demonstrated that sexual opposition also motivates Freud’s concept of libido and his account of feminine desire as a passivity.53

We can find Beauvoir’s argument radicalized in the writings of Cixous and Irigaray. In the essay “Sorties,” Cixous writes: “Philosophy is constructed on the premise of woman’s abasement. Subordination of the feminine to the masculine order which gives the appearance of being the condition for the machinery’s functioning.”54 In *This Sex Which Is Not One*, Irigaray puts forward a similar analysis: “[T]he articulation of the reality of my sex is impossible in discourse, and for a structural, eidetic reason. My sex is removed, at least as the property of a subject, from the productive mechanism that assures discursive coherence.”55 For both thinkers, the subordination of the feminine to the masculine means that sexual difference remains to be articulated; what we have are merely different representations of masculine subjectivity and its negative modifications that are claimed to stand for the feminine.

The methods and practices that Cixous and Irigaray develop for this project of rethinking are similar but not identical. Both are influenced by Heidegger’s destructive reading of classical philosophy (directly and through Derrida’s deconstructive modification), both recommend Nietzschean strategies for inventing new metaphors and concepts, both resort to the poetic aspects of language, and both develop a practice of disruptive mimesis, a playful repetition.56 But whereas Irigaray inserts her concepts in canonical philosophical texts, Cixous takes distance from the “master’s discourse” and works to renew the literary practices of prose, poetry, and theatre.

To summarize: whereas Le Doeuff’s thesis is about the exclusion of individual concrete women in sociohistorical circumstances, Cixous and Irigaray study critically the hierarchical constitution of the meanings of sexual difference, femininity, and masculinity. These two arguments have interesting connections but they should not be lumped together because they concern two different levels or aspects of our lives.

It is also worth emphasizing that Le Doeuff comments explicitly on the approaches and solutions of her postphenomenological colleagues. In the

55. Irigaray, *Ce sexe qui n’en est pas un*, 145; *This Sex Which Is Not One*, 149.
56. Irigaray describes the mimetic practice in the following way: “There is, in an initial phase, perhaps only one ‘path,’ the one historically assigned to the feminine: that of mimicry. One must assume the feminine role deliberately. Which means already to convert a form of subordination into an affirmation, and thus to begin to thwart it” (*This Sex Which Is Not One*, 76; *Ce sexe qui n’en est pas un* 73–4). On her relation to Nietzsche, see Ingeborg Owesen, *Sexual Difference as a Philosophical Problem: The Philosophies, Styles and Methods of Luce Irigaray and Friedrich Nietzsche*, PhD thesis, theoretical philosophy, University of Oslo (2007).
early work, *The Philosophical Imaginary* (1980), she acknowledges the innovations of Irigaray. Later she becomes more concerned about the dangers of overemphasizing feminine specificity and feminine desire. In the fourth notebook of *Hipparchia’s Choice*, she presents a detailed critique of “the feminism of difference.” According to her, all contemporary theories of sexual difference have deep roots in the philosophical tradition of the Enlightenment, and most approaches repeat Rousseau’s claims about the specificity and distinction of feminine capacities and virtues. Against this model Le Doeuff presents a nominalist and empirical approach that argues that we cannot judge women’s spiritual, creative, or intellectual powers until we have taken down the social institutions that favor and support male performance and power. In her latest work, *The Sex of Knowing* (1998), Le Doeuff’s reaction to the feminism of difference is even more skeptical, and dismissive. Here she joins those American feminists who have rejected the discourse of sexual difference as essentialist, idealistic, and apolitical.

### IV. THE IMAGINARY OF WESTERN PHILOSOPHY

Despite her very different methodological approach, Le Doeuff shares with the feminists of difference one central concept, the concept of the *imaginary*. Commentators quite rightly warn that Le Doeuff’s analyses of the philosophical imaginary should not be confused with the analyses of Lacan and his feminist critics: whereas Le Doeuff’s analyses of images concern an integral element of *philosophical discourse*, the Lacanian concept of the imaginary names a developmental phase or a constitutive element of *subjectivity*. The realization of this difference should not, however, lead us to overlook the fact that Le Doeuff shares with Cixous, Kristeva, and Irigaray at least one crucial metaphilosophical interest: they all attack, in their different ways, the intellectualistic self-representations of Western philosophy. They all work to demonstrate that the dominant metaphilosophical discourse is not just false but self-deceptive: that is, nonphilosophical *par excellence*. In Le Doeuff’s words: “Philosophy reworks elements of a mode of discourse which philosophy elsewhere repudiates.”

57. See, for example, *L’Imaginaire philosophique*, 153; *The Philosophical Imaginary*, 117.
60. See, for example, Le Doeuff, *Le Sexe du savoir*, 14, 118–19; *The Sex of Knowing*, xiv, 65.
Traditionally, philosophers have defined their discourse in opposition to narrativity (myth, fable), poetic language (rhetoric, prosody), and/or pictorial presentation (icons). There are some thinkers who have questioned this self-understanding (e.g. Peirce, Wittgenstein, Merleau-Ponty, Derrida), but most claim that philosophy is, or should be, independent of all figurative, sensible, and material elements of language. Le Doeuff joins the rare dissidents, and argues that in truth the paradigmatic cases of philosophical work – Plato’s dialogues, Descartes’s *Rules* and *Principles*, and Kant’s first *Critique* – combine conceptual and narrative-poetic elements in unique and creative ways. Moreover, the metaphoric and pictorial elements of language are not extrinsic or additional to philosophy, as if decorations or ornaments, but are necessary means of thinking and writing about truth and being. To be sure, the imaginary elements are usually framed as superficial and dispensable, but Le Doeuff’s analyses intend to show that they operate in keeping the argument, or the conceptual system, together.

Le Doeuff focuses her inquiries on the works of certain central philosophers: Plato, Descartes, Rousseau, and Kant. Her general argument, however, is that the images that are used by philosophers are not unitary, homogenous phenomena but combine several different meanings that stem from different historical periods and contexts. Thus the image is always a multiple and unstable element: it is both functional and dysfunctional for the stability and coherence of the text. Le Doeuff puts forward several additional arguments about philosophical images. First, she argues that philosophy is able to renew itself through its images, and even more strongly: “No philosophical thought is without its imaginary plane and it is perhaps on this level that the most significant changes take place.” Second, she claims that images usually appear when the question concerns the existential value of epistemology, that is, when philosophical insight or knowledge is claimed to contribute to happiness or the good life. Third, her analyses show that philosophical images are not common possessions but particular and specific means of thinking that come to us through particular lines of influence and inheritance. She explains: “images in philosophical texts

regularly turn out to have been taken from precise earlier sources making their study into part of a history of learning’s fabulous motifs.”

This latter insight has led Le Doeuff to study some less central or less prominent philosophical figures, such as Galileo, Francis Bacon, and Thomas More. She shows, for example, that the image of an island of truth that we find in Kant’s *Critique* is an inheritance from Bacon. These analyses are valuable as such, and they communicate in interesting ways with Anglo-American feminist epistemology, but for our purposes, it is crucial to notice that they also betray an important difference between Le Doeuff and her postphenomenological colleagues. Whereas Cixous and Irigaray work to disrupt, or to “destroy” in Heidegger’s terms, the teleological movement of Western thinking, from its ancient sources to its latest developments in psychoanalysis, Le Doeuff rejects all claims about the internal teleology of thought. Instead of struggling with transhistorical forces, she tracks a contingent development that depends not on any necessities, but on particular actions and choices, practices and institutions established by individual actors. In this antiteleological interest, her work bears similarities to that of Foucault, both being influenced by the tradition of French history of science (Bachelard, Canguilhem). In her understanding, the images that we find in philosophical texts do not threaten their conceptual, theoretical, and discursive categories, but rather support and assist them. The task is not to find or to create another speaking locus, outside the conceptual order, but to demonstrate the mutual dependence of the theoretical and the imaginary: “the imaginary which is present in theoretical texts stands in a relation of solidarity with the theoretical enterprise itself (and with its troubles) … it is, in the strict sense of the phrase, at work in these [theoretical] productions.”

So even if Le Doeuff’s explications of her critical practice resemble those of Cixous and Irigaray, there are important differences between these two approaches: whereas one studies philosophical texts as contingent formations, the other attacks them as phases or stages of a teleological movement; whereas one sees images as contributing to theoretization, the other studies them as traces of a pretheoretical order.

66. For a discussion of this tradition, see the essay by Pierre Cassou-Noguès in *The History of Continental Philosophy: Volume 4*.
Kristeva offers a third perspective on Western images and imagination. Her inquiries into literary expressions and visual images of suffering and love are strongly influenced by Freud’s and Lacan’s theories of subjectivity, but her analyses are empowered and refined by conceptual distinctions that she finds developed by Husserl and Peirce. Both these philosophers argued that not all signs signify in the same way or in the same sense. Some signs represent determinate or fully constituted objects, whereas other signs merely indicate something indeterminate outside the sense-giving forms of conceptual language. Drawing on this idea, Kristeva argues that in addition to their representative functions, Western images and expressions of suffering and love also have indicative functions: they signify what cannot be captured by any forms of representation, verbal or nonverbal. Thus it is not just that we find representations of death anxiety in our tradition of religious, literary, and artistic creations, as Freud already argued; we also find elements that indicate the nonrepresentable power of the death drive: “the work of death as such … can be spotted precisely in the dissociation of form itself, when form is distorted, abstracted, disfigured, hollowed out.”

Kristeva sets out to study the operation of both types of signs in the images of desire and suffering that we find in the Western traditions of religion, literature, and visual arts.

The distinction between representation and indication also allows Kristeva to put forward a critical account of the feminine subject that finds pleasure in the cultivation of the unrepresentable. In Soleil noir, she argues that this is not any ideal – as Irigaray’s and Cixous’s early texts may suggest – but only one possible type of feminine subjectivity, specific both culturally and historically.

Despite this divergence in the analysis of the feminine condition, there is a deep theoretical alliance between Kristeva, Cixous, and Irigaray: all are successors of Lacan, and through Lacan all are indebted to the phenomenological analysis of signification and intentionality. In a lecture course held at the University of Paris VII in 1995–96, Kristeva explains: “Lacan has bequeathed us a psychoanalysis informed by phenomenology: his structural linguistics did not ignore Sartre or Merleau-Ponty, any more than Husserl or Heidegger.” The crucial idea in this tradition is that all psychic life, all mental states and processes, unconscious as well as conscious, are characterized by absence, or nonpresence. This is the fundamental structure of all signification, and more generally of all intentionality. Thus all presence of objects, subjects, goals, values, and events – clear or obscure, external or internal, real or imaginary – is given to us with some

---

68. Kristeva, Black Sun, 27; Soleil noir, 38.
69. Kristeva, Soleil noir, 77–8; Black Sun, 66–9.
type of absence. There is no simple or pure presence in psychic life, and in most cases the given presence involves references to many different types of absence. The absence constitutive of the perception of a physical thing, for example, differs in kind from the absence that characterizes the perception of a person; and the nonpresence that belongs to imagined events is very different from the nonpresence of remembered happenings. This means that we can succeed in our analyses of different psychological functions – imagining, desiring, and remembering – only if we manage to keep apart the different forms of absence involved in them: “What phenomenology has taught us – particularly Sartre’s rereading of it, as well as Merleau-Ponty’s – is that intentionality is in the mode of not being [n’être pas]: in other words, all psychic representation (conscious and, a fortiori, unconscious) is of an essential negativity.”\textsuperscript{71}

\textbf{V. CONCLUSION}

I have argued that the feminist interventions of Cixous, Kristeva, and Le Doeuff have deep roots in the existential and phenomenological traditions of modern philosophy. This does not mean that these theorists would relate to the phenomenological movement in a similar way. On the contrary, we have seen that Le Doeuff takes a very critical position toward phenomenology and rejects its basic concepts, whereas Cixous and Kristeva question specific results and assumptions and proceed to develop new analyses of feminine experiences and new interpretations of the human condition.

In short, French feminism is a complex and heterogeneous field of inquiry that includes many different positions and approaches. None of these positions or approaches, however, can be understood, or rightly criticized, without studying how they relate to the discussions of subjectivity, intentionality, and embodiment that evolved in classical and existential phenomenology earlier in the twentieth century. The role of Beauvoir is crucial here, as she was the first French feminist who used phenomenological and existential tools to account for the hierarchical relation between the sexes. The fact that some “French feminists” do not refer to Beauvoir’s works while others dedicate whole volumes to the interpretation of her ideas should not mislead us into ignoring the profound and multiple impact of her feminist philosophy on contemporary debates.

Deconstruction first arrived in the North American academic world not as philosophy, but as literary theory. Indeed, throughout his career, Jacques Derrida’s major standing appointments outside France (Johns Hopkins University, Yale University, University of California-Irvine) were located in literature departments, rather than philosophy departments.1

Derrida’s academic debut in North America took place at the famous 1966 “Languages of Criticism and the Sciences of Man” conference organized at Johns Hopkins by literary critics Richard Macksey and Eugenio Donato. The purpose of the conference, and the two-year series of events that followed it at Hopkins, was, in the organizers’ words, “to bring into an active and not uncritical contact leading European proponents of structural studies in a variety of disciplines with a wide spectrum of American scholars.”2 In short, the conference was intended to introduce contemporary European (especially French) thought to English-speaking audiences, and in the process to reinvigorate a somewhat stagnating Humanities discourse in the US.

By the mid-1960s, New Criticism – in its American (Cleanth Brooks, Robert Penn Warren), British (F. R. Leavis, I. A. Richards), and European (René Wellek) modalities – had ruled over literary and humanistic studies for several decades, and French structuralism promised to add new methodological life to a set of disciplines desperately in need of new directions. Indeed, as the American university began to “corporatize” in the 1960s and 1970s, the humanities came

---

1. For a discussion of Derrida’s career, see the essay in this volume by Samir Haddad.
under increasing pressure to conform to a science-based model of publication and evaluation, and structuralism (with its neoscientific insistence on the underlying linguistic structures of art and experience) seemed to offer a very promising methodology for moving beyond New Criticism’s primarily pedagogical emphasis on literary evaluation and its neo-organic appeals to poetic wholeness. Structuralism seemed a much-needed potential cure for the malaise of the North American humanities, and the Hopkins conference was intended to be structuralism’s “product launch” in North America. It turned out, however, to function not so much as the debut of structuralism, but as the introduction of deconstruction, the “poststructuralist” theoretical orientation that would come to dominate North American literary studies in the 1970s and 1980s.

Indeed, when the conference proceedings were republished in 1972, under the revised title The Structuralist Controversy, the organizers had already seen the deconstructive writing on the wall: looking back from the early 1970s, they see that “evidence was already available in the Johns Hopkins symposium of the ensuing moment of theoretical deconstruction.” Indeed, while the 1966 conference saw memorable presentations from many well-known French intellectuals associated with an emergent structuralism (Roland Barthes, René Girard, Jacques Lacan), the most lasting and subsequently anthologized presentation was the one given by Derrida, “Structure, Sign, and Play in the Discourse of the Human Sciences.” And, despite the intentions of the conference organizers to bring the gospel of structuralism to American shores, Derrida’s essay was not so much an explanation or demonstration of structuralist principles as it was a deconstruction of them.

I. “STRUCTURE, SIGN, AND PLAY”

Derrida’s “Structure, Sign, and Play” takes as its topic the heart of Claude Lévi-Strauss’s structuralism, which teaches us that the ground of any given system is not to be found somewhere outside that system’s regulated play; rather, it is the play within a (linguistic or kinship) structure that makes possible the distinction between meaning and nonsense, presence and absence, norm and taboo. Meaning is generated relative to a structure, and is not grounded by a positive relation to some founding moment outside the parameters of the system (such as the universal incest taboo or some transcendental signified). As concerns

3. Ibid., ix.
4. The linchpin text here is Saussure’s Course in General Linguistics, and its grounding claim for structuralisms of all kinds: “in language, there are only differences without positive terms. Whether we take the signified or the signifier, language has neither ideas nor sounds that existed before the linguistic system” (Ferdinand de Saussure, Course in General Linguistics,
literary criticism, this general methodological breakthrough was structuralism’s
great leap forward from New Criticism. However, Derrida’s “Structure, Sign, and
Play” also produces a devastating critique of structuralism: when it thinks struc-
ture, Derrida argues, structuralism continues to replicate a displaced version of
the metaphysical drama, where underlying conditions of structural or social
possibility (like kinship systems, the unconscious, or grammatical constraints)
continue to regulate the emergence of objects in an all-too-transcendental
manner.

If Derrida’s “Structure, Sign, and Play” and its critique of structuralism is in
some sense the inaugural moment of deconstruction in America, the essay’s
initial translation in The Structuralist Controversy (and that version’s subsequent
anthologization in a litany of introductory theory handbooks) inscribed a prob-
lematic reading at the heart of deconstruction’s English-language reception. The
“play” (jeu) in “Structure, Sign, and Play” (“La Structure, le signe et le jeu”) was
in strategic places throughout the essay translated into English as “freeplay,”
which inexorably suggested to English-speaking readers that Derrida’s critique
of structuralism consisted of arguing that any notion of structure denies the
“free,” originary openness of play, in favor of the rigid totalizations of regulation.

For example, Derrida writes toward the conclusion of that essay: “Le jeu est la
disruption de la présence … Le jeu es toujours un jeu d’absence et de présence,
mais si l’on veut le penser radicalement, il faut le penser avant l’alternative de
le présence et de l’absence; il faut penser l’être comme présence ou absence à
partir de la possibilité de jeu et non l’inverse.”

5. Jacques Derrida, “La Structure, le signe et le jeu dans le discours des sciences humaines,” in

Macksey (trans.), in The Structuralist Controversy, Richard Macksey and Eugenio Donato

is or can be “free,” in the sense of being unregulated, originary, or not subject to the rules of a set of structures. There is no “outside” or “before” to structurality in Derrida’s work: there is, as Derrida (in)famously insists, no extra-text, nothing outside the play of structures.8 This insistence on structures, against the Romantic metaphysics of an unfettered, originary “beginning” in “freeplay,” is in fact where Derrida’s work most clearly agrees with, rather than criticizes, the doctrines of structuralism.

Derrida’s critical point in “Structure, Sign, and Play,” then, is not that structuralism has a totalizing notion of structure which is everywhere opposed by an inherently disruptive “freeplay,” an excessive and unbounded pre-originary moment that structure could never hope to tame; rather, Derrida’s argument is that structuralism cannot adequately think the structurality of structure. In other words, structuralism’s notion of structure is troublesome not because concepts, persons, or signs are naturally excessive (“free”) and thereby escape the determining strictures of regulation, but because structure is itself a concept that is subject to structuration. Any supposedly grounding structure is subject to a series of other strictures and structures: at the ground of any system there will always be a “play” among a series of other structures. So linguistic meaning, for example, is not excessive because of an inherent semantic fertility that cannot be captured by grammatical predicates, but because those grammatical, meaning-making structures themselves are beholden to many, many other “originary” structures – historical, political, theoretical, idiomatic, performative, institutional, and so on. Deconstructive “play,” in short, does not have to be “free” in order to be excessive – quite the opposite, in fact. As Derrida demonstrates time and again in his work, it is calculation or determination (in short, reading) that mobilizes excess, rather than that excess being the hidden origin (or its flipside, the originary abyss) to be revealed, uncovered, or “freed” by a deconstructive analysis. As Derrida writes in an essay on Emmanuel Levinas, “everything must be so calculated that calculation should not have the last word over everything.”9

In any case, it is this supposed commitment to deconstructive “freeplay,” against the seeming tyranny of structures and structuralism, that for better or worse laid the groundwork for Derrida’s reception in English-language literary

8. Derrida writes in Of Grammatology (Paris: Éditions de Minuit, 1967), “il n’y a pas de hors-texte,” translated by Gayatri Chakravorty Spivak as “there is nothing outside the text [there is no outside-text]” ([Baltimore, MD: Johns Hopkins University Press, 1976], 158). He retranslates the phrase himself in the Afterword to Limited Inc.: “there is nothing outside context. In this form, which says exactly the same thing, the formula would doubtless have been less shocking” (“Afterword”, in Limited Inc., 136).

DECONSTRUCTION AND THE YALE SCHOOL OF LITERARY THEORY

studies, and it also opened the door to a litany of critiques that accused deconstruction of being a ludic discourse dedicated to the apolitical nihilism of linguistic freeplay. As, for example, British critic Terry Eagleton writes in his hugely influential 1983 introduction, *Literary Theory*, deconstruction:

frees you at a stroke from having to assume a position on an important issue, since what you say of such things will be no more than a passing product of the signifier and so in no sense to be taken as “true” or “serious”…. Since it commits you to affirming nothing, it is as injurious as blank ammunition.10

II. THE YALE SCHOOL

It was at the fateful 1966 Johns Hopkins conference that Derrida first met Paul de Man and J. Hillis Miller, who would both land at Yale in the early 1970s, and along with critics Harold Bloom and Geoffrey Hartman, as well as Derrida himself, would form the Yale School of deconstructionist literary critics through the 1970s to the mid-1980s. The moniker “School” is a bit misleading, however, as even during the heyday of the Yale School, it was clear that these five thinkers shared no coherent doctrine, much less a “deconstructive” methodology supplied by Derrida’s texts and then applied to literature.11 While much reference was made to the centrality of Derrida’s texts and their philosophical authority, each of the Yale deconstructionist critics had his own distinct set of interests and characteristic habits of thought.

In his introduction to the 1979 Yale School manifesto *Deconstruction and Criticism*, Hartman already makes a distinction between what he termed the “boa-deconstructors Derrida, de Man, and Hillis Miller,”12 and fellow travelers Bloom and Hartman himself. And this methodological heterodoxy of the Yale School became even clearer in subsequent years: Bloom and Hartman have remained much more invested in a certain aesthetic criticism, which became at times in fact hostile to “deconstruction,” while Hillis Miller continued to carry the deconstruction flag beyond Yale.

---

11. Of course, deconstruction was not the only thing going on at Yale during those years. For example, Fredric Jameson was a member of the Yale French department from 1976 to 1983, and while he is and was sympathetic to deconstruction, his own Marxist itinerary differs sharply from the habits and interests of Yale School deconstruction.
In the end, what the Yale School critics had in common was probably nothing other than an insistence on the excessive, abyssal, or “undecidable” character of literary language. In Hartman’s words, all deconstructors are interested in “figurative language, its excesses over an assigned meaning.” For his part, de Man writes, “A deconstruction always has for its target to reveal the existence of hidden articulations and fragmentations within assumedly monadic totalities.” As Hillis Miller expands in his contribution to Deconstruction and Criticism, “Deconstruction’ is neither nihilism nor metaphysics but simply interpretation as such”, or, “deconstruction,” he writes even more straightforwardly, “is analytic criticism as such.” In short, for the Yale School of deconstruction, the closer one reads a text, the more the meaning escapes or becomes elusive, and the more the nature of reading is revealed not as the attainment of a single meaning or correct reading, but univocal meaning’s ultimate failure. For many critics of deconstruction, this commitment to close readings of canonical texts was the Yale School’s not-so-secret continuation of a traditionalist New Critical methodology. For his part, de Man seemingly concurs:

I don’t have a bad conscience when I’m being told that, to the extent that it is didactic, my work is academic or even, as it is used as a supreme insult, it is just more New Criticism. I can live with that very easily, because I think that only what is, in a sense, classically didactic, can be really and effectively subversive.

Thus understood (as close reading intensified to a fever pitch of undecidability rather than assured meaning), deconstruction became the dominant movement in literary criticism of the late 1970s and early 1980s. As de Man wrote in the aftermath of his deconstructive reading of Proustian metaphor and metonymy in his 1973 “Semiology and Rhetoric,” deconstruction was poised to become the literary critical Zeitgeist:

The whole of literature would respond in similar fashion, although the techniques and patterns would have to vary considerably, of course, from author to author. But there is absolutely no reason why analyses of the kind suggested here for Proust would not be

13. Ibid.
16. Ibid., 252.
applicable, with proper modifications of technique, to Milton or to Dante or to Hölderlin. This in fact will be the task of literary criticism in the coming years.18

And the ensuing period did in fact see such a heyday of American deconstruction: its unique methodology applied to virtually “the whole of literature.” Deconstruction may have taken much criticism both from the Right (conservatives who took it to be an anything-goes nihilism) and from the Left (those who took it to be merely an apolitical reading method), but the sheer amount of fire deconstruction took only solidified its place as the theoretical dominant in North American literature departments.

Deconstruction’s reign as the dominant paradigm of literary criticism lasted well into the early 1980s. Tragically, however, its linchpin figure, Paul de Man, would die unexpectedly from cancer in December 1983. Shortly thereafter it was discovered that, as a young man in Belgium during the Second World War, de Man had written several newspaper columns that contained overtly anti-Semitic statements. A great deal of discourse was produced in the aftermath of these findings, both by people sympathetic to deconstruction and de Man and by those for whom this was the final proof of deconstruction’s evasiveness and inability to grapple with political questions.19 In any case, the de Man affair ushered in the beginning of the end for deconstruction as the dominant methodology in American literary criticism. Following de Man’s death, Hillis Miller left Yale and went to the University of California-Irvine (in 1986, the same year he was elected president of the Modern Language Association), and Derrida would soon follow, effectively ending the period of the Yale School.

III. CRITIQUES OF THE YALE SCHOOL

Essentially, critics of the Yale School fell into three broad camps. The first comprised literary traditionalists, who felt that deconstructive “undecidability” was to be the death of literature and literary criticism. This critique was quickly dispensed with, however, insofar as the reign of deconstruction saw an explosion, rather than a constriction, of books and articles in literature and literary theory.

19. See, for example, de Man’s collected Wartime Journalism, 1939–1943 (Lincoln, NE: University of Nebraska Press, 1988), as well as the responses to it collected in Responses: On Paul de Man’s Wartime Journalism, Werner Hamacher et al. (eds) (Lincoln, NE: University of Nebraska Press, 1989).
The second tier of critiques came from those who felt that deconstruction was never a radical enough break from formalist literary criticism. Cultural critic Simon Frith, for example, suggests that deconstruction as literary theory could be categorized “as a new scholasticism, a set of terms and techniques to be applied, rigorously but routinely, to any passing text.”

On this line of reasoning, although deconstructive reading claimed to be something radically new, in actuality it functioned as simply another version of New Criticism’s traditional methodology of close reading, cloaked in a theoretical vocabulary and reapplied to a series of texts in order to yield “new” readings. As Jane Tompkins points out in her 1980 “The Reader in History”:

What is most striking about reader-response criticism and its close relative, deconstructive criticism, is their failure to break out of the mold into which critical writing was cast by the formalist identification of criticism with explication. Interpretation reigns supreme both in teaching and publication just as it did when the New Criticism was in its heyday in the 1940s and 1950s.

These detractors pointed to the way in which deconstructive readers of literary texts hunted for self-canceling binary oppositions in the same (essentially unproblematic) way the New Critics hunted for themes and ironies. In addition, according to this line of reasoning, the end result of both readings is the same: a New Critical reading totalizes the text by offering an all-inclusive meaning or interpretation, while a deconstructive reading totalizes the text in exactly the opposite way – denying meaning or interpretation by showing how oppositions in the text cancel themselves out.

A third line of critique, related to the second, emphasized the supposedly apolitical and ahistorical bent of much Yale School deconstruction. As Rodolphe Gasché writes in his hugely influential critique of the Yale School in *The Tain of the Mirror*:

By neglecting the pragmatic and historical context of the utterance of what is dramatized in such a manner as to cancel it out, the criticism in question reveals its origins in Romantic (as well as, in a certain interpretation, Idealist) philosophy. It is a suprahistorical criticism

---

that pretends to speak from a position free of ideology – that is, from an absolute point of view.22

Additionally, those concerned with the worldly dimensions of literature studies pointed to the danger of the political despair inevitably fostered by these readings’ notions of textual self-cancellation, the danger of fostering passive acceptance as the political result of a supposedly nihilistic textual undecidability. For the Marxist, feminist, or (new) historical literary critic, Yale School deconstruction was surmounted by a reorientation in literature departments toward the situated, political and social dimensions of literary texts and of the discipline of literary criticism itself.23

IV. DECONSTRUCTION AND LITERARY THEORY
AFTER THE YALE SCHOOL

Ironically, deconstruction probably had its greatest impact on literary theory not during its Yale School heyday, but afterwards. Or, to put it somewhat more precisely, deconstruction had its greatest impact not as a method for reading texts or producing literary-critical interpretations, but as a larger and more robust theoretical orientation toward questions of culture, ethics, and politics: the very “worldly” things that Yale School deconstruction had been criticized for supposedly ignoring. And much of this work of expanding deconstruction’s critical role beyond an interpretive method was carried out by scholars who were trained by the Yale School and its allies.

On the theoretical and pedagogical scaffolding of the more orthodox rhetorical deconstruction of the Yale School, an emergent political deconstruction could be found, for example, in the work of the boundary 2 group. There emerged also the postcolonial deconstruction of Gayatri Chakravorty Spivak, the African-American deconstruction of Henry Louis Gates, the philosophical deconstruction of Derrida himself and thinkers such as Gasché, and the feminist

---

23. Of course, there was at the time an emergent neo-Marxist deconstruction, most overtly presented in Michael Ryan’s Marxism and Deconstruction and in the group around the journal boundary 2 (Jonathan Arac, Donald Pease, Daniel O’Hara). There are also the various feminist deconstructions mentioned below, as well as a kind of “pedagogical” deconstruction associated with the work of Gregory Ulmer (see Applied Grammatology [Baltimore, MD: Johns Hopkins University Press, 1985]) and others. Yale School (or “rhetorical”) deconstruction was, already by the 1980s, one among many.
deconstruction of scholars such as Barbara Johnson, Eve Kosofsky Sedgwick, and Judith Butler.24

In short, the Yale School appropriation and usage of deconstruction was expanded in the 1990s, and refashioned for use in feminist, historicist, and political modes of theory and criticism. Importantly, this expansion constituted not so much an outright rejection of Yale School deconstruction, but an extension of its scope and its objects of study – beyond the literary canon, and indeed beyond the interpretation of literature itself. As cultural critic Colin MacCabe writes:

If the full cultural history of the complex transformation of French theory as it made the Atlantic crossing is impossible until much more time has elapsed and a full inventory can be made, it is [nevertheless] now possible to see clearly what was at stake in the de Manian appropriation of Derrida. De Man transformed Derrida's use of literature to interrogate the philosophical tradition into a celebration of literature as the timeless bearer of sceptical truth . . . . At this point the radicalism of deconstruction becomes moot. The anti-humanist ethic of literature as the perpetual staging of linguistic crisis remains absolutely wedded to the traditional curriculum, that curriculum structured to salvage substantial moral truths from the best that has been written and thought.25

24. Gayatri Chakravorty Spivak is University Professor at Columbia University, and author of the first American dissertation directed by Paul de Man at Cornell University, as well as author of Critique of Postcolonial Reason and translator of Derrida's Of Grammatology. Judith Butler (PhD in philosophy, Yale, 1984) is Maxine Elliot Professor in the Departments of Rhetoric and Comparative Literature at the University of California-Berkeley, and author of Gender Trouble. Eve Kosofsky Sedgwick (1950–2009) (PhD in English, Yale, 1975) was Distinguished Professor of English at the CUNY Graduate Center, and author of Epistemology of the Closet. Barbara Johnson (1947–2009) (PhD in French, Yale, 1977) was Professor of English and Comparative Literature and the Frederic Wertham Professor of Law and Psychiatry in Society at Harvard University, and author of A World of Difference. Henry Louis Gates, Alphonse Fletcher University Professor at Harvard, was finishing his Oxford dissertation as a Yale lecturer from 1976–79, and was subsequently appointed Assistant Professor at Yale from 1979 to 1984; his groundbreaking study The Signifying Monkey is greatly influenced by Yale School deconstruction.

For an extensive list of Hillis Miller's doctoral students, at Yale and after, see www.humanities.uci.edu/english/j/aboutjhm.html (accessed June 2010). For an overview of de Man's pedagogical career at Yale, see Marc Redfield's "Courses Taught by Paul de Man during the Yale Era," an appendix to a special issue of Praxis on "Legacies of Paul de Man": www.rc.umd.edu/praxis/deman/appendix1.html (accessed June 2010).

Likewise, Eve Kosofsky Sedgwick, even while calling her work in feminism and queer theory “deconstructive,” recalls that “a deconstructive analysis of ... definitional knots, however necessary, [is not] at all sufficient to disable them.” She continues: “Deconstruction, founded as a very science of différ(e/a)nce, has both so fetishized the idea of difference and so vaporized its possible embodiments that its most thoroughgoing practitioners are the last people to whom one would now look for help in thinking about particular differences.” Sedgwick very concisely marks the movement from thematizing of difference as textual undecidability, to a more robust interest in embodying, mobilizing, and responding to specific social, political, and ethical differences: gender, sexuality, race, sexual orientation. After deconstruction understood as a discipline or method, an other deconstruction surfaces: a deconstruction that concerns itself with social alterity, specificity, and the ethical response to the other.

This “other” deconstruction, then, returns literary theory specifically to Derrida’s work and its engagements with political issues. Recall Derrida’s caveat in his 1989 essay on the states of theory: “Deconstruction,” he writes:

is neither a theory nor a philosophy. It is neither a school nor a method. It is not even a discourse, nor an act, nor a practice. It is what happens, what is happening today in what they call society, politics, diplomacy, economics, historical reality, and so on and so forth. Deconstruction is the case.

Certainly, this “other” deconstruction was there all along, beside or before the more widely known literary critical method. But it is precisely this “other” deconstruction that came to the fore after the Yale School. Perhaps this is the kind of deconstruction that Butler calls for when she writes:

If essentialism is an effort to preclude the possibility of a future for the signifier, then the task is surely to make the signifier into a site for a set of rearticulations that cannot be predicted or controlled, and to provide for a future in which constituencies will form that have not yet had a site for such an articulation.

Something like this, finally, may be what deconstruction has to offer to the future of literary theory: the necessary trace not of the hermeneutic past but of the reinscriptive future. Deconstruction here teaches us that future reinscriptions are necessitated or foreclosed by the inscription at hand, by the question and promise that is today. The project of deconstruction, thus defined, would not then consist in showing the monotonous remainder-producing undecidability of texts and other cultural products, but rather in asking how, through a specific analysis, we can account for other, future reinscriptions of their sense. Perhaps one could say in shorthand that this is a deconstruction of futural production rather than originary undecidability or lack. As Derrida writes, “any coherent deconstruction is about singularity, about events, and about what is ultimately irreducible in them.”

V. “LIVING ON”

Derrida died, after a bout with pancreatic cancer, in October 2004. But deconstruction, as he had already made clear in his contribution to the Yale School’s *Deconstruction and Criticism*, does not live or die: rather, deconstruction is characterized by “Living On.” In the present, deconstruction lives on and proliferates in literary theory not so much as a method for reading texts, but as a general set of critical orientations, political engagements, and ethical responses. In the end, Derrida’s work on political and ethical questions – gender, apartheid, the new Europe, his final works on terrorism, globalization, and the American rogue state – have perhaps had more influence on recent literary theory than his earlier works on literature. Ironically, one might say that while deconstruction arrived in America as literary criticism and theory, it lives on most decisively as philosophy.

J. Hillis Miller

When Richard Rorty\(^1\) died in June 2007, nearly every obituary began with a statement about the controversy surrounding his work and his international influence. Perhaps no American philosopher has attracted such international attention and the controversial nature of his work is only part of the reason. No philosopher in recent memory was as adept at transcending the schism that had divided Western philosophy for half a century and his influence transcended the restrictive boundaries of academic philosophy.

Rorty first sparked controversy with his book *Philosophy and the Mirror of Nature*, in which he argued that the philosophical tradition from Plato through Descartes and Kant had simply outlived its usefulness. But worse, his argument drew on central currents in the tradition of analytic philosophy, turning them against its favored preoccupations with the foundations of knowledge, the nature of mind, truth, and realist interpretations of science. If that was not bad enough, he had favorable things to say about Heidegger, Gadamer, Derrida, and Foucault, luminaries of contemporary European philosophy ignored by analytically trained philosophers. The book established Rorty as philosophy’s chief gadfly in the United States, a role that he occupied unflinchingly to the end. It also stimulated interest in European philosophy among some younger, analytically trained philosophers in the United States. It attracted the attention of

\(^{1}\) Richard Rorty (October 4, 1931–June 8, 2007; born in New York; died in Palo Alto, California) received a BA and MA from the University of Chicago (1949, 1952), and PhD from Yale University (1956). His influences were Dewey, Heidegger, Sellars, and Wittgenstein, and he held appointments at Yale University (1956–57), Wellesley College (1958–61), Princeton University (1961–82), the University of Virginia (1982–98), and Stanford University (1998–2005).
European philosophers at least in part because he flirted with postmodernism, a term he later regretted using, and because he paid increasingly serious attention to Heidegger as well as other contemporary European philosophers.

Rorty remained controversial not only as the arch “truth denier” and a “self-hating” philosopher — a philosopher who seeks to end philosophy — but also because of his provocative readings of other philosophers, both Anglo-American and European. He was accused of being a relativist, an irrationalist, and an ethnocentrist. He was criticized for turning everyone he liked into pragmatists by dismissing the parts that did not seem to fit his reading. Furthermore, as he elaborated the political consequences of his views, he was condemned from both the left and right of the political spectrum. One popular conservative commentator condemned him for “hating America.” Political theories criticized him for the thinness of his account of liberalism. Feminists routinely attacked what they viewed as his old boys’ clubby sense of solidarity, and many international philosophers viewed him as merely an apologist for US style liberal democracy, treating him as its latest global export. I will not attempt to detail these criticisms or assess them since they have been organized in several substantial collections of essays and Rorty has responded to them frequently. What I wish to do instead is situate Rorty’s work between its American context and European resonances in order perhaps to make sense of his appearance in this volume of essays on “master thinkers” of recent continental philosophy.

To appreciate the initial controversy Rorty caused in the United States it is worth recalling the state of philosophy in the US when Philosophy and the Mirror of Nature exploded on the scene. The philosophical house was not only divided, as the title of a recent collection of essays has described it: analytic philosophy was by far the dominant and dominating approach to philosophy. This occurred in part because Rudolph Carnap and other European positivist philosophers who fled the Nazi advance through Europe and immigrated to the United States in the 1930s and 1940s came to exert an influence on the direction of philosophy in American universities that was to marginalize the indigenous philosophy, pragmatism. But their influence also led to the dismissal of the most influential schools of European philosophy. As a consequence, analytic philosophy became established as the dominant form of philosophical training and practice. The

---

marginalization of pragmatism and the so-called “analytic/continental” split that was opened up did not simply produce alternative styles of philosophy: they polarized the philosophical landscape, resulting in real antipathy among leading proponents of each camp.

Carnap had set the tone in “The Elimination of Metaphysics through Logical Analysis of Language,” by famously quoting a passage from Heidegger’s *What is Metaphysics*, using it as an unusually telling example of “pseudo-statements of a kind where the violation of logical syntax is especially obvious, though they accord with historical-grammatical syntax.” For the next generations of analytically trained philosophers, that is about the only exposure to twentieth-century European philosophers they were to receive or thought to need. But the criticism went both ways. Herbert Marcuse, for example, a very influential philosophy for other US students at the time, criticized logical positivism as merely a philosophical version of one-dimensional society: “The radical empiricist onslaught … provides the methodological justification for the debunking of the mind by the intellectuals – a positivism which, in its denial of the transcending elements of Reason, forms the academic counterpart of the socially required behavior.” Positivism, and by extension analytic philosophy generally, were simply part of the problem of late capitalist culture.

The dominance of analytic philosophy to the exclusion of pragmatists and continentally oriented philosophy was to become an especially fractious aspect of disciplinary politics in the late 1970s. A group of nonanalytic philosophers led a “pluralist revolt” against the analytic philosophers who dominated the American Philosophical Association (APA) and especially its largest division, the Eastern Division, accusing them of controlling the leadership and program committees of this major disciplinary association to the detriment of other philosophers. It is not without a little irony that Rorty was president of the Eastern Division of the APA during the pluralist revolt, yet he was on the receiving end of a good deal of hostility from all quarters of the conflict. But that story is best told in a different setting. The reason for mentioning it here is to contextualize both the reception of *Philosophy and the Mirror of Nature* and

---

what Rorty’s role in the profession was to become in the remainder of the twentieth century in the United States.

The book was seen by analytic philosophers as a betrayal. That it was not exactly embraced by pragmatists is another matter, but it at least gave some initial aid and comfort to continentally oriented philosophers in the divided landscape. And for many young philosophers at the time, myself included, it opened up exciting possibilities for meaningful dialogue across traditions heretofore kept distinct. Rorty, more than any other philosopher at the time, challenged the aspirations of analytic philosophy while bringing the icons of the warring camps – Dewey, Wittgenstein, and Heidegger – together in fruitful dialogue.

Until the publication of *Philosophy and the Mirror of Nature*, Rorty was generally viewed as a bright and rising star among analytic philosophers. He had published significant papers on the range of topics then occupying analytic philosophers – on language, truth, the foundations of knowledge, the mind–body problem – and he had proposed an alternative in the mind–body identity theory debate that was attracting attention.9 Rorty had not been trained as an analytic philosopher, however. At the young age of fourteen, he had attended the University of Chicago, which had initiated a special program for gifted students, and through his study at Chicago he was influenced by the deeply historical approach that Richard McKeon10 had established there. In an autobiographical essay, Rorty says that in those days he had tried very hard to be a Platonist – “to hold reality and justice in a single vision”11 – but it had not worked out. He went to graduate school at Yale where he wrote a dissertation on Alfred North Whitehead under the direction of Paul Weiss, a leading process philosopher. He did not turn seriously to analytic philosophers until he joined the Princeton philosophy department. But when he did so, it was with considerable skill.

---

10. Richard McKeon was Professor of Greek Philosophy and became dean of the humanities at the University of Chicago. In addition to his teaching and scholarship in the history of philosophy, he led the establishment of the University of Chicago’s signature general education program and its interdisciplinary committee on ideas and methods. He was also an originating member of the “Chicago School” of literary criticism.

Rorty’s social and political convictions, so prominent in his later work, however, go back to his childhood and a family steeped in progressive and leftist politics of the 1920s and 1930s. His grandfather had been one of the founders of the “Social Gospel” movement in America, his father was prominent in leftist literary circles, and his mother had studied at the University of Chicago during the time of its preeminence in reform-oriented social sciences. His parents, however, made a bitter break with their circle of New York City leftists and communists over the Rortys’ opposition to Stalinism. They left the city for rural New Jersey, where Rorty grew up around political talk and the comings and goings of political activists. By the time he was twelve, he says, “he knew that the point of being human was to spend one’s life fighting social injustice.”

These formative themes – the inability to hold reality and justice in a single vision and a progressive political conscience formed at an early age – give shape to his work and his sense of himself beginning with Philosophy and the Mirror of Nature and continuing to his last collection of philosophical papers, Philosophy as Cultural Politics. One theme informed the primarily critical aspect of his work – his view of the philosophical tradition from Plato through Descartes and Kant as a merely contingent development that had outlived its usefulness for us; and the other constituted the positive aspect of his work that sought to replace traditional philosophical preoccupations with the foundations of knowledge, truth, and reality with concern for expanding freedom and social hope. I will sketch the development of each of these themes.

Philosophy and the Mirror of Nature is a challenging book. It has unusual historical sweep for a work that is also filled with detailed and technical arguments within the literature of analytic philosophy: arguments about foundational theories of knowledge; theories of truth, language, and meaning; and realist theories in the philosophy of science. The thesis of the book, however, is relatively easy to state: philosophy, since the time of Plato and especially since Descartes and Kant, has been held captive by an image of the mind as a mirror of nature; of knowledge and language as accurately representing in thought the world independent of mind; and of philosophy as the foundational discipline for the rest of culture because of its special understanding of the fundamental problems that arise within this image about consciousness, knowledge, truth, and reality. The book argued, however, that this image was contingent and thus optional. Further, analytic philosophy and its preoccupations remain stuck in this image, an image that has outlived its usefulness. What we need, Rorty argued, is a postphilosophical outlook that favors a pragmatic sensibility.

12. Ibid., 6.
about knowledge focused not on whether we accurately represent the world but instead on what people do to successfully cope with the world; an outlook that seeks descriptive freedom rather than truth – that resists attempts to find the single true vocabulary at the foundation of all vocabularies but rather fosters proliferation of incommensurable ways to talking about ourselves and the world; an outlook that seeks to replace the philosopher as adjudicator of the rest of culture with the public intellectual, informed dilettante, “the polypragmatic, Socratic intermediary between various discourses.”

Rorty claimed that this was the view held in common by Dewey, Wittgenstein, and Heidegger. However, his arguments were drawn primarily from analytic philosophers: from Wilfrid Sellars, Willard Van Orman Quine, and Donald Davidson. It is impossible in this context to detail their views or Rorty’s controversial interpretation. A sketch will have to suffice in order to make two points. The first is that Rorty’s central claim was and continued to be that it is the dialectical direction of analytic philosophy itself that undermines the image of mind, language, and truth at the heart of the analytic conception of philosophy; and equally controversially, that analytic philosophy ultimately leads us back to the pragmatism of Dewey. Rorty did not see Philosophy and the Mirror of Nature as debunking analytic philosophy as much as carrying out its consequences.

The second point is that Rorty was initially led to Heidegger, Derrida, Foucault, and other European philosophers because of the resonance he found in them for the antifoundationalist view he drew from Sellars, Quine, and Davison. This led him to interpret them as simply arriving at the same place from somewhat different paths. And, more provocatively, he claimed that the place they arrived at had already been occupied by Dewey and pragmatism.

The first part of Rorty’s account was drawn from Sellars’s “Empiricism and the Philosophy of Mind,” in which Sellars had argued against what he called “the myth of the given”: the idea central to empiricism that all knowledge must ultimately be grounded in the immediacy and incorrigibility of sensory aware-

---

15. For a more detailed discussion of this tradition in analytic philosophy, see the essay by John Fennell in The History of Continental Philosophy: Volume 8.

ness. Sellars had argued that awareness, in the sense of raw sensory stimulation, can play no role in grounding knowledge claims. Awareness in an epistemologically significant sense is a linguistic matter – awareness as or of something; and that sort of awareness already presupposes a range of concepts whose possession are necessary for awareness of that sort to be possible. Furthermore, knowledge must always have a linguistic, propositional structure – a justified true belief that can be formulated into a proposition that something is the case – and like the later Wittgenstein, Sellars had argued that these propositional claims make sense only within a community of language users and shared norms about reasons and justification. The empiricist idea that knowledge is ultimately grounded on the immediacy of bare sensory awareness was a myth. Knowledge is a matter of the relationship among some proposition and other propositions in the context of a linguistic community. Knowledge is a social practice.

The second part of Rorty’s account was drawn from Quine. Quine had exposed another myth in his very influential essay, “Two Dogmas of Empiricism.” It has been standard since Hume for empiricists to distinguish between claims that are true in virtue of meaning (analytic claims) and therefore necessary, and claims that are true in virtue of experience (synthetic claims), which are contingent. In addition, empiricism assumed that every meaningful empirical statement was reducible to a statement of immediate experience. Against the first presupposition, Quine had argued that a boundary between analytic and synthetic propositions cannot be drawn except conventionally and that any distinction between necessary and contingent truth was no more than a distinction between what, at some time, we were willing to hold immune from possible revision and what we allow to be revisable. He had argued that any proposition was revisable in principle if we are willing to make enough adjustments elsewhere in our system of beliefs. Against the reductionist presupposition, Quine had argued that no proposition, no matter how reductively atomic, can be meaningful apart from the meaningfulness of other propositions: that ultimately the unit of meaningfulness of an empirical proposition was the totality of empirical propositions, the whole of science.

Finally, Davidson had exposed a third dogma of empiricism in “The Very Idea of a Conceptual Scheme.” Empiricism presupposed a distinction between thought and the world: between a conceptual scheme, on the one hand, and the empirical content that the conceptual scheme organized, on the other. This presupposition, of course, has led to questions about whether we can know that

our conceptual scheme accurately represents the empirical content (the world) and, thus, produced various attempts to combat skepticism about the external world. It had also led to questions about the possibility of alternative, incommensurable conceptual schemes against which it produced various attempts to combat relativism through correspondence theories of truth and realist interpretations of science. Davidson had framed these issues in terms of language and the possibility that a language might fail to fit the world or the possibility that there might be incommensurable languages, languages for which it would be impossible to translate from the propositions of one to the other because they organized the empirical content in radically different ways. His argument was complex and subtle but the high points are these. In order for conceptual relativism to make sense, it must make sense to distinguish between the meaning of a linguistic community’s beliefs and the empirical content of those beliefs; otherwise we would not be able to distinguish beliefs that are merely different in relation to some factual content within a linguistic community from fundamentally different meanings across different linguistic communities. But Davidson had argued that the distinction between meaning and belief cannot be clearly drawn when interpreting what others say, and, furthermore, he had argued that we can only attribute a language or conceptual scheme to others if we assume that most of their beliefs are true. Why would we be inclined to think of something as a linguistic community if it had mostly false beliefs? If this were the case, then to suggest that a linguistic community could have beliefs that are incommensurable with our own amounted to saying that an alternative conceptual scheme was true but untranslatable into our own. Drawing on Tarski’s analysis of truth, Davidson argued that such a suggestion was incoherent. And if the idea of alternative but untranslatable languages was incoherent, the idea of a conceptual scheme as distinct from the content it organizes was incoherent too. In a provocatively titled article, “The World Well Lost,” Rorty drew out what he thought was the consequence of this Davidsonian argument: the philosophical notion of “the world” was vacuous and theories of truth that seek to connect language with the world, as well as the realist and idealist arguments they support, were also vacuous. And Rorty concluded that:

if we can come to see both the coherence and correspondence theories as noncompeting trivialities, then we may finally move beyond realism and idealism. We may reach a point at which, in Wittgenstein’s words, we are capable of stopping doing philosophy when we want to.21

---

While Rorty drew on a wide range of philosophical sources – including European sources such as Heidegger and Derrida – it was this Sellars–Quine–Davidson dialectic that was the core of his argument in *Philosophy and the Mirror of Nature*, and he returned to it unwaveringly across the span of his work. It formed the basis for the critical thrust of his work – his antifoundationalism, antilessentialism, antirealism, and anti-Philosophy (in the sense he defined it) in his early work. He continued to elaborate this critical aspect in occasionally new but always provocative ways throughout his career. What he did with the consequences of Sellars–Quine–Davidson, however, he owed to his reading of John Dewey and to what he found to be common among Dewey, the latter Wittgenstein, and aspects of Heidegger. I will return to this triumvirate shortly, but the obvious should be stated at this point: Rorty’s readings of his heroes are controversial and sometimes eccentric. A cottage industry has grown up around attempts to save them from his embrace. Some traditional pragmatists have claimed that he distorted Dewey. Sellarsians have objected to the consequences he drew from Sellars. Quine and Davidson themselves denied the consequences Rorty drew from their work. Students of Heidegger blanch at his pragmatized reading that dismisses significant chunks – for some, the most important chunks – as insufficiently pragmatic. However, while sometimes idiosyncratic, Rorty’s readings were always strong readings, in Harold Bloom’s sense. I think it is more interesting to focus on what he did with them rather than whether he got them quite right or read them comprehensively.

Rorty was clear in *Philosophy and the Mirror of Nature* that the upshot of his reading of his heroes was that we should not seek new and better theories of knowledge, truth, and language. Rather, he argued that the spaces vacated by epistemology, theories of truth, and philosophy of language should not be filled. Thus, the self-undermining of analytic philosophy in the works of Sellars, Quine, and Davidson undermined the traditional conception of philosophy itself, as Rorty understood that traditional conception. In the last chapters he toyed with ways of expressing this hope that the space of traditional philosophy would not be filled, invoking Gadamer’s *Truth and Method* and adapting the German conception of *Bildung*, which Rorty dubs “edification,” in contrast with philosophy. It will come as no surprise that Rorty’s reading of Gadamer is somewhat idiosyncratic. Gadamer’s views of hermeneutics and *Bildung* were deeply connected to culture and historical consciousness whereas Rorty used hermeneutics not as a method but as the hope that the space vacated by epistemology will not be filled, and he used edification in a future-oriented way “to stand for the project of finding new, better, more interesting, more fruitful ways of

speaking” (PMN 360). I do not want to dwell on his interpretation of Gadamer and his appropriation of hermeneutics and edification, at least in part because he dropped these terms, for the most part, after Philosophy and the Mirror of Nature. It is what edification meant for Rorty at this stage and how he elaborated this intent subsequently that is important. Crucially, edification does not aim at discovering truth since the upshot of Sellars–Quine–Davidson is that truth is just what the social norms of justification, the practice of giving reasons and of normal discourse, allows us to get away with saying. Truth, in other words, is not in need of a theory.

[T]he point of edifying philosophy is to keep the conversation going rather than to find objective truth. Such truth, in the view I am advocating, is the normal result of normal discourse. Edifying philosophy is not only abnormal but reactive, having sense only as a protest against attempts to close off conversation by proposals for universal commensuration through the hypostatization of some privileged set of descriptions. The danger which edifying discourse tries to avert is that some given vocabulary, some way in which people might come to think of themselves, will deceive them into thinking that from now on all discourse would be, or should be, normal discourse. The resulting freezing-over of culture would be, in the eyes of edifying philosophers, the dehumanization of human beings.

(PMN 377)

Edification seeks to advance human freedom by resisting attempts to reduce all descriptions of ourselves to one description. Edification functions by always sending the conversation off in new directions. It is edification rather than philosophy that he claimed was the shared goal of Dewey, Wittgenstein, and Heidegger.

Rorty said in an interview that the most significant change in his thinking after Philosophy and the Mirror of Nature was in his appreciation of Heidegger. He had read Being and Time as early as the 1950s and during the time of writing Philosophy and Mirror of Nature, it was primarily Heidegger’s drawing out the consequences of Nietzsche’s critique of the Western metaphysical tradition that interested him. It interested him first and foremost because it resonated with Dewey’s critique of the “quest for certainty” and Dewey’s pragmatism. He dismissed the rest of Heidegger as unfortunate nostalgia for the Greeks before Plato and for what he characterized as Heidegger’s desire for something for philosophers to do at the end of metaphysics.23 After Philosophy and the Mirror

of Nature, Rorty had intended to write a book on Heidegger that would explore Heidegger more fully. Although he abandoned the project, he gave some lectures and published parts of the project that are included in the second volume of his philosophical papers. Still, his issue with Heidegger remained whether Heidegger was entitled to his nostalgia for the early Greeks and for thinking about Being:

The question of Heidegger’s relation to pragmatism can be seen as the question: does Heidegger have any right to nostalgia? Any right to regret the golden time before Platonism turned out to be simply implicit pragmatism? Is there any room in his story for the notion of belatedness …? To put it another way, should we read him as telling a story about the contingency of vocabularies or about the belatedness of our age? Or rather: since he is obviously telling both stories, can they be fitted together? I do not think they can.24

In an essay on Wittgenstein and Heidegger, he struck the same theme by arguing that the later Heidegger had reverted to a position he had earlier rejected. Rorty suggested that if the young Heidegger had read Wittgenstein’s Tractatus and its nostalgia for what was unsayable, mystical at the limit of language and the world, young Heidegger would have recognized it as simply another piece of the Western metaphysical tradition, another attempt to distance itself from the world of contingency. Rorty went on to claim that at about the same time the later Wittgenstein came to reject his earlier self and recognize that language was just a matter of contingent social practices and that philosophy was just therapy that we can quit doing whenever we like, the later Heidegger had reverted to the idea of Thinking after the end of metaphysics, something the later Wittgenstein would have rejected for the same reasons he rejected his own Tractatus.25 On Rorty’s reading, the later Wittgenstein and the early Heidegger had it just about right. Wittgenstein had cured himself of nostalgia for the mystical. Rorty read Derrida as ridding Heidegger of his nostalgia for something more elemental after metaphysics.26

That said, Rorty rejected both the Heideggerian implication that the history of metaphysics and the history of the West were synonymous and also the

ominous centrality Derrida implied for philosophy and the metaphysical tradition in Western culture. Against Heidegger he said:

I want to protest the tendency to take Heidegger’s account of the West for granted. There is, it seems to me, a growing willingness to read Heidegger as the West’s final message to the world. This message consists largely of the claim that the West has, to use one of Heidegger’s favorite phrases, “exhausted its possibilities.”

Rorty did not think that the West was held captive by the sort of metaphysical drag that required either Heideggerian Thinking or Derridean deconstructive strategies against metaphysics. And what became clearer in Rorty’s relatively more recent writing about Derrida was that he thought that metaphysics-bashing, while admirable, did not have much relevance for politics, and it was the political consequences of his antifoundationalism that increasingly dominated his thinking. Finished with foundationalism, Rorty shrugged off philosophy, rejecting its pretension of centrality to Western culture. He was to pursue instead the continuing “adventure of the West” still alive in the literature of Dickens, Emerson, Whitman, Kundera, Larkin, Nabokov, and Orwell. It is not insignificant that in 1982 Rorty left his position in the philosophy department at Princeton University for a professorship in humanities, teaching mostly in the English department and law school at the University of Virginia; or that in 1998 he became a professor of comparative literature at Stanford University.

While Rorty returned again and again to the critique of traditional philosophical preoccupations, much of his subsequent work was a celebration of contingency and its political consequences, drawing his inspiration from literary as much as philosophical sources. This celebration of contingency was to come together in the figure of the liberal ironist, the central figure in Contingency, Irony, and Solidarity.

There was both an existential strand and a pragmatic strand to Rorty’s work from the 1980s on. The existential strand drew out the implications of his claim that the modern, Cartesian–Kantian notions of mind and the self are contingent and optional. He supplemented Dewey and the later Wittgenstein with his readings of Nietzsche and Freud as well as Heidegger, Derrida, and Foucault. It was this existential strand that informed his view of private life and irony developed in Contingency, Irony, and Solidarity. The pragmatic strand focused on the possibilities of solidarity and drew out the consequences of his antifoundationalism for a liberal democratic polity, supplementing his reading of Dewey with a pragmatic reading of John Rawls’s influential theory of justice. This pragmatic

strand informed his view of the public sphere and of liberal hope. The contingency of the self and the contingency of community formed the core of his brand of liberal democracy.

The foundation had been laid in *Philosophy and the Mirror of Nature*, where Rorty had argued that the Cartesian tradition conflated ancient concerns about reason, personhood, and moral agency with the specifically modern problem of consciousness (PMN 35). One result of disentangling these issues and recognizing that the Cartesian conflation was contingent, Rorty claimed, was that we can come to see that questions of our uniqueness, autonomy, and selfhood swing entirely free of issues about the nature of mind. We can come to see that the self need not be grounded in a conception of the mental; there was in fact no essence of selfhood, mental or otherwise. Rather, our uniqueness and autonomy lie in recognizing the contingency of the self and thus the fact there can be no single, privileged description of human beings capable of capturing the whole truth about ourselves. Rorty read Nietzsche as putting to rest any attempt to discover a common human nature, focusing us instead on the project of self-creation or self-elaboration in the face of the contingency of selfhood. And he read Freud as putting to rest the temptation to treat Nietzsche as an alternative way of working out the Kantian project of authentic human being, interpreting Nietzsche as discovering the truth about the self.28 Rorty put it this way in *Contingency, Irony, and Solidarity*:

> It has often seemed necessary to choose between Kant and Nietzsche, to make up one's mind – at least to that extent – about the point of being human. But Freud gives us a way of looking at human beings which helps us evade the choice … Freud himself eschewed the very idea of a paradigm human being. He does not see humanity as a natural kind with an intrinsic nature, an intrinsic set of powers … By breaking with both Kant's residual Platonism and Nietzsche's inverted Platonism, he lets us see both … as exemplifying two out of many forms of adaptation, two out of many strategies for coping with the contingencies of one's upbringing, of coming to terms with a blind impress.29

There was no privileged way of becoming authentic. The upshot of Rorty's descriptive pluralism was that Nietzsche's Übermensch, for example, or Foucault's aesthetics of existence, or Charles Taylor's dialogical self, and so forth, are merely

among the many possibilities open to us for describing ourselves.\textsuperscript{30} The very idea that we should become authentic was also contingent and optional. All that was necessary were social and political institutions that created an environment of tolerance so that we could engage in the project of self-description, self-enlargement, self-elaboration, or self-creation if we wish to do so. Projects of self-description were private concerns and Rorty notoriously wished to wall off such private enthusiasms from public matters and the requirements of community.\textsuperscript{31}

So far as our sense of being part of community – as being in solidarity with other human beings – was concerned, Rorty also claimed there was no foundation in human nature or elsewhere to ground a social self or social commitment. In Consequences of Pragmatism, he had claimed that “our identification with our community – our society, our political traditions, our intellectual heritage – is heightened when we see this community as ours rather than nature’s, shaped rather than found, one among many which men have made.”\textsuperscript{32} Community did not require an objective foundation, but only a moral commitment to solidarity with other human beings.\textsuperscript{33} Toward the end of Contingency, Irony, and Solidarity, Rorty said that:

solidarity is not thought of as recognition of a core self, the human essence, in all human beings. Rather it is thought of as the ability to see more and more traditional differences (of tribe, religion, race, customs, and the like) as unimportant when compared with similarities with respect to pain and humiliation. (CIS 192)

Borrowing from Judith Shklar’s definition of the liberal, recognition of the pain and humiliation of others, not a discovery of our common human nature, was the core of liberalism. The liberal is someone who believes that cruelty is the worst thing we can do to fellow human beings.

Rorty’s brand of liberalism does not require philosophical justification, he argued. Rather, it required moral imagination, tolerance, and an expanding sense of solidarity with fellow sufferers. This was the conclusion he drew from the evolution of political liberalism in Rawls’s work. In the first formulation of

\textsuperscript{31} Charles Guignon and I have been critical of this aspect of his work. See our “Biting the Bullet: Rorty on Public and Private Morality,” in Reading Rorty, Malachowski (ed.), 339–64; and our “Introduction” in Richard Rorty, Guignon and Hiley (eds), 21–38.

\textsuperscript{32} Richard Rorty, “Pragmatism, Relativism, Irrationalism,” in Consequences of Pragmatism, 166.

justice as fairness, Rawls had attempted to ground his conception of justice in the nature of the self and what rational and mutually self-interested individuals would necessarily choose as the basic institutions of society if they did not know concretely their place in it. This essentially Kantian metaphysical project was one source of significant criticism of Rawls's view early on. However, Rawls subsequently was to argue that “justice as fairness” should be understood as a political rather than a metaphysical account of justice. Rorty's gloss on the significance of this shift was that Rawls had made philosophical conceptions of human nature, moral agency, and the nature of the self irrelevant to liberal democratic politics. Liberalism did not require a foundation. Democracy was prior to philosophy.

Liberal democracy, for Rorty, required toleration without epistemological pretense, it required a desire to reduce humiliation and expand solidarity, and fostered social hope rather than metaphysical grounding. Rorty also rejected the emancipatory rhetoric too often attached to defenses of democracy, that is, that within democratic society individuals will be finally free to realize their true nature. He did not believe that solidarity, Enlightenment optimism, and hope for social progress required an emancipatory justification any more than it required a metaphysical justification. In an exchange with Jean-François Lyotard – a response to the challenge Lyotard posed about whether, when we drop meta-narratives, we can still appeal to an ideal of the universal history of humanity – Rorty said that the:

pragmatist utopia is … not one in which human nature has been unshackled, but one in which everybody has a chance to suggest ways in which we might cobble together a world (or Galactic) society, and in which all such suggestions have been thrashed out in free and open encounters … we want narratives of increasing cosmopolitanism, though not narratives of emancipation. For we think there was nothing to emancipate … There is no human nature which was once or still is in chains. Rather, our species has – ever since it developed language – been making up a nature for itself.

35. See Michael Sandel, Liberalism and the Limits of Justice (Cambridge: Cambridge University Press, 1982).
This nature has been developed through ever larger, richer, more muddled, and more painful syntheses of opposing values.  

Take care of freedom and progress will take care of itself, to paraphrase the title of a recent collection of Rorty’s interviews.  

While Rorty eschewed any attempt to have an overarching narrative that might unite basic beliefs about self-creation with basis beliefs about liberal society, these public and private aspects were brought together for Rorty, albeit in a fundamentally bifurcated way, in the figure of the liberal ironist. An ironist is:

the sort of person who faces up to the contingency of his or her own most central beliefs and desires – someone sufficiently historicist and nominalist to have abandoned the ideal that those central beliefs and desires refer back to something beyond the reach of time and chance. (CIS xv)  

An ironist recognizes the groundlessness of her final vocabulary. An ironist was liberal when among those ungrounded beliefs and desires was the “hope that suffering will be diminished, that the humiliation of human beings by other human beings may cease” (ibid.).  

It was within this framework that Rorty read European political philosophy. In these terms, Rorty claimed, for example, that Foucault was an ironist without being a liberal and Habermas was a liberal without being an ironist.  

He thought that Foucault’s genealogies of modern social institutions had powerfully shown the distinctive nature of modern constraints on self-elaboration when compared with premodern institutions. However, Foucault was unwilling to concede that these constraints were a price worth paying for their contribution to reducing pain and humiliations. Rorty was willing to pay the price, to “bite the bullet” as Charles Guignon and I have argued elsewhere. Furthermore, while Foucault’s analysis of disciplinary power raised challenging questions about the very coherence of the idea of freedom from power, Foucault nonetheless imagined an epistemic transformation in which new configurations of power might be less dangerous and more commodious for self-creation. Rorty, however, thought that liberalism already contains these resources:

39. See Rorty, Take Care of Freedom and Truth Will Take Care of Itself.  
41. Guignon and Hiley, “Biting the Bullet.”
I think that contemporary liberal society already contains the institutions for its own improvement – an improvement which can mitigate the dangers Foucault sees. Indeed, my hunch is that Western social and political thought may have had the last conceptual revolution it needs. J. S. Mill’s suggestion that governments devote themselves to optimizing the balance between leaving people’s private lives alone and preventing suffering seems to me pretty much the last word. (CIS 63)

On Rorty’s reading, Habermas was appropriately liberal but insufficiently ironic. He wanted to ground the liberal commitment to domination-free democratic decision-making in the nature of rational and intersubjective communication itself. Rorty’s ironist would not take this liberal expression of basic hope for domination-free communication (in Rorty’s terms, this particular final, although contingent, vocabulary) as grounded or needing a ground. Liberalism did not require a metaphysician, even a quasi-metaphysician. In contrasting the liberal ironist and the liberal metaphysician, Rorty said that the:

liberal metaphysician wants our wish to be kind to be bolstered by an argument, one which entails a self-redescription which will highlight a common human essence, an essence which is something more than our shared ability to suffer humiliation. The liberal ironist just wants our chances of being kind, of avoiding the humiliation of others, to be expanded by redescriptions. (CIS 91)

His difference with Habermas was not over the value of liberal democratic institutions such as education, free press, equality of opportunity, political participation, and the like. Unlike Habermas, Rorty thought that we could simply be pragmatist about these things, recognizing that they are based on social hope, not on knockdown arguments. Or using his more recent terminology, the arguments are matters of cultural politics, not foundational philosophical arguments. If Foucault and Habermas would just give up on attempts to integrate private and public life, then ironist Foucault could join “we liberals” and liberal Habermas could join “we ironists.” On Rorty’s readings, Foucault was drained of his excessive Nietzscheanism and Habermas was weaned from his residual Kantianism.

Rorty interpreted Derrida as a pragmatist as well. In a series of articles about Derrida beginning in the early 1980s, Rorty enlisted Derrida in the war against foundationalism, complimented him for being Heidegger’s strongest reader,

---

42. See Rorty, “Introduction,” Philosophy as Cultural Politics.
praised him for blurring the boundary between philosophy and literature, and defended him against interpreters who would turn him into a transcendental philosopher. In *Contingency, Irony, and Solidarity*, Derrida was his paradigmatic private ironist. However, Rorty claimed that his irony had nothing to offer politics, liberal or otherwise.

It will not come as a surprise that Derrida appreciated the compliment but he repudiated Rorty’s interpretations. Simon Critchley has also done an especially good job of examining Rorty’s reading of Derrida and of responding to Rorty’s claim that Derrida’s writing had no public utility. Derrida rejected Rorty’s view that there was a distinguishable “early” and “late” aspect to his work. He rejected the idea that he was blurring philosophy and literature. And he especially rejected Rorty’s public/private distinction that pigeonholed Derrida as a private ironist. Instead, he claimed that the texts Rorty most admired and used to characterize Derrida as a private ironist – *Glas* and *La Carte postale* – were intended not as works of private irony, but rather “are performative problematizations of the public/private distinction.” As interesting as it would be to pursue the difference between Rorty and Derrida on public and private life, it is a disclaimer that Derrida made while introducing this response to Rorty that I want to note since it will introduce my concluding remarks on Rorty.

Derrida acknowledged in passing that he did not fully comprehend the context of deconstruction in the United States and how that figured in Rorty’s thinking about Derrida’s work. I believe, however, that the American context was always paramount for Rorty, in his reading of Derrida and contemporary European philosophers generally. Despite his interest in European philosophy, Rorty was fundamentally an American philosopher, as American as his hero and model, John Dewey. Not only did Rorty’s critique of traditional philosophy draw on Dewey’s antifoundationalism, but his critique of analytic philosophy was also aimed at its professionalizing of philosophy at the expense of the role in American culture that figures like Dewey played. His attraction to European philosophy was moderated by what was distinctively American in his concerns and how different the American problematic was from the European.

Just as he worried about the effect of analytic philosophy on the professionalization and marginalization of philosophy in the United States, he worried about the way European philosophy had been digested in American universities and especially among the academic/cultural left in America. This was especially clear in Achieving Our Country,\textsuperscript{47} where Rorty defended the idea of America common to Walt Whitman, Dewey, and the progressive leftist of the early twentieth century and where he castigated the academic left in America for abandoning the reformist activism and social hope of the progressive era leftists of the first half of the twentieth century. According to Rorty, the academic left had become spectatorial and cynical cosmopolitans who distrusted the idea of America, and of patriotism and social hope. As interested as he was in Heidegger, Derrida, Foucault, and other European philosophers of the last half of the twentieth century, Rorty thought that their influence on the academic left in the last decades of the century had resulted in disengaging the Left from active politics, replacing political activism with “theoretical hallucinations” (AC 94). Against the spectatorial left, Rorty argued that the critiques of metaphysics, modernity, and Enlightenment rationalism that one finds in Heidegger, Derrida, and Foucault are perfectly compatible with “old fashioned reformist liberals” like Dewey (AC 96) since the significance of their critiques was for our private lives, our private projects of self-elaboration. They should not serve as guides to political conduct and deliberation. They should be kept separate from our public lives.

Against the academic left, Rorty sought to revive Whitman’s idea of America and democracy and to reinvigorate the progressive liberalism of Dewey:

For both Whitman and Dewey, the terms “America” and “democracy” are shorthand for a new conception of what it is to be human – a conception which has no room for obedience to a nonhuman authority, and in which nothing save freely achieved consensus among human beings has any authority at all. \hfill (AC 18)

Rorty began Achieving our Country this way:

[N]ational pride is to countries what self-respect is to individuals: a necessary condition for self-improvement. Too much national pride can produce bellicosity and imperialism, just as excessive self-respect can produce arrogance. But just as too little self-respect

makes it difficult for a person to display moral courage, so insufficient national pride makes energetic and effective debate about national policy unlikely. Emotional involvement with one’s country – feelings of intense shame and glowing pride aroused by various parts of its history, and by various present-day national policies – is necessary if political deliberation is to be imaginative and productive. Such deliberation will probably not occur unless pride outweighs shame.

Conservatives in the United States attacked Rorty for dwelling too much on shameful US policies in this book and in his prolific political commentary and opinion pieces in the liberal press. International critics of US policy and cosmopolitan-inclined political theorists have attacked his nationalist sentiments. In the very important debate now taking place over the future of the nation-state in a global world and the viability of national identity with its unhappy track record, it would be easy to place Rorty in the nationalist rather than the cosmopolitan side of this debate. But I believe it is more appropriate to think of Rorty as a cosmopolitan patriot in the sense Jonathan Hansen gives it, a position that attempts to reconcile Whitman’s ideal of America with the global spread of liberal principles that undergird it – a cosmopolitan outlook based on hope for expanding solidarity and the global reduction of suffering rather than universalistic theories about human nature.

MAJOR WORKS

“Continental philosophy” is itself a contested concept. For some, it is understood to be any philosophy after 1780 originating on the European continent (Germany, France, Italy, etc.). Such an understanding would make Georg von Wright or Rudolf Carnap – respectively, a Finnish-born philosopher of language and a German-born logician who taught for many years in the US – a “continental philosopher,” an interpretation neither they nor their followers would easily accept. For others, “continental philosophy” refers to a style of philosophizing, one more attentive to the world of experience and less focused on a rigorous analysis of concepts or linguistic usage. In this and the accompanying seven volumes in this series, “continental philosophy” will be understood historically as a tradition that has its roots in several different ways of approaching and responding to Immanuel Kant's critical philosophy, a tradition that takes its definitive form at the beginning of the twentieth century as the phenomenological tradition, with its modern roots in the work of Edmund Husserl. As such, continental philosophy emerges as a tradition distinct from the tradition that has identified itself as “analytic” or “Anglo-American,” and that locates its own origins in the logical analyses and philosophy of language of Gottlob Frege. Whether or not there is in fact a sharp divergence between the work of Husserl and Frege is itself a contested question, but what cannot be contested is that two distinct historical traditions emerged early in the twentieth century from these traditions’ respective interpretations of Husserl (and Heidegger) and Frege (and Russell). The aim of this history of continental philosophy is to trace the developments in one of these traditions from its roots in Kant and his contemporaries through to its most recent manifestations. Together, these volumes present a coherent and comprehensive account of the continental philosophical tradition.
that offers readers a unique resource for understanding this tradition’s complex and interconnected history.

Because history does not unfold in a perfectly linear fashion, telling the history of continental philosophy cannot simply take the form of a chronologically organized series of “great thinker” essays. And because continental philosophy has not developed in a vacuum, telling its history must attend to the impact of figures and developments outside philosophy (in the sciences, social sciences, mathematics, art, politics, and culture more generally) as well as to the work of some philosophers not usually associated with continental philosophy. Such a series also must attend to significant philosophical movements and schools of thought and to the extended influence of certain philosophers within this history, either because their careers spanned a period during which they engaged with a range of different theorists and theoretical positions or because their work has been appropriated and reinterpreted by subsequent thinkers. For these reasons, the volumes have been organized with an eye toward chronological development but, in so far as the years covered in each volume overlap those covered in the subsequent volume, they have been organized as well with the aim of coordinating certain philosophical developments that intersect in a fashion that is not always strictly chronological.

Volume 1 begins with the origins of continental philosophy in Kant and the earliest responses to his critical philosophy, and presents an overview of German idealism, the major movement in philosophy from the late eighteenth to the middle of the nineteenth century. In addition to Kant, the period covered in the first volume was dominated by Fichte, Schelling, and Hegel, and together their work influenced not just philosophy, but also art, theology, and politics. This volume thus covers Kant’s younger contemporary Herder, and his readers Schiller and Schlegel – who shaped much of the subsequent reception of Kant in art, literature, and aesthetics; the “Young Hegelians” – including Bruno Bauer, Ludwig Feuerbach, and David Friedrich Strauss – whose writings would influence Engels and Marx; and the tradition of French utopian thinking in such figures as Saint-Simon, Fourier, and Proudhon. In addition to Kant’s early critics – Jacobi, Reinhold, and Maimon – significant attention is also paid to the later critic of German idealism Arthur Schopenhauer, whose appropriation and criticism of theories of cognition later had a decisive influence on Friedrich Nietzsche.

Volume 2 addresses the second half of the nineteenth century, in part as a response to the dominance of Hegelian philosophy. These years saw revolutionary developments in both European politics and philosophy, and five great critics dominated the European intellectual scene: Feuerbach, Marx, Søren Kierkegaard, Fyodor Dostoevsky, and Nietzsche. Responding in various ways to Hegelian philosophy and to the shifting political landscape of Europe and

viii
Volume 7
the United States, these thinkers brought to philosophy two guiding orientations – materialism and existentialism – that introduced themes that would continue to play out throughout the twentieth century. The second half of the nineteenth century also saw the emergence of new schools of thought and new disciplinary thinking, including the birth of sociology and the social sciences, the development of French spiritualism, the beginning of American pragmatism, radical developments in science and mathematics, and the development of hermeneutics beyond the domains of theology and philology into an approach to understanding all varieties of human endeavor.

Volume 3 covers the period between the 1890s and 1930s, a period that witnessed revolutions in the arts, science, and society that set the agenda for the twentieth century. In philosophy, these years saw the beginnings of what would grow into two distinct approaches to doing philosophy: analytic and continental. It also saw the emergence of phenomenology as a new rigorous science, the birth of Freudian psychoanalysis, and the maturing of the discipline of sociology. Volume 3 thus examines the most influential work of a remarkable series of thinkers who reviewed, evaluated, and transformed nineteenth-century thought, among them Henri Bergson, Émile Durkheim, Sigmund Freud, Martin Heidegger, Edmund Husserl, Karl Jaspers, Max Scheler, and Ludwig Wittgenstein. It also initiated an approach to philosophizing that saw philosophy move from the lecture hall or the private study into an active engagement with the world, an approach that would continue to mark continental philosophy's subsequent history.

The developments and responses to phenomenology after Husserl are the focus of the essays in Volume 4. An ambiguity inherent in phenomenology – between conscious experience and structural conditions – lent itself to a range of interpretations. While some existentialists focused on applying phenomenology to the concrete data of human experience, others developed phenomenology as conscious experience in order to analyze ethics and religion. Still other phenomenologists developed notions of structural conditions to explore questions of science, mathematics, and conceptualization. Volume 4 covers all the major innovators in phenomenology – notably Sartre, Merleau-Ponty, and the later Heidegger – as well as its extension into religion, ethics, aesthetics, hermeneutics, and science.

Volume 5 concentrates on philosophical developments in political theory and the social sciences between 1920 and 1968, as European thinkers responded to the difficult and world-transforming events of the time. While some of the significant figures and movements of this period drew on phenomenology, many went back further into the continental tradition, looking to Kant or Hegel, Marx or Nietzsche, for philosophical inspiration. Key figures and movements discussed in this volume include Adorno, Horkheimer, and the Frankfurt School,
Schmitt, Marcuse, Benjamin, Arendt, Bataille, black existentialism, French Marxism, Saussure, and structuralism. These individuals and schools of thought responded to the “crisis of modernity” in different ways, but largely focused on what they perceived to be liberal democracy’s betrayal of its own rationalist ideals of freedom, equality, and fraternity. One other point about the period covered in this volume is worthy of note: it is during these years that we see the initial spread of continental philosophy beyond the European continent. This happens largely because of the emigration of European Jewish intellectuals to the US and UK in the 1930s and 1940s, be it the temporary emigration of figures such as Adorno, Horkheimer, Lévi-Strauss, and Jakobson or the permanent emigration of Marcuse, Arendt, and Gurwitsch. As the succeeding volumes will attest, this becomes a central feature of continental philosophy’s subsequent history.

Volume 6 examines the major figures associated with poststructuralism and the second generation of critical theory, the two dominant movements that emerged in the 1960s, which together brought continental philosophy to the forefront of scholarship in a variety of humanities and social science disciplines and set the agenda for philosophical thought on the continent and elsewhere from the 1960s to the present. In addition to essays that discuss the work of such influential thinkers as Althusser, Foucault, Deleuze, Derrida, Lyotard, Irigaray, Habermas, Serres, Bourdieu, and Rorty, Volume 6 also includes thematic essays on issues including the Nietzschean legacy, the linguistic turn in continental thinking, the phenomenological inheritance of Gadamer and Ricoeur, the influence of psychoanalysis, the emergence of feminist thought and a philosophy of sexual difference, and the importation of continental philosophy into literary theory.

Before turning to Volume 7, a few words on the institutional history of continental philosophy in the United States are in order, in part because the developments addressed in Volumes 6–8 cannot be fully appreciated without recognizing some of the events that conditioned their North American and anglophone reception. As has been mentioned, phenomenologists such as Alfred Schutz and Aron Gurwitsch, and other European continental philosophers such as Herbert Marcuse and Hannah Arendt, began relocating to the United States in the 1930s and 1940s. Many of these philosophers began their work in the United States at the University in Exile, established in 1933 as a graduate division of the New School for Social Research for displaced European intellectuals. While some continental philosophy was taught elsewhere around the United States (at Harvard University, Yale University, the University at Buffalo, and elsewhere), and while the journal Philosophy and Phenomenological Research began publishing in 1939, continental philosophy first truly began to become an institutional presence in the United States in the 1960s. In 1961, John Wild (1902–72) left Harvard to become Chair of the Department of Philosophy at Northwestern University. With a commitment from the provost of the university
and the Northwestern University Press to enable him to launch the Northwestern Series in Phenomenology and Existential Philosophy, Wild joined William Earle and James Edie, thus making Northwestern a center for the study of continental philosophy. Wild set up an organizational committee including himself, Earle, Edie, George Schrader of Yale, and Calvin Schrag (a former student of Wild's at Harvard, who was teaching at Northwestern and had recently accepted an appointment at Purdue University), to establish a professional society devoted to the examination of recent continental philosophy. That organization, the Society for Phenomenology and Existential Philosophy (SPEP), held its first meeting at Northwestern in 1962, with Wild and Gurwitsch as the dominant figures arguing for an existential phenomenology or a more strictly Husserlian phenomenology, respectively. Others attending the small meeting included Erwin Straus, as well as Northwestern graduate students Edward Casey and Robert Scharff, and today SPEP has grown into the second largest society of philosophers in the United States. Since those early days, many smaller societies (Heidegger Circle, Husserl Circle, Nietzsche Society, etc.) have formed and many journals and graduate programs devoted to continental philosophy have appeared. In addition, many of the important continental philosophers who first became known in the 1960s – including Gadamer, Ricoeur, Foucault, Derrida, Lyotard, and Habermas – came to hold continuing appointments at major American universities (although, it must be mentioned, not always housed in departments of philosophy) and, since the 1960s, much of the transmission of continental philosophy has come directly through teaching as well as through publications.

The transatlantic migration of continental philosophy plays a central role in Volume 7, which looks at developments in continental philosophy between 1980 and 1995, a time of great upheaval and profound social change that saw the fruits of the continental works of the 1960s beginning to shift the center of gravity of continental philosophizing from the European continent to the anglophone philosophical world and, in particular, to North America. During these years, the pace of translation into English of French and German philosophical works from the early twentieth century as well as the very recent past increased tremendously, and it was not uncommon to find essays or lectures from significant European philosophers appearing first in English and then subsequently being published in French or German. In addition, the period covered in this volume also saw the spread of continental philosophy beyond the confines of philosophy departments, as students and faculty in centers of humanities and departments of comparative literature, communication studies, rhetoric, and other interdisciplinary fields increasingly drew on the work of recent continental philosophers. Volume 7 ranges across several developments during these years – the birth of postmodernism, the differing philosophical traditions of France, Germany, and Italy, the third generation of critical theory, and the so-called
“ethical turn” – while also examining the extension of philosophy into questions of radical democracy, postcolonial theory, feminism, religion, and the rise of performativity and post-analytic philosophy. Fueled by an intense ethical and political desire to reflect changing social and political conditions, the philosophical work of this period reveals how continental thinkers responded to the changing world and to the key issues of the time, notably globalization, technology, and ethnicity.

The eighth and final volume in this series attempts to chart the most recent trends in continental philosophy, which has now developed into an approach to thinking that is present throughout the world and engaged with classical philosophical problems as well as current concerns. The essays in this volume focus more on thematic developments than individual figures as they explore how contemporary philosophers are drawing on the resources of the traditions surveyed in the preceding seven volumes to address issues relating to gender, race, politics, art, the environment, science, citizenship, and globalization. While by no means claiming to have the last word, this volume makes clear the dynamic and engaged quality of continental philosophy as it confronts some of the most pressing issues of the contemporary world.

As a designation, “continental philosophy” can be traced back at least as far as John Stuart Mill’s *On Bentham and Coleridge* (1840), where he uses it to distinguish the British empiricism of Bentham from a tradition on the continent in which he sees the influence of Kant. Since that time, and especially since the early twentieth century, the term has been used to designate philosophies from a particular geographical region, or with a particular style (poetic or dialectical, rather than logical or scientistic). For some, it has been appropriated as an honorific, while for others it has been used more pejoratively or dismissively. Rather than enter into these polemics, what the volumes in this series have sought to do is make clear that one way to understand “continental philosophy” is as an approach to philosophy that is deeply engaged in reflecting on its own history, and that, as a consequence, it is important to understand the history of continental philosophy.

While each of the volumes in this series was organized by its respective editor as a volume that could stand alone, the eight volumes have been coordinated in order to highlight various points of contact, influence, or debate across the historical period that they collectively survey. To facilitate these connections across the eight volumes, cross-referencing footnotes have been added to many of the essays by the General Editor. To distinguish these footnotes from those of the authors, they are indicated by an asterisk (*).

Alan D. Schrift, General Editor

Silvia Benso is Professor of Philosophy at Rochester Institute of Technology, where she works in the areas of contemporary European philosophy and ancient philosophy. She is the author of Pensare dopo Auschwitz: Etica filosofica e teodicea ebraica (1992) and The Face of Things: A Different Side of Ethics (2000). With Brian Schroeder she is the coeditor of Contemporary Italian Philosophy: Crossing the Borders of Ethics, Politics, and Religion (2007) and Between Nihilism and Politics: The Hermeneutics of Gianni Vattimo (2010), and cotranslator of Carlo Sini’s Ethics of Writing (2009) and Ugo Perone’s The Possible Present (forthcoming). With Brian Schroeder she also coedits the series Contemporary Italian Philosophy.

Bruce Ellis Benson is Professor and Chair of the Philosophy Department at Wheaton College (IL). He is the author of Graven Ideologies: Nietzsche, Derrida and Marion on Modern Idolatry (2002) and Pious Nietzsche: Decadence and Dionysian Faith (2007). He is coeditor of The Phenomenology of Prayer (with
Norman Wirzba; 2005), *Hermeneutics at the Crossroads* (with Kevin J. Vanhoozer and James K. A. Smith; 2006) and *Transforming Philosophy and Religion: Love’s Wisdom* (with Norman Wirzba; 2008). His areas of research include continental philosophy of religion, Nietzsche, and political theology.

**Rosi Braidotti** is Distinguished Professor in the Humanities at Utrecht University in the Netherlands and founding Director of the Centre for the Humanities at Utrecht University. She was the founding Chair and Professor of Women’s Studies in the Arts Faculty of Utrecht University (1988–2005), Scientific Director of the Netherlands Research School of Women’s Studies (1995–2005), set up the Network of Interdisciplinary Women’s Studies in Europe (NOI&SE) within the Erasmus Programme in 1989, and has been elected to the Australian Academy of the Humanities. She has published extensively in feminist philosophy, epistemology, poststructuralism, and psychoanalysis, and is the author of several books, including *Patterns of Dissonance* (1991), *Nomadic Subjects: Embodiment and Sexual Difference in Contemporary Feminist Theory* (1994), *Metamorphoses: Towards a Materialist Theory of Becoming* (2002), and *Transpositions: On Nomadic Ethics* (2006).

Simon Duffy is an ARC Postdoctoral Fellow in the Department of Philosophy at the University of Sydney. His research interests include early modern philosophy, European philosophy, and the history and philosophy of science. He is the author of The Logic of Expression: Quality, Quantity and Intensity in Spinoza, Hegel and Deleuze (2006), and is editor of Virtual Mathematics: The Logic of Difference (2006).

Robert Eaglestone is Professor of Contemporary Literature and Thought at Royal Holloway, University of London. He works on contemporary literature and philosophy, and literary theory, and on Holocaust and genocide studies. He is the author of Ethical Criticism: Reading after Levinas (1997), Doing English (1999, 3rd ed. 2009), Postmodernism and Holocaust Denial (2001), and The Holocaust and the Postmodern (2004), and the editor of several books, most recently J. M. Coetzee in Theory and Practice (2009), and the Blackwell Encyclopaedia of Literary and Cultural Theory, volume 2 (2010). He is the series editor of the book series Routledge Critical Thinkers.

Josef Fulka, Jr. teaches modern philosophy and literary theory at the Faculty of Humanities, Charles University, Prague. He is the author of Zmeškané setkání: Denis Diderot a myšlení 20. století (The missed encounter: Denis Diderot and twentieth century thought; 2004), and Psychoanalýza a francouzské myšlení (Psychoanalysis and contemporary French thought; 2008), and coauthor of Michel Foucault: politika a estetika (Michel Foucault: politics and aesthetics; with Pavel Barša, 2005). He translates from French (Althusser, Barthes, Chion, Derrida, Foucault, Kristeva, and others). His areas of research include psychoanalysis, contemporary French philosophy, and literary theory.

Simon Malpas is a lecturer of English Literature at Edinburgh University. He is the author of Jean-Francois Lyotard (2003) and The Postmodern (2005), and has edited Postmodern Debates (2001), The New Aestheticism (with John Joughin; 2003), and The Routledge Companion to Critical Theory (with Paul Wake; 2006), and has published articles on literature and philosophy, aesthetics, postmodernism, and Romanticism.

Patrice Maniglier is a lecturer in the Department of Philosophy of the University of Essex. Before coming to Essex, he taught in several institutions in France, including Nanterre, Lille, the École Normale Supérieure-Ulm and Nice School
of Arts. He is the author of La Vie enigmatique des signes, Saussure et la naissance du structuralisme (2006) and many articles on structuralism and postwar French philosophy, where he argues for a reinterpretation and reactualization of structuralism and of the semiotic tradition. He is currently working on a book on the metaphysical stakes of structural anthropology.

José Medina is Associate Professor of Philosophy at Vanderbilt University. He works in philosophy of language, social and political philosophy, and philosophy of race. Medina's publications include the books The Unity of Wittgenstein's Philosophy (2002), Language (2005), and Speaking from Elsewhere (2006). He has also published two edited volumes: Truth: Engagements Across Philosophical Traditions (with David Wood; 2005) and Identity and Ethnicity (The Journal of Speculative Philosophy, April 2004).

Brian Schroeder is Professor and Chair of Philosophy and Director of Religious Studies at Rochester Institute of Technology. With Silvia Benso, he is coeditor of the book series Contemporary Italian Philosophy. The author of Altered Ground: Levinas, History and Violence (1996), he is, with Silvia Benso, coauthor of Pensare ambientalista: Tra filosofia e ecologia (2000), with whom he has also coedited Contemporary Italian Philosophy: Crossing the Borders of Ethics, Politics, and Religion (2007), Levinas and the Ancients (2008), and Between Nihilism and Politics: The Hermeneutics of Gianni Vattimo (2010), and cotranslated Carlo Sini’s Ethics of Writing (2009) and Ugo Perone’s The Possible Present (forthcoming). Schroeder’s other edited books include Thinking Through the Death of God (2004) and Japanese and Continental Philosophy: Conversations with the Kyoto School (2010).

Lasse Thomassen is Senior Lecturer in Political Theory in the Department of Politics at Queen Mary, University of London, and García Pelayo Fellow at Centro de Estudios Políticos y Constitucionales in Madrid. His research focuses
INTRODUCTION

Rosi Braidotti

I. AFTER THE WALL

If there ever was an age of historical and philosophical transition, it would have to be the 1980–95 period that is addressed in this volume. Let us play with a few significant dates to illustrate the point: In 1979, the high priest of the radical libertarian Left Herbert Marcuse dies, followed in 1980 by the cofounder of existentialism, Jean-Paul Sartre, and by Jacques Lacan in 1981. With the death of General Tito, also in 1980, many start mourning the crisis of Western European Marxism, while a greater portion of the world youth is far more affected by the assassination of John Lennon, in New York, which also took place in the year of (dis)grace 1980. “Lennon, not Lenin!” had been a cry of revolutionary youth throughout the previous decade and it acquires a more poignant meaning at the dawn of the 1980s, as the fallout from the previous radical decades comes to a new and sharper focus.

In her seminal text The Summer of 1980, the French writer Marguerite Duras, who was also a member of the communist anti-Nazi resistance in her youth, comments extensively on the political events taking place in the Gdansk shipyard in Poland. Under the leadership of Lech Walesa (future Nobel Peace Prize winner) and the trade union Solidarity, Soviet hegemony is being challenged to the core. It is the beginning of the end for Soviet-style communism, announces Duras with barely contained joy. Paris had provided the world forum for progressive and even left-wing critiques of Soviet communism since the 1970s, and for the elaboration of alternative forms of political radicalism. This positions French philosophy as a particularly important factor in the philosophical landscape of the period under review in this volume. Two examples: Nobel Peace
Prize winner Alexander Solzhenitsyn’s *Gulag Archipelago*, written in secrecy in the USSR as the definitive account of Stalin’s death camps, was published in three volumes in Paris between 1973 and 1978. It provides the background for many of the poststructuralist philosophers’ critiques of the failed social experiments of Soviet socialism, as well as extra ammunition for the conservatives’ opposition to Marxism. The second significant event: Ayatollah Khomeini, the spiritual leader and political inspiration behind the Iranian Islamist revolution of 1979 was in exile in Paris in the years preceding the fall of the Shah. The 1980s is in many ways a decade dominated by the cultural and political energies emanating from Paris.

Then comes the landmark year 1989, which signals the fall of the Berlin Wall, the events of Tiananmen Square, and the opening of a new geopolitical era under the aegis of American domination. The philosophical implications of the historical defeat of communism are enormous: both theoretically and politically, the end of the Cold War marks the official rejection of Marxism as a platform for thinking and political organizing. Nineteen eighty-nine also marks the Soviet withdrawal from Afghanistan and the buildup of Islamist opposition that will consolidate Osama Bin Laden’s power base in the region. An era of perpetual warfare seems to open after 1989, both in the Balkans and in the Gulf area.

For an era that proudly announced itself as marking the “end of ideology,” the 1980s and 1990s witnessed a series of conservative ideological onslaughts, starting with the election of Margaret Thatcher as prime minister in the UK in 1979 and of Ronald Reagan as president in the US in 1980. The Christian-driven American Right celebrates both the end of history (Fukuyama) and the triumph of advanced capitalism as the highest point of human evolution. This conservative political ontology centered on American hegemony is unquestionably one of the offshoots of the end of the Cold War, and although it meets with robust opposition, especially in France after the election of François Mitterrand as president in 1981, it sets the tone for the fast-growing globalization project. Alain Touraine describes it as “one-way thought,” that is to say, a unilateral approach to geopolitical affairs and a monological idea of social progress. In this regard, 1989 marks simultaneously the end of communism and the birth of neo-Marxist resistance: both the resurgence of neoliberal economics and its betrayal by neoconservative Christian and, later, Muslim fundamentalists. How and to what extent these in turn result in the renegotiation of the groundings of philosophical practice in this period is a crucial point for discussion.

It is striking, as one looks back over this period, to what extent issues of cultural identity and ideological belonging, of imperial and postcolonial legacies, and of new modes of resistance come to the fore. The Berlin Wall, in fact, fell on both sides, which means that this event challenges binary identity definitions in the former West as well as in the former East, and that it restructures
discursive power relations accordingly. Post-Cold War scholarship can now begin, as Gayatri Spivak announces in *Death of a Discipline*: the “postcommunist” era in the East is matched by a global “postcolonial” era in the West, that is to say, a dual displacement of the core of formerly unitary and oppositional identities. Continental philosophy cannot avoid confrontation with these shifting relations and terms. Historical events unfold alongside each other and shift the axis of philosophical reflection across the board: the election of Benazir Bhutto as the first woman leader of an Islamic nation takes place in 1988; the liberation of Nobel Peace Prize-winning Nelson Mandela in 1990; the Maastricht Treaty is signed in 1992, the same year as the signing of the North American Free Trade Agreement (NAFTA), while the World Trade Organization (WTO) is set up in 1995.

This speed of events introduces new levels of complexity into the discussion of what counts as the basic unit of continental philosophy: Is it Europe? Which idea of Europe would that entail? And what might be its conceptual, ethnic, and territorial border? What is the legacy of the colonial and fascist past in the present discursive relations engendered by the practice of this discipline? The self-perception of the former West shifts towards a more acute awareness of its colonial and postcolonial legacy. The impetus for this revision does not originate in philosophy, but the discipline cannot fail to be affected by it. The dislocation of eurocentrism becomes a central concern and is especially important to the discussions about the new cosmopolitanism and non-Western humanism. In this volume we dedicate a chapter to the rise of cultural and ethnic studies and their impact on philosophy. This chapter should be approached as a marker of the philosophical relevance and the lasting legacy of anticolonial philosophies and postcolonial theories. These concerns are also featured elsewhere in *The History of Continental Philosophy* and should therefore be approached as transversal and recurrent concerns.

These developments affect also the world-historical and political project that is the European Union (EU). The construction of the EU, through the enlargement process, is made both possible and necessary by the postcommunist/postcolonial conjunction. This issue unfortunately still remains largely unexamined in philosophy, but *The History of Continental Philosophy* does recognize the emergence of the EU as a philosophical question and addresses it accordingly (in Volume 8). For this volume, we try to come to terms with it by devoting special attention to what one could define as philosophical area studies: we have specific chapters on German, Italian, and Czech philosophies, which try to assess whether the changing political context in continental Europe actually affects the practice and the agenda of continental philosophy.

In other words, our understanding of “continental philosophy” has broadened since philosophy extricated itself from the Cold War in 1989, in that
philosophy needs to be redefined in a transnational manner in the context of globalization, postcommunism, and postcolonialism. As a result, continental philosophy is caught, more than ever, in a dialogue with and excursions into its multiple “outsides,” both geopolitically and conceptually. This means that the contributors to this volume resist any attempt to flatten out the diversity of political traditions and histories within former Central and Eastern but also former Western Europe. We neither assume nor support any common metanarrative of postcommunist philosophy or any consensus about a post-1989 neoliberal world order, let alone the place and role of philosophy within it.

Because the contributors to this volume come from a great diversity of geopolitical locations, and because of the large number of Europe-based authors we have been able to gather, more reflection is needed in order to account for this diversity of locations. The specificity of our respective location, in the sense of a sociocultural history as well as a geopolitical position, needs to be taken into account as a factor that shapes post-1989 continental philosophy and leads to the contemporary developments that will be mapped out in this and also the last volume of *The History of Continental Philosophy*.

**II. THAT POSTMODERNISM WHICH WAS NOT ONE**

In other disciplines, notably cultural and film studies and comparative literature, the 1980s may count as the era of “high” postmodernism. Jean-François Lyotard’s seminal text *The Postmodern Condition* appears in 1979, Fredric Jameson’s equally influential *Postmodernism, or, the Cultural Logic of Late Capitalism* appears in 1991. In this period, the discipline of philosophy experiences a great deal of interdisciplinary expansion, as Judith Butler and I argue in this volume. This interdisciplinary drift – which is likely to horrify the philosophical purists – is philosophy’s way of coping with the staggering technological and cultural developments of this era.

Again, let us look at some dates: 1980 is the year that Cable News Network (CNN) begins to provide twenty-four-hour television news coverage, while the watershed debut of MTV occurs in 1981. Madonna’s first agenda-setting album is released in 1981, while Michael Jackson’s legendary *Thriller* comes out in 1982. *The Oprah Winfrey Show* debuts in 1986, while the World Wide Web becomes publicly available on the internet in 1991.

The convergence between advanced technologies in the field of communication and information on the one hand, and the bioscientific domain on the other, contributes to accelerate the social and intellectual changes. Nineteen eighty-four fails to live up to the apocalyptic, proto-totalitarian scenario dreamed up by George Orwell in the throes of the Cold War. “Big Brother” will soon become
the title of a globally successful reality television program and 1984 goes down in history as the year of publication of William Gibson’s *Neuromancer*, the book that launches a thousand links and provides the imaginary to code the emerging phenomenon that is the internet. Michel Foucault’s death is mourned by many that year, but the masses are more concerned about the disastrous outcome of the miners’ strike in the UK, which will mark a resolute political victory for the neoliberal forces that back Thatcher. The rise of digital culture and the demise of the old Left stand side by side as landmarks of the era and mirror images of each other. As Donna Haraway publishes her paradigm-shifting text “A Cyborg Manifesto” in 1985, J. G. Ballard’s *Crash* – first published as a novel in 1973, but issued as a film in 1996 – casts a more pensive but also more decadent shadow over the ongoing cybernetic revolution. The process of biogenetical recoding of reproduction, which opens in 1978 with the birth of the first test-tube baby, Louise Brown, culminates in 1996 with the cloning of Dolly the sheep, while the Human Genome Project is officially launched in 1990.

The posthuman element of the postmodern condition comes to the fore with increasing insistence throughout the period covered in this volume, making it redundant to wonder whether we are or ever were postmodern. This age of transition is so intense and speedy as to question the very status of what counts as human. Reflections of humanism, posthumanism and antihumanism, Western and non-Western humanism, increase within philosophy, contributing to the so-called “ethical turn,” but also overcoming it in the direction of transnational and postcolonial perspectives. Philosophy’s unresolved relationship to technology proves quite an obstacle in the discipline’s attempt to stay relevant in a technologically mediated and globalized world.

The fact that most of the material in this volume is very contemporary and concerns philosophers who are still alive and writing has also a number of important methodological implications. The first is that by virtue of the ongoing nature of many movements of thought outlined in this volume, the contributors honored their commitment to the social relevance of philosophy by working hard to engage productively with the contradictions, paradoxes, and injustices of their historical context. Furthermore, given that so much of the contemporary context has to do with complex transformations, social mutations, and technological change, they encourage philosophy to think about processes rather than concepts. This is neither a simple nor a particularly welcome task in the theoretical language and disciplinary conventions that have become the norm in philosophical practice. The fact that theoretical reason is concept-bound and fastened on essential notions makes it difficult to find adequate representations for processes, fluid in-between flows of data, experience, and information. They tend to get frozen in spatial, metaphorical modes of representation that itemize them as “problems.” As Gilles Deleuze puts it, the task of philosophy in our
times is not to know who we are, but rather what, at last, we are in the process of becoming. Methodologically speaking, transitions require cartographies that are closer to weather maps than to strict synoptic tables. The contributors to this volume had the unenviable task of trying to capture processes, not single events, and detect collectively enforced movements, not just the rise of proper-noun celebrities. This calls for inventiveness as well as rigor.

This takes us to the second methodological implication: the criteria for the selection of the main texts and authors out of the ongoing processes this volume attempts to account for. Our hope is that decisions about what texts to include from the recent past do not claim to, nor do they objectively have the power to, actually create a canon. The selection therefore reflects something other than the lasting philosophical importance of the works cited. It is rather the case that the works that are mentioned are there to help historically contextualize the overall narrative about the 1980–95 period, more than to acknowledge the appearance of canonical works. The chronology that appears at the end of the volume serves essentially the purpose to align chronologically cultural, historical, and philosophical events so that they can resonate with each other. It is an event-based timeline for the period under scrutiny, which aims at emphasizing processes of change.

Another side effect of this methodological choice is that in this volume chronological linearity is replaced by a more complex kind of temporality. There are two main reasons for this added historico-temporal complexity; first, it reflects the main hypothesis of this volume, namely, that in the 1980–95 period philosophy “explodes” outwards in a number of interdisciplinary thematic and theoretical developments that ignore the canonical periodization of the institutional practice. Second, it fulfills a genealogical purpose that, given the new interdisciplinary orientation, forces many of the authors to cover a broader temporal frame that often begins long before 1980. For instance, the essay on French and Italian Spinozism has to look back to the earlier parts of the twentieth century in order to set the context for what emerges in the 1980s. Similarly, the chapter on postcolonial theory has to extend the time frame of this volume in order to account for philosophical events that are central to it, but took root much earlier. And the essays that explore philosophical developments in the national contexts of France, Germany, Italy, and the Czech Republic must also examine the genealogy of these developments in the intellectual influences and formations of the philosophers discussed.

A third methodological implication of the contemporaneity of the topics discussed here is that the speed of the social and political transformations of the period covered in this volume is itself an important factor. By the start of the third millennium, the social context has changed considerably since the days when the poststructuralist philosophers discussed in Volume 6 of The History
of Continental Philosophy first put “difference” on the theoretical and political agenda. The return of biological essentialism, under the cover of genetics, molecular biology, evolutionary theories, and the despotic authority of DNA has caused both inflation and a reification of the notion of “difference.” As the US celebrates its first black president, in Europe today contemporary racism celebrates rather than denies differences. In this reactionary discourse, however, cultural and ethnic differences are essentialized and attached to firm beliefs about national, regional, provincial, or even town-based parameters. In this context, however, difference is a term indexed on a hierarchy of values that it governs by exclusions through binary oppositions.

This political context makes it all the more important to return the post-poststructuralist and other philosophies of difference to their original progressive and even radical potential. After thirty years of postmodernist debates for, against, or undecided on the issue of the “nonunitary,” split, in-process, knotted, rhizomatic, transitional, nomadic subjects, issues of fragmentation, complexity, and multiplicity have become part of philosophical terminology and practice. The relative popularity of these notions, however, and the radical-chic appeal of the terminology, does not make for consensus about the issues at stake. It is therefore urgent to assess the implications for contemporary culture and politics of the critiques of the subject that have been developed throughout the 1980s and 1990s. Much disagreement and cross-purpose arguments have been voiced as to the ethical and political issues that the question of the subject raises in contemporary culture and politics. In other words, the “so what?” part of the discussion on philosophical subjectivity is more open than ever, while the contradictions and the paradoxes of our historical condition pile up around us. This volume accordingly gives ample space to the ethical turn, to issues of epistemology, and to the redefinition of the political. These mark major shifts of the categorical distinctions among different branches of philosophy and return to the basic questions about the values, norms, and criteria that philosophy can offer to a fast-changing world.

The volume has been organized according to a rhythmic sequence that groups the chapters in significant clusters. We open with Simon Malpas and the keynote concept of postmodernism, which is contextualized in the political context of advanced capitalism, marked by both fast social change and high levels of cultural anxiety. The unprecedented rate and type of technological developments led by advanced technologies results in critical questioning of the Enlightenment notions of the self-regulating and intrinsically liberating powers of scientific rationality, for instance in the work of Jean Baudrillard, Fredric Jameson, and Jean-François Lyotard. As advanced societies slide toward a culture of digital simulation and virtual reality, the social nexus that held together the Enlightenment project of European modernity slackens off. This requires new critical interventions on the part of philosophers.
There follows a cluster of essays that aim to outline relevant philosophical developments in the field in a number of different national contexts. In “German Philosophy after 1980: Themes Out of School,” Dieter Thomä argues that a dissolution of boundaries takes place in this period not only between continental and analytic philosophy, but also within them. He points to the alliance between Habermas and Derrida, or to Honneth reading Levinas, as clear indication that the labels of the old philosophical “schools” lose much of their relevance in the period under scrutiny in this volume and require more creativity on our part. Writing from France about the lasting legacy of that generation, Patrice Maniglier addresses “The Structuralist Legacy.” He emphasizes the importance of the theory of subjectivity that sustains the epistemological core of structuralism. By analyzing the agenda-setting journal Cahiers pour l’analyse and stressing the structuralists’ interest in the ontological nature of the dynamic unity of subjectivity, Maniglier draws illuminating connections between Althusser, Lacan, Lévi-Strauss and contemporary developments by Badiou, Balibar, and Lecourt. “Italian Philosophy Between 1980 and 1995,” by Silvia Benso and Brian Schroeder, explores a historical context marked by the rigid separation of three cultural domains: the Catholic area, the secularist, and the Marxist thinkers. These domains affect and frame the reception and local developments of wider movements of thought, resulting in three main strands: the crisis of reason and subjectivity, modernity and postmodernity, and hermeneutics and “weak thought.” In his chapter on “Continental Philosophy in the Czech Republic,” Josef Fulka, Jr. adds a much needed note from the eastern side of the former Berlin Wall. By focusing on political and theoretical development in the Czech Republic and especially the thought of Jan Patočka, Fulka traces also the intense and often informal networks of philosophical exchanges that connected East to West during the Cold War. He also highlights the important role played by French philosophy as a harbinger of democracy and freedom.

It is evident that the range of essays included in this section is not exhaustive but is at best a selective choice necessitated by the limitations of size and scope of the volume. The selection could have been expanded to include similar developments both within the European Union and elsewhere in the world. The case of Spain and of Spanish philosophy comes to mind as a particularly relevant one, considering the wealth and continuity of philosophical tradition it offers in the works of, for example, Eugenio Trías Sagnier (1942– ; considered by many the most important Spanish philosopher since Ortega y Gasset), ethical philosopher Fernando Fernández-Savater Martín (1947– ; who follows in the tradition of Nietzsche and Emil Cioran), and critical and postcolonial theorist Eduardo Subirats (1947– ). Philosophical thought in Asia, notably the adaptation of phenomenology to traditions of thought in China, Korea, and, in particular, Japan should also have received more attention than we could grant.
INTRODUCTION

them here. However regrettable, such omissions are inevitable in a volume that aims not at exhaustiveness but rather at tracking the developments of the main traditions of continental German and French philosophies not only in their home countries but more especially in the diasporic mode that is central to the period covered in this volume. The central hypothesis that sustains the selection made here in fact is that continental philosophy after poststructuralism explodes outside the established institutional and disciplinary framework and goes nomadic. Tracking this diasporic move fully would require more space and resources than we could mobilize here. It might be more fitting therefore to read these essays on different national contexts as fulfilling an exemplary function. This is particularly true of the only essay that explicitly examines continental philosophical developments in Eastern Europe: the chapter on the Czech Republic should be approached as representative of the vitality of philosophy behind the Iron Curtain and of its expansion after 1989, rather than as a compre-

1. Nishida Kitaro (1870–1945), widely considered modern Japan’s first original philosopher, introduced Husserl’s work to Japan, thus beginning a long tradition of Japanese phenomenological and postphenomenological philosophy. Taking its point of departure from the thinking of Nishida, the “Kyoto School” – whose name was coined by Tosaka Jun (1900–1945) in 1932 – came into its own via Nishida’s younger colleagues and successors Tanabe Hajime (1885–1962) and Nishitani Keiji (1900–1990), who, through their original contributions, helped shape and solidify the school’s early identity by their association with contemporary European thinking of the day. Both Tanabe and Nishitani studied in Germany during the years between the First and Second World Wars (Tanabe in 1922–24, Nishitani in 1936–39). Tanabe, whose formation in Western philosophy was grounded in Kant and German idealism, had gone to Germany to explore the relation between Kant’s transcendental logic, Bergson’s vitalism, and Husserl’s phenomenology, but encountered the work of the young Heidegger, who impressed him with his “phenomenology of life.” On his return to Japan, Tanabe wrote the first article in the world on Heidegger’s thought. Nishitani, who wrote a dissertation on Schelling and Bergson, returned from Germany to Japan where he became perhaps the most influential proponent of Heideggerian philosophy and an even stronger proponent of Nietzsche, with whose thought Heidegger was actively engaged at the time. Kuki Shūzō (1888–1941) also traveled to Germany, where he studied with Husserl, Heidegger, and Rickert before traveling to Paris in 1928, where he hired, as a French tutor, a young Jean-Paul Sartre, and it has been claimed that it was Kuki who first interested Sartre in Heidegger’s philosophy (see Graham Parkes, Heidegger and Asian Philosophy [Honolulu, HI: University of Hawaii Press, 1990], 158). Kuki wrote the first book-length study of Heidegger (The Philosophy of Heidegger, 1933). Heidegger’s Sein und Zeit, published in 1927, appeared in Japanese translation in 1939, while an English translation did not appear until 1962 and a complete French translation not until 1985. More recently, continental philosophical themes have appeared in the work of Kojin Karatani (1941–; Transcritique: On Kant and Marx [2001], Sabu Kohso [trans.] [Cambridge, MA: MIT Press, 2003]), Akira Asada (1957–), and Kuniichi Uno (1948–). For a critical exploration of the relation between the Kyoto School and continental philosophers, see Bret W. Davis et al. (eds), Japanese and Continental Philosophy: Conversations with the Kyoto School (Bloomington, IN: University of Indiana Press, 2010).
hensive or definitive survey of the importation of continental philosophy into Eastern Europe after 1980.

The next cluster of essays addresses more directly issues in political philosophy. Amy Allen, in “Third Generation Critical Theory: Benhabib, Fraser, and Honneth,” examines the work of Habermas’s three most prolific students as they critically engage his reorientation of critical theory toward normative justifications, the pragmatics of language, and the discourse theory of morality, law, and politics. “French and Italian Spinozism,” by Simon Duffy, on the other hand, traces the development of an alternative ethics inspired by French philosophers’ innovative take on Spinoza. Spinozist materialism as the antidote to Hegelian idealism becomes one of the driving forces in poststructuralist innovations in thinking the political in the work of Étienne Balibar, Pierre Macherey, Gilles Deleuze, and Antonio Negri. This line is pursued and expanded by Lasse Thomassen in “Radical Democracy,” which is presented as an antifoundationalist approach to democratic politics. Focusing on thinkers such as William E. Connolly, Ernesto Laclau, Chantal Mouffe, and Slavoj Žižek, Thomassen explores the longer-term political implications of poststructuralism.

A cluster on new normative approaches to philosophy opens with “Cultural and Postcolonial Studies” by Iain Chambers. He highlights the innovative force of the interdisciplinary field of race and postcolonial theory, mostly in the work of Stuart Hall, Paul Gilroy, and Gayatri Spivak. The innovation is both political and conceptual in that it highlights the critique of racialized power relations while rejecting black essentialism or any kind of essentialism. Chambers also bring out the wealth of philosophical texts generated by anticolonial politics and pleads for a reappraisal of their importance for a contemporary history of philosophical thought. “The ‘Ethical Turn’ in Continental Philosophy in the 1980s,” by Robert Eaglestone, takes the influential figure of Levinas as the lead in sketching the phenomenon of a return to issues of norms and values in the period covered by this volume. Both in reaction to the structural injustices of globalization, and as the effect of poststructuralist critiques, ethics emerges as the main forum for debates about contemporary subjectivity. In my own essay “Feminist Philosophy: Coming of Age,” I explore the explosion of scholarly work in this field after poststructuralism. I argue that an interdisciplinary impetus as well as radical politics drive the “intermediate” generation’s work in developing the insights of “high” poststructuralism toward new understandings of what is the matter with materialism and the materiality of the sign. Bruce Ellis Benson’s contribution, “Continental Philosophy of Religion,” analyzes the theological turn, mostly in French philosophy, with special emphasis on Jean-Louis Chrétien, Jacques Derrida, Michel Henry, Emmanuel Levinas, Jean-Luc Marion, and Paul Ricoeur. The chapter traces its definition and development, as well as the ways in which theological and religious concerns affect not only
philosophical discourse but also phenomenology’s very structure as a theologi-
cally neutral discourse. “The Performative Turn and the Emergence of Post-
Analytic Philosophy,” by José Medina, follows the lead of the linguistic turn
as a thread that runs through both analytic and continental philosophy. This
achieves a double result: it develops new perspectives at the intersection of the
great schools, but it also challenges the categorical distinctions between them.
Again interdisciplinary in approach, post-analytic thought addresses issues of
identity, knowledge, and values that reach well beyond the confines of academic
philosophy.

This is precisely the theme addressed by the essay that closes this volume:
“Out of Bounds: Philosophy in an Age of Transition,” by Judith Butler and
myself. The chapter documents the interdisciplinary explosion of the disci-
pline in the 1980–95 period and the extent to which this extracurricular vitality
challenges the traditional disciplinary constraints. The nonacademic energy of
philosophy in this period is sustained by an intense political desire to reflect the
changing historical and social conditions of a world that is rapidly becoming
globally linked, technologically mediated, and ethnically mixed. That challenge
continues and grows in quantity and quality in the following decades, decades
that are addressed in the eighth and closing volume of The History of Continental
Philosophy.
Simplifying to the extreme, I define postmodern as incredulity toward metanarratives. ... To the obsolescence of the metanarrative apparatus of legitimation corresponds, most notably, the crisis of metaphysical philosophy and of the university institution which in the past relied on it. The narrative function is losing its functors, its great hero, its great dangers, its great voyages, its great goal.

(Lyotard, *The Postmodern Condition*)

Although by no means the first instance of the term “postmodern,” this is probably one of the most immediately recognizable. The publication in 1979 of Jean-François Lyotard’s *La Condition postmoderne: Rapport sur le savoir* – an investigation into “the condition of knowledge in the most highly developed societies” commissioned by the Council of Universities of the Provincial Government of Quebec – provides a useful moment at which to locate the beginning of a very rapid spread of postmodernism as a subject of theoretical and philosophical discussion throughout a wide range of academic disciplines and, beyond them, across the media and culture of the developed world. The worldview presented in Lyotard’s book encapsulates the sense of change that was in the air at the beginning of the period covered in this volume of *The History of Continental Philosophy*, and anticipates what would become for people across the globe some of the defining experiences of the final decades of the twentieth

century. At the beginning of the 1980s, with the elections that brought Ronald Reagan’s and Margaret Thatcher’s new breeds of monetarist economics, market deregulation, and ideologies of aggressively anti-welfare-state individualism to the US and UK, Lyotard’s invocation of the transformation of knowledge from an end in its own right into just one more product to be bought and sold in an international marketplace seemed to many to capture the spirit of the time. The “great goals” of Enlightenment philosophy – truth and emancipation – appeared to be replaced by new, less apparently noble objectives as knowledge became the quintessential commodity for a postmodern consumer society: “Knowledge is and will be produced in order to be sold,” Lyotard declared, “it is and will be consumed in order to be valorized in a new production: in both cases, the goal is exchange.”3 In this sense, postmodernism located knowledge within the newly deregulated markets that came quickly to define the experience of economic life in the 1980s.

Alongside this commodification of knowledge, the period also saw radical innovations in communications media with the rapid development of the internet, the spread of digital telephony, and the ever-increasing numbers of radio and television channels catering to more specialized tastes, all of which created a sense of more and more complex and fragmented modes of production, interaction, and exchange. The collapse of the Berlin Wall in 1989 and the dissolution of the Soviet Union led some in the West to declare not just victory in the Cold War but, as the title of Francis Fukuyama’s 1992 book put it, the “end of history” itself with the triumph of a US form of “free-market democracy” and what President George Bush (senior) was to call a “New World Order.” It appeared for a time that economically, politically, socially, and culturally the global order was changing, and for many commentators the theories and arguments of those philosophies grouped beneath the banner of postmodernism best captured the opportunities and threats this new world might have to offer. Even if Lyotard’s particular responses to this change have frequently been questioned and challenged, the general sense that the world was in the process of undergoing a profound transformation rapidly developed into a key topic for debate, and the term “postmodern” became increasingly ubiquitous as the designation of this new “condition.”

There were moments in the 1980s and 1990s where it seemed that every new innovation, idea, and artifact had to be hailed or dismissed as “postmodern,” where discussions of culture were obliged to invoke the term to identify anything even remotely contemporary, and its deployment by journalists, commentators, critics, and students was practically mandatory. For better or worse, by 1995 it had become clear to many that, although the meaning of the term was

---

3. Ibid., 4.
anything but certain, Western culture and society had incontrovertibly become “postmodern.” One consequence of this, and a key difficulty for any attempt to delineate precisely what the term designates, is that precise analytical definitions of the postmodern in such works as Lyotard’s quickly became difficult to discern among the myriad mass-media and popular-cultural invocations. Some thinkers, faced with such confusion, explicitly renounced the term’s association with their work: for example, both Derrida and Foucault reject the application of postmodernism as a label for their work, with Foucault going so far as to claim that he has no idea what it might mean. 4 Separating out a rigorously philosophical postmodernism from the significantly wider phenomenon that shaped many aspects of the cultural climate of Europe and North America during the 1980s and 1990s is no easy task.

This, though, is the aim here: to isolate and identify some of the key philosophical problems and arguments associated with postmodernism. Rather than attempting to encompass the countless different definitions provided by commentators from the whole range of humanities and social science disciplines, the objective is to explore postmodernism’s engagement with some of the problems and ideas it inherits from the continental philosophical tradition. For the purposes of this essay, then, the focus will fall predominantly on the work of the three most central and influential postmodern philosophers of the period: Fredric Jameson, Jean Baudrillard, and Lyotard. 5 The aim is to outline the key tenets of their definitions of the postmodern, to produce a brief account of the philosophical contexts in which their work might be located, and to explore their influence on the broader thought and culture of the period.

Beginning with Jameson, the chapter will outline his arguments about the disruption of modern identity through the pastiche and schizophrenia generated in contemporary consumer society, and explore his critique of the idea of a loss of critical distance in postmodernist culture. The chapter will then introduce some of Baudrillard’s attempts to reorient philosophy, including the moves from a representational to a simulation-focused epistemology, from a Marxist production-orientated analysis of society to one driven by a thinking of consumption, from ethics to seduction and – in what is perhaps his most controversial work on such topics as the Gulf War and international terrorism – from

*5. For a discussion of Lyotard’s philosophy more generally, see the essay by James Williams in *The History of Continental Philosophy: Volume 6*. 
oppositional critique to the ironic detachment of “skeptical intelligence.” Moving on to Lyotard’s more robustly pro-postmodern formulations, it will then discuss his analyses of the breakdown of modernity’s master narratives, his rethinking of Kantian reflective judgment, and his transformation of the category of the sublime, in order to facilitate explorations of the unrepresentable, the differend, and the event.

I. THE DEATH OF THE SUBJECT IN LATE CAPITALISM

According to Jameson, a key aspect of postmodernism is “the ‘death’ of the subject itself – the end of the bourgeois monad or ego or individual.” The Cartesian subject, the keystone of modern philosophy, politics, and social science, loses its purchase in a postmodern world, and with it go modernist conceptions of aesthetic form, representation, critique, and collective politics. For Jameson, the disruption of such categories is the most profound and troubling aspect of the move to postmodernism. The causes and consequences of the death of the subject are central to his influential definition of postmodernism as “the cultural logic of late capitalism” in his important essay “Postmodernism, or, the Cultural Logic of Late Capitalism,” first published in the journal New Left Review in 1984, and expanded into a book with the same title in 1991. In these texts, Jameson develops an analysis of postmodernism that presents it as the cultural consequence of a transformation of capitalist economics in the second half of the twentieth century and seeks a means by which radical political critique might be able to continue in the contemporary world. He defines “late capitalism” as a “world capitalist system fundamentally distinct from the older imperialism” in which the globalization of stock-market speculation, the movement of industrial production to developing countries by multinational business, increasing automation and computerization, and the disruption and dispersal of the proletariat of classical Marxism give rise to new forms of identity, experience, and culture that can be called “postmodern.” The result of this,

8. Ibid., 3.
according to Jameson, is that “every position on postmodernism in culture … is also at one and the same time, and necessarily, an implicitly or explicitly political stance on the nature of multinational capitalism today.” This is crucial: for Jameson, the innovation and experimentation of contemporary artistic and cultural production can be grasped only as an expression of the transformed conditions of modern society, politics, and economics.

On the basis of this account of postmodernism as the superstructural expression of the development of global capitalism, Jameson presents a historically materialist-inflected analysis of contemporary culture in terms of the commodification of aesthetic experience:

Aesthetic production today has become integrated into commodity production generally: the frantic economic urgency of producing fresh waves of ever more novel-seeming goods (from clothing to aeroplanes), at ever greater rates of turnover, now assigns an increasingly essential structural function and position to aesthetic innovation and experimentation.¹⁰

This focus on the aesthetics of production and the consumption of aesthetic affect is crucial to his analysis of contemporary experience, identity, and politics. In a series of discussions of art, poetry, architecture, cinema, and television, Jameson traces the movement from what he identifies as the modernist idea of cultural practice as a vehicle that contests and parodically undermines bourgeois assumptions about the world to what he sees as the significantly less challenging postmodern notion of cultural production as having become just another aspect of commodity exchange and thereby lacking a critical edge. Modernist parody, he argues, has degenerated into little more than “blank pastiche” as art mixes and matches elements and fragments of everyday life without any sense of critical engagement or challenge, and in doing so has lost touch with the materiality of existence and community.

More generally, what is at stake in the commodification of aesthetic production is what Jameson sees as an increasing aestheticization of day-to-day identity: the key focus of production and consumption in late capitalism is the generation and marketing of images, lifestyles, and modes of being. The Western consumer purchases identities in the shape of everything from fashionable brands whose advertisements hold out the promise of spontaneous personal fulfillment as one joins the “smart set” to empty signifiers of identity such as trendy ringtones for mobile telephones that are designed less to inform

---

us that we have a call than to tell those around us how cool we are and which cultural clique we have bought our way into. “Postmodernism,” Jameson asserts, “is the consumption of sheer commodification as a process.”11 Commodities are no longer simply objects; they are brands, identities, ways of forging personalities and communities in a world that, he claims, has lost touch with traditional senses of being in common.

Jameson illustrates this process by contrasting two works of art: Vincent Van Gogh’s *A Pair of Boots* – which also formed the focus of Martin Heidegger’s seminal essay “The Origin of the Work of Art”12 and from which Jameson draws ideas – with Andy Warhol’s *Diamond Dust Shoes*. Unlike the former, which presents “the whole object world of agricultural misery,” the latter, he argues, “no longer speaks to us with any of the immediacy of Van Gogh” nor even provides “a minimal place for the viewer” in a work that simply embraces the “commodity fetishism” rather than offering any form of critique.13 Shorn of context and history, Warhol’s shoes are presented immediately as a random collection of desirable commodities without the depth of community or history.

This postmodern consumption of images has, in its turn, a profound effect on identity. Commodified and aestheticized by the ubiquitous and all-encompassing fashion and marketing industries, the world “comes before the subject with heightened intensity, bearing a mysterious charge of affect, here described in the negative terms of anxiety and loss of reality, but which one could just as well imagine in the positive terms of euphoria, a high, and intoxicatory or hallucinogenic intensity,”14 which Jameson identifies with schizophrenia. Caught up in the infinite transformation and interchangeability of fashions and commodities, which are all the postmodern subject has to ground her or his sense of identity, the rapid alternations between anxiety and euphoria disable any potential for objective analysis or understanding of self or world. The consequences of contemporary culture’s schizophrenic intensity are a destruction of subjective identity, a loss of a sense of history, and a disruption of the ability to engage with the real:

Cultural production is thereby driven back inside a mental space which is no longer that of the old monadic subject but rather that of some degraded collective “objective spirit”: it can no longer gaze directly on some putative real world, at some reconstruction of a

---

past history which was once present; rather, as in Plato’s cave, it must trace our mental images of that past upon its confining walls.15

Enclosed in the illusory world of the postmodern commodity, in the degraded objectivity of infinite financial exchange, the subject loses all sense of a real, all access to history and any ability to form or maintain firm distinctions between self, other, and world.

The loss of critical distance in the schizophrenic depthlessness of postmodern culture, Jameson argues, appears to disable modern forms of political critique and collective action. If an artistic or philosophical challenge to late capitalism is to be mounted and modern forms of political resistance and organization are to be re-enabled in the contemporary world, radical critique must begin with the rediscovery of the forms of identity and agency that stood at the core of the modern subject: “the practical reconquest of a sense of place and the construction or reconstruction of an articulated ensemble which can be retained in memory and which the individual can map and remap along the moments of mobile alternative trajectories.”16 In other words, Jameson calls for a process of critique that allows the subject to reorient herself or himself through a process of “cognitive mapping” that generates a “situational representation” from the mass of images and commodities that make up the experience of everyday life in order to make apparent the “vaster and properly unrepresentable totality which is the ensemble of society’s structures as a whole.”17 A coherent political response to the postmodern superstructure of our late-capitalist world must, according to Jameson, begin with a reorientation of experience in order to ground the subject in a manner that allows the revivification of modern political categories. Whether postmodern culture is able to provide the resources for this, he argues, remains an open question.

II. SIMULATION, HYPERREALITY, AND THE “END OF HISTORY”

Just as it does for Jameson, the problem of a loss of critical distance plays a crucial role in the work of Baudrillard:18 it is “the perfect crime” of postmodern

15. Ibid., 25.
16. Ibid., 51.
17. Ibid.
18. Jean Baudrillard (July 29, 1929–March 6, 2007; born in Rheims, France; died in Paris) received a PhD in sociology, and the habilitation, from the University of Paris X–Nanterre (1966, 1972). His influences include Bataille, Debord, Freud, Lefebvre, Marx, Mauss, McLuhan, and Nietzsche, and he held appointments at the University of Paris X–Nanterre (1966–86), and
culture, “the murder of reality.” If the former’s analysis of the postmodern superstructure of late capitalism focuses on the problematic of subjective orientation, Baudrillard’s diagnosis of the challenges of the postmodern world presents contemporary culture as a perverse “hyperreal” literalization of G. W. F. Hegel’s assertion about the relation between the real and the rational in the Preface to *The Philosophy of Right* (1820):

> There is no longer any critical and speculative distance between the real and the rational. There is no longer really even any projection of models in the real … but an in-the-field, here-and-now transfiguration of the real into model. A fantastic short-circuit: the real is hyperrealized. Neither realized nor idealized: but hyperrealized. The hyperreal is the abolition of the real not by violent distinction, but by its assumption, elevation to the strength of the model.

For Baudrillard, postmodernism marks the point at which the real has been entirely replaced and “transfigured” by rationalized models with the result that any possibility of a “critical and speculative distance” between them has collapsed. If, as Hegel argues, the movement of history can be understood in terms of a progressive transformation of rationality’s grasp of reality by means of ideas, practices, and institutions that develop dialectically to overcome particular forms of impasse thrown up by the contradictions inherent in this movement, Baudrillard presents the postmodern as a moment at which this process has been bypassed in a “fantastic short-circuit” generated by the immediacy of a technological hyperreality in which the rational/actual “distinction” of modernity is simply abolished “by its assumption,” “elevation,” and “transfiguration” into the postmodern “model.” Modern history, on this reading, has run its course, and the orientation it once offered to speculative dialectical philosophy has disappeared. The consequences of Baudrillard’s discussion of the “end of history,” however, are quite different from those presented in the readings of Hegel that see his work as aimed at the realization of universal freedom as well as from the so-called “good news” about the final triumph of North American free-market democracy over its various political alternatives that is announced in Fukuyama’s *The End of History and the Last Man*. Instead, according to Baudrillard, this postmodern end of history marks the absolute annihilation of critical distance and the disruption rather than completion of modern political

---

thought: we can no longer use reason to map the real because, owing to the precision, complexity, and ubiquity of contemporary modelling systems, any resistance or difference that allowed the latter to remain distinct has vanished. What Baudrillard means by this is that with the advent of new sciences and technologies, the models that can be produced to understand the world have become more real, more sophisticated, and more accurate than reality itself. He depicts this process by evoking a telling inversion of the image of the “perfect” map from Jorge Luis Borges’s short story “On Exactitude in Science”:21

The territory no longer precedes the map, nor survives it. Henceforth, it is the map that precedes the territory … it is the map that engenders the territory and if we were to revive the fable today, it would be the territory whose shreds are slowly rotting across the map. … The desert of the real itself.22

The breaking down of the distinction between rationality and actuality, and the insistence that in contemporary culture the map precedes the territory, marks a move Baudrillard makes from a philosophy founded on questions of representation to one that focuses on the concept of simulation. Simulation, which Baudrillard presents as the quintessence of postmodern culture, refuses to raise those questions of originality and referentiality that are central to representationalist philosophies. For him, images and objects function only as placeholders in a structural system in which all values are exchangeable: the postmodern subject exists within the framework of an “infinite code” to which no one has the key. Baudrillard develops this idea of the infinite code of images from a reading of the work of the Situationist theorist Guy Debord, who argued in his 1967 book The Society of the Spectacle that the “whole life of those societies in which modern conditions of production prevail presents itself as an immense accumulation of spectacles. All that was once lived has become mere representation” so that spectacle “epitomizes the prevailing model of social life,” the “very heart of society’s real unreality.”23 Working through the logic of Debord’s arguments, Baudrillard removes from them any vestiges of representationalist philosophy to focus rigorously on postmodern simulation. Contemporary culture, he asserts, is not the producer of simulations, but their product: in postmodern simulation, meaning “implodes” as any last instance of a distinction between rational and

22. Baudrillard, Simulations, 1.
actual is abolished and the world moves from the critical distance inherent in representational reality to the immediacy of the hyperreal.

“Hyperreality” is not, of course, simply “unreality.” Baudrillard uses the term to identify a culture in which the fantastical creations of media, film, and computer technologies are more real, and interact more fundamentally with experience and desire, than the hitherto dominant “realities” of nature or spiritual life. The real, he argues in *Simulations*, is now “produced from miniaturized units, from matrices, memory banks and command models … It is a hyperreal: the product of an irradiating synthesis of combinatorial models in a hyperspace without atmosphere.”24 In an often-cited passage about Disneyland, Baudrillard produces a clear example of how simulation operates to generate hyperreality:

> Disneyland is there to conceal the fact that it is the “real” country, all of the “real” America, which *is* Disneyland …. Disneyland is presented as imaginary in order to make us believe that the rest is real, when in fact all of Los Angeles and the America surrounding it are no longer real, but of the order of the hyperreal and simulation. It is no longer a question of a false representation of reality (ideology), but of concealing the fact that the real is no longer real …25

Disneyland is not a fantastic space that makes the mundane reality of everyday American life more bearable, but is rather a means of masking the fantastical nature of that day-to-day existence: it is, he claims, “a deterrence machine set up in order to rejuvenate in reverse the fiction of the real.”26 The function of Disneyland is to appear fantastical so as to conceal the loss of everyday reality in postmodern simulation, to prevent the American public from recognizing the “fact that the real is no longer real.”

As well as disguising the disconnection of representation and reality, Disneyland is a useful illustration of a key economic and political aspect of Baudrillard’s postmodernism: the “deterrence”-effect of the seductive power of consumer culture. Like Jameson, Baudrillard’s discussions of the postmodern focus explicitly on the structures of global capitalism. In *The Mirror of Production*, Baudrillard asserts that, today, “capitalism crosses the entire network of natural, social, sexual and cultural forces, all languages and codes.”27 It is ubiquitous, he argues, not simply present in the circulation of money and commodities in the financial marketplaces, but everywhere, infecting every aspect of experience:

25. Ibid., 25.
26. Ibid.
The circulation, purchase, sale, appropriation of differentiated goods and signs/objects today constitute our language, our code, the code by which the entire society communicates and converses. Such is the structure of consumption, its language, by comparison with which individual needs and pleasures are merely speech effects.\textsuperscript{28}

In *The Consumer Society*, Baudrillard equates the commodity with the sign and argues that as they collapse into one another, they generate the language or code that shapes postmodern identity. The postmodern consumer, he argues, “sets in place a whole array of sham objects, of characteristic signs of happiness, and then waits … for happiness to alight.”\textsuperscript{29} This passivity is the result of the “seduction” of the commodity: the unfulfillable desire to find happiness among the “array of sham objects” that make up modern life is produced by contemporar y capitalism as the organizing force of experience and leads to the most central aspect of Baudrillard’s postmodernity – the ubiquity of the messages produced by advertising in the communications media and the subsequent annihilation of reality, agency, and the possibility of critique.

The postmodern mass media present a “dizzying whirl of reality” that is not a reflection or representation of actuality, but rather the production of a simulated world in which “we live, sheltered by signs, in the denial of the real.”\textsuperscript{30} It is in terms of this account of the seductive apathy generated in a media-produced world of hyperreal simulation that Baudrillard’s work has become most notorious. In a series of articles published in 1991, he argued that the Gulf War “will not,” “is not,” and “did not” take place. The central thrust of these polemical pieces is the argument that in an age of mass-media simulation and the commodification of the image, any coverage of the war is readable only in terms of promotion: “The media promote the war, the war promotes the media, and advertising competes with the war … It allows us to turn the world and the violence of the world into a consumable substance.”\textsuperscript{31} In the ubiquity, immediacy, and self-referentiality of the blanket media coverage of the twenty-four-hour news channels, access to any “real war” behind the self-promotion, speculation, and manufactured dissension of the “fake and presumptive warriors, generals, experts and television presenters” that fill the screens is impossible. In the face of this infinite spiral of promotion, Baudrillard argues, the Western subject as a consumer of media images becomes incapable of making rational judgments about what is “really taking place”: “uncertainty

\textsuperscript{29} Ibid., 31.

\textsuperscript{30} Ibid., 34.

invades our screens like a real oil slick, in the image of that blind sea bird stranded on a beach in the Gulf, which will remain the symbol-image of what we all are in front of our screens, in front of this sticky and unintelligible event.\textsuperscript{32}

In the light of this, and on the basis of what he sees as the impossibility of breaking through the infinite code of simulation, Baudrillard despairs of any genuine engagement with the actuality of the war and calls instead for what he terms a “skeptical intelligence”: “If we do not have practical intelligence about the war (and none among us has), at least let us have a skeptical intelligence towards it, without renouncing the pathetic feeling of absurdity.”\textsuperscript{33} What this skeptical intelligence might amount to as a mode of critical engagement with the contemporary world is something critics of Baudrillard have found difficult to pin down. To his detractors, Baudrillard’s postmodernism offers nothing on which to base a politics of collective action and little more than sardonic detachment as means of resistance to contemporary culture. His work is attacked as a fashionable nihilism that is incapable of producing any call to action by such thinkers as Christopher Norris, who responds explicitly to the politics of Baudrillard’s philosophy in \textit{Uncritical Theory: Postmodernism, Intellectuals and the Gulf War}. Less negatively, Baudrillard has been presented as a diagnostician of the conflicts and tensions of today’s world: a thinker whose arguments allow other postmodern theorists and political and social philosophers to identify crucial elements and effects of postmodernity even if he refuses to offer his own alternatives to the status quo.\textsuperscript{34} His work is provocative, and this provocation is itself the point. In the most positive light, then, critics argue that the explicit irony of Baudrillard’s skeptical writings generate a space in which the apparently totalizing seductive forces of contemporary mass-media simulation and capitalist commodification are shown to be finite, fragmentary, and anything but transparent, and therefore fit subjects for criticism.

\textbf{III. REFLECTION, SUBLIMITY, AND THE DIFFEREND}

If Jameson’s analysis of postmodern culture results in a call for new modes of cognitive mapping as a means to renew modern political organization, and Baudrillard’s explorations of hyperreality appear to reject oppositional politics in its entirety in favor of a detached mode of ironic skepticism, Lyotard’s\textsuperscript{35} work

\begin{itemize}
\item \textsuperscript{32} Ibid., 32.
\item \textsuperscript{33} Ibid., 58.
\item \textsuperscript{34} See, for example, Paul Patton, “Introduction,” in \textit{The Gulf War Did Not Take Place}, or Rex Butler, \textit{Jean Baudrillard: The Defence of the Real} (London: Sage, 1999).
\item \textsuperscript{35} Jean-François Lyotard (August 10, 1924–April 21, 1998; born in Versailles, France; died in Paris) was educated at the Lycée Buffon, Lycée Louis-le-Grand, and received his \textit{agrégation de}}
sets out to generate a resolutely postmodern political philosophy that seeks to engage with, critique, and disrupt the totalizing power structures of the contemporary world. The call issued in the well-known closing passage from his influential 1982 essay “Answering the Question: What is Postmodernism?” to “wage a war on totality,” to “be witnesses to the unpresentable,” and to “activate the differences [différends]”\(^{36}\) is central to this work and forms the basis of his postmodern philosophy.

It is important not to read the account of the contemporary commodification of knowledge in *The Postmodern Condition* as a summation of Lyotard’s entire engagement with postmodernism. Although his analyses of commodification in that book appear bleak and incapable of offering a coherent alternative to the status quo, the account there is a diagnosis of a condition rather than the active critique of totalizing and totalitarian systems of thought that much of his other work is concerned to develop. While it refuses to discard many of the arguments developed there, the focus of Lyotard’s work changes to present the postmodern less as a historical condition and more as a mode of critical intervention in the continuing development of modernity. Like Baudrillard, Lyotard is careful to distance his critique from the systematic philosophies of modernity that he discovers in the work of thinkers such as Hegel and Marx, and instead seeks to identify and activate the moments where such modern systems appear to fall into contradiction, and it is this idea of the postmodern as a disruptive force that offers the best way into his work.

Although beginning his career as a Marxist philosopher, activist, and member of the radical group *Socialisme ou Barbarie*\(^{37}\) in the 1950s and 1960s, his 1974 book *Libidinal Economy* marks a violent rejection of systematic political organization. In what he was later to call his “evil book,”\(^{38}\) Lyotard attacks Marxism as a political philosophy head on, challenging its pretension to systematically diagnose, oppose, and resolve the evils of capitalism. In a particularly notorious

---

37. *Socialisme ou Barbarie* is discussed in more detail in the essay on French Marxism by William L. McBride in *The History of Continental Philosophy: Volume 5*.

passage, he launches his critique of Marxist thought by splitting the figure of Karl Marx into two characters, each of whom represents a different relation to capitalism found in Marx’s texts: the first is the Moses-like figure of “Old Man Marx,” who scientifically and systematically describes the ills of capitalism and provides sets of laws to determine its overthrow, and the second is the erotically fixated “Little Girl Marx,” who is seduced by it and enters into a love affair with capitalism’s perverse body, enjoying its violent destructive power. In this way, Lyotard argues that Marxism exists in a paradoxical relationship with capitalism as it simultaneously condemns it and is captivated by it: Old Man Marx is the systematizer, the producer of Marxism’s grand narrative that presses everything into its mold, whereas Little Girl Marx points toward what he identifies as the jouissance of capitalist culture: the necessary excess of speculative value that arises from commodity exchange as the engine to perpetuate desire and consumption in a manner that exceeds rational definition and constantly haunts Marx’s systematic thought with desire and seduction.

Lyotard’s conversion of Marx into a “strange bisexual assemblage” was not simply done to offend his ex-colleagues in Socialisme ou Barbarie (although it certainly achieved this). Rather, it highlights the ways in which capitalism “exceeds the capacity of theoretical discourse” to explain its effects. Owing to its love–hate relationship with capitalism, Libidinal Economy argues, Marxism’s analyses remain complicit with the latter’s conception of social change as a grand narrative of development, and in the end both are able to depict the people caught up in capitalism only as objects of this development, as “cattle who couldn’t enter the future except backwards under a hail of blows.”

If Lyotard makes his final break with some of the key premises of modern political philosophy in Libidinal Economy, it is during his discussions of postmodernism in the 1980s and 1990s that he begins to formulate alternative bases for critique, most explicitly through a rereading of Immanuel Kant’s analyses of reflective judgment and aesthetics in the Critique of Judgment. The question of aesthetics is crucial for Lyotard’s analysis of the postmodern, just as it is for Jameson and Baudrillard. Unlike them, however, in “Answering the Question: What is Postmodernism?” Lyotard is careful to present postmodern aesthetics as a disruptive element within a continuing modernity rather than a new mode of representation that simply replaces the modern. In this essay, he defines and distinguishes between three forms of presentation: realism, modernism, and

40. Ibid., 96.
41. Ibid., 98.
postmodernism. These are not historical categories that succeed one another in time; rather, all exist simultaneously and are manifest in many different cultures and periods. In fact, throughout his work, Lyotard is careful always to demonstrate that modernism and postmodernism are irreducible to straightforward historical categories: so, for example, he identifies aspects of the work of thinkers as historically diverse as Aristotle, Augustine, Montaigne, and Kant as explicitly postmodern, and quite explicitly defines the thinking behind some recent developments in digital technology and culture as modernist or even realist. Grasping what realism, modernism, and postmodernism are and how they are related will, then, take us right to the heart of Lyotard’s postmodern philosophy.

Defining realism as the mainstream style of presentation in a culture, Lyotard sees its task as to “stabilize the referent, to arrange it according to a point of view which endows it with a recognizable meaning, to reproduce the syntax and vocabulary which enable the addressee to decipher images and sequences quickly” so that the viewers, auditors, or readers can “preserve [their] consciousnesses from doubt.” In other words, the aim of realism is to depict the world according to conventions with which the addressee is already familiar so that it can quickly and unproblematically be understood and consumed. Realism is not simply a reflection of a pregiven reality, but is, as Lyotard defines it in *Postmodern Fables*, “the art of making reality, of knowing reality and knowing how to make reality.” Like Baudrillard’s hyperreality, realism is the presentation of the world as a comprehensible, mappable, and functional totality.

In contrast to this realism, Lyotard sets modernism and postmodernism, both of which he sees as potentially disruptive forms whose task is to “present the fact that the unpresentable exists. To make visible that there is something which can be conceived and which can neither be seen nor made visible: this is what is at stake.” Instead of realistically presenting a world that is immediately recognizable, modern and postmodern presentations disrupt recognition by alluding to what a particular culture represses or excludes from its normal means of communication. They are, in other words, deliberately difficult and disturbing: direct challenges to accepted realist practices of presentation and understanding. Lyotard, explicitly invoking Kant’s aesthetics, calls the effect of

43. This noncontemporary sense of postmodernism is, for example, the basis of Lyotard’s discussion in his last (unfinished) book, *The Confession of Augustine*. His analysis of the “realism” of new technologies is most explicit in the essay “Can Thought go on without a Body?” in *The Inhuman: Reflections on Time*, Geoffrey Bennington and Rachel Bowlby (trans.) (Cambridge: Polity, 1993), 8–23.
44. Lyotard, *The Postmodern Condition*, 74.
this sort of presentation “sublime.” In contrast to the beautiful, which is based on a feeling of harmony and attraction between the subject and the world, the sublime is a mixed feeling of pleasure and pain: simultaneous attraction and repulsion, awe and terror. De-emphasizing the traditional sense of a possible transcendence inherent in sublime presentation, Lyotard focuses on its capacity to “develop a conflict” between conception and presentation, and thereby upset the apparent seamlessness of a realist worldview.47 This notion of the sublime as a disturbance of everyday sense-making activity is central to Lyotard’s postmodern philosophy, whether he is discussing art and literature, history, technology, politics, or philosophy.

He differentiates between the modern and the postmodern sublime by arguing that in the former the unpresentable is “put forward only as the missing contents; but the form, because of its recognizable consistency, continues to offer to the reader or viewer matter for solace and pleasure,” while the latter “puts forward the unpresentable in presentation itself.”48 In other words, modernism presents the fact that there is within the culture in which it exists something that eludes presentation, but does so in a form that remains familiar and assimilable. In contrast to this, postmodernism confronts the reader or viewer with a presentation that is challenging in terms of both form and content; it sets out deliberately to unsettle, seeking to generate “new presentations, not in order to enjoy them, but in order to impart a stronger sense of the unpresentable.”49 The postmodern sublime disturbs, disrupts, and challenges the subject to respond without providing the recognizable forms that make it possible to determine in advance what mode that response should take.

For Lyotard, then, modernism and postmodernism are modes of presentation that work to disrupt the realist conventions and expectations of a culture, and change as that culture is transformed and readers and spectators become used to, and no longer shocked by, their contents and methods. So, while for nineteenth-century European culture the quattrocento-style representational painting and triple-decker realist novel might have been the norm, the rapidly moving images of today’s MTV music video and the self-referential parody of the viral advertising campaign are equally realist in Lyotard’s sense of the term, as they are familiar, quickly decodable, and unproblematically assimilated by contemporary capitalism. In contrast to this, the modern and (especially) the postmodern are explicitly critical. For Lyotard, the role of postmodern presentation is to perform an immanent critique of the day-to-day structures of this realism; it operates within the realist context of a given culture to shatter its norms and challenge its

47. Ibid., 77.
48. Ibid., 81.
49. Ibid.
assumptions, not with a new set of criteria drawn from outside of that culture, but rather by showing the contradictions the culture contains, what it represses, refuses to recognize, or makes unpresentable.

While “Answering the Question” focuses its discussion predominantly on visual art, *The Differend: Phrases in Dispute*, which many see as Lyotard’s most important book, develops this model much further to outline a postmodern mode of ethical and political engagement as well as discussing culture, history, and philosophy. Although employing a slightly different lexicon, the distinction between a realist mode of politics and a model that seeks to testify to the existence of the unpresentable and mobilize sublime feeling and reflective judgment remains central to the book.

Lyotard defines a differend as “the unstable state of language wherein something which must be able to be put into phrases cannot yet be.”\(^{50}\) A differend thus occurs as a feeling, a moment or event that agitates and dislocates experience as it is irreducible to the categories and conventions of the community – specifically, it happens as the presentation that there is something unpresentable. It is thus an interruption of the seamlessness of realism, a break in the flow of language, a moment where the “right words” will not come. And, for Lyotard, this lack of propriety is tied explicitly to the question of justice – in another definition, he presents a differend as:

>a case of conflict, between (at least) two parties, that cannot be resolved for lack of a rule of judgment applicable to both of the arguments. One side’s legitimacy does not imply the other’s lack of legitimacy. However, applying a single rule of judgment to both in order to settle their differend as though it were merely a litigation would wrong (at least) one of them (and both of them if neither side admits this rule).\(^{51}\)

In this sense, a differend appears as an apparently intractable dispute: it marks a point of suffering where an injustice cannot find a space to articulate itself, where an injury is silenced or a mode of testimony rejected. Lyotard offers a series of examples in the book, ranging from the claims of Holocaust deniers to the idea of the unpublished masterpiece of literature, but in each case the focus falls on the question of how the occurrence of a wrong provokes ethical questions and how the victim of that wrong might be helped to find means of self-presentation.

\(^{51}\) *Ibid.*, xi.
Differends are thus the point of departure for Lyotard’s exploration of the politics and philosophy of language in *The Differend*. He argues that their existence places an obligation on thought to attempt to “find new rules for forming and linking phrases that are able to express the differend disclosed by the feeling [of injustice], unless one wants the differend to be smothered right away in a litigation and for the alarm sounded by the feeling to have been useless.”

While the role of realism is, precisely, to “smother” any differend that occurs in order to “preserve consciousnesses from doubt,” Lyotard argues that the ethical response to the feeling of the unrepresentable differend must be to work actively to transform the context in which it occurs by seeking “new rules for forming and linking phrases” so as to “bear witness to differends by finding idioms for them.”

A differend is, in other words, an event. And for Lyotard, the thinking of the event in a manner that is open to its singularity and difference lies at the heart of the postmodern. In an article on the abstract expressionist painter Barnett Newman, Lyotard argues that the event is:

> what dismantles consciousness, what deposes consciousness, it is what consciousness cannot formulate, even what consciousness forgets in order to constitute itself. What we do not manage to formulate is that something happens …. An event, an occurrence – what Martin Heidegger called *ein Ereignis* – is infinitely simple, but this simplicity can only be approached through a state of privation. That which we call thought must be disarmed.

This disarming of thought, the breaking open of the closed system of realism that would silence the event by assimilation into the grand narrative of a systematic philosophy, is the basis for Lyotard’s construction of a postmodern politics. In a manner that differs from both Jameson and Baudrillard, he explicitly rejects the idea that the problems and categories of philosophical modernity have been or should be left behind, but seeks to mobilize events, to “activate the differends,” in order to disrupt the closed systems of thought and presentation that shape our continuing modernity.

In keeping with this model, at the end of the 1980s Lyotard came to differentiate his work from the then ubiquitous popular-cultural definitions of postmodernism that celebrated the freedoms offered by new forms of communications

---

technology. In an article that takes the phrase as its title, he does this by describing what is at stake in his work as “rewriting modernity”:

Rewriting clearly has nothing to do with what is called postmodernity or postmodernism on the market of contemporary ideologies … Postmodernity is not a new age, but the rewriting of some of the features claimed by modernity, and first of all modernity’s claim to ground its legitimacy on the project of liberating humanity as a whole through science and technology … Rewriting means resisting the writing of that supposed [technological] postmodernity.56

In other words, the technological acceleration that is driven by contemporary capitalism, which Jameson and Baudrillard both identify as the essence of postmodernity, is for Lyotard the very realism that the postmodern rewriting of modernity sets out to disrupt. By paying attention to the sublime feeling produced by the unpresentable event of a differend, modernity’s legitimizing claims can, he asserts, be questioned, challenged and opened to critique. This is what Lyotard sees as the central stake of a “war on totality.”

This chapter has focused on three central accounts of the postmodern: Jameson’s analysis of it as the “cultural logic of late capitalism”; Baudrillard’s presentation of it as the culture that arises as a result of a movement from representation to simulation, seduction, and hyperreality; and Lyotard’s discussion of a postmodern resistance within a continuing modernity that emerges from the events and differends that disturb and dislocate modern institutions by opening them up to their own unpresentable alterity. That these three versions of the postmodern are impossible to draw together to form a coherent definition is part of the point: throughout the 1980s and 1990s, postmodernism’s challenge lay as much in its disruption of identity and definition as it did in any form of coherent philosophical or political alternative. Although there is no coherent postmodern philosophical or political program, its continuing interest lies in the development of a capacity to interrogate and challenge the everyday sense-making processes of the contemporary world.

German philosophy after 1980: themes out of school

Dieter Thomä

1. The Discontent with Continental Philosophy

German philosophy is regarded by many as the epitome of “continental philosophy.” This claim would gain credibility if French philosophy, the other main contender for this title, could be traced back to German origins as well, be it to the so-called three “H’s” – Hegel, Husserl, and Heidegger – or to their counterparts Marx, Nietzsche, and Freud. (Vincent Descombes explored these two genealogies as early as 1979.) Yet instead of indulging in any such philosophical imperialism, we should rather raise the question of whether the label “continental philosophy” suits recent German philosophy at all. Moreover, we should be aware of the conceptual problems that go along with this label. Addressing these problems will eventually provide us with a kind of “entry code” to the philosophical labyrinth that we are about to explore.

First, we should be aware of the fact that the term “continental” does not render any substantial information on how philosophers proceed and which problems they tackle. As the label “continental” is so vague, it tends to fuel the suspicion that a philosophy of this kind is in want of a clear focus. If we are to take “continental philosophy” seriously, we need to identify a set of questions that deserve to be called “philosophical,” with no strings attached.

Second, we should not expect to discover some kind of common denominator, a unified self-image that German philosophers share by virtue of their

---

belonging to “continental” thought. Given the multitude of voices in recent German philosophy (and the controversies between and among them), the search for such a self-image is futile. In order to do justice to recent philosophical debates in Germany, we should take into account the plurality of partly incompatible traditions on which they are based.

We are thirdly invited to appreciate the attempts of German philosophers to build bridges to the “analytic” camp. The building blocks for bridges of this kind were laid when the cold war between analytic and continental philosophy was still raging: From the late 1970s on, authors from different camps published books that generously combined discussions of philosophers with wildly different affiliations. In his *Self-Consciousness and Self-Determination* (1979), Ernst Tugendhat referred to Heidegger on the one hand, Hector-Neri Castañeda and W. V. O. Quine on the other. In recent years, analytic philosophers have become more and more interested in the work of so-called continental thinkers and vice versa. As the label “continental” fades, its counterpart, the “analytic,” is on the brink of being put out of service as well, even though some representatives of these two camps confidently stick to what may be called their philosophical “identity politics.”

In order to come to grips with the discontent with “continental philosophy,” we need to engage in the three arguments described above. (i) We should identify the key issues addressed in recent debates in Germany and situate these debates in the philosophical framework at large (the “bigger picture”). Recent German philosophy should not be portrayed as being in a state of less than splendid isolation. (ii) Yet we are also obliged to reconstruct the specific philosophical traditions at work in major contributions from German philosophers in the past decades. This will prevent us from imposing an artificially unified research agenda; it will “teach us differences” (as Shakespeare would put it). (iii) We will also have to take into consideration how German philosophers seek to overcome the constraints set by these traditions and how they consciously and conscientiously combine insights from seemingly unrelated theoretical contexts. In the following, I will slightly alter the sequence of these questions: I will remind the reader of the major schools setting the scene for late-twentieth-century German philosophy (section II), and then identify four key issues (section III) that can be used for mapping the philosophical landscape of the day (sections IV–VII).

---

II. GERMAN PHILOSOPHY AFTER THE POSTWAR PERIOD

The year 1989 is to be regarded as the “closing bell,” putting an end to the postwar period in German history: German reunification made disappear what had been the indirect, yet most obvious and obtrusive, consequence of the political and moral collapse of Germany in the Nazi period – the existence of two “Germanys.” If we were to answer the question of when the postwar period in German philosophy came to a close, however, we would not want to identify one single emblematic event, nor would we choose a date as late as 1989. In the field of philosophy, the end of the postwar era can be linked to the death of the leading figures or founding fathers of the three most influential philosophical schools in Germany after the Second World War: Theodor W. Adorno and Max Horkheimer, the leading figures of the Frankfurt School, died in 1969 and 1973 respectively; Heidegger, whose influence in postwar Germany was mainly mediated through Hans-Georg Gadamer’s hermeneutics, died in 1976; and the so-called “Ritter School” lost its central figure with the death of Joachim Ritter in 1974. This last name on the list may come as a surprise, as Ritter is not regarded as a major philosophical figure equal in rank to Adorno or Heidegger. But it is safe to say that his institutional influence exceeded that of the Frankfurt School; in fact, a recent debate circled around the question of whether Ritter’s neo-Aristotelian approach and his theory of political and cultural institutions actually represented the philosophical core identity of the so-called “old,” that is pre-1989, Federal Republic of Germany.

It is important to note that the epochalization suggested above does not refer to a new beginning or breakthrough, but rather indicates that an era has come to an end. I do not mean to imply that the schools mentioned above disappeared from the scene for good in the 1970s; Habermas and other younger members of the Frankfurt School published some of their main works after that date, Gadamer had a lasting and even growing influence until his death in 2002, and so on. Yet it is safe to say that those schools have lost most of their identificatory, defining force in German philosophy since the mid-1970s. This loss could

*3. Adorno, Horkheimer, and other figures associated with the Frankfurt School are discussed in several essays in The History of Continental Philosophy: Volume 5.

4. Born in 1903, Joachim Ritter studied with Ernst Cassirer, to whom he submitted his thesis on Nicolas of Cusa in 1927. From 1946 until his retirement in 1968, he was Professor of Philosophy at the Westfälische Wilhelms-Universität in Münster. Among his most important works are Metaphysik und Politik; Subjektivität; and Hegel and the French Revolution. Ritter was the initiator and main editor of the comprehensive Historisches Wörterbuch der Philosophie, whose twelve volumes appeared between 1971 and 2005.

also be regarded as a win of a kind: “Schools” tend to become scholastic, which does not coalesce particularly well with philosophical creativity. It should also be acknowledged that some of the main representatives of those schools were actively involved in the self-abolition of philosophical factions themselves. That this is particularly true for the Frankfurt School becomes clear when we think of Habermas eventually joining forces with Derrida, or of Honneth reading Levinas.\(^6\) Here and elsewhere, we can observe a dissolution of boundaries.

If we want to understand how the philosophical debates have picked up new momentum in the more recent past, we need to briefly reflect on the legacy set by those three schools mentioned above. Their trajectories provide the framework for the more individual itineraries that have moved into uncharted territory in the last quarter of the twentieth century and up to the present. When going through these different legacies, we aim to switch back and forth between the focus on “schools” on the one hand, and the focus on “topics” on the other. Instead of merely reconstructing different scholarly traditions in a historical manner, we seek to establish patterns of themes in which we can locate German philosophy as it emerges after the end of the postwar period.

III. VARIETIES OF A THEORY OF MODERNITY

If there is such a thing as a common denominator shared by the Heideggerians, critical theorists, and the circle around Ritter, it is the search for a theory of modernity.

**Heidegger**

In Heidegger, this search is framed in his project of rewriting the “history of metaphysics.” Cartesian subjectivity, Hegelian reason, Nietzschean will to power, and modern technology in general are described as variants of a dualist model that eventually leads back to Plato. In modern times, this dualism has become the standard device for dealing with the world and with ourselves: we have come to totally dominate nature and to turn ourselves into “rational animals.” Heidegger’s “destruction” of this dualism was first formulated in *Being and Time* (1927) in his attempt to redescribe human existence as “Being-in-the-world,”

---

and later became part of his project of “overcoming metaphysics.” Although Heidegger’s unique terminology tends to make him immune to external criticisms and makes it difficult to contextualize his approach, it is still legitimate to highlight certain topics that make his work appear to be a natural part of the philosophical debates of the day (be they analytic or continental). Two such themes deserve particular attention.

(i) *Being and Time*, as well as Heidegger’s later texts on the “history of metaphysics,” can be regarded as contributions to the debates on the concept of a *person* and to the theory of the *subject*. In his earlier work, he deals with the structure of “self-relation” and with issues of authenticity in a more constructive sense; his later work is dedicated to the “destruction” of the metaphysical “subject.” Hans Blumenberg’s account of self-preservation in the modern age, Dieter Henrich’s work on subjectivity and selfhood, and Tugendhat’s discussion of self-consciousness and self-relation have all been developed in critical reference to Heidegger, as will be seen in the extended discussion below. But it also should be said at the outset that the debates on the “subject” and the “person” are by no means limited to a Heideggerian framework.

(ii) Throughout his writings, Heidegger grapples with the problem of *language*. In *Being and Time*, Heidegger gives an outline of nonpropositional language, and discusses its reduction to idle talk on the one hand and its powers of “disclosure” on the other. Language becomes a battleground for the encounter between those who objectify the world, propagate a “worldview,” and forget about the secret of “Being,” and those who stress the insurmountable difference between what is and what is said. In this crisis of representation and referentiality, poetry and art in general gain particular relevance. It is obvious how and why discussions of Heidegger’s early conception of language have drawn comparisons to Wittgenstein’s theory of language games and life forms, or how and why Heidegger’s later writings served as an inspiration for the deconstructivist critique of logocentrism.8

*The Frankfurt School*

It is safe to say that what Heidegger and the Frankfurt School had in common was their interest in the theory of modernity. In spite of Adorno’s fierce critique

---

of Heidegger’s “jargon of authenticity” and Heidegger’s unrelenting ignorance of critical theory,9 there are striking similarities between Heidegger’s and Adorno’s accounts of the subject’s striving for domination. This does not mean, however, that these accounts were compatible. The distinctive features of critical theory come to the fore when we once again turn to the “subject” and, second, to “society.”

(i) Whereas Heidegger seeks to eventually overcome subjectivity as such and to outbid history by the “destiny of Being,” the Frankfurt School describes the subject as being fully and inevitably immersed in the dynamics of history. They describe the dialectics of Enlightenment and the crisis of modernity as emerging from the internal logic of subjective empowerment and alienation. In this perspective, any “great escapes” to another way of thinking (or being) are deemed to be illusory or even ideological. The Hegelian legacy that comes to the fore here is still visible in more recent contributions of critical theorists to the fields of moral philosophy and aesthetics.10 It is this Hegelian perspective that also enables critical theorists to engage in a fruitful dialogue with the contextualist or holistic approaches put forward by Charles Taylor or Robert Brandom.11

(ii) If the subject cannot escape from history, it cannot escape from society either. Critical theorists turn their attention to societal aspects of the functioning and formation of the individual. Some have stressed the oppressive nature of modern societies, while others have highlighted the constitutive role of intersubjectivity, interaction, reciprocity, and recognition for individual self-determination. In more recent years, this second group has become more and more influential, and this group has left its marks in the field of moral philosophy as well as in the theory of the subject.12 The sharp critique of the modern “subject” that played a central role in the early classic Dialectic of Enlightenment (1944) has been superseded by less bleak theories of self-determination and by a reappraisal of social relations. Within critical theory and also on its margins, important contributions to the theory

12. See the essay by Amy Allen in this volume.
of intersubjectivity and sociality have been published in recent years (see section VI).

The Ritter School

When the members of the so-called “Ritter School” talk about modernity, they choose a Hegelian starting-point that is clearly distinguished from the approach chosen by the Frankfurt School. Instead of focusing on the dynamics of modern societies as they emerge from internal contradictions, they settle for Hegel’s insight into the inevitability of “diremption” (Entzweiung) in modern societies. Following this account, the differentiation of social spheres has led to a liberation of the individual that bears new risks and gives way to dissatisfaction and discontent. This theory of modernity is not so much concerned with an attempt to reconcile the individual and the universal or to sharply analyze the alienating effects of overpowering institutions, as with the malaise of the individual and its lack of orientation.

In a certain respect, Ritter has a more positive reading of modernity than the members of the Frankfurt School. Instead of tracing down the alienating effects of capitalism, he acknowledges the liberating effects of modern diremption. In another respect, however, Ritter is driven by a discontent with liberation. He claims that the individual will not find an answer to the old Socratic question of “how to live” without relying on institutions that compensate for the shortcomings of subjective orientation. As the Ritter School questions the historical malleability of human beings, it is called on to identify patterns of human life and of the “good life.” This is why the Ritter School takes a step back from Hegel to Aristotle and moves on to questions of anthropology. As we will see in section VII, the reappraisal of classical “philosophical anthropology” (Arnold Gehlen, Helmut Plessner, etc.) meanwhile goes far beyond the Ritter School itself.

Let me briefly recall the key concepts that have emerged in this short discussion of major philosophical schools in postwar Germany: our list consists of subject, language, society, and anthropology. In the following, I will leave the perspective of “schools” aside and focus on a number of philosophers whose contributions can be organized along the lines of these key concepts. But it should be made clear at the outset that if, in what follows, a certain philosopher, for example, is discussed under the label of “anthropology,” this is not meant to imply that he is a member of the Ritter School, or that the Heideggerians are the only philosophical school concerned with “language.”

In the following, I will briefly discuss some contributions to the theory of the subject and to the concept of a person made by philosophers from extremely different backgrounds.

As early as 1955, Henrich\textsuperscript{14} made clear that the theory of the subject – the topic that would be central to virtually all of his writings – would lead him back to classical German philosophy, primarily Kant and Fichte, and force him to engage critically with Heidegger's critique of the subject. In his 1955 review of Heidegger's \textit{Kant and the Problem of Metaphysics},\textsuperscript{15} he combines a defense of Kant with an attack on Heidegger, in which he anticipates his later claim that the subject is anything but a stronghold of “unrestrained power.” Instead of settling for a critique of such a subject, as Heidegger and Adorno had, Henrich explores the primordial structure of self-awareness as a form of “being-a-self” (\textit{Selbstsein}) or of “conscious life” (\textit{bewusstes Leben}).\textsuperscript{16} The primacy of subjectivity is also defended against a scientific reductionism advocated by some representatives of the life sciences and against a linguistic reductionism that takes the subject to be an epiphenomenon generated by propositional, pronominal language or by autobiographical self-construction.\textsuperscript{17} Henrich defends the immediacy or unmediatedness of self-awareness against the popular model of self-reflection that has always been charged with the problem that the object appearing in the mirror needs to be artificially and belatedly identified with the subject looking into the mirror. Following Henrich, the immediacy of self-awareness is to be distinguished from more elaborate forms of self-knowledge, as it is inextricably bound to consciousness of any kind.

Henrich’s reading of subjectivity as immediate self-awareness has attracted objections from different camps, which, in turn, have prompted Henrich and his disciples to further refine their position and to raise counter-arguments. Two characteristics of these controversies are particularly interesting. First, they often cross the boundaries between analytic and continental philosophy; and second, they establish connections between the problem of subjectivity on the one hand,

\textsuperscript{14} Dieter Henrich (1927– ) studied philosophy at the University of Heidelberg with Gadamer. He has taught at the Free University of Berlin (1960–65), University of Heidelberg (1965–81) and University of Munich (1981– ).

\textsuperscript{17} Dieter Henrich, \textit{Bewußtes Leben} (Stuttgart: Reclam, 1999), 40, 43, 54–6.
and language and society on the other. The leading representative of a linguistic theory of subjectivity is Tugendhat, while Habermas is the leading theorist who focuses on the link between self and society.

Henrich claims that self-awareness or self-acquaintance is independent from references to objects or other persons. Self-awareness does not coincide with self-knowledge, as the latter is already based on a distinction between a knowl-edgeable person and the content of her knowledge. Self-awareness is regarded as being prior to language and society: if you talk about yourself, you already have to be familiar with yourself; if you are recognized by others, you need to be “you” in order to experience it. When Henrich and his disciples, first and foremost Manfred Frank,18 discuss the immediacy of self-acquaintance, they painstakingly avoid any allusions to relatedness.19 The fact that you are acquainted “with” yourself must still be clearly distinguishable from, say, being friendly “with” a neighbor. Henrich and Frank argue that you cannot think of yourself as not being acquainted with yourself.20 Any linguistic or societal account of subjectivity based on human relatedness seems to be “running late.” Any self-relation is to be founded on something that antecedes relation.

Tugendhat21 actually sides with Henrich’s critique of self-reflection and with his claim that it is impossible to think of myself as not being me.22 Yet instead of explaining this phenomenon by going back to the immediacy of consciousness, he hints at the tautological character of propositions of the type “I know that I do x.” It goes without saying that these two “I’s” are identical: there is nothing mysterious about it. Following Tugendhat, self-relation is based on self-attributions: on a permanent process of describing me as doing x or being y. He also highlights the normative implications of such a process of self-attribution, as beyond their epistemic status they also allow for self-evaluations, that is, for appreciating or deprecating certain attitudes. This practical “taking stance” is part and parcel of a person’s becoming herself or forming a character.23 Tugendhat’s model of practical self-relation is indebted to Aristotle and Heidegger; it is worth mentioning that his reference to “care” and to “being

18. Manfred Frank (1945– ) studied philosophy at the University of Heidelberg with Gadamer, Karl Löwith, Tugendhat, and Henrich. He has taught at the University of Dusseldorf (1971–82), University of Geneva (1982–87), and University of Tübingen (1987– ).
21. Ernst Tugendhat (1930– ) studied philosophy at Stanford University and at the University of Freiburg with Heidegger. He has taught at the University of Heidelberg (1966–75), the Max Planck Institute in Starnberg (1975–80), and the Free University of Berlin (1980– ).
22. Ernst Tugendhat, Selbstbewußtsein und Selbstbestimmung (Frankfurt: Suhrkamp, 1979), 68.
23. Ibid., 182, 189.
related to oneself” puts the early Heidegger into play again, whereas Henrich is intent on dismissing Heidegger’s later critique of subjective power. In his reply to Tugendhat and defense of Henrich’s position, Frank claims that such an external, linguistic approach to self-consciousness barely grasps the individual experience of biographical coherence and continuity. It is still unclear, though, why and how such a temporal process should be more accessible to those who rely on Henrich’s abstract notion of consciousness and self-awareness.

It is important to note that Tugendhat, a student of Heidegger’s and an analytically trained philosopher, has recently complemented his linguistic reflections on personal identity with considerations on mysticism. Even though Tugendhat does not refer to Henrich in his 2003 book Egozentrität und Mystik, the implicit alternatives that are at stake between them are fairly evident, and their importance is considerable. In his most recent work, Denken und Selbstsein (Thinking and being-a-self; 2007), Henrich goes back to his old idea that the self can rely on an “internal foundation of its own possibility”; he now takes this foundational subject as a building block for a comprehensive model of epistemology and ethics that centers around a subject that, as Henrich puts it, “reaches out [to] the whole of a world.”

Tugendhat takes issue with such a centralized subject in his latest writings. As he has objected to the primacy of self-awareness from very early on and has always thought of the subject as referring to something or being involved in something, he now discusses mysticism as an attempt to overcome self-centeredness and to make peace with the world.

Whereas Tugendhat wants to prove that Henrich’s position is untenable, Habermas does not seem to see any need for such strong judgments. But, like Tugendhat, he shies away from Henrich’s “metaphysical” assumptions on a primordial subject. Given his record as a philosopher of communicative action, it does not come as a surprise that Habermas is at odds with Henrich’s claim that subjectivity is prior to intersubjectivity. Habermas criticizes the “extra-mundane” status of Henrich’s subject.

32. Habermas, Nachmetaphysisches Denken, 272.
traditional Kantian approach based on the autonomy of the subject, while Habermas takes the social dimension of moral justification into account.

Henrich’s and Frank’s theory of immediate self-acquaintance and Tugendhat’s concept of self-relation are based on different theoretical premises, but they both argue for what may be called a “thin” conception of the subject. In Henrich’s case, the idealist core of the subject is the autonomy of the spirit; in Tugendhat’s case, the self is identical with itself by being responsible for its practical instantiations. Neither Henrich nor Tugendhat are particularly concerned with what has become a major topic in the contemporary debates on the subject or the person. This topic is aptly characterized by the Nietzschean question of “how one becomes what one is.” By going beyond the formal analysis of self-acquaintance or self-relation, those contributing to this debate seek to describe the process of shaping qualitative identity, fostering commitments, and so on. This debate has drawn increasing attention in the light of recent controversies on the freedom of the will triggered by the neurosciences. Those who do not defend freedom by tracing it back to an intangible human spirit redescribe it as the capacity to know what you want and what you are. The concept of a person or a subject thus leads to a theory of self-formation. In an exemplary manner, this in turn is put into practice in the recent work of a former student of Henrich’s who, in his earlier career, was one of the main mediators of analytic philosophy in Germany: Peter Bieri.

In his 2001 book Das Handwerk der Freiheit (The craft of freedom), Bieri relies heavily on Harry Frankfurt’s concepts of “care” and “commitment.” These concepts obviously resonate with Heidegger’s (and Foucault’s) notion of “care,” yet instead of exploring such correspondences between the analytic and the continental tradition, Bieri seeks to overcome his analytic past by engaging in a groundbreaking meditation on the freedom of the will. Bieri’s answer to the question of “how we become who we are” culminates in a notion of freedom that is associated with internal consistency and relies on a process of “self-appropriation.” Bieri argues for a “thick” conception of subjectivity that circles

35. This is, of course, the subtitle of Nietzsche’s final work, Ecce Homo.

36. Peter Bieri (ed.), Analytische Philosophie des Geistes (Königstein: Hain, 1981) and Analytische Philosophie der Erkenntnis (Frankfurt: Athenäum, 1987). Bieri (1944–) studied philosophy at the University of Heidelberg with Henrich and Tugendhat. He has taught philosophy at the University of Bielefeld (1983–90), the University of Marburg (1990–93), and the Free University of Berlin (1993–2007).

around the question of how a person learns to know herself. The social sphere, however, is as secondary in his approach as it is in Henrich’s.

Two other points should be mentioned before closing this section on the theory of the subject. First, Blumenberg also argues for a “thick” conception of subjectivity, but insofar as his account is as much indebted to the debate on philosophical anthropology as it is to the discourse on the subject, Blumenberg’s position will be discussed in section VII. Second, although the critique of the subject put forward by early critical theory primarily focused on the subjective domination of external and internal nature, more recent contributions from members of the Frankfurt School have become increasingly interested in the process of self-formation in a social context. Some of these contributions will be discussed in section VI.

V. LANGUAGE: PERSPECTIVISM, INTERPRETATIONISM, AND AESTHETICIZATION

In Gadamer’s hermeneutics, Heidegger’s theory of language and understanding is transformed into a methodology of the humanities or Geisteswissenschaften in general. Language appears as a fabric of meanings, as a kingdom of ideas. This approach misses out on the internal connection between discourse and power that plays a central role, for example in Foucault’s adaptation of Heidegger and Nietzsche. That analytic philosophy became particularly appealing to young German philosophers in the 1980s and 1990s was, to a certain extent, owing to the fact that Gadamer had turned most of “philosophy” into “history of philosophy.” Overcoming an old-fashioned historicism of this kind was also instrumental for rediscovering and reappropriating the best of so-called continental philosophy itself.

An important preparatory step on the way to this reappropriation was taken by Wolfgang Müller-Lauter in his interpretation of Nietzsche’s theory of the will. This interpretation was directed against Heidegger’s influential Nietzsche lectures from the 1930s and 1940s and brings to the fore that Nietzsche talks about a plurality of the will as embodied in individuals. Müller-Lauter’s anti-metaphysical reading of Nietzsche also leads to a reappraisal of perspectivism:

---

39. Wolfgang Müller-Lauter (1924–2001) studied philosophy at the Free University of Berlin with Wilhelm Weischedel. After having taught for many years at the Kirchlichen Hochschule in Berlin, he was professor emeritus at Humboldt University, Berlin from 1993 until his death.
the plurality of the will corresponds to a plurality of interpretations. Whereas a hermeneutical account focuses on meanings and their unstable reference to reality, a perspectivist reading turns to the conflict between interpretations and their respective claims to truth. It could be said that truth, in Nietzsche himself, appears to be reduced to a matter of power, but perspectivism in a broader sense also leads to a recontextualization and reappraisal of language in cultural, ethical, and even epistemological respects.

By intentionally using the rare, almost awkward plural form of “the wills to power,” Günter Abel stresses the inherent plurality of Nietzsche’s perspectivism and draws a line from Nietzsche to Nelson Goodman’s “ways of world-making.” In Abel’s book Interpretationswelten (Worlds of interpretations), Nietzschean perspectivism, while rarely mentioned, is virtually omnipresent, hidden behind discussions of analytic controversies on realism and linguistic indeterminacy. His main interest lying in the context of epistemology, Abel seeks to respond to the relativist threat of perspectivism by introducing clearly distinguished levels of interpretations that go along with different validity claims.

With or without reference to Nietzsche, a number of other philosophers suggest that the philosophy of language should embrace cultural and symbolic patterns of human self-understanding. Nietzsche is very much present in contributions by Josef Simon (1930–) and Werner Stegmaier (1946–), who remain critical of universalistic claims founded in ahistorical reason and defend the ethical potential of perspectivism. The leading phenomenological school in Germany – the group around Bernhard Waldenfels – does not pay particular attention to Nietzsche’s antidualist concept of the “body,” but comes to similar conclusions by going back to Merleau-Ponty’s philosophy of the “flesh” and his theory of “signs.” The reinsertion of language in the context of life-worlds allows Waldenfels to widen the perspective and leads him from a hermeneutical account of the clash of interpretations to the task of approaching and acknowledging the “other,” the “stranger,” or the “alien”: this task is central to what he calls “responsive phenomenology.”

41. Günter Abel (1947–) studied philosophy at the University of Marburg. He has taught philosophy at the Berlin Institute of Technology since 1987.
44. Bernhard Waldenfels (1934–) studied philosophy at the University of Bonn and the University of Munich. He has taught at the universities in Munich (1968–76) and Bochum (1976–).
It is in line with Nietzschean perspectivism or the phenomenology of “life-worlds” that philosophy goes beyond the analysis of propositional language and takes the expressive and aesthetic qualities of language into account. The debate on aesthetics in recent German philosophy mainly circles around the question of whether artworks are defined by their trans- or antipolitical potential, or whether they contribute to the refinement of judgment and to the conversation of mankind, albeit in an indirect manner. Whereas Karl Heinz Bohrer (1932–) defends artistic transgression beyond any social or ethical concerns, Wolfgang Welsch (1946–) combines a broad phenomenological account of Aristotelian *aisthesis* with an analysis of the cultural and social impact of postmodern aestheticization.

In contributions from more recent critical theory, the account of the aesthetic revolves around an ambivalence that is central to the work of Adorno, who sees the work of art as a reminder of another possible world, yet warns against the collapse of aesthetic autonomy, which would be the price paid for turning life into a work of art. Whereas Martin Seel (1954–) explores potential convergences between aesthetics and the theory of the good life, Christoph Menke (1958–) insists on the rift between art and reality. He also uses Adorno’s concept of the “nonidentical” as a springboard for building bridges to deconstructivist theories of language and politics.

VI. SOCIETY: RECOGNITION, SELF-TRANSCENDENCE, SOCIAL SYSTEMS

Social philosophy has long been the domain of critical theory in Germany. As another chapter in this volume extensively discusses the more recent developments in this field, let me here complement the discussion of Honneth, Fraser, and Benhabib by hinting at the fact that critical theory has recently moved in two fairly different directions and, consequently, has entered fairly different philosophical debates.

When it comes to the normative grounds of social cooperation, Habermas’s theory of communicative action and discourse ethics obviously has a lot in

common with liberal theories of justice and contractual theories: the anticipation of possible objections or disagreements inherent to rational discourse is, like Rawls’s concept of the “veil of ignorance,” indebted to the ideal of impartiality. With or against Habermas, a number of moral and political philosophers (Ursula Wolf, Wolfgang Kersting, Otfried Höffe, and others) have been involved in debates on sources of normativity and on justice and human rights; it would be a task of its own to put these debates in relation to the international debate on these matters, and I cannot address this here.49

Yet the task of social philosophy is not confined to a primarily normative approach, and the subject’s social behavior is of interest philosophically even if it does not comply with the standards of universalized norms. This is where critical theory has taken a different turn. With Axel Honneth’s refined theory of recognition, we learn to distinguish between different social spheres – reaching from the political sphere to civil society, or from the workplace to the family – and to relate them to different self-images and forms of self-esteem.50 The formal distinction between different social roles gives rise to a more complex description of the subject or the social actor. Such an account is directed against minimalist accounts of the person as an agent maximizing benefits as well as against functionalist social theories that make the subject emerge from behavioral patterns and structural settings.

A younger generation of social philosophers and social theorists has grown suspicious of an unfettered defense of autonomy and seeks to reconstruct the social embeddedness of individuals by carefully analyzing the intertwining of autonomy and self-abandonment (Seel51) or the dialectics between “self-determination” and “self-transcendence” (Hans Joas52). In a poignant synthesis of German social philosophy, communitarianism, and American pragmatism, Joas, in The Genesis of Values, argues that the involvement of a person in symbolic orders or social imaginaries is not just an obstacle to autonomy, but plays a constitutive role in the process of self-constitution, in the “genesis of

51. Martin Seel, Versuch über die Form des Glücks (Frankfurt: Suhrkamp, 1995).

values,” or in what Charles Sanders Peirce called “the fixation of belief.” This new approach has much in common with what may be called a social turn within phenomenology: Waldenfels (see section V), Hans Jonas (see section VII), Michael Theunissen, Rainer Marten (1928–), and others venture to think with and against Heidegger’s “being-with” and seek to understand the relation to the Other without relying on either individualistic premises or on an all-embracing social framework.

The emphasis on the agent, a main feature of Habermas’s Kantian transformation of early critical theory, paves the way to a reconsideration of the complex internal structure of the subject, but it also attracts criticisms from social theorists who dismiss any strong notion of agency and autonomy and turn to social structures instead. In the famous controversy on “theory of society or social technology,” Niklas Luhmann’s “systems theory” established itself, at least in Germany, as the main contender to Habermas’s social philosophy. From the late 1980s on, Luhmann published a series of volumes that were dedicated to the analysis of different social spheres: the economy, education, art, politics, religion, and so on. In his groundbreaking work *Social Systems*, Luhmann describes “self-referential systems” and the “co-evolution” of societal structures on the one hand, psychological structures of individuals on the other. Following Luhmann, the identity of individuals is emerging from an “autopoietical” process of social differentiation and is directly linked to socially generated meaning. Luhmann borrows this concept of meaning from Husserl’s phenomenology, yet he does not allow for an account of subjective intentionality or for an analysis of individual agency from within.

A discontent with the subject in a totally different context comes to the fore in the work of Peter Sloterdijk. In his account of modern societies, he neither analyzes the premises of individual agency and commitment (as do Habermas, Joas, and others), nor promotes disillusionment in Luhmann’s sense. It could be said that Sloterdijk is rather concerned with a reenchantment of the world, as he seeks to reorganize our modern worldview along the lines of fairly vague
metaphors such as “globe,” “bubble,” “foam,” and so on. His approach has much in common with Oswald Spengler’s “morphology” in *The Decline of the West*, which was published shortly after the First World War. As a member of the “New Age” generation who spent two years with Bhagwan Shree Rajneesh in India, and as a representative of what he calls the “Heideggerian Left,” Sloterdijk criticizes the self-confidence of the “active subject.” His attempt to recreate a new shelter for the modern individual remains highly ambivalent though, as his discontent or weariness with the present age makes him susceptible to the temptation of overcoming the “human” and making use of modern genetics for creating or rearing a new mankind.

VII. ANTHROPOLOGY: THE THEORY OF COMPENSATION,
NEO-ARISTOTELIANISM, METAPHOROLOGY

The dissatisfaction with the master-narrative of individual emancipation has led not only to postmodernism, but also to a reappraisal of premodern traditions. As mentioned above (see section II), the Ritter School was centrally concerned with modern diremption in a Hegelian sense, yet instead of enrolling in a project of modernity that would eventually lead to the liberalization of lifestyles and to the self-organization of citizenry, the Ritter School said “farewell” to theories of progress and to the Hegelian tradition of *Geschichtsphilosophie*. According to Ritter and his disciples Robert Spaemann and Odo Marquard, modern diremption cannot be healed or sublated in some kind of higher reconciliation. We can bear the burden of modernity only by relying on institutions that compensate for a blatant loss of orientation. Central to their account is the theory of “compensation” that they borrow from one of the main representatives

64. Robert Spaemann (1927– ) studied philosophy at the University of Münster with Ritter. He has taught at the universities in Stuttgart (1962–68), Heidelberg (1969–72), and Munich (1972–92).
65. Odo Marquard (1928–1993) studied philosophy at the University of Münster with Ritter and at the University of Freiburg with Max Müller. He has taught at the University of Giessen (1965–93).
of philosophical anthropology in Germany, Arnold Gehlen. This theory is guided by the idea that the shortcomings of individual self-regulation are to be compensated for by cultural, social, and political institutions. This account has an anthropological twist as it is based on the assumption that such compensation meets certain invariable, unalterable needs of human being as such.

The second generation of the Ritter School does not speak with one voice. For example, Marquard defends compensation in the light of a more negative, skeptical account of modern life, and his skepticism regarding social experiments leads him to a defense of traditions and to an affirmation of the status quo. Spaemann’s praise of institutions, in turn, is based on a more positive account of human existence and personal integrity. In a compelling critique of Luhmann’s sociological functionalism, Spaemann turns away from the notion of the modern individual as a “man without qualities.” The fact that Spaemann discussed Luhmann’s work in such detail stands as an impressive example of an intellectual exchange among German philosophers and social theorists that transcends methodological and ideological borders. Spaemann seeks to retrieve the “qualities” of the modern man by interpreting the human being as a “person” whose integrity deserves protection and entails moral obligations. Following Spaemann, a person leading a life that aims at the “good life” cannot help but refer to and rely on values. A person does not generate them, but cannot do without them or even “owes” herself to them. Spaemann argues that a Nietzschean reevaluation of values runs against the human condition, as does a Kantian or Habermasian rational justification of values. Spaemann does not deny human freedom, but redefines it based on primordial commitments and convictions. In his critique of Frankfurt, Spaemann suggests that freedom consists in revising volitions rather than in determining them. When we compare Spaemann’s Aristotelian Catholicism to, for example, Martha Nussbaum’s “Aristotelian social

67. Arnold Gehlen (1904–76) taught at universities in Leipzig, Königsberg, Vienna, Speyer, and Aachen. He was one of the founders of “philosophical anthropology.” His major work Der Mensch: Seine Natur und seine Stellung in der Welt (Man: His Nature and Place in the World) appeared in 1940 and, in a “de-Nazified” version, in 1950.
71. Ibid., 233.
democracy, “it becomes evident that Spaemann’s anthropological account puts much more weight on substantial preconditions of the “good life” than does Nussbaum. In his view of education, for instance, he puts values first and allows for critical reconsiderations of any kind only after a set of firm convictions has already been established.

It is safe to say that the issue of intergenerational relations presents a particular challenge to liberal moral philosophy. Spaemann detects this challenge in his claim that the ideal of autonomous decision-making cannot be applied to children and may even not be an ideal suitable to the human life form at all. Intergenerational relations could be regarded as a kind of showcase for the new fusion of anthropology and ethics in general. On display are the limits of emancipation as well as alternative justifications for moral duties. Thus Jonas discovers a primal scene of morality in the anthropological bond between parent and child. In his work on *The Imperative of Responsibility*, he seeks to overcome the “is–ought” problem by claiming that the parental “being with the child” is insolubly linked to the immediate moral demand for protecting it, caring for it, and so on. In an ethical re-reading of Heidegger’s “being-with,” Jonas urges us to rely on this primordial source of morality and to extend it to a responsibility for a livable future on earth in general. Substantialist anthropologies of this kind are always prone to generalizing certain findings: in this case, the bond between parents and children. It is hard to make the case that this bond is not subject to historical change and cultural differences. Yet there is also a type of anthropology that evades criticisms from the side of historical relativists. For example, an anthropological account does not necessarily aim at substantial claims on the assets of human nature, but could also be concerned with structural descriptions of human behavior: Plessner’s notion of the “eccentric positionality” of the person that accounts for individual embodiment as well as for reflective self-distancing may serve as an example in this respect. Plessner, who is much more cautious with references to biological findings than Gehlen, has also been a major inspiration for Hans-Peter Krüger’s (1954–) innovative contributions to this area of research.

---

74. Hans Jonas (1903–93) studied at the University of Freiburg and the University of Marburg with Heidegger and Bultmann. He emigrated to England in 1933, joined the British Army during the Second World War and also fought in the 1948 Arab–Israeli War. He later taught at the New School of Social Research in New York (1955–76).

While Spaemann’s and Jonas’s philosophical anthropology is pitched to the liberal consensus in recent moral philosophy, Blumenberg’s\(^76\) anthropology is pitched to the consensus that describes the modern age as a success story of full-fledged emancipation. Blumenberg’s anthropological reflections go back to the beginning of the modern age, that is to the age of “secularization” and “self-assertion.”\(^77\) His reading of the modern subject is not based on a theory of self-acquaintance (as is Henrich’s), but goes back to the concern with self-preservation that plays a central role in early modern philosophy. Compared to this tradition, however, Blumenberg’s concept of self-preservation has its own distinctive features.

Blumenberg does not address self-preservation as it appears on the horizon of the individual and its interests (e.g. in Hobbes); instead, he asks the question of how self-preservation could be put on the modern agenda in the first place. He sees it as an outcome of a dramatic resurgence of human finitude, of earthly existence. According to Blumenberg, the modern age is humane in the specific sense that it is willing to finally acknowledge and to take charge of the finite existence of human beings. The “legitimacy” of the modern age in general and of technological progress in particular does not consist in Promethean emancipation,\(^78\) but lies in the willingness to take the concerns of finite existence seriously. Blumenberg shares this interest in temporality with Theunissen,\(^79\) who complements current theories of the good life by exploring various forms of pathologies linked to temporal experiences and by hinting at life forms that make temporality bearable or livable, guided by the question “Können wir in der Zeit glücklich sein?” (Is it possible to be happy under the reign of time?).\(^80\)

With the focus on individual frailty, Blumenberg marks the greatest possible difference from the critique of the modern subject put forward by Heidegger on the one hand and Horkheimer/Adorno on the other hand (see above, section

\(^76\) Hans Blumenberg (1920–96) studied philosophy in Frankfurt, but later became a victim of racial persecution and had to hide from the Nazis. After the Second World War he continued his studies at the University of Hamburg and the University of Kiel with Ludwig Landgrebe. He taught at the universities in Hamburg (1958–60), Giessen (1960–65), Bochum (1965–70), and Münster (1970–85).

\(^78\) Cf. the comments on technology and against emancipation in Hans Blumenberg, *Wirklichkeiten, in denen wir leben* (Stuttgart: Reclam, 1981), 47, 49.

\(^79\) Michael Theunissen (1932– ) studied philosophy at the University of Bonn and the University of Freiburg with Max Müller. He has taught at the universities in Berne (1967–71), Heidelberg (1971–80), and Berlin (1980–98).

II). Given the contingency and frailty of human existence, self-preservation is concerned not only with bodily needs, but with individual vulnerability as such. A major challenge to the concern with individual self-preservation is the collapse of a cosmological order (or the “disembedding” of the individual, as it has been called in a totally different context81). Under modern conditions, the individual becomes more and more aware of the dramatic rift between its lifespan and the world as a whole.82 The individual’s place in the world is insecure; it is left alone with its sense of belonging.

Even though Blumenberg did not belong to the Ritter School, he was at least as impressed by Gehlen’s theory of compensatory institutions83 as were Marquard and others. Yet in his theory of compensation, Blumenberg proves to be aware of the limited reach of social institutions. His quest for an order that may provide orientation leads him to language, which itself is deemed to be fragile. We are not capable of scientifically reorganizing our world, hence we take refuge in metaphors that serve us as guidelines. As these metaphors are irreducible to any objective reality, they can only be “absolute metaphors.”84 This does not mean that they are useless, however. According to Blumenberg, human self-understanding cannot engage with “reality” in any direct, unmediated manner and relies on words lacking unequivocal referentiality.85 When he uses the term “anthropology,” he does not mean to refer to biological findings, but hints at the fact that the conditio humana is the condition of an “animal symbolicum,” referring at this point directly to Ernst Cassirer’s theory of symbolic forms.86 Thus the debate on anthropology reaches out to the philosophical debate on language. If “being human” means relying on something that “is not,” that is metaphors, we are invited to adopt a paradoxical self-image that leads from being to non-being and vice versa. It is striking to see how these considerations based on Blumenberg’s metaphorology come close to debates that are familiar to theorists of deconstruction. Whoever wants to attack complacent self-identity finds the best possible witness in Michel de Montaigne, who is quoted by Blumenberg with the marvelous phrase: “The worst place we can take is in ourselves.”87

VIII. CONCLUSION

Given the vast array of topics and traditions that we have encountered on our path through the labyrinth of recent German philosophy, any attempt to summarize these “themes out of school” would be futile. Let me instead conclude with three short remarks.

1. It goes without saying that this account of some recent developments in German philosophy is by no means exhaustive. This short overview could at best serve as an invitation to the reader to further engage in these debates and to explore what has been left aside or mentioned in passing only. Among the significant thinkers who, because of space constraints, have not been discussed are Rüdiger Bubner, Volker Gerhardt, Friedrich Kambartel, and Hermann Lübbe.88

2. It should have become clear that the most striking and promising contributions often seek to cross boundaries: be it that they cross the line between different scholarly traditions and think “outside the box,” or that they seek to overcome any narrow account of the subject, language, society, or anthropology. It should be regarded as a philosophical achievement of a kind if, at the end of the day, these topical distinctions appear to be insufficient.

3. If the reader came to the conclusion that the label “continental” does not really fit the philosophical work that has been presented here, I would not disagree.

---

It may seem strange to publish an essay entitled “The Structuralist Legacy” in a volume devoted to 1980s and 1990s French philosophy. After all, was structuralism not dominant for only a brief period of time in the 1960s (and maybe only from 1966 to 1968)? And was it not both rapidly disavowed by its own leaders (some of them giving way to “post-structuralism”), and also questioned on the level of its very identity, both as it hesitates between philosophy and the human sciences, and as it is progressively evolved into many arguably incompatible individual projects, such as those of Lévi-Strauss, Lacan, Foucault, Althusser, Deleuze, or Derrida? Equally, from a scientific perspective, has it not been superseded by cognitivism as the new transversal paradigm for the social sciences? While this may be the common view, the conviction underlying this essay is that structuralism has been the fundamental matrix of twentieth-century postwar French philosophy, running right up until the end of the century – a matrix realized in a diverging constellation of answers to philosophical problems raised by the introduction of structural methods into the social sciences. But it needs to be said from the beginning that we will not understand structuralism here as a determinate set of affirmative propositions bearing a lumbering, dogmatic identity, but rather as a movement that presents a problematic unity. This unity derives from methodological reforms in the various empirical sciences that made them realize, each in their own way, that they could not establish themselves

1. In 1966, both Foucault’s Les Mots et les choses and Lacan’s Écrits were published, and were huge best-sellers.
without passing through philosophical reflections on the very strange ontological nature of new entities that had been introduced into the scientific domain, such as the purely differential and positional entities that Ferdinand de Saussure called signs.

I would like to argue here that some of the most important works of 1980s and 1990s French philosophy (those of Alain Badiou, Étienne Balibar, Dominique Lecourt, Jacques-Alain Miller, Jean-Claude Milner, Michel Pêcheux, and Jean Petitot) originate in the idea – first put forward by both Lacan and Althusser in misleadingly similar terms just before 1968 – that far from dismissing the notion of subjectivity, structuralism offers the scientific and philosophical framework to give an accurate account of the emergence of subjects in the world. Most of these philosophers began their intellectual career as contributors to a little-known journal, the *Cahiers pour l’analyse*, which seems retrospectively to have staged the problematic of the next decades. Created by students of Althusser who attended Lacan’s seminar when it was relocated to the École Normale Supérieure, the *Cahiers pour l’analyse* aimed to inquire into the epistemological status of psychoanalysis in the context of structuralism.3

Structuralism, thus understood, appears as an attempt to overcome Kant’s dilemma: either science is possible, but we cannot understand how any subject can appear in the very world that can be made an object of science (since the transcendental structure of this world leaves no room for a genuinely self-determined entity); or there are subjects in the world, but we have to accept that something in reality resists scientific objectification. In contradistinction to Kant, structuralism aimed to make science and subjectivity compatible. However, this scientifically objectified world in which subjectivity could appear was not nature, but rather culture, understood as a set of symbolic systems (as in Lévi-Strauss’s definition).4 Here, the term symbolic refers not so much to a certain function (that of communication), as to a certain type of being, the being of differential and positional entities whose identities depend on their oppositional relations and structural positions within a system. In other words, structuralism offered a chance to make objective science and subjective experience compatible because it offered, through the concept of the sign, a new tran-

3. Ten issues of the journal appeared between 1966 and 1969. They are now all available online thanks to the AHRC funded project at Middlesex University “Concept and Form: The *Cahiers pour l’analyse* and Contemporary French Thought,” www.web.mdx.ac.uk/crmep/cahiers (accessed August 2010). I am grateful to Peter Hallward, Ray Brassier, and Christian Kerslake for having provided me with their English translations of the texts.

4. See the definition of culture by Lévi-Strauss: “Any culture can be considered as a combination of symbolic systems headed by language, the matrimonial rules, the economic relations, art, science, religion” (*Introduction to the Work of Marcel Mauss*, Felicity Baker [trans.] [London: Routledge & Kegan Paul, 1987], 16).
scendental “ontology.” Structuralism claimed that given what a cultural system is in general, it is possible, perhaps even necessary, for subjects to arise within it. Thus, the guiding question became transcendental: What must the ontology of culture, that is, the ontology of signs, be, so that subjects can appear and operate within our world? In what follows, I would like to show that the relation between structure as an ontological concept and subjectivity as an effect has been the vexing question of one of the most significant parts of post-1968 French philosophy, and that it remains a fertile issue today.

I. FROM STRUCTURALISM TO HYPERSTRUCTURALISM: ONTOLOGY OF STRUCTURE AND SUBJECTIVITY AS AN EFFECT

The idea that structuralism, far from dismissing the notion of subjectivity, on the contrary allowed us to understand it in a truly Freudian sense, was at the core of Lacan’s teaching in the 1960s.5 Freud’s second topography – dividing the psyche into the agencies of ego, id, and superego – was, according to Lacan, nothing but “a reworking of the analytic experience in accordance with a dialectic best defined as what structuralism has since allowed us to elaborate logically: namely, the subject – the subject caught up in a constituting division.”6 Lacan finds in “a very particular mode of the subject” – a mode in which “the subject is, at it were, internally excluded from its object” – “the crucially important mark of structuralism.”7 To explain this sentence would require much more space than this essay allows,8 but it is nonetheless necessary to briefly answer two preliminary questions, since both psychoanalysis and structuralism are commonly deemed to have utterly dismissed the notion of subjectivity in the account of our life.

Following French Marxist philosopher Georges Politzer’s 1928 breakthrough work *Critique des fondements de la psychologie*, Lacan was convinced that psychoanalysis could not function without a notion of truth. Furthermore, this truth could not be an objective and substantial one (as if behind the illusions of the ego reigned the positive and deterministic forces of the unconscious), but needed to be a truly subjective one. There are good arguments for such a claim. As Sartre put it, why would I feel concerned by those wishes that appear through the cure to be at the origin of my symptoms and dreams if they were nothing but

---

5. Lacan is the focus of an essay by Ed Pluth in *The History of Continental Philosophy: Volume 5.*
rough facts, simple data of the world, or if I refer to them in an intersubjective way or as “other”?9 What reason do I have to consider them as “mine”? Why should I assume these wishes more than, say, the ones of the analyst? And if I do not assume them, can the cure still be efficient?

But if the subject is not a thing, nor is it a transparent, self-determined, and self-constituted capacity of action, as Kant suggested. To put it rather metaphorically, we could say that the subject is never contemporary or coincident with its own engendering (as it is for Kant, since it is strictly coextensive with the rationality of moral law). Instead, the subject is always behind itself, it finds itself as having-always-already-decided, constituting itself through this very delay even though this primary being-already-here does not enable it to record itself as a fact. To designate the paradoxical nature of the subject, Lacan famously coined the term “split subject,” characterized as follows: “I am thinking where I am not, therefore I am where I am not thinking.”10 This does not mean, though, that I am somewhere else, but rather that I am nothing other than this very displacement. We may add that Lacan suggested that such a truth, which does not lie in the correspondence between a sign and a fact, can be found in figures, in the sense of rhetorical figures, where a sign functions not by referring to a thing, but as a displacement from one sign to another. The truth of a proposition such as “I want to kill my father” would be of the same kind as “We are such stuff as dreams are made on and our little life is rounded by a sleep.”

Now, this definition of the subject may strike us as rather unoriginal. After all, a very long tradition running at least from Hegel to Sartre, passing via Kierkegaard and Heidegger, also defined the subject as a relation to oneself given by the impossibility of coinciding with oneself, whether this takes the form of an impossible being that is what it is not and is not what it is, or of one for whom identity and difference are identical, of one that is at the same time a given and a task, or of one that is eventually an ecstatic term that cannot stand (in) itself.

What is original, though, is the claim that this paradoxical element, far from being originary and only accessible through a philosophical a priori approach, is “best elaborated” by a scientific approach such as structuralism. So, already a second preliminary question arises: In what sense does structuralism have anything to say about subjectivity? Has Saussure not argued that meaning is

not found in subjective intentions, but in signs’ respective oppositions? Did Lévi-Strauss not accept the characterization of his philosophical position as a “Kantianism without a transcendental subject”? Did Althusser not defend a Spinozist “process without subject”?

The best argument to show that structuralism needed a theory of subjectivity was given by Jacques-Alain Miller, at the time only twenty years old, who would later become the editor of the Cahiers pour l’analyse and eventually Lacan’s son-in-law and legatee. This argument was given in “Action de la structure,” an article that, I will argue, formulates the basic program of his generation. If structuralism does not provide a theory of subjectivity, he writes, its extension to all the domains of cultural sciences, and especially to anthropology, is invalid: “as long as the alteration brought about by the exclusion of the speaking subject is not annulled, the structures proper to linguistics are of no value beyond their region of origin.”

Why so? First, while linguistics may study the abstract objects that Saussure called langues, anthropology studies man in his living totality, including the complete range of his actions (speaking, working, etc.), as Lévi-Strauss himself acknowledged, reminding his readers that the true meaning of Mauss’s notion of “total social fact” is precisely to “reintegrate subjectivity in objectivity.” But second, if structuralism is unable to explain the emergence of a subject as one of its effects (this very subject who considers himself or herself to be, at least in principle, the origin of all meanings), it will have to leave the explanation of the real functioning of structures to the most classic philosophical anthropology. For, even if we accept that a linguistic performance is nothing but the actualization of a possibility predetermined in the linguistic system, how can we account for this particular possibility being actualized rather than another one? Must it not be because of a subject who “chooses” it? Everything that structuralism was deemed to undermine – subjectivity, context, reference, practice – will then come back at another level, the level of use or speech, as Ricoeur’s work convincingly shows.

---

11. For a discussion of Saussure’s linguistic theory, see the essay by Thomas F. Broden in The History of Continental Philosophy: Volume 5.
13. Jacques-Alain Miller, “Action de la structure,” in Un début dans la vie (Paris: Gallimard, 2002), 61. This text was written in September 1964 and signed also by Jean-Claude Milner and Yves Duroux, in order to introduce a “cartel” (defined by its interest in “discourse theory”) and then join Lacan’s new school; it was published four years later in volume 9 of the Cahiers pour l’analyse; for details see Miller, Un début dans la vie, 57.
“Action de la structure” therefore argues that structuralism needs to give way to a perfectly general concept of structure (which therefore belongs to what he calls a logic, a theory of the form of a symbolic system in general, which he will call the “logic of the signifier”), one that will also explain or formalize the implication of a subjective effect in the workings of every symbolic system. These two aspects – a strictly conceptual approach to structuralism and a causal theory of subjectivity – define what Jean-Claude Milner will later call “hyperstructuralism.”

But a last preliminary concern arises: Can structuralism actually function at such a general level? Is there any such thing as a general logic of structure? Is it not the task of each discipline, concerned with its particular domain of culture (be it language, fashion, kinship, ritual, or myths), to offer a specific account of the actual subjective effect of its symbolic structures? Is it not well known that all general concepts of structure are either too precise to encompass the variety of usage of structural terms in the various disciplines it has been imported into, or too broad to be truly significant?

The best argument in favor of such a “logical” approach to the relation between structure and subjectivity is to be found not in Miller’s 1964 “Action de la structure,” but in Milner’s later book Le Périple structural (2002), which is both one of the few serious historical interpretations of this period in French and a major sign of the renewed interest in structuralism in contemporary French philosophy. Milner’s argument, coming from a linguist, has the advantage of being grounded in a profound understanding of the philosophical issues raised by structural linguistics. He remarks that it is inaccurate to say that structural linguistics discovered a structural dimension in language; one should rather say that it has defined linguistic reality by this structural dimension. For, belonging to a system is not a property of signs; it is that which constitutes them in their existence and essence: “structural linguistics constitutes itself precisely by aiming at disregarding in language everything that would be specific to language and

would thus obscure the structural level as such.”¹⁷ Therefore structuralism is the extension of a linguistic model to all cultural phenomena only because it is first a reduction of language to structure as such. We can go even further and argue that the extension of the concept of the sign to various cultural phenomena is not grounded on the assumption of a common function (for instance, that of communicating, as Roman Jakobson argued), but on a common problematic mode of existence. If variants of myths can rightfully be called signs, it is not because they serve to communicate, but because they share the same ontological characteristics that Saussure first isolated in language: differentiality, duality, codetermination, and so on.¹⁸ There must, therefore, be a general theory of structure that sustains each application of structure to a particular domain. If it appears that such a general theory is in fact impossible, this would be a decisive argument against structuralism. In short, structuralism must be hyperstructuralist.

This remark is also important because it clarifies, retrospectively, the nature of the “logic” Miller pointed toward in “Action de la structure”: this “logic,” in truth, turns out to be an ontology. The Cahiers pour l’analyse therefore represents the moment when structuralism realizes its own ontological dimension. This gives us a more vivid image of its main hypothesis: it is because we are sensitive to the strange entities that Saussure called signs that we are constituted as subjects. Of course, this means that there needs to be some sort of cognitive function that underlies the constitution of these objects; however, this could very well be a blind, automatic, data-processing function – the symbolic function. Subjectivity itself, far from being the origin of discourse or the function that precedes and supports the signs we produce, is something that occurs in an already given domain of objects, the domain of language or discourse.¹⁹ To the familiar structuralist motto “It speaks [ça parle],” we should add that the way it speaks implies that “I speak.”

However, Miller used another argument in “Action de la structure” in favor of a purely conceptual or logical approach. He invokes Georges Canguilhem’s

¹⁷. Milner, Le Périple structural, 144. See also what Milner calls “minimalisme de l’objet”: “One will know a linguistic system only by constraining oneself to consider in it nothing but the minimal properties that constitute it as a system, that can be analyzed into minimal elements” (L’Œuvre claire, 97).

¹⁸. See Milner about Saussure: “Taken in its extension, the program could apply to any species of reality, if it is admitted (strong structuralist assumption) that any reality can be considered only from the point of view of its systemic relations. Pushed to its extreme point, it led to a new type of ontology. One understands that it ended up affecting all parts of the culture, from psychoanalysis to philosophy” (Le Périple structural, 38). For a detailed argument, see my La Vie énigmatique des signes: Saussure et la naissance du structuralisme (Paris: Léo Scheer, 2006).

¹⁹. Foucault will give a powerful expression to these structuralist themes in particular in The Discourse on Language.
definition of concepts\(^2\) (which will figure in the epigraph of every issue of the *Cahiers pour l’analyse*) as a tool for exporting ideas and methods from one theoretical domain to another. For Canguilhem, Bachelard had argued that science was worked through by a “dialectic” that recognizes the same problematic structure in two apparently dissimilar domains of knowledge; for example, the dialectic between the theory of electricity and the theory of movement gives way to modern physics.\(^3\) In the same way, according to Miller, the theory of structure was deemed to uncover the deep identity of apparently dissimilar theoretical domains; for example, Marxism and psychoanalysis, or, rather, the respective reinterpretations of each of them offered by Althusser and Lacan. Just as Lacan argued that the unconscious is not a positive substance behind consciousness, Althusser argued that the “real” causal forces in history do not constitute another substantial level of determination behind those that we believe to be efficacious, but are on the contrary to be looked for at the surface of these different levels and in the way they relate to each other in a “complex articulated whole.”\(^4\) The cause, therefore, is not a thing, but the structure itself. From this it is arguable that Althusser and Lacan’s works are connected through their belief that a certain concept of structure has genuine causal power without defining another level of reality. This leads to the theory of “structural causality,” in which structure is not another being behind appearances but is rather the “absent cause”: a cause that exists only through its interpretations/effects.

The nature of the problem can now be reformulated: we have to find the concept of a cause that operates through the very way it triggers chains of operations where it *does not* “seem” to operate, or rather – since we must obviously avoid intentional concepts – that is absent from the very operations it guides. Hence the concept of a “causality of the lack” (*causalité du manque*), where the absence of the cause is the principle of its efficaciously. If we can successfully argue that in each and every symbolic system there is one term that is included by the very manner in which it is excluded, that is, by a possibility that at the same time is its own impossibility, then we would have shown that symbolic systems cannot constitute themselves without implying a subject in the Freudian sense. How so? Because we have seen that the authentic definition of the subject

\(^2\) “[T]o work on a concept is to vary its extension and comprehension, to generalize it by incorporating exceptional traits, exporting it beyond its original region, taking it for a model or inversely seeking a model for it, in brief, to progressively confer the function of a form by regulated transformations” (Georges Canguilhem, “Dialectique et philosophie du non chez Gaston Bachelard,” in *Etudes d’histoire et de philosophie des sciences* [Paris: Vrin, 1970], 206).

\(^4\) Althusser is the focus of an essay by Warren Montag in *The History of Continental Philosophy: Volume 6*. 
is not as a positive entity, but rather as a term that exists only in the form of a being displaced, as the impossibility of coinciding with itself.

II. SUTURE AND THE LOGIC OF THE SIGNIFIER: JACQUES-ALAIN MILLER

The construction of this “logic of the signifier” has known many different stages. The first attempt was in a very influential text by Jacques-Alain Miller published in the first issue of the Cahiers pour l’analyse: “La Suture.”

“Suture” is the name Miller gives to the relation whereby causality operates via what is lacking. The argument, though, seems surprising. Miller does not start from signs in Saussure’s sense, but rather from Frege’s tentative reduction of arithmetic to logic in his Foundations of Arithmetic, as if to show that in logic itself one can find a trace of subjectivity, that is, of a term that has no substantial identity but only a displacing function. Miller isolates three steps in Frege’s reasoning. First, number is defined as the concept of an identity to a concept; for instance, “children of Agamemnon and Cassandra” refers to Pelops and Teledamus, but the concept “identical to the concept ‘children of Agamemnon and Cassandra’” refers to 2, Pelops and Teledamos having been deprived of all their qualities and reduced to pure marks. Second, Frege invokes the concept of an object that is “non-identical to itself.” Its extension is null, but the extension of the concept “identical to the concept of ‘non-identical to itself’” is not empty: it is precisely zero. Zero is an object, although it does not subsume any object. Third, we remark that the concept of “the sequence of all the numbers up to 3” subsumes four terms: 3, 2, 1, and 0. Therefore, zero introduces an imbalance in the relation between numbers and objects: there are always more numbers than objects. What appears as an absence on the side of things functions as an excess on the side of names. This very imbalance is enough to engender the entire series of natural numbers, as if it was because we can represent nothing by something that everything can be put in a serial univocal order. The lack that zero subsumes does not exist, but it is efficacious: it operates, and operates even more because it does not exist as such. Zero is nothing but the displacement that it imposes on every other term in the series.

Of course, Miller sees in zero the trace of the subject:

The impossible object, which the discourse of logic summons as the not-identical with itself and then rejects as the pure negative,

---

23. “La Suture” was published before “Action de la structure,” but written after it, as “Action de la structure” was first presented at Lacan’s seminar on February 24, 1965.
which it summons and rejects wanting to know nothing of it, we name this object, in so far as it functions as the excess which operates in the series of numbers, the subject. Its exclusion from the discourse which internally it intimates is suture. If we now determine the trait as the signifier and ascribe to the number the position of signified, the relation of the lack to the trait should be considered as the logic of the signifier.24

Miller’s idea seems to be that because traditional forms of logic cannot account for zero, this would require another logic, one that is not concerned with concepts and objects, but rather with lacks and marks, or rather with signifier and subject, with signifiers that signify (literally) nothing, but, precisely because of this, are signified in turn by another signifier, illustrating Lacan’s definition of the signifier as that which signifies the subject (the impossible or contradictory term) for another signifier.

Miller’s construction is also in line with Lacan’s notorious phrase: “The subject of the unconscious is the subject of science.”25 But its status is unclear. Is it just an example of the way “suture” (causa in absentia) works? Is it a way of clarifying the nature of the operation through which the subject exists in every structural domain by appealing to an analogy? But this interpretation would fall prey to a sort of vicious circle since the “logic of the signifier” would be made clear by appealing to what it grounds. We must rather read this text as an attempt to make a stronger point: that even the most formal and apparently unequivocal form of thinking relies on our access to the symbolic, that is, on our capacity to apprehend the strange entities that structuralists called signifiers. These do not function through reference, but thanks to the ability of one of them to hold the place of nothing and to trigger an autonomous series where each sign is built on another one by means of the imbalance between the positivity of signs and the nothing that they mark. This is a way of saying that behind formal logic itself one should look for the most fundamental logic, as in the first pages of Lévi-Strauss’s The Savage Mind, where symbolic thought is presented as the precondition of every thought; this assumes that we define signs by a relation between not concepts and objects, but lacks and marks. However, it is fair to say that this “logic” cannot yet be found in “La Suture.”

To find it, we have to turn to Miller’s 1975 text “Matrice.” We will reconstruct somewhat freely its argument in order to show its relation to the ontology of signs. According to Saussure, signs are positional entities: they have no other

the structuralist legacy

reference than their own position. But what is a position other than what is left when everything of the mark itself is erased – hence nothing? Therefore, a positional entity is an entity that contains, as part of itself, its own absence. The very concept of a positional entity thus implies a splitting of the object between itself and itself-plus-its-own-absence.26 This provides the matrix for the iteration Term → Lack → Term (= Term + Nothing) → Lack …. It is still possible to distinguish among these terms (T', T", …), but only by considering two series: the series of the terms and the series of their absences. These series are not parallel, but lagged (décalés) and relate to one another thanks to this very lag (décalage). It is also possible to consider them as the iteration of only one impossible or split entity, an entity that is all of them without being able to be any of them, an impossible object that is distant from itself and can thus be rightly called the subject.

A similar and somewhat simpler argument has been offered by Milner in Le Périple structural, arguing on the basis of the differential nature of signs. First, says Milner, we must remember that signs are relational entities. This implies that they have no properties unless there is another term. For instance, the phoneme /p/ can be said to be “voiceless,” because there exists a term from which it is distinct (in English) according to this feature, /b/. Rigorously, /p/ does not have any property, since it is impossible to separate it from them: there is no substance to which we attribute these properties since it is defined by its distinctive features as a purely differential term.27 Second, there is one property that is common to all the terms of any symbolic system: their being differential. But there needs to be a term to which all of them refer in this regard (since there are no properties without terms). Now, this term must also relate to itself as being distinct from itself. The conclusion follows that this term is the impossible or paradoxical term that exists only by absenting itself from every occurrence – the subject, in accordance with the tradition that defines it by this noncoincidence to itself: “Allowing that any structural term as such is non-identical to oneself, the subject is the term of the chain which supports the ‘not-identical to oneself’ of any term of the chain.”28

Many objections could be made to this argument, but here let me simply draw attention to its reliance on two disputable presuppositions. The first one is that the very idea of a “logic of the signifier” implies that this logic must be valid for every symbolic process, and therefore both for scientific and nonscientific discourses alike. The problem here is that this claim could be accused of erasing

26. While Miller’s reconstruction of Saussure bears some resemblance to Derrida’s account of the trace, I would suggest that while Derrida’s concept of trace implies a notion of time, with a reference to Husserl and Heidegger, such a notion of time is absent in Miller’s account.
28. Ibid., 165.
the distinction between science and ideology under a homogeneous theory of symbolic processes. The second objection is that these analyses make sense (if they do) only on condition that the structuralist approach to cultural phenomena as signs (and therefore as differential entities) is empirically grounded. But this very approach has been challenged by Noam Chomsky’s generative grammar. These objections will give way to alternative forms of “hyperstructuralism,” which construe differently both the concept of structure and the concept of the subject.

III. FROM FORMAL PRODUCTIVITY TO THE MATHEMATICS OF BEING: BADIOU AGAINST THE LOGIC OF THE SIGNIFIER

The first objection was advanced by one of the most important contemporary French philosophers, Badiou, in one of his first articles, “Marque et manque: À propos du zéro,” published precisely in Cahiers pour l’analyse.29 I will even argue that Badiou’s entire philosophical undertaking is rooted in the issues discussed here. Jacques-Alain Miller’s application of the “logic of the signifier” to formal logic relies on Frege’s unquestioned claim that the constitution of arithmetic requires an appeal to a purely conceptual impossibility (the “non-identical with itself”), to some unthinkable. But in “Marque et manque,” Badiou attempts to prove that logic does not need to appeal to this operation that Miller called “suture,” and logic is therefore liberated from the constraints of semiotic thinking. In line with Althusser’s Spinozist inspiration in the 1960s, Badiou defends the claim that science, as opposed to ideology, is a process without a subject, a process entirely contained in the immanent productivity of its formal apparatus, and that, in direct contradistinction to Lacan, “there is no subject of science.”

The heart of the objection is quite simple: Frege’s construction relies on a definition of meaning as referring to an object. But this is not, according to Badiou, the way logical symbols work. In accordance with the most formalist understanding of logic, Badiou emphasizes that logical symbols should be regarded as letters that define operations on other letters, and that they do not refer to anything other than what has been previously introduced as a letter (or a sequence of letters) through purely constructive procedures that have nothing to do with “suture.”30 Likewise, zero refers to something that has been previously

---

29. For a detained discussion of Alain Badiou, see the essay by Bruno Bosteels in The History of Continental Philosophy: Volume 8.
the structuralist legacy

defined at another level or layer of the formal theory. For it is a characteristic of every formal system that it is stratified: new systems can be built by introducing new rules and symbols in the former one. Badiou provides in his article the formal demonstration that it is possible to deduce zero without making any appeal whatsoever to the Unthinkable, but instead by playing on these different layers, zero being introduced at one level, excluded at another one, and reintroduced in the last one. A lack, in a formal system, is always the lack of a mark: there is no mark of the lack as such.

From this we can conclude that there is at least one language in which we do not need to speak of a subject (as an impossible object marked by a “placeholder”). This language is logic itself, the language of “science,” and the core of all mathematical thinking. Therefore, Lacan was wrong to say that “the subject of the unconscious is the subject of science.” Science has no subject, and this is what defines it in opposition to “ideology” or symbolic thought, which are characterized precisely by the way they hide their own productive processes.31

This early text is all the more interesting because Badiou’s mature work appears as a sort of rigorous redaction of this first position. In Being and Event, Badiou endorses a clear “hyperstructuralist” perspective. First, he explicitly renounces the logicist understanding of mathematics that underpinned his critique of Miller’s argument.32 Second, he defends the claim that the subject, far from being a function of ideology, is a function of truth,33 and even more strikingly, he endorses Miller’s question about the compatibility of such a theory of the subject with ontology.34 Third, this ontology appears to be a general theory of structure, and of a structure that leaves room for the emergence of a subject, closely echoing Miller’s attempt to “formalize” Lacan’s concepts. In short, it seems that in his later work, Badiou endorses the hyperstructuralist program, although redefining both the concept of structure and the notion of subject. While I cannot here do justice to Badiou’s highly articulated construction, it may be enough to say that the gist of the attempt to prove the compatibility between a structural ontology and a theory of the subject relies on the discrepancy between structure (here defined as a way of turning a pure multiplicity

31. “The suture thus is not a concept of the signifier in general, but the property characteristic of the signifying order that comes to bar a subject. By name, ideology. There is always a subject of ideology, and this is the mark by which it is recognizable” (ibid., 162).
32. “I had been caught in the grip of a logicist thesis which holds that the necessity of logico-mathematical statements is formal due to their complete eradication of any effect of sense” (Alain Badiou, Being and Event, Oliver Feltham [trans.] [London: Continuum, 2005], 5).
33. See ibid., meditation 35.
34. “But that the process-subject be compatible with what is pronounceable – or pronounced – of being, there is a serious difficulty for you, one, moreover, that I pointed out in the question posed directly to Lacan by Jacques-Alain Miller in 1964: ‘What is your ontology?’ Our wily master responded by an allusion to Non-Being, which was well judged, but brief” (ibid., 4).
– which as such contains nothing but multiplicities, thereby making it impossible to count – into a multiplicity of units, i.e., of elements belonging to it, that can be distinguished and counted\textsuperscript{35}, and what Badiou calls metastructure. This metastructure replicates the operation of structure on its own effects, no longer counting elements, but subsets, and thus re-presenting the units that were previously presented by the structure. Now, it is well known that there are always more subsets of elements of a set than there are elements in a set. Badiou makes use of an important theorem by Paul Cohen (published in 1963), which proved that for infinite sets this difference cannot even be measured, to situate what in Being (i.e. multiples or sets) allows for the appearance of a subject. For, in these infinite sets, there are subsets that can be proved to exist even though they cannot be constructed from inside the language of the original situation: they are said to be “indiscernible.” Badiou’s claim is that truths are such subsets that we cannot grant existence to on the basis of what we already know, but that can be “forced” to realization. Now, the subject is nothing other than the operation through which a set is reorganized according to the hypothesis of the existence of such an indiscernible subset. Subjects are not entities but rather operations through which the consequences of a truth unfold in a world in which, prior to the truth’s unfolding, they cannot be grounded.\textsuperscript{36} But it is clear that the condition of possibility of the emergence of a subject in the world is the essential tearing up of any structure. Therefore, for Badiou as for Miller or Milner, it is the structural construal of Being that accounts for the possibility of subjectivity.

Even so, Being and Event can be seen as still marked by the decisions taken in his early article, and if there is one thing that characterizes Badiou’s original answer to the Lacanian question, it is its enduring skepticism toward the very program of the “logic of the signifier.” First, in the same way that he does not believe in a deeper logic than formal logic, Badiou does not accept the idea of a specific ontology of signs.\textsuperscript{37} He claims that ontology is a perfectly general, nonspe-

\textsuperscript{35} “This is the most general definition of a structure; it is what prescribes, for a presented multiple, the regime of its count-as-one” (ibid., 24).

\textsuperscript{36} For a more detailed and remarkable analysis of Badiou’s theory of subjectivity, see Peter Hallward, Badiou: A Subject to Truth (Minneapolis, MN: University of Minnesota Press, 2003); and for an excellent account of Badiou’s early controversy with Miller’s “logic of the signifier” and more generally of the entire philosophical context that is discussed here, see Bruno Bosteels, “Alain Badiou’s Theory of the Subject: Part I. The Recommencement of Dialectical Materialism,” Pli 12 (2001).

\textsuperscript{37} The only moment in which Badiou seemed to have taken seriously the idea of a specific “logic” or ontology is Théorie du Sujet. But Badiou will disavow this attempt in the introduction of Being and Event, as a pointless pursuit of a dialectics of nature (see L’Être et l’événement [Paris: Éditions du Seuil, 1988], 10). But it could be argued that the very idea of a “great logic,” which is at the core of his last major book, Logics of Worlds, nuances the picture here sketched and complicates Badiou’s stand toward the legacy of a specifically semiotic ontology (see Patrice
pecific theory of what is, inasmuch as it is, and inasmuch as it is nothing in particular. This single ontology is as valid for nature as it is for culture, and Badiou does not wish to distinguish between them. In the same way that formal logic does not require any “other” logic to provide a symptomatic analysis of the former (as Miller pretended to do with Frege), Badiou holds that mathematics constitutes a qualitatively distinctive regime of signs that is entirely self-sufficient and cannot gain anything by being understood from the point of view of a general capacity for speaking or the symbolic function (in other words: there is no semiotic of mathematics). Particularly decisive is the fact that, for Badiou, the subject is not a condition coextensive to the constitution of a structure, but is rather something that arises from the introduction of a transgressive element within the structure: the event, defined as a set that belongs to itself. In contrast with Miller and Milner, who thought that every structure required a paradoxical element, for Badiou structured sets can perfectly well exist without implying any paradoxical element. The question is not “What must Being be in order that subjects necessarily arise?” but rather “What must Being be so that subjects may arise?” It is, in other words, a question of compatibility, not of emergence.38 This point is very important because it implies that, for Badiou, it is not enough to be able to speak to become a subject; becoming a subject requires access to truth, not merely to signifiers, and this access is by definition rare. Subjectivity is not a given dimension of our lives and, in opposition to Lacan, who he claims “supposed there were ‘always’ some truths and some subjects,”39 Badiou holds that many speaking beings can perfectly well live their entire lives without becoming subjects.

IV. A THEORY OF IDEOLOGY: LECOURT, BALIBAR, PÊCHEUX

This impressive attempt to provide a theory of the subject from a different form of hyperstructural perspective, one that does not make any appeal to the “logic of the signifier,” is nonetheless confronted by two lines of objections, defining two new topical positions on the map of late twentieth-century French philosophy we are trying to draw. The first one remains on the epistemological terrain that motivated Badiou’s first objection. For in both his early articles and his late books, Badiou relies heavily on the main thesis of what has been called the

---

38. Meditation 15 of Being and Event criticizes Hegel for offering a “generative ontology,” one that tries to make the One emerge from the multiple.

French epistemological tradition (which was being reinterpreted at that time by Althusser): the thesis that science is not about finding truths, as if such truths were out there waiting for an adequate intelligence to bring them to light, but about creating them. This creation does not imply any form of relativism; on the contrary, it grounds their universality (since they cannot be reduced to their own conditions of occurrence). Bachelard’s concept of “epistemological break” was intended precisely to argue that science is not a continuous process of ever accumulating correct opinions about the world, but rather a discontinuous series of complete reframings of the very structure of thought, as if truths always created their own subjective conditions. Truth is always revolutionary, changing at the same time both what can be held as objective and the subjective capabilities of thought.

But this sharp distinction between science and nonscience has been put in question within the Bachelardian tradition itself by several of Althusser’s students. They claim that this distinction is a typical way of ideologizing science, one that hypostasizes (not to say totemizes) it by taking it away from the history of human beings. It thus remains always in danger of losing Bachelard’s main breakthrough: that there is no such thing as science in general, only effects of historical disruption.

Dominique Lecourt, whose later work in philosophy and history of science would prove to be very attentive to the images that guide our concept of science and their political implications, pointed out very early in his career that “it is clear what is designated, but not thought, by Bachelard: the necessity, in order to build the concept of a history of science, to refer it to a theory of ideologies and to their history.” This translation into the vocabulary of ideology aimed to overcome the main disadvantage of Bachelard’s concept of imagination: its absolutely nonhistorical character. Imagination, for Bachelard, is the

---

*40. For a discussion of this tradition, see the essay by Pierre Cassou-Noguès in The History of Continental Philosophy: Volume 4.
41. This idea would lead to the program of a historicization of transcendental philosophy that Foucault makes fully explicit in The Archaeology of Knowledge. About Foucault, see Béatrice Han, Foucault’s Critical Project: Between the Transcendental and the Historical, Edward Pile (trans.) (Stanford, CA: Stanford University Press, 2002); and about this peculiar link between truth and history, which is characteristic of the French epistemological tradition, see Enrico Castelli Gattinara, Les Inquiétudes de la raison: Épistémologie et histoire en France dans l’entre-deux-guerres (Paris: Vrin, 1998).
function that produces the evident perceptions through which we make sense of our everyday world and that constitutes obstacles to scientific knowledge. But Lecourt rightfully remarks that this concept undermines Bachelard's own breakthrough – the rejection of any general philosophy of knowledge (science, being a historical process continually tumbling over its own conditions, ruins in advance all attempt to specify them a priori) – since imagination is nothing but the timeless condition of science, with Bachelard's “poetics” as the equivalent of a transcendental theory of knowledge. Ideology, on the contrary, designates the historical apparatuses that produce these evident perceptions. Since this formulation, Lecourt has provided many practical examples of a history of science that refuses to sever itself from cultural history.

Étienne Balibar, who is best known for his contributions to political philosophy, defended the same arguments on a more conceptual basis in a series of articles about Althusser (Écrits pour Althusser) and a short book entitled Lieux et noms de la vérité. Drawing on Canguilhem's paradoxical concept of “scientific ideology,” he undertook to show, through the example of mechanism, that ideology is not only a negative condition from which we have to depart, but that it is also a positive factor that contributes to history. Even though the metaphysical (viz. “ideological”) debates about the possible interpretations (substantialist or positivist) of the concepts of force, absolute space, and time, function as “epistemological obstacles” in light of Einstein's revolutionary transformation of physics, they also make explicit the internal contradictions of Newton's classical mechanics, thus preparing its crisis: “[Mechanism’s] role of epistemological obstacle is not turned solely toward the past. On the contrary, it dialectically contributes to carry science toward its future, thus towards its crisis.”

Therefore the relation of “science” and “ideology,” far from being one of only asymmetrical breaking-up, is more dialectical: the reideologization of science contributes to its history. This means that truths can never break so completely from the general history of mankind that they could be said to be “eternal” (in the sense that they would create their own conditions of intelligibility): they cannot function outside their own ideological context. As a consequence, the history of science can neither be separated from cultural history nor reduced to it. Truths are local processes, and even though they cannot be reduced to mere symptoms of a worldview or to social contradictions, they must nonetheless be defined by what they do to the symbolic or ideological systems they contribute

*44. Balibar's work in political philosophy is discussed in this volume in the essay on Spinozism by Simon Duffy, and in the essay by Rosi Braidotti in The History of Continental Philosophy: Volume 8.

to transforming. Saying this does not open the door to relativism, but escapes the very opposition between relativism and universalism. The entire question becomes one of the transfer of scientific events into the world they bring about in order that they maintain their revolutionary power. While Badiou wants to guarantee that truths will always have the same persisting power (once a truth, forever a truth), Balibar and Lecourt argue that, even if it is right to say that science escapes from time, it is truer to say that it never ceases tearing itself away from it. Truth is a process or, even better, an *activity*, rather than an event separating two entirely distinct regimes of thought.

This has far-reaching consequences for the problems at stake in this essay, since the concept of the subject can no longer be derived from a radical break from the ordinary circumstances of symbolic life. However, we also cannot reduce scientific discourses to any general symbolic logic, since there are ruptures: the subject of science is not the subject of the unconscious. Instead of trying to explain subjectivity within a univocal logic either of the signifier or of truth, we should rather pay attention to the variety of regimes of subjectification at work in different types of discourses, and to the different forms of subjectification at work within each regime. The theory of subjectivity is now understood as the theory of the techniques through which historically resulting forms of thought erase their own production in order to appear as obvious, intuitive, and deprived of any historical conditions. Epistemological breaks become *displacements* of already given intuitions and, therefore, processes of *desubjectivation* and *resubjectivation*. In other words, as Althusser argued in his late work, the theory of subjectivity is nothing but the theory of ideology – and vice versa.

47. “One could even say, negatively, that a general definition of the break consists of this: scientific knowledge is only thinkable insofar as it produces an effect of truth, *neither as ‘absolute,’ nor as ‘relative’*” (*ibid.*, 158, my translation).
48. The characteristic of a scientific concept, such as the concept of relativity, is that it “can be carried out in contradictory research programs which follow one another indefinitely” (*ibid.*, 155, my translation).
49. “Science escapes from ‘general time’ (the time of the world, of humanity, of universal history, in which the idea of progress, or relative truth, would like on the contrary to bring it back, as if science and history were the mirror of each other)” (*ibid.*, 161, my translation).
50. “[L]a science ne cesse jamais de s’en extraire” (*ibid.*).
51. It is fair to say that Badiou’s last book, *Logics of Worlds*, offers a powerful answer to this criticism, since it defines the eternity of truth as a capacity of being transported from the world in which it occurs to any other world it contributes to bring about. See our discussion of Badiou on this point in Maniglier and Rabouin, “A quoi bon l’ontologie?”
52. “Any science is as such, not the knowledge of a pure ‘object,’ but science of *something of the formal determinations of a subject*” (Balibar, *Lieux et noms de la vérité*, 130, my translation).
However, the most complete formulation of such a theory is not to be found in Balibar’s or Lecourt’s contributions, but in the work of another student of Althusser and contributor to the *Cahiers pour l’analyse* (under the pseudonym Thomas Herbert54), Michel Pêcheux.55 In his unfortunately little-known work, he is among the few philosophers to have tried to draw the consequences for an empirical theory of language of Lacan’s and Althusser’s questions about the relation between structure and subjectivity. In his main book, *Les Vérités de la palice*, Pêcheux sets for himself the ambitious project of producing a theory of the subject as an effect of a symbolic process, a process that is exactly coextensive with the production of *meaning*. This is the theory of a mechanism that produces *as a result* something that does not seem to be produced at all, a thing that functions as a *cause of itself*.56

Pêcheux first criticizes the idea that meaning could possibly be an immanent property of linguistic signs belonging to the linguistic *system* itself. He argues that meaning is always ascribed from a position within an enunciative context; the meaning of the same words can vary according to the position taken by the speaker. There is no meaning, therefore, without somebody being constituted as a subject of discourse. The first part of his book is devoted to proving that referentialist theories of meaning (Frege and Russell in particular) necessarily imply an appeal to an enunciative context, expressed through words such as “this,” “here,” and “now,” which obviously only makes sense along with “I.”

However, instead of considering the situation where “I see this thing, here and now” is the real originary source of meaning, Pêcheux argues for a truly materialist theory of both meaning and subjectivity. He appeals to Althusser’s theory of interpellation, according to which the subject is produced, but produced as that which does not need to be produced, as that which is “always-already there.” Althusser illustrated the concept of interpellation with the famous little dialogue: “Hey, you there!” “Yes, here I am!” In this, the “I” does not precede the answer, but is rather constituted by recognizing itself in the one that is addressed. This

---

55. Michel Pêcheux (1938–83) sought to contribute to a general theory of ideology in the line of Althusser, and he imagined very early that real discursive machines, that is computers, could contribute to discourse analysis (Michel Pêcheux, *Analyse automatique du discours* [Paris: Dunod, 1969]). His originality is to have pulled together a Marxist theory of ideology and a computer-simulated theory of discourse.

56. “[I]t treats of the *subject as process* (of representation) inside the *non-subject constituted by the network of signifier, in Lacan’s sense: the subject is ‘caught’ in this network – ‘common nouns’ and ‘proper names,’ ‘shifting’ effects, syntactic constructions, etc. – such that he results as a ‘cause of himself,’ in Spinoza’s sense of the phrase” (Michel Pêcheux, *Language, Semantics and Ideology*, Harbans Nagpal [trans.] [Basingstoke: Macmillan, 1982], 108, my translation).
recognition, therefore, is not simple; it functions through a retroactive effect via which the subject appears to have always-already been here to answer the appeal. Pêcheux then tries to uncover the linguistic conditions for such a paradoxical self-erasing process. This can be summarized in a few theses. First, language is not homogeneous but is constituted by a multiplicity of heterogeneous discursive formations, where the meaning of each term is defined through paraphrases and reformulations (such as “Kepler” = “the one who discovered the elliptical form of planetary orbits”). Second, the syntactic mechanisms of language make it possible to inscribe, in one and the same discursive process, terms that belong to each other, that is, terms that evoke things as having been said elsewhere. He calls this insertion the “preconstruct effect.” Therefore, speaking is not only about actualizing possibilities defined within a discursive formation (i.e. to choose within a paradigmatic set of options), but also about articulating discourses that are external to one another in the same syntagmatic series; we say what we say by evoking what has been said and therefore what does not need to be said again. Through this, Pêcheux suggests a new method for interpreting relative sentences in sentences such as “Whoever discovered the elliptical form of the planetary orbits died in misery,” which Frege famously claimed was not a real proposition. Instead of interpreting this sentence, as Frege did, as denoting an object (and not a thought or a truth value) and therefore judging it the illusion of a proposition, one that reveals the imperfections of natural language, Pêcheux argues we should see it as an appeal to something said elsewhere, something that does not need to be constructed as such.

The consequence is that the same term can appear both as being constructed in a discursive process and as having “always-already” been constructed. This duplication appears in paradoxes and witticisms such as “Is this the place where the Duke of Wellington spoke his famous words? – Yes, this is the place, but he never spoke those words,” or “There are no cannibals anymore in this country, we ate the last one yesterday,” or “He who saved the world by dying on the cross never existed.” In all these cases, the same term appears twice in the same discursive act: once as part of what is actually said here and now and once with some distance maintained from the enunciation. Thanks to this mechanism (and a few others), linguistic terms “duplicate and divide to act on themselves as other than themselves.”

This mechanism sustains the production of subjectivity: “it is possible to regard the effect of the preconstructed as the discursive modality of the discrepancy by which the individual is interpellated as subject … while still being ‘always-already a subject.’”

57. Ibid.
58. Ibid., 107.
it identifies as that which does not need to be constituted because it is always-already there. In the expression “Here I am,” I both say something and say it as that which does not need to be said. In other words, the preconstruction mechanism allows us to think of a relation to oneself as being behind oneself (an identity requiring lag), constituted in the very way it resists every constitution, which was, as was said earlier, one of the definitions of subjectivity.59

This short sketch does not do justice to Pêcheux’s rich empirical and speculative work, and will certainly raise many objections. However, it is hopefully sufficient to indicate yet another path that the radicalization of structuralism that Milner called hyperstructuralism has taken, a path where the theory of the subject as an effect is grounded on a theory of discourse sustained by a theory of ideology, and which allows precise empirical analyses of real discourses. It will find its acknowledged development in what has since become, on the other side of the English Channel and under the influence of Ernesto Laclau, discourse theory.

V. AN ONTOLOGY OF SIGNS: JEAN PETITOT

However, there is yet another reply to Badiou’s objection to the very idea of the “logic of the signifier,” one that reactivates the problematic of an ontology of signs. For the paradox of Badiou’s solution is to have provided an ontology that cannot apply to signs in Saussure’s sense. The very definition of the identity of a mathematical set is fundamentally incompatible with Saussurean signs because set-identity depends on the contents of the set: it is extensional and internal (i.e. indifferent to what exists elsewhere). Saussure’s signs, on the other hand, have no positive identity; a sign is everything the other signs are not, it can be radically changed by a movement in them, and its identity is therefore relational and external.60 Therefore, even if we accept Badiou’s solution as a convincing ontological framework for a theory of subjectivity, in what sense can it be valid for us as agents enmeshed in semiotic networks? The kind of beings that we require a theory of constitution for is not the being of mathematical structures, but the being of languages, mythological systems, and political discourses. In the face

59. The paradox of subjectivity appears in typical mistakes that children make when they say, for example, “I have three brothers, Mike, Henry and me,” which Lacan relished quoting because it illustrates well that the subject replicates himself in what is said about him.

60. “The change which has occurred … would tell us nothing if our explanation of it centered on the form itself. Its only source is in the comparable forms … as always in morphology, movement comes from the sides” (Ferdinand de Saussure, Writings in General Linguistics, Carol Sanders and Matthew Pires [trans.] [Oxford: Oxford University Press, 2006], 129). See my La Vie énigmatique des signes, 180–85, for a detailed commentary on this idea.
of this demand, Badiou’s attempt to use the language of mathematics to speak about our “situation” may seem at best metaphorical.

Now, the positional and differential ontology in which Jacques-Alain Miller and Jean-Claude Milner argued for a theory of subjectivity as effect can make sense only if structuralists, following Saussure, are right to assume that cultural phenomena can be best scientifically objectified by methods that treat them as systems of differential and positional entities. In other words, the ontological deduction of subjectivity relies on empirical claims. However, at the very time that the idea of the “logic of the signifier” was evoked, the empirical kernel of structural linguistics was forcibly challenged by the successes of generative grammar. Milner himself was one of those who clearly saw that generative grammar ruled out the ontological claims that followed from structural linguistics. For, as Chomsky himself made clear in his critique of Saussure, it implied a substitution of the conception of “langue” as a set of codetermined elements endowed with a differential and positional identity with a conception of “langue” as a system of rules generating valid or invalid judgments of grammaticality, displacing the philosophical question to that of the status of the mental. Milner therefore holds that structuralism as a scientific research program has been superseded by generative grammar, in the sense that the latter has proved more successful than the former. While he still tries to defend the interests of hyperstructuralism from a purely philosophical standpoint, it remains a fact that the interest of structuralism lay precisely in the intricate articulation between philosophy and empirical science it represented. Therefore, the very philosophical context that we have tried to reconstruct would be definitively over if Chomsky’s objections to structuralism cannot be answered.

One author, who did not belong to the group of the Cahiers pour l’analyse, but who, as we will see, shared their interests, undertook a reply to Chomsky in favor of a reactivation of structuralism. In his 1985 book Morphogenèse du sens, Petitot unambiguously endorses the claim that beyond both poststructuralist and neorationalist critiques, structuralism is still more alive than ever: “far from becoming obsolete as the incurable instigators of fashion would like to make it believe, structuralism is on the contrary discovering the mathematical Idea conforms to its concept.” He too sees in structuralism an ontological

---

61. “[T]hey return to a definition of linguistic objects by a positive matter and not only by a negative form” (Milner, Le Périple structural, 39); and see Milner, L’Amour de la langue, 61–5; For the Love of Language, 89–92.

64. Jean Petitot, Morphogenesis of Meaning (Berne: Peter Lang, 2003), 19.
challenge raised by the introduction in the empirical sciences of new objects (such as phonemes). Moreover, Petitot finds, as did Miller, that this challenge bears on the notion of a positional entity, an entity that cannot be said to occupy a position but is its own position. Interestingly enough, he praises Deleuze for having formulated this question better than anyone in his famous article “How do we Recognize Structuralism?” Petitot’s originality is first to explicitly conceive of ontology as a transcendental reconstruction of our categorical apparatus (in a Kantian sense) on the basis of ever new forms of scientific positivity, and second to argue that such an ontology requires adequate mathematical models to provide the schematization of the categories without which they cannot be related to the positive phenomena produced by empirical sciences.

But Petitot is aware that no philosophical and mathematical construal of the concept of structure will make sense unless the empirical objections raised by generative grammar are answered. As Chomsky made clear in his criticism of Saussure, the debate is between a rule-based model – for which speaking is about generating an indefinite number of well-formed utterances through a hierarchy of formal rules applied to basic mental representations processed from one module (system of rules) to another one – and a taxonomic one – for which speaking is nothing other than the identification of a possibility globally defined through its contrast with other possibilities. There are two arguments in favor of the latter. The first is that generativism cannot provide an answer to the problem that motivated the original introduction of structural methods in linguistics, that is, the relation between the self-identical units of language that we actually perceive and the physical or phonetic signals we observe. For example, it is a scientific fact that it is impossible to define a phoneme via a set of positive phonetic features that would be instantiated in all and only the occurrences in which native speakers do perceive them. The signals appear to be continuous and scattered, whereas the phonemes are perceived as discontinuous and invariant units. This is the reason Saussure made the hypothesis that phonemes should not be defined by any positive features (such as phonetic properties), but rather as strictly relational and positional entities interdefined in an abstract system.

The second objection to Chomsky concerns the fact – which became more and more inescapable with the growth of generative grammar and eventually brought it to a crisis demanding its complete reconstruction65 – that the various modules (and the rules inside each module) are not applied in a simple sequential order: that it may be necessary, for instance, to have some semantic

65. This paradigm shift is known as the passage from a rule-based model to the approach called “Principles and Parameters”; see Noam Chomsky, Some Concepts and Consequences of the Theory of Government and Binding (Cambridge, MA: MIT Press, 1982).
information in order to know which syntactic rule should be applied. Far from mental representations undergoing a series of rewrites through sequentially related modules (or systems of rules), we would require a multidimensional responsive system to identify a single linguistic possibility.66 As a consequence, not only do Chomsky’s arguments against the taxonomic model seem to have been refuted by the progress of the very discipline he established, but also his inaugural dismissal of meaning in linguistics, along with his dismissal of the sign as the nature of linguistic objects,67 would need to be reconsidered.

Therefore, Petitot is able to reformulate the theoretical and philosophical program of structuralism as an open research project.68 Structuralism must not only philosophically and mathematically construe the concept of positional entities; it must also explain the passage from continuous and variable substrata to relatively substance-independent positional systems. His claim is that the mathematical formalization that structuralism requires can be found in René Thom’s catastrophe theory. It is impossible within the confines of this essay to do more than provide a suggestive account of his demonstration. Petitot’s claim relies on a rigorous analogy between the phonological categorization of phonetic spaces and the phenomena of physical transitions between material phases, such as the passage from water to ice that occurs at a precise temperature and is modeled by catastrophe theory. In the same way that, in the case of water, the parameter (temperature) is continuous but the morphological effect is discontinuous (from liquid to solid), phonemes (and semiological entities) are discreet morphological “catastrophes” on a continuous phonetic substratum. Transition phases can be geometrized by ascribing to the substratum a certain type of dynamics, far from equilibrium but without becoming chaotic, which results in abrupt changes in a small number of forms precisely theorized by catastrophe theory. A phonological system would be the result of a morphogenetic process grounded in the dynamics of phonetic substances.

But these catastrophic schemes not only capture the passage from substance to form, but also allow us to formulate what Miller called the action of the structure, since they “become the generative devices of actantial relations,”69 that is,

67. “[W]e are studying language as an instrument or a tool, attempting to describe its structure with no explicit reference to the way in which this instrument is put in use” (Noam Chomsky, Syntactic Structures [New York: de Gruyter, 2002], 103).

69. Petitot, Morphogenesis of Meaning, 193.
relations in which the terms do not relate to each other as alternative categories (this phonetic signal is *either* /p/ or /b/), but functional connections (expressed in relations such as: “after /p/ you cannot figure /b/”). Exactly as Miller wanted to construe the “virtual” system in such a way that it implies its actualization in symbolic “chains,” Petitot claims that catastrophic formalization allows us to understand not only why systems of discreet categories (what structuralists called “paradigms”) emerge from the substratum, but also the serial orders in which these categories actualize (what Saussure called “syntagms”). In other words, it would be possible to deduce from the very nature of the paradigmatic units the syntagmatic chains in which they are actualized. Refusing the separation between formal syntax and semantic interpretation, he draws on A. J. Greimas’s actantial model to explain what he calls “conversion”: the projection of the paradigmatic systems into syntagmatic chains. This projection shows the intrinsically *discursive* nature of symbolic systems: it is as if we cannot divide the real into alternative identities as is the basis of traditional structuralism without triggering narrative formats. Interestingly enough, subjects are no longer paradoxical entities belonging to systems only by absenting themselves from them; instead they are actants corresponding to different positions in the serial succession of symbolic terms. The ontological paradox is not on the side of the subject anymore, but on the side of *values*, that is, of these objects that, according to Lévi-Strauss, have to be exchanged and circulate in the actual working of a symbolic system. Subjectivity is an effect of the fact that symbolic objects never present themselves as real things: they are always divided into partial and complementary perspectives.

Therefore, the two main problems of structuralism – the passage from “substances” (such as phonetic substrata) to “forms” (systems of interdefined positional entities), and the passage from paradigmatic systems to syntagmatic series defining subjective positions – are both answered at once. It is apparent that after this move we are now very close to satisfying Milner’s demands for the hyperstructuralist program. But we must remark that this new solution requires, apart from a new understanding of subjectivity, a major displacement.

---

70. “The contents deep semantics articulates (Life/Death, Nature/Culture, Man/Woman, Divine/Human, etc.) do not have a reference in the objective world. They are some sort of psychical drives or ideals that ‘give meaning to life,’ *a meaning that cannot be grasped as such but only experienced via its conversion into actantial structures*” (*ibid.*, 49). See also *ibid.*, 193–248.

71. “Only the circulation of such objects of value can allow them to be subjectivized; in other words, they can become part of the subject only through experiences and actions” (*ibid.*, 49). Contemporary anthropology (Marilyn Strathern, Eduardo Viveiros de Castro, Roy Wagner) provides solid empirical grounds for this hypothesis and a renewed form of structuralism (see Eduardo Viveiros de Castro, “Intensive Filiation and Demonic Alliance,” in *Deleuzian Intersections in Science, Technology, and Anthropology*, Casper Bruun Jensen and Kjetil Rødje [eds] [Oxford: Berghan Books, 2009]).
The symbolic systems appear now as *emerging* forms, and the real processes underlying these forms are not to be found at the same level on which they operate. The processes are in the specific dynamic of the substratum, and the morphological semiotic distribution simply emerges from it in the same way a Kanizsa triangle emerges from three incomplete disks. The ontology of signs would then have to be answered from an emergentist perspective. Following a suggestion made more than once by Lévi-Strauss and drawing on models of cognitive simulation other than the classic Turing Machine (such as connectionist models\(^{72}\), Petiot in his later work tries to find in the nature of the brain the physiological realization of such mechanisms. Of course, this peculiar form of “hyperstructuralism,” with its strong links to mainstream cognitivism, is no more safe from objections than the other ones discussed above. However, our discussion does prove that questions raised forty years ago about the articulation between a formal and ontological construal of the concept of structure and the theory of subjectivity as effect are still relevant in the most contemporary scientific and philosophical debates.

We therefore have good reasons to think that, beyond the main two opposing directions taken after (and against) structuralism by theoretical and philosophical thought, namely cognitivism and poststructuralism, contemporary French philosophy has been worked through, until the end of the century, by the question of a conceptual and formal (viz. ontological and mathematical) construal of the concept of structure valid for every symbolic domain, one that at the same time could offer an account of subjectivity itself as a necessary effect. But, rather than defining the “present moment” in contemporary French philosophy through a positive common feature or collective insight, the ambition of this essay was to define it (one may remark, in a truly structuralist way) as a *problem*: one that produces many alternative paths that some of the most important contemporary philosophers have pursued. In the process, four answers to the question of the theory of subjectivity articulated through a theory of structure have been distinguished: the “logic of the signifier” pretends to deduce a subject effect as a paradoxical term necessarily belonging to systems of positional and differential entities (Miller and Milner); another path refuses the specificity of the symbolic and grounds the theory of subjectivity on a set-theoretical ontology that leaves room for truth as a creation of unconstructible sets (Badiou); a third option tries to associate a theory of ideology with a theory of discourse construed as the set of mechanisms that produces the subject as *that which does not need to be produced* (Balibar, Lecourt, and Pêcheux); while the fourth suggestion argues for a morphodynamic interpretation of structuralism where

---

symbolic systems emerge from a certain type of dynamic process, distributing complementary perspectives in a symbolic exchange (Petitot). Four ways are thus traced of construing the concept of structure (signifier, matheme, discourse, and morphologies), to which corresponds four concepts of the subject (as a figurative displacement, as a consequent bet, as a preconstructed term, as an actant). It would not now be difficult to distribute in this chart other important contemporary thinkers such as: Miller’s former student, Slavoj Žižek; the founding figure of the British School of discourse analysis, Ernesto Laclau; or the post-Althusserian theorist of subjectivity, Judith Butler, among many others. Therefore, we have a strong basis for thinking that, far from having been outdated by developments in cultural science or philosophy, structuralism, at least as a problematic space, is still a major though secret matrix of contemporary philosophy. Answers, of course, remain to be assessed or enriched, and, even better, to be discovered. However, such discovery requires that we are at least not oblivious to their history.

---

*73. The work of Žižek, Laclau, and Butler are all addressed in essays in The History of Continental Philosophy: Volume 8.

74. I wish to thank Tim Secret for his excellent job editing the text in English, Alan Schrift for his helpful comments and generous editing work, Yves Duroux for having introduced me to this literature and discussing with me some of these issues, Étienne Balibar for being at the origin of this work, and, finally, Rosi Braidotti for having asked it of me and for her patience waiting for its completion.
Italian philosophy is characterized in the period immediately following the Second World War by the somewhat rigid distinction among three main cultural domains: religious (principally Catholic), laicist (laica), and Marxist.1 This distinction mirrors the political laceration within the country, split between the religious inspiration of the Christian Democratic Party (DC) and the liberal, secular tradition derived from the Risorgimento2 that often includes, although laterally, the Socialist Party (PSI), with the strong constituency of the Communist Party (PCI) rigorously excluded from all government coalitions.3

The religious philosophical domain is marked in general by a strong interest in metaphysical themes having to do with foundational issues such as the problem of the absolute, the possibility of metaphysical reason, and the universality of

2. This is the period of Italian history that, through a series of independence wars, led to the political unification of most of the Italian peninsula, and eventually to the establishment of the kingdom of Italy in 1861 and to the annexation of Rome in 1870.

3. This occurred from 1948 to 1976 and then again from 1979 to 1991, while during the period 1977–79 the PCI granted external support to the government.
morality. These issues are often discussed in light of the problem of the relation between Christianity and philosophy, and between faith and reason. The great metaphysical themes led to a renewed interest in Aristotle and Aquinas in a number of neoclassical, neoscholastic, and neo-Thomist thinkers, for example: Agostino Gemelli (1878–1959), the founder in 1921 of the Università Cattolica del Sacro Cuore in Milan, the center of Italian neoscholasticism; Francesco Olgiati (1886–1962), the founder of the Centro di Studi Filosofici Cristiani di Gallarate (Gallarate Center of Christian Philosophical Studies), for whom philosophy’s starting-point is not knowledge but metaphysics; Carlo Giacon (1900–1984), a historian of scholasticism; Gustavo Bontadini (1903–90), a firm supporter of classical metaphysics; Cornelio Fabro (1911–95), who is also a scholar of existentialism and a translator of Kierkegaard; Marino Gentile (1906–91), who embraces an Aristotelian-influenced metaphysics marked by problematizing (problematicità) and historicity; and Umberto Padovani (1894–1968), for whom the philosophy of religion must justify religion.

Opposed to this array of thinkers is the variegated, less-unitary group of Christian spiritualist thinkers who, being more receptive of the neoidealist tradition of Benedetto Croce and Giovanni Gentile, accentuate the dimension of

---

4. Benedetto Croce (1866–1952) was educated at the school of Francesco De Sanctis (who was the major literary critic and historian of literature in nineteenth-century Italy and was formed in the legacy of Vico), and Antonio Labriola (an Italian philosopher with strong interests in Marxism). His encounter with Hegel's philosophy confronted him with the idea of Spirit as the dialectical principle of reality born out of ever-new contradictions. Unlike Hegel, Croce neglected the role of the realm of nature (and hence the role of science) in the development of Spirit (this neglect remained as a legacy in much subsequent Italian philosophy and education), and developed instead an absolute historicism based on the idea that all reality is Spirit, but Spirit manifests itself only in history and human activities. From here derives Croce's emphasis on the cultural (especially his influential work on aesthetics) and historico-political world (Croce was a theorist and defender of liberalism during the fascist regime, and actively participated in the political life of the Italian state). His works include Historical Materialism and the Economics of Karl Marx ([1900] 2008), The Aesthetic as the Science of Expression and of the Linguistic in General ([1902] 1992), Philosophy of the Practical: Economic and Ethic ([1909] 2004), and History as the Story of Liberty ([1938] 2000). [*] For a discussion of Croce’s aesthetic theory, see the essay by Gary Shapiro in The History of Continental Philosophy: Volume 2.

Giovanni Gentile (1875–1944) taught philosophy at the universities of Palermo, Pisa, and then Rome. He was deeply influenced by Hegelian philosopher Donato Jaja (1839–1914) during his studies at the Scuola Normale Superiore in Pisa. Taking up Hegel's idealism, Gentile accentuates the position and role of consciousness as self-consciousness as ground of reality, and considers the act of thinking, that is, the “pure act,” as the principle and form of becoming. Hence, his philosophy is known as “attualismo” (actualism). Gentile was also a pedagogue and took part in several political, cultural, and educational initiatives during the fascist era (resulting in Croce’s severing of their relationship). Among his works are La riforma della dialettica hegeliana (The reform of Hegelian dialectics; 1913), The Theory of Mind as Pure Act ([1916] 2007), The Reform of Education ([1920] 2007), and Origins and Doctrine of Fascism ([1929] 2004).
self-consciousness in the Absolute. Among them, albeit on differentiated positions, are Armando Carlini (1878–1959) and Augusto Guzzo (1894–1986), both students of Gentile and dedicated to a retrieval of the motifs of interiority, spiritual life, and religious transcendence, and Michele Federico Sciacca (1908–75), who denies the sharp opposition between neo-Thomism and spiritualism characterizing the debate of the period. An original proposal that links together metaphysics and personalism is the “theological personalism” of Carlo Arata, for whom the Person – understood as first person (ego sum qui sum: I am the one who I am) – constitutes the coherent radicalization of Aquinas’s actus essendi.

The secular culture is split between a properly laicist tradition (laicismo) of liberal descent (including also some nondogmatic Catholic or Marxist thinkers) that claims the reciprocal autonomy of all human activities in the name of the values of pluralism, freedom, and tolerance, and a Marxist current inspired and revitalized in its traditionally Marxist principles by the philosophy of Antonio Gramsci (1891–1937), whose Quaderni dal carcere (Prison Notebooks) were published immediately after the Second World War. In general, the laicist domain, whose main centers are at the universities of Turin, Milan, and Florence, seeks a critical and nondogmatic (that is, non-Catholic and non-Marxist) employment of reason, and also moves against the idealist tradition of Croce and Gentile, even when it engages in explicitly historiographic inquiries. Moreover, this area searches for and encourages contacts with the most advanced forms of recent international philosophical trends, such as phenomenology and existentialism, but also American pragmatism. A strong interest in the sciences and scientific methodology should also be noted. Two major tendencies can be retraced within the laicist tradition. The first has a clearly theoretical attitude with neo-Enlightenment positions inspired by the appeal to reason, the struggle against metaphysics, and the rediscovery of experience. The second is marked more by a historicist attitude that leads to important historiographic activities. The leading thinkers in this laicist area are Nicola Abbagnano (1901–90) and his students Pietro Rossi, Pietro Chiodi, and Carlo Augusto Viano, and also Norberto Bobbio, Ludovico Geymonat, Enzo Paci, Giulio Preti, Mario Dal Pra, Eugenio Garin, and Paolo Rossi.

Within the Italian Marxist philosophical tradition of this period and up to the crisis of Marxism that starts in the early 1970s, two fundamental trends can be identified. The first, supported by the cultural politics of the Italian Communist Party, combines Marxism with the idealist, humanist, and historicist tradition of Crocian descent associated with the mainly bourgeois culture, and focuses on the relation between human being and society, on Marx’s humanism, and on

---

*5. Gramsci is discussed in an essay by Chris Thornhill in *The History of Continental Philosophy: Volume 5.*
historical materialism. This line of interpretation, which affects also the reading of Gramsci’s own texts as promoted by the PCI leader Palmiro Togliatti, was predominant in Italy up to the 1960s – that is, up to the crisis that followed Khrushchev’s report on Stalin’s crimes, the Hungarian Revolution, and the parallel capitalist economic boom of the early 1960s. Representatives of this trend are, among others, Valentino Gerratana (1919–2000) and Nicola Badaloni (1925–2005). Opposed to this is the trend that focuses on the relation between human being and nature found in dialectical materialism, and therefore centers on the problem of scientific knowledge understood in terms of a nondogmatic materialism attentive to contemporary epistemological debate. A major representative of this current is Geymonat and his Milan school. Other Marxist thinkers who move outside the division delineated above and who deserve special mention because of their influence on future philosophers are Galvano Della Volpe (1895–1968) and Cesare Luporini (1909–93). Della Volpe develops a “Galileian” Marxism opposed to the Hegelian–Marxian line of interpretation, to Gramscian historicism, and to Soviet dogmatism; Della Volpe finds in Marx a historico-experimental (Galileian) logic articulated in the circle “concrete–abstract–concrete,” according to which experimental verification is needed to integrate the historico-material data from which any inquiry starts and the abstract rational hypothesis, that is, to integrate matter and rationality. Close to Louis Althusser’s position of an “epistemological break” in the development of Marx’s thought, Luporini stresses the importance of the conditioning power of structures, but also insists on the fact that structures are for Marx functional to the individuals, and not vice versa.

The cultural–ideological division mapped above contributes greatly toward shaping the longstanding Italian tradition of schools of thought, which gravitate toward single philosophical personalities or approaches and significantly complicate the map of Italian philosophy. Thus, the same philosophical figures and themes can be developed in completely different directions. Specific interpretations depend in fact on whether the interpreting scholars are situated in the neoscholastic, metaphysical tradition of the Milan Catholic Università del Sacro Cuore, which, in addition to openings to (especially German) phenomenology, develops metaphysical themes by relying on Aristotle read through Aquinas, or whether they are located in the Padua tradition that, despite its mainly Catholic legacy, bypasses scholasticism and studies Aristotle through a less religious lens, thus elaborating a different metaphysical and political approach; whether they are part of the Milan tradition of the Università Statale, in which existentialism and phenomenology are often coupled with Marxism\(^6\) and Anglo-American

pragmatism, or whether they partake of the Florentine school of thought, in which Marxism is paired with critical theory, especially as developed by the Frankfurt School, and in general with an interest in social and cultural critique, and thus in history. The historical approach of the Florentine school, which shares many elements with the approach associated with the University of Pisa with its additional focus on the history and philosophy of science, is very different, however, from the idealist–historicist attitude of the University of Naples, in which the neo-Hegelian influence of Croce and Gentile is still alive together with a purely historic-oriented tradition that goes back to Vico.\footnote{For an overview of Hegel's influence on Italian philosophy, see Angelica Nuzzo, “An Outline of Italian Hegelianism (1832–1998),” \textit{Owl of Minerva} 29(2) (1998).} Other schools of thought possessing a specific identity can be found at the University of Turin, divided into a secular, neo-Enlightenment, even neopositivist variation focused on the privileging of reason and history and a spiritualist variant open to French and German existentialism and personalism, and later accepting the results of a properly hermeneutic position; and the Venice school, in part born out of a secession from the Catholic Università del Sacro Cuore in Milan, in which metaphysics, nihilism, and religious considerations of various nature intersect.

From being almost nonexistent in the period following the Second World War, conversations among the three cultural areas of philosophy and the schools of thought that develop in parallel connection grow increasingly common from the mid-1950s up to the late 1970s, and an array of cultural and philosophical orientations more or less loosely inspired by Marxist and Christian principles flourish. During this period, interesting hybrids are produced such as the nearing of: Marxism and Christianity (in Italo Mancini [1925–93]); Christian existentialism and hermeneutics (in Luigi Pareyson [1918–91]); Marxism, existentialism, and phenomenology (in Enzo Paci [1911–76]), religious experience, hermeneutics, and nihilism (in Alberto Caracciolo [1918–90]), neopositivism and Marxism (in Geymonat and Preti), and neoscholasticism and phenomenology (in Sofia Vanni Rovighi [1908–90]).\footnote{For overviews of Italian philosophy in general up to the late 1970s, see Adriano Bausola \textit{et al.} (eds), \textit{La filosofia italiana dal dopoguerra a oggi} [Italian philosophy from the postwar to today] (Rome–Bari: Laterza, 1985); Giovanna Borradori (ed.), \textit{Recoding Metaphysics: The New Italian Philosophy} (Evanston, IL: Northwestern University Press, 1988); Pietro Rossi and Carlo A. Viano (eds), \textit{Filosofia italiana e filosofie straniere nel dopoguerra} [Italian philosophy and other philosophies after the war] (Bologna: Il Mulino, 1991).}

The physiognomy of the philosophical debate takes up new forms in the late 1970s, and the old ideological–cultural distinction in the three areas begins to lose its relevance. The novel panorama occurs in part because of the crisis of
Marxism, many forms of which circulate in Italy, such as Geymonat’s dialectical materialism, Preti’s pragmatism, Paci’s Husserlianism, Augusto Del Noce’s atheism, and Emanuele Severino’s nihilism. The interest in Lukács, present in the late 1950s and 1960s, is replaced in the 1970s with an interest in heterodox Marxist thinkers such as Horkheimer, Adorno, Marcuse, Luxemburg, Benjamin, Bloch, and Korsch, and then with French inspired Marxism as developed by Sartre, Althusser, and Foucault. The varieties of Marxism and their inspirations in fact provoke a fading of the separation between Christian thought and secular culture. The reconfiguration of the areas and terms of the philosophical debate also occurs, however, in part because of the new and somewhat sudden interest across the three traditional cultural areas for authors of the so-called “irrationalist” trend of the nineteenth and twentieth centuries, namely Nietzsche, Heidegger, and Wittgenstein during his Vienna period (then a very different thinker from the one appropriated by the analytic tradition). Additional recent authors who exercise a deep influence on Italian philosophers of the 1980s are Ricoeur, Gadamer, and Derrida, who join thinkers such as Benjamin, Adorno, Rosenzweig, and other philosophers already present in the Italian discussion such as Hegel, Marx, Husserl, and some American pragmatists, especially Dewey but also Peirce. An increased interest in authors such as Apel and Habermas, and in German practical philosophy in general is also to be recorded in these years.

A traditional, idealist legacy mandates that in Italy the learning of the history of philosophy is a basic requirement for all licei (that is, for the non-technical high schools that constitute the preferred access to a university education), and that the high-school teacher of philosophy – which is always understood as history of philosophy – is also the history teacher. Because of this tight intersection (that finds its roots already in the Italian liberal tradition of the Risorgimento) between (history of) philosophy and history in the formation of most Italian intellectuals in addition to the Marxian emphasis on the funda-

9. An exemplary case of a Marxist intellectual whose very own itinerary of thought represents the ascent and crisis of Italian Marxism is Lucio Colletti (1924–2001), a student of Della Volpe who, in the late 1970s, after having been one of the most renowned theoreticians of the Marxist doctrine for almost twenty years, became a resolute critic of the Marxist ideology.

*10. For a discussion of some of these figures, see the essays by Chris Thornhill, John Abromeit, Deborah Cook, and William L. McBride in The History of Continental Philosophy: Volume 5.

11. This legacy was formalized in the so-called Riforma Gentile carried out by the neo-idealistic philosopher Giovanni Gentile during his tenure as Minister of Education during the fascist regime.

12. This coincidence gives to the historiographic, historicist tradition in Italy a legitimacy that goes beyond purely philological interest. In this sense, one could refer to the continuous flourishing and health of historiographic schools such as those of Abbagnano, Dal Pra, Garin, Geymonat, Giovanni Reale, Pietro Rossi, Viano, and others.
mental role of the intellectuals – an emphasis acknowledged by Marxist and leftist thinkers and accentuated by Gramsci’s theory of the “organic intellectual”\(^{13}\) – Italian philosophy is characterized by a strong civic commitment and engagement in history and public life, which in turn has affected the configuration of Italian philosophy. This influence occurs parallel to external theoretical stimuli and resonances certainly coming from the broader international philosophical debate.

The Italian philosophical scene between the years 1980 and 1995 is framed by two sets of historico-political events.\(^{14}\) The period opens with the kidnapping and subsequent murder of the leader of the Christian Democratic Party Aldo Moro, allegedly by the Red Brigades (Brigate Rosse), in 1978.\(^{15}\) Gianni Vattimo’s pensiero debole (weak thought), arguably the most original and renowned expression of Italian philosophy during this time, develops “as a response to the terrorist interpretation of the Italian democratic left during the 1970s, as a recognition of the unacceptability of the Red Brigades’ violence.”\(^{16}\) Terrorism, the use of force, and the widespread killings (the so-called stragismo) of the early 1980s spur, for example, many of the reflections on violence, law, justice, rights, and the state of Bobbio, one of Italy’s leading political philosophers, scholar of

---

13. See Antonio Gramsci, *Gli intellettuali e l’organizzazione della cultura* [The intellectuals and the organization of culture] (Turin: Einaudi, 1949). According to this theory, the intellectuals are both product and consciousness of a specific sociopolitical group.

14. Such events, on which a completely clear light has yet to be cast, are two attacks carried out, albeit by forces of an entirely different nature and origin, against the legitimacy of the democratically constituted political regime. Thus, they both represent a direct attack against the rationality of the political subject and its power.

15. Moro, who had been Professor of Philosophy of Law at the University of Bari, was the political leader and statesman who, as president of the DC, favored the dialogue (the so-called compromesso storico, or historical compromise) between the Democrazia Cristiana (Christian Democrats) and the PCI led by Enrico Berlinguer to avoid the political and institutional dangers of what some perceived as the possibility of a “Chilean crisis” (that is, a coup d’état by the conservative forces) in Italy. The Red Brigades is the name of a terrorist organization founded on radical Marxist–Leninist principles. It became operative in Italy in the early 1970s with the intention of destroying the state and replacing it with a popular democracy. The murder of Moro occurred just before the parliamentary vote that marked, for the first time since 1947, the entry of the Communist Party (PCI) in the ruling majority. Moro’s murder, which also brought to a climax the strategia della tensione (stress strategy) enacted by terrorist groups during the so-called anni di piombo (years of lead; with a clear reference to the heavy atmosphere characterizing all aspects of Italian life but also to the material of which bullets are made), raised major issues, also of a philosophical nature, by radically calling into question the use of force and violence, on all sides, in the political life of a democratic state. While fascinating, the complexities of this political period of turmoil, which among other events sees the presence of terrorist activities of opposite extremes, are too complex to be taken up here.

rights, and activist, who is for several days in 1992 a presidential candidate for the Italian Republic.17

In the context of the social, political, and institutional turmoil and instability leading to and following the murder of Moro, mention should also be made of Antonio (Toni) Negri, a Padua philosopher and Professor of Theory of the State.18 Negri was the founder with Mario Tronti19 of various journals of Marxist

17. Norberto Bobbio (1909–2004) was a student of jurist Gioele Solari and of philosopher Annibale Pastore (1868–1956) in Turin. Inspired by Hobbes and Kelsen, he reread the history of philosophy (Kant, Locke, Hegel, Marx) in their light. Defender of a procedural concept of democracy, that is, a democracy based on the minimal principle of consensus and thus opposed to any authoritarian imposition of truth, Bobbio argued against the confusion of ethics and right. With Abbagnano, Geymonat, and other philosophers of the Turin school he shared a form of neo-Enlightenment geared toward a retrieval of the legacy of eighteenth-century rationalism to promote a concept of philosophy closer to science and to the Anglo-Saxon line of reflection on the philosophy of language. A strenuous defender of the republic, Bobbio represented the secular, liberal, anti-fascist but also anti-Marxist-orthodoxy soul of the Italian republic, and deeply engaged in the public debate, especially when of an ethical nature.

18. Antonio Negri (1933– ) was educated at the University of Padua under the guidance of Umberto Padovani. Negri was Professor of Theory of the State, a peculiarly Italian field of studies concerned with juridical and constitutional law, at the same university from 1967 to 1979, during which time he was also a visiting lecturer at the École Normale Supérieure in Paris. Negri was arrested in 1979 with, among other charges, the accusation (dropped after a few months) of being the ideologue of the Red Brigades and the moral mastermind of the Moro kidnapping. He was ultimately convicted in a long, complex, controversial, and highly politicized case for the “constitution of armed group and subversive association” (a verdict confirmed in 1988). Negri escaped part of the punishment through an equally controversial fourteen-year exile in France. He expiated the remainder of the sentence after his voluntary return to Italy in 1997. During his sojourn in France (1983–97), he taught at the University of Paris VIII–St. Denis, Collège International de Philosophie, and at the Collège de France. Among his works are Stato e politica (State and politics; 1970), Marx Beyond Marx: Lessons on the Grundrisse ([1979] 1991), and, with Michael Hardt, Labor of Dionysus: A Critique of the State-Form (1994 [1995]), and the important trilogy Empire (2000), Multitude: War and Democracy in the Age of Empire (2004), and Commonwealth (2009).

19. Mario Tronti (1931– ) was Professor of Moral Philosophy and then of Political Philosophy at the University of Siena. A militant in the PCI in the 1950s and then a supporter of Berlinguer, he was one of the major theoreticians of operaismo (workers’ movement), a political position that challenges the traditional workers’ organizations such as the party and the trade unions in favor of the direct connection with the working class, and considers the factories as the site of the class struggle. Under the influence of Marxist philosopher Della Volpe and in an anti-Gramscian interpretation, he elaborated a philosophical position geared toward reopening the revolutionary chance of Marxism in Western societies as attested in his fundamental 1966 work Operai e capitale (Workers and capital), a very influential book for the subsequent period of youth contestation and political mobilizing. Abandoning the position of operaismo (he broke with Negri in 1967–68), Tronti focused on the notion of the “autonomy of the political” based on an original mixing of Marx and Carl Schmitt. He is the author of Hegel politico (The political Hegel; 1975), Sull’autonomia del politico (On the autonomy of the political; 1977), and La politica al tramonto (Politics at its decline; 1998).
inspiration (albeit deeply critical of the reformist turn taken by the PCI through its theorization of a “national way,” that is, “an Italian way to socialism”) such as Quaderni Rossi (Red notebooks) in 1961 and Classe operaia (Workers’ Class) in 1964; he was also an exponent of the extraparliamentary revolutionary organization Potere operaio (Workers’ Power), which included in its ranks some of Negri’s students and also the younger Rome philosopher Paolo Virno. After its dissolution in 1973, Potere operaio evolved into Autonomia operaia (Workers’ Autonomy), a movement whose connections with the Red Brigades are too complicated and still unclear to be taken up here. Both the journals and the political organizations of which Negri was part, in opposition to the organized moments of workers’ affirmation such as trade unions and parties, exalted the centrality of the workers’ class and its spontaneity, and the role of factories as privileged places of the class struggle.

The latter years of the period 1980–95 in Italy are marked, more than by the fall of the Berlin Wall, by the series of events that follow the car bombing at Capaci, near Palermo, orchestrated by the Mafia, in which the anti-Mafia high commissioner and judge Giovanni Falcone was killed on May 23, 1992. This

---

20. Paolo Virno (1952– ) graduated in philosophy from the University of Rome “La Sapienza” in 1977 with a dissertation on the concept of work and the theory of consciousness in Adorno. A member of Potere operaio and later of the journal Metropoli, he was placed in preventive custody, accused of belonging to the Red Brigades (although his participation was never proved), and convicted for “subversive activities and constitution of armed groups,” a conviction eventually overturned in 1987. During his years in prison, he developed a materialistic conception of language centered on the notion of thought as work and on the historical and linguistic feature of all political categories. The Spinozist concept of “multitude” lies at the core of his most recent reflections. He has published Convenzione e materialismo (Convention and materialism; 1986), Parole con parole: Poteri e limiti del linguaggio (Words with words: Powers and limits of language; 1995), and Il ricordo del presente: Saggio sul tempo storico (The memory of the present: Essay on historical time; 1999).

21. In Italy, the crisis of Marxism and of the dialectical reason inspiring it had already been consumed during the 1980s. The degeneration of terrorism further contributed to the calling into question of Marxist ideology and the spreading of a different Stimmung. As Lucio Colletti remarks, “the publishing houses of the extreme left, which are often the most sensitive seismographers … have moved from Rosa Luxemburg to Lou Salomé. From Marx to Nietzsche. And if they have not gotten hold of Heidegger, it is only because in this case they have been preceded by the Catholic publishers” (Tramonto dell’ideologia [Decline of ideology] [Rome-Bari: Laterza, 1980], 80). This situation of general crisis of Marxist ideology culminated in the decision by the PCI led by Achille Occhetto on February 3, 1991, to dissolve the Party and promote the constitution of the Partito Democratico della Sinistra (PDS, Democratic Party of the Left), in which the name change was meant to underline the accentuated democratic component of the newly named party. A number of delegates who did not accept the name change convened in the formation of the Partito di Rifondazione Comunista (PRC, Party for a Communist Refoundation).

22. Judge Falcone lost his life, as did his wife and entire escort, in a killing that upset the whole country at various levels.
killing starts a process eventually leading to the electoral victory in 1994 of Silvio Berlusconi. The success of Berlusconi’s coalition marks the role of media technology and its owners on the configuration of political power, and de facto radically alters the concepts of democracy, political representation, subjectivity and power, and even civic and political commitment and responsibility. It is not by chance, then, that on a strictly philosophical level the main debate of this period originates in conversation with authors such as Nietzsche, Heidegger, Wittgenstein, Foucault, Gadamer, Ricoeur, Derrida, and Rorty, who have radically called into question the concepts of subjectivity, reason, history, foundations, power, technology, and other metaphysically fixed entities such as ground and being. And it is also not by chance that – perhaps as a consequence of, or in response to, Berlusconi’s ascent to power, orchestrated mainly through the channels of mass media public appearance – several philosophers revive the traditional Italian idea of civic and political engagement by intensifying in turn their own media appearances as public figures, and by explicitly engaging in various reflections on the nature and role of technology, especially the mass media. On this front, the position of Mario Perniola seems particularly relevant. Perniola collapses the traditional metaphysical distinction between being and appear-

23. The killing of Falcone was followed by the murder of another anti-Mafia magistrate, Paolo Borsellino, a few days later; then by a series of alleged Mafia attacks against various targets in Florence, Rome, Milan, and Sicily; and finally, by the success and then progressive stalling of the so-called Tangentopoli (bribe-city) trial carried out by the magistrates of the Milan-based pool “Mani pulite” (clean hands), who were investigating and letting surface the connections between briberies (possibly of a mafia kind) and existing traditional political party powers. Taken together, these were all episodes that greatly contributed to the dissolution of the traditional political parties and to the revolution on the political scene culminating in the electoral victory, on March 27, 1994, of the coalition led by former cruise ship entertainer, entrepreneur, business man, and media owner Silvio Berlusconi, a nontraditional figure of a politician, who was himself formally charged with corruption in 1994 while presiding over a world conference on crime organized by the United Nations in Naples.

24. The election of Berlusconi ended the tradition of the so-called First Republic, formally already defunct through the passage (in 1993) from the proportional to the majoritarian form of government based on the personal charismatic power – almost always built through a connivance of economic and technological ownership – of individual political leaders.

26. Mario Perniola (1941– ) is Professor of Aesthetics at the University of Rome “Tor Vergata.” He was educated in Turin under Luigi Pareyson, and then developed an interest for the avant-garde, meta-literature, and situationism, especially as developed by Guy Debord. Among his works are: *La società dei simulacri* (The society of simulacra; 1980), *Transiti: Come si va dallo
ance, and reduces all being to appearance construed as mere semblance. In this sense, Perniola writes of *simulacra*: that is, images, or copies without the original, “that impose their own effectiveness on the subjects dissolving their reality.”

The cultural societal forms such as parties, educational institutions, and especially the mass media are not mirrors of reality, then, but simply *simulacra* that act as conditions of social experience. In this condition of heightened public performance, many philosophers seem to resurrect the Platonic model of the philosopher-king by renewing the traditional Italian civic commitment to and involvement in various political activities.

In this context and from a purely theoretical perspective, Salvatore Veca (1943–) is, as Remo Bodei recognizes, “the political philosopher who has translated into the language of ‘public ethics’ the demands for social justice previously advanced by Marxism, and who, together with Bobbio, keeps alive, in other ways, the traditional civic vocation of Italian philosophy.”

Raised in Paci’s phenomenological school, Veca moved from the study of Kant’s epistemology and Marx’s scientific economic program to the “contractualist” variant of Anglo-American political philosophy, especially Rawls’s theory of justice. Considering the idea of global justice as the major challenge for contemporary normative political theory, Veca is interested in determining how the maximum level of common good may be reached in societies marked by the ideals of pluralism and individualism.

During the years 1980–95 various parallel conversations and interest develop, such as the concern with analytic philosophy of language in Andrea Bonomi (1940–), Marco Santambrogio (1946–), and Diego Marconi (1947–). Santambrogio, in particular, has become known for “institutionalizing” the

---

28. Most famously, Massimo Cacciari became mayor of Venice in 1996; Marcello Pera became senator for the Berlusconi’s party in 1996 and then president of the senate in 2001; Aldo Masullo was involved in the government of Naples and became senator for two legislatures in 1994; Ugo Perone, a Turin philosopher of the Pareyson school, held several positions in the Turin administration before being appointed director of the Italian Cultural Institute in Berlin in 2001; and Gianni Vattimo started a political career that led him to winning a seat in the European Parliament in 1999.

30. Salvatore Veca is currently Professor of Philosophy of Politics at the University of Pavia. Among his publications are: *La società giusta* (The just society; 1982), *Cittadinanza: Riflessioni filosofiche sull’idea di emancipazione* (Citizenship: Philosophical reflections on the idea of emancipation; 1990), and *La filosofia politica* (Political philosophy; 1998).
Italian interest for analytic philosophy of language through the publication in 1992 of the edited volume *Introduzione alla filosofia analitica del linguaggio* (Introduction to the analytic philosophy of language). There also emerges an interest for various forms of applied ethics and for the theories of justice, for example in Eugenio Lecaldano (1940– ), Maurizio Mori (1946– ) and Sebastiano Maffettone (1948– ). A concern with philosophy of science and epistemology in general is found in the thinking of Francesco Barone (1923–2001) and Paolo Parrini (1943– ), who develop neopositivist studies and positions, in Sergio Moravia (1940– ), who defines himself as a “neo-pragmatist” and an “applied epistemologist,” and in Evandro Agazzi (1934– ), Giulio Giorello (1945– ), Marcello Pera (1943– ), and Dario Antiseri (1940– ), with the latter two contributing significantly to the diffusion of Karl Popper’s philosophy in Italy. The main general reflection of this period gravitates, however, around three major themes of debate, within which individual philosophical thinkers whose contribution to the conversation is particularly (although not exclusively) relevant will be indicated in what follows. The three topics of debate, which are in many ways deeply intertwined, are the crisis of reason and subjectivity; the concepts of modernity, postmodernity, and their relation; and hermeneutics as philosophical *koine* and the notion of “weak thought.”

II. THE CRISIS OF REASON AND SUBJECTIVITY

had already challenged the foundational solidity of sciences in an earlier work, *Il sapere senza fondamenti* (Knowledge without foundations; 1975). According to him, reason, which he names not without equivocation “classical reason,” is incapable of reflecting adequately the laws and forms of reality first of all because reality is not an objective world that can be grasped; rather, reality is itself the consequence of a series of choices, values, interests, and myths constituting a specific civilization. The traditional, rationalistic image of reason inspired by a desire for omnipotence should be denounced and renounced, he argues, whereas philosophy should no longer aim at producing foundations or logical arguments, and should stop competing for status with the hard sciences. Furthermore, philosophy should, as Gargani himself does, unfold into “narrated thought,” which intertwines reflection and narration, development of ideas and personal experiences, philosophy and literature. With no preconstituted certainties to move from, one should learn to transform chance into advantage and benefit, in the recognition that truth is neither possession nor goal but simply a matter of “influential images directing our lives.”33 The idea of a self-centered subject is only “a theater,” a “great exorcism carried out against reality.”34 The task is that of accepting the existential challenge and acquiring “the courage to be” always different from oneself in the unforeseeable encounters to which one is constantly exposed.35

The idea of *Krisis*, which somehow sustains Gargani’s position, is explicitly thematized in the philosophy of Massimo Cacciari, who had already devoted to this topic his books *Krisis: Saggio sulla crisi del pensiero negativo da Nietzsche a Wittgenstein* (Krisis: An essay on the crisis of negative thought from Nietzsche to Wittgenstein; 1976) and *Pensiero negativo e razionalizzazione* (Negative thought and rationalization; 1977).36 Cacciari opposes to the soteriological, conciliatory, continuous images of reason and history, especially of a dialectical

---

36. Massimo Cacciari (1944– ) was three times the mayor of Venice, after being a member of the Italian Parliament, the European Parliament, and the regional government of Veneto. Cacciari studied philosophy at the University of Padua with a dissertation on Kant’s *Critique of Judgment*; he became Professor of Aesthetics at the University of Venice and later Professor of Philosophy at the Vita-Salute San Raffaele University in Milan. He has been among the founders of some of the most important philosophical and cultural journals in Italy: *Angelus Novus* (1964–74), *Contropiano* (1968–71), *Laboratorio Político* (1980–85), *Il Centauro* (1980–85), and *Paradosso*, started in 1992 and codirected with Sergio Givone, Carlo Sini, and Vincenzo Vitiello.
(Hegelian–Marxian as well as Lukácsian) kind, the idea of *Krisis* as the permanent emergency in which thinking and being are situated. In this situation of antidialectical “negative thought,” which is exemplified in the “decadent” figures of Nietzsche and the early-twentieth-century Austrian thinkers Freud, Hoffmannstahl, Rilke, Roth, Schönberg, Trakl, and Wittgenstein, no salvation is ever granted or assured, and there is no possibility for a dogmatic uniqueness of the truth, not even the truth of subjectivity. In *Icone della legge* (Icons of the law; 1985), the symbol of the enigmatic ambiguity of existence bordering on tragedy, that is, of the *Krisis of nomos*, becomes the Kafkaian and Rosenzweigian metaphor of the door, which can be understood both as a barrier that could have been destroyed and as an opening at the end of any apparently closed life path. The contemporary subject is placed in the situation of constantly having to make choices on behalf of a law and a goal the meanings of which are no longer clear – they are obfuscated or lost. Contemporary subjectivity is completely autonomous, but in the sense of its being entirely uprooted from all grounds, and thus standing on a precarious nothing. This is the deepest sense of the nihilism that Cacciari reaches also through a meditation on Heidegger’s *Nietzsche*. The contemporary individual is placed in a situation of nomadism similar to that of the children of Israel. At this point, and especially in some later works, Cacciari’s philosophical approach intertwines with more theological themes, as becomes explicit in his books *The Necessary Angel* ([1986] 1994), an allegory for the infinite tension between the human limited ability of representation and the nonrepresentable, and *Dell’inizio* (On the beginning; 1990), which explores the traditional philosophical theme of the beginning as the proper philosophical problem, whereas all other disciplines start from an already constituted object. Cacciari’s itinerary leads him to reconsider the entire history of metaphysics according to a different line of interpretation than the one suggested by Heidegger. His “negative thought” in fact rereads the history of philosophy according to a different line of origin or beginning, which goes from Proclus to Damascius to Scotus Eriugena to Meister Eckhardt to Cusanus to Schelling and which intersects, once again, philosophy and theology to produce a new “double” heresy. In his works from the mid-1990s, *Geo-filosofia dell’Europa* (Geo-philosophy of Europe; 1994) and *L’arcipelago* (The archipelago; 1997), Cacciari’s philosophical sensitivity to those differences that “negative thought” does not want to unify and reconcile manifests itself through an exploration of the irreducible plurality of cultural roots present in the European landscape.

The idea of a crisis of reason with its tragic and nihilistic implications is parallel to the theme of a crisis of the monolithic subject sustaining such

---

37. The theme of tragedy becomes explicit in Luigi Pareyson’s later work on Dostoevsky, Schelling, and Heidegger (see note 48), and finds its utmost conceptualization in his *Ontologia della*
rationality. The themes of the subject and subjectivity in their genesis and as structuring Western modern individuals are powerfully present in the philosophy of Bodei, starting with his work *Scomposizioni: Forme dell’individuo moderno* (Deformations: Forms of the modern individual; 1987), which in many senses is an inaugural text with respect to later reflections on subjectivity, multiplicity, and the “multiverse.” Moving from the consideration of a fragment by Hegel in which individuality is structured in a pyramidal manner, Bodei understands history, and the individual, neither as a continuum according to the historicist model nor as eternal history à la Vico, but rather as a *metamorphosis*, a stratification, a layering, and a passage of forms according to the suggestions of Gestalt psychology. *Scomposizioni* is the first volume in a series including *Geometria delle passioni: Paura, speranza e felicità: filosofia e uso politico* (Geometry of passions: Fear, hope and happiness – philosophy and political use; 1991), *Ordo amoris: Conflitti terreni e felicità celeste* (The order of love: Earthly conflicts and celestial happiness; 1991), and *Logics of Delusion* ([2002] 2007), all devoted to exploring forms of logics different from the one displayed by theoretical rationality, through an extensive conversation with Descartes, Hobbes, and Spinoza, but also Augustine, Foucault, and psychiatric theory. Bodei’s theoretical project aims at the elaboration of a logical-interpretative structure capable of thinking conceptual and historical tensions and conflicts as a form of antagonistic complicity, that is, of a *logos* intrinsically connected but also foreign to *polemos*. He thus extends the sphere of intelligibility to notions such as passion,

---

libertà: Il male e la sofferenza (Ontology of freedom: evil and suffering; 1995). The concept of the tragic is present also in the considerations of Sergio Givone (1944–), a student of Pareyson in Turin and currently Professor of Aesthetics at the University of Florence. For Givone, the tragic, explored in its Romantic and not only Nietzschean implications, constitutes the hermeneutic model capable of confronting the current historical epoch hanging over the abyss of nihilism. Among Givone’s publications are *Ermeneutica e romanticismo* (Hermeneutics and Romanticism; 1983), *Disincanto del mondo e pensiero tragico* (Disenchantment of the world and tragic thought; 1988), and *Storia del nulla* (History of nothingness; 1996).

38. Remo Bodei (1938–) studied at the University of Pisa. He was then awarded various fellowships at the universities of Tübingen and Freiburg, where he attended lectures by Ernst Bloch and Eugen Fink, and at the University of Heidelberg, where he attended lectures by Karl Löwith and Dieter Henrich. In 1971 he was appointed Professor of History of Philosophy at the University of Pisa. After being granted a Humboldt fellowship at the Ruhr University in Bochum (1977–79), he became visiting professor at King’s College, Cambridge (1980), and later at Ottawa University (1983). He taught for many years (1969–93) at the Scuola Normale Superiore in Pisa. He has also taught on several occasions at New York University, and more recently at the University of California, Los Angeles. His books have been translated into many languages. Among his publications are *Sistema ed epoca in Hegel* (System and epoch in Hegel; 1975), *Multiversum: Tempo e storia in Ernst Bloch* (Multiversum: Time and history in Ernst Bloch; 1979), and *Le forme del bello* (The forms of the beautiful; 1995).
delusion, history, and beauty while preserving their alterity by not submitting them to a form of rationality that searches for absolute exactness and certainty.

The theme of subjectivity is central also to Aldo Masullo, a Neapolitan philosopher educated under the guidance of Antonio Aliotta (1881–1964) and Cleto Carbonara (1896–1976) in the tradition of a historicism of a liberal nature, which is deeply aware of the insufficiencies in which the idealistic historicism à la Giovanni Gentile had fallen. Following Croce’s teaching, Masullo neither abandons the field of history nor understands the humanistic ideal of freedom as spiritual freedom that translates into cultural works and political institutions. Sharing with Gargani and Bodei a deeply antimetaphysical sentiment, Masullo exercises a radical criticism of the foundational pretension of philosophy and of its substantialized concepts. His reflection gravitates toward the notion of subjectivity no longer understood as pure and disembodied activity as in the rationalist or transcendental subject. Rather, Masullo construes subjectivity in terms of passivity, and thus of intersubjectivity. The individual is an intimacy on which time and experience carve deep marks, and leave traces constituting the individual as he or she is. The individual is time, which also means that subjectivity is finite, that is, exposed. This is the dimension of affectivity, or pathetic character of the subject, which is not a subject unless it is in a relation of intersubjectivity, that is of dialogue and communication with others. Far from an ingenuous exaltation of the individual and the power of the will and rationality, Masullo’s philosophy borders on some of the themes of nihilism in the awareness of the unstable and vulnerable nature of subjectivity and the unhappiness of reason, doomed to search for a foundation it can never achieve. Masullo’s project is to elaborate “an active ethics of salvation” understood in a nonreligious register as the ability to recognize the intersubjective connection linking all individuals and as the availability to work within history without closure to the novelty history may bring unexpectedly.

The theme of ethics as the proper field of activities in which contemporary subjectivity can confront and care for its own finitude is present also in Salvatore Natoli, a student of Severino (see below) at Milan Catholic University. Through a meditation on Nietzsche, Heidegger, and Foucault, Natoli elaborates an ethics

39. Aldo Masullo (1923– ) is the author of Il senso del fondamento (The sense of ground; 1967), Anti-metafisica del fondamento (Antimetaphysics of ground; 1971), and Filosofie del soggetto e diritto del senso (Philosophies of the subject and the law of sense; 1990).
40. Salvatore Natoli (1942– ) is Professor of Theoretical Philosophy at the University of Milan-Bicocca. His publications include Vita buona, vita felice: Scritti di etica e di politica (Good life, happy life: Essays in ethics and politics; 1990), L’esperienza del dolore: Le forme del patire nella cultura occidentale (The experience of pain: Forms of suffering in Western culture; 1995), and Soggetto e fondamento: Il sapere dell’origine e la scientificità della filosofia (Subject and ground: Knowledge of the origin and the scientific character of philosophy; 1996).
of finitude capable of including passions, affections, happiness, the dimension of corporeality, and, in Natoli’s later writings, also the sacred. These dimensions have all been underestimated and marginalized by classical rationalism and contribute to a different configuration of subjectivity. Natoli proposes a form of neopaganism made possible by modernity and secularization. Such paganism abandons Christianity insofar as Natoli’s proposal relies on finitude in its natural and unrevealed dimension: that is, it is centered on an ethos of self-sufficient finitude. It also differs from ancient and modern paganism insofar as Natoli’s neopaganism is void of the tragic aspect characterizing ancient paganism, and it is not anti-Christian (like modern paganism) but rather post-Christian. The measure of finitude is death, which does not open up to nothingness but rather to a sense of mystery. Natoli’s project is therefore not nihilist. Whereas it utters a need for the salvation of the finite, it does not find such salvation in the redemption of the finite but rather in its ethos, in the dwelling in it as self-sufficient as long as it lasts.

A reflection on subjectivity interpreted under the rubric of “person” is carried out by Enrico Berti, who intertwines historical, theoretical, and ethical analyses with the study of Aristotle, an area in which Berti is a world-renowned scholar. Berti, who belongs to a neoclassical and neo-Aristotelian tradition, also engages in a confutation of the absoluteness of experience, which for him always refers to the transcendence of the Principle: that is, to the recognition of the necessity of a transcendent absolute. Such a Principle, or Infinite, is independent of any dogmatic or confessional religious belief, and its necessity, although not its nature, is knowable by finite reason. A supporter of ethical personalism, Berti is especially interested in practical philosophy, a theme privileged also by his student Franco Volpi (1952–2009), a scholar of Heidegger and of Aristotle’s presence in Heidegger’s thought.

In this general climate of a rethinking of the role and nature of reason and subjectivity, an interesting experience occurs that, however, remains marginal and unnoticed to the broader philosophical and even academic community. It is the creation by a group of women philosophers of Diotima, a philosophical women’s community based at the University of Verona and finding its major

---

41. A student of the neoclassical philosopher Marino Gentile, Berti (1935–) is Professor of Philosophy at the University of Padua. Among his works are Contraddizione e dialettica negli antichi e nei moderni (Contradiction and dialectic in the ancients and the moderns; 1987), Analitica e dialettica nel pensiero antico (Analytics and dialectics in ancient thought; 1989), and Soggetti di responsabilità (Subjects of responsibility; 1993).

42. Despite the history of political activism and success of the women’s liberation movements in Italy, to this day there are no departments of women’s studies in Italian universities where feminist theorists can be housed and develop a “thought of sexual difference” in all its aspects and implications.
representatives in Adriana Cavarero (1947– ), Luisa Muraro (1940– ), and Chiara Zamboni (1954– ). Their philosophical activity is inspired by the thought of Luce Irigaray and the cultural–political debate of women’s movements, especially the so-called feminism of difference. They engage in a rereading of the history of philosophy and culture, and a reconfiguration of subjectivity according to women’s lines of thought (pensiero al femminile). By reconfiguring subjectivity according to sexual difference, they challenge the universality and neutrality of the philosophical discourse and its concepts, which are in fact revealed as the historical and symbolic expression of male subjects. More specifically, they thematize the issues of women’s authority, the symbolic order of the mother, the concept of mother tongue, and the idea of philosophical practice as a starting-from-oneself.

Through the discussion on the crisis of reason and subjectivity, Italian philosophers acknowledge that there is no unifying history providing a single meaning to the world, no unitary knowledge capable of systematizing the various fields of experience, no overarching rationality penetrating and adequately mirroring the complexity of reality, and no monolithic subject supporting all this. During the 1980s and 1990s, the world of modernity and its optimism seems to have come to an end.

III. MODERNITY AND POSTMODERNITY

The second topic of debate that occupies Italian philosophers of the period contemplates precisely the status of the current condition of a general loss of unitary meaning, what has been called “the postmodern condition,” in relation to the previous condition of modernity. This debate, which often assumes the tones of an open, harsh, and in the end sterile polemic, and which prolongs itself for almost a decade, finds major representatives in Gianni Vattimo, Paolo Rossi (1923– ), and Carlo Augusto Viano (1929– ), with the last two taking an explicit position in favor of modernity against any postmodern configuration. Fundamental works engaging the debate are Vattimo’s *The Adventure of Difference: Philosophy After Nietzsche and Heidegger* ([1980] 1993), *The End of Modernity: Nihilism and Hermeneutics in Postmodern Culture* ([1985] 1992), and the reactions to the postmodern position delineated by Vattimo and others (such as Gargani, Cacciari, Eco, and many of the thinkers analyzed in the present

---

*43. For a discussion of Luce Irigaray, see the essay by Mary Beth Mader in *The History of Continental Philosophy: Volume 6*.  
essay) as discussed in Viano’s numerous journal articles in the Rivista di Filosofia and in Va’ pensiero: Il carattere della filosofia italiana contemporanea (Onward, thought: The character of contemporary Italian philosophy; 1985), and in Paolo Rossi’s Paragone degli ingegni moderni e postmoderni (Comparison between modern and postmodern minds; 1989). The debate between the two positions, which originated in the Turin school but ended up dividing the Italian philosophical world, is documented in Giovanni Mari’s edited volume Moderno Postmoderno (Modern postmodern; 1987) and in Berti’s Le vie della ragione (The ways of reason; 1987).

Since, in general, postmodernism appears as an evaluation of history and metaphysics that reconfigures them (when they are not abandoned) in terms of break and discontinuity, the debate on modernity and postmodernity takes up the features of a discussion on the historical and metaphysical categories guiding modernity. The defenders of modernity support neo-Enlightenment, neorationalist, and secular theses considered to be bearers of reform projects and reconfigurations of knowledge in close proximity to science. Among them are Abbagnano’s Turin students, such as Pietro Rossi and Viano, who devote themselves to a historiographic production accompanied by a theoretical commitment against irrationalistic positions. Historiography, which in Italy enjoys a long tradition going back at least to Vico, finds additional representatives in Milan with Dal Pra and his students, and in Florence with the school of Garin. Both schools are geared toward an anti-idealist understanding of the development of history, which is grounded in the empirical historicity of various human beings and philosophers. Among the opponents of postmodernism are also some historians and intellectuals formed in the Marxist tradition such as Lucio Colletti, concerned by the postmodern abandonment of the idea of critical and scientific rationality and the escape into antiscientist positions.

Among the secular scholars, particularly vocal in the debate against postmodernism are Viano and Paolo Rossi. In Va’ pensiero, Viano links postmodernism and its Italian specific variation, Vattimo’s weak thought, to an anti-Enlightenment, antireformist, and traditionalist tendency. This trend, widespread in Italy and internationally, is contrary to science and the industrial society in general, which it counters with tradition and edifying literature. Similarly, Paolo Rossi criticizes and confutes on historical grounds the postmodern discourse of a unified, homogeneous, totalizing “classical rationality” geared toward unity and dominating the philosophical scene up to the twentieth century, when it would finally come to an end. Through the study of major representatives of so-called classical reason such as Bacon, Hobbes, Diderot, and Comte, Rossi shows how the postmodern theses, which unfold out of a Heideggerianism radically different from the one that inspired many Marxist thinkers during the 1960s and 1970s, are an undocumented, superficial construct geared toward attributing prophetic
legitimacy to its supporters in an anti-Enlightenment move. It should be noted that while quite vehement in their tone, the positions outlined above defending modernity represent a minority perspective in Italian philosophy, as they do not seem capable of counteracting the widespread affirmation of the various postmodern attitudes against metaphysics.

An interesting thinker to be considered within the range of this debate because in fact he radically jumps over the terms of the discussion is Emanuele Severino,\(^{45}\) who, taking recourse to Nietzsche’s concept of the eternal recurrence and Heidegger’s analysis of technology and the contemporary world, argues for the return to a pre-Greek, premodern form of thinking as exemplified by Parmenides. Severino was educated at the University of Pavia under the guidance of classical metaphysician Bontadini, with whom he clamorously broke relations while they were teaching together at the Milan Catholic University of the Sacred Heart in 1970. This break, which originated in a dispute regarding Bontadini’s analysis of becoming and prompted Severino’s move to the University of Venice, marked the beginning of the development of Severino’s own original thinking, which has been named “neo-Parmenideanism.” According to Severino, whose philosophical position develops in sustained conversation with Nietzsche, Heidegger, and Marx, the Western world is dominated by a nihilistic will to power, domination, abuse, and the devastation of nature, which is the consequence of the folly of placing trust in the notion of becoming. The will to power, ultimately displayed in the technological attitude and in capitalism but also guiding scientific behavior, is in fact based on the conviction that things and humans are destructible, modifiable, and manipulable because they are exposed to the nullification due to the process of becoming. Against the “folly of becoming” with its dominating and violent charge, Severino suggests a return to Parmenides that does not deny the multiplicity of beings, but rather asserts, contra Heidegger, the immutability of Being and the eternity of all beings because becoming is the appearing and disappearing of the eternal. Through his original Parmenidean ontology, which configures itself as an “ontology of necessity” against much “ontology of freedom” (as in Pareyson’s case, discussed below), Severino reads the entire history of metaphysics as the alteration and forgetfulness of the authentic meaning of being. Thus, his postmetaphysical invi-

\(^{45}\) Emanuele Severino (1929– ) graduated at the University of Pavia in 1950 under the guidance of Gustavo Bontadini with a dissertation on Heidegger and metaphysics. After teaching at the Catholic University of the Sacred Heart in Milan, he became Professor of Theoretical Philosophy at the University of Venice. He is a member of the Italian National Academy (Accademia Nazionale dei Lincei), and writes regularly for the Italian daily newspaper Corriere della Sera. His publications include Essenza del nichilismo (Essence of nihilism; 1972), Techne: Le radici della violenza (Techne: The roots of violence; 1979), Destino della necessità (Fate of necessity; 1980), and L’anello del ritorno (The ring of the return; 1999).
tation is the return to a premetaphysical, premodern place of thinking that *de facto* ignores the controversy between modernity and postmodernity.

A postmetaphysical position that tries to keep together the results of modernity, especially in its Kantian, transcendental legacy, and the insights of existentialism and hermeneutics, is the one developed by Virgilio Melchiorre.\(^{46}\) Melchiorre’s thought develops within the tradition of classical metaphysics, but he subjects it to a double verification, stemming from phenomenology and hermeneutics, respectively. In the mode of French phenomenology and especially Ricoeur, he considers the concreteness of history and human beings as the center of philosophical discourse, and thus develops an interest in the themes of the body, space, and time. Within these themes, however, Melchiorre finds the experience of something that cannot be dismissed as simple becoming (which is, for him, a concept as abstract as that of pure being). From this experience, one is called to interpret reality, which is better understood in terms of finitude and precariousness rather than becoming. The interpretation leads to a move to the transcendental level in the quest for the conditions of possibility of the finite being that phenomenology and hermeneutics describe. For Melchiorre, the path is thus from consciousness and its concrete historicity to an “ultimately unconditioned,” which is in itself unsayable, but which transpires in the individual perspectives. The analogical path (*via analogica*) becomes the way through which, within the horizon of finitude, the structures of being unconditioned are revealed; reason necessarily requires such structures not simply as its goal but also as the immanent horizon of sense that is implied in every specific meaning. Melchiorre’s long analogical path preoccupies itself with ethical questions, with issues in the philosophy of history, with the topic of symbolism as various ways to indicate a direction toward the unconditioned, which is simultaneously the most sayable (because always implied) and the least determinable (because always escaping speech and communication).

**IV. HERMENEUTICS AS PHILOSOPHICAL KOINE AND WEAK THOUGHT**

The third theme that occupies Italian philosophers, especially in the second part of the 1980s, is *il pensiero debole*, a term that indicates, even before Vattimo’s

---

46. Virgilio Melchiorre (1931–) taught moral philosophy at the University of Venice. Later, he became Professor of Moral Philosophy at the Catholic University of the Sacred Heart in Milan, where he had previously taught the philosophy of history since 1961. In 2000, he became Professor of Theoretical Philosophy at the same university, where he also directed the School of Specialization in Social Communications. His publications include *Essere e parola: Idee per una antropologia metafisica* (Being and word: Ideas for a metaphysical anthropology; 1982), *Corpo e persona* (Body and person; 1987), and *La via analogica* (The analogical way; 1996).
own specific position, a constellation of positions geared toward a rethinking in “weak” terms of traditional metaphysical categories. In parallel with weak thought and in many senses as a premise for the possibility of the development of weak thought, there emerge various attempts at a reconfiguration of reason, which has undergone a crisis in its techno–scientific–rationalistic as well as Hegelian–Marxist–dialectical variations, both a legacy of modernity. The reconfiguration occurs in terms of the complexity of a hermeneutic reason open to discourse and confrontation with alterities. Thus, a variety of philosophical positions not necessarily associated with weak thought yet more or less loosely affiliated with a properly hermeneutic stance develop. This justifies Vattimo’s recognition of hermeneutics as the contemporary cultural koine.

Vattimo’s weak thought could not have been accomplished without the fundamental influence of Luigi Pareyson, who in Europe is often considered the third hermeneutic variant beside Gadamer and Ricoeur.47 Pareyson’s philosophical itinerary begins in Turin under the guidance of spiritualist and personalist philosophers Guzzo and Carlini, and moves from existentialism, which Pareyson first introduced into Italy and which appears in him not only in its German variations (Jaspers, Barth, Heidegger, Kierkegaard), but also in its French interpretations (especially Marcel and Lavelle, but also Maritain, and, later, Pascal, although he is not canonically an existentialist). He develops a rereading of the history of German Romanticism and classical idealism that releases its representatives (most notably Fichte and later Schelling, but also Schiller and Novalis) from their subservience to Hegel. Pareyson also manifests an interest in aesthetics through the elaboration of the notion of “formativity” that opens up the path to a conception of art (and thus of myth and religion) as a place of interpretation of the truth, and thus as a hermeneutic site.48 In 1971, Pareyson published his highly original and innovative book, Verità e interpretazione (Truth and interpretation), which is arguably the most important essay in Italian hermeneutics. Truth is here understood as something not ineffable (as in Heidegger, who thus walks down the “dead end” of an ontology of the ineffable, or a “negative ontology”), but rather inexhaustible (inesauribile). Quoting Pareyson’s most famous claim, made against any objectivistic and thereby scientistic notion of truth, “of the truth there can only be interpretations; and any interpretation can only be of

the truth,”⁴⁹ which because of its inexhaustibility constantly spurs new interpretations, that is, new relations to itself. Since any interpretation is, ultimately, a matter of a historical and personal decision in favor of a faithfulness to truth and being or a betrayal of them both (and thus any interpretation involves a risk), the theme of interpretation develops, in Pareyson’s final years, in the direction of an “ontology of freedom.” The ontology of freedom not only locates the possibility for human freedom but also, through a reading of Schelling and Dostoevsky, it situates freedom, as both beginning and choice, in God. This is not the God of metaphysics but rather the biblical God, the God of Christianity who is abandoned by God and dies on the cross, God against God, a tragic God who does not explain but rather assumes on himself death, doubt, anguish, and atheism. For Pareyson, the heart of reality is thus freedom and ambiguity, suffering, pain, and evil, as the title of his final, posthumously published volume, *Essere libertà ambiguità* (Being freedom ambiguity; 1998), suggests and as a philosophical hermeneutics of Christian religious experience reveals.

In 1983, Vattimo and Pier Aldo Rovatti published their important and influential coedited volume *Il pensiero debole* (Weak thought), which, besides their own contributions, also contains essays by Leonardo Amoroso, Gianni Carchia, Filippo Costa, Franco Crespi, Alessandro Dal Lago, Umberto Eco, Maurizio Ferraris, and Diego Marconi. Vattimo and Rovatti are the two major representatives of this widespread, precise (although with indefinite margins) philosophical position known as *pensiero debole* (“metaphor,” as it is qualified in their preface to the volume, which Vattimo now prefers to replace with the less demanding term “ontology of decline”), although Vattimo is now its principal proponent.⁵⁰

As evidenced in *Al di là del soggetto* (Beyond the subject; 1981), and *The End of Modernity: Nihilism and Hermeneutics in Postmodern Culture* ([1985] 1991), Vattimo’s thought emerges from the realization (which he has matured through association with his teachers Pareyson, Gadamer, and Löwith and his readings of Barth, Benjamin, Bloch, Croce, Heidegger, Lukács, Marcuse, and Nietzsche) of the current impossibility of any fixed structure of being. Such impossibility has been completed through the philosophies of Nietzsche and Heidegger.

---

⁵⁰ Gianni Vattimo (1936– ) was a student of Pareyson, under whose guidance he graduated in 1959 in Turin with a dissertation on Aristotle. He studied in Heidelberg with Karl Löwith and Hans-Georg Gadamer, whose thought he introduced in Italy. After teaching aesthetics at the University of Turin, he later became Professor of Theoretical Philosophy there. He has been a visiting professor at various universities in the United States. Recently he was an elected member of the European Parliament in Brussels. Among his publications are *Il soggetto e la maschera: Nietzsche e il problema della liberazione* (The subject and the mask: Nietzsche and the problem of liberation; 1974), *The Transparent Society* ([1989] 1992), and *Beyond Interpretation: The Meaning of Hermeneutics for Philosophy* ([1994] 1997).
The experience of the oblivion of being and of the death of God, however, are not carried far enough by the widespread discourses on the crisis of reason and “negative thought” because of their fundamental nostalgic attitude toward metaphysics. Weak thought aims at completing the process initiated by the two German thinkers by weakening or disempowering the strong metaphysical structures and entities (such as reason, truth, absolute values, and so on) that have constituted modernity. Vattimo thus wishes for an overcoming of metaphysics that results in an ethics of interpretation insofar as the truth is resolved into its continuous interpretations. Playing on the meaning of Überwindung (overcoming) as Verwindung (distortion or twisting), Vattimo considers metaphysical “immutables” as traces that are no longer practicable as absolutes and yet are unrenounceable as the provenance from which the postmodern subject comes. Truth becomes for Vattimo the transmission of a linguistic and historical legacy orienting one’s own understanding of reality. Toward such a legacy, one can only exercise a form of pietas and, as far as the present and the future are concerned, concentrate on an “ontology of actuality” (the term is borrowed from Foucault) focused on the elaboration of a nonunitary, multifaceted subject open to freedom, tolerance, building of consensus, and relations with other cultures. Emancipation for Vattimo is not a matter of a progressive liberation from prejudices toward the goal of a clear, objective truth, but rather the freedom from strong metaphysical structures that hermeneutic reason achieves through the realization that all truths are a matter of interpretation.

The ethical implications of weak thought are taken up by Pier Aldo Rovatti. Although he shares with Vattimo many philosophical presuppositions, Rovatti is a phenomenologist and does not recognize himself in the general landscape of hermeneutics. Especially in his book L’elogio del pudore: Per un pensiero debole (In praise of modesty: Toward a weak thought; 1989), written with Dal Lago, and in conversation with Freud, Heidegger, Husserl, Levinas, and Vattimo, Rovatti introduces the metaphor of modesty (and elsewhere the dimension of silence, as in L’esercizio del silenzio [The exercise of silence; 1992]) as a way to respond ethically to the weakening of philosophy attested in Vattimo’s philosophical hypoth-

51. On these themes as they relate to Vattimo, see Brian Schroeder, “Theological Nihilism and Italian Philosophy,” Philosophy Today 49(4–5) (Winter 2005).
52. Pier Aldo Rovatti (1942– ) completed his studies in theoretical philosophy with a dissertation on Whitehead at Milan State University under the guidance of Enzo Paci and Ludovico Geymonat. After working as a theater critic for the daily newspaper L’Avanti, he taught at Milan State University and later at the University of Trieste, where he is currently Professor of Theoretical Philosophy. Among his publications are La posta in gioco (What is at stake; 1987), Le trasformazioni del soggetto: Un itinerario filosofico (The transformation of the subject: A philosophical itinerary; 1992), and Abitare la distanza: Per un’etica del linguaggio (Inhabiting distance: Toward an ethics of language; 1994).
Modesty is defined by Rovatti as a movement of withdrawal of thought from things and events so as to allow the emergence of a “shadow zone” that remains invisible and ineffable, a zone of renunciation of the claims advanced by traditional philosophy to be able to grasp its objects. The contemporary weakening of philosophy thus entails an ethical aspect, which can be identified with the modesty, discretion, and lack of violence of a universe of thought deprived of its dimension of will to power. Rovatti’s invitation is to an “ethics of diminution,” that is, an ethics of dwelling in the distance, from oneself and from others.

Interesting philosophical perspectives that unfold with hermeneutics on their background and accentuate various different components of the contemporary debate are those of Umberto Eco, Carlo Sini, Vincenzo Vitiello, and Mario Ruggenini. Among the four, the thinker who is most clearly influenced by hermeneutics is Ruggenini, who, in conversation with Heidegger, develops hermeneutics on the grounds of a general evaluation of the crisis of metaphysics inherited from his teacher Severino. Starting with a hermeneutic retrieval of phenomenological themes (Husserl and Heidegger), Ruggenini’s overall philosophy develops the theme of the finitude of existence in relation to the problem of alterity, so as to replace the metaphysics of meaning and sufficient reason with a different experience of the truth—an experience of truth that occurs in human speech and in the conversation with others in which the world opens up. In general, three themes recur in Ruggenini’s philosophy: a rethinking of ontological issues in a hermeneutic-phenomenological register; a new hermeneutics of the I or self that is made possible out of the relation with the other and constitutes the I neither as substance nor as self-certainty, but rather as responsibility for the other; and the appeal of the other as opening to the dimension of the sacred. The sacred is here understood not as the god of presence and ontotheology, but rather as the god of absence, which entails for human beings faithfulness to the earth and a retrieval of the religious sense of philosophical questioning. The entire Western tradition is for Ruggenini marked by an immanent nihilism, which is deepened through the Christian idea of creation from nothingness, since such \textit{creatio ex nihilo} constantly exposes the world to the

---

53. Mario Ruggenini (1940–) is Professor of Theoretical Philosophy at the University of Venice. A student of Emanuele Severino first at the University of the Sacred Heart in Milan, Ruggenini then followed Severino to Venice after the latter’s break with his master and then colleague Bontadini. He has spent periods of study and research in Cambridge and Oxford, and has lectured on questions of phenomenology and hermeneutics in various universities in Europe and elsewhere. Among his publications are \textit{Volontà e interpretazione: Le forme della fine della filosofia} (Will and interpretation: The forms of the end of philosophy; 1984), \textit{I fenomeni e le parole: La verità finita dell’ermeneutica} (Phenomena and speech: The finite truth of hermeneutics; 1991), and \textit{Il discorso dell’altro: Ermeneutica della differenza} (Discourse of the other: Hermeneutics of difference; 1996).
risk of a renewed fall into the nothingness from which it comes. The only way out of such nihilism is through a radically and genuinely hermeneutic attitude. The fall into nothingness is strictly related to the violent domination by a single truth; nothingness can be defeated only with the recognition that the truth is multiple and cannot be owned or possessed. Rather, truth gives itself in the changing and rich intertwining of multiple discourses. As Ruggenini repeats on the wave of Hölderlin, “we are a discourse,” since our finite being is always and already in a relation in which we are, first and foremost, listeners and interlocutors. Ruggenini’s perspective is thus that of a hermeneutic philosophy that has abandoned all forms of transcendence since transcendence is implicitly considered an (albeit unintentional) generator of nihilism. Such a perspective opens up to a dimension of sacredness that is clearly identified with the finitude of human existence, which is always conversation.

The philosophy of Vitiello is also deeply engaged with a hermeneutic of Christian thought, which he rereads in a direction that eliminates all perspectives of redemption while emphasizing finitude. A scholar of German classical idealism, Nietzsche, Heidegger, and the Christian and Neoplatonist traditions (especially Plotinus and Augustine), Vitiello has focused his research on some crucial theoretical questions such as the interpretation of time, the concept of difference, and the relation between dialectic and hermeneutics, arriving at his own hermeneutic theory – which he names “topology” – founded on a reinterpretation of the notion of space. The recognition of the multiplicity of the truth does not lead him to nihilism or relativism; rather, it solicits the retrieval of a conceptual site or topos capable of constituting the true possibility of the concept. He explores a “topology of the modern,” that is, a possible and always questionable identity constituting the truth of the modern. The concept of possibility extends also to divine being, which Vitiello interprets in the sense of omnipossibility, that is, of complete possibility of everything, at all times – of creation as well as “de-creation.” The Christian experience of the cross becomes the experience of a God that does not save, opening up the dimensions of restlessness, of anguish, of Angst. The cross marks the limit of human beings. The notion of the redeeming God, who denies such dimensions in the victory of salvation, is replaced with the concept of the deus absconditus, which in turn relies on a radical faithfulness to finitude.

54. Vincenzo Vitiello (1935– ) studied at the University of Naples Federico II, where he wrote on the topic of “Freedom and Justice in the Thought of Benedetto Croce.” He has taught aesthetics, the history of modern and contemporary philosophy, and currently is Professor of Theoretical Philosophy at the University of Salerno. He has also taught in several German and Spanish universities, and at the University of Chapingo in Mexico. Among his publications are Utopia del nichilismo (Utopia of nihilism; 1983), Topologia del moderno (Topology of the modern; 1992), and Cristianesimo senza redenzione (Christianity without redemption; 1995).
The themes of hermeneutics as philosophy of interpretation are taken in a different direction by Umberto Eco, a student of Pareyson who interlaces hermeneutics and semiotic interests in his own original way.\(^{55}\) The hermeneutic theme of an infinity of interpretations, filtered through Peirce’s notion of unlimited semiosis, is taken up by Eco with the suggestion of the construction of “encyclopedia-like semantics,” which, unlike and in opposition to “dictionary semantics,” because of their rhizomatic and labyrinthine structure insert the reader into an open, potentially infinite, at least indefinite, even if perhaps contradictory plot of interdisciplinary references proper to intertextuality. The theory of an interpretative cooperation of various narrative texts extends to the reader, who is also caught in an interpretative game to become the model reader for each particular text. Against many deconstructionist positions, especially in their American variations, Eco nevertheless asserts the limits of interpretation when claiming that, if it is not possible to legitimate good interpretations, it is always possible to invalidate bad ones. The open multiplicity of interpretations is always confronted with the already given and already said, which thus work as the limits of any interpretative freedom. In his philosophy of language, Eco embraces a “contractualist” position not only in reference to signifieds but also to signifiers, which are the result of valid agreements made correctly to mean certain expressions; in other words, their validity is entirely practical.

Linguistic themes, especially the notion of sign, are at the center of the philosophy of Carlo Sini, who is deeply influenced by Peirce’s semiotics, which he intertwines with suggestions coming from Heidegger, phenomenology, the hermeneutic tradition, and Derrida.\(^{56}\) Although Sini is not exactly a hermeneutic philosopher, strong motifs coming from hermeneutic theory play a fundamental role in his position. For Sini, signs are not things but rather relations referring on the one side to the object, and on the other to the interpreter. Objects subsist only as indicated by a sign, and never in themselves. Analogously, interpreters are neither metaphysical subjects nor empirical figures; rather, they are formed within and by virtue of interpretations that are themselves situated within a process of unlimited semiosis understood as event and not as fact. An originary

\(^{55}\text{Umberto Eco (1932– ) is Professor of Semiotics at the University of Bologna. In addition to various novels, he is the author of A Theory of Semiotics ([1975] 1976), The Role of the Reader: Explorations in the Semiotics of Texts ([1979] 1979), Interpretation and Overinterpretation ([1995] 1992), and The Limits of Interpretation ([1990] 1990).}\)

\(^{56}\text{Carlo Sini (1933– ) was educated in the tradition of the Milan State University, where he studied under the guidance of Enzo Paci. Sini is Professor of Theoretical Philosophy at the Milan State University. His publications include Passare il segno (Passing the sign; 1981), Il silenzio e la parola: Luoghi e confine del sapere per un uomo planetario (Silence and speech: Places and boundary of knowledge for a planetary human; 1989), and Etica della scrittura (Ethics of writing; 1992). [\*] For a discussion of Peirce, see the essay by Douglas R. Anderson in The History of Continental Philosophy: Volume 2.}\)
form of the eventuation of signs is writing, which for Sini is more than a purely mechanical activity. Writing is in fact a practice characterized, as we know it, by the alphabet. This specific alphabetic practice, itself inserted in various other practices based on bodies, voices, writing tools, and material support such as stone, paper, computer screen, and so on, defines the specific way of being of Western civilization with its values and concepts gravitating around logic and scientific rationality. Truth is here inserted in a universe of practices that themselves conform to other social practices while founding new ones. Thus, practices, and the specific practice of writing constituting philosophy, are linked to ethics understood simply as being or dwelling in the world. Following Husserl, Sini is convinced that all theories are in fact the practices through which we inhabit our time. Whereas Husserl's phenomenology aimed at a rigorous form of knowledge, Sini's encyclopedic phenomenology retraces various practices that have more or less meaning, but that can never claim for themselves the status of absolute truth. Thus, Husserl's phenomenology is reinterpreted in the sense of a “phenomenography” geared toward translating truth into signs. This is a commitment, or an ethos, each individual takes upon himself or herself, thereby becoming the figure and not the foundation of a continuously different practice. For Sini, then, the confrontation (made possible by the awareness that Western theory as the outcome of the alphabetic practice is one practice among many, one way of inhabiting the truth among many) among diverse concrete practices of life, discourses, and forms of writing would lead to a profitable reconsideration of various forms of knowledge in the richness of their differences – which cannot be reduced to the alphabetic practice of writing and its will to power.

The three areas of reflection discussed above – the crisis of reason and subjectivity, modernity and postmodernity, and hermeneutics and weak thought – certainly do not exhaust the varied and multiple interests of the Italian philosophical panorama during the years 1980–95. Nevertheless, by challenging and rethinking traditional metaphysical concepts, especially those of subjectivity and the role and nature of philosophy, the Italian philosophers of this period prepare the way for the ethical, political, and religious reflection that shapes much of the philosophical discourse that follows.
The end of the 1970s is marked by the “adventures” of the Charter 77 and by the death of Jan Patočka (1907–77), a former student of Husserl and Heidegger and the most prominent Czech philosopher of the second half of the twentieth century. It is not an exaggeration to say that most of what happened in the following decade is delimited by various efforts to prolong and develop Patočka's specific version of phenomenology and philosophy of history, even though these interpretations very often took unexpected and peculiar forms of personal “philosophies” of particular authors, for whom Patočka’s own ideas represent a pretext for the development of their own specific positions.

A lot has been said about the “underground” character of philosophical activity during the 1970s and 1980s. One of the very few fields of study that seem to have been spared the general persecution of non-Marxist philosophy was German idealism, considered as a precursor of Marxism. For example, remarkable and subtle interpretative work was accomplished by Milan Sobotka (1927–), a specialist on Hegel and author of several books on classical German philosophy (the most important being probably Člověk, práce a sebevědomí [Man and work in German philosophy], published in 1964). Sobotka wrote, coauthored with Ladislav Major (1935–), a clear and concise introduction to Hegel, published in 1979. In 1993, his texts on Hegel (results of seminars on Phenomenology of Spirit and Hegel’s philosophy of law) were published under the title Stati k Hegelově Fenomenologii a filosofii práva (Studies in Hegel’s phenomenology and philosophy of law). Sobotka’s interpretation is concerned with the relation between Hegelianism and the philosophy of antiquity, and with Hegel’s criticism of Kant and the development of post-Hegelian left-oriented philosophy and its Marxist results. Another example is Jiří Pešek (1929–2003), who produced interesting...
and nondogmatic interpretations of the notion of “division of labor” in Marxism. Pešek wrote an important work entitled *Dialektika dělíby práce* (The dialectics of the division of labor) in 1966, and his later interests in the problem of temporality led to his work *Active Man and Time* in 1986. Both Sobotka and Pešek helped form a new generation of students, many of whom became university teachers after 1989 (Milan Znoj, Ladislav Benyovszky, and others).

Nonetheless, the most powerful current of Czech non-Marxist philosophy remained a matter of private teaching. The tradition of Patočka’s private seminars and courses – held during the 1970s with a group of students founded by Ivan Chvatík – has been continued on various levels and in different contexts. Daniel Kroupa, Julius Tomin, Petr Rezek, Zdeněk Neubauer, Ladislav Hejdánek, and Radim Palouš1 were among the most active organizers of lectures and seminars dealing more or less loosely with philosophical matters. On the other hand, this does not mean that Czech philosophy was condemned to remain in complete isolation: a very intense collaboration between the Czech and “Western” philosophers began in the late 1970s, thanks especially to Kathy Wilkes, who came to give a lecture on Aristotle in Tomin’s seminar as early as in 1979. Afterwards, many other thinkers followed: Roger Scruton (who lectured on Wittgenstein in 1979), Alan Montefiore, Anthony Kenny (whose seminar on Aristotle was interrupted by the secret police), Christopher Kirwan (who lectures on Augustine in Hejdánek’s seminar), and others. These visits soon became systematically organized: the Jan Hus Association was founded in 1980 to facilitate the intellectual exchanges between Anglo-Saxon and Czech philosophers and to provide material aid (books, research fellowships) to isolated Czech intellectuals. This project soon included the French intellectual scene as well. Jean-Pierre Vernant became the president of the French section of the Jan Hus Association (he remained in this position until his death in 2007, when the presidency was taken over by Étienne Balibar), and Jacques Derrida accepted the role of vice-president. This moment marked the beginning of regular visits of French philosophers in unofficial Czech seminars – the first being Paul Ricoeur in 1980. In 1984, Derrida came to Prague to give a lecture on Descartes in Hejdánek’s seminar, after which a bizarre and well-known incident occurred: he was arrested by the police, accused of drug smuggling, and released only after the intervention of the French government. This curious event, however, did not dissuade others from coming, and Jean-Claude Eslin, Balibar, Richard Rorty, Jürgen Habermas, and Ernst Tugendhat were among the other lecturers who took part in the Czech

1. Daniel Kroupa (1949– ) became a deputy in the Czech parliament in 1996. He also teaches political philosophy at the University of Plzeň. Radim Palouš (1924– ) worked as a rector of the Charles University from 1990–94. In his theoretical work, he concentrates on the philosophy of education and his approach is inspired especially by Patočka and Levinas. Julius Tomin (1938– ) studied philosophy and psychology. He works especially on Descartes and Plato.
“underground university.” The publication policy reflected this rather unusual situation. Very few philosophers managed to write (and to publish) a full book: most of what happened in Czech philosophy is concentrated in articles that were published in samizdat editions — Hejdánek directed the publishing house oikoumenh, which became official after 1989 and is now a leading publisher of philosophical literature in the Czech Republic. Karel Palek, a philologist and author of a book on the relation between totalitarianism and language, founded a samizdat review entitled Kritický sborník (Critical review). This review played a particularly important role in the Czech underground intellectual scene in the 1980s and started to be published officially in the 1990s. Apart from original works, several translations were produced, mainly as a result of the work in the seminars: these include Nietzsche’s Untimely Meditations, Heidegger’s Being and Time, and works by Levinas, Popper, and others.

From this tumultuous atmosphere an unusual image of Czech philosophy emerges: a sort of bricolage, an unusual mixture of penetrating insights and curious conceptions, high ambitions and abandoned projects that often remained in the form of unfinished sketches, plans and proclamations. There are, however, at least two lines of thought that are specific to Czech philosophy and represent an original achievement. The first consists in reinterpreting and developing Patočka’s phenomenology; the second in connecting the legacy of the Czech structuralism (particularly the thought of Jan Mukařovský) with French poststructuralism and deconstruction. In what follows, it is those two domains that we will briefly examine.

I. PATOČKA AND HIS SHADOW

In his philosophical project, Patočka outlined several domains of reflection that remain “open” for future interpreters. As early as the 1950s, he developed his conception of negative Platonism, which is an original reinterpretation of the notion of idea in Plato’s philosophy. Although Patočka’s essay on negative Platonism deals specifically with Plato, the question involved concerns Western metaphysics in general and the problem of ideality in particular. As a starting-point, Patočka takes the Platonic notion of khorismos (the dividing line between the sphere of ideality and the material world) and reinterprets it in a negative way: khorismos is not a border between two realms, an ideal one and a material one, but rather an expression of the separation itself, a negativity that makes it impossible to hypostatize the ideality as a “second positivity“ based on the model

of a material object. Human freedom and indeterminacy (living “on the edge,” we might say) is a correlate of this negative experience of separation that is a basic structure of human existence.

Another important project, formulated in a series of articles written in German,\(^3\) consists in predicting the possibility of what Patočka calls “asubjective phenomenology.” Asubjective phenomenology is not a phenomenology without subject; such a claim would be ridiculous. Rather, it is a phenomenological project in which the subject loses the status of transcendental guarantee of the phenomenal field (Patočka’s criticism of Husserl’s alleged subjectivism goes precisely in this direction) and becomes a part of the structure of appearance (i.e. the world). In other words, the subject becomes implied in the world and ceases to be an abstract instance to which the world appears (certain parallels here between Patočka and late Merleau-Ponty are obvious). As a consequence, Patočka proposes to understand the subject as a corporeal entity whose existence in the world is conceived in terms of movement (one of the most important notions in Patočka’s later philosophy, which originated in his interpretation and radicalization of Aristotle), which represents the most fundamental dimension of being-in-the-world; hence Patočka’s renewed interest in the Husserlian concept of Lebenswelt, which became a key notion for many of his Czech interpreters.

Last but not least, it is Patočka’s philosophy of history that has attracted considerable attention. Patočka’s considerations on history are expressed – in its most consistent form – in his last great work, *Heretical Essays in the Philosophy of History*.\(^4\) This book was heavily influenced by Heidegger; especially the final essay entitled “Wars of the Twentieth Century and the Twentieth Century as War.” In this essay, Patočka stressed the ecstatic, “nocturnal” experience of the war front, but in a way that leaves the reader both fascinated and perplexed, as it reminds one more of Georges Bataille than phenomenology.

In the Czech context, all of the motives mentioned above were taken over and developed, enabling the Czech philosophers, for whom Patočka was the major point of reference, to delimit their own positions.

---

Ladislav Hejdánek (1927– ) studied philosophy in the late 1940s and early 1950s, worked as a manual laborer and librarian in the 1950s and became, for a short period in the late 1960s (1968–71) a researcher at the Academy of Science. He signed the Charter 77 and during the 1970s and 1980s, he became one of the most efficient organizers of the underground intellectual life. In his own philosophy – developed in a series of essays – Patočka’s influence, although it is not the only one, is undeniable and is overtly acknowledged in the preface to one of his most important books. The notion of negative Platonism led Hejdánek to specify the two key notions of his own philosophical project: nonobjective thought and meontology. Roughly speaking, the idea of nonobjectivity or rather nonobjectiveness (partly inspired by the Patočkian interpretation of the khorismos) led Hejdánek to criticize the stiff model of the subject–object relation, as well as the correlative notion of the subject as a non-object, and to propose a model of thought that is based on meontological (from the Greek me ontos) premises, according to which non-being is more originary than positivity. In this perspective, the subject is no longer considered as a stable constitutive entity but rather as an event whose concrete form is unforeseeable and cannot be subjected to calculable laws. It is in theology and in religious experiences that Hejdánek finds a model for such unforeseeable and nonobjectifiable events – a conclusion that seems to resonate, for example, with Jean-Luc Marion’s conception of the saturated phenomenon. Even what Hejdánek calls “the loss of subject” in contemporary philosophy is interpreted in the same vein: as a crisis of the objectifying thought for which the positive delimitation of the subject is “an unthinkable and untenable concept.” The problems of such a philosophical perspective are obvious enough: it may present itself as an impressive philosophy of invention, unforeseeability, and event, but the fact remains that the all-embracing notion of nonobjectivity remains vague (unlike Patočka’s very precise reinterpretation of Plato). Moreover, Hejdánek’s essays often take the form of programmatic

5. See Ladislav Hejdánek, Nepředmětnost v myšlení a ve skutečnosti [Non-objectiveness in thought and in reality] (Prague: oikoymenh, 1997), 16. Even though the book in question was published in 1997, it is composed mainly of essays written in the 1980s.

6. The adjective “non-objective” is a clumsy translation of the Czech word “nepředmětný,” which could equally be translated “insubstantial.” “Nepředmětný” does not mean a lack of objectivity, but rather a distance taken toward the notion of object and toward the objectifying tendency of thought. Hejdánek’s “self-made” and highly personal terminology makes him very often exceedingly difficult to translate.

8. Hejdánek, Nepředmětnost v myšlení a ve skutečnosti, 156.
proclamations rather than of a concise and consistently developed philosophical analysis. Recently, Hejdánek has been heavily criticized for inconsistencies and his generalizing tendencies of thought, and criticisms of his very specific terminology often verge on irony.ª

Zdeněk Neubauer (1942– ) is a former biologist who turned to philosophy and tried to connect phenomenological perspectives with scientific thought in the strict sense of the word. Neubauer criticizes the traditional conception of scientific objectivity (drawing often on thinkers such as Prigogine, Kuhn, and others) and defends the essentially subjective nature of experience. The notion of the natural world (Lebenswelt) becomes a key feature of this critique. According to Neubauer, the task of philosophy is “to take care of the natural world, of its sense and unity.”10

It is, nonetheless, the work of Petr Rezek and Miroslav Petříček that might be seen as the most remarkable accomplishments of Czech phenomenological philosophy in the 1980s. Rezek (1948– ), an important but also a very controversial figure, has acquired the reputation of an enfant terrible of Czech philosophy. A psychologist by profession, he studied under Patočka’s guidance in the 1970s, and his private seminar, which he led during the 1980s, was one of the most popular and productive ones. His interests range from philosophy to visual arts, music, and psychopathology. His most original contribution consists in drawing a link between phenomenology and aesthetics, which he elaborated in a series of articles, later gathered in volumes entitled Jan Patočka a věc fenomenologie (Jan Patočka and the problem of phenomenology; 1993), and Tělo, věc a skutečnost v současném umění (Body, thing and reality in contemporary art; 1983). In 1991, he published Filosofie a politika kýče (Philosophy and politics of Kitsch), a violent attack on several Czech philosophers (including Neubauer and Hejdánek) whom he accuses – in a very straightforward and ironic manner – of incompetence and lack of rigor.

In his interpretations of Patočka, Rezek concentrates – unlike his colleagues – on the originality of Patočka’s position within the frame of phenomenology itself. By abandoning the idea of the transcendental subject as a substratum of apparition, Patočka is forced to come up with a new conception of the relation between the subject and the world. This relation, as we have already mentioned, takes form in movement; it is, therefore, no longer treated in terms of contemplation or objectifying intentionality (as in early Husserl) but rather in terms of

the active engagement of the subject in the world.\textsuperscript{11} Therefore, the corporeality of the subject, which acquires an “ontological status,”\textsuperscript{12} becomes a key issue in this version of phenomenology, albeit in a different sense from, for example, Merleau-Ponty, who speaks about the intertwining of the body and the world. Where Merleau-Ponty transforms this into his famous concept of the flesh of the world, Patočka treats the relation in question on the level of the subject’s corporeal capacity to move. In Rezek’s view, the very notion of the world is deeply affected by this change of perspective. The world is not an intentional correlate of a transcendental consciousness, but rather a \textit{milieu} or a system of places. With the shift from transcendental ego to movement, the subject becomes situated – placed in the world. The theory of movement “is not a theory of absolute subjectivity, but rather a \textit{topology} of the natural world.”\textsuperscript{13} The notion of the \textit{Lebenswelt} as topology enables Rezek to grasp the radicalism of the transformation Patočka has brought about, as well as to stress the undeniable fact that this version of phenomenology verges on a kind of cosmology because the capacity to move is not specific to the human subject. Another inevitable consequence is that the relation of the subject to his milieu is less transparent than in classical phenomenology: Patočka discovers, according to Rezek, the dark side of human existence, which can never be clarified and which finds its paroxysmal expression in the last of the \textit{Heretical Essays}.

In his essays on aesthetics, Rezek tries to apply Patočkian phenomenology to modern visual arts. In the Czech context, it is one of the rare attempts to elaborate an interdisciplinary approach based on phenomenology. As Rezek clearly states in the introduction of \textit{Tělo, věc a skutečnost v současném umění} (Body, thing and reality in contemporary art), phenomenology is not “a vision of the visible, but rather a search for the vision itself.”\textsuperscript{14} This basic principle is the starting-point of analyses of pop art, body art, conceptual art, or modern sculpture. Even if some of Rezek’s formulations remind us of Merleau-Ponty’s interpretation of Cézanne,\textsuperscript{15} in other essays, he attempts a more original approach. Thus, modern sculpture, interpreted from the point of view of a (potential) haptic contact, is envisaged through the prism of Patočka’s theory of movement.

\end{footnotesize}
and the corporeal character of the subject: sculpture is an "invitation to movement" and "our corporeal life in the mode of an ‘ability to move’ finds its counter-weight in modern sculpture."16 In some of these texts, Rezek seems to anticipate the phenomenological conception of ontological desire, proposed recently by Renaud Barbaras,17 as well as the attempts to enrich strictly phenomenological thought (like Merleau-Ponty before him) with references to Kurt Goldstein and Gestalt psychology.

Miroslav Petříček (1951– ), who studied under Patočka from 1972 to 1977, spent the 1980s working in the Czech Meteorological Institute. Equipped with an impressive knowledge of phenomenology and German idealism (he translated Schelling together with Patočka), he soon took interest in contemporary French philosophy. After 1989, while he worked as a researcher at the Czech Academy of Science and as a teacher at the Central European University in Prague, he became one of the most active promoters on the Czech intellectual scene – both as a translator and original philosopher – of French thought. In 1993, he published an excellent volume of translations of Derrida's works, including Speech and Phenomena and a selection of essays from Margins of Philosophy, Writing and Difference, and Positions, that was accompanied by a long preface in which a comprehensive introduction to Derrida's thought is combined with a very specific interpretation of the deconstruction that seems to have set the tone of Petříček's own thought in the years to come (we will deal with this text in the next section). His other translations include Deleuze’s Qu’est-ce que la philosophie? Levinas’s Totalité et infini, a selection of Lyotard’s essays from Des dispositifs pulsionnels, L’Inhumain, and Moralités postmodernes, Ricoeur’s Temps et récit, Merleau-Ponty’s Le Visible et l’invisible, Barthes’s La Chambre claire, and many others. In 1991, he published Úvod do (současné) filosofie (An introduction to (contemporary) philosophy), a book based on introductory lectures on twentieth-century philosophy. Dealing with authors as diverse as Bergson, Husserl, Levinas, Camus, Foucault, or Derrida, Petříček’s introduction still remains one of the most popular textbooks of modern philosophy. Later, in 2000, his reflections resulted in The Majesty of Law, an unusual philosophical interpretation of detective stories (by Raymond Chandler in particular) based implicitly on Derrida (who is hardly mentioned but constantly present), but also Montaigne, Adorno, and others.

As far as the strictly phenomenological line of Petříček’s reflection is concerned, he stresses, like Rezek, the fecund notion of movement, which “refers to human corporeality as a basis for realizing human possibilities and enables

16. Rezek, Tělo, věc a skutečnost v současném umění, 196.
the understanding of human life as a possibility that comes into existence in the relation of man and world, of which we are both actors and witnesses.”

On the other hand, he interprets Patočka’s break with classical phenomenology as a philosophical move that brings Patočka closer to French thinkers, and to poststructuralism. This interpretation is outlined notably in an extensive essay entitled “Jan Patočka a myšlenka přirozeného světa” (Jan Patočka and the idea of the natural world), published in 1990, even though the first version of the text originates from 1987. If we understand human existence as movement, there is no longer a place for the invariant structures in the sense of Husserl’s eidetics. The natural world is a world of praxis and of active participation with the things that surround us. Petříček does not stress the motif of language, which is considered in Patočka’s later works, as an objectifying instrument but as an element that pervades perception itself. In this sense, “in the development of Patočka’s formulations concerning the natural world, it is easy to find a parallel to the development of structuralism.” If, as Patočka’s most fundamental innovations proposed, static eidetic structures are replaced by the dynamism of the natural world and the constitutive transcendental ego steps aside in order to make a place for the possibility of an asubjective phenomenology, where the epoché concerns not only the phenomena themselves but also the very status of the subject to whom they appear, a possibility is opened for a new dialogue between phenomenology and structuralism. This new version of phenomenology examines the process behind the structure rather than the structure itself, and the birth of subjectivity rather than the stable intentional substratum: l’engendrement de la signification, as Petříček puts it. Therefore, it is not illogical to find an indirect link between this dynamic phenomenology and, for example, Derrida’s différence or Foucault’s epistemic foundation of subject and knowledge. This perspective seems rather refreshing, given the fact that even in France (with a few exceptions, such as Ricoeur’s attempt to reconcile structuralism and phenomenologically inspired hermeneutics or Derrida’s early interpretations of Husserl), phenomenology and structuralism have developed more or less separately. Even Patočka’s negative Platonism, considered as an experience of separation that is not a separation between two symmetrical domains (which might make us think of the notion of “difference,” reinvented by Deleuze and other French thinkers), may be reinterpreted in the same spirit. Petříček speaks

about Patočka's philosophy as “heterology” (a term taken over from Bataille), an experience of radical alterity that ties Patočka closely to Levinas or Derrida.20

These few names do not form an exhaustive list. Among other scholars who were involved in the interpretation of Patočka's philosophy are Pavel Kouba, working especially on Nietzsche and Arendt (his interpretation of Nietzsche will be discussed below) and Ivan Chvatík (1941–), publisher of Patočka's collected papers (twenty-seven volumes published until 1989) and founder of Patočka's Archive in Prague in 1990; Jiří Němec (1932–2001), a clinical psychologist, who was also associated with Patočka's group; Jiří Michálek (1941–), who considers himself a pupil of Patočka, and whose special interests are Heidegger and the philosophy of education; and Ivan Dubský (1926–), who works in the domain of both philosophy and literature and who wrote a book on Patočka in 1991.21

Václav Bělohradský (1944–), a philosopher teaching in Italy since the early 1970s, transposes Patočka's reflection into the realm of political philosophy: the title of his most important book, Přirozený svět jako politický problém (The natural world as a political problem), is a clear allusion to Patočka's early work Přirozený svět jako filosofický problém (The natural world as a philosophical problem). Inspired by the Husserlian notion of the crisis of the European sciences, by Patočka’s return to the natural world, and by Arendt’s notion of the banality of evil (and possibly by the Heideggerian concept of Gestell), Bělohradský criticizes the classical Western conception of universalism as an overcoming of “the personal consciousness,” as he puts it, and attempts to “look for universality in what has been up to now stigmatized as unreal and illusionary: in the natural world given in the first person and in personal consciousness.”22 This attempt permits us to grasp “the ethical aspect of phenomenology,” in the sense that “phenomenology is a radical critique of European reason insofar as it refuses the legitimacy of any claim to rationality, if it is not founded … in the reflection on the contents of the personal consciousness.”23 Thus, phenomenology represents a counterpoint of an alleged impersonality of ideology and totalitarianism, because in the phenomenological view, “personal consciousness” is not considered as “merely” private, but constitutes the most essential starting-point of philosophical reflection. The natural world becomes a political problem not in the sense of a “subjectivization” of the political (a sort of political “anything goes”), but in the sense that the political subject cannot be reduced to an impersonal entity devoid of affective states and personal experiences.

23. Ibid., 110.
Erazim Kohák (1933– ), who lived in the United States until 1990 and whose work concerns especially the philosophy of nature, translated some of Patočka’s texts into English (Heretic Essays; Body, Community, Language, World; Introduction to Husserl’s Phenomenology) and wrote an introductory book Jan Patočka: Philosophy and Selected Writings. After 1989, he returned to Prague and lectured especially on ethics and phenomenology.

Even nowadays, the interest in Patočka’s philosophy is considerable. Thanks to the activity of the Patočka Archive and Center for Theoretical Studies, the Czech school of phenomenology has gained something of a reputation abroad. Patočka’s work became known especially in France: brilliant translations of Patočka into French (by Erica Abrams) enabled the French phenomenologists (namely Renaud Barbaras, Marc Richir, and Françoise Dastur, not to mention the well-known essay on Patočka by Jacques Derrida24) to incorporate his theory of movement, asubjective phenomenology and natural world into their own reflection.

II. OPENING THE STRUCTURES

Apart from the Patočkian heritage, there is another important current of reflection, inaugurated by the tradition of Czech structuralism, that has been connected with the activity of the famous Prague Linguistic Circle in the 1920s and 1930s. (Roman Jakobson lived in Prague from 1920 to 1939 and had intense relations with both Czech poets and linguists.25) Prague structuralism found its most considerable achievement in the work of Jan Mukařovský (1891–1975). His multifaceted oeuvre includes erudite studies on Czech poetry (the Czech romantic poet Mácha in particular) as well as a general theory of aesthetics that is based on the notion of the aesthetic function.26 In this line of reasoning, the aesthetic character of any part of reality (the aesthetic function is not limited to an intentionally created work of art) is the basis of the aesthetic function that any object might possibly acquire and opens a way for introducing more subtle analytical criteria than those dictated by the rigid notion of structure. Structural aesthetics is replaced by functional aesthetics within a domain where

25. For a discussion of Jakobson and the Prague School, see the essay by Thomas F. Broden in The History of Continental Philosophy: Volume 5.
new realities may enter that have hitherto been ignored or left unexplained by classical structuralism.

It is clear that the thought inspired by structuralism constantly oscillated between literary theory and philosophy in the proper sense of the word. In this respect, we must mention at least the name of Josef Zumr (1928– ), who – apart from strictly philosophical work – has always manifested a deep interest in literature, especially in the work of Bohumil Hrabal; and Ladislav Klima (1878–1928), a Czech philosopher and writer known for his slightly bizarre novels and short stories, as well as for his highly personal reinterpretation of Nietzsche and Schopenhauer. Květoslav Chvatík (1930– ) has done important work introducing the Czech school of structuralism to the German-speaking world in two books: *Tschekoslowakischer Strukturalismus: Theorie und Geschichte* (Czechoslovak structuralism: Theory and history; 1981) and *Mensch und Struktur* (Man and structure; 1987). *Tschekoslowakischer Strukturalismus* deals with the history of the Czech structuralist movement and with its philosophical bases, while *Mensch und Struktur* (1987) is a collection of essays on more particular topics. Oleg Šus (1924–82) and Felix Vodička (1909–74) have added their personal insights to structuralist perspectives. Theorists such as Miroslav Červenka (1932–2005), the editor of Jakobson’s selected paper and author of a monograph *Styl a význam* (Style and meaning; 1991), developed the incentives of structuralism in the field of poetics. Last, but certainly not least, is Robert Kalivoda (1923–89) who in the late 1960s had already attempted to find a bridge between Marxist dialectics and structuralism.27

In a series of texts inaugurated in the late 1960s, literary theorist Milan Jankovič (1929– ) has elaborated his own version of structuralism that often incorporates philosophical elements. His most important text, “Dílo jako dění smyslu” (The work as a process of meaning), takes off from Mukařovský’s concept of “semantic gesture.” Semantic gesture is:

an organizing principle of the semantic construction of the work, which nevertheless cannot be identified with a noetic relation that the author entertains with reality and which appears, in an analysis of the work, rather as a principle of its formal construction, as an author’s particular technique.28

---

28. Milan Jankovič, “Dílo jako dění smyslu” [The work as a process of meaning], in *Cesty za smyslem literárního díla* [Pathways toward the meaning of literary work] (Prague: Karolinum, 2005), 59.
The construction of a literary work, for Jankovič, has an essentially dynamic character: speaking about literary meaning in terms of process means, of course, getting away from classical, static structuralism. Mukařovský’s conception of the aesthetic function enables Jankovič to abandon the static structuralist frame and to conceive the literary work as a movement rather than a fixed state. The very notion of semantic gesture suggests the idea of dynamism rather than that of stable structural relations. It is therefore not surprising that Jankovič studies the literary work from the point of view of its “corporeal energy,” rather than that of authorial intention or ideality.

Despite these innovations, Jankovič is a devoted follower of Mukařovský and remains more or less resistant to French poststructuralism and deconstruction. In his work, Roland Barthes’s semiology is mentioned with sympathy: the vision of literary work as an active interplay of signifiers may get very close to the dynamism of semantic gesture. On the other hand, Jankovič believes that Barthes’s weakness is due to his refusal to study this play of signifiers on the level of particular texts, to pass from langue to parole, as he himself puts it, to move “from the linguistic conception of the system of literature to the aesthetic theory of the work.” Even though one might object that in *S/Z* or *Sade, Fourier, Loyola*, Barthes does precisely what Jankovič misses in him, that is, he passes from the langue of literature to the parole of individual writers, the fact remains that Jankovič’s book is one of the texts that prepares the way for the reception of poststructuralist thinkers in the Czech Republic.

In 1991, Petříček published an article on “Mukařovský and Deconstruction,” in which the potentialities of the passage from the closed to the open structures are outlined in a very clear manner. This perspective is brought to more radical conclusions in Petříček’s long preface to his translation of Derrida in 1993. Petříček speaks about an “elementary phenomenology of border, limit, and dividing line.” This project puts forward the question of limit not as an outer limitation, but as an internal element and foundation of any structure or system. The limit thus conceived does not divide the inside from the outside, but becomes an internal and constitutive element of any structure – because the structure is founded by its own limit. The Derridian inspiration of such a view is obvious. It needs to be added that in Petříček’s view, the key issue in deconstructive thought is not transcendence but transgression. Once we adopt the deconstructive approach, the problem is “not a transcendental interrogation, but the

transgression of limits.”\footnote{Ibid., 23.} This leads Petříček to meditate on the concept of pure difference, which he develops not only in the preface we are dealing with here, but also in many texts on thinkers as different as Barthes, Levinas, or Foucault. If the object of deconstructive transgression is the difference between the inside and the outside itself, any structure becomes essentially open and infinite. It might seem that such a view leads to an exclusion of otherness: if the structure is infinite, no “outside” is possible and the famous Derridian adage according to which “There is nothing outside the text” takes slightly negative connotations, as it may be understood as a neutralization of alterity, event, or encounter. Petříček, however, does not share this interpretative approach and tries to coin a concept of alterity that would not fall under the simple dichotomy inside/ outside. Deconstruction and the concept of pure difference, according to him, offer a certain possibility to think of an “otherness different from metaphysical alterity.”\footnote{Ibid., 25.} It is not surprising that Levinas becomes a key reference in this effort, regardless of the criticism Derrida addressed to him.\footnote{See Miroslav Petříček, “Derrida a Lévinas” [Derrida and Levinas], Česká mysl [Czech mind] 1–2 (1992), where Petříček stresses the “out-of-joint” nature of philosophical concepts that both Derrida and Levinas bring to philosophy.}

In a monograph Nietzsche: Filosofická interpretace (Nietzsche: A philosophical interpretation), published in 1995, Kouba (1953– ), a specialist on hermeneutics, Patočka, and Arendt, takes a different view of deconstructive philosophy. His Nietzsche is the fruit of many years of research and it still remains one of the most interesting books that appeared after 1989. French Nietzscheanism\footnote{For a discussion of French Nietzscheanism, see the essay by Alan D. Schrift in The History of Continental Philosophy: Volume 5. Nietzsche is the focus of an essay by Daniel Conway in The History of Continental Philosophy: Volume 2.} is not dealt with directly – Deleuze is mentioned only once and Klossowski not at all – but one chapter is devoted to the central motif that French continental philosophy has undoubtedly inherited from Nietzsche, namely what Kouba calls “perspectivism.” By perspectivism, which is considered to be an emblematic character of contemporary (French) thought, Kouba understands the stress put on “the rhetorical and narrative nature of knowledge and on the literary character of philosophy itself.”\footnote{Pavel Kouba, Nietzsche: Filosofická interpretace (Prague: oikoymenh, 2006), 203.} The conditioned character of knowledge, which can no longer be based on the classical model of theoria, does not lead to nihilism and this version of perspectivism abandons precisely the notion of perspective as a \textit{mere} perspective. If contemporary French thought – and deconstruction in particular – adopts this idea of an impossibility of
“any recourse to pre-linguistic evidence,”37 the problem remains – at least for Kouba – that the Derridian reformulation of Nietzsche’s starting-point implies a misunderstanding, as far as the original Nietzsche view itself is concerned: imposing “the autonomy of the signifier” leads to a situation in which “we are left among the perspectives that – given the absence of a regulative idea and the ever escaping character of différence – always remain, in a sense, the same.”38 The question Kouba asks is the following: how does a clash – or at least a dialogue – among those perspectives, none of which aspires to be a true one, become possible? What is abandoned is not a philosophical (or metaphysical) naivety that counts on the existence of objective fact, but the very difference between truth and untruth that Nietzsche himself has never given up. The Nietzschean innovation consists in dynamizing the truth–untruth distinction, not in abandoning it altogether: “Nietzsche destroys the metaphysical foundation of the truth/untruth dichotomy, but insists on a situated persistence of this distinction in a dynamized form,” as well as on our capacity of distinguishing the truth and untruth from our perspective.39 For Kouba, deconstruction is, in fact, a neutralization of alterity rather than its affirmation in a nonmetaphysical form: a uniform slippage of the signifiers (or perspectives) always oscillating between presence and nonpresence and characterized by the sameness of this oscillation. Here, the elusive and omnipresent specter of the différence itself is what precisely excludes alterity from this movement.

Apart from these very different interpretations of deconstruction, the question of alterity or “becoming other,” to be more precise, is a central problem in the first monograph on Foucault written by a Slovak philosopher: Miroslav Marcelli (1947– ).40 The title of the book itself is quite eloquent: Michal Foucault alebo stať sa iným (Michel Foucault or how to become other). The question of otherness is treated on two different levels: first, as a fantasy of Foucault himself, leading him to change constantly his theoretical positions and to undermine any stable identity he might have acquired. This does not mean that the book in question would make any attempt to “psychoanalyze” Foucault. Rather, the idea of becoming other is understood as an impetus inherent to the movement of Foucault’s work itself. In Marcelli’s own words: “I attempt to determine the starting points that did not allow Foucault to remain attached to the positions he has elaborated and led him to constantly change. I am convinced that such an impetus of his theoretical and practical activity was an effort to become other.”41

37. Ibid., 211.
38. Ibid., 220.
39. Ibid., 222.
40. Marcelli is well known for his fine translation of The Order of Things, one of the rare translations from modern French philosophy published officially before 1989.
41. Miroslav Marcelli, Michal Foucault alebo stať sa iným (Bratislava: Archa, 1995), 19.
Becoming other thus develops into a concept enabling Marcelli to envisage Foucault’s work as a “syntax of space,” which he systematically explores. The second level on which the otherness is analyzed is more concrete: the experience of otherness is very often an explicit subject of Foucault’s analyses, be it the otherness of madness in *Madness and Civilization* (the debate between Foucault and Derrida concerning Descartes is interpreted in this manner: what is at stake here is the question whether the otherness is or is not internal to *cogito*), the “death of the author,” or even the late Foucault whose work on Greek and Roman thought “opens a perspective of individual existence: there is the possibility of becoming other and making of one’s life a work of art.”

Marcelli’s book, despite its relative shortness, is a remarkable achievement insofar as it – together with Petříček’s translations and writings – inaugurated an interest in French thought at a time when Czech continental philosophy was still dominated (almost exclusively) by phenomenology and hermeneutics. Since then, an impressive number of translations of Foucault, Derrida, Barthes, and Lyotard appeared, making their philosophy accessible to a larger audience. A very unusual and amusing example of this interest is a book by Ladislav Šerý (1958–), himself a translator of Bataille, Artaud, Jean Genet, and others, entitled *První knížka o tom, že řád je chaos* (The first book on the fact that order is actually chaos; 1997) and written provocatively in nonacademic, colloquial Czech. Drawing on Bataille, Foucault, Pierre Clastres, but also the early Rousseau, the author develops a concept of subversion that echoes Bataille’s transgression, and attacks Patočka’s authority by mocking his “monumental” conception of European history.

The same interest shows in numerous books by Jiří Pechar (1929–), a well-known translator who first translated literature (including Proust’s *Remembrance of Things Past* or Huysmans’s *Against the Grain*), but later turned to philosophy, with translations of Wittgenstein’s *Philosophical Investigations*, Lyotard’s *Postmodern Condition*, and other works. His studies provide good and concise information on the topics he chooses, although they rarely go beyond mere summary. However, it needs to be mentioned that Pechar has filled a considerable gap by writing a book on psychoanalysis, overcoming at least partly the absence of interest in this domain that Czech philosophers have generally manifested.

42. *Ibid.*, 133.

Even with nearly twenty years of hindsight, it is not easy to sum up the development that Czech philosophy has undergone after the major political change in 1989. It would be, of course, naive to believe that everything changed all at once and that a fully developed philosophical culture has emerged out of nowhere. A long and often painful reorganization of philosophy departments was needed, which lasted for many years and was not often devoid of personal conflicts. People like Sobotka or Pešek became highly respected experts on German idealism (Pešek died in 2003 and Sobotka still teaches at Charles University in Prague). Rezek started to teach at the philosophy department at the Faculty of Arts in Prague, but not content with the level on which philosophy was taught, he left in the mid-1990s and founded his own publishing house, which specializes in ancient philosophy (Plotinus, Aristotle, and others). Petříček and Kouba have worked in the same department and at the Center for Phenomenological Research in Prague since the early 1990s and are still its most active members. Zdeněk Pinc (1945–), a former student of Patočka, and Jan Sokol (1936–), Patočka’s son-in-law, a former minister of education and the presidential candidate of the Social Democratic party in 2003, founded the Faculty of Humanities at Charles University, conceived as a more liberal counterpoint of the Faculty of Humanities. Philosophy was an integral part of the curriculum and, as time progressed, a specific group of philosophers emerged at the Faculty of Arts, constituting a philosophical school oriented mainly toward Hegel and Heidegger.

It is obvious that a domain in which Czech philosophy was lacking was translation. Officially published translations from modern continental philosophy were extremely rare before 1989. There were only three books by Husserl (*Cartesian Meditations, The Crisis* and *The Lectures on Internal Time Consciousness*, all published in a relatively liberal period in the late 1960s), a rather poor translation of a selection of essays by Merleau-Ponty (*Eye and Mind and Other Essays*), some works by Sartre, Max Scheler, Walter Benjamin, Claude Lévi-Strauss and a few others (*The Second Sex* by Simone de Beauvoir, for example). Even though the efforts to translate contemporary philosophy have been considerable since the beginning of the 1990s (we have already mentioned Petříček’s translation of Derrida and others, and Pechar’s translation of Lyotard and Wittgenstein), it was not until the second half of the decade that twentieth-century philosophy was systematically introduced. Even today, the state of things is far from satisfactory, given the limited number of translators capable of translating difficult philosophical texts. Nonetheless, very few important modern European thinkers remain who have not been translated at all into Czech. OIKOYMENH, the publishing house mentioned in the introduction, became an official enterprise and has played a considerable role in this respect, as well as *Filosofický*
Časopis (The philosophical review), which abandoned its former Marxist orientation and became the most important review publishing both translations and original contributions. Among other publishers, there was a publishing house – Herrmann a synové – oriented especially toward French thought (Foucault, Deleuze, Bataille, Blanchot, and others), and filosofia, publishing both phenomenology and analytic philosophy.

The time period between 1989 and 1995 may be considered a transitory one, dominated by a general feeling that there is much to be done and by intense, although sometimes a little chaotic, efforts to catch up on what had been missed during the communist era. The early 1990s also marks the advent of a new generation of younger philosophers, often trained abroad and equipped with a remarkable technical knowledge of the history of philosophy. Filip Karfík (1963–), a former classical philologist, works on both Patočka and ancient philosophy. Lenka Karfíková (1963–) became a professor of theology and is an expert on medieval thought. Karel Thein (1961–) studied in Paris under Derrida in the early 1990s and wrote his thesis on Plato in French. His interests range from Plato and the Stoics to Foucault and Benjamin, literature, and film studies. Karel Novotný (1964–) started working on Kant and Fichte, but later turned to Patočka and French phenomenology (Merleau-Ponty, Levinas, and Marion). Jindřich Karásek (1963–) is an accomplished Kant expert. Sobotka's student Milan Znoj (1952–) became an authority in the field of political philosophy, and Ladislav Benyovszky (1958–), who studied under Pešek, continues his work on Heidegger and German idealism. It is also thanks to them – and many others – that Czech philosophy has overcome its fragmentary and dispersed character and become a disciplined area of research in the realms of both the history of philosophy and systematic philosophy.
The second generation of Frankfurt School critical theory was largely defined by one towering figure – Jürgen Habermas – and his reorientation of critical theory around issues of normative justification, the pragmatics of language use, and, more recently, the discourse theory of morality, law, and politics. It is perhaps no surprise, then, that members of the third generation of critical theory have devoted a good deal of time and attention to developing criticisms of Habermas’s work. As valuable and important as such critical perspectives are, the third generation has not rested content with this project. Rather, they have used these critiques as a springboard for the development of their own, original work in critical theory. This essay offers an overview of the main themes of three major third generation critical theorists – Seyla Benhabib, Nancy Fraser, and Axel Honneth – in each case, situating their work vis-à-vis their critical engagements with Habermas and with each other.

*1. For a discussion of Habermas and other members of the second generation of Frankfurt School critical theorists, see the essays by Christopher F. Zurn and James Swindal in *The History of Continental Philosophy: Volume 6.*

Nancy Fraser (May 20, 1947–; born in Baltimore, Maryland) received a BA in philosophy from Bryn Mawr College (1969) and a PhD in philosophy from the City University in New York (1980). Her influences include Arendt, Foucault, Habermas, and Marx, and she has held
A distinctive feature of the critical theory tradition is its dual emphasis on the project of critiquing actually existing societies (in contrast to analytic political philosophy, which concentrates on the project of ideal theory) and on the location of progressive, context-transcending potentials for change within the existing societies it aims to critique (a point that is often thought to set it at odds with the major figures of poststructuralism, although this point is debatable). In light of this dual emphasis, it is especially important to understand the project of third generation critical theory in terms of how it is shaped by and responds to its social, political, cultural, and historical context. The figures under consideration here were born in the middle of the twentieth century, which means that they came of age as intellectuals against the backdrop of the massive social and cultural upheaval that began in May 1968. As a result, their work has been profoundly shaped by the so-called new social movements of the 1970s. More recently, they have faced the fall of soviet communism and the resulting exhaustion of left-wing utopian energies, the accelerating pace of globalization, and the continual damage wrought by capitalism in its contemporary, neoliberal, globalized form. True to the critical theory tradition, these thinkers are not only shaped by these historical developments, but they continually reflect explicitly on such developments, and strive to develop critical-theoretical tools that can illuminate both the chief dangers of the present moment and the immanent potentials for progressive transformation of it.

There is an inherent difficulty in any attempt to identify a “generation” of thinkers. Moreover, it may be surprising to some readers that two of the three figures identified here as representative of the third generation are not German appointments at the University of Georgia (1980–82), Northwestern University (1982–95), and the New School (1995– ).

Axel Honneth (July 18, 1949–; born in Essen, Federal Republic of Germany) studied philosophy, sociology, and German literature at the Universities of Bonn and Bochum (1969–74), Promotion (~PhD) from the Free University Berlin (1982); and habilitation from the JW Goethe University, Frankfurt (1990). His influences include Adorno, Foucault, Habermas, Hegel, Horkheimer, and George Herbert Mead, and he has held appointments at the Free University of Berlin (1992–96), JW Goethe University, Frankfurt (1996– ), and as Director at the University of Frankfurt Institute for Social Research (2001– ).

3. For Fraser’s comments on the relationship between her activism and her philosophical work, see her Unruly Practices: Power, Discourse, and Gender in Contemporary Social Theory (Minneapolis, MN: University of Minnesota Press, 1989), 1–13. For Benhabib’s views on her work in relation to the new social movements, see the interview with her at: http://globetrotter.berkeley.edu/people4/Benhabib/benhabib-con0.html (accessed May 2010).

4. On this point, see Joel Anderson’s fine essay “The ‘Third Generation’ of the Frankfurt School,” Intellectual History Newsletter 22 (2000); online at www.phil.uu.nl/~joel/research/publications/3rdGeneration.htm (accessed May 2010). Anderson confines the bulk of his discussion to Honneth, whose work he rightly takes to be representative of the third generation in Germany.
(although both Benhabib and Fraser certainly do situate their work with respect to the German critical theory tradition). To be sure, there are many important third generation critical theorists from both sides of the Atlantic whose work could arguably also be included here. Nevertheless, one could, I think, make a strong case that the work of Benhabib, Fraser, and Honneth is both more original and systematic than that of many of their contemporaries and also is the most familiar to the English-speaking philosophical audience for a volume such as this one. This, in turn, would allow one to make the observation that with the rise of the third generation the center of gravity of critical theory is no longer exclusively in Frankfurt. Critical theory is now thriving at least as much outside Germany as within it.

Because these theorists have developed their ideas largely in and through conversation with one another, I have chosen to organize this discussion thematically, rather than by individual thinker. I begin in the first two sections by discussing two strands of the third generation’s critique of Habermas and the ways in which these criticisms have served as the basis for the development of the third generation’s own distinctive version of critical theory. The first section focuses on Hegelian themes, in particular on Benhabib’s and Honneth’s efforts to contextualize and historicize the insights of Habermas’s communicative action paradigm. The second section focuses on the Foucaultian theme of the role of power in the lifeworld, articulated primarily by Honneth but also by Fraser, and also considers the third generation’s encounter with Foucaultian post-structuralism more broadly. Subsequent sections take up the third generation’s conceptualizations of subjectivity and selfhood and their attempts to rethink the postsocialist condition around the notions of recognition and redistribution. By way of a conclusion, in the final section I consider an emerging trend in third generation critical theory by briefly discussing Benhabib and Fraser’s recent work on cosmopolitanism and global justice.

I. CRITICAL ENGAGEMENTS WITH HABERMAS: HEGELIAN THEMES

Although each of the thinkers considered here has his or her own specific and detailed critique of Habermas, at least two common themes emerge from these critical engagements. The first set of criticisms, which I discuss in this section, concerns the overly rational, procedural, and formal character of his understanding of ethics and morality. The second set, which I turn to in the next section, concerns his inadequate conceptualization of power, particularly as it

5. For a comprehensive list of both German and American third generation critical theorists, see Anderson, “The ‘Third Generation’ of the Frankfurt School.”
functions in the lifeworld. In articulating these criticisms, the third generation relies on certain Hegelian and Foucaultian themes that Habermas’s work arguably represses.

Benhabib’s critical appropriation of Habermas, for instance, is explicitly grounded in a resuscitation of Hegel’s critique of Kant’s ethics. Although Benhabib does not go so far as to argue for a Hegelian or Aristotelian alternative to discourse ethics, she does advance a more Hegelian version of discourse ethics, one that stresses the contextual, the ethical, the particular, and the concrete as crucial aspects of moral-political deliberation. In so doing, Benhabib develops an interactive version of universalism that is more attentive than is Habermas to the ineliminable role of particularity in our ethical and political lives.

Benhabib’s central criticism of Habermas, articulated in her first book, *Critique, Norm, and Utopia*, is that, notwithstanding Habermas’s attempts to avoid the empty formalism of Kant’s moral theory, his theory of communicative action and his communicative ethics remain excessively and problematically rationalist. The general thrust of Benhabib’s critical engagement with Habermas and of her own critical theory is the development of a more contextualized and concretized version of critical theory. More specifically, Benhabib criticizes the status of the idealizations that form the normative core of Habermas’s moral-political universalism. Indeed, Benhabib maintains that Habermas’s “program of a strong justification of communicative ethics cannot succeed” (CNU 263). As she puts it:

---

7. In this respect, her project is similar to that of Thomas McCarthy, who has also developed a more contextualized and pragmatic version of Habermasian critical theory in works such as *Ideals and Illusions: On Deconstruction and Reconstruction in Contemporary Critical Theory*; and (with David Hoy) *Critical Theory*. I discuss McCarthy’s work in more detail in my *The Politics of Our Selves: Power, Autonomy, and Gender in Contemporary Critical Theory* (New York: Columbia University Press, 2008), ch. 6.

---
are “irreversible” in that the future we would like to see can only be realized by fulfilling their still unexhausted potential. (CNU 279)

In addition to this critique of the status of Habermas’s normative idealizations, Benhabib is also critical of his notion of autonomy. Here, once again, the central point is that Habermas falls into “a certain rationalistic fallacy of the Kantian sort, in that it ignores the contingent, historical, and affective circumstances which made individuals adopt a universalist-ethical standpoint in the first place” (CNU 298). In other words, Habermas’s allegedly purely formal accounts of universal pragmatics and of the postconventional self necessarily have “a cultural-historical content built into them” (CNU 306). This does not mean that Benhabib thinks we should give them up. On the contrary, Benhabib is quite clear that she shares the normative presuppositions of universal respect and egalitarian reciprocity that she claims are implicit in Habermas’s idealizations. But she does think we should advance more modest claims about their status than does Habermas. As Benhabib puts it, our commitment to such norms “is not a consequence of conceptual analysis alone; rather, it reflects the commitments of a moral philosophy as practiced by individuals who are themselves members of a culture that cherishes universalism” (CNU 306).

This critique of Habermas leads Benhabib, in *Situating the Self* (1992), to attempt to develop a “post-Enlightenment defense of universalism,” one that is “interactive not legislative, cognizant of gender difference not gender blind, contextually sensitive and not situation indifferent” (STS 3). Benhabib delineates three steps that are involved in developing such an interactive universalism. First, following Habermas and Karl-Otto Apel, Benhabib offers a discursive and communicative, rather than substantive, conception of rationality. Second, she understands subjects of reason as “finite, embodied and fragile creatures, and not disembodied cogitos or abstract unities of transcendental apperception to which may belong one or more bodies” (STS 5). Third, because she regards reason itself as “the contingent achievement of linguistically socialized, finite and embodied creatures,” Benhabib reformulates the moral point of view as “the contingent achievement of an interactive form of rationality rather than as the timeless standpoint of a legislative reason” (STS 6). Even as the first aspect of Benhabib’s post-Enlightenment defense of universalism draws on Habermas for inspiration, her second and third points push beyond his discourse-ethical framework. Indeed, Benhabib claims that her aim is “to save discourse ethics from the excesses of its own rationalistic Enlightenment legacy” (STS 8). This

---

involves developing the insights of communicative ethics in a more historically self-conscious way. Thus, for instance, Benhabib emphasizes that the normative principles of universal respect and egalitarian reciprocity:

are our philosophical clarification of the constituents of the moral point of view from within the normative hermeneutic horizon of modernity. These principles are neither the only allowable interpretation of the formal constituents of the competency of postconventional moral actors nor are they unequivocal transcendental presuppositions which every rational agent, upon deep reflection, must concede to. (STS 30)

Benhabib’s universalism is not only historically self-conscious but also interactive, in that the goal of her communicative ethics is not consensus (even as a counterfactual ideal) but instead “the idea of an ongoing moral conversation” (STS 38). Thus, in her version of communicative ethics, “the emphasis now is less on rational agreement, but more on sustaining those normative practices and moral relationships within which reasoned agreement as a way of life can flourish and continue” (STS 38). Benhabib’s interactive universalism presupposes a completely open-ended model of discourse, one in which “even the presuppositions of discourse can themselves be challenged, called into question and debated” (STS 74).

In addition to offering a more historically self-conscious, interactive, and open-ended version of communicative ethics, Benhabib also aims to articulate a specifically feminist version of Habermasian critical theory. This aim is already evident in Critique, Norm, and Utopia, when she asks: “can the theory of communicative action really explain the emergence of one of the most significant social movements of our times, namely, the women’s movement?” (CNU 252). In Situating the Self, Benhabib further clarifies her feminist engagement with Habermas, arguing that one of her aims is to “engender the subject of moral reasoning, not in order to relativize moral claims to fit gender differences but to make them gender sensitive and cognizant of gender difference” (STS 8). This is part and parcel of her broader goal, which is “to situate reason and the moral self more decisively in contexts of gender and community, while insisting upon the discursive power of individuals to challenge such situatedness in the name of universalistic principles, future identities and as yet undiscovered communities” (STS 8).

A related criticism of Habermas’s excessive formal and concomitant contextualizing impulse can be found in Honneth’s work on recognition. As Honneth argues in his 1993 inaugural lecture at the Free University of Berlin, the central problematic of critical theory and what makes it distinctive as a mode of social
critique is “its attempt (which still has not been abandoned) to give the standards of critique an objective foothold in pre-theoretical praxis.”9 Whereas first-generation theorists10 located this foothold in the point of view of the proletariat, subsequent critiques of the notion of a working-class subject have rendered this strategy unworkable. As Honneth sees it, however, Habermas completely side-steps this issue when he attempts to ground the normative demands of critical theory in a pragmatic account of language use. As Honneth puts it,

the emancipatory process in which Habermas socially anchors the normative perspective of his Critical Theory in no way appears as an emancipatory process in the moral experiences of the subjects involved. They experience an impairment of what we can call their moral experiences, i.e., their “moral point of view,” not as a restriction of intuitively mastered rules of language, but as a violation of identity claims acquired in socialization.11

Honneth’s way out of this problem is to “follow Habermas’s communication paradigm more in the direction of its intersubjective, indeed sociological, presuppositions.”12 The central intersubjective presupposition of the communication paradigm is, according to Honneth, the acquisition of social recognition, which “constitutes the normative expectations connected with our entering into communicative relationships.”13

In his 1992 Habilitationsschrift, Kampf um Anerkennung, published in English as The Struggle for Recognition, Honneth locates the foothold for critique within the subjective experience of injustice that arises when one’s legitimate expectations for recognition are violated. Drawing on the writings of Hegel’s Jena period and on George Herbert Mead’s social psychology, Honneth develops a tripartite conception of social recognition. Following Hegel, Honneth delineates three primary forms of mutual recognition: love in primary (particularly familial) relationships, legal rights, and communal solidarity. Following Mead, Honneth connects these forms of mutual recognition to a social psychological account of the intersubjective development of three primary forms of
