“Continental philosophy” is itself a contested concept. For some, it is understood to be any philosophy after 1780 originating on the European continent (Germany, France, Italy, etc.). Such an understanding would make Georg von Wright or Rudolf Carnap – respectively, a Finnish-born philosopher of language and a German-born logician who taught for many years in the US – a “continental philosopher,” an interpretation neither they nor their followers would easily accept. For others, “continental philosophy” refers to a style of philosophizing, one more attentive to the world of experience and less focused on a rigorous analysis of concepts or linguistic usage. In this and the accompanying seven volumes in this series, “continental philosophy” will be understood historically as a tradition that has its roots in several different ways of approaching and responding to Immanuel Kant’s critical philosophy, a tradition that takes its definitive form at the beginning of the twentieth century as the phenomenological tradition, with its modern roots in the work of Edmund Husserl. As such, continental philosophy emerges as a tradition distinct from the tradition that has identified itself as “analytic” or “Anglo-American,” and that locates its own origins in the logical analyses and philosophy of language of Gottlob Frege. Whether or not there is in fact a sharp divergence between the work of Husserl and Frege is itself a contested question, but what cannot be contested is that two distinct historical traditions emerged early in the twentieth century from these traditions’ respective interpretations of Husserl (and Heidegger) and Frege (and Russell). The aim of this history of continental philosophy is to trace the developments in one of these traditions from its roots in Kant and his contemporaries through to its most recent manifestations. Together, these volumes present a coherent and comprehensive account of the continental philosophical tradition.
that offers readers a unique resource for understanding this tradition’s complex and interconnected history.

Because history does not unfold in a perfectly linear fashion, telling the history of continental philosophy cannot simply take the form of a chronologically organized series of “great thinker” essays. And because continental philosophy has not developed in a vacuum, telling its history must attend to the impact of figures and developments outside philosophy (in the sciences, social sciences, mathematics, art, politics, and culture more generally) as well as to the work of some philosophers not usually associated with continental philosophy. Such a series also must attend to significant philosophical movements and schools of thought and to the extended influence of certain philosophers within this history, either because their careers spanned a period during which they engaged with a range of different theorists and theoretical positions or because their work has been appropriated and reinterpreted by subsequent thinkers. For these reasons, the volumes have been organized with an eye toward chronological development but, in so far as the years covered in each volume overlap those covered in the subsequent volume, they have been organized as well with the aim of coordinating certain philosophical developments that intersect in a fashion that is not always strictly chronological.

Volume 1 begins with the origins of continental philosophy in Kant and the earliest responses to his critical philosophy, and presents an overview of German idealism, the major movement in philosophy from the late eighteenth to the middle of the nineteenth century. In addition to Kant, the period covered in the first volume was dominated by Fichte, Schelling, and Hegel, and together their work influenced not just philosophy, but also art, theology, and politics. This volume thus covers Kant’s younger contemporary Herder, and his readers Schiller and Schlegel – who shaped much of the subsequent reception of Kant in art, literature, and aesthetics; the “Young Hegelians” – including Bruno Bauer, Ludwig Feuerbach, and David Friedrich Strauss – whose writings would influence Engels and Marx; and the tradition of French utopian thinking in such figures as Saint-Simon, Fourier, and Proudhon. In addition to Kant’s early critics – Jacobi, Reinhold, and Maimon – significant attention is also paid to the later critic of German idealism Arthur Schopenhauer, whose appropriation and criticism of theories of cognition later had a decisive influence on Friedrich Nietzsche.

Volume 2 addresses the second half of the nineteenth century, in part as a response to the dominance of Hegelian philosophy. These years saw revolutionary developments in both European politics and philosophy, and five great critics dominated the European intellectual scene: Feuerbach, Marx, Søren Kierkegaard, Fyodor Dostoevsky, and Nietzsche. Responding in various ways to Hegelian philosophy and to the shifting political landscape of Europe and
the United States, these thinkers brought to philosophy two guiding orientations – materialism and existentialism – that introduced themes that would continue to play out throughout the twentieth century. The second half of the nineteenth century also saw the emergence of new schools of thought and new disciplinary thinking, including the birth of sociology and the social sciences, the development of French spiritualism, the beginning of American pragmatism, radical developments in science and mathematics, and the development of hermeneutics beyond the domains of theology and philology into an approach to understanding all varieties of human endeavor.

Volume 3 covers the period between the 1890s and 1930s, a period that witnessed revolutions in the arts, science, and society that set the agenda for the twentieth century. In philosophy, these years saw the beginnings of what would grow into two distinct approaches to doing philosophy: analytic and continental. It also saw the emergence of phenomenology as a new rigorous science, the birth of Freudian psychoanalysis, and the maturing of the discipline of sociology. Volume 3 thus examines the most influential work of a remarkable series of thinkers who reviewed, evaluated, and transformed nineteenth-century thought, among them Henri Bergson, Émile Durkheim, Sigmund Freud, Martin Heidegger, Edmund Husserl, Karl Jaspers, Max Scheler, and Ludwig Wittgenstein. It also initiated an approach to philosophizing that saw philosophy move from the lecture hall or the private study into an active engagement with the world, an approach that would continue to mark continental philosophy’s subsequent history.

The developments and responses to phenomenology after Husserl are the focus of the essays in Volume 4. An ambiguity inherent in phenomenology – between conscious experience and structural conditions – lent itself to a range of interpretations. While some existentialists focused on applying phenomenology to the concrete data of human experience, others developed phenomenology as conscious experience in order to analyze ethics and religion. Still other phenomenologists developed notions of structural conditions to explore questions of science, mathematics, and conceptualization. Volume 4 covers all the major innovators in phenomenology – notably Sartre, Merleau-Ponty, and the later Heidegger – as well as its extension into religion, ethics, aesthetics, hermeneutics, and science.

Volume 5 concentrates on philosophical developments in political theory and the social sciences between 1920 and 1968, as European thinkers responded to the difficult and world-transforming events of the time. While some of the significant figures and movements of this period drew on phenomenology, many went back further into the continental tradition, looking to Kant or Hegel, Marx or Nietzsche, for philosophical inspiration. Key figures and movements discussed in this volume include Adorno, Horkheimer, and the Frankfurt School,
Schmitt, Marcuse, Benjamin, Arendt, Bataille, black existentialism, French Marxism, Saussure, and structuralism. These individuals and schools of thought responded to the “crisis of modernity” in different ways, but largely focused on what they perceived to be liberal democracy’s betrayal of its own rationalist ideals of freedom, equality, and fraternity. One other point about the period covered in this volume is worthy of note: it is during these years that we see the initial spread of continental philosophy beyond the European continent. This happens largely because of the emigration of European Jewish intellectuals to the US and UK in the 1930s and 1940s, be it the temporary emigration of figures such as Adorno, Horkheimer, Lévi-Strauss, and Jakobson or the permanent emigration of Marcuse, Arendt, and Gurwitsch. As the succeeding volumes will attest, this becomes a central feature of continental philosophy’s subsequent history.

Volume 6 examines the major figures associated with poststructuralism and the second generation of critical theory, the two dominant movements that emerged in the 1960s, which together brought continental philosophy to the forefront of scholarship in a variety of humanities and social science disciplines and set the agenda for philosophical thought on the continent and elsewhere from the 1960s to the present. In addition to essays that discuss the work of such influential thinkers as Althusser, Foucault, Deleuze, Derrida, Lyotard, Irigaray, Habermas, Serres, Bourdieu, and Rorty, Volume 6 also includes thematic essays on issues including the Nietzschean legacy, the linguistic turn in continental thinking, the phenomenological inheritance of Gadamer and Ricoeur, the influence of psychoanalysis, the emergence of feminist thought and a philosophy of sexual difference, and the importation of continental philosophy into literary theory.

Before turning to Volume 7, a few words on the institutional history of continental philosophy in the United States are in order, in part because the developments addressed in Volumes 6–8 cannot be fully appreciated without recognizing some of the events that conditioned their North American and anglophone reception. As has been mentioned, phenomenologists such as Alfred Schutz and Aron Gurwitsch, and other European continental philosophers such as Herbert Marcuse and Hannah Arendt, began relocating to the United States in the 1930s and 1940s. Many of these philosophers began their work in the United States at the University in Exile, established in 1933 as a graduate division of the New School for Social Research for displaced European intellectuals. While some continental philosophy was taught elsewhere around the United States (at Harvard University, Yale University, the University at Buffalo, and elsewhere), and while the journal Philosophy and Phenomenological Research began publishing in 1939, continental philosophy first truly began to become an institutional presence in the United States in the 1960s. In 1961, John Wild (1902–72) left Harvard to become Chair of the Department of Philosophy at Northwestern University. With a commitment from the provost of the university
and the Northwestern University Press to enable him to launch the Northwestern
Series in Phenomenology and Existential Philosophy, Wild joined William Earle
and James Edie, thus making Northwestern a center for the study of continental
philosophy. Wild set up an organizational committee including himself, Earle,
Edie, George Schrader of Yale, and Calvin Schrag (a former student of Wild’s
at Harvard, who was teaching at Northwestern and had recently accepted an
appointment at Purdue University), to establish a professional society devoted to
the examination of recent continental philosophy. That organization, the Society
for Phenomenology and Existential Philosophy (SPEP), held its first meeting at
Northwestern in 1962, with Wild and Gurwitsch as the dominant figures arguing
for an existential phenomenology or a more strictly Husserlian phenomenology,
respectively. Others attending the small meeting included Erwin Straus, as well
as Northwestern graduate students Edward Casey and Robert Scharff, and today
SPEP has grown into the second largest society of philosophers in the United
States. Since those early days, many smaller societies (Heidegger Circle, Husserl
Circle, Nietzsche Society, etc.) have formed and many journals and graduate
programs devoted to continental philosophy have appeared. In addition, many of
the important continental philosophers who first became known in the 1960s –
including Gadamer, Ricoeur, Foucault, Derrida, Lyotard, and Habermas – came
to hold continuing appointments at major American universities (although, it
must be mentioned, not always housed in departments of philosophy) and, since
the 1960s, much of the transmission of continental philosophy has come directly
through teaching as well as through publications.

The transatlantic migration of continental philosophy plays a central role
in Volume 7, which looks at developments in continental philosophy between
1980 and 1995, a time of great upheaval and profound social change that saw
the fruits of the continental works of the 1960s beginning to shift the center of
gravity of continental philosophizing from the European continent to the anglo-
phone philosophical world and, in particular, to North America. During these
years, the pace of translation into English of French and German philosophical
works from the early twentieth century as well as the very recent past increased
tremendously, and it was not uncommon to find essays or lectures from signifi-
cant European philosophers appearing first in English and then subsequently
being published in French or German. In addition, the period covered in this
volume also saw the spread of continental philosophy beyond the confines of
philosophy departments, as students and faculty in centers of humanities and
departments of comparative literature, communication studies, rhetoric, and
other interdisciplinary fields increasingly drew on the work of recent continental
philosophers. Volume 7 ranges across several developments during these years –
the birth of postmodernism, the differing philosophical traditions of France,
Germany, and Italy, the third generation of critical theory, and the so-called
“ethical turn” – while also examining the extension of philosophy into questions of radical democracy, postcolonial theory, feminism, religion, and the rise of performativity and post-analytic philosophy. Fueled by an intense ethical and political desire to reflect changing social and political conditions, the philosophical work of this period reveals how continental thinkers responded to the changing world and to the key issues of the time, notably globalization, technology, and ethnicity.

The eighth and final volume in this series attempts to chart the most recent trends in continental philosophy, which has now developed into an approach to thinking that is present throughout the world and engaged with classical philosophical problems as well as current concerns. The essays in this volume focus more on thematic developments than individual figures as they explore how contemporary philosophers are drawing on the resources of the traditions surveyed in the preceding seven volumes to address issues relating to gender, race, politics, art, the environment, science, citizenship, and globalization. While by no means claiming to have the last word, this volume makes clear the dynamic and engaged quality of continental philosophy as it confronts some of the most pressing issues of the contemporary world.

As a designation, “continental philosophy” can be traced back at least as far as John Stuart Mill’s *On Bentham and Coleridge* (1840), where he uses it to distinguish the British empiricism of Bentham from a tradition on the continent in which he sees the influence of Kant. Since that time, and especially since the early twentieth century, the term has been used to designate philosophies from a particular geographical region, or with a particular style (poetic or dialectical, rather than logical or scientistic). For some, it has been appropriated as an honorific, while for others it has been used more pejoratively or dismissively. Rather than enter into these polemics, what the volumes in this series have sought to do is make clear that one way to understand “continental philosophy” is as an approach to philosophy that is deeply engaged in reflecting on its own history, and that, as a consequence, it is important to understand the *history* of continental philosophy.

While each of the volumes in this series was organized by its respective editor as a volume that could stand alone, the eight volumes have been coordinated in order to highlight various points of contact, influence, or debate across the historical period that they collectively survey. To facilitate these connections across the eight volumes, cross-referencing footnotes have been added to many of the essays by the General Editor. To distinguish these footnotes from those of the authors, they are indicated by an asterisk (*).

Alan D. Schrift, General Editor
CONTRIBUTORS

Daniel Dahlstrom is Professor of Philosophy and Chair of the Department of Philosophy at Boston University, and has served as Visiting Professor at the Katholieke Universiteit Leuven (Belgium). He is the author of Das logische Vorurteil: Untersuchungen zur Wahrheitstheorie des frühen Heidegger (1994) and Heidegger's Concept of Truth (2001), editor of sixteen collections of essays, translator of important works from German to English, and author of numerous articles on medieval philosophy, German philosophy, aesthetics, logic, and the philosophy of science.

Richard Fincham is Assistant Professor in Philosophy at the American University in Cairo. He is the author of various articles on Kant, German idealism, and German Romanticism. He is working on a monograph on Schelling’s philosophy of nature.

Joseph P. Lawrence is Professor of Philosophy at the College of the Holy Cross, Worcester, Massachusetts. He is the author of Schellings Philosophie des ewigen Anfangs (1989). In addition to a number of specialized articles on Schelling, he has also written a variety of essays on topics ranging from Socrates to Thomas Mann and has been a regular contributor to the Turkish newspaper Zaman. His Becoming Socrates will soon appear in a series sponsored by the Comparative and Continental Philosophy Circle. He is currently working on a book entitled Philosophical Religion.

Diane Morgan is Lecturer in the School of Fine Art, History of Art and Cultural Studies at the University of Leeds. Her research interests include Enlightenment
thought (especially Kant), European modernity, and utopianism. She is the author of *Kant Trouble: The Obscurities of the Enlightened* (2000), coeditor of *Cosmopolitics and the Emergence of a Future* (with Gary Banham; 2007), and coeditor of *Nihilism Now! “Monsters of Energy”* (with Keith Ansell-Pearson; 2000). She is currently engaged in two monograph projects: *Kant, Cosmopolitics and Globality* and *The Reaffirmation of Social Values in the Work of Saint-Simon, Fourier and Proudhon*.

**Thomas Nenon** is Professor of Philosophy at the University of Memphis. He is the author of *Objectivitaet und endlich Erkenntnis* (1986), coeditor of vol. 25 (*Aufsätze und Vorträge 1911–21*) and vol. 27 (*Aufsätze und Vorträge 1922–37*) of the *Husserliana*, and author of a number of articles on Husserl, Heidegger, Kant and German idealism, hermeneutics, and the philosophy of the social sciences. He has served as review editor for *Husserl Studies*, President of the Center for Advanced Research in Phenomenology, and as Director of the Center for the Humanities at the University of Memphis. His current research interests include Husserl’s theories of personhood and subjectivity, Husserl’s ethical theory, and Kant and Hegel’s practical philosophy.

**Terry Pinkard** is University Professor in the Department of Philosophy at Georgetown University. He is the author of *Hegel’s Phenomenology: The Sociality of Reason* (1996), *Hegel: A Biography* (2000), and *German Philosophy 1760–1860: The Legacy of Idealism* (2002), and editor of *Heine: On the History of Religion and Philosophy in Germany* (2007), and has published numerous articles on German philosophy from Kant to the present.

**Sonia Sikka** is Associate Professor of Philosophy at the University of Ottawa, Canada. Her primary research interests are in modern European philosophy and philosophy of culture. She has written on Heidegger, Levinas, and Nietzsche, and has recently been working on issues related to cultural identity and pluralism within Herder’s thought. Her publications on Herder include: “Herder’s Critique of Pure Reason” (*Review of Metaphysics*), “On the Value of Happiness: Herder contra Kant” (*Canadian Journal of Philosophy*), “Herder and the Concept of Race” (*Herder Yearbook*, 2006), “Enlightened Relativism: The Case of Herder” (*Philosophy and Social Criticism*, 2005), and “Herder on the Relation Between Language and World” (*History of Philosophy Quarterly*, 2004).

**Lawrence S. Stepelevich** is Professor Emeritus of Philosophy at Villanova University. He has written numerous articles on Hegel and the Hegelian schools. He is the author of *Hegel’s Philosophy of Action* (1983); has edited several works, including *Young Hegelianism: An Anthology* (1983; reprinted 1997), and *Selected
Essays on G. W. F. Hegel (1993); and has translated several works, including Bruno Bauer’s 1841 work, *The Trumpet of the Last Judgement Against Hegel the Atheist and Antichrist* (1989). He has also written entries on various members of the Young Hegelian school in *The Routledge Encyclopedia of Philosophy, The Edinburgh Encyclopedia of Continental Philosophy, Blackwell’s Compassion to Continental Philosophy*, and *The Dictionary of Literary Biography*.

**Bart Vandenabeele** is Professor of Aesthetics and Philosophy of Art at Ghent University (Belgium). He is the author and editor of several books in aesthetics, philosophy of art, and philosophy of language, editor of *A Companion to Schopenhauer* (2011), and writes on eighteenth-century aesthetics and on post-Kantian nineteenth- and twentieth-century philosophy, especially Schopenhauer, Nietzsche, and Lyotard. His current research draws on both historical and contemporary approaches to aesthetics and the philosophy of art, is informed by recent debates in art theory, and engages the philosophical aspects of contemporary art.

**Robert R. Williams** is Professor in Germanic Studies and Religious Studies at the University of Illinois at Chicago. He was President of the Hegel Society of America (1998–2000), and has published in both philosophy and theology, with interests in continental philosophy (Husserl, Heidegger, Sartre, Foucault and Levinas) and German thought from Kant to Nietzsche, specializing in Hegel. He is author of *Hegel’s Ethics of Recognition* (1998), *Recognition: Fichte and Hegel on the Other* (1992), and *Schleiermacher the Theologian: The Construction of the Doctrine of God* (1978), and translator and editor of *Hegel’s Lectures on the Philosophy of Spirit 1827/8* (2007) and *I. A. Dorner: The Immutability of God* (1994). He is currently completing a project on *Recognition, Tragedy and the Death of God: Studies in Hegel and Nietzsche*. 
While the term “continental philosophy” as a name for a philosophical direction or tradition did not come into wide use until the second half of the twentieth century, there is nonetheless some justification for identifying Kant and those followers and critics who were influenced by his work in a substantial way as an origin for a tradition that would much later identify itself as “continental philosophy.” For it is indeed true that most of the philosophers who have accepted this description of themselves during the past half-century take seriously the philosophical contributions of Kant and those who were most strongly influenced by him in Germany and France in the nineteenth century. This has historically not been the case for philosophers in the analytic tradition, in contrast to which “continental philosophy” has defined itself. Over time, this has changed somewhat with respect to Kant himself. P. F. Strawson’s *The Bounds of Sense* opened the way for philosophical discussions within analytical philosophy that took seriously some of the epistemological and metaphysical arguments presented in the *Critique of Pure Reason* so that questions about “transcendental claims” and “transcendental arguments” are now an accepted part of the analytic discussions of theoretical philosophy. Moreover, John Rawls’s appropriation of Kant has proved to be so influential within analytic ethics and social and political philosophy that “Kantian” approaches and positions are not only discussed, but also widely held by many prominent analytic philosophers in those areas. However, this has not yet occurred with regard to the other figures who followed

Kant and whose work is described and analyzed in this volume.\(^3\) Within continental philosophy, by contrast, the direct or indirect influence of these figures can hardly be overstated. Hegel, Marx, Kierkegaard, and Nietzsche, for instance, have long belonged to the standard repertoire of discussions in continental philosophy. A course on “nineteenth-century philosophy” has commonly been offered in departments with an interest in continental philosophy or even the history of philosophy, usually taught by philosophers who think of themselves as experts in continental philosophy. Yet Hegel’s own work is unthinkable without the contributions of figures such as Herder, Fichte, and Schelling, as the following essays will document; it is well known how much Schopenhauer’s work had an influence on Nietzsche; Kierkegaard heard lectures by Schelling in Berlin that had a strong influence on his critical dialogue with Kant and Hegel; and the figures described in the last two chapters – Bauer, Strauss, and Stirner, on the one hand, and the “French utopian thinkers,” on the other – were sources of inspiration and critical analysis for the younger Marx as well.

To put it rather pointedly: one of the main differences between continental and analytic philosophy has been that Kant and the figures described in this volume have remained an important part of the continental philosophical tradition, but their work has not generally been regarded as philosophically significant and relevant for the analytic tradition of the twentieth and early twenty-first centuries.\(^4\) Even more importantly, Kant and the other figures whose work is analyzed in this volume have remained not just historical figures, but rather integral and living parts of the tradition of continental philosophy where their philosophical positions continue to be taken seriously and serve as a point of departure for current discussions of philosophical issues.\(^5\) This has always been the case for Kant and Hegel in particular, but increasingly in the past few years also for some of the less well-known figures such as Herder, Fichte, and Schelling. Part of the intent of this volume is to reinforce this trend and to introduce readers to other figures in the decades following Kant whose work was not only influential in its time, but also still deserves serious critical consideration today.

\(^3\) Although, as Terry Pinkard notes in his essay in this volume, this situation has recently been changing with respect to Hegel.

\(^4\) An exception would be the movement within American philosophy that came to be known as “process philosophy,” oriented on the work of Alfred North Whitehead, Charles Hartshorne, and Paul Weiss, whose thought is in many ways reminiscent of Hegel’s. By the 1960s and 1970s, however, this was no longer part of the mainstream of American analytic philosophy, but more a movement of its own; and even this movement locates its historical roots less in the eighteenth- and nineteenth-century philosophers who are included in this volume than on the history of philosophy as a whole.

\(^5\) Consider, for example, the importance of Kant in the oeuvre not only of Jürgen Habermas, but also of Michel Foucault.
The notion of an “origin” also conveys the sense of a new beginning. Certainly Kant’s own description of his critical turn in terms of a “Copernican revolution” suggests that he himself thought that his approach to traditional problems in metaphysics represented a completely new way to address those problems. And subsequent readers have tended to take him at his word on this point, seeing Kantian philosophy as the new point of departure from which they must begin or as a particularly new and unique threat to the insights attained by previous philosophers, religious traditions, or even common sense. At the same time, though, Kant clearly locates himself within the framework of the main directions in modern philosophy, namely rationalism and empiricism, and within the predominant intellectual movement of his age, the Enlightenment. Hence even Kant himself was aware that his new approach to traditional questions was not an absolute beginning, but was rather the culmination of a discussion that had begun with the advent of modern science and modern philosophy and in a certain sense can also be located within the arc of the history of philosophy as a whole that goes back for him to Plato, Aristotle, and the Stoics.

In fact, one of the distinguishing marks of the tradition of philosophy that Kant establishes is a keen sense of the awareness of one’s own place within an overarching historical development. This is in some regards ironic in light of his claim to have solved the problems once and for all in a way that would make further philosophical progress on these issues superfluous, even though his political essays suggest that further political progress is not only possible, but also necessary and perhaps even inevitable. The essays of this volume show how this conception of thinking as essentially located within a specific historical context comes to take center stage in the philosophers who follow. Of course, Kant was not the first philosopher of his age whose work exhibits such an awareness. One hallmark of the Enlightenment movement as a whole was its emphasis on the notion of “progress” as the gradual unfolding of reason in history.

When the Prussian Academy of the Sciences posed the prize question “What is Enlightenment?” in 1783, part of the motivation for the question was the perception that the age of Enlightenment had already reached its zenith, so that when Kant characterizes his own age as the “age of Enlightenment,” he is locating himself and his thinking in terms of a movement and historical developments that had formed the background for his work, but was about to enter a new phase. Moreover, when Kant, in the essay that represents his response to that question, describes enlightenment as the process of liberating oneself from the self-imposed tutelage that results not from a lack of understanding, but from a

lack of resolve or courage to use one’s understanding without the guidance of another, he is also taking a position that goes beyond the previously predominant rationalist themes of the Enlightenment. The emphasis in Christian Wolff’s (1679–1754) variation of Leibnizian philosophy that had been Kant’s philosophical starting-point before the critical turn, had been on the primary task of enlightenment as the development of the intellect by making concepts clear and distinct in order to lead to correct beliefs that will then serve as inevitable catalysts to right action.\footnote{Werner Schneider’s work *Die wahre Aufklärung: Zum Selbstverständnis der deutschen Aufklärung* (Freiburg: Alber, 1974) provides an excellent summary and overview of this development along with several examples of lesser known figures whose languages and approaches remain strongly indebted to this rationalist legacy.} As we will see in Chapter 1 below, Kant will rather see the primary role of philosophical clarification in vindicating common sense by adopting some philosophical positions that are at first every bit as counter-intuitive as the view that the earth goes around the sun in order to justify our everyday beliefs about our ability to experience natural objects in the world. More importantly, though, in the moral realm he will see his philosophy of pure practical reason as combating false theories that could undermine our healthy natural instincts about right and wrong. In the essay “What is Enlightenment?” he is going even further by attributing a lack of enlightenment to false dispositions such as timidity and lack of resolve while acknowledging the barriers placed by social institutions such as the church and insecure rulers who fear that free-thinking individuals will threaten their power.

Of course, even before the appearance of this essay and Kant’s critical works, there had been other criticisms of certain one-sided tendencies within the Enlightenment movement. Two prime motivating factors for the Enlightenment were the development of modern natural science and the power of the new model that it offered, and the emergence of middle classes who, at least according to their own self-understanding, depended more on their individual initiatives, skills, and knowledge than on inherited privileges for their prosperity. Each of these trends will continue to play a role in the further intellectual and artistic developments at the end of the eighteenth and the beginning of the nineteenth centuries, but with some important modifications.

The two names Kant mentions in conjunction with modern natural science are Copernicus and Newton; two centuries earlier, Descartes and Hobbes had cited Galileo as their model. What united all of them was that the mathematically oriented mechanistic model advanced by modern physics changed the general view of the world. Exceptionless laws that hold for all kinds of objects replace observations about general tendencies of different kinds of things, and blind causal explanations seem to make teleological explanations superfluous.
At the same time, this seems to raise problems about determinism and how to account for freedom, and therefore for moral and legal notions of individual accountability. It also seems to present a picture of nature as a complicated but ultimately blind, perhaps even lifeless machine. So we will see part of Kant’s interest and attractiveness for subsequent thinkers in his attempt to reconcile causal determinism within nature, on the one hand, with the idea of freedom and human moral agency, on the other. Others, for instance Herder, will try to reconcile mechanism and teleology along Leibnizian lines; and following him and Kant’s political writings, Fichte, Schelling, and Hegel will try to show how mechanistic explanations at a micro-level do not preclude seeing history itself from an overall teleological perspective. All of the figures covered in this volume stand under the sway of the power of the model of modern natural science, but all of them seek alternatives to a simple mechanistic approach to traditional philosophical problems and to our everyday insights about the world and our place within it. Some of the key categories that will arise as alternatives to this model are concepts such as “life” and “spirit” that will continue to play an important role in response to the challenges posed by the natural scientific model well into the twentieth and twenty-first centuries. Similarly, the concepts of “culture” and “history” that emerge as central philosophical themes during the period covered in this volume will remain crucial concepts that call for different ways of thinking and different scholarly and scientific approaches than those of modern natural science. It is therefore no accident that these concepts have played a particularly strong role in the continental philosophical tradition, which has defined itself since its inception as an attempt to avoid the reductionist tendencies of philosophies that are too one-sidedly under the sway of the model of the mathematically oriented natural sciences.

The notion of “freedom” in a somewhat different sense is connected with the second overall modern trend mentioned above, that is, the emergence of the new middle classes. “Freedom” here has a social and political connotation according to which individual human beings should have greater latitude in making their decisions and determining their own fates. As modern societies gradually began to shift from agrarian to commercial and then later eventually to manufacturing societies, new groups became predominant who would come to be called the “middle classes”: “middle” in the sense of something in between the hereditary aristocracies, on the one hand, and the powerless agricultural workers, that is, peasants and serfs, on the other. In Germany, the development took place somewhat later than, for instance, in England and France, but

---

8. Herder’s work represents an important milestone in this regard as the notion of culture shifts from the Enlightenment notion of a set of skills to the shared habits and dispositions of a people. See the essay by Sonia Sikka in this volume.
By the eighteenth century it was well underway there as well. As opposed to England, where manufacturing began much earlier and the colonial enterprises gave rise to a very large number of rich merchants and traders, the commercial classes in Germany were represented primarily by independent handworkers and smaller merchants and traders. Even more predominant, especially as representatives for the Enlightenment as an intellectual movement, was the growing class of educated administrators and professionals – teachers and professors, pastors, lawyers, doctors – some of whom served the commercially independent classes, but most of whom were in the direct or indirect employment of the many German states still ruled by monarchs or other hereditary aristocracy.9

By the second half of the eighteenth century and the beginning of the nineteenth century, a completely new class had emerged. The new middle classes came to have the means and the desire to buy journals and books, attend concerts and plays, and buy sheet music to play at home. The reading public expanded significantly and came to include women as well. Lutheran clergy had a great deal more independence within the much looser organization of that Church than had traditionally been enjoyed by the Catholic clergy. With the increasing religious tolerance that followed the Peace of Westphalia that had ended the Thirty Years’ War in the previous century, educated Jews were coming to be included in intellectual life as well. In the wake of all these changes, the role of the artist changed from being an artisan or decorative artist employed by the Church or the aristocracy to that of an independent agent creating and producing art as a profession for consumption by these new middle classes, thereby also gaining an artistic freedom previously impossible for them and emblematic for the freedom in thinking and acting to which the rest of the middle classes aspired. In some ways, then, the artists became the symbols for the middle classes as productive, independent, and creative – at least in their aspirations and, to some extent, in their professional and personal lives as well. Consistent with this trend is the concept of the “genius,” given a conceptual and theoretical grounding in Kant’s *Critique of Judgment*, but at the heart of all of the subsequent philosophical reflections on art and artistic creation as well.

Of course, development in literature and music had not waited on the kind of philosophical justifications that Kant and his successors provided. The literary movement of *Empfindsamkeit* that had developed a new literary language of sentiments and emotions that connected this emerging circle of writers as friends and collaborators, was at its heights in the early 1770s. Arising out of personal relationships and the letters that these friends composed, circulated,

---
and read together publicly, it popularized a new genre, the epistolary novel. Its better-known, unruly cousin that flourished at about the same time was the *Sturm und Drang* movement, which stressed the passions, strong natural drives and urges, and the right of subjectivity, first in plays, then later in Germany’s most famous epistolary novel, Goethe’s *The Sorrows of Young Werther* in 1774. Both of these movements were consciously directed against the one-sidedness of rationalistic description of human events in literature, the tendency toward conventional moralizing, and a rule-governed aesthetics that modeled artistic production on the technical craftsmanship of other productive enterprises – be they artistic or not. Art would come to be closely associated with, and often seen as an expression of the subjectivity of the author who creates it. During the period covered by this volume, these tendencies within literature would lead to classicism, which tried to strike a balance between subjectivity and rules, between reason and the emotions, on the one hand, and romanticism with its enthusiastic endorsement of the rights of subjectivity and the passions and emotions that motivate action, on the other.

In music there was a similar development at this time. Johann Sebastian Bach (1685–1750) served his entire professional career in the employment of the aristocracy and the Church, and Joseph Haydn (1732–1809) spent his career with the wealthy aristocratic Hungarian Esterházy family. Both of them are renowned as much for their craftsmanship as their originality, but Haydn’s case is an interesting one because he did leave an indelible mark on the history of musical composition through the key role he played in the establishment of specific forms of the symphony and of chamber music that seemed to exhibit the balance and rationality consistent with the demands of the intellect that led them to become canonical for at least the following century. Contrast this with the well-known career of Wolfgang Amadeus Mozart (1756–91), who constantly and vocally chafed at his dependency on his ecclesiastical and aristocratic sponsors as he increasingly took on the role of a musical entrepreneur, marketing his music at public concerts in the newly created symphony halls and public opera houses that were open to the well-to-do of all estates. Ludwig van Beethoven (1770–1827), too, began his career under the sponsorship of several prominent aristocrats, but even as he continues to accept their sponsorship, he sells himself

11. Public opera houses had been introduced in Italy in the seventeenth century. The first in German-speaking countries was in Hamburg in 1678, but by the end of the eighteenth century, they were open in several other German cities including Vienna and Munich, where Mozart’s opera were performed. The national theatre in Mannheim is the oldest dramatic theatre in Germany, opened in 1779. Schiller’s play *The Robbers* premiered there in 1782 in the presence of the author.
to them in market terms – going to the highest bidder, so to speak – while he reduces his dependency on them through public performances of his work and through the sale of the sheet music of his chamber compositions. Franz Schubert (1797–1828) never even had a professionally paid regular position, making what little money he did from publishing his music and giving private lessons. For each of them, “freedom” meant economic independence as well as the artistic independence that they associated with it. It meant the increasing ability to control one’s own destiny and to use art as an expression of one’s own views and sensibilities according to one’s own best instincts instead of subordinating oneself to someone else’s dictates and tastes.

At the same time, however, it remained true that most of the educated members of the groups from whom the leading representatives came – the professors, pastors, and teachers – continued to depend on the church or the state for their employment. Hence the German Enlightenment had always been more typically reformist than revolutionary in tone, assuring church hierarchy and the rulers that an enlightened public would more reliably recognize the truths of religion and the benefits that accrue from enlightened leadership within the bounds of the monarchic order than a people led by superstition and emotions such as fear, and that the other benefits that accrue to such a state would include the greater prosperity and success that follows from a better educated and enterprising populace. Against this backdrop, rationality and subjectivity were not seen as opposites but rather as complementary under the right circumstances. Autonomy, rightly understood, does not have to lead to instability and disorder.

This was particularly the case for religion. By the middle of the eighteenth century, reinterpretations of traditional religious doctrines were becoming quite common. Particularly in the Protestant states, it had long been acceptable to reinterpret or reject many traditional teachings and beliefs as “superstition” and to reinterpret them in line with what is acceptable to reason. The Reformation’s own shift of emphasis away from the authority of the institution of the Catholic Church and its traditional beliefs in favor of an emphasis on each individual subject’s ability to receive grace, understand the Scriptures, and follow his own lights had opened the way for a theology that could re-examine other traditional beliefs and reinterpret them according to the lights of reason as well. Stories from the Scriptures about miracles could be read as metaphorical accounts about the power of spiritual healing and not historically reliable accounts about natural events. The truths of historical religion could be understood as allegorical messages about one’s moral duties, stories that were taken at face value by the less educated and those at less advanced stages of human development, but that had become increasingly unnecessary for those who were capable of understanding and following the dictates of reason alone. The essay on “The Education of Humanity” (Die Erziehung des Menschengeschlechts) by the famous playwright
and author Gotthold Ephraim Lessing (1729–81) is one of the clearest and most succinct examples of this general tendency. It describes different stages of the development of human societies along the model of the intellectual and moral development of an individual human being who in childhood follows moral rules not out of internal motivations, but out of fear of punishment and hopes for rewards. As development progresses, the individual increasingly comes to understand the inherent rationality of these rules, internalizes them, and acts simply out of insight into their rightness. So, too, at earlier stages of development, religion has all sorts of taboos, superstitions, and fantastic stories about vengeful gods, horrible punishments for evildoers, and direct interventions by the gods on the behalf of those who obey them. As human rationality progresses through the ages, these are replaced by ideas of a just God with laws that benefit humankind, then later by the image of God in the form of one perfect human being, Jesus Christ, who can serve as a model for all human beings, until finally, at the stage of complete maturity and enlightenment, we come to understand the divine principles in all of us through our ability to reason, act morally, and acknowledge the transcendent dignity of all of our fellow human beings. Even in the modern, enlightened age, however, not everyone will be capable of such rational insights and autonomous moral actions, so religion continues to serve as an appropriate moral compass for those individuals or classes who have not yet reached full intellectual and moral maturity.

Not just in his views about religion, but in Kant’s overall approach, his own thinking certainly fits within these parameters. His later work on religion is consistent with the reinterpretation of Christian doctrine in terms of the tenets of pure practical rationality, and his famous essay on Enlightenment also employs the language of human development and maturity. Moreover, he – along with Lessing and others – believes that Enlightenment, properly understood, leads not to social and moral disorder, but rather to free and rational assent to the overall social order in a more or less well-functioning and just state so that subjectivity and lawfulness are not only consistent with each other but can be mutually self-reinforcing principles.

As we have seen, however, there were others who were not as sanguine about the conformity between enlightened subjectivity and the established social order. The *Sturm und Drang* movement, for instance, reflected the impatience of many, especially young, people over the repressiveness of the established orders and conventional morality. It invokes the power of nature and the passions in asserting the rights of subjectivity even when they were not necessarily subordinated to the overall goals of the state and social order. At the opposite end of the spectrum, within the established order, especially with the transition from Frederick the Great to Frederick William II in Prussia and as part of the reaction to failed reforms in the Austrian Empire, there was a reassertion of the rights of

Volume 1
tradition and the need for limits on what should be publicly discussed and propagated. Even some of those who advocated freedom of thought and religion for the educated, were not necessarily in favor of removing limits on public speech for fear of confusing the members of the lower orders who continued to obey out of habit and whose underdeveloped rational capacities did not render them susceptible to the constraints imposed by enlightened reason alone.

It is against this background that the monumental event of the age, the beginning of the French Revolution in summer 1789 decisively and irreversibly raised the stakes. It called into question two key assumptions that had guided the enlightenment movement, at least in Germany, until that time. As we have seen, the first is the view that increasing enlightenment does not necessarily lead to conflict with the established social and political order, but rather can strengthen it through gradual reform; the second is that progress in one area of human cultural development will be reflected in progress in other areas as well.

On the latter point, one can follow Kant who, in his lectures on “Anthropology in a Pragmatic Regard” (AA VII, 322), had distinguished three different dimensions of human development. The first he calls “technical.” It involves the development of our intellectual skills and techniques for dealing with nature and material objects. These range from our ability to understand causal relationships to our ability to produce objects that help us improve our lives through technologies such as construction of shelters and agricultural techniques, as well as the production of increasingly useful and productive technologies of goods that make life more pleasant. The second dimension he calls “pragmatic.” It concerns social skills, for example, the development of speech, manners, and social arrangements that allow us to deal with each other more skillfully and effectively. At an advanced stage, these might include development of wit, rhetorical skills, and proficiencies in the arts. Finally, he lists “moral cultivation” as the most important of them. These are not the same as pragmatic skills. For instance, the skilled rhetorician may not actually be concerned with the truth of his case or the good of the audience but is rather simply interested in manipulating the audience for his own ends, whereas the morally responsible speaker would speak honestly and with the best interest of the community in mind. Although each of these dimensions of cultural development is distinct, the overall optimism of the enlightenment project was that they would progress more or less in tandem. The advances in modern science were occurring at the same time that advances in trade, commerce, and production were contributing to a greater prosperity for the middle classes; advances in administration skills and public policy were seen to support this development and hopefully lead to greater prosperity and justice for all; refinements in the arts would not only make life more pleasant, but lead to refined sensibilities that would make human beings more receptive and responsive to others; advances in knowledge and understanding would lead
to greater social and religious tolerance that would remove a source of conflict and eliminate the previous destruction caused by religious wars and repression; increasingly enlightened rulers would see the benefits of free and open societies that make their states more prosperous and powerful and make their regimes more stable by reducing the tensions between the rulers and those they govern. Progress on one front implied progress on all of them. The French Revolution made clear that much of this progress depended on specific political conditions and assumptions about their continuous improvement that turned out to be questionable. So it became clear that questions about the actual progress of enlightenment would also be tied to the political circumstances in which it is pursued.

Of course, even before the French Revolution, important voices had called assumptions about the mutual reinforcement of progress in these different dimensions into question. Jean-Jacques Rousseau (1712–78), above all and most notably, had claimed the opposite, namely that increasing civilization was leading to increasing moral degradation. Rousseau shared the Enlightenment’s optimism about the basic perfectibility of humanity and he endorsed its striving for freedom and call for the recognition of individuals based on their virtues and skills. Indeed, he was renowned for resenting his dependency on the beneficence and good graces of the wealthy and powerful of his age whose power rested not on merit but on inherited privilege, and whose exercise of their power was often arbitrary and even ruthless when it was threatened. For him, the means to human perfection was not through advances in civilization with its increasing material wealth and accomplishments in the arts, but rather through a return to nature in order to restore a natural harmony for which the technical, artistic, and administrative achievements of modernity are at best distractions, but have more often served as impediments to human flourishing and happiness. He thereby gives voice to the disappointments and frustrations of those who have become impatient with progress towards a better and more just society in which there will be a more direct relationship between achievements and rewards, in which individuals can have greater control over their own fates and be less dependent on the whims and favors of those who rule. For Rousseau, who found himself forced to flee both France and Geneva to avoid retaliations, the reactions of those whom he criticized or whose interests he threatened in his writings confirmed his view that their own interests were not aligned with those who were concerned with genuine human progress. The rising expectations of the citizens in the age of Enlightenment were not always met by the political institutions governing the societies in which they lived.

His writings struck a strong chord with many, not just those who were frustrated with the lack of social progress, but also among those who had come to see rationalism as too far removed from the needs and sentiments of concrete
human beings and who were dissatisfied with a view of the intellect that was set at odds with nature and who found constraints of universal and bloodless rules oppressive. Part of the problem, then, was a lack of progress in political institutions. Another part concerned the notion of progress itself and whether it was to be seen in overcoming nature or in finding a way to live more harmoniously with nature. This latter development should not necessarily be seen as a departure from the overall project of the Enlightenment, but as an internal corrective to its one-sided emphasis on the intellect. The goal remains the happiness of individual subjects not in a transcendent world, but in this life. However, this means that the intellect should no longer be seen as a completely independent source of motivation and guidance, but rather must be aligned with concrete human needs and emotions if it is to be effective.

We have already seen how this corrective pertained not just to French society prior to the Revolution, but was consistent as well with literary and artistic developments at the same time in Germany. Moreover, German society during the second half of the eighteenth century faced some of the same problems, and its states shared some of the same flaws as France. The states were still run by more or – in many cases – less enlightened monarchs. The death of a monarch could lead to a complete reversal by his successor of whatever progress had been made under his reign. Even in the city-states like Hamburg, powerful patrician families operated more like an aristocracy than as members of an open civil society. The Peace of Westphalia had ended the religious wars that had ravaged Europe in the previous century, but the European powers were all in a more or less constant state of tension that intermittently erupted into armed conflicts as each strove to increase its wealth and power at the expense of its neighbors. The great powers England, France, and Spain, and the Habsburg monarchy had been at odds for centuries and much of the drain on the French finances that increased the tensions that eventually led to the Revolution can be traced back to the escalation of those conflicts during the second half of the eighteenth century. But on a somewhat smaller scale, the same was true for the lesser German states as well. Prussia as an ascendant power had gained it at the expense of its neighbors in Denmark, Poland, and Saxony, and its plans for further expansion still put it in direct conflict with Austria. During Kant’s own lifetime, a Prussian setback had led his home city of Königsberg to fall under Russian rule. For even the most enlightened monarchs, among whom Kant and most of the Prussian intellectuals counted Frederick the Great, the need to support their wars led to repeated conscriptions, increased taxes, and the search for other new sources of revenue.

For Germany’s intellectuals, who were at the same time for the most part civil servants, the appropriate response was not to advocate sweeping new forms of government, but to continue to press for reforms within the bounds of the
existing social orders. The idea of radically different social orders or a social order that was not mediated through the institutions of the state seemed inconceivable to them. Even those who, like Kant, recognized that states often or usually act out of non-moral or immoral motives, believed that progress was nonetheless possible because the enlightened self-interest of the individual citizens and the rulers would force them to make the appropriate reforms in order to keep their states stable and prosperous. Up until the Revolution, the choice did not seem to be between enlightenment and the existing social order, but rather how to continue the process of enlightenment within that order.

The French Revolution changed everything. For those in the ancien régime who were always suspicious of reforms and the new freedoms that came with them, the French example served as a dramatic and irrefutable confirmation of the dangers of underestimating the consequences of allowing reforms to go too far or too quickly. Many of those who had initially welcomed the opportunity for a rapid expansion of freedoms for the bourgeoisie were appalled at the reign of terror that soon followed. Napoleon's later invasions served to unite the rival German states against the common enemy so that the idea of a German national culture, if not for a long time a German national state began to arise. Against this background, the idea of a German Kultur, in which the individual finds his or her place within an organically developing social network and through artworks that reflect both the individuality of their creators as well as the historical and social background in which they arise, took root. This was supposed to be an alternative to the French notion of a “civilization” that overemphasizes wealth and material objects and places an overemphasis on individuality at the expense of the common good and a common identity. And finally, the very notion of the state itself and its institutions now comes into play. In a well-functioning society made up of intellectually and morally enlightened individuals, is there any need for a state at all? Are state institutions by their very nature not repressive, or is there an essential role for institutions in guaranteeing that individual liberties are secure? On the one side, what one might call the “romantic view,” stands the idea that progress will eventually lead to the elimination of the need for a state. The idea of the Greek polis of independent individuals with very little organizational structure, acting according to a common consensus, becomes a popular notion standing for the first of these two alternatives. Fichte, the early Hegel, and Marx advocate this position. The most famous articulation of the opposite view, what one might call the “realist” position, is the later Hegel's Philosophy of Right from 1827, in which appropriate institutions are defended as the necessary realization of freedom itself. For Hegel in his mature thinking, institutions are not impediments to freedom, but rather appropriate institutions are necessary preconditions for the assurance of the rights and welfare of each individual and individuals necessarily find their identities not in their particularity, but rather
as contributing members of the comprehensive wholes (families, professions, states) of which they are members.

The essays in this volume then can be seen not just in terms of Kant and his influence, but in the way that all of the writers and theorists covered here can be located within the overall framework of the modern project as it had developed in the second half of the eighteenth century and the turns it took at the beginning of the nineteenth century. All of the authors discussed in this volume can be seen as heirs to the Enlightenment in the sense that all of them remained committed to the project and the prospect of the continued progress in human affairs. Where they differ is the accents they place on the role of reason alone to guide that process, how they strike the balance between tradition and change, what role they see for institutions in the process, and how art and philosophy should contribute to that change.
The year 1781 marks the beginning not only of a remarkably productive two decades in Kant’s own work, but in many ways also a decisive turning point in the history of philosophy. Up until that point, Kant\(^1\) was known as a gifted, but not very significant figure in the German philosophical scene. But 1781 marked the appearance of the first edition of the *Critique of Pure Reason*, in which Kant introduced a “critical” philosophy with a radical new approach to traditional questions in epistemology and metaphysics that completely reshaped the philosophical landscape. In the years that followed, he would produce equally significant and original contributions to philosophical ethics in his *Groundwork of the Metaphysics of Morals* (1785), *Critique of Practical Reason* (1788), and in the second part of his *Metaphysics of Morals* (1797); an influential new approach to theories of art and the production of artworks in his *Critique of Judgment* (1790), novel ways of considering the philosophy of history in the *Critique of Judgment* and in his later political essays such as “Concerning Perpetual Peace” (1795); important reinterpretations of theological themes in all of these works and in his *Religion Within the Boundaries of Mere Reason* (1793); and theories of the state and society in the first part of the *Metaphysics of Morals* and in his later essays. The impact that this work had on the history of philosophy in general and on

---

1. Immanuel Kant (April 22, 1724–February 12, 1804; born and died in Königsberg, East Prussia) studied philosophy, theology, mathematics, and science at the Albertina-University of Königsberg (1740–48). He became a tutor in private families near Königsberg (1748–54) before returning to the university to finish his dissertation and take up an appointment as Privatdocent (1755–69). He went on to be appointed Professor ordinarius for Logic and Metaphysics (1770–96).
what later, in the second half of the twentieth century, would come to be known as “continental philosophy” can hardly be overstated.

I. EARLY WORKS

The publications prior to 1781 are commonly referred to as Kant’s “precritical writings.” They give little hint of the scope, originality, and significance of the work that was to follow. Of relatively modest origins (his father was an independent harness-maker), Kant was raised and schooled in an atmosphere that was strongly influenced by Pietism.² As he began his university studies at the age of sixteen, however, he was also strongly influenced by the theology professor Franz Albert Schultz (1692–1763) and the philosophy professor Martin Knutzen (1713–51), both of whom took seriously the work of the Leibnizian Christian Wolff (1679–1754), who had been banished from Prussia at the urging of some orthodox Pietists, who saw his relatively enlightened adoption of Leibnizian philosophical positions such as pre-established harmony as a threat to traditional religious belief. Other prominent influences there were professors oriented on Aristotelian philosophy and on Christian Thomasius’s (1655–1728) eclecticism.

Kant’s earliest publications deal with questions at the intersection of natural science and philosophy and on methodological issues in philosophy and theology. His first book, Thoughts on the True Estimation of Living Force, written in 1746 and published in 1749 when Kant was still a young student, and his 1755 dissertation Succinct Exposition of Some Meditations on Fire and his General History of Nature and Theory of the Heavens from the same year are examples of the former; prime examples of the latter are his 1755 essay A New Exposition of the First Principles of Metaphysical Knowledge, which he defended as part of the requirements for his appointment as private docent, his essay on The Only Possible Basis of a Demonstration of the Existence of God (1763), his Investigations of the Clarity of the Principles of Natural Theology and Morals (1764), and the inaugural dissertation On the Form and Principles of the Sensible and the Intelligible World, which he defended in conjunction with his appointment to the rank of professor in 1770. The underlying issues throughout all of these works is the attempt to reconcile the empirical and rational grounds

². A succinct and helpful overview of Kant’s earlier years can be found in Otfried Höffe, Immanuel Kant (Albany, NY: SUNY Press, 1994), 9–15. For a more extensive and thorough description of Kant’s biography and intellectual development, see Manfred Kühn, Kant: A Biography (Cambridge: Cambridge University Press, 2001). His publications from this period are all published in Gesammelte Schriften, begonnen von der Königlich Preußischen Akademie der Wissenschaften (Berlin: de Gruyter, 1900– ) (known as the Akademie-Ausgabe), vols I and II; hereafter cited as AA followed by the volume and page numbers.
of knowledge and the question of the possibility and limits of metaphysical reasoning in resolving disputes regarding natural phenomena such as comets, tides, and fire as well as debates in theology, morals, and rational psychology. They also show how he began to move beyond the framework of rationalist metaphysics in the Leibniz–Wolfian mode and to incorporate the critical stance of thinkers such as Rousseau and Hume into his own work.

During his years as private docent, Kant’s sole source of income was the fees paid by the students who attended his lectures. Nonetheless, it is also during this period that Kant gained a reputation for sociability and a kind of urbane cosmopolitanism in spite of the fact that he had not ventured (and never would travel) more than about a hundred miles from Königsberg. His appointment to a professorship in 1770 alleviated his financial concerns considerably, but during the following ten years prior to 1781, Kant’s publication output was so scant that this period of his career has become known as “the silent decade.”

One way to introduce the problems that occupied Kant’s thinking during that decade is in terms of the positions he defended in his inaugural dissertation about how knowledge in general is possible, and more specifically rational metaphysical knowledge of what he calls the “sensible and intelligible worlds.” He notes there, for instance, that there are certain “forms” that seem to be invariant features of every object even within the sensible world, namely space and time, but that these forms are not “rational forms or nexus of objective ideas” but rather “phenomena” that “attest to some principle of universal conjunction but do not exhibit it.” Moreover, with regard to the “matter” or

---

4. During this period, Kant did not publish any philosophical works at all. He did publish a very brief book review and two essays: one “Concerning the Different Races of Mankind”; the other, very brief essay entitled (in German) “Aufsätze, das Philanthropin betreffend” in support of a progressive educational institution. All three of these publications are contained in the *Akademie-Ausgabe*, vol. II.

6. I will render Kant’s term “Erkenntnis” as “knowledge” in this essay even though that usage departs in some ways from common interpretations (especially in epistemology) that take knowledge to be belief that is certainly true. For Kant, metaphysical knowledge aims at a kind of certainty that is not possible for empirical “Erkenntnisse.” For Kant, then, empirical “knowledge” aspires to truth but is in principle always subject to refutation or revision.

7. Inaugural Dissertation, in *Akademie-Ausgabe*, vol. II, 391; hereafter cited as ID followed by the volume and page numbers in *Akademie-Ausgabe*. With the exception of quotes from the *Critique of Pure Reason*, citations within the text identify Kant’s other works using abbreviations as follows: *Critique of Practical Reason* (CprR); *Groundwork of the Metaphysics of Morals* (GMM); *The Metaphysics of Morals* (MM); *Prolegomena to any Future Metaphysics* (Prol).
“contents” as opposed to the form of objects within the sensible world, metaphysical knowledge cannot say anything, since from the standpoint of metaphysics these appear as “accidents” or “contingencies” that cannot be derived from the concepts of those things. Knowledge of these properties or determinations of objects in the “sensible world” is given to us through sensibility, not through the intellect (commonly translated into English as “understanding” as a result of Kant’s own translation of the Latin term “intellectus” into the German “Verstand”). This “sense knowledge” provides us, he says there, “merely representations of things as they appear; intellectual knowledge by contrast are representations of things as they are” (ID, II, 392). He traces back the form of these objects to a kind of image that results from laws innate to the subject and its mind. Since these images, space and time, are the forms of all appearances, Kant says, they are nonetheless “true” because they are necessary components of the appearance of any sense object.

Insight into the “intellectual world” that provides access to the “things themselves” is for Kant still seen as possible through the employment of concepts that are accessible to the intellect (at this stage Kant does not distinguish between what will later be seen as the two different faculties of the understanding and of reason). Hence, methodological reflection must restrict the use of the principles of the sensible world to appearances; however, Kant still maintains that proper employment of intellectual concepts such as “cause,” “substance,” and “necessity” can be employed to attain knowledge of the things in themselves in a manner similar to the analyses conducted in Leibnizian–Wolffian metaphysics. The guarantee for the possibility of such knowledge is the fact that, “The human mind is only affected by external things and the world is only infinitely accessible to human intuition to the extent that it, together with everything else, is sustained by one and the same infinite power of a single entity” (ID, II, 409), a view that, he admits, puts him in close company with Malebranche, “namely that we intuit everything through God” (ibid.). In spite of the similarities of several of these doctrines with the positions later expounded in the Critique of Pure Reason, for instance the conception of space and time as forms of the sensible world that have their origin in the subject and hold only for appearances, the dominant idea here is still that traditional metaphysical knowledge of things in themselves is possible through the proper employment of intellectual concepts.

---

Specific passages are identified by reference to the Akademie-Ausgabe by volume and page numbers. Those page numbers are listed in the margins of other editions and translations, so the reader can easily identify the passage without needing to consult the Akademie-Ausgabe itself. Quotes from the Critique of Pure Reason will follow the standard convention of listing the page numbers in the first edition (A) from 1781 and second (B) edition from 1787, which are also normally listed in all scholarly editions and translations of that work.
II. THE CRITIQUE OF PURE REASON

The basic question that Kant wrestles with during the following ten years can be summarized most succinctly through a famous quote from a letter to his friend and student Marcus Herz dated February 21, 1772. In his reflections on a “general phenomenology” that would introduce a theoretical metaphysics that could provide the basis for practical philosophy, he notes that:

As I thought through the theoretical part, considering its whole scope and the reciprocal relations of all of its parts, I noticed that I still lacked something essential that I had failed to pay attention to and that, in fact, constitutes the key to the whole secret of hitherto still obscure metaphysics. I asked myself: What is the ground of the relations of that in us which we call “representation” to the object?

(AA X, 129–35)

If the sensibility simply gives us representations of the objects and not the objects, then one finds oneself trapped in the problem that has vexed modern philosophers from Descartes to Hume, namely, how do we know that these representations are “true,” that is, correspond to the objects they purport to give us? If the reply falls out along the lines of the inaugural dissertation, and we count truth as agreement with the representations, then it seems we abandon any claims to genuine objectivity except by recourse to the creator God who governs the order of nature and the order of the human mind accordingly. Moreover, the entire edifice rests on the ability of the intellect’s concepts to grasp the true nature of the things themselves, that is, the universe, the mind, and God without any reliance on the senses – and if the guarantee for the ability of the mind’s ability to do so is supposed to be a benevolent and all-powerful creator God who is the source of the universe and the mind’s order, then this seems to fall prey to the same sort of circularity that befell Descartes. When Kant later famously attributes Hume with having awakened him from his “dogmatic slumbers” (Prol, IV, 260), it is precisely these kinds of questions that he recognizes his previous position could not answer.

Kant famously describes the radicality and originality of his solution to the problem in the Critique of Pure Reason through a comparison with Copernicus’s “revolution in the way we think” (B XXII n.). Instead of assuming that the objects have a pregiven structure in themselves and then asking how human cognition can come to know it, Kant says that we should pursue the hypothesis that there are structures of knowledge that are necessary for the very experience of any object so that any object we can ever possibly experience must conform to and hence exhibit those structures. Although he makes clear that he begins
with this assumption as a hypothesis, he believes that the results of the analyses he presents in the Critique confirm that he has taken the right approach. Just as Copernicus begins with a counterintuitive assumption that ends up providing a better and more elegant solution that still explains the facts we observe about planetary movement in our daily lives, Kant believes that by adopting several counterintuitive philosophical assumptions, he can explain and vindicate our everyday beliefs about things that are otherwise difficult to explain.

The general structure of the Critique still exhibits traces of the overall organization of Wolff’s metaphysical system that began with a “metaphysica generalis vel ontologia,” followed by a “metaphysica specialis” that is subdivided into a rational psychology, a rational cosmology, and a rational theology. The former corresponds roughly to Kant’s “Transcendental Aesthetic” and “Transcendental Analytic,” which represents the first section of the “Transcendental Logic”; the latter to the “Transcendental Dialectic,” which makes up the second section of the “Transcendental Logic.” Together, the “Transcendental Aesthetic” and the “Transcendental Logic” are grouped together under the heading of a “Transcendental Doctrine of the Elements,” which constitutes about 80 per cent of the book. They are preceded by a brief “Preface” and a longer “Introduction,” which outline his general approach, and the book closes with a “Transcendental Doctrine of Method,” which provides some general reflections on the method of Kant’s transcendental philosophy, and an architectonic that outlines the systematic place of various philosophical topics that may be treated with the framework of transcendental philosophy.

The “Transcendental Analytic” shares with traditional ontology the claim that it can show the formal principles of any object whatsoever, with the important caveat, however, that these principles apply only to the extent that these objects can be objects of experience for us. This means that it must remain mute about the possibility that there can be objects that may exist but lie beyond the range of possible experience for us. The “Transcendental Dialectic” then turns explicitly to such objects, namely the soul, the world as a whole, and God, showing why human reason inevitably gives rise to such ideas, but demonstrating that and why experience can neither confirm nor refute the existence of those objects.

Much of the Critique hinges on Kant’s analysis of the very notion of “experience” (Erfahrung) itself. In fact, in several places Kant explicitly describes the project as a “Zergliederung” – literally a “dissection,” or, to use a Greek term that provides the basis for the common English translation of the term, the “analysis” (“breaking up” or “taking apart”) – of knowledge and the appearances that are given to us in experience. Kant tries to show that experience involves more than just having sense impressions – or even having them against the backdrop of a formal backdrop of space and time as he had described in the inaugural dissertation. Rather, it must be organized in terms of concepts that bring
these impressions into some sort of unity. And, of course, from the very outset, Kant had believed that, at least for objects in the sensible world, concepts alone are not sufficient without some input from the senses. Hence Kant’s famous dictum: “Thoughts without concepts are empty, intuitions without concepts are blind” (A 51/B 75). The general view is that positive knowledge is possible only on the basis of experience, which necessarily involves both sense experience (intuitions) and the operations of the intellect (concepts). In the Critique, Kant further distinguishes between those functions of the mind that are involved in the organization and unification of intuitions into knowledge from the functions that involve the higher-order unifying operations of seeking overarching unities or ultimate grounds for knowledge in objects that lie outside the realm of sense experience. The former he calls “Verstand” or “understanding”; for the latter, he reserves the term “Vernunft” or “reason” in the strict sense. He concedes, though, that the term “reason” is often used ambiguously, sometimes as a name for the “higher faculties” encompassing both the intellect and reason and sometimes just for reason in the narrower sense.

In the Critique, Kant’s primary focus is on reason only in its theoretical function, that is, in its claims to knowledge. He believes that a proper comprehension of the possibilities and limits of theoretical reason is crucial for an adequate understanding of the role and possibilities of practical reason as well, but the latter are not the primary focus of the “first Critique” from 1781. His conclusion is that the intellect in conjunction with the senses can provide us with more or less reliable, empirical knowledge of sense objects, but that reason alone cannot yield theoretical knowledge – with the sole exception of philosophical knowledge that can be gained through reflection about the necessary conditions for the possible objects of experience, that is, the empirical knowledge of natural objects that can be given to us through the senses. The former kind of knowledge follows from sense experience and hence – using the Latinate term – is called a posteriori; the latter, because it does not derive from the senses, is by contrast a priori. If the latter could tell us something new that is not just a repetition of what is contained in a concept, but rather in this case a demonstration of the necessary conditions for experience itself, it would not only be a priori – at least with regard to experience and the objects of experience – but it would also be “synthetic.” Hence, for Kant, “transcendental” (as opposed to “empirical”) knowledge, which had been the traditional goal of metaphysics, is no longer seen as pure rational knowledge about unchanging non-natural objects such as God or the immortal soul, but rather as synthetic a priori knowledge about the conditions for the possibility of the experience, and therefore of empirical knowledge of natural objects or “appearances.” The critique of pure reason is then a first step toward a system of pure reason because it would show the sources and limits of pure reason. Because the emphasis within the realm of theoretical reason is on
the limits of reason alone, philosophy as “transcendental knowledge” no longer claims speculative insight into eternal or necessary objects, but rather takes a completely different form: “I call all knowledge transcendental that does not concern itself so much with objects, but rather with our way of knowing objects in general, in as far as the latter is possible a priori. A system of such concepts would be called transcendental philosophy” (B 25).

The pure forms of intuition: space and time

The term “concepts” as employed in the previous quote turns out to be fairly broad, because the first section of the “Transcendental Doctrine of Elements,” namely the “Transcendental Aesthetic,” identifies two such a priori elements of experience that are not derived from the intellect, but as “forms of intuition” are necessary preconditions for the perception of sense objects. Space and time, Kant says, are not things we directly perceive, but are necessary elements of our perceiving, “intuiting” (Anschauung) the objects of sense perception. The general ability to have impressions of objects given to us, Kant calls “receptivity”; “sensibility” is the act of being affected (affiziert) by the objects (A 19/B 33); and he follows the modern philosophical tradition in calling the effects of this process “impressions” (A 19–20/B 34). The latter correspond to the “matter” (Materie) or “manifold” (Mannigfaltige) of sense objects as given in perception. In our intuition of sense objects, Kant notes, in addition to the matter, in each case predicates that are of a different kind, namely spatial predicates related to their location such as “above/below,” “next to,” “in front of/behind,” “right/left,” and so on, and temporal predicates such as “before,” “at the same time,” or “after.” These “formal” predicates are of a different kind than the material ones. They are not tied to one of the specific senses as are color, smell, and sound; nor can we imagine a natural object that does not have spatial or temporal location, in contrast to material predicates that may or may not apply to specific objects (for instance, a sound without a color, much less a specific color, taste, or sound). One helpful way to think of the difference is the way that the material predicates apply to properties that are clearly adjectival in nature, for example, “blue” or “loud,” whereas the temporal and spatial predicates are in a certain sense adverbial – they tell us the “when” or the “where” of the experienced object. Hence, Kant argues, these forms or “modes” of the way objects are intuited are “a priori” because they are universal and necessary predicates – as opposed to the particular and contingent properties given to us as the appearance’s “matter.” Moreover, he argues, they cannot come to us “from the object” – his term is that they are not “of objective origin” – because then they would share those features of particularity and contingency that are shared by all of the predicates that come to us through sensibility as our only access to natural objects. Here he is building
on Hume’s insight into the lack of strict predictability based on past experience. With regard to empirical properties, Kant agrees with Hume, but he thinks that the spatiality and temporality of sense experience are different. They cannot “come from” the object precisely because they do not share that feature of experiences derived from the senses; and since everything is either a subject or an object and they do not come from the objects, they must then be “of subjective origin.” Nonetheless, Kant claims they hold for and apply to all possible objects of experience (i.e. possess “objective validity” or “objective reality”) since any experiences of natural objects will necessary be in terms of these a priori dimensions of sense experience (A 326–9/B 42–4).

Their a priori and formal character is what makes it possible to describe them in a priori sciences that investigate these formal systems as such, namely in geometry, which examines the formal characteristics of space as such, and in arithmetic, which is based on a system of ordered succession, and all of the other formal systems of mathematics that are derived from these two.

The pure forms of thinking: the categories

As mentioned above, intuition alone is not sufficient for experience. In order to experience objects, Kant says that the material provided by intuition must be organized according to concepts before we can recognize any object as this or that thing of this or that kind. Not only the “receptivity of impressions” but also the “spontaneity of concepts” (A 50/B 74) is required for knowledge. Concepts, he says, are “functions” or “activities” that bring together the material that is presented in spatial and temporal arrangements and organizes it into knowledge. In our daily lives, these are specific concepts such as “boat,” “house,” “dog,” or “lantern,” to use just a few of the examples that Kant employs. However, what is common to all of them is that they are “forms” of unity, general ways of distinguishing differences and drawing things together in terms of similarities. Kant builds here on what he sees as Aristotle’s insight that there are a finite number of logically relevant “forms of judgment,” formal distinctions in the ways that concepts are combined into judgments, and he argues that these different ways of unifying concepts parallel the ways that these functions organize the material provided by intuition into concepts. According to Kant’s own slight revision of a table of judgments as developed with the logics of the Leibniz–Wolffian school, the table of judgments can be organized into four headings, each with three specific forms within them: quantity – universal, particular, or individual; quality – positive, negative, or infinite (a mixed mode of positing a non-negative such as “that is not-white”); relation – categorical, hypothetical, or disjunctive; and modality – problematic, assertive, or apodictic. Accordingly, the pure forms of thinking when applied to the manifold given in perception, what he calls the
“categories,” are also twelve in number, with three under each of four different headings that correspond to the forms of judgment, namely quantity (unity, plurality, or universality); quality (reality, negation, limitation); relation (inheritence and substance, cause and effect, mutual interaction); and modality (possibility, actuality, necessity).

The argument that these are the twelve categories, Kant calls the “metaphysical deduction” of the categories. In addition to that argument, Kant thinks that he also needs to show that and how they are related to objects, how they have “objective validity.” The strategy he employs parallels the “transcendental deduction” of the pure forms of intuition. Once again, he tries to show that, even though they do not originate from experience, they are nonetheless “necessary conditions for the possibilities of experience” and hence for any object of experience for us. He tries to show that without such forms of unity, the objects of sense intuition would not be “objects for us” (A 90/B 123). More specifically, in the two versions of the section entitled “Transcendental Deduction of the Categories” – one from the first edition of the Critique in 1781 (usually referred to as the “A” edition) and another, almost completely revised version in the second edition of 1787 (the “B” edition) – he argues that experience, the objects of experience, and even the consciousness of the subjects who experience objects are unities, not just aggregates of data that come and go over time. Each of them has a fundamental unity across time in spite of the specific changes in the state of experience, in objects, and in the subjects of experience over time. Kant asserts that intuition provides us with a series of impressions that are arranged into temporal and spatial constellations, but that without some other forms of unity to actively group them together and organize them, neither the world nor the objects within it would ever exhibit the unity that is an essential feature of nature as a whole and the objects it comprises. Knowledge involves recognition of patterns and the a priori assumption that there are patterns within experience. The fact that we must assume that we can and do organize our intuitions according to these patterns for knowledge to be possible is the core insight that Kant advances in these sections. At the same time, this “justification” exhibits the limits of the categories. As forms of unity, they depend on and are essentially related to the material presented by intuition, which is why they represent essential conditions for the recognition of objects of experience and hence for the objects presented in experience as appearances “for us,” but we have no basis for extending their validity any further than that.

Kant’s famous summary of his argument in terms of the relationship to possible experience as the supreme principle of every synthetic judgment states: “the conditions for the possibility of experience in general are at the same time conditions for the possibility of the objects of experience and thus possess objective validity” (A 158/B 197). This explains why he also concludes that the categories
have validity for objects of possible experience, but not for things in general – that is, not for objects that may or may not exist “in themselves” but that, by their very nature, would be outside the parameters of any possible experience.

These general arguments about the nature and necessity of the categories leave open the question how specifically they apply to objects. Based simply on the arguments articulated in the two versions of the “Transcendental Deduction of the Categories,” it is not clear what guidance – if any – intuition provides to the understanding. The deductions make clear that intuition is required for knowledge, but it might seem that the intuitions simply provide a kind of raw material that can be formed in whatever way the subject may choose in thinking. The section that follows the deductions, called the “Analytic of the Principles” attempts to show how concepts apply to objects as appearances according to a priori principles that ultimately can be traced to the universal form of all intuitions, namely time. Since all intuitions are given with a temporal dimension, Kant argues, the formal characteristics of their temporal givenness can be used to provide guides, or “schemata” for the application of the pure categories of the understanding.

For instance, Kant says that the pure schema of quantity is number, which is nothing other than the successive (a temporal term, in Kant’s view) addition of one and one. The categories of quality all have the formal character of an intensity that can also be expressed in terms of a number or quantity. Most famously and clearly, the categories of “relation” such as substance and causality have temporal schemata, namely simultaneity according to a rule for substance and succession according to a rule for causality. Finally, the categories of modality can also be characterized in terms of their relationship to the conditions of experience. “Possibility” means that something “could” appear since it is not inconsistent with the conditions of experience (intuition and concepts). “Actuality” means that it has a relationship to what he calls a “material condition” of experience (to an impression given in some “now”). Necessity involves a connection to what is actual according to a universal condition of experience (“always”) (A 218ff./B 265ff.).

Attaining knowledge involves organizing the material provided by the senses according to the general rules of what things are “always” given together (e.g. the properties of a substance) or “always” succeed each other (according to a causal law). Hence, intuition provides not only the “raw material” for knowledge, but a guide for how to arrange them in terms of their formal temporal relationships and the measure and the corrective of empirical knowledge through what Kant calls the “further course of experience.” Empirical knowledge is always open to revision because the rules that we are attempting to discern through the course of the specific experiences given to us are intended as holding “always,” but our specific experiences can tell us only what orders of concurrence and succession have proved to be the case “up until now,” so that further experiences can
confirm or refute those patterns that we take to be to the objective rules of what Kant calls “time itself” (A 200/B 245).

The general picture that emerges is one of nature as a rule-governed whole of individual objects (substances) that causally interact with one another. We gain knowledge of nature and natural objects by recognizing the regularities in the constellations of impressions provided to us by the senses. The examples Kant cites in the Critique are everyday objects – lanterns, houses, and boats. For instance, in the “Analogies of Experience” he describes how I recognize that the house I am seeing remains the same even though what presents itself to me in perception changes as my gaze focuses first on one part of it, for example, the bottom floor, then on another, for instance, the top floor. I recognize that the changes in what I perceive are not due to changes in the object, but to changes in my perceiving of it. It is very clear that Kant does not think that time and space or the categories are relevant only for knowledge within the natural sciences. However, this general picture of nature is certainly consistent with that of modern natural science along Galilien/Newtonian lines, and his schematization of even the qualities of the impressions presented to us by the senses in terms of their quantifiable intensity suggests that he follows the view underlying much of natural science at the time that sees true properties of natural objects as those “primary qualities” that can be measured (such as wavelength and weight) instead of secondary qualities, such as “blue” or “sweet,” that depend on the specific nature of individual human sensibilities. In fact, Kant himself claims that the consistency of his philosophical theory with modern natural science is an indication of its truth and even tries to provide an explanation and justification of his positions for a broader audience in the Prolegomena to any Future Metaphysics from 1787 by showing that his work can answer the questions “How is pure mathematics possible?” and “How is pure natural science possible?” in a way that none of his predecessors or contemporaries could.

Throughout the history of the reception of Kant’s philosophy, this close tie to modern natural science has been seen as a virtue, for instance, in late-nineteenth- and early-twentieth-century neo-Kantianism that took this to be an indication of Kant’s genius. However, even in the late nineteenth century, other philosophers such as Dilthey\(^\text{10}\) began to criticize Kant’s approach not as

false, but as limited because it may indeed have correctly identified the “categories of nature,” but completely overlooked the “categories of life” and history that provide the basis for the cultural and human sciences.\textsuperscript{11} Along the same lines, Husserl\textsuperscript{12} will fault him for having overlooked the possibility of other “regions” in addition to nature as the correlate of natural science and hence of completely different sets of categories that would govern them. In short, they fault him for following modern science too uncritically in its orientation on “objectivity” and for adopting a much too narrow notion of human cognition. Moreover, subsequent developments in mathematics and natural science raise the question whether Kant’s orientation on Euclidean geometry and Newtonian physics as the paradigms of knowledge is not evidence that what he took to be universal and unchangeable \textit{a priori} principles are actually assumptions that hold only relative to these specific systems that are no longer taken to be the only or even the best mathematical and scientific theories.

\textit{The “Transcendental Dialectic”}

As mentioned above, the primary purpose of the “Transcendental Analytic” was to show that it is indeed possible to identify certain \textit{a priori} principles for experience and for the objects of experience. Most contemporary work on Kant’s theoretical philosophy focuses primarily on the validity of this claim. In his own age, however, Kant’s work was seen as significant and controversial just as much for the obverse side of this claim, namely that knowledge of the traditional objects of metaphysics is impossible so that claims about the nature and existence of the immortal soul (or even the self as a substance), about God, or about the world as a whole from a nonempirical perspective can be neither proved nor disproved – they simply transcend the abilities of finite knowers such as human beings. Compared to the aspiration and claims of the metaphysical tradition before him, Kant then appeared as the “\textit{alles zermalmender}” (the one who shatters everything), as his friend Moses Mendelssohn famously formulated.

In the “Transcendental Analytic” Kant had repeatedly stressed that time, space, and the categories apply only to the objects of experience and that “thinking without intuitions” is empty, but it is only in the “Transcendental Dialectic” that Kant identifies the origin of the inherent tendency of human reason to overreach and offers a detailed refutation of the arguments that had traditionally been advanced in defense of the claims to possess reliable knowledge of the entities

\footnotesize{\textsuperscript{*12} Husserl is discussed in detail in the essay by Thomas Nenon in \textit{The History of Continental Philosophy: Volume 3}, as well as in several other essays in that volume.}
it posits as a result. He begins by characterizing dialectic as a “logic of illusions” (*Logik des Scheins*) (A 393/B 349) and asserting that these illusions arise from the nature of reason itself and its search for first principles or grounds. Kant distinguishes between thinking in its function of synthesizing intuitions into concepts and articulating that experience in judgments, which he calls “understanding,” from thinking in its search to bring unity to knowledge by grounding these judgments in first principles, which he calls “reason” in the narrower, strict sense of the term as employed in the “Transcendental Dialectic.” He follows Plato in calling these first principles that, by their very definition, cannot be sense-objects and hence lie beyond the possibility of being given through intuition “Ideen” (Ideas; usually capitalized in English to distinguish them from “ideas” in the sense of mental states).

Kant claims to show that three, and only three, such ideas are conceivable: the absolute unity of the thinking subject (i.e. the self or the soul), the absolute unity of the series of the conditions of experience (i.e. the world as a whole), and the absolute unity of the condition for all objects of thinking at all (i.e. God) – corresponding precisely to the objects of rational psychology, rational cosmology, and rational theology in the Liebnizian–Wolffian metaphysics that had preceded him.

He addresses each of them separately and shows how the illusions of knowledge of such objects can arise by applying the categories (and in the case of rational cosmology, the pure forms of intuition) to the entities. Having established in the “Transcendental Analytic,” however, that the pure forms of intuition and thinking have their proper application only to the objects of possible experience, Kant then concludes that these claims lie outside the bounds of human knowledge. In the “Paralogisms,” for example, Kant shows how the idea of a self arises when one posits a ground of thinking that is a substance. Although, as Kant noted already in the “Deduction of the Categories” in the 1787 edition, the “I think” must be able to accompany any of my thoughts (B 131–2) because to deny that would be to deny the thought or deny that I am the one having that thought, this does not mean that I am aware of myself as a unified substance. It simply means that thinking and the object of thought are not identical, and that, in an act of reflection, I can always turn my attention from the object of the thought to the thinking of the thought as something that I am aware of. However, that does not mean that we are given to ourselves as an object of experience, and it certainly does not mean that I am ever aware of myself as an ego independently of the acts of thinking that are what I am aware of when I am aware of myself. One of Kant’s most important legacies in the history of German idealism and in continental philosophy is the shift from thinking of the self or ego as a “what” to an activity, from a thing within the realm of experience to the site of experience or to experiencing itself – beginning with Fichte’s notion of
the ego as a “Tathandlung” (active deed) through Heidegger’s notion of Dasein to current French phenomenological thinkers such as Marion and Henry, who call into question Cartesian notions of subjectivity that are inadequate to the actual experience we have of our lives.

Best known among these refutations of traditional metaphysical speculations are Kant’s analyses of the various dilemmas that arise around questions concerning the world as a whole. In the section entitled “The Antinomy of Pure Reason,” Kant deals with questions such as whether the world as a whole has temporal limits (a beginning and an end) or spatial limits (infinite extension or a finite size); whether it is a unified whole whose parts are dependent for their nature and existence on the whole, or whether it is an aggregate of independently existing units; whether every event in nature is determined or whether it is possible for events to occur that initiate new causal chains within the world; and whether nature has necessary beings within it that serve as the explanation for other contingent beings or whether it is necessary to seek an explanation for nature in a necessary being outside nature. In each case, Kant shows that the antinomies are irresolvable because arguments can be provided for each of the two alternatives that seem to be equally valid. This is because each of them rests on false assumptions about the application of the pure forms of intuition or of the categories such as causality, substance, and necessity that have their proper function within the realm of experience, but cannot be applied to things that by definition are beyond sense experience. For instance, we experience individual material objects that do have specific temporal and spatial locations, but the world as a whole is never an object of experience. So it makes no sense to say that it has a specific spatial or temporal location. To solve the dilemma, Kant introduces the notion of an indefinite progression according to which it is always possible to think of a distance or a time further removed from the present one than another one that is slightly closer, but he says we can never actually experience the infinite series of all of the possible points further removed, nor can we think of a specific object or a point that is located at a limit that cannot be exceeded. Empirical objects are necessarily located in time and space, but the world as a whole neither is nor is not located in time and space.

Kant’s approach to this issue is still considered relevant to discussions in philosophy and theory of science about space, time, and cosmology. However, the greatest historical significance and, according to Kant’s own estimation, the most crucial issue addressed in the antinomies is the conceivability of events that are not subject to the laws of natural causality, that is, the question about

*13. For further discussion of Fichte, see the essay by Robert R. Williams in this volume.
*14. For a discussion of Marion and Henry, see the essay by Bruce Ellis Benson in The History of Continental Philosophy: Volume 7.
whether freedom is or is not possible. For us to make sense of a natural event, he says, we must conceive of it as following from other natural events according to causal laws. Exactly what Kant's solution to the dilemma entails is still a matter of scholarly debate, but this much is clear: if there is to be some such “absolute beginning” for a causal chain of subsequent events in the world, it would have to originate in a source outside nature. Causality as a category applies to every natural event within the world, but that does not mean that freedom is impossible if some other non-natural factors or agents would exist outside the sensible realm whose actions would follow different laws than those of natural causality. Whether such entities actually exist is a question that lies outside the bounds of theoretical knowledge.

Finally, in the third main section of the “Transcendental Dialectic,” entitled “The Ideal of Pure Reason,” Kant explicitly addresses the question whether a theoretical proof for the existence of God is possible, and he comes to a negative conclusion. While theoretical reason cannot prove that God exists, the fact that such a God cannot possibly be an object for sense experience and cannot be proved by theoretical reason alone does not definitively establish that God does not exist. It simply means that the existence of God is a matter of faith, not knowledge. Here once again, the general strategy is to show that concepts whose proper application lies within the domain of experience, such as actuality (genuine existence), have no application to entities outside the realm of possible experience.

The term Kant uses for such entities in the *Critique* is “noumena” because they are possible objects for thought, but not experience, whose proper objects are appearances or “phenomenal objects” (see the section “Concerning the Grounds for the Distinction of All Objects in General into Phaenomena and Noumena” [A 235ff./B 294ff.]). The soul, the world as a whole, and God are clearly such noumenal objects. Another way of expressing this same point is that they can never be “appearances” and so, if they do exist, they exist as “things in themselves.” An additional controversial point among Kant’s readers from the very beginning has been the question of whether it makes any sense to talk of “things in themselves” in addition to those three, objects to which we do not have access but that underlie or somehow cause the appearances to which we do have access. Does it make sense to think of a “table in itself” that is the cause of the appearance “table”? The notion of appearances as formulated in the inaugural dissertation suggests that at that stage, Kant might have thought the answer was yes, and many commentators and critics have assumed that this is still Kant’s position in the *Critique*. However, it is hard to reconcile Kant’s repeated assertions that notions such as “actuality,” “cause,” and “substance” have objective validity only for objects of possible experience and the relationships between them with the idea of positing the “existence” of things in themselves that are
the “causes” of the “appearances” that are not themselves natural objects but part of experience itself.15

What is beyond dispute is that the Critique opens up a space to posit the existence of the traditional “things in themselves” as a matter of faith or for other possible reasons not related to theoretical knowledge. In fact, as we shall see, the limitations of the claims of knowledge within the practical sphere are crucial elements in Kant’s own development of a moral theory that he will see as consistent with the claims of knowledge and with modern natural science, but still leaves room for freedom and hence moral agency and for a unique reinterpretation of the traditional role of notions such as souls, an afterlife, and a divine order to the universe in a practical regard.16

III. KANT’S MORAL PHILOSOPHY

According to Kant’s own self-understanding, the clear distinction between the realm of experience and the intelligible realm that he sketches out and defends in the Critique of Pure Reason opens the way for a critique of pure practical reason that will provide a philosophical foundation for a theory of morality that he believes is the only one that can guarantee the binding character of moral obligation. He introduces the basic outlines of this theory for the first time in the Groundwork of the Metaphysics of Morals in 1785; follows up with a comprehensive Critique of Practical Reason in 1788, which provides a much more comprehensive presentation of the relationship between Kant’s moral theory and traditional metaphysical issues such as freedom, immortality, and God; and then elucidates the normative application of this theory in “The Metaphysical Grounds of a Doctrine of Virtue,” which is the second part of his Metaphysics of Morals from 1797. Kant does not claim that his theory advances a new moral code, but rather that his theory provides a philosophical foundation for the everyday common-sense morality of which every rational human being has an implicit awareness.

15. For an attempt to provide a reading of the Critique that does not involve the need to posit these kinds of “things in themselves” as the grounds for appearances, either on textual or systematic grounds, see my Objektivität und endliche Erkenntnis, esp. 171–4.

16. Wilhelm Windelband (in “Ueber die verschiedenen Phasen der Kantischen Lehre von Ding-an-sich,” Vierteljahresschrift für wissenschaftliche Philosophie 1 [1876]) is the first to have correctly observed that the concept of “things in themselves” plays a much more prominent role in the second edition of the Critique of Pure Reason than it did in the first. He attributes this increased interest to Kant’s development of an entirely new approach to moral philosophy between the first edition in 1781 and the appearance of the second edition in 1787, two years after the publication of his Groundwork of the Metaphysics of Morals in 1785, and the crucial, positive role that this concept plays in his practical philosophy.
Groundwork of the Metaphysics of Morals

The very title of the *Groundwork* signals that Kant has not given up on the claim that philosophy can identify *a priori*, nonempirical or “metaphysical” principles for practical reason. The starting-point for his moral theory is an analysis of what he takes to be our common intuitions about the nature of moral obligation. He begins with the assertion that “There is nothing in the world, indeed nothing at all that one can imagine outside of it, that could be considered good without any qualification except for a *good will*” (GMM IV, 393). He continues by comparing the goodness of a good will with that of other things commonly taken to be goods such as character traits, talents, material goods, and even happiness, but concludes that the first three cannot be said to be good if they are misused, and that happiness itself cannot be considered good without reservation, for instance in the case of an immoral person who has everything she wants in spite of the harm she causes other people. Happiness, he claims, is only considered a good by an “impartial observer” (*ibid.*) if the happy person is morally deserving of happiness.

What makes the good will good is not what it achieves, but rather the very fact that its sole aim is the good, and for Kant this means the will that acts based on its awareness of its obligation or its duty (*Pflicht*). It is not enough for the will merely to be in line with duty, for example, that I do what I should do for a non-moral reason such as fear of retribution or desire for recognition, but rather the awareness that this or that act is one’s duty must be the reason for willing that action if the will is properly to be considered a good or moral will. What then is “duty” and where does it come from? Kant defines it as “the necessity of an action done out of respect for the law” (GMM IV, 400). How can this be squared with everyday common sense? Kant’s answer is that all of us experience cases where what we want to do (our inclinations) conflict with what we know we ought to do (our duty). Moreover, we are also aware that what we ought to do in that situation is what any practically rational or moral person ought to do. Our private interests and inclinations may vary: some people like sweet, others sour; some people prefer power to money, others friendship or the praise of others; some people might even prefer helping other people and the feeling that gives them to monetary rewards. Sometimes what these preferences incline us to do might even coincide with what we know is the right thing to do, for instance when we feel inclined to help a friend or family member. However, according to Kant, the particularities of our preferences and inclinations cannot provide a firm and stable basis for moral obligations. We become aware of our moral

17. For instance: “the concept of a … good will as it is already present in natural healthy understanding does not need to be as much taught as rather just illuminated” (GMM IV, 397).
obligations when we ask not what we are inclined to do and what we want (and the best way to accomplish that), but rather when we ask what any reasonable person must admit is the right thing to do in this situation. That is why he defines duty in terms of the notion of a “law.” A law is a rule of conduct that holds generally and, at least in principle, for everyone. In fact, one might say that, for Kant, it is our very ability to look at our actions in general terms and not just from the perspective of our individual inclinations and desires, that is, to look at them in terms of laws, that makes us truly rational in a practical regard. “Pure” practical rationality would be willing that is motivated strictly by this awareness of the moral law. Kant believes that all persons act on some sorts of general principles or priorities such as seeking their own advantage whenever possible or trying to look good in the eyes of other people if they can. What distinguishes pure practical rationality is that its general principles or maxims can be traced back not to some specific inclination or desire, but rather to one’s awareness of one’s duty as such. In this regard, the will of the moral individual is not determined by something outside itself such as a pre given desire for money, fame, or recognition – it is not, as Kant says, “heteronomous” – but rather by one’s own rational awareness of one’s duty. The will of the moral person is therefore “autonomous.” Since the good will is not determined by anything outside itself, it is therefore also in the fullest sense “free.” In fact, it is the only will that is truly free since all other non-moral willings are determined by something else even if the action that follows from them is not inconsistent with an action that would be demanded by the moral law. Since these maxims or principles tell us what we must do, Kant calls them “imperatives.” Those that tell us what we need to do in order to achieve something we desire such as fame, health, or pleasure would be hypothetical imperatives because they tell us what to do if we want to achieve this or that end. A command that would tell us simply what we must do independently of what we want to do would be a categorical imperative, so the moral law is the only maxim that expresses a categorical imperative.

Because of the necessary relationship between the notion of a categorical imperative and the idea of universality, Kant formulates the categorical imperative as follows: “Act only according to that maxim that you can at the same time thereby will that it become a universal law” (GMM IV, 421). He stresses that there is but one categorical imperative, but he offers four alternative formulations. The first, a minor variation on the initial definition, namely “act as if the maxim of your action should become through your will a natural law” (ibid.), clearly expresses the lawfulness and universality of the good will as pure practical reason. The second formulation, however, is quite different, but Kant claims that it amounts to the same thing. It states: “Act in such a way that you treat humanity, both in your own person as in the person of every other, as an end and never merely as a means” (GMM IV, 429). The autonomy and freedom of
human beings as persons that follow from their awareness of the moral law endow human beings with a dignity (Würde) that is inconsistent with treatment that would deny or manipulate their freedom, a point that will also become crucial for his political philosophy, which will be discussed later in this essay. The third formulation explicitly draws on this notion of autonomy: “Act in such a way that the will can view itself in its maxim as at the same making a universal law” (GMM IV, 432). Finally, the fourth formulation brings together the notions of universality and the notion of human beings as ends in themselves as follows: “Therefore, every rational being must so act as if he were through his maxim always a legislating member in the universal kingdom of ends” (GMM IV, 433).

For each of these formulations, Kant provides four examples that follow the same formal principles. He divides our duties into duties toward ourselves and duties toward others, on the one hand, and into perfect and imperfect duties, on the other. Duties to ourselves demand, for instance, that we may not end our own lives and that we take steps to maintain our health and develop our talents; duties to others demand that we not kill them or lie to them, and that we help other deserving persons in need. The perfect, or determinate, duties are unequivocal and do not admit of more or less: we should never commit suicide, according to Kant, and we should not just avoid telling lies too often or too maliciously; rather, we must avoid them altogether. The imperfect duties, by contrast, involve a great deal of indeterminacy because it is not always clear, for example, which talents one needs to develop, how best to maintain one’s health, and who most deserves one’s help and how much they may lay claim to it.

He closes his observations about the nature of moral obligation in the *Groundwork* with the following summary remark:

> The absolutely good will, whose principle must be the categorical imperative, as indeterminate with regard to any object, will thus include the form of willing in general, and specifically as autonomy; that means that the suitability of the maxim of any good will to become a general law is the only law that the will of every rational being imposes upon itself without basing it on any other motivation or interest. (GMM IV, 444)

The third section of the *Groundwork* indicates how this new theory of morality has important implications for what he calls a “critique of practical reason” that would address questions about the ontological implications of this theory. In the *Groundwork*, Kant focuses simply on the question of freedom and how it can be reconciled with the idea of natural causality. The idea of freedom implies a certain kind of causality, he says, but a causality according to laws that do not have their origin in nature. The ability of insights into moral obligation
to serve as sufficient motivation for actions, which we as moral agents recognize as something we presuppose in all of our moral deliberations and actions, means that the actions of moral agents, at least in some cases, follow from different laws than those of natural causality. Hence freedom as an Idee, an ideal that is a necessary presupposition for the moral sphere of pure practical reasons, means that we are also aware of ourselves as citizens of what he calls a “kingdom of ends,” an “intellectual world” (Verstandeswelt), whose laws are different from those that explain and govern nature. The Critique of Pure Reason had shown that causality necessarily applies to everything in so far as it is an object of experience for us, but since the moral law and our awareness of ourselves as subject to it are not the kinds of things that can be presented in sense experience, they simply fall outside the limits of the necessary conditions for appearances as objects of experience in the sense that Kant uses the term. If one wants to call such objects that fall outside the bounds of sense experience “things in themselves,” then the realm of pure practical reason is a domain populated by just such entities when we see ourselves and others as “ends in themselves” subject to the obligations of the moral law. This “positive sense” of the notion of “things in themselves” is reflected not only in changes to the second edition of the Critique of Pure Reason in 1787, but also developed more extensively and systematically in the 1788 publication of the Critique of Practical Reason.

Critique of Practical Reason

The “second Critique” builds on the same insights that had been articulated in the Groundwork:

The concept of freedom, in as far as its reality is proven by an apodictic law of practical reason, represents the cornerstone of the entire edifice of a system of pure, even of speculative reason, and all other concepts (those of God and immortality) that in the latter [i.e. in a system of pure “speculative” or theoretical reason] remain without any basis, follow from it [i.e. the concept of freedom] and receive through it content and objective reality, i.e., the possibility of them is thereby proven because freedom is actual; for this Idea [Idee] reveals itself through the moral law. (CprR V, 4–5)

The Critique of Pure Reason had left open the question whether such entities outside the realm of possible experience can exist and, if so, how. Theoretical reason can neither confirm nor refute the existence of such objects, but here Kant asserts that out of the three ideas that theoretical reason necessarily thinks but can never experience – freedom as the ability to initiate a chain of causality
outside the strictures of natural causality, the soul as a substance, and God – there is one that is the direct object of pure practical reason: “Freedom, however, is also the only one among all of these Ideas of speculative reason of which we know the possibility a priori, without being able to explain it, because it is the condition for the moral law, which we do know” (CprR V, 5). The proof of freedom, then, is provided not by theoretical reason, but by the activity (Tat) of reason as practical (CprR V, 3).¹⁸ So Kant's famous dictum about awareness of freedom as a “Faktum” of reason (e.g. CprR V, 56, 72) implies not just that it is a starting-point for analysis instead of a conclusion, but more importantly that it exists not on its own, but that it is an accomplishment, an activity of pure practical reason itself. So the analysis of freedom, although much more extensive than in the *Groundwork*, is consistent with the moral theory advanced in the earlier work, even though it is also articulated in more detail in the “second Critique.”

What is new is Kant's treatment of the other two ideas, God and the soul. They follow not from Kant's moral theory per se, but from his views about the necessary conflicts that arise for finite beings who cannot reasonably help but wish that happiness would somehow follow from moral actions, but who are at the same time aware that there is no necessary relationship between the worthiness of happiness from a moral standpoint and the actual prospects of happiness in this world. In fact, the two might and often do stand in direct conflict with each other, according to Kant. Kant thinks the Stoics fail to appreciate actual human psychology if they believe that we can (or should) extinguish any hopes for material happiness and well-being in this life. We all know as rational beings that we are obliged to follow the moral law, but we cannot help but wish and hope that we would somehow be rewarded for doing so. The action would not be moral if it were done strictly or even primarily for the sake of the reward, so in a sense it is appropriate that we cannot know about such a reward as a matter of theoretical certainty. Kant's doctrine of the “highest good” states that, even though the only thing that can be said to be good without qualification is a good will, so that it is the supreme good, we can envisage a more comprehensive good that would entail a coincidence between happiness and moral worth. If we were to imagine how this highest good would be possible, and it clearly cannot happen in this life, then it seems that one would have to postulate the existence of the person in a life after this one, that is, an immortal soul, and an all-knowing, omnipotent, and just God who would assure that the rewards one has earned in this life are provided in the next. Hence Kant calls freedom, the immortality of the soul, and the existence of a perfect God “postulates” of

¹⁸. See Kant’s definition of a “Tat” in the *Metaphysics of Morals*: “We call an action a deed (Tat) in as far as it is subject to laws of obligation, consequently also in as far as the subject is viewed in it according to the freedom of its will” (MM VI, 223).
practical reason: things we can never know or count on, but things that a moral person must in some sense hope for; things that a moral person cannot help but implicitly want when he or she is acting in conformity with the moral law.

“The Metaphysical Grounds of a Doctrine of Virtue”

Most discussions of Kant’s moral theory have historically focused almost exclusively on the *Groundwork* and the *Critique of Practical Reason*. In those works, Kant stresses the ability of the moral agent at any point to decide in favor of actions that the moral law demands. The notion of moral personhood refers to the unique status of human beings as moral agents, but Kant makes clear (i) that the struggle to act morally for finite beings always remains a struggle because the awareness of one’s moral obligations never completely extinguishes the pull of other inclinations, and (ii) the moral responsibility of every human being capable of thinking in general terms means that even the most morally corrupt person could in principle at any point choose to follow the dictates of the moral law that he or she is implicitly aware of. So the notion of character or virtue is mentioned only infrequently and does not seem to play a significant role in Kant’s moral theory in those works. Recently, however, there has been renewed attention to Kant’s *Metaphysics of Morals* in general and to the doctrine of virtue that Kant advances there in an attempt to show that a Kantian theory of morality can also accommodate some of the basic insights from virtue ethics and avoid some of the problems that the standard readings of Kant’s ethics seem to face.19 Prominent among those problems is the fact that Kant’s descriptions of “pure” practical reason seem to suggest that the person who, because of good training or good habits, has learned to do her duty gladly seems to be less moral than the person whose actions consistent with the moral law are most clearly moral because she has no inclinations to do so otherwise. So the acquisition of virtue, it seems, could actually be a hindrance to truly moral action because it makes them too easy for the virtuous person.

The “Doctrine of Virtue” makes it clear that this is not the case for Kant. In an important remark, he both recognizes and qualifies traditional definitions of virtue:

Virtue is also not merely to be esteemed and explained as the skill and … as a lasting habit that is acquired through morally good actions.

For if this is not the result of considered and solid principles that are continually refined, then it is just like every other mechanism that arises from technical-practical reason and is not sufficiently secured in every case, nor is it secure in the face of changes that new temptations might bring about. (MM VI, 383–4)

Note that Kant does not deny that virtue is acquired nor that it can become habitual. He also does not deny that it is to be esteemed. His reservations concern the source and motivation of virtue. Unless it is the result of what he calls “lasting and solid principles,” namely the resolve to allow the demands of the moral law to serve as the guiding principles for one’s actions, then it is not reliable, in his view. Moreover, from Kant’s overall position, one can add that the moral value of virtue derives not from its results (namely conduct consistent with the demands of the moral law), but from the fact that it is acquired and maintained out of respect for the moral law. As long as this is the case, then the virtue is indeed something to be esteemed and cultivated.

That is why the notion of Gesinnungen or “dispositions” plays a much more central role in this work than in the Groundwork and in the Critique of Practical Reason. Instead of stressing the decision in favor of moral action in each specific act, the “Doctrine of Virtue” (along with many passages from Religion Within the Boundaries of Mere Reason) focuses more on a person’s abiding commitment to make the moral law the guiding principle of all of one’s actions and one’s life as a whole. So Kant recognizes that the moral person will find moral actions easier and learn to take satisfaction in fulfilling one’s moral obligations, but the moral worth of virtue derives from the fact that the original decision and the concomitant change in attitude are based on that person’s recognition of the binding character of the moral law and the desire to respond to it consistently. Kant explicitly recognizes that the virtuous person can learn to take satisfaction in acting virtuously and that this is laudable, but he stresses that such satisfaction follows from that person’s moral disposition and that it is not the reason for becoming moral. However, throughout this work (and in his work on religion), Kant makes it clear that this resolve is always in danger and must be constantly and consistently renewed because of the fact that human motivation never eliminates heteronomous inclinations that even the firmest moral resolve never completely extinguish.

20. Henry Allison’s study of Kant’s moral philosophy stresses the centrality of Gesinnung and the lasting choice of the moral law as one’s supreme maxim as the keys to understanding that theory. See Allison, Kant’s Theory of Freedom (Cambridge: Cambridge University Press, 1990).

21. “The thinking human being, when she has conquered the temptations of vice and is aware that she has performed her often unpleasant duty, finds herself in a state of quietude in one’s soul and satisfaction, in which virtue is its own reward” (MM VI, 214).
Kant himself abjures the term “aesthetics” for his philosophical reflections on the *a priori* foundations for judgments of taste that have far-reaching implications for theories of art and artistic creativity and for philosophical determinations of concepts such as beauty and sublimity. For Kant, the “aesthetic” refers to questions about sensibility; its opposite is the “logical,” which has to do with thinking. Hence the “transcendental aesthetics” concerns the *a priori* forms of sensibility, and there is an aesthetics of the way that various things arouse desire or aversion in us, an aesthetics of pleasure, but because of the variability of individual human sensibilities, this would be an empirical study. Nonetheless, the importance of Kant’s analysis of judgments of taste and related topics in the *Critique of Judgment* from 1790 for the philosophical area that has now come to be known as “aesthetics” justifies the use of this term for his theories about these topics.

The *Critique of Judgment* consists of two main parts. In the first, Kant examines the nature of what he calls “judgments of taste”; in the second, he considers the validity of various teleological claims, both the inherent role of teleology in nature and of nature as teleologically ordered in such a way as to be conducive to the aims of systematic knowledge. For Kant’s aesthetic, the relevant considerations are therefore contained in the first section. We will return to the second section below in the discussion of Kant’s philosophy of history.

Judgments of taste, Kant points out, have a different character both from judgments about what is pleasant and from judgments about good and evil. Aesthetic judgments about what is pleasant to one person do not legitimately lay claim to assent from others. There may be empirical generalizations about what is normally pleasant or painful, pleasurable or not, for most people, but Kant says that because all of these claims are in a strict sense “subjective,” that is, they depend on our specific sensibilities and preferences, they can never claim strict universal validity. Moral claims, by contrast, do legitimately claim universal assent because they are based on the nature of pure practical reason itself and the absolute obligation that derives from the moral law. The interesting point about judgments of taste, specifically judgments about what is and is not beautiful, is that they do resemble moral claims (and theoretical claims about truth) in that they lay claim to universal assent even though they do not have an objective basis, as legitimate moral and theoretical claims do. They also share with moral judgments the characteristic that they seem to be made from the standpoint of the impartial observer because one can judge an object beautiful without necessarily having an interest in possessing that object (as would be the case in judgments about pleasurable objects). In fact, Kant says, the observer of the beautiful does not necessarily have any interest at all in the existence of this kind of object.
Judgments that this or that object is beautiful are based in a feeling of pleasure (Lust) that the experience of the beautiful object arouses in the person who experiences, so what makes it beautiful in the strict sense is something subjective (namely the feeling it awakens), but nonetheless one expects general assent to that judgment. So Kant concludes that it must be something about the experiencing of the object that gives rise to the judgment and Kant surmises that this has to do with an optimal proportion between the imagination and the understanding that gives rise to this feeling of pleasure. Hence even though there is no specific external purpose that gives rise to the feeling of beauty aroused by the object, it exhibits a kind of purposiveness through its ability to produce just this feeling of pleasure in the observer. The fact that we do make these claims suggests for Kant that we have a “common sense” that is awakened by these objects, that is, that each of us has some basic commonality in our cognitive faculties and that each of us is capable of registering this feeling of pleasure in the experience of the beautiful object based on this commonality. One of the indirect benefits of our awareness of beauty is that it fosters dialogue and sociability among human beings, especially in light of the fact that the proof of the validity of these judgments cannot be found in a specific observable feature of the object, but rather in the actual intersubjective agreement that the judgments posit as both necessary and possible for them.

Following the analysis of the beautiful, Kant turns to the question of the sublime. He asserts that the basic features of their claims to universal assent remain the same. However, the proportionality for judgments of taste regarding the sublime rests on the proportionality between the imagination and concepts of reason, that is, the unconditioned Ideas described in the “Transcendental Dialectic”, rather than the concepts of the understanding that are involved in judgments about beauty. In this regard, experiences of the sublime serve as symbols of the transcendent objects that lie beyond the grasp of the intellect. As such, they can help foster an appropriate sensitivity to the special status of non-natural objects such as duty and human beings as persons. The prime examples of the sublime are overwhelming natural phenomena such as the vastness of the sea, the majesty of mountains, or the ferocity of a storm whose expansiveness and sheer power overwhelm us and our ability to comprehend them. They serve as examples of powers beyond our reach.

Although natural phenomena can also be beautiful, prime examples of the beautiful are also successful works of art. In his analysis of such works and their creation, Kant also develops a theory of genius in the *Critique of Judgment* that has been extremely influential not just in philosophical aesthetics, but every bit as much in the self-understanding of many artists in the nineteenth and twentieth centuries. Because beauty is not simply a matter of the intellect, there are no rules for what makes an article beautiful or not, and because it is not a concept,
in each case what is beautiful is something unique and individual. Nonetheless, because of its exemplary character, the beautiful seems to establish a rule in the sense of a paradigm for future works of art.

The genius is the one who is able to create art works without having any rules to follow and who is able to create works that serve as exemplary for others who will follow. The creator of such works produces original objects that evoke appropriate feelings in the audience that experiences them, without being able explicitly or adequately to explain how the creative process occurs. Such creativity is unique and inexplicable; it seems to be a gift of nature that even the artist cannot account for. That is why Kant restricts the notion of genius to the fine arts as truly creative activities, whereas even the most innovative scientist or mathematician is not a genius in this sense because the scientist or mathematician can point to objective regularities or laws that he or she might have been the first to discover, but did not truly create.

V. KANT’S PHILOSOPHICAL REFLECTIONS ON RELIGION

In the second division of the Critique of Judgment, Kant examines the utility and validity of the notion of purposiveness (Zweckmäßigkeit) that arises through the activity of reflective judgment and leads one to search for connections among natural phenomena that go beyond what is presented in the regularities that the intellect alone is able to recognize. Most concretely, he considers certain kinds of natural phenomena, namely organisms, which he defines as those entities that are characterized as self-sustaining because they exhibit what he calls “mutual causality.” We can understand how one part of the organism, for instance the digestive system, can serve to provide nutrients and how the blood pumped from the heart can serve to make it possible for the digestive system to be maintained and work as it should. In a broader sense, however, we can come to see nature as a whole as a kind of organism, as something whose various parts sustain one another, and ask how it came to be crafted as it is. We can also develop an appreciation for the fact that it seems to be organized so that we can always proceed from specific regularities to ever broader laws that allow us to understand it as a system. The ideas serve a heuristic function in leading us to search continually for new connections and ever more encompassing laws to explain natural phenomena.

If we pursue these questions and seek answers in terms of something outside nature that can serve as an explanation for nature’s internal purposiveness and its suitability for the human pursuit of comprehensive scientific explanation, this leads us to the idea of an all-knowing creator who is the author of the order we seek and believe that we discover in nature. Kant contends that, even though
the notion of purposiveness does indeed lead us to continue to seek ever new connections and ever-higher generalities, what we actually discover are specific causal connections, not the purposiveness of nature as a whole and certainly not a non-natural agent that is the source of such purposiveness. So the treatment of teleology in the second division confirms the results of the “Transcendental Dialectic” that knowledge of such non-natural objects (God and nature as a purposive whole) is not possible or, as he puts it in the third Critique, that the “constitutive” use of these concepts is not justified, but that they nevertheless fulfill an important “regulative” function for human knowledge. Once again, Kant limits the claims of knowledge but leaves room for other important functions for the Ideas that arise through reason and reflective judgment.

In a work that appears between the publications of the last two Critiques, *Religion Within the Boundaries of Mere Reason* from 1793, Kant elaborates his views about the relationship between revealed religion and the truths that reason alone can provide us. His basic thesis is that something of which we can be absolutely certain, namely the moral law and the obligations that follow from it, can provide a rational basis for us to evaluate the tenets of revealed religions. In the *Critique of Pure Reason*, Kant had said that theoretical reason can neither confirm nor refute claims about God, the immortal soul, or the nature of human beings as non-natural objects that figure prominently in most revealed religions. However, he believes that the *Critique of Practical Reason* provides an apodictic basis for evaluating claims that cannot be true. Anything that a revealed religion purports to tell us that is not consistent with what we know about morality solely through pure practical reason must be false. Moreover, many of the doctrines of revealed religion can be seen as historical and metaphorical expressions of fundamental truths about moral life and moral obligation. For instance, questions about the inherent goodness or evil of human nature are interpreted in terms of the ineradicably heteronomous nature of the human will. The rational justification for the doctrine of original sin is what he calls the “radical evil” of human nature, namely the ineradicable tendency of each person to seek ways to avoid the demands of the moral law by adopting maxims contrary to the obligations that pure practical reason dictates to each finite rational agent. Christian doctrines about life after death and the eternal reward for moral conduct in this world are read in light of the postulates of pure practical reason, but the doctrine of eternal damnation is rejected as inconsistent with a beneficent moral order. Against the backdrop of his moral philosophy, Kant believes that there is a rational standard for the evaluation of all religions and suggests that Christianity, especially modern Protestant Christianity, is closest to the truths that in principle could be known without necessarily relying on the historical accounts of revealed religions.

This general approach of reducing the truths of revealed religion to moral truths is not uncommon in a whole range of Enlightenment figures, for instance
by Lessing in his essay on “The Education of Humanity,” and it is consistent with Hegel’s later characterization of religion as a form of figurative “representation” (Vorstellung) that finds its ultimate truth in the conceptual knowledge advanced in philosophy. It is also an approach that will be decisively rejected by Schelling in the Philosophy of Revelation and by Kierkegaard in Fear and Trembling.

VI. KANT’S PHILOSOPHY OF HISTORY AND HIS POLITICAL PHILOSOPHY

In the third Critique, Kant looks at nature as a whole and asks if we can find anything there that can be seen not merely as a means, but as an end in itself. Whatever that would be, would have to be seen as the end or goal of nature and hence of history as a whole. Consistent with his moral philosophy, Kant identifies this as the idea of humanity as an end in itself. What makes human beings special is none of their natural properties, but rather their status as subjects of the kingdom of ends because of their awareness of the moral law. If one is to conceive of history as having a purpose, then, it would have to be in terms of the moral progress of humanity.

Kant’s famous essay “Concerning Perpetual Peace,” which was published in 1795, provides an outline of how he sees this ideal not only as a measure for evaluating historical progress or lack of it, but also as a driving force in history itself. Kant does not claim that individual human beings or governments consciously always or even usually dedicate themselves to the goal of advancing human freedom, dignity, and moral progress. Rather, the opposite is the case: he assumes that most individuals and most governments will pursue what they see as their own self-interest. However, he also believes that the overall outcome of their interactions will be positive because the mechanisms that govern history make it in people’s self-interest to join civil societies that secure the rights of all of their citizens and eventually even to form an international confederation that will end the constant state of warfare among states that has characterized history until now. Such a historical order would be consistent with progress toward a “kingdom of God on earth” not just as a normative measure for evaluating different societies and different historical epochs, but also consistent with the idea of history as a process that was created and overseen by a benevolent author. The influence of this general approach can be seen in Fichte’s conception of the ultimate resolution of dichotomies through the practical process of history and in Hegel’s famous concept of the “cunning of reason” in history. It finds its concrete historical expression, among other things, in the formation of a “League of Nations” after the First World War and the “United Nations” after the Second World War as attempts to institutionalize the ideals and the
mechanisms for their enforcement that Kant had articulated at the end of the eighteenth century.

Another historically influential doctrine in this essay – one that recently has received significant attention from Jacques Derrida, among others – is his explicit adoption of the notion of “cosmopolitan” rights for individuals and nations that sees all human beings as “citizens of the earth” and not just citizens of specific nations or states.

Although Kant’s political philosophy also exerted a strong influence on subsequent thinkers in legal theory and politics during the decades immediately following the publication of the first part of the *Metaphysics of Morals*, in which he articulates his theory of political order based on fundamental principles of morality, Kant’s political theory did not attract the attention during the second half of the nineteenth century and most of the twentieth century that the other main topics in his philosophical work received. Kant takes philosophical and legal positions from a range of predecessors, from Hobbes and Locke to Grotius and Achenwall, and assesses and modifies them in light of what he takes as the guiding principle for the philosophy of any domain of practical activity that should be guided by the principles of morality, including politics. A philosophical treatment of right must ask not only what the positive laws of a given political order prescribe, but also whether they can be legitimized in terms of the normal ideal of justice (*Recht*) that they purport to instantiate.

The purpose of the state, according to Kant, is to secure external human freedom. By “external” Kant means that the state is intended to secure the right of each individual to exercise free choice except where that exercise conflicts with the rights of others to the exercise of their free choice. The purpose of the state is not to enforce morality in the strict sense because the latter concerns the agent’s motivation and the state is neither able to nor entitled to regulate motivations, but only the actions of its citizens. Hence the general principle of the law states: “Act externally in such a way that the free enactment of your free will can coexist with the freedom of everyone else according to a general law” (MM VI, 231). The only justification for the use of coercion is to prevent

23. For instance in Fichte’s *Foundations of Natural Right* and Hegel’s *Outlines of a Philosophy of Right*.
24. This has recently begun to change significantly as the *Metaphysics of Morals* has begun to attract more scholarly attention. For example, see Sharon Byrd and Joachim Hruschka, *Kant’s Doctrine of Right: A Commentary* (Cambridge: Cambridge University Press, 2010); Sharon Byrd *et al.* (eds), special issue on the 200th anniversary of Kant’s *Metaphysics of Morals*, *Annual Review of Law and Ethics* 5 (1997); and Timmons (ed.), *Kant’s Metaphysics of Morals*.
25. See Byrd and Hruschka, *Kant’s Doctrine of Right*. 
others from doing something that restricts other persons' freedom. “Persons” are those entities who possess practical reason that makes them morally accountable and endows them with rights. Since everything else is a mere object that has neither responsibilities nor rights, there are no inherent restrictions on a person's entitlement to possess and use things as property except insofar as those things are already the property of others. In a state of nature, the only things that are secure are those things that one is physically able to acquire and protect. Hence, all physical goods, including one's own bodily well-being, can be reliably secured only if there is an enforcement mechanism that makes it in everyone's self-interest to observe the rights of others, namely a civil society with recognized laws and institutions that enforce them. In a civil society, property is acquired through commonly recognized means and property is exchanged on the basis of mutual agreement through contracts. It is the responsibility of the state to prevent violations of the rights of others or failures to fulfill contracts through regulations that clearly establish rightful ownership and punish those who fail to honor them. The state is entitled to restrict or violate the freedom of those who violate the freedom of others in order to discourage such violations and thereby secure the freedom of all.

Kant's orientation on the notion of a civil society based on contracts and property rights extends beyond the realm of what one typically thinks of in terms of contracts to the realm of personal rights such as relationships between parent and child, husband and wife; and it relegates peoples whose institutions do not resemble those of European states to the status of primitives whose rights can be neglected or ignored by “civilized” societies as they are gradually brought into the community of civil societies. Many of Hegel's critiques of Kant in his *Outlines of a Philosophy of Right* pertain to just this attempt to see right strictly in terms of property and contracts; recent critics of European colonialism and racism have criticized Kant as a witting or unwitting accomplice to Western violations of the rights of others over the past few centuries because of what now seem apparent as the obvious flaws of the latter tendencies. Apologists for Kant will point out that he was hardly alone in those views and that he was in many ways ahead of his time in stressing that the sole justification for the authority of the parents is the responsibility and concern they have for their children's well-being, in seeing the duties of husband and wife toward each other as symmetrical instead of one-sided, and in his unequivocal condemnation of slavery as

an institution and the recognition that at least in principle every human being is endowed with reason and moral rights.

VII. CLOSING REMARKS

There are a number of other topics that Kant addressed after his critical turn, for instance, the philosophical foundations of modern natural science, philosophical anthropology, and a philosophy of education, that we do not have sufficient space to cover in this essay, but that have also been influential in those fields. What is most impressive about Kant’s overall achievement, though, is not the extraordinary range of problems he addressed, but the originality and importance of the positions he advances as philosophical solutions to those problems. Also impressive is the way that he addresses them as part of an overall philosophical system that he believes reflects the unity of reason itself. This notion of system was perhaps most influential in the major figures of German idealism who all saw themselves as building on and more truly systematically developing the insights originally derived from Kant’s transcendental philosophy. Yet even after the notion of comprehensive and definitive philosophical systems had fallen out of favor during the second half of the nineteenth century, Kant’s transcendental philosophy served as a fundamental point of orientation and in many ways as a point of departure for almost all of twentieth-century continental philosophy and for influential philosophers such as John Rawls and Wilfrid Sellars within the analytical tradition as well.

MAJOR WORKS

Translations

The publication of Kant's *Kritik der reinen Vernunft* (Critique of Pure Reason) in 1781 marks a watershed in modern philosophy. It appeared at a time when almost no one but a few Humean skeptics questioned belief in the isomorphism between *reason* and *being*. The Newtonian physicist believed that this isomorphism enabled knowledge of laws of nature, just as the rationalist metaphysician believed that it enabled knowledge of God. Yet, whereas Newtonian physics seemed a genuine “science,” metaphysics remained nothing but a “battle-field of endless controversies.” Kant explains why this is the case and in so doing prescribes how metaphysics may become “scientific.” Yet, for many, he did so at great cost. For Kant reveals that the isomorphism between *reason* and *being* is only valid of experience and outside of that cannot be legitimately assumed. When Moses Mendelssohn referred to “the all destroying Kant,” therefore, he was referring to Kant’s conclusion that the rationalist metaphysician’s endeavor to provide knowledge of God could never be realized. Kant’s *Kritik* thus seemed to mark the “destruction” of the Leibnizian–Wolffian metaphysics that Mendelssohn perpetuated. Without such metaphysics, it would, Mendelssohn

2. Moses Mendelssohn (1729–86), a philosopher of Jewish heritage based in Berlin, was a leading representative of the German Enlightenment and a disciple of the Leibnizian–Wolffian school of rationalist metaphysics. His principal works include the *Philosophische Schriften* (1761), *Phädon* (1767), *Jerusalem* (1783), and *Morgenstunden* (1785).
feared, prove impossible to rationally justify religion and morality, thus opening
the door for fideism and irrationalism.

However, Mendelssohn was wrong to think that Kant’s delimitation of
knowledge precluded rational justification of religion and morality and that
Leibnizian–Wolffian metaphysics was damaged beyond repair. When Friedrich
Heinrich Jacobi⁴ challenged Enlightenment faith in reason by arguing that,
rather than acknowledging Kant’s delimitation of knowledge, we should acknowl-
dge that reason itself must be delimited, it was Kant’s philosophy that seemed
best able to demonstrate that religion is not incompatible with reason. Thus, far
from viewing Kant as an “all-destroyer,” Karl Leonhard Reinhold⁵ saw him as a
“restorer of Christianity.”⁶ Yet thinkers, such as Reinhold, who were convinced
by Kant’s conclusions, became increasingly dissatisfied with the arguments
employed to establish them. And it was the resources of Leibnizian–Wolffian
metaphysics that they drew on to resolve tensions within Kant’s philosophy.
Thus, Reinhold argued for the necessity of a synthetic-deductive methodology,
in which Kant’s results are deduced from an indubitable foundation. However,
the most explicit advocate of a return to Leibnizian–Wolffian metaphysics was
Salomon Maimon,⁷ who argued that Kant’s philosophy could only satisfactorily
explain the isomorphism between reason and being in experience by incorpo-
rating Leibnizian–Wolffian resources within itself. These moves toward founda-
tionalism and monism would decisively shape the tradition of German idealism.

I. THE PANTHEISM CONTROVERSY

Jacobi’s challenge to the Enlightenment’s confidence in reason attained no-
toriety in the 1780s as a result of the “pantheism controversy,” which began within
correspondence between Jacobi and Mendelssohn concerning Jacobi’s claim
that Lessing⁸ was a Spinozist. Like Mendelssohn, Lessing had been a significant

⁴. Friedrich Heinrich Jacobi (January 25, 1743–March 10, 1819; born in Düsseldorf, Germany;
died in Munich) was educated in Frankfurt am Main and Geneva. His influences included
Hume, Pascal, Rousseau, and Spinoza.
⁵. Karl Leonhard Reinhold (October 26, 1757–April 10, 1823; born in Vienna, Austria; died in
Kiel, Germany) was educated in Vienna. His influences included Kant and he held appoint-
ments at the University of Jena (1787–94) and the University of Kiel (1794–1823).
⁶. Karl Leonhard Reinhold, Letters on the Kantian Philosophy, Karl Ameriks (ed.), James
⁷. Salomon Maimon (Salomon ben Josua) (1752–54–November 22, 1800; born in Sukowiborg,
Polish Lithuania; died in Nieder-Siegersdorf, Lower Silesia) was educated in Mirz and Iwenez.
His influences included Hume, Kant, Leibniz, Maimonides, and Spinoza.
⁸. Gotthold Ephraim Lessing (1729–1821) was a dramatist, art critic, and theologian, who, just
as much as his close friend, Moses Mendelssohn, is regarded as a leading representative of
proponent of the Enlightenment confidence in reason and, as such, Mendelssohn was alarmed at the notion that his “co-worker” could have held views incompatible with religion and morality. For Jacobi, Lessing’s Spinozism suggested that rigorous ratiocination would, contra Mendelssohn, always contradict religion and morality. The controversy became public in 1785 when Jacobi heard that Mendelssohn was planning to publish an interpretation of Lessing’s Spinozism that would render it innocuous. To prevent Mendelssohn from taking the wind out of his sails, Jacobi hastily compiled his Briefe über die Lehre von Spinoza an Herrn Moses Mendelssohn, through which the controversy first entered the public domain.

In his Briefe, Jacobi argues that Spinoza reveals the ultimate consequences of the principle on which ratiocination is based, the principle that “a nihilo nihil fit [out of nothing comes nothing].” It is rigorous application of this principle that leads Spinoza to claim that the nexus of efficient causality is infinite in both directions, since one cannot suppose an absolute beginning of an action without supposing that nothingness produces something. The Spinozistic universe has therefore existed from all eternity and will continue to exist throughout eternity, and cannot be the creation of a transcendent God, since such a conception effectively maintains that the universe is produced from nothing. Spinoza thus claims that individual things immediately originate from “an immanent [infinite substance], an indwelling cause of the universe eternally unalterable within itself.” Spinoza’s universe thus subsists in itself, as the immediate expression of an infinite substance, which he calls “God.” The whole of Reality is exhausted by this one substance, which immediately expresses itself as the universe of finite things. The two presuppose one another: the infinite substance cannot exist without manifesting itself as the universe of finite things, and this universe only exists insofar as it is the immediate expression of this infinite substance. Although the universe may logically depend on the one infinite substance, nothing can precede it in a temporal sense, so that it cannot be described as “created.” Any philosophy that posits substance as temporally preceding the universe of finite things presupposes “a coming-to-be from nothingness.” And, according to Jacobi, Spinoza resisted such assumptions insofar as they contravened the principle that a nihilo nihil fit.

the classical German Enlightenment. His principal works include Nathan der Weise (1778) and Die Erziehung des Menschengeschlechts (1780).

11. Ibid., 188.
12. Ibid., 217.
Jacobi argues that Spinozism is the most consistent rationalist metaphysics, and yet nonetheless finds its consequences deeply unappealing. The unappealing consequences of Spinozism – to which Jacobi sees all rationalist metaphysics as ultimately leading – are “fatalism” and “atheism.”

Jacobi clearly sees “fatalism” as the product of Spinoza’s denial of free will. In Spinoza’s system, the rejection of free will ultimately follows from the parallelism between thought and extension, which renders thought a reflection of interactions between extended things. Thought thus cannot influence the determinations of individual extended things; only other extended things possess such a capacity. Furthermore, will can influence neither the determinations of individual things nor the mechanism of efficient causes since “the will is posterior to thought.” For the will is a “modification” of thought that expresses the relationship between oneself and other finite things, all of which are necessarily determined by the mechanism of efficient causes. Therefore, the will “is only a remote effect of relations, and can never be an original source, or a pure cause.”

Free will is thus flatly denied. Indeed, any actions that were the product of free will would, _qua_ spontaneous action, not be the product of any prior condition and would literally have _come-to-be from nothing_. For Jacobi, acceptance of Spinozism is thus tantamount to fatalism.

Jacobi’s equation of Spinozism and atheism is hardly original, but more original is his claim that all consistent rationalist metaphysics leads to atheism. Before the publication of the _Kritik_, Jacobi himself embarked on a refutation of the ontological argument. Remembering Leibniz’s claim “that Spinozism is exaggerated Cartesianism,” Jacobi turned to Spinoza to understand Descartes’s ontological argument. Jacobi says, “it’s here [in the _Ethica_] that the Cartesian proof shone forth for me in its full light.” Yet, far from uncovering the fallacy that Kant identified, Jacobi discovered a valid version of the argument. He writes:

> if the concept of God is formed in the manner of Spinoza (in such a way that the highest Being is nothing but Reality itself, and his works nothing but the compositions of this Reality), then the Cartesian demonstration of God’s existence is right enough: the concept of

God is at the same time the unshakeable proof of his necessary existence.\textsuperscript{20}

The ontological argument is valid on the Spinozistic assumption that God is “Reality itself.” For, from the existence of “determinate finite being,” we can justifiably infer the necessary existence of an “indeterminate infinite being,” of which determinate beings are modifications. Kant’s objection that the ontological argument fallaciously treats “\textit{Being}” as “a real predicate”\textsuperscript{21} fails to undermine this version of the argument, since the “unique and infinite being of all beings … is not a separate, individual, different, thing [to which] any of the determinations that distinguish individual things pertain.”\textsuperscript{22} Rather, God is “primal material, \textit{pure matter, universal substance},”\textsuperscript{23} which precedes determinate things and thus all predication. For Jacobi, therefore, the ontological argument \textit{does} prove the necessary existence of an infinite substance. However, \textit{this} necessarily existing substance cannot be equated with the God of religion: “if the concept of God is construed [as] a \textit{Being external} to all beings, then neither can the intrinsic truth of his concept be made out from the concept itself, nor can the connection of the concept with the necessary Being ever be realized.”\textsuperscript{24} A God who is “an intelligent personal cause of the world”\textsuperscript{25} thus cannot be proved to exist through the ontological argument. If the rationalist metaphysician attempts to use this argument to prove the existence of the God of religion, what he in fact proves is more consistent with atheism than theism.

As, for Jacobi, Spinozism is the most consistent rationalist metaphysics, he does not try to refute the unappealing consequences of Spinozism by means of rationalist metaphysics itself.\textsuperscript{26} Jacobi thus extricates himself from Spinozism “through a \textit{salto mortale},”\textsuperscript{27} by which one recognizes convictions that defy rational explanation. Jacobi thus says that “from fatalism I immediately conclude against fatalism.”\textsuperscript{28} Although, for a consistent rationalist metaphysician, free will must be rejected for contravening the principle that \textit{a nihilo nihil fit}, the fatalism this engenders simply cannot be accepted, with the result that we must retain our conviction in the reality of free will and declare it incapable of

\end{itemize}
rational justification. Jacobi thus sets himself the task of defining an already established “boundary” between convictions that require rational justification and convictions that resist it. Within the latter category, he places conviction in the following:

1. A God who is an intelligent personal cause of the world;
2. The human soul;
3. Free will;
4. An external world; and
5. Other minds.

All human beings are – at least potentially – immediately certain of the reality of these objects, as a result of “feeling” (Gefühl). As these convictions resist rational justification, their immediate certainty is a matter of “faith,” and the condition in which it is disclosed is one of “revelation.” That there are convictions of which we are immediately certain is something that everyone, not least the rationalist metaphysician, should accept. For (i) we would never strive for certainty through rational justification unless we were already acquainted with certainty that precedes rational justification, and (ii) the certainty that we award a proposition through rational justification, that is, through connecting it with prior conditions of which we are already certain, implies that there are convictions of which we are immediately certain, from which rationally justified propositions derive their certainty. Jacobi thus posits a distinction between two kinds of convictions: (i) convictions of which we are immediately certain, in which we have “faith,” and (ii) convictions that rest on rational demonstration, which derive their certainty from prior grounds. The latter are logically dependent on the former. Rationalist metaphysics must therefore recognize that its method of deriving truths from prior grounds is only possible insofar as there are convictions of which we are immediately certain and which resist rational demonstration. Failure to respect this, however, leads to rationalist metaphysics illegitimately breaching the boundary between the explicable and inexplicable, to illegitimately endeavor to rationally justify convictions in which we can only

have faith. And it is this illegitimate endeavor to explain the inexplicable that ultimately leads to fatalism and atheism. Therefore, Jacobi proposes that the use of reason should be limited and that it should not be used to justify the presuppositions of religion and morality.

Jacobi’s writings thus set in motion a seemingly irresolvable conflict between Enlightenment rationalists, who claimed that religious belief should be rationally justified rather than based on irrational articles of faith, and theological enthusiasts, who claimed that religious belief is grounded by a “blind faith,” “feeling,” or “revelation” that cannot be justified by reason, which in fact has no jurisdiction within this sphere. An indirect result of the considerable interest this controversy generated, however, was that Kant’s critical philosophy began increasingly to attract attention, in part as a result of the publication – within installments in Der Teutsche Merkur – of Reinhold’s Briefe über die kantische Philosophie (1786/7), which claimed that the Kritik decisively resolves the antagonism between reason and faith that had come to a head within the pantheism controversy. Indeed, Reinhold’s Briefe argue that the pantheism controversy presents a dialectical conflict akin to an antinomy that the Kritik possesses the resources to resolve.

Reinhold argues that Kant is the “restorer of Christianity” by means of an argumentative strategy that describes how a primordial union has given way to pernicious divisions that can be reconciled only by means of a new higher union. The primordial union is the reconciliation between religion and morality established by Christ “by means of the heart”; the division denotes the separation of religion and morality that occurred “when the free and scientific cultivation of reason collapsed with the Roman Empire.” Many recent Enlightenment thinkers have sought to end the division, but they have done so in vain. Kant does so by means of a new higher union, through which he reconciles religion and morality “by means of reason.” Reinhold essentially sees Christianity as a “Platonism for the people”:

38. I am here alluding to Nietzsche’s description of Christianity as “Platonism for the people” in the Preface to Beyond Good and Evil. The allusion seems appropriate insofar as, just like Nietzsche, Reinhold argues that the values espoused by Christianity have their origin within the philosophical speculations of the ancients; it should be stressed, however, that, unlike Nietzsche, Reinhold is in no way making a case for the essential historicity or relativity of these values.

historical or hyperphysical religion, in which religion is divorced from reason and turns into an incomprehensible dogma, to which one must subscribe through blind faith. Religion thus becomes thoroughly immoral. With the Reformation, reason “regained the free use of its powers”\(^{40}\) to produce the epoch of philosophical or metaphysical religion, characterized by the Enlightenment confidence that religious convictions can be demonstrated by speculative reason. In this second epoch, however, religion remains divorced from morality. The grounds justifying religious belief are declared to be theoretical, and they therefore have a tenuous relationship with morality. At the same time, it is believed that there can be morality without religion. Whereas Christ discovered a world of religion without morality, Reinhold believes that the modern age is characterized by a world with morality in which religion is in retreat. The “restoration” of Christianity thus requires a reunification of religion and morality, which, rather than showing how morality depends on religion, will instead show how religion depends on morality. It is this reunification that Reinhold discerns within Kant’s Kritik, a work that exposes the inadequacies of both hyperphysical and metaphysical religion, in order to ground “religion on morality … to complete thereby the unification of both by means of reason.”\(^{41}\) Reinhold thus sees Kant’s Kritik as the product of an unfolding historical process. The medieval world was dominated by hyperphysical religion, which, to the detriment of morality, demanded blind faith. It thus grounded its claims upon “feeling.” The modern world, on the other hand, has been dominated by metaphysical religion. This religion, wholly indifferent to morality, endeavors to ground its claims through the unrestricted use of reason. Kant’s Kritik, Reinhold believes, heralds the birth of a new era, the epoch of “moral religion,” in which, to ground religion on morality, feeling and reason are unified. In producing this unification, the Kritik nullifies the claims of both the proponents of hyperphysical and metaphysical religion, even if the “moral faith” prescribed by the Kritik emerges as the result of the “overcoming” of a previous dialectical conflict between religious claims.

The pantheism controversy is indicative of this “dialectical ambiguity,”\(^{42}\) which may deceive us in religious matters. Reinhold describes how the factions of both Mendelssohn and Jacobi, just like the opposed parties of Kant’s “Antinomies,” threaten to “wear one another out,” insofar as “the more keenly they insist on their claims, the more the weakness of the arguments on both sides come to light.”\(^{43}\) Their conflict can only be resolved by a critical investigation which asks, “what is possible through reason proper?”\(^{44}\) That the Kritik can resolve

\(^{40}\) Ibid., 32.
\(^{41}\) Ibid., 38.
\(^{42}\) Ibid., 26.
\(^{43}\) Ibid., 8.
\(^{44}\) Ibid., 11.
this conflict proves, for Reinhold, that Kant’s endeavor to ground religion on morality reveals the true grounds of religious belief, which were not previously fully disclosed. Reinhold describes the “dialectical conflict” exposed by the pantheism controversy in the following passage:

“Only through reason is the true cognition of God possible” and “Through reason true cognition of God is impossible” are the slogans of the disputing factions, and the actual and alleged proofs for these two claims are the most common weapons with which one takes the field against the other.45

The first slogan represents the faction of the rationalist metaphysicians or proponents of metaphysical religion, who we can understand as asserting the “thesis” of this dialectical conflict. Just as, in the history of Christianity, the epoch of metaphysical religion emerged after the epoch of hyperphysical religion, Reinhold understands the thesis as a reaction to the claims of hyperphysical religion. The rationalist metaphysician attempts to refute the hyperphysician’s claims that religion can only be grounded on “feeling” by endeavoring to demonstrate that speculative reason can provide certain knowledge of God’s existence. The dialectically opposed counter-claim constituting the “antithesis” represents Jacobi’s faction, which argues, in the name of hyperphysical revelation, that any rational justification of religious belief is impossible. The proponents of the antithesis attempt to subvert the claims of metaphysical religion, to prove that reason is incapable of demonstrating the existence of a personal God.

Assessing these dialectically opposed claims through the lens of Kant’s critical philosophy, Reinhold concludes that “each one, considered on its own, was neither completely true nor completely false.”46 The proponents of the thesis are correct to argue that religion can be grounded on reason, and yet err in expecting “too much” from reason by dogmatically presuming that we can know God’s existence in a manner that would make faith superfluous.47 The proponents of the antithesis are correct to expose the rationalist metaphysician’s overconfidence in reason, but err in expecting “too little from reason”48 by dogmatically presuming that religious belief cannot be rationally justified. The errors of both parties occur “as a result of [a] universal misunderstanding of reason,”49 which conceives it too narrowly as only speculative or theoretical. Kant resolves the dialectical conflict by providing a critical investigation concerning “what

45. Ibid., 12.
46. Ibid., 40.
47. See ibid., 14.
48. Ibid., 14.
49. Ibid., 16.
is possible through pure reason.”50 In so doing, he both grounds our cognition of reason anew and uncovers a new domain of reason from which a “new” and “better” metaphysics may emerge. The critical philosophy concludes that speculative or theoretical reason cannot prove either the existence or nonexistence of God, but demonstrates from the essence of practical reason the necessity of moral faith in his existence.51 For the philosopher needs to assume “a principle that is wise and powerful enough to determine and bring about the happiness of rational beings as a necessary consequence of moral laws” just as much as the common man “feels compelled to accept a future rewarder and punisher of the actions that his conscience approves and condemns.”52 Common-sense religious beliefs have, Reinhold says, always been derived from practical reason, even if the essential role of morality in the formation of religious belief was only discovered by Kant. In this way, Reinhold sees Kant’s *Kritik* as having already provided a resolution to the pantheism controversy before its actual outbreak.53

II. JACOBI’S ATTACK ON KANT

Rather than conceding that the *Kritik* had annulled his objections to the Enlightenment’s confidence in reason, Jacobi responded by attacking the critical philosophy itself. Jacobi claims that the critical philosophy leads to solipsism or, as he calls it, “speculative egoism,”54 which undermines common-sense convictions as much as any consistent rationalist metaphysics. He therefore believes that Kant’s idealism robs the world of any “deeper meaning,”55 by declaring that “the substantiality of the human spirit, … a free Author of this universe [and] a Providence conscious of its rule [are] merely logical phantoms.”56 Rather than “restoring Christianity,” Jacobi thus argues that the *Kritik* in fact “leads to nihilism [with] an all-devastating power.”57

In his *David Hume über den Glauben, oder Idealismus und Realismus* of 1787, Jacobi argues that Kant’s claims that experience is “occasioned” by sensible impressions, received insofar as “we are affected by objects,”58 cannot be reconciled with his claims that all cognition of objects is the product of a “synthetic

50. Ibid., 21.
51. See ibid., 20.
52. Ibid., 23.
53. See ibid., 24.
55. Ibid., 515.
56. Ibid., 583.
57. Ibid., 544.
unity in the manifold of intuition.” In Jacobi’s words, the claim that “objects produce impressions on the senses through which they arouse sensations [and] bring about representations” contradicts the claim that any cognizable object “is always only appearance” and “cannot exist outside us and be something more than a representation.” According to Jacobi, the objects Kant describes as “affecting us” are transcendent objects or things in themselves, which are not cognizable by us. Kant thus seems to want to claim that all cognition begins insofar as we are affected by things in themselves, only to subsequently declare that the existence of such objects is “problematic.”

Jacobi thus claims “that without that presupposition [that we are affected by things in themselves] I could not enter into the [Kantian] system, but with it I could not stay within it.” The “contradiction” between the claim that things in themselves affect us and the transcendental idealist denial of any cognition of things in themselves does indeed have the further pernicious consequence of threatening to undermine the strict dichotomy between sensibility and understanding, on which so much of Kant’s reform of metaphysics is grounded. For Jacobi believes that Kant’s claims that we possess a “passive” faculty of sensibility necessarily presuppose that we are affected by things in themselves. He writes that “to feel passive and to suffer is only one half of a condition that cannot be thought on the basis of this half alone.” Any claim that we passively receive impressions necessarily presupposes that there exists “a thing . . . outside us in a transcendental sense” that affects us and is the “cause” of impressions. He continues: “even the word ‘sensibility’ . . . would be meaningless . . . if the concepts of ‘outside one another’ and ‘being combined,’ of ‘action’ and ‘passion,’ of ‘causality’ and ‘dependence,’ were not already contained in the concept of it as real and objective determinations.” Jacobi therefore believes that Kant’s claims that a passive faculty of sensibility is a necessary constituent of experience necessarily presuppose the existence of both things in themselves outside us and ourselves qua things in themselves, as well as necessarily presupposing that the latter causally act on the former. Jacobi thus finds it problematic that Kant explicitly denies that we can know the validity of these presuppositions by rendering the existence of things in themselves problematic and claiming that the concept of causality can only meaningfully connect representations. For Jacobi, therefore, Kant’s system is erected on a foundation that is subsequently

59. Ibid., A 105.
60. Jacobi, The Main Philosophical Writings, 335.
61. Ibid.
62. Ibid., 336.
63. Ibid., 338.
64. Ibid.
65. Ibid., 336.
undermined by the very system erected on it. The foundation is the presupposition that we “have a sensation of cause and effect understood transcendentally and [are] able to infer [the existence of] things outside us in a transcendental sense in virtue of it”;66 and this presupposition is undermined by the transcendental idealist claim that “objects (as well as their relations) are merely subjective beings, mere determinations of our own self, with absolutely no existence outside us.”67

Reflecting on Kant’s claim that all causally efficacious objects are merely the product of a synthesis of the manifold of representations, Jacobi concludes:

…it must not even be probable to [the transcendental idealist] that there be things present outside us in a transcendental sense …. If he were ever to find this even just probable, if he were to believe it at a distance, then he would have to go out of transcendental idealism, and land himself in truly unspeakable contradictions. The transcendental idealist must have the courage, therefore, to … not be afraid of the objection of speculative egoism, for it is impossible for him to pretend to stay within his system if he tries to repel from himself even just this last objection.68

Furthermore, Jacobi argues that Kant cannot object to the charge of egoism without renouncing “what [he] alleges to be [the doctrine’s] main advantage [namely] that it sets reason at rest.”69 Regarding this professed “transcendental ignorance”70 of things in themselves, however, Jacobi objects that it is “unqualified”; so that it “would lose all of its power if even a single conjecture were to rise above it and win from it even the slightest advantage.”71

How successful are Jacobi’s criticisms of Kant? In regard to Jacobi’s criticisms that Kant’s claims that objects affect us contradict his claims that objects are the product of the synthesis of a manifold of intuition, it may be objected that this apparent contradiction can be annulled by reading Kant as simply referring to how empirical objects (as opposed to things in themselves) affect the empirical subject (which is itself just as much an appearance as an empirical object). Kant’s references to the distinction between primary and secondary qualities in the Transcendental Aesthetic does indeed make it clear that, throughout experience, we are persistently affected by objects, insofar as secondary qualities are merely

66. Ibid., 338.
67. Ibid., 336.
68. Ibid., 338.
69. Ibid.
70. Ibid.
71. Ibid.
determinations of a temporally determined consciousness caused by the affection of spatially determined objects. Kant's claims that our “faculty of knowledge [is] awakened into action [by] objects affecting our senses”72 may therefore, contra Jacobi, simply refer to how, throughout experience, a temporally determined subject receives sensible impressions from spatially determined objects, which are, just like the temporally determined subject, simply appearances; a claim that would not contradict the critical strictures of transcendental idealism.

We might also object that Jacobi’s equation of “transcendental idealism” with solipsism (“speculative egoism”) cannot be squared with Kant’s argument in the 1787 “Refutation of Idealism” that self-cognition is only possible as a result of our immediate awareness of bodies in space. In a “Preface” appended to the 1815 edition of David Hume, however, Jacobi accepts that Kant’s “Refutation” successfully refutes the “empirical idealism” of Descartes, Malebranche, and Berkeley, which Jacobi refers to as “incomplete or half-way idealism.”73 Such idealism is “incomplete,” insofar as it claims that we are immediately conscious of the existence of the temporally determined subject qua thing in itself, while only declaring that the existence of actual objects in space is either problematic or impossible. Kant does indeed turn the tables on this form of idealism by showing that our cognition of own temporally determined consciousness is possible only insofar as there are spatially determined objects outside us, to thus turn “the Cartesian cogito ergo sum” into “a similarly constituted ‘cogito ergo es.’”74 Kant’s argument functions, however, only insofar as it is accepted that our own temporally determined consciousness is just as much an appearance as objects in space outside us. In claiming that, contra the empirical idealist, we are no more immediately aware of the self in itself than we are of things in themselves, Kant instigates what Jacobi calls an “entire and complete … Universal-Idealism,” which dissolves “both the world of spirits and that of bodies equally into nothingness,”75 and replaces “all previous half-hearted, and hence inconsistent idealism.”76 Therefore, although Kant can legitimately claim that I am conscious of myself and my reception of sensations only insofar as there are causally efficacious objects in space outside me, such a claim must also be accompanied by the caveat that both these spatially determined objects and the temporally determined subject that receives sensation are not things in themselves, but appearances and are thus – in Jacobi’s terms – mere “phantoms.”77

74. Ibid., 555.
75. Ibid., 553.
76. Ibid., 555.
77. Ibid., 524.
We may also wish to object that Kant by no means intended to produce “a system of absolute subjectivity” and that he introduces transcendental idealism, not to deny knowledge of actual things, but rather as a new methodological “point of view” better able to explain cognition of actual things. But Jacobi’s criticisms cannot be dispensed with so easily. For it cannot be denied that Kant’s claims that we must think of things in themselves and that our problematic concepts of such entities may possess an actually existing referent do suggest that there is a more fundamental reality into which our cognition cannot penetrate. Freeing transcendental philosophy from Jacobi’s criticisms would therefore require either (i) proving the existence of things in themselves, or (ii) proving their nonexistence, so that appearances become the only actual objects. Both these options were pursued by Kant’s successors.

III. REINHOLD’S ELEMENTARPHILOSOPHIE

The aim of decisively proving the existence of things in themselves was pursued by Reinhold. On the strength of his Briefe, Reinhold was appointed to the University of Jena to promulgate the Kantian philosophy. Once there, however, he embarked on a project of his own, which would push Kantian philosophy in directions that Kant himself was not willing to sanction. While Reinhold still professed allegiance to transcendental idealism, he became critical of the arguments Kant employed to establish this position. He thus argued that Kant’s conclusions had to be re-established on a new foundation. For, while Kant’s “results” were universally valid (allgemeingültig), the arguments he employed to establish them rested on so many controversial presuppositions that they were not universally binding (allgemeingeltend), and thus were unable to adduce the acceptance of those of opposed philosophical persuasions. Reinhold took it upon himself to re-establish the validity of – what he saw as – Kant’s position, with arguments to which supposedly everyone should assent. A case in point is precisely Kant’s doctrine that we cognize only appearances and not things in themselves. A realist like Jacobi will find little within the Kritik to decisively sway him in favor of transcendental idealism. It is to just such a stubborn dogmatist that Reinhold’s project – which he eventually titled the Philosophy of the Elements (Elementarphilosophie) – is directed. Reinhold thus attempts to decisively prove the validity of transcendental idealism from grounds about which absolutely everyone should be convinced. He grants Jacobi’s point that rational demonstration must be preceded by immediate conviction, to argue

---

78. Ibid., 555.
For the validity of transcendental idealism *from* an immediate conviction that everyone shares.

For Reinhold, a major problem is Kant’s analytic-inductive method. This leads to Kant endeavoring to justify fundamental doctrines by transcendental arguments that begin by assuming the validity of their *explicandum*. Reinhold admits that the process of “discovery” must necessarily proceed in this analytical manner from “consequence” to “ground,” but argues that the truths that Kant discovered in this manner can be satisfactorily justified only by the employment of a synthetic-deductive method of deriving consequences from grounds.

A case in point is Kant’s Transcendental Analytic. According to Reinhold, problems are generated insofar as “experience” constitutes the “basis of the Kantian system.” Kant thereby assumes that we possess *sensible perceptions of objects* that are *necessarily connected* within law-governed relations and, on the basis of this assumption, attempts to discover the conditions of possibility of such experience. But this procedure is problematic insofar as the precise meaning of the “concepts of … sensible perception, objects, connection and necessity,” which are presupposed by Kant’s “concept of experience,” can, insofar as the latter is “the basis of the Kantian system,” in no way “be explained by it without circularity.” Furthermore, the procedure is also question-begging, insofar as a Humean skeptic could deny the Analytic’s conclusions on the grounds that he denies the validity of the basis from which they are derived. The most Kant can do (as Maimon was later to point out) is provide a “hypothetical answer” to the skeptic, to claim that necessary connection within experience could, *contra* Hume, be rationally justified; but he cannot *prove* to such a skeptic that there actually *is* necessary connection within experience. For Reinhold, however, this is not good enough; he therefore wishes to construct an argument so forceful that it will compel the Humean skeptic to accept the validity of such necessary connection.

Problematic transcendental arguments also bedevil Kant’s Transcendental Aesthetic. One of Kant’s fundamental arguments for the transcendental ideality

81. Reinhold’s objection is succinctly outlined by Alexander von Schönborn in the following passage: “if, as Kant puts it, experience is possible only ‘through a representation of necessary connection of perceptions,’ then not only can experience not be explained, in Kant’s terms, without circularity, but anyone not already committed to the presence of ‘necessary connection’ in perception will be free to deny the entire edifice built on this foundation” (Alexander von Schönborn, “Karl Leonhard Reinhold: ‘Endeavoring to keep up the pace mit unserem zeitalter,’” in *The Emergence of German Idealism*, Michael Baur and Daniel O. Dahlstrom [eds] [Washington, DC: The Catholic University Press, 2000], 55–6).
of space and time is that, qua forms of intuition, they are conditions of possibility for the a priori synthetic judgments constituting mathematics. But Reinhold objects that Kant has not decisively proved that mathematical judgments actually are a priori synthetic, meaning that anyone who disagrees about this will be under no obligation to accept the consequences Kant derives from it. This is particularly worrying insofar as the bulk of Kant’s readers do not accept that mathematical judgments are a priori synthetic. Reinhold mentions that “many mathematicians” consider such judgments to be merely “hypothetical” and so deny their apriority, but devotes most of his attention to the claims of the Leibnizian rationalist, who, together with the Humean skeptic, claims that such judgments are analytic. The Kritik does not possess the resources to convince the latter that mathematical judgments do not simply explicate concepts, since the distinction between intuition and concept, sensibility and understanding, requisite for any such discussion, is derived in the Kritik from the very assumption that mathematical judgments are a priori synthetic judgments.82 Just as with the question concerning necessary connection within experience, Reinhold believes that Kant has once again failed to realize that the regressive analytic direction one should take in discovering truth does not likewise serve as the direction one should follow in justifying it. For Reinhold, therefore, the fundamental distinction between intuition and concept and the transcendental ideality of space and time should not have been derived from the a priori synthetic nature of mathematical judgments because this assumption is so controversial; rather, the a priori synthetic nature of mathematical judgments should be proved by the distinction between intuition and concept83 and the transcendental ideality of space and time, and the distinction between intuition and concept and the transcendental ideality of space and time should be derived from something about which both the rationalist and skeptic agree.

If one accepts Reinhold’s criticisms, it follows that, unless Kant’s arguments for necessary connection within experience and the a priori synthetic nature of mathematical judgments are reformulated, the transcendental philosopher cannot convince the Humean skeptic that there do actually exist any true a priori synthetic cognitions. Likewise, unless Kant’s arguments for the transcendental ideality of space and time are re-established, the transcendental philosopher has no means of swaying the Jacobian from his belief that spatiotemporal objects are things in themselves. However, another one of Reinhold’s many concerns is that a philosopher could in fact accept all of Kant’s claims concerning necessary connection within experience, the a priori synthetic nature of mathematical judgments and the transcendental ideality of space and time, and yet still deny

82. See Reinhold, Beiträge zur Berichtigung, 199.
83. See ibid., 203.
the critical limitations Kant placed on cognition. One could, in other words, claim that, although understanding can only cognize appearances, reason can still cognize things in themselves. Reinhold is thus concerned that Kant did not adequately demonstrate that the faculty of reason cannot be employed to cognize things in themselves that transcend our experience. His concern is understandable when one considers how some of his contemporaries maintained that reason’s ideas could in fact be employed to cognize transcendent things in themselves. It was thus believed that the claims of rationalist metaphysics could be reconciled with Kantian criticism by means of an “Akkomodationsphilosophie,” which maintained that, while sensibility and understanding are unable to cognize things in themselves, reason can still cognize them. While Reinhold sees that this reconciliation is completely contrary to the spirit of Kantian criticism, he still believes that the Kritik cannot rule out the “possibility” that our ideas do correspond to things in themselves. He thus concludes that Kant’s arguments for the unknowability of things in themselves should be reconstructed in such a way that even the Akkomodationsphilosoph would be compelled to accept them.

In response to these problems, Reinhold proposes reconfiguring the critical philosophy in such a way that its results will be shown to emerge through a synthetic-deductive derivation. Such a method should, Reinhold believes, be able to compel everyone to accept the universally valid results of the critical

---

84. Ibid., 220. Faustino Fabbianelli convincingly argues that Reinhold employs the appellation “Akkomodationsphilosophie” in order to refer to the position defended by J. A. Eberhard and the contributors to his Philosophisches Magazin, as well as the interpretation of the critical philosophy promulgated by the Kantian, L. H. Jakob (see ibid., xxviii–xxxii, 390–92). Johann August Eberhard (1739–1809) founded his Philosophisches Magazin in 1788 in order to attempt to defend the classical Leibnizian–Wolfian tradition of rationalist metaphysics against Kantian criticism. A common strategy employed by Eberhard, as well as many of the other contributors to the Magazin, was to argue that Kant’s doctrine that sensibility and understanding only affords cognition of appearances leads to a pernicious solipsism that is most adequately avoided by maintaining the Leibnizian claim that reason affords cognition of the supersensible (see Frederick Beiser, The Fate of Reason [Cambridge, MA: Harvard University Press, 1987], 193–5). In contrast, Ludwig Heinrich Jakob (1759–1827) saw himself as one of Kant’s disciples and yet, nonetheless, within his Grundriss der allgemeinen Logik und kritische Anfanggründe zu einer allgemeinen Metaphysik (1788), interpreted Kant’s critical philosophy as maintaining that – by means of reason – we do in fact possess cognition (Erkenntnis) – albeit an indeterminate one – of things in themselves and God. Reinhold criticized Jakob for this misinterpretation of Kant’s concept of cognition within a review of his Grundriss that appeared within the Allgemeine Literatur-Zeitung in 1790. Jakobi’s letter to Kant of May 4, 1790, written in the wake of Reinhold’s review, expresses doubts concerning the correctness of such a broad application of the concept “cognition,” but also suggests that such a reading could have the merit of reconciling Eberhard’s rationalist faction to the critical project (see Kant, Gesammelte Schriften, begonnen von der Königlich Preußischen Akademie der Wissenschaften [Berlin: de Gruyter, 1900–], vol. 11, 168–70).

85. Reinhold, Beiträge zur Berichtigung, 223.
philosophy if the synthetic-deduction begins from a point that “binds universally.” The adoption of a synthetic-deductive method should also be able to resolve problems that are internal to the critical philosophy itself. A famous example is Kant’s table of categories. As far as Reinhold is concerned, Kant’s metaphysical deduction from forms of judgment can in no way convince us that just these twelve, and no other, are the fundamental a priori concepts by which we cognize objects of experience, and thus the completeness and correctness of this twelfold inventory will only be satisfactory once this is demonstrated from premises that rest on a foundation that binds universally.86

Reinhold’s *Elementarphilosophie* thus endeavors to synthetically deduce the results of Kant’s *Kritik* from a truth that is immediately obvious and accepted by everyone, that is, “a universally binding first principle [allgemeingeltenden Grundsatz].”87 Reinhold follows Descartes in believing that “consciousness as such” – or, what Reinhold calls, “mere representation” – is a truth that is absolutely self-evident and cannot be denied; the ultimate first-principle of the *Elementarphilosophie* – and thus of all philosophy – therefore expresses the existence of that consciousness. Reinhold also follows Jacobi in claiming that all rational demonstration must be preceded by an immediate certainty. If consciousness itself – and the proposition expressing it – is to be the ground of all demonstration, then it itself cannot be rationally demonstrated; it is therefore a fact that simply cannot be proved, but of which we are immediately certain.88 This self-evident “fact” is expressed as a first principle, which he calls the “proposition of consciousness,” which states that “in consciousness, the representation is distinguished by the subject from subject and object and is referred to both.”89 This proposition “immediately expresses nothing other than the fact that occurs in consciousness.”90

It may appear that Reinhold has in fact supplied us with a proposition riddled with ambiguity, liable to all manner of conflicting interpretations. However, Reinhold is careful to point out that all three terms should be understood as divested of metaphysical connotations: the “object” referred to thus simply denotes the “intentional object” of every conscious state (even self-consciousness). Insofar as, in being conscious, there is something I am conscious of, or, in other words, in every representation something is represented, one can quite easily accept that such “objects” necessarily occur in consciousness without

---

86. See *ibid.*, 215. Reinhold’s discussion is clearly the basis for Fichte’s later castigation of Kant for having merely inductively derived the categories from experience (see Johann Fichte, *Sämtliche Werke* [Berlin: Veit, 1845–46], I, 53, 57).
88. See *ibid.*, 98–9.
addressing any metaphysical questions concerning the ontological status of their referents. The “subject” denotes the “action” of representing, by means of which I am aware of representations as mine. The “object” and “subject” should thus in no way be read as referring to either things in themselves or a soul-substance, both of which must be derived from the proposition of consciousness before they may be admitted into the Elementarphilosophie. Clearly, therefore, the proposition of consciousness, if correctly understood, expresses nothing more than the fact of consciousness itself, and therefore expresses something about which there should be consensus among thinkers of all philosophical persuasions, the transcendental realist, the empirical idealist, no less than the Humean skeptic.

Reinhold is, however, quick to grant the terms “object” and “subject” an ontological interpretation. As such, the consensus that the proposition of consciousness was supposed to establish quickly dissipates. Reinhold thus argues that “the mere representation” described within his first-principle “must consist of two distinct moments.” If a representation both belongs to a subject and represents an object, then it must consist of two distinct elements, one referring to the subject and the other referring to the object; the fact that the subject and object are distinguished in consciousness demonstrates that whatever “within the representation … is referred to the object must also be distinguished from that through which it is referred to the subject.” These two “moments” are described as “content” and “form.” The content, which refers to the object, is that which distinguishes different representations. On the other hand, the form, which refers to the subject, is that which supplies distinct particular representations with a commonality that makes them into my representations. Reinhold continues to argue that the object, insofar as it is no longer considered as the represented to which the representation refers, must be thought of as a “thing in itself,” to which the “mere content” of representation belongs. The object described within the proposition of consciousness thus receives an ontological interpretation, as that which, abstracted from the form of representation, exists in itself, supplying content to our representations. For Reinhold, this “thing in itself” certainly exists, as that “to which a content in a representation corresponds, or can correspond, upon which the same representation in regard to its content certainly depends.” He therefore writes:

91. See *ibid.*, 99–101.
94. See *ibid.*, 125.
96. *Ibid.*, 127. Reinhold makes it clear that not every representation requires an objective content given from a thing in itself. We can possess pure representations, derived from the mind’s
The things in themselves can be as little denied as the representable objects themselves. They are these objects themselves insofar as they are not representable. They are that something which must ground the mere content of a representation outside of the representation. The thing in itself and its properties, distinguished from the form of representation, are not only nothing impossible, but even something indispensable to mere representation, for no mere representation is thinkable without content and no content is thinkable without something outside of the representation that does not have the form of the representation, i.e., the thing in itself.\textsuperscript{97}

Despite the fact of their existence, however, the things in themselves are proved to be unknowable on account of the fact that they are, by definition, unrepresentable. For, to represent anything I must supply it with form, meaning that I cannot represent that which precedes the form and therefore cannot represent things in themselves. Reinhold thus writes that “the representation of the so-called thing in itself contradicts the concept of a representation as such.”\textsuperscript{98} In this way, Reinhold takes himself to have proved Kant’s mere “assumption” – the validity of which was denied by the Akkomadationsphilosophen among others – that we are incapable of cognizing things in themselves. We can also see that Reinhold has at least succeeded in providing a response to Jacobi’s criticisms of the role of things in themselves within Kantian philosophy. Reinhold’s reconfigured transcendental philosophy cannot be described as a system of “speculative egoism,” since it concludes that there must exist things in themselves on which the content of all representations depend.

**IV. MAIMON’S EMPIRICAL SKEPTICISM**

Rather than following Reinhold in proving their existence, one could also respond to Jacobi’s criticisms concerning Kant’s things in themselves by abolishing them from transcendental philosophy, to thus deny the objective reality of these things in themselves.
of any transcendent entities and effectively render our appearances the only real objects. This latter strategy was adopted by Salomon Maimon. Maimon’s engagement with Kant yielded a series of reflections that were published in 1790 as the _Versuch über die Transzendentalphilosophie_. Prior to publication, Maimon sent Kant the manuscript (together with covering letters from himself and Marcus Herz⁹⁹), hoping that he would grant it a written commendation. Maimon presents himself as Kant’s loyal follower, but Kant obviously found this declaration disingenuous. He therefore refused to publicly commend the work on the grounds that “for the most part it is directed against me.”¹⁰⁰ Nonetheless, in his reply to Herz, Kant proclaimed that “none of my critics has understood me … so well.”¹⁰¹

Maimon nevertheless admitted in his letter to Kant that his manuscript contained “some observations” concerning lacunae within the first _Kritik_. The first of these lacunae concerns Kant’s answer to the question “Quid juris?,” that is, the question concerning how we can legitimately apply _a priori_ concepts to something _a posteriori_. Maimon claims that Kant has not sufficiently answered this question, but suggests that he himself has provided new resources for its answer, by means of his conception of “ideas of understanding.”¹⁰² The second lacuna concerns “the question _Quid facti?_,” that is, the question concerning whether that which is _a posteriori_ is actually subsumable under _a priori_ concepts. Maimon suggests that Humean skepticism necessitates an answer to this question, and criticizes Kant for leaving it unanswered.

Within the _Versuch_, Maimon wrestles with both these questions. His endeavor to sufficiently respond to them leads him to promulgate a reconfigured transcendental philosophy that evidently proved too innovative for Kant to sanction. Maimon describes his position as one of _rational dogmatism_ and _empirical skepticism_.¹⁰³ He is a _rational dogmatist_ insofar as, in endeavoring to satisfactorily answer the question _quid juris_, he explicitly advocates returning to the Leibnizian conception that the _a posteriori_ is itself the product of understanding. He is an empirical skeptic insofar as his reflections on the question _quid facti_ lead him to doubt whether that which is _a posteriori_ actually is subsumable under _a

---

⁹⁹. Marcus Herz (1794–1803) was, prior to matriculating in 1766, a student of Kant who went on to participate in the public defense of Kant’s _Inaugural Dissertation_. In fall 1770 he moved to Berlin (where he met Maimon). His extensive correspondence with Kant is one of the most useful sources of information concerning the _Kritik der reinen Vernunft_’s genesis during Kant’s “silent decade.” He became a Professor of Philosophy in 1786.

¹⁰¹. _Ibid._, 49.

¹⁰². _Ibid._

priori concepts. To this extent, Maimon not only denies that Humean skepticism has been refuted by Kant, but also denies that such skepticism will ever admit of refutation.

Like Reinhold, Maimon argues that Kant’s failure to adequately respond to Humean skepticism results from his analytic-inductive methodology. According to Maimon, Kant simply “presupposes as indubitable” a fact that the Humean skeptic doubts, namely, “the fact that we possess propositions of experience.” Kant thus simply assumes that we cognize objects that exist in accordance with the *a priori* principles of a *physica pura*. Thus, despite the fact that the Humean skeptic doubts such an assumption, Kant simply assumes that the principle that, for example, “every alteration must have a cause,” is necessarily and universally valid of experience. Having presupposed that we possess such an experience, he then attempts to show how such an experience is possible. Crucially, Kant argues that *a priori* concepts are conditions of possibility of experience; they are objectively valid insofar as, without them, we would possess merely a “rhapsody of perceptions.” However, Maimon doubts the very presupposition of Kant’s argument, that is, his initial assumption concerning the nature of experience. It is certainly possible, Maimon concedes, that we do possess the “experience” Kant describes, but he denies that this is indubitable, and entertains the prospect that we actually only possess a “rhapsody of perceptions.” Maimon thus highlights how Kant’s “answer” to Humean skepticism is essentially hypothetical, arguing that if we possess “experience,” then cognition of causality must be derived from an *a priori* concept; this “answer” therefore cannot decisively silence the skeptic’s counter-claim that we possess merely a “rhapsody of perceptions” from constant conjunctions, among which the concept of causality is inductively derived. If we do possess “experience,” then Kant has at least provided resources for explaining how it is possible. However, Kant leaves the question *quid facti*, that is, the question concerning whether we do in fact possess such an experience, without a sufficient answer.

Maimon’s skepticism concerning the subsumption of the *a posteriori* under *a priori* categories is demonstrated by his discussion of our (supposedly) necessary application of the category of causality. Within the “Second Analogy,” Kant questions how we can distinguish between a merely subjective succession of representations (e.g. in the apprehension of a house from basement to roof) and an objective succession (e.g. in the apprehension of a ship moving downstream). Kant concedes to the Humean skeptic that there is no “impression” that legitimates our (supposed) cognition that some perceptions are necessarily

104. Ibid., 105.
106. Ibid., A 156/B 195.
He therefore argues that our ability to distinguish between subjective and objective successions must be grounded by the category of causality. Without this category, Kant says, we would possess merely a “play of representations,” but, insofar as we apply it, we understand that certain successively apprehended representations represent necessarily connected and irreversible events undergone by empirically real objects. Kant thus concludes that the “recognition of the rule [that everything which happens has a cause] has been the ground of experience itself, and has therefore preceded it a priori.” But of course, Kant’s whole discussion presupposes that we do possess experience of a world in which necessarily connected and irreversible events occur. Maimon, however, doubts this presupposition. He thus believes that we cannot (i) distinguish between subjective and objective successions with absolute certainty, and thus cannot (ii) legitimately apply the category of causality.

Maimon uses against Kant his own claims that there is no “impression” that distinguishes objective and subjective successions. He maintains that if, within the successive apprehension of our perceptions, we cannot find anything enabling us to determine which of them are to be necessarily connected, we can still legitimately deny that we possess an adequate ground to distinguish between a subjective and objective succession. The criterion of “irreversibility” is of no use insofar as, during my perception of a subjective succession from C to D, it is just as impossible that I may perceive from D to C as it is that, in regard to a (supposedly) objective succession from A to B, I could perceive from B to A. Maimon therefore alludes to Kant’s examples of the house and ship, and concludes that “considered in themselves, these two kinds of succession are not at all distinguished from one another.” Maimon thus questions the very applicability of the category of causality. For in doubting that we adequately distinguish between a subjective and objective succession, he is forced to question whether the distinction is evidence of an a priori concept of causality. For, one can still consistently object to Kant that we actually possess no experience of objective succession, and that everything is a dream in which the category of causality has no objective reality. However, one does not necessarily have to embrace such hyperbolic doubt to question the applicability of this category. Kant maintained that “I render my subjective synthesis of apprehension objective only by reference to a rule,” made possible by the application of the category of causality; but Maimon asks how we are justified in subsuming this initial apprehension under the category of causality, to thus attach to it the necessity

107. See ibid., B 234.
108. Ibid., A 196/B 241.
110. See ibid., 201.
111. Kant, Critique of Pure Reason, A 195/B 240.
according to a rule. The problem is again generated by Kant’s concession to the Humean skeptic that there is nothing within the perceptions themselves that serves to distinguish an objective and subjective succession. Taking up Kant’s example of the heated stove, Maimon shows how previous sense experience provides a more adequate explanation for our inclination to distinguish an objective and subjective succession than the category of causality. He writes:

How do we cognize that the succession from $b$ to $a$, but not that from $c$ to $a$ is objective? E.g., the stove in the room was heated, we notice that after that the air in the room became warm, and that outside snow has fallen …. What kind of ground have we, therefore, for considering the warming of the air in the room as an objective consequence and the snowfall as a subjective consequence? We certainly possess a propensity to believe that the heating of the stove and warmth in the room stand necessarily connected within an irreversible causal relationship, whereas the heating of the stove and the snowfall do not. But this propensity, Maimon argues, can only be based on the fact that we have frequently observed the warming of the room to follow the heating of the stove and have never observed the heating of the stove to follow the warming of the room, whereas, in contrast, we have observed a snowfall to sometimes follow the heating of the stove and sometimes to precede it. That the heating of the stove and the warming of the room seem to be necessarily connected (unlike the relation between the heating of the stove and the snowfall) is therefore something that only sense experience can teach us. But if the application of the concept of causality can be justified only by the observation of such constant conjunctions, we are forced to return to Humean skepticism. Therefore, according to Maimon, although the concept of causality may be an a priori concept supplied by the understanding, it does not possess the power, attributed to it by Kant, of explaining our capacity to distinguish between objective and subjective successions, since only previous sense experience decides what seems to constitute an objective succession.

It may be objected that this argument does not undermine Kant’s claims concerning the applicability of the category of causality to experience in general, with the result that the objective validity of the principle that “every alteration must have a cause” remains unscathed. We can thus still maintain that the category of causality has a useful role in justifying the axiomatic principles of a physica pura. Maimon’s argument does, however, still pose a serious

112. See Maimon, Versuch über die Transzendentalphilosophie, 200–201.
113. Ibid., 201.
problem insofar as it questions the extent to which the category of causality can legitimately be applied to particular representations. For, if we must appeal to previous sense experience to cognize particular causal relations, we are not employing the category of causality at all, for, as Kant following Hume points out, previous sense experience cannot justify the objectivity of a necessary connection. Our employment of the concept of causality in particular instances therefore merely expresses a subjective necessity. But this is a kind of “relative necessity,” which is obviously far weaker than that which Kant claimed that the category of causality expressed.

Another, more fundamental, objection that Maimon directs against Kant is that, in terms of his system, it remains inconceivable how any of the categories can be applied to our intuitions. The problem arises because of the heterogeneity between the categories and their supposed referents. Because of this, Maimon says that Kant is incapable of providing any adequate answer to the question concerning how the a posteriori conforms to rules expressed by a priori categories, so as to justify the latter’s application. He admits that Kant sought to avoid this difficulty by claiming that the categories are applicable to the a posteriori only insofar as it appears within an a priori form of intuition. However, this does not obviate the initial difficulty because of Kant’s dualism of sensibility and understanding. In his reply to Herz concerning Maimon’s manuscript, Kant endeavors to respond to this question. He argues that a priori concepts must be applicable to a priori intuitions insofar as we would otherwise possess no cognition – and hence no experience – with the result that our intuitions “would be nothing for us.” The question as to how the heterogeneous faculties of sensibility and understanding relate to one another cannot, Kant argues, receive any further explanation, and yet he says that it does not require one, simply because he has demonstrated that our cognition and experience is only possible insofar as they do interact. By his own admission, however, Kant had only read the first two sections of Maimon’s manuscript, and so most probably did not realize that this attempted rebuttal only confirms that his philosophy is as question-begging as Maimon believes.

Maimon, however, does not dismiss Kant’s philosophy out of hand. It may not be indubitable that we possess “experience,” but it is still possible. The task of Maimon’s transcendental philosophy therefore consists in giving a hypothetical account of: what would have to be the case if we possess experience? It is because

114. See ibid., 39–40.
115. See ibid., 40.
116. See Kant, Gesammelte Schriften, vol. 11, 50–51.
117. See ibid., 49.
of the nature of his answer to this question that Maimon describes himself as a rational dogmatist as well as an empirical skeptic.

V. A REBIRTH OF RATIONALIST METAPHYSICS?

Maimon suggests that the Kantian question *quid juris* will only admit of a sufficient answer insofar as the resources of Leibnizian–Wolffian metaphysics are incorporated into transcendental philosophy. When discussing how Kant’s division between understanding and sensibility renders incomprehensible the application of the former’s categories to the latter’s forms, he observes how “according to the Leibnizian-Wolffian system, time and space [are] concepts of the understanding of the relations of things as such, and thus we can with perfect legitimacy subject them to the understanding’s rules.” 118 Likewise, when discussing how it remains incomprehensible how the understanding’s categories could apply to particular empirical intuitions, he observes that “according to the Leibnizian-Wolffian system, both [objects and the understanding’s rules] flow from a single cognitive source: (their difference consists only in degrees of completeness of this cognition).” 119 Maimon therefore proposes incorporating these elements of the Leibnizian–Wolffian system into Kantian transcendental philosophy to thus claim that empirical objects, as well as the understanding’s rules, are produced from one and the same source. Such a hypothesis would satisfactorily answer the question *quid juris*, since, if the *a posteriori* arises together with the understanding’s rules from the same cognitive source, there is no difficulty in conceiving how empirical objects conform to rules and conditions dictated by the understanding. This source from which empirical objects arise would also produce all possible relations between objects, with the result that time and space would also conform to the understanding’s rules.

Maimon describes this source as “an infinite understanding,” which he says he assumes “at least as an idea.” 120 This is the highest transcendental idea to which reason can attain. He thus says that “I distinguish myself from Kant … insofar as, instead of three ideas, which he assumes, I assume a single idea (an infinite understanding).” 121 “Our understanding,” he says, “is just the same [as the infinite understanding], only to a limited extent,” 122 and it is the limitations of our own finite understanding that accounts for our everyday failure to realize that empirical objects are the product of understanding. We might, like Kant, find

119. Ibid.

121. Ibid., 198.
122. Ibid., 40.
this idea more reminiscent of Spinoza than Leibniz, however, the inspiration for this idea may have in fact come from Maimon’s twelfth-century namesake.

Maimon says “I attach objective reality to this idea [of the infinite understanding]”; it does not possess objective reality insofar as it is “considered in itself (for this contradicts the nature of an idea),” but it “receives objective reality from the objects of intuition,” which likewise only “receive their objective reality from this idea.” The infinite understanding, therefore, does not denote a transcendent thing in itself that exists independently of the empirical reality it produces. Rather, the infinite understanding denotes a transcendental condition of experience, which is as inseparable from empirical reality as Spinoza’s “God” is inseparable from the sphere of finite modes. Therefore, if we wish to maintain that we possess the “experience” Kant describes, we must assume the objective reality of an infinite understanding as the transcendental condition of the possibility of such an experience.

The idea of an infinite understanding allows Maimon to contradict Kant’s claim that space and time are originally a priori forms of intuition (to maintain instead that they are originally concepts of the relations of things), while leaving the apodictic truth of mathematics intact. For Maimon argues that all mathematical truths are in fact analytic. In fact, he goes even further and claims that “all cognition a priori must be analytic and derived from the principle of non-contradiction.” It is only the limitations of our finite understanding that make us believe that there are true a priori synthetic judgments; for the infinite understanding, on the other hand, all such judgments are analytic. Maimon argues that we only believe mathematical judgments to be synthetic insofar as their subject is either “badly defined” or “not defined at all,” and claims that demonstrating that all such supposedly a priori synthetic truths are in fact analytic would be a not impossible, albeit laborious, task.

123. See Kant, Gesammelte Schriften, vol. 11, 50.
124. When, in the mid-1780s, Salomon ben Josua (as he was then known) was required by the Prussian state to adopt a surname in place of his patronymic name, he chose to name himself after the twelfth-century philosopher, Moses ben Maimon or – as he is more commonly known in the European tradition – Moses Maimonides (1135–1204). Abraham P. Socher suggests that the Versuch’s reconstruction of Kantian transcendental philosophy owes more to the influence of Maimonides than that of modern European rationalism (see Abraham P. Socher, The Radical Enlightenment of Solomon Maimon [Stanford, CA: Stanford University Press, 2006], 92), and thus argues that “the notion of human cognition as ultimately explicable through recourse to a divine mind was, in Maimon’s case, a direct application of Maimonidean ideas” (ibid., 47).
125. Maimon, Versuch über die Transzendentalphilosophie, 198.
126. Ibid., 100–101.
But what sense can be made of the claim that the *a posteriori* is posited by the understanding, so that it is not completely heterogeneous from the categories after all? Maimon responds to this question with his “theory of differentials.” We of course differentiate between objects not merely by means of their spatiotemporal position and differing magnitudes (both extensive and intensive), which depend on these spatiotemporal relations, but also by means of the sense impressions supplying our intuitions with content. If this latter condition is logically prior to spatiotemporal conditions, then it cannot be considered as possessing either an extensive or intensive magnitude. Maimon thus says that “considered in itself, every sensible representation must, as quality, be abstracted from all extensive as well as intensive quantity.”128 That which, for example, produces the representation of red color, must therefore “be thought without all finite extension.”129 If we intuit something red, this color must possess a determinate magnitude, but that does not mean that that which ultimately produces this sense impression can itself be intuited. Indeed, Maimon argues that everything we intuit must be thought as decomposable into basic elements that cannot be intuited. It is these infinitesimally small “physical points,” from which our diverse sense impressions are constituted and objects are generated, that Maimon describes as “differentials.” Because they cannot *in themselves* be intuited, Maimon describes them as “mere ideas.”130 His reconfigured transcendental philosophy thus asserts that there are two kinds of “ideas,” which are both “limiting concepts of a synthesis.” On one hand, there are the “ideas of reason,” in which we think of a “complete synthesis comprehending the infinite in itself”; and, on the other hand, there are – although Maimon is not always consistent in this terminological distinction – “ideas of understanding,” which express the basic elements from which all synthesis is constituted. The former’s referents cannot appear within intuition because they are infinitely large, whereas the latter’s referents cannot appear within intuition because they are infinitely small. Maimon compares the situation with that of the number series:

We proceed here just like, e.g., we proceed in calculations according to our system of numbers, in which we proceed according to just the same rules of unity forwards as well as backwards in relation to an extended magnitude (through the decimal fractions), i.e., we always can think of a greater and lesser unity, for after having counted to 10, we think of 10 as a unity and count again 10 such unities until

129. *Ibid*.
100, etc., i.e., we always think a greater unity, thus we also go backwards and think 0.1, 0.01 etc., as a unity, i.e., we always think smaller unity.\textsuperscript{131}

Thus, just as the number series can potentially be augmented \textit{ad infinitum} and diminished \textit{ad infinitum}, so it is with the sphere of experience. Maimon thus says that “with our cognition of things, we therefore begin from the middle and stop again in the middle.”\textsuperscript{132} Therefore, like Kant's mathematical-transcendental ideas, the differentials are ideas insofar as they express something to which our finite cognitive faculty can only infinitely approximate, but never reach.\textsuperscript{133} They can, nonetheless, be consistently thought, if we think of “a constant regression or decrease of the consciousness of an intuition \textit{ad infinitum}”\textsuperscript{134} and, according to Maimon, their existence must be presupposed if we wish to give a satisfactory account of the genesis and diversity of empirical intuition,\textsuperscript{135} as well as why particular objects are subsumable under the categories.

Particular empirical objects can be cognized by the understanding’s rules insofar as the categories do not \textit{immediately} relate to empirical intuitions, but rather relate to them \textit{mediately}, insofar as the understanding applies itself to the differentials that produce such intuitions.\textsuperscript{136} He explains this with the following examples:

If I, e.g., say: \textit{red} is dissimilar from \textit{green}; the pure concept of understanding of dissimilarity [i.e. the category of negation] is not considered as a relation between the sensible qualities (for otherwise, the Kantian question \textit{quid juris} would remain), but rather … as a relation between their differentials, which are a priori ideas of reason.\textsuperscript{137}

If one judges: fire melts wax; this judgment is not related to fire and wax as objects of intuition, but rather to their elements, which are thought by the understanding in the relations of cause and effect.\textsuperscript{138}

\begin{enumerate}
\item \textsuperscript{131} \textit{Ibid.}, 190.
\item \textsuperscript{132} \textit{Ibid.}
\item \textsuperscript{133} See \textit{ibid.}, 21 n.
\item \textsuperscript{134} \textit{Ibid.}, 21 n.
\item \textsuperscript{135} See \textit{ibid.}, 22 n.
\item \textsuperscript{136} See \textit{ibid.}, 193.
\item \textsuperscript{137} \textit{Ibid.}, 23. Maimon is here describing the differentials as “\textit{Vernunftideen},” despite the fact that in later sections of the text, he insists that they are in fact “\textit{Verstandsidesen},” which should thus be distinguished from our “\textit{Vernunftsideen}.”
\item \textsuperscript{138} \textit{Ibid.}, 193.
\end{enumerate}
Particular empirical objects are thus subsumable under *a priori* categories insofar as the understanding relates itself to differentials that “serve as principles for the explanation of the generation of objects according to certain rules of understanding.” In other words, if we wish to maintain that understanding can legitimately employ the category of negation to judge that “red is not green,” or the category of causality to judge that “fire causes wax to melt,” we must presuppose that the understanding can *understand* the nature of “red,” “green,” “fire,” and “wax,” by *understanding* the determinate rules by means of which these particular empirical objects arise from differentials. The understanding thus *understands* how particular objects have arisen in accordance with the rules that it dictates. It thus *understands* that it is precisely “fire” that melts “wax” and not “melting wax” that is the cause of “fire.” And, in maintaining that “the understanding has not merely a faculty to *think* universal relations between determinate objects of intuition, but also has a faculty to determine objects through relations,” we have to likewise assume that these differentials to which the understanding relates are not ultimately heterogeneous from its nature, but are also produced by it. Maimon thus describes how “the understanding does not subject something given *a posteriori* to its *a priori* rules; it rather lets it be generated in accordance with these rules”; this, Maimon continues, “is the only way to answer the [Kantian] question: *quid juris?* in a completely satisfactory manner.”

As ideas or concepts, the referents of which cannot appear within intuition, Maimon says that “these differentials of objects are the so-called *noumena.*” On the other hand, “the objects themselves that arise from them are the *phenomena.*” As they are introduced in order to explain the material content of our representations, we can see that Maimon abolishes things in themselves from transcendental philosophy in order to replace them with these differentials. The differentials are akin to Kant’s things in themselves insofar as they are thought as existing prior to space and time. But, unlike Kant’s things in themselves, they are not thought as transcendent entities beyond the world of experience (that logically precede the ultimate transcendental condition of experience), since the distinction between the differentials and their appearances is a question of degree as opposed to a distinction between two heterogeneous metaphysical spheres.

---

VI. THE LEGACY OF KANT’S EARLY CRITICS

The importance of the influence of Jacobi, Reinhold, and Maimon on later post-Kantian German idealism cannot be overstated. The German idealists understood themselves to be continuing the Kantian project of making metaphysics into a science, and yet they nonetheless introduced striking innovations that Kant seemed unprepared to sanction. However, it was precisely the need to resolve the tensions and contradictions that figures such as Jacobi, Reinhold, and Maimon identified within Kant’s writings that convinced the German idealists of the necessity of their innovations.

Within the first wave of German idealism in the early 1790s, it was Reinhold’s foundationalist reconstruction of transcendental philosophy that seemed to provide the most promising resources for successfully rendering metaphysics scientific. The skeptical objections to which Reinhold’s “proposition of consciousness” was subjected by Aenesidemus-Schulze\(^\text{143}\) and Maimon, however, convinced Fichte and others that the science of metaphysics needed to be grounded on a new foundation that would itself ground the proposition of consciousness. Within his *Grundlage der gesamten Wissenschaftslehre* of 1794/95, Fichte thus argues that the science of metaphysics must be grounded on a *Grundsatz* expressing the immediate certainty of self-consciousness, namely, “I am I.” However, the influence of Reinhold was shortlived. By the mid-1790s, the total collapse of the *Elementarphilosophie* and the wealth of attacks on the very idea that *any* proposition could adequately ground a system of philosophy (by the early German Romantics and others) led to the German idealists completely turning their back on *Grundsatzphilosophie*.

Perhaps far more influential, however, were Maimon’s claims that the results of Kantian philosophy could be rendered consistent only by returning to the resources of the rationalist metaphysics, to revoke the duality of sensibility and

---

\(^{143}\) Gottlob Ernst Schulze (1761–1833) anonymously presented a skeptical counter-attack against the transcendental philosophy of both Kant and Reinhold within a series of letters composed by an author masquerading as the Pyrrhonist, Aenesidemus, within his *Aenesidemus, oder Ueber die Fundamente der von Herrn Professor Reinhold in Jena gelieferten Elementarphilosophie* (1792). Reinhold’s claim that the “proposition of consciousness” can serve as the first principle of all philosophy is subjected to a barrage of criticisms by Schulze within *Aenesidemus*’s third letter (see Schulze, *Aenesidemus*, Manfred Frank [ed.] [Hamburg: Felix Meiner, 1996], 38–63). This attack proved highly influential insofar as it was precisely the process of reviewing Schulze’s work that convinced Fichte that the first principle of all philosophy must express a more fundamental transcendental condition from which the “fact of consciousness” itself emerges. Within his “Review of *Aenesidemus*” of 1794, Fichte thus declares that the first principle of a system of transcendental philosophy must be “even higher than the concept of representation” (Fichte, *Sämtliche Werke* I, 5) so that even Reinhold’s “proposition of consciousness can be strictly derived [from it] a priori” (*ibid.*, I, 8).
understanding, rid transcendental philosophy of things in themselves, and effectively introduce a Spinozistic monism, in which the forms of thought and the content of intuition are posited as arising from one and the same source. A striking example of this can be seen within Schelling’s Allgemeine Uebersicht der neuesten philosophischen Litteratur of 1797/98, a text in which the germs of Schelling’s later Naturphilosophie and “absolute idealism” are already apparent. Within that text, Schelling turns to Kant, not to discuss “what Kant had intended with his philosophy,” but rather “what … he had to have intended if his philosophy was to prove internally cohesive.”144 If it is to prove internally cohesive, Schelling argues, the notion of a realm of “things [in themselves], which exist in addition to actual things, primordially affect us, and lend content to representations”145 must be rejected. The first argument Schelling introduces to justify this contention is Jacobi’s argument that Kant’s appeal to things in themselves contradicts his conclusion that “everything that is an object, a thing, or an entity has become an object, etc., only through an initial synthesis of intuition.”146 The second argument Schelling employs is essentially a restatement of Maimon’s argument that the notion that the content of intuition is “given” from a source completely heterogeneous from the understanding will forever make the isomorphism between thought and nature inexplicable, and so will forever be unable to answer Humean skepticism. Schelling thus writes that the very idea that our understanding imposes laws “onto nature as something completely heterogeneous” in fact makes Kant an “inconsistent Humean”; inconsistent insofar as he refuses to admit along with Hume that, if concepts and sensations arise from heterogeneous sources, the assumed isomorphism between thought and nature is merely “a deception” produced by “our imagination.”147 Schelling thus claims that we have to give up the notion of things in themselves and thus argue that “nature is nothing different from its laws”;148 thereby defending the isomorphism between thought and nature by making them both arise from the same source, that is, the self-intuiting activity of Spirit (Geist), which, just like Maimon’s “infinite intellect,” is inseparably related to empirical reality in the same way that Spinoza’s God is inseparably related to the sphere of finite modes. “No thing,” Schelling thus proclaims, “can be real unless there is a Spirit to know it,” and he goes on to explicitly compare this position to that of Leibniz.149 Indeed, taking his cue

145. Ibid., 75.
146. Ibid., 73.
147. Ibid., 79.
148. Ibid.
149. Ibid., 76.
from Maimon, Schelling suggests that it is only by incorporating the resources of Leibnizian rationalism into Kant’s transcendental philosophy that the latter will become an “internally cohesive” system.150

We can therefore see that Mendelssohn was incorrect if he thought that the “all destroying Kant” could completely “destroy” the Leibnizian–Wolffian tradition of rationalist metaphysics. For, as the history of the development of German idealism shows, it was precisely the tradition of Leibnizian–Wolffian rationalist metaphysics that was looked toward in order to resolve the tensions and inconsistencies in Kant’s own transcendental philosophy.

I. PHILOSOPHY OF LANGUAGE

Among philosophers, Johann Gottfried Herder is probably best known for his ideas on language. This topic also forms an excellent point of entry into his thought, as it reveals some of the crucial components of Herder’s philosophical system, combining empiricism, metaphysical monism, cultural pluralism, and a qualified brand of realism. To speak of a philosophical “system,” in this context, may seem strange, as Herder is often charged with being an unsystematic thinker. He never produced an extended, carefully ordered treatise of the sort that Kant wrote, spelling out and arguing for a set of logically interconnected claims about knowledge and reality. Writing such a treatise seems not to have accorded with his personality, his talents, and even his own understanding of good philosophical method. Nonetheless, one can isolate a coherent and well-integrated philosophical position informing Herder’s epistemology and metaphysics, along with his anthropology and ethics, and this position is comprehensively illustrated by his theory of language.

Herder’s early essay, “On the Origin of Language,” constitutes his most sustained engagement with the subject. It was composed in response to an essay

1. Johann Gottfried Herder (August 25, 1744–December 18, 1803; born in Mohrungen, East Prussia; died in Weimar) studied theology at the University of Königsberg (1762–64), where he became friends with Johann Georg Hamann and attended lectures by Kant. He became a teacher at Domschule in Riga (1764–69). From 1769 to 1770 he took a long voyage to France, then Holland, met Lessing, and began a friendship with Goethe. He became pastor and court preacher in Bückeburg (1771–76), and then general superintendent and pastor of the court church in Weimar (1776–1803).
contest sponsored by the Berlin-based Prussian Academy of Sciences in 1769. The contest posed the question of whether human beings could have invented language by the use of their natural faculties alone and, if so, how. Herder’s essay, which won the contest, argues that the source of language rests in a particular human capacity, which he terms *Besonnenheit*. In German, this word commonly means considered reflection and self-restraint, but Herder uses it in a specialized sense. Hans Irmscher glosses this sense as “the human ability to distance oneself from impressions of reality and to make them and oneself the object of a free determination.”² In the essay on language, the term *Reflexion* is sometimes substituted for *Besonnenheit*. The concept is actually the counterpart of Condillac’s³ notion of *réfléchir*, a process in which, according to Condillac, our minds are disengaged from the objects pressing on them, so that “we are able to turn our attention successively to various objects or to different parts of a single object.”⁴ But whereas Condillac had claimed that this capacity is produced by the employment of signs, Herder describes it is a necessary condition for their institution. “Man displays reflection,” he writes, “when the power of his soul works so freely that, in the whole ocean of sensation rushing through all the senses, it isolates a wave, so to speak, clings to it, directs its attention towards it, and is able to be conscious of observing it” (*Language*, W1, 722). The latter form of consciousness permits the recognition of distinct properties. Only on its basis can these properties, and objects defined through them, be marked with signs.

Thus, for Herder, the human capacity for naming is rooted in the ability to step back from the multiplicity of impressions received through the senses, and to distinguish unifying patterns within that multiplicity. In the case of natural languages, moreover, the remarking of significant patterns is a function of human needs, wishes, and feelings. Words do not name objects as experienced by a neutral spectator. They name events and things as they affect the inventor of language, and that inventor is an embodied, sensing, feeling creature. Herder

---

². Hans Irmscher, “Herders Verständnis von ‘Humanität,’” in Johann Gottfried Herder, *Letters on the Advancement of Humanity*, W7, 818. Cf. Herder’s *A Metacritique of the Critique of Pure Reason*: “In me there is a double ‘I’; conscious of myself, I can and must become an object to myself. This advantage raises us above animals; it is the characteristic of our species” (W8, 592). Unless otherwise indicated, all citations from Herder’s writings are taken from *Werke in zehn Bänden*, Ulrich Gaier et al. (eds) (Frankfurt: Deutscher Klassiker, 1985–2000), and the translations are my own. References to this edition are cited as W followed by the volume and page number.

³. The French philosopher and psychologist, Étienne Bonnot de Condillac (1715–80), radicalized Locke’s empiricism by arguing that both the contents and the capacities of the mind are derived entirely from sensation. His best-known works are *Essay on the Origin of Human Knowledge* (1746), and *Treatise on Sensations* (1754).

is at pains to stress the primacy of passion and interest in the construction of language, and he connects that primacy with the idea that the first language is closer to poetry than to prose (W1, 740). This idea of language as originally poetic in character is also closely related to Herder's understanding of the initial motivation for the development of language. According to Herder’s description, language is not first invented as a tool for communication. Rather, it arises, spontaneously, from a natural inclination toward imitative expression. The first language, he speculates, was a “mimicking [Nachahmung] of sounding, acting, stirring nature” (ibid.). Consequently, the first speaker – to use an idealized figure – is more of an artist than a utilitarian agent. His expressions respond mimetically to the influx of impressions working on him, which he gives back from his own perspective. When he first wants to become acquainted with a thing, his approach to it seeks a distinguishing feature, a Merkmal, within the welter of sensations that strike him, and finds it in the property that makes the strongest impression. For instance, he first identifies the sheep as der Blöckende, the bleating one (i.e. the one that goes “blööö”), because the sound it makes catches his attention with greater force than any other property, and is echoed in a corresponding expression (W1, 723–4).

Words therefore refer to what is experienced in a given place, in relation to human interests and affects. Accordingly, the different languages of the world are strongly rooted in the environment and circumstances within which they originally arose. They articulate the collective experiences of a particular people (Volk), naming elements within the world of that people. The differences between these elements from one place to another are then, naturally, reflected in the differences between languages. “If the Arab has so many words for stone, camel, sword, snake (things among which he lives!); so is the Ceylonese language, in accordance with the tendencies of its people, rich in flatteries, titles and splendid phrases” (W1, 757). Languages, then, express culturally variable patterns of significance (W1, 794), wedded to forms of life, and inherited across generations. Since Herder also insists, in agreement with his mentor and close friend Johann Georg Hamann,⁵ that words and ideas are inseparable,⁶ it follows that languages circumscribe what their speakers are able to think.

⁵. Johann Georg Hamann (1730–88), German philosopher and theologian, critic of the Enlightenment and general gadfly to his contemporaries. Known for the denseness and obscurity of his style, Hamann called into question Enlightenment ideas of reason through analyses of aesthetics, emotion, and language. He wrote short works rather than extended treatises, including: Socratic Memorabilia (1759), Aesthetics in a Nutshell (1760), and “Metacritique on the Purism of Reason,” an essay that remained unpublished during his lifetime.

⁶. Cf.: “[language] is more than a tool: in the wisdom of the world, words and ideas are closely related” (On the New German Literature: Fragments, W1, 177); and “among all sensuous concepts in the whole language of everyday life thought sticks to the expression” (ibid., 557).
Historically, this is the aspect of Herder’s theory of language that has been the most influential: the thesis that language is profoundly connected with culture, and that different languages embody distinct, and possibly incommensurable, worldviews and patterns of thought. Similar ideas are developed by Wilhelm von Humboldt,7 and Charles Taylor describes this pair as having inaugurated the “expressive-constitutive” line of thought, whose insights some of Taylor’s own writings on language seek to develop.8 This line of thought took a number of important historical directions. It can be traced in the evolution of literary and biblical hermeneutics in Germany, for instance, subjects that were intense areas of interest for Herder himself.9 It was also critical to the establishment of anthropology as a distinct discipline.10 Last, but far from least, Herder’s analysis of language as playing an essential role in the formation and transmission of cultural identity has serious political implications, and helped to provide, in some cases, a foundation for linguistic nationalism. Herder’s conception of the connection between language and culture does not necessarily entail, though, that linguistic borders should match the borders of nation-states. It only entails recognition that language is more than a communicative tool, and that linguistic communities share common horizons of meaning.

Furthermore, given the empiricist slant of Herder’s theory of language,11 the idea that Herder espoused “linguistic constitutivism”12 has to be understood in a qualified fashion. Herder does maintain that “thought sticks to the expression” (Fragments, W1, 557), so that one can only think with words, and, in the case of actual speakers, these words are inherited. Nonetheless, language is still the incarnation of experience, understood in a broad sense, and its meaningfulness

7. Wilhelm von Humboldt (1767–1835) made important contributions to linguistics and the philosophy of language, as well as anthropology and political thought. He is often credited with having originated the idea that language is a rule-governed system, and with having anticipated the thesis of linguistic relativity. Major works include: On the Limits of State Action (1792), Outline of a Comparative Anthropology (1797), On the Genesis of Grammatical Forms and their Influence on the Development of Ideas (1822), and The Heterogeneity of Language and its Influence on the Intellectual Development of Mankind (published posthumously, 1836).
10. On this subject, see John Zammitto’s detailed and ground-breaking work, Kant, Herder, and the Birth of Anthropology (Chicago, IL: University of Chicago Press, 2002).
is granted and sustained by its link with that experience. Consequently, while Herder does see language as a marker of culture, that is because of its intimate connection with the world of a people. Herder does not maintain, moreover, that people cannot communicate across distinct languages and cultures. On the contrary, he argues for the importance of learning different languages on the grounds that “each language is a key to many treasure rooms.” The study of a foreign language is part of Einfühlung, a word Herder invented to describe the process of “feeling one’s way into” the world of another people through learning and sympathetic imagination.

The issue of empiricism points to another dimension of Herder’s theory of language, which tends to receive less attention, but unjustifiably so. For Herder, as we have seen, a language draws its life from its roots in experience. Words give form to, and thereby first define, the feelings and sensations of human beings interacting with the things around them. But these definitions are not all literal; language is crisscrossed with affective metaphors, in which ideas drawn from one feeling are transferred to another, mingled with transitory associations and related sensations (W1, 752–73). Over time, these metaphors, originally so bold, tend to die, leaving mere empty containers (W1, 754). The result is a decline of poetic force in the languages of late societies, an increasing level of formality and abstraction, divorced from concrete sensations and true sentiments.

This movement, in which language is progressively detached from experience, also has serious ramifications for metaphysics, the language of philosophy. Herder does not eschew metaphysics altogether, as he thinks it can provide useful analogies and a posteriori schematizations of experience. At the same time, he is sharply critical of any brand of metaphysics that proposes to do more than that. Herder’s mature position on metaphysics is developed in his late work, Metacritique of the Critique of Pure Reason, directed, as the title suggests, against Kant. While Kant’s first Critique also rejects the knowledge claims of metaphysics, Herder objects to Kant’s claims about the existence of a priori concepts. His own analysis and critique of metaphysical concepts are very similar to those of John Locke. These concepts neither mirror the structure of nature, nor are they a priori elements of the mind. Rather, they result from the same anthropomorphic and culturally relative remarking of significant features that characterizes all language construction. Within metaphysics, this process is carried out at higher and higher levels of abstraction, until we eventually arrive at words such as “substance,” “subject,” and “quality” (W8, 406). Such words express the being

of a thing in general, answering the question “How does a thing exist?”, but they do not explain anything. They only recognize, and characterize in a particular manner, a broad feature of our experience (ibid.).

They also carry with them the risk of becoming devoid of any sense whatsoever, and of losing all connection with their origins in experience. Language in general carries these dangers with it, and Herder consequently stresses the need for a genealogy of concepts that will trace them back to their birth. Since reason and language are closely intertwined, for Herder, this would be at the same time a genealogy of reason. In Plastik, an essay on sculpture published in 1778, Herder asks:

> Will a practical doctrine of reason ever be written, a philosophical lexicon of language, the senses, and the fine arts that traces each word and each concept back to its origin and uncovers the processes whereby a word or concept is carried over from one sense to another, and from the senses to the mind?16

Given Herder’s nominalist and empiricist account of concepts, and given his repeated insistence on their anthropomorphic content, it might seem that he views language as entirely subjective, and as revealing more about the character of its inventor than about things in the world. Some of Herder’s statements do leave this impression, suggesting that language not only describes things from a partial perspective, but also falsifies the fundamentally dynamic character of the experienced world. In the Metacritique, for instance, he writes:

> So the snake (Schlange) [gets its name] from its twisting (schniegenden), winding movement, the river (Fluß) from flowing (Fließen), the stream from streaming, the lightning (Blitz) from its quick flash (Blick), the thunder from its crash, and so forth. It is instructive to compare the languages of different peoples in this naming, i.e., substantivizing. Such a comparison shows not only the different

---

16. Johann Gottfried Herder, Sculpture: Some Observations on Shape and Form from Pygmalion’s Creative Dream, Jason Gaiger (ed. and trans.) (Chicago, IL: University of Chicago Press, 2002), 90; hereafter cited as Sculpture followed by the page number. Cf.: “It is a difficult thing to trace every science in all its concepts and every language in all its words back to the senses, in which and out of which they arise, and yet that is necessary for every science and language” (Journal of My Voyage in the Year 1769, W9/2, 119). These ideas about the construction and analysis of concepts prefigure central themes in later German philosophy of language. An example is Heidegger’s thesis, in Being and Time, on the historical Entwürzelung or uprooting of language (§35), as well as his various etymological deconstructions of philosophical terms. Through his theory of language, Herder is, in fact, an important avenue of influence between British empiricism and the continental tradition.
characters of the inventors, but also the different aspects of things that can be noted and the moment of characterization itself.

(W8, 403–4)

In some respects, these claims are quite similar to Nietzsche’s skeptical assertions in “On Truth and Lies in a Nonmoral Sense,” that the creator of language “only designates the relations of things to men,” and that the edifice of concepts is constructed “as it were, on running water.” However, Herder’s position is better described as perspectivist, rather than as skeptical, because of the relation he posits between human beings and nature. Herder is fundamentally a monist, combining a Spinozistic belief in the unity of reality with a Leibnizian conception of this reality as dynamic, and as revealing itself in multiple ways to distinct and limited perspectives. For Herder, reality is essentially Kraft, force, and the forces that build the things we apprehend are the same forces that build us, with all of our faculties. Given this intimate relation to nature, human beings do not project an alien character upon the world; they clarify a bit of the world, from limited perspectives, and they do so through language. The human drive for linguistic articulation, which is at the same time a drive for understanding, seeks, Herder writes, “from the vast whole of the universe to clear [entwölken] a part for oneself” (W8, 509). The critical remarks Herder sometimes makes about the partial, culturally relative, and anthropocentric character of names, do not, therefore, arise from a full-fledged subjectivism. They are directed against the human tendency to mistake the limited perspective for the whole, and to fix in place what is constantly evolving.

II. AESTHETICS

In the corpus of Herder’s writings, there are three major works dedicated to the subject of art: the fourth of the Critical Forests, written in 1769 but not published during Herder’s lifetime; Plastik (1778); and Kalligone (1800), a critique of Kant’s Critique of Judgment. Of these, the short essay on sculpture, Plastik, is by far the most readable, and broaches the major themes that preoccupy Herder in his engagement with aesthetics. The essay claims that sight, hearing, and touch correspond to different art forms, with each of these senses playing a primary role in the creation and appreciation of, respectively, painting, music, and sculpture (Sculpture, 43). Herder argues further that while sight perceives only surfaces, the sense of depth essential to an appreciation of sculpture is actually

rooted in touch, without which we would never gain a sense of the three-dimensionality of the world (40). This attempt to restore value to the neglected sense of touch is linked to a reassessment of the preeminence usually accorded to vision in doctrines of psychology. “Sight,” says Herder, “is the most artificial, the most philosophical of the senses” (39). Given the clarity and precision of the world revealed by the eye, it is unsurprising if our theories borrow most of their terms from this sense (40), but sight only perceives images, forms and colors, the surfaces of things, not the “physically present, tangible truth” (ibid.) of solid bodies. Thus, a phenomenology of the beautiful and the true based on sight alone does not cover everything, and certainly not what is “most fundamental, simple and primary” in our experience (39).

Herder’s analysis of the respective roles of seeing and touch in our perception of things reflects the value he commonly attributes to direct, embodied contact with reality, as opposed to distanced contemplation. Sculpture expresses, and evokes, this kind of contact, putting us in touch with the immediacy of life. It presents “a human being, a fully animated body” which awakens in us “the full range of responsive human feeling” (80–81). Herder’s appreciation for the particularity and definiteness conveyed by sculpture intends at the same time to isolate the distinctive excellence of Greek art. Of the latter, he writes:

> It is beyond doubt that the extraordinary determinateness and fidelity that the Greeks gave to every situation, every passion and every character helped them to achieve a level of art that has not been seen on the earth since. They perceived as do blind people and, through feeling, saw. They did not peer through the glasses of some system or ideal that would conjure the ensouled form of the human body from a cobweb floating in the autumn breeze. (80)

Herder contrasts this Greek sense of reality with the artificiality of life and manners in his own society, from which nature has departed, and for which sculpture would be impossible (82). Yet he does not propose a return to Greek art. Art is the expression of the life and character of a people, as it unfolded at a given time and place. It cannot be resurrected in a different society, for “we can only give loyal, complete, truthful, and living expression to those forms that communicate themselves to us and that live on in us through our own living senses” (53). Herder therefore opposes any classicism aiming at imitation of the ancients, suggesting that we should rather treat them as “friends, not idols,” as “exemplars that present to us in bodily form the truth of ancient times, making us aware of the proximity and distance between their form of life and our own” (61).

Herder’s view of Greek art, in relation to his own age, anticipates Hegel’s account of the place of Greece in human history, with the important difference
that Herder does not see the movement beyond Greek immediacy and naturalness as simply a form of progress. Nor is it only decline, although there are certainly Rousseauian themes in the contrasts Herder draws between ancient Greek society, as expressed in its art, and his own. Herder is, on the whole, a cultural pluralist, seeing different historical moments as revealing unique and unrepeatable possibilities of the human spirit. What he complains about most fervently in his own society is its failure to be itself, a failure he connects with too much secondhand learning: “we see so much that we in fact see nothing, and we know so much that we no longer possess anything that is our own, that is to say, something we could not have learned, something that arises out of the virtues and errors of our own self” (81–2). With respect to aesthetics, the normative implication of this criticism is that art should evolve out of the genuine life of a people; its style and content should reflect that life and not imitate some other. This call for authenticity and naturalness in art, combined with the view that every people has a distinctive character, helped to inspire the Sturm und Drang movement in Germany, with which Herder’s name is often connected. The collection of essays entitled On German Style and Art (1773) was particularly influential in this regard.

III. EPISTEMOLOGY AND METAPHYSICS

Herder’s reflections on language and art reveal the basic contours of his theory of knowledge, and of his ontology. They show Herder to be an empiricist, stressing embodiment, sensation, and emotion in our engagement with the world. This empiricism in turn grounds Herder’s belief that human understanding is plural and partial, that thought is dependent on language, and that metaphysical abstractions are mere empty forms. At the same time, Herder’s analyses of linguistic and aesthetic expression also point to a brand of monism, and an attendant dimension of realism, within his position. Language and art do not, for Herder, only manifest the nature of the human subject; they reveal the world as mediated through the perspective of that subject. They can do so because reality is a single system of forces that create, and remain operative within, human beings, as they do in the rest of nature. Sensing, feeling, speaking, thinking people take in a portion of this reality through multiple channels of perception, and give it back in the variety of their cultural products.18

18. For an excellent German-language analysis of these themes in Herder’s earlier works, see Marion Heinz, Sensualistischer Idealismus: Untersuchungen zur Erkenntnistheorie und Metaphysik des jungen Herders (1763–1778) (Hamburg: Felix Meiner, 1994).
Many of these elements are focused and made explicit in Herder’s essay, “On the Cognition and Sensation of the Human Soul,” the final version of which was published in 1778. Herder affirms, in this work, that “our thought depends upon sensation” (W4, 365), and that “we only sense, what our nerves give us” (W4, 351), so that our understanding is built out of what we encounter in our embodied being in a given location. “From the Platonic realm of the before-world [the soul] recalls nothing: it also did not set itself on the place where it stands; it does not even know how it got there. But it knows this, or should do so, that it only understands what this place shows to it” (W4, 354–5). It is crucial to Herder’s view, though, that the soul does not just passively receive what is given to it. The active forces of which it is composed – its drives, feelings, and passions – relate to things in tandem with the bodily senses. Through this interaction of the whole human being with its environment, the soul weaves its distinctive world. Given the enormous variety among individuals with respect to the strength and character of their inclinations, in combination with the equally enormous variety of locales in which they can be placed, the resulting possible configurations are virtually infinite, and each is unique. “As individuals differ from one another, so even more do families and nations; the manner of their thought is arranged according to the circle of their manner of sensation” (W4, 368).

In the Metacritique, Herder will say that the essence of understanding rests in the act of making for itself, out of the vast totality of the universe, a world appropriate to the human circle of vision (W8, 509). The human soul clarifies a bit of the universe, from a perspective that is itself part of that universe, and shares its nature. Individuals, as well as cultures, are therefore like Leibnizian monads, mirroring reality from multiple, more or less clear, angles, except that they most emphatically have windows. The soul’s windows are senses and affeets. The latter, for Herder, are not vehicles of distortion, but, as Theodor Litt notes, the threads that bind us with the world.19 Through them, the world plays upon us, as it were; we are, in Herder’s metaphor, a Saitenspiel (W4, 339), a kind of stringed instrument that resounds in accordance with the way it is touched. Cognition, working in the medium of language, raises to a higher level of distinctness what sensation more closely and dimly apprehends. But it does so at the cost of moving away from the richness of experience, and from its proximity to real things, at best bringing only selected features of those things into relief, and at worst degenerating into nonsense.

This theory of the relation between experience and reflection applies to self-understanding as much as to understanding of the world. Within Herder’s account, human beings are by no means transparent to themselves. Rather, “the

---

deepest depth of our soul is cloaked in night,” for our thought could not possibly grasp every stimulus and sensation in its primary parts. It could not hear the “crashing ocean of such dark waves” without being overcome by fear and anxiety, and losing its grip on the helm. Nature therefore wisely distanced “our poor thinker” from whatever could not enter into clear consciousness, and closed every channel thereto. Now, the soul does not penetrate to its roots, but enjoys the blossoms:

[F]ragrances drift to it from dark bushes, which it did not plant, did not raise; it stands on an infinite abyss and does not know that it stands there. This self-ignorance is also better for the dark forces and stimuli, which must work together at such a subaltern level: they do not know, why? And they cannot and should not know. (W4, 345)

In fact, Herder maintains that the innermost nature of reality, whether subjective or objective, is beyond the reach of our concepts, and therefore of any scientific or rational knowledge. Thought is dependent on language, and language only names how things appear in relation to a given perspective. It follows that we do not have any direct knowledge of things in themselves. In the Ideas for a Philosophy of the History of Mankind (1784–91), Herder therefore claims that “all our science calculates with abstracted individual external marks, which do not touch the inner existence of any single thing,” and “our poor reason is thus only a marking calculator [bezeichnende Rechnerin], as its name says in many languages” (W6, 349). When engaging in abstract reasoning, the soul only calculates “with counting coins [Rechenpfennigen], with sounds and figures,” with external symbols torn away from things and cloaked in other arbitrary symbols, resulting sometimes in empty nutshells (W6, 350).

This thesis, that knowledge is confined to appearances and does not reach the essence of any thing, might lead one to wonder how Herder can then find a foundation for his monism, and the qualified realism connected with it, and why he takes issue so sharply with Kant’s idealism in the Metacritique. To take up the last question first, Herder objects, as noted earlier, to Kant’s claim that the structure of our experience is determined by a priori categories and forms of intuition. Against this claim, he advances an empiricist argument that the operation of our capacity for reflection (Besonnenheit) suffices to explain the development, from experience, of our most general ideas. For instance, describing the initial sense, and subsequent concept, of space, Herder says:

As sensuous awareness, space [Raum] is first making room [räumen], i.e., a privative concept. Our limits, that is to say, have led understanding to note the there, where we are and are not, and to determine,
to measure, to describe it in a thousand fine distinctions, until it finally wanted to be elevated to a pure, i.e., entirely non-sensuous, concept of reason. It is, however, not such a pure concept.

(W8, 352)

“Space” is first encountered through the self-reflexive, interested awareness of being able to be here or there, an awareness grounded in the experience of limits defined by embodiment, essential to the sense of being in this place or that. Thus, space is, in a sense, “subjective”; “it is placed and given with our limited existence [Dasein] in the universe” (W6, 353). We brought space into the world “with our selves,” bringing at the same time a soul that could become aware (inne werden) and make note (bemerken) of it as a multiplicity of possible places (W6, 353).

Herder’s analysis of the concept of time, in the Metacritique, is similar:

For a long time, it seems, man was inattentive to the sequence of changes within and around him; he enjoyed the duration of his existence, without placing a measure upon it. Only when the moment came, that something needed to happen, did he say: “now it is time!” The commanding moment [Augenblick] simultaneously shook him from his sleep. He let the fruits grow; then he plucked them and said: “now they are ready [zeitig].” When something arrived inconveniently, i.e., too late or too early; then he said: “that is untimely [unzeitig].”

(W8, 357)

Animals are also aware of themselves and their environment, and have some relation to time, but here Herder is characterizing the explicit grasp enabled by reflectivity, which permits the highlighting of significant moments that can subsequently be abstracted into a concept of empty time. Thus, Herder locates the roots of our original grasp of space and time in our embodied, practical existence, with the formal idea evolving later, through a process of abstraction.

As to the question of why he supposes that this existence grasps the real world, rather than subjective phantasms, Herder’s answer is, quite simply, that we are “parts of the world” (W6, 508), and have no reason to think of ourselves as separated from it by a difference of kind. Furthermore, being, for Herder, is a primary datum. He had argued in a very early essay, “An Inquiry Into Being” (1764), that being, the givenness of the real, is indemonstrable, and yet certain, not needing any demonstration except in the minds of over-learned philosophers (W1, 19). In the Metacritique, he reaffirms this position, insisting that “being is the ground of all knowledge” (W8, 364), and that Kant’s reduction of the whole of being to “appearance” (Erscheinung), a mere “seeming” (Schein), runs counter to the way in which we ordinarily describe our experience. He
points out, in this regard, that if one pays attention to the original meaning of the Greek terms, “Phänomenon means, what appears; Noumenon, what understanding (nous) thinks.” Understanding then thinks “not behind and outside, but from (an) the phenomenon, and with that the whole confusion is lifted away” (W8, 469).

This does not mean, however, that we have direct access to the source of what appears to us, to the active causes that produce the being and becoming of what we perceive. We can only draw analogies from ourselves, while being informed by the results of the natural sciences, as Leibniz does in constructing his “monad poem” (Cognition, W4, 338). Of the various analogies on offer in his age, Herder finds this one the most compelling, and his own conception of reality as a living system of elemental forces owes a great deal to it, although, unlike Leibniz, Herder sees these forces as interconnected and interacting with one another. One implication of his view that all reality consists of force is that nature is not divided into radically different substances. It is enlivened by a single principle, which shades by degrees into various shapes and forms (W4, 338). There is then no iron wall between the material and the immaterial, for there is no iron wall anywhere in nature (W4, 354). The whole of nature is infused with “One Spirit, One Flame” (W4, 338).

Herder identifies this “One Spirit” with God, and while his view of reality as force is inspired by Leibniz, along with the mathematician and natural philosopher Roger Joseph Boscovich (1711–87), this notion of God as an immanent ground revealing itself in the whole of being recalls Spinoza. Herder’s sympathetic relation to Spinoza is treated directly in his work God: Some Conversations (1787). This was written as an intervention into the Pantheismusstreit, the debate on pantheism, in Germany, which had been ignited by Jacobi’s report, in a letter to Mendelssohn, that Lessing had told him he had been convinced of Spinoza’s idea of God. Herder himself rejects Spinoza’s term “substance,” with its static connotations, in favor of the more dynamic notion of Kraft (force). He also argues that the recent investigations of natural science, “without which metaphysics only builds castles in the air or gropes about in the dark,” have discovered more and more “active or interactive forces” in matter, and have consequently abandoned “the empty concept of extension.” On these points, Herder takes issue with Spinoza. But in describing God as “the primal force of all forces,” who “reveals himself in an infinite number of forces in an infinite number of ways” (God, 103), he offers a revised version of Spinozistic monism,

---

*20. For a discussion of Jacobi and the Pantheism Controversy, see the essay by Richard Fincham in this volume.

and its attendant sense that God is not separate from nature. Whether or not this counts as “pantheism” is a question of definition. The description of God, on Herder’s account, would be radically different from the description of any thing, or of the totality of things, so that one cannot posit a simple identity between God and the world. Yet that is true of Spinoza’s system as well, and it is often described as pantheistic nonetheless.

Speaking more precisely, though, for Herder, we cannot give any literal “description” of God qua force, because we cannot give a description of force at all. What we see and feel are the effects of force, within us and outside us, but “we do not know what force is, nor how it works” (154). “Still less,” then, “do we know how the divine force has produced anything, and how it imparts itself to everything according to its nature” (97). Herder never claims that the concept of force can be explicated, or that using it clarifies why things are the way they are. In the essay on cognition and sensation, he says of Kraft: “I am not saying that I hereby explain something; I have not yet known any philosophy that can explain what force is” (W4, 337). We see the operations of various forces in nature, and we feel their operation in ourselves. We can remark, order, and describe their activity, as well as their interaction, but what is acting, what is operating, of that we have no clear knowledge.

## IV. ANTHROPOLOGY AND PHILOSOPHY OF HISTORY

Herder’s *Ideas for a Philosophy of the History of Mankind*, published in four parts between 1784 and 1791, proposes to sketch a history of the products of these forces on earth. Herder is well aware of how ambitious such a project is, if it wants to be based on empirical knowledge of natural and human history, and he acknowledges that his own contribution can only be provisional (W6, 18). Most of the *Ideas* consists of cultural anthropology, as it deals with human civilization, but it is significant that Herder locates the development of the human species within the overall course of nature, seeing the former as a phase in the latter’s evolution. This is not to imply that Herder espouses any theory of evolution in the modern sense, where later species are thought to be descended from previous ones. He firmly believes in divine creation, working through natural forces, the “finger of divinity” (W6, 173), as he describes them. His picture of nature is that of a chain of being, created successively rather than all at once, in which the distinctions between varieties are graduated and fuzzy rather than sharp. Human beings certainly possess powers unique to their own species – the capacity for reflection being the foremost among these – but Herder tends to describe these powers as continuous with nature, not as constituting a radical break from it. “There is in the human heart no virtue, no drive of which one
cannot find an analogy here and there in the animal world” (W6, 109), he says, and this sense of the inclusion of human beings in nature is reinforced by a repeated use, in the context of anthropological descriptions, of metaphors drawn from other organisms. The most well-known examples are the botanical metaphors in Herder’s account of cultures, which he often pictures as plants adapted to, and flourishing in, distinct regions of the globe.22

This metaphor indicates a literal thesis: namely, that “man is not an independent substance, but is bound to all of the elements of nature” (W6, 252). Human beings, that is, are bodily creatures embedded in a physical world, and this embeddedness shapes the character of all of their capacities and products. It provides the primary data for imagination and reason. It determines the content and style of languages and forms of art. It affects a society’s religions, morals, and social structure. In short, sensuous interaction with a tangible environment forms the material basis of all of those shared features of human communities that are constitutive of culture. Individuals always acquire their human traits in the context of a culture, and a culture brings with it a particular Klima. This term, which has no precise English counterpart, names, for Herder, not only “climate” but all of those factors that affect a person’s bodily existence:

The elevation or depression of a region, its constitution and products, the food and drink a person consumes, the manner of life he follows, the work he performs, clothing, even customary positions, pleasures and arts, along with a host of other circumstances, which operate powerfully in connection with one’s life; all these belong to the portrait of this greatly changing Klima. (W6, 266)

Some of these elements of Klima are themselves a matter of custom, and are passed along by tradition. The less tangible aspects of culture – language, reason, and religion – are in their very nature traditions, as they depend on expressive marks handed down from one generation to the next. They are still, however, linked to a Klima, out of which they evolve and to which their meaning remains connected.

22. In the Ideas, for instance, Herder writes that every plant belongs to a certain climate, to which it is adapted, and adds that likewise: “every form of humanity organizes itself in its region in the most natural way” (W6, 62–3). He therefore expresses the wish for “a general botanical geography for human history” (W6, 67). His corresponding ideal of cultivation is summed up in the Letters: “To the good of mankind as a whole can no one contribute who does not make of himself what he can and should become; each should therefore cultivate and tend the garden of humanity first on that bed, where he turns green as a tree, or blossoms as a flower” (W7, 164).
Culture, then, is a combination of Klima and Tradition. The development of humanity, in its many cultural variants, is conditioned by this combination. Consider, for example, the following chapter titles, from Book 8 of the Ideas:

The power of imagination is everywhere organic and climactic; everywhere, though, it is led by tradition.

The practical reason of the human species everywhere grows under the needs of a manner of life; everywhere, though, it is a flower of the genius of nations, a son of tradition and custom.

The sensations and drives of people are everywhere fitted to the situation in which they live, and its organization; everywhere, though, they are ruled by opinions and custom.

The happiness of people is everywhere an individual good; consequently, though, it is everywhere climactic and organic, a child of usage, tradition and custom. (W6, 1210)

The next book of the Ideas, dealing with language, reason, and religion, is then at pains to stress the empirical rootedness of these human properties, along with their essential sociality and dependence on tradition (W6, 336–79). In making these points, Herder wants to insist on both the cultural specificity and the universality of these attributes. For instance, in the chapter on reason, Herder objects, on the one hand, to efforts by philosophers to make this faculty into something independent of the senses, and free of tradition. On the other hand, he insists, and accordingly, that every human society possesses reason, and that “the distinction between enlightened and unenlightened, between cultivated and uncultivated peoples is therefore not of kind, but of degree” (W6, 340).

Herder’s position on the concept of “race,” which is being formulated and debated among his European contemporaries at the time he is writing, conforms to this general thesis about the unity and diversity of mankind. The chapter of the Ideas in which Herder discusses the term Rasse is entitled: “In however many different forms the human race [Menschengeschlecht] appears on the earth, it is nonetheless one and the same human genus [Menschengattung]” (W6, 251). All human beings, he argues here, are fully human, and this fact has ethical consequences. It means that unlike the higher apes, “the American and the Negro” are your brothers, and “therefore you must not oppress or kill or rob them: for they are human beings, as you are” (W6, 255). Although he does not mention Kant by name, some of Herder’s remarks in this chapter are clearly directed against Kant’s 1775 essay, “Von den verschiedenen Racen der Menschen,” which had divided the human species into four fixed and sharply distinct races on the basis of color. Herder complains that he sees no reason for such a designation, “for every people [Volk] is a people: it has its own national formation [Bildung], as
well as language (W6, 255). Herder does posit some physical differences among human types, and sometimes even links these to differences in psychology and culture. But he abhors the way in which Europeans use alleged anthropological distinctions to justify their greedy, exploitative, and violent behavior toward non-European peoples. Against this genre of hypocritical self-justification, Herder asserts that all members of the human species possess the virtues and capacities that define humanity, although these are realized in different patterns across the world’s many human types.

A major portion of the *Ideas* consists of descriptive accounts of these patterns among the world’s existing and historical peoples. The accounts themselves are in many cases badly dated, and they are not always free of the cultural partiality to which Herder explicitly objects. They do, however, illustrate Herder’s belief in the need for close study and empathetic imagination when approaching historically or geographically distant peoples. They also constitute an attempt to survey human cultures objectively and without prejudice, even if Herder does not always manage to live up to his stated ideals in this regard. Indeed, promotion of the ideal of cultural impartiality is a major aim of the *Ideas*. The writer of the history of humanity, Herder maintains, must not adopt his own tribe as a favorite, despising all those who do not belong to it. He must, like the botanist, look with equal regard on all the entities he surveys, recognizing each one for its unique qualities (W6, 509). Herder takes it as a central principle that cultures should be appreciated for what they are – which is precisely what they could be, given the time and place in which they emerge and flourish – and that they should not be judged by the standards of later ages and alien nations.

Nonetheless, Herder does claim, in the *Ideas*, that human history manifests a kind of progress. This progress is neither simple nor linear, and there is no single scale on which it can be measured. Still, “in universal history as in the life of fallen, individual human beings all the follies and vices of our species exhaust themselves, until finally we are forced through need to learn reason and fairness” (W6, 668). This pole of Herder’s philosophy of history, in which the internal and external struggles of civilizations lead, ultimately, to a higher development of humanity, is influenced by Kant and anticipates Hegel. “Individual generations go under,” Herder writes, in a very Hegelian sentence, “but the immortal whole survives the wounds of the vanished parts and learns good from evil” (W6, 645). Herder is also, like Hegel, inclined to see this process as one of maturation. He often draws an analogy between historical stages and the stages of individual life: childhood, adolescence, adulthood, and old age, situating non-European peoples at “younger,” less advanced stages of development. However, this condescending stance in Herder’s account of Asian, African, and native American societies does not fit well with his own strictures against Eurocentrism. And he does, at the same time, repeatedly claim that each civilization is characterized by its own
forms of excellence, which it makes no sense to compare with others. Among the Chinese, he says, one finds a refined political morality; among Indians a species of detached purity, quiet activity, and patience. The culture of Greece reached the highest level of sensuous beauty, while the Romans cultivated the virtue of heroic patriotism. The respective qualities of these ancient peoples depend so much on time and place that they are almost incomparable (W6, 549). Such qualities are not, furthermore, taken up without loss into different and supposedly more advanced societies. They are merely displaced by other goods, better in some respects, because of lessons learned from the past, but not in all. As Isaiah Berlin points out, one of Herder’s central insights is that no single society is capable of realizing all possible human goods.23 Not only are varieties of human flourishing the product of unique and unrepeatable historical moments, but some human goods are simply incompatible with one another, and so cannot be realized at the same time in the same society.

In Herder’s view, moreover, every society has its vices along with its virtues. Modern “enlightened” Europe is quite certainly no exception. Against the self-congratulatory pretensions of many of his contemporaries, Herder frequently dwells on what he sees as the shortcomings of this Europe. He describes it as overly learned and tired, on the one hand (the analogy of old age is actually ambiguous), and yet voracious, on the other, brutally indifferent to the welfare of non-European peoples, whom it exploits in order to satisfy its ever-multiplying wants. These criticisms, reiterated in the Ideas, had formed a primary theme in Herder’s earlier work, Yet Another Philosophy of History, published in 1774. He affirms, in this work, as he will continue to do in the Ideas and throughout his career, that history manifests some kind of progress (W4, 40), but he objects to the view that his enlightened century forms the pinnacle of all human perfection. Ridiculing this view, he remarks, sarcastically: “How many edges first had to be forcibly rubbed away, before the round, smooth, pretty thing that we are could appear!” (W4, 54). One should not assume, he warns, that a progress in enlightenment is automatically accompanied by an increase in individual happiness and virtue (W4, 40), so that the most enlightened nation is necessarily the happiest one. In fact, “every nation has its center of happiness [Glückseligkeit] within itself, as every sphere its center of gravity” (W4, 39). This statement does not propose thoroughgoing ethical relativism. Herder always emphasizes the common attributes of humanity along with the varied forms these assume in different cultures, and he does not hesitate, on the basis of these, to criticize the flaws and injustices of all of the nations he examines. He rejects the idea, however, that there is a single best nation toward which history has been

inexorably moving as a final end, and for the creation of which all others have merely been means. Herder refuses entirely this way of thinking about the status of historical phases and cultures, insisting that “nothing in the entire kingdom of God … is only a means – everything is simultaneously a means and an end, and so certainly this century as well” (W6, 54).

Taking up this theme again in the Ideas, Herder rails against the presumption that the past existed only for the sake of the present, and maintains that all people everywhere are, and have been, ends in themselves: “[Y]ou people in all parts of the world, who have passed away over the ages, you did not live only to fertilize the earth with your ashes, so that at the end of time your descendants could become happy through European culture” (W6, 335). While the targets of Yet Another Philosophy of History are primarily the French philosophes such as Voltaire, in later works Herder’s affirmation of the intrinsic worth of all ages and cultures is often directed polemically against Kant. To be sure, the progressivist pole of Herder’s philosophy of history has strong affinities with Kant’s own position on this subject. Herder was, however, appalled by some aspects of Kant’s essay, “Idea for a Universal History with a Cosmopolitan Intent” (1784). As Herder saw it, this essay suggests that a well-constituted state, rather than human well-being, is the true goal of history, and that, in light of this goal, earlier generations exist and struggle only for the sake of later ones. Such a view is simply anathema to Herder. What, he asks, could it mean to say that man is “made for the state, as the end of his race and all of its generations, made in fact only for the last generation, which sits enthroned on the decayed frame of the happiness of all previous ones?” (W6, 332).

V. POLITICAL PHILOSOPHY

This last cited remark brings out one connection between Herder’s philosophy of history and his political philosophy. Happiness, which Herder conceives quite broadly, in a way that includes the exercise of capacities proper to a species (W6, 329), is decidedly for him the goal of history. It is therefore also the goal of politics. Unlike Kant, who derives moral and political principles of right from the value of freedom, Herder takes the promotion of human well-being as the basis for judgments about fair relations between individuals and nations, and about the constitution of a just state. Kant had rejected this possibility on the grounds that happiness is too variable and subjective a good to serve as such a basis.24 If Herder has no qualms on this score, it is because he is more than willing to

accept the implications of precisely these features of happiness: for instance, that moral and political principles cannot be determined *a priori*, but will have to be based on empirical knowledge about human nature, a knowledge that will require anthropological and cultural investigation, and that these principles will, to a degree, be variable, shifting, and fallible.

Herder’s own anthropological investigations lead him to conclude that human beings share a set of basic capacities and characteristics that unfold into different shapes according to time and place. Herder’s political position is the logical counterpart of this conclusion, and is probably best described as a form of pluralism, treading a line between both relativism and universalism. In his late work *Letters on the Advancement of Humanity* (1793–97), Herder writes: “Man has been the same in all ages; only, he expressed himself in each case according to the conditions in which he lived” (W7, 577). From this anthropological thesis, Herder draws the normative conclusion that the advancement of humanity requires an increase in “reason, goodness, and fairness” (*Vernunft, Güte, Billigkeit*) (W7, 128) across the world, but in a manner that still allows room for cultural diversity. The goal is *Humanität*, but while there are many ways of failing this goal, there are also many ways of accomplishing it. Consequently, “it is quite right for the French and the English to paint their *humanité* and *humanity* in an English and a French manner” (W7, 736). It is quite wrong, on the other hand, for one nation to set itself up as the measure and repository of all perfection, and to impose its will on others. Needless to say, there is no justification for treating the members of any nation as animals (W6, 739), and the enslavement of Africans by Europeans is a moral disgrace (see W6, 674–85).

With respect to the relations between peoples, the moral ills with which Herder is most powerfully concerned are colonialism, imperialism, and slavery. As a result, he tends to stress the right of each people to be left alone to follow its own course, appealing to the uniqueness and significance of cultural identity as a justification. A shortcoming of this position is that it is not sufficiently sensitive to the internal diversity of cultures, or to the hybridity and complexity of many cultural identities. Herder’s position on Jewish identity is a case in point. He expresses great admiration for ancient Hebrew culture in its original setting, but sees the diasporic Jew as culturally uprooted, describing Yiddish as a “sad mixture” (*Spirit of Hebrew Poetry*, W5, 678). Herder recommends, as a solution, a combination of return to Palestine and assimilation within Europe, and his views on this subject have sometimes been read as anti-Semitic, and sometimes as proto-Zionist. Whatever Herder himself might have meant, the idea that the borders of a state should match the borders of a *Volk* has serious limitations, and

---

Herder’s stress on völkisch identity played a historical role in the development of European fascism.

Herder does not explicitly advance a global culture:state equation, however, and his precise political prescriptions remain rather vague. He was certainly no great fan of the state, whose totalizing power he feared, and one of his criticisms of the age of reason was that it turns society into a “machine,” in which every individual has its allotted place and function (Yet Another Philosophy of History, W4, 73). Herder worries especially about the formulation of large-scale human engineering plans for this social machine. “It is a terrible thing,” he writes in the Letters, to regard mankind as just a line which one can bend, cut, extend, and shrink for some purpose quite as one pleases, in order to execute a plan, to accomplish a task” (W7, 733). Change must be organic and natural, starting with small things and building itself into something greater; when imposed from above according to a grand design, it inevitably fails (W4, 58). The measure of success here is never anything other than human happiness. With respect to the state, this means that “all state constitutions are nothing but means for human happiness” and “the sum of the individual happiness of all members is the happiness of the state” (W7, 132–3). If that happiness is variable and plural, as Herder believes it is, there can be no single and precise formula for the constitutions of good states. They can only be the product of the wishes of individuals, although these individuals must also learn from one another. Generations and nations should likewise continue to learn from one another, until they arrive at the understanding that “no people on earth is the exclusively chosen people of God; truth must be sought by all; the garden of the common good must be built by all” (W7, 226).

VI. PHILOSOPHY OF RELIGION

Herder’s claim that no one people is the chosen people of God also hints at his position on the status of the world’s various religions. At first sight, that position may seem inconsistent, standing in tension, at some points, with his professed pluralism. On the one hand, in the Ideas, Herder praises China for its internal religious toleration (W6, 432), and writes sympathetically, and even admiringly, about the Brahminic idea of God in India (W6, 454). On the other hand, he affirms the superior merit of Christianity, for which the Hebrew Bible – which he describes as unmistakably preferable to all other ancient religious books (W6, 488) – is a prelude. However, Herder’s assessment of his own faith actually mirrors the blend of particularity and universality that one finds in his cultural anthropology and his ethics. The Christianity he holds up as an ideal is a moral institution rather than a set of specific doctrines, rituals, and symbols.
This Christianity is supposed to be the first religion to transcend national boundaries. *Yet Another Philosophy of History* defines it as “the clearest philosophy of morals, the purest theory of truth and of duties, independent of all laws, all petty local constitutions; in short, if one likes, the most humanitarian [menschenliebendste] deism” (W4, 47). Certainly, one could object that the essential moral truth Herder identifies here with Christianity can be found, in some version, in other religions as well. Be that as it may, Herder’s prioritization of Christianity rests on his belief in the universality of this truth, with its message of brotherhood and love (W4, 46–7). This is the aspect of religion Herder has in mind when he writes, in *Of Religion, Doctrines and Customs*, that “doctrines divide and embitter; religion unites: for in the heart of all people it is only one” (W9/1, 727). Religion, so understood, involves being true to one’s conscience in a spirit of self-sacrificing love. That is Herder’s definition of Christianity, but he adds: “If the name, ‘Christianity’ disappears, this faith must be called the ‘religion of mankind’” (W9/1, 785).

Religion is, of course, more than morality, as Herder recognizes, and he is not a universalist about the rest of religion, which he sees as firmly connected to culture. Religion is not, for Herder, merely a set of beliefs that can be isolated and placed on the table for universal discussion. It is the medium through which human beings relate to the divine, and this relation is unlike the relation between scientific knowledge and its objects. Religions do not, that is, relate to God as to an object to be known. Rather, their approach to their subject is an indirect one, enacted in ritual practice and expressed in nonliteral language, through the evocative power of metaphors, analogies, symbols, and myths. But these elements are rooted in, and derive their meaningfulness from, the specific forms of life of a given people who live, think, and feel in a particular time and place. Herder’s analysis of “the spirit of Hebrew poetry,” in a work of that title, stresses the fact that the language of this religion, the Hebrew religion, is the language of a people. The force of its symbolic expression is granted by the allusive reference it makes to the experiences of this people: to, for instance, significant elements within the world of its concerns. “In the tents of shepherds,” Herder writes, “God is a shepherd, in the circle of a family, a Father” (W5, 968). For Herder, the capacity of religious language to stir and move, to elevate the mind, the heart, and the spirit toward that which cannot be literally described rests on the derivation of its metaphors from things, persons, relations, and activities that hold a meaningful place in the lives of a community. One should, therefore, be a pluralist about the expressive dimension of religion, a position that also accords well with Herder’s metaphysical picture of an immanent God who is revealed in infinite ways.

Ultimately, Herder advocates universal acceptance of the moral message of Christianity, but in such a way that this acceptance can be combined with
commitment to another religion. That is the conclusion of a short piece Herder wrote very late in his life and published in his own journal *Adrastea*, called “Conversations on the Conversion of Indians through our European Christians” (1802). This work imagines a dialogue between an “Asian” and a “European.” The Asian says, at one point, “Leave to everyone his religion, the one that belongs to him,” and the dialogue is, in the end, against conversion. At the same time, the Asian proposes that the religion of Christians will be blessed by Indians if it brings them good things, “without any Indian accepting it formally and historically … all will enjoy the fruit of Christianity, true humanity of pure relations in a happy union of peoples” (W10, 474).

Yet the dialogue also tries to decenter the European gaze, and to bring the cultural presuppositions of that gaze into question, by asking Europeans to imagine themselves as they appear from the point of view of a very different culture. To this end, Herder imagines the Asian as saying:

> Here you appear, wine drinkers and flesh eaters, animal hair on your head, unclean salve in your hair, in what to us is indecent clothing, of a black color which we cannot abide. You place before us books bound in animal skins – we may not and do not want to touch them. You refuse to adopt those forms of politeness, which, within our traditions, even a king does not refuse; for example, removing your unclean shoes (because, as you say, Moses took off his shoes only before the burning bush). You torment and exhaust us everywhere, on road and bridge, resthouse and pagoda, with your importunate preaching, which enters into every little circumstance of our way of life. What else can we do but let you talk, as long as you want, until you – go. (W10, 474–5)

This passage, while ostensibly about religion, nicely encapsulates the fundamental principles of Herder’s understanding of culture, and of the way in which crosscultural interaction should proceed. It emphasizes the differences between peoples in their values, customs, and ways of life. It underlines the fact that these differences are too readily judged as marks of inferiority by those who do not understand them, and especially by Europeans who take themselves to be on a civilizing mission for the rest of the world. It asks, finally, not only that one try to understand the other in his own terms, but also that one try to see oneself from the other’s perspective. Thus, while the passage does speak against attempts to force one’s own cultural norms on others, its critique of an imperialistic ethnocentrism does not exclude the possibility of fruitful dialogue across differences. Rather, here, as in all of Herder’s writings, the goal is to promote the right conditions for such a dialogue. These include an acknowledgment of the
shaping force of culture, along with a willingness to engage, patiently and attentively, in the acts of imaginative interpretation required, not to transcend one’s cultural horizons – an impossible and incoherent aim – but to expand them.

PLAY AND IRONY: SCHILLER AND SCHLEGEL ON THE LIBERATING PROSPECTS OF AESTHETICS

Daniel Dahlstrom

Friedrich Schiller\(^1\) and Friedrich Schlegel\(^2\) are responsible for shaping much of aesthetics, literature, and criticism for generations of continental philosophers after Kant. Both writers were able to transmit a conviction that freedom in some sense defines what it means to be human and that literature is uniquely capable of embodying and expressing that freedom. For both writers, literature is transformative – personally, morally, and politically transformative. However,

---

1. Friedrich Schiller (November 10, 1759–May 9, 1805; born in Marbach; died in Weimar) studied medicine at the Military Academy (Karlsschule) 1773–80, before launching his career as playwright and poet. His plays include: *Die Räuber* (*The Robbers*; 1781); *Kaballa und Liebe* (*Intrigue and Love*; 1784); *Don Carlos* (1787); the Wallenstein trilogy (1798–99); *Maria Stuart* (1800); *Die Jungfrau von Orleans* (*The Maid of Orleans*; 1801); and *Wilhelm Tell* (1804). Despite the onset of ill health in 1791, which ended a two-year stint as professor of history at University of Jena, Schiller completed *Geschichte des dreißigjährigen Krieges* (*History of the Thirty Years’ War*) in 1792. Fichte, Goethe, Kant, Lessing, and Rousseau, were significant influences.

2. Friedrich Schlegel (March 10, 1772–January 12, 1829; born in Hannover; died in Dresden) studied law at Göttingen and Leipzig (1790–93) before devoting himself to the study of literature and philosophy. Together with his brother, August Wilhelm, he published *Athenaeum* (1798–1800), the main organ of the Romantic movement. Fichte, Goethe, Herder, Kant, Lessing, Plato, Schiller, Spinoza, and his friends in the Romantic movement exercised significant influence on his thinking. His major works include: *Über das Studium der griechischen Poesie* (*On the Study of Greek Poetry*; 1797); “Fragments,” “Ideas,” and “Dialogue on Poetry” in *Athenaeum*; the novel *Lucinde* (1799); *Charakteristiken und Kritiken* (Characteristics and critiques; 1801); *Über die Sprache und Weisheit der Indier* (*On the language and wisdom of India*; 1808); *Geschichte der alten und neueren Literatur, Vorlesungen* (*Lectures on the History of Literature, Ancient and Modern*; 1815). For translations of key contributions to early Romanticism, see Jochen Schulte-Sasse *et al.* (eds), *Theory as Practice: A Critical Anthology of Early German Romantic Writings* (Minneapolis, MN: University of Minnesota Press, 1997).
they differ significantly on how literature liberates and, by extension, on the freedom it expresses. Whereas a holistic notion of play, a semblance of canceling time in time, is at the center of Schiller’s conception of an aesthetic education, Schlegel’s conceives Romantic poetry as a fragmentary combination of wit and irony, an endless, historically riveted striving. Schiller asserts the liberating potential of art’s capacity to express the ideal satisfaction of human striving; Schlegel counters by affirming the equally liberating potential of art’s capacity to disillusion or, better, to remind itself that any such expression reproduces the “endless play of the world.” In the following essay, I attempt to make these differences more precise by reviewing first Schiller’s and then Schlegel’s most influential statements of their positions. The aim of the exercise is to make clear why their aesthetic imaginations in tandem have been (and continue to be) so compelling for philosophical reflection on art and literature.

I. PLAYFUL FREEDOM: SCHILLER ON TRAGEDY, AESTHETIC EDUCATION, AND THE PROMISE OF POETRY

Beyond good and evil in early essays on tragedy

Despite considering comedy superior, Schiller not only wrote tragedies but also made his first major contributions to post-Kantian aesthetics in a series of essays on tragedy, published in the early 1790s. Schiller’s account of tragedy and, in particular, the pleasure that it affords is framed by Lessing’s interpretation of sympathy and Kant’s analysis of dynamic sublimity. Yet Schiller departs significantly from both of his illustrious forebears as he elaborates a notion of freedom that, precisely in being beyond good and evil, is both sublime and an object of sympathy. Following Schiller’s own development, I begin with his account of the sympathies at work in the tragic genre before moving to his construal of the sublimity of the genre.

According to Lessing, the object of our sympathy is precisely the sort of evil that we fear for ourselves; as he puts it, “where this fear is not present, neither is any sympathizing.” On this account, the dramatist, in order to succeed, must present us with circumstances and situations similar to our own. “From this similarity arises the fear that our fate could very easily be just as much like his as we feel ourselves to be like him and it is this fear that sympathy brings, as it were,

to fruition.” In Schiller’s early essay “On the Art of Tragedy,” he also emphasizes that the purpose of tragedy is to arouse sympathy. Schiller rejects several explanations of this pleasure: Lucretius’s and Hobbes’s view that it results from comparison with our safety or the view that the pleasure satisfies a love of justice or gratifies a desire for revenge, in the case of someone suffering from some transgression. He contends instead that “the same tender feeling that has us shrinking back from the sight of physical suffering or even from physical expression of moral suffering allows us, in sympathy with the pure moral pain, to feel a pleasure all the sweeter” (Essays 2). In these opening paragraphs Schiller distinguishes two sorts of sympathy in terms of what he takes to be the two competing sources of pleasure and pain: sensual and moral. Like Lessing, he recognizes the inherent pleasure of emotions and the theater’s capacity to communicate these emotions on one or more of these levels. He is not about to deny that sympathy with another’s suffering and the pleasure afforded it can be largely sensual. However, to the degree that moral capacities get the upper hand in someone, she is more likely to be sensitive to the pleasure that, thanks to a connection with morality, combines with even the most painful state. “Such a frame of mind is most capable of enjoying the pleasure of compassion” (4). Otherwise, the tragic stage’s only appeal would be the sensational and the lurid, the sheer spectacle of gallows, mortal combat, and cries of anguish.

Schiller accordingly countenances, at least prima facie, two types of sympathy, that is, sympathy for someone’s sheer physical pain or “pure moral pain.” The two sorts of sympathy, both of which can be found in the dynamics holding between the stage and the audience, are in inverse relation to one another, and the degree of sympathy with the “pure moral pain” as well as the degree of pleasure entailed by that sympathy are relative to the moral state or character of the sympathizer. Schiller offers little argument for these controversial claims; instead he seems content merely to register the fact that some of the paramount pleasures afforded by the tragic genre depend on moral sensibilities on the part of the audience. Yet the question remains why this sort of sympathy is pleasing and why this sympathetic pleasure is in proportion to the sorrowfulness of “tragic emotions.”

The answer, Schiller claims, is the fact that the assault on our sensuous life is the condition for igniting the power of our minds to act, that is, our rationality,

and this rational “activity produces the pleasure that we take in sympathetic suffering” (5). Sympathizing with someone battling their natural, selfish interests satisfies or at least approximates vicariously satisfying an urge in us to do likewise. For this satisfaction to take place, Schiller adds, there must be (i) a display of conflict and suffering, paradigmatically between moral interests and self-interest, and (ii) a rational desire to resolve the conflict in the favor of the moral interests. As Schiller puts it, “the pleasure that sorrowful, tragic emotions give us originates in the satisfaction of the urge to act” (5). We may, to be sure, fear for someone else or for ourselves, sympathies requiring a communication of suffering and a degree of identification with the victim of suffering. But the aim of tragedy is not to produce sympathy with someone else’s pain either because we fear for them (as Mendelssohn contends) or for ourselves (as Lessing contends). Tragedy’s aim is to arouse sympathy with a protagonist’s moral battle with suffering since that sympathy is preeminently pleasurable.

That very state of mind, therefore, that above all proclaims this power and awakens this higher activity, is the most purposeful to a rational being and the most satisfying for the instinct to act. Hence, it must be linked with a superior degree of pleasure …. The particular art that establishes the pleasure of sympathy as its purpose is called the art of tragedy in the most general sense of the term. (6)

Schiller links sympathy directly to our capacity for empathy, our ability to put ourselves in someone else’s situation, an ability that requires in turn that we have already been in the same sort of situation. Furthermore, the object of our sympathy must have the same nature as we do. So the pleasure of sympathy is the pleasure that derives from putting ourselves in a condition or situation in which someone like ourselves finds herself and doing so in such a way that we share in the action that is her moral response to that condition or situation. Herein, moreover, lies the distinctiveness of the genre. Whereas lyrical literature depicts feelings, tragedy depicts actions; history depicts actions, too, but to instruct and not, like tragedy, to arouse sympathy.

Given this summary of what Schiller means when he says that the aim of tragedy is to arouse sympathy, we can see how clearly it departs from Lessing’s view on the matter. For Schiller it is not fear for ourselves, indeed, not even fear, affection, or love for others, that underlies the sort of sympathy that he regards as proper to tragedy. Tragic emotions, the emotions that we feel in sympathizing with a tragic figure, are pleasing because they vicariously satisfy and thus confirm our capacities as rational, moral agents to take charge of our natural condition and, in that sense, in the very struggle, to transcend or move beyond who we have been. It satisfies our drive to act, our urge to exert control
over ourselves and our emotions by means of a capacity that is distinctly ours as human beings. We sympathize with protagonists on a moral plane because we identify with them, not in their victory or defeat and not, as we shall see, in the goodness or evil of their ways, but simply in their moral struggle as such.

Adapting the terminology of Kant and other late-eighteenth-century figures, Schiller also characterizes this moral struggle as something sublime. When Schiller first addresses the notion of sublimity, he follows Kant in sharply contrasting representations of what is stirring and sublime from representations of beauty. What distinguishes representations of sublime objects is precisely the fact that they bring about a pleasure from something displeasing or, equivalently, provide us with a feeling of purposiveness that presupposes something counter-purposive. A sublime theme or object, for example, makes us feel the pain of our impotence (Ohnmacht) on the one hand, and exult at the existence of a power in us superior (Übermacht) to nature on the other. That pained feeling that seems to serve no natural purpose turns out in fact to be a sensual condition for, and thus in purposive harmony with, a higher, rational capacity within us.

In “On the Sublime,” Schiller revises Kant’s notion of the dynamic sublime into what he calls the “practically sublime,” the moral neutralization of nature’s physical power over us, exemplified by a protagonist’s moral defiance of pain, suffering, and other assaults on her natural well-being and even her life. Schiller sometimes speaks of nature as sublime, other times of the resistance to nature as sublime. But in either case, the sublime object is such because it “discloses the very power within us that does not feel itself bound to these conditions” in nature and this very disclosure is the ground of the pleasure afforded by the sublime (25–6). Indeed, according to Schiller, the experience of the practically sublime not only discloses, but also expands our power. In this connection he cites Kant’s own characterization that “nature is judged to be sublime, not insofar as she arouses fear, but because she calls up in us a force [Kraft] of ours (that is not of nature).” Schiller adds that the force in question is not our capacity, as natural beings, to master nature by natural means, but instead our moral ability, as rational beings, to withstand it. The sublime object must be frightening without inciting actual fear, since “only in a detached consideration of something and through the feeling of the activity inside ourselves can we take pleasure in something sublime” (29). The playwright necessarily walks a fine line here. She must represent scenes and characters that, on the one hand, are vivid enough to produce something analogous to genuine fear without actually frightening the audience and, on the other hand, disclose a humanity intrepid and defiant of nature. “Hence, any object that shows us our impotence as natural

---

beings is practically-sublime, as long as it also discloses a capacity within us to resist that is of a completely different order” (35).

In this general account of the dynamically sublime, Schiller makes no mention of sympathy. However, he subsequently distinguishes two types of such sublimity, contemplative and pathetic. The former consists merely in some power of nature superior to us, that we are left to contemplate or not in relation to our physical or moral state. But in the case of the pathetically sublime where we are presented with images of people suffering the catastrophic consequences of this power, Schiller says that we “suffer sympathetically.” “The image of another’s suffering, combined with the emotion and consciousness of the moral freedom within us, is pathetically sublime” (42). Here we see the convergence of the themes of sympathy and sublimity in Schiller’s account of tragedy, a convergence that Kant eschews – at least in so many words.7 We sympathize with someone painfully struggling in a crisis because that sympathy is pleasing and it is pleasing because it reconfirms our own power to act. The image of precisely that struggle is sublime and, hence, tragedy is defined by the sublimity of its themes.

Not to be overlooked here is the crucial dimension common to sympathy and sublimity: the dimension of power. We are pleased by the sympathy, allegedly because it reconfirms a power that is distinctively human, and that sympathy reconfirms this power because we are sympathizing with someone who displays it by resisting any forfeiture or surrender of her control not only to something or someone else but also to a part of her that, in the form of instincts, is already under the sway of the power of nature. This emphasis on power and, indeed, a clash of powers, an emphasis already pronounced in Kant’s account of sublimity,8 is particularly evident in Schiller’s essay “On the Pathetic,” where he insists that, while the mere depiction of suffering can never be the aim of art, it is the necessary means of portraying a human power invincible to that suffering. “The first law of tragedy,” he tells us, is to depict suffering, the second law to depict “moral resistance” to it (48). In contrast to physical resistance, the pitting of one natural instinct against another, this moral resistance to suffering is resistance born of a commitment to an “idea of reason.”9 In what may well be a mild rebuke of Kant’s views in this connection, Schiller thinks that the theater is capable of portraying this commitment through depiction of human phenomena that are contrary to or not determined by instinct, namely, “phenomena that are subject to the will’s influence and control or that we at least can regard as such, that is to

7. See ibid., 157–8.
8. See ibid., 147–8.
9. Here again Schiller is simply aping Kant; see ibid., 148–9.
say, phenomena that the will could have prevented” (52). The tragedian has the job of presenting both suffering and resistance or, as Schiller also puts it, pathos and sublimity. Indeed, the more violent the passion expresses itself in the animal realm without being able to maintain the same force in the human realm, the more evident the latter. “The pathos and the power of tragedy lie precisely in this reference to something transcending sensuality” (53 n.).

At the same time Schiller refuses to infer that the moral resistance must be successful. The ethical propensity or “independence of spirit in a state of suffering” can take two forms, negative or positive, depending on whether a person's suffering has no effect on his moral disposition or issues from his moral character. The former scenario yields what he calls a “sublime composure,” the latter a “sublime action.” His list of portraits of sublime composure includes Milton’s Lucifer and Medea. Paradigms of sublime actions include not only those who suffer for doing their duty, but also those who suffer for violating their duty.11

If Schiller had stopped here, we might be justified in reckoning his view of the tragic hero quite traditional, fully subject to moral considerations of good and evil. But he takes the further step of distinguishing the sublime, entailing evidence of a capacity for morality, from the morally sublime as the actualization of that capacity (61). While the morally sublime is morally satisfying, the sublime alone is aesthetically pleasing. The two senses of sublimity may converge; for example, in the case of Leonidas’s self-sacrifice at Thermopylae, “we applaud the fact that Leonidas actually made the heroic decision that he did, but we shout for joy, we are positively thrilled that he could make it” (63). By contrast, Peregrinus Protheus’s self-immolation at Olympia produces a negative moral assessment and a positive aesthetic one. From a moral point of view, he violated the duty of self-preservation, but from an aesthetic point of view, he set aside the interest of self-preservation.

Schiller’s differentiation of the aesthetic pleasure afforded by the sublime from the moral satisfaction of morally sublime actions is in keeping with his insistence throughout his career that the purpose of the theatrical art is pleasure and not moral improvement. At the same time, as in his On the Aesthetic Education of Man in a Series of Letters (Aesthetic Letters), he cannot resist muddying the waters somewhat by pointing out certain advantages of aesthetic judgments over moral judgments and according a more liberating potential to the former than to the latter.

10. According to Kant, though ideas cannot, strictly speaking, be represented, the sublime can determine the mind to think “the unattainability of nature as a presentation of ideas” (Kant, Critique of Judgment, 151).

11. In “On the Art of Tragedy,” Schiller maintains that our compassion is no less weak when it is mixed with revulsion at the object of sympathy (Essays 8).
In making aesthetic judgments we veer from actual things to possibilities and rise up from the individual to the species, while in making moral judgments we descend from the possible to the actual and enclose the species within the limitations of the individual. No wonder, then, that we feel ourselves broadened in aesthetic judgments, but confined and restricted in moral judgments. (64)

Iago, Richard III, and Medea are not merely moral failures, violating the strictures of our moral imaginations, but for all that they are aesthetically pleasing, sublime subjects of tragic theater. This account of a sublimity beyond good and evil further embellishes Schiller’s explanation of the sympathy that the tragic stage calls for. We sympathize with the moral potency of scoundrels and sinners no less than that of heroes and saints. Schiller adds that the experience is itself enriching: “It is merely the capacity for a similar dutifulness that we share with him and the fact that we see our own capacity in his that explain why we feel our spiritual power elevated” (66). Although Schiller does not specify the precise sense of that enhancement (e.g. aesthetic, moral, or both), he clearly puts great stock in the art’s capacity to “shape humans morally” – not directly, but indirectly. That indirection follows, for Schiller, from the fact that art’s direct aim must be pleasure not moral edification and that art directly influences the character, not the actions of people.

The two direct aims converge. In her attempts to please, the dramatic artist comes to realize that the greatest pleasure is afforded by creating sublime characters with whom we can sympathize, protagonists caught up in a moral conflict, because this sort of sympathy confirms and even enhances a power within us, as rational beings, to transcend or overcome ourselves as creatures of instinct. What is striking about Schiller’s conception of tragedy is precisely this affirmation of a sublimity that is beyond good and evil, the sublimity of a tragic figure with whom we can sympathize and who, for that reason, pleases us aesthetically even if we find him or her morally repulsive. The Nietzschean ring of this aesthetic freedom and the possibilities of self-overcoming it presents are patent.12

As far as his [the poet’s] interest is concerned, it makes no difference if he intends to take his heroes from the class of pernicious or of good characters, since the very measure of power required for the good can quite often, for that very reason, be demanded of something evil. When we make aesthetic judgments, we focus far more

---

*12. For discussion of Nietzsche’s aesthetics, see the essays by Daniel Conway and Gary Shapiro in The History of Continental Philosophy: Volume 2.
on power than on its orientation and far more on freedom than on lawfulness. (67–8)

Not surprisingly, Schiller also places this distinctively aesthetic freedom at the core of his project of a humanizing education, for which aesthetics provides both means and end.

**Aesthetic education**

Schiller published *On the Aesthetic Education of Man in a Series of Letters* (hereafter *Letter*(s)), his most celebrated contribution to aesthetics and, in particular, to the age-old question of its moral and political significance, in three installments (*Letters* 1–9, 10–16, and 17–27, respectively). In the first, largely diagnostic installment, Schiller identifies the dire plight of humanity, particularly in the wake of the failed promise – in his eyes – of the French Revolution. A lack of moral readiness on the part of the people is allegedly responsible for that failure. But this lack exemplifies a basic dilemma confronting politics and political theorists and animating the *Letters*. For while the character of a society’s political life depends on the character of its people, the reverse is no less true. But if politics itself cannot provide a way out of this conundrum, then nor can reason; as Schiller puts it pointedly, why in an “enlightened age” are we still barbarians? Nor would history suggest that the arts provide a way out of the dilemma. Echoing Rousseau, Schiller acknowledges that “in almost every epoch of history one finds humanity diminished where the arts blossom and taste rules” (*Letter* 10). Nevertheless, on this very question of the moral and political efficacy of the arts, Schiller parts ways with the Genevan in no uncertain terms. “If man is ever to solve the problem of politics in practice,” Schiller contends, “he will have to approach it through the problem of the aesthetic, because it is only through beauty that man makes his way to freedom” (*Letter* 2).

There are at least two reasons motivating this contention. First, in the Greek world, Schiller notes, there is historical precedent for the opposite of the disharmonies characteristic of modern culture (disharmonies between the senses and reason, between the individual and the mechanisms of economic and political life

---

14. Although Schiller sometimes (e.g. *Letter* 14) ascribes freedom and morality solely to the rational side of human nature, the overriding sense of freedom at work in the *Letters* is freedom as self-mastery, equally liberated from the tyranny of nature and the tyranny of ideas. In a footnote to *Letter* 19, Schiller acknowledges the possible misunderstandings caused by these two notions of freedom.
as a whole). In light of his differences with Schlegel's Romanticism (see below), it bears noting that Schiller's admiration for Greek culture, while profound, was measured, owing to his sense of its limitations and the cost of moving beyond them born by subsequent ages. “The appearance of Greek humanity was indisputedly a maximum that on this level could neither continue nor rise higher” (Letter 6). The second reason why, despite Rousseau's historical argument, Schiller is more sanguine about the prospects for educating humanity aesthetically is his rejection of that argument's working assumption of an empirical conception of beauty. In the second installment of the Letters Schiller proposes instead to pursue a “transcendental path” to a purely rational conception of beauty as “a necessary condition of humanity,” with the explanation that this departure from concrete phenomena is required to establish “a secure, unshakable ground of knowledge” (Letter 10).

Schiller contends that, for every human being, there is at once an enduring person and a transient condition, each dependent on the other and demanding its due. As a result, there are two basic, ostensibly antithetical laws of human nature, that of “externalizing” (realizing) everything within the person and “formalizing” everything outside it. We are accordingly “driven” by two opposing forces, a “sensuous” drive toward the material content of life’s individual, momentary sensations and a “formal” drive toward freedom in the form of universal, eternal laws (Letters 11–12). Inasmuch as each drive acts as a constraint on the other (the sensuous drive as a physical, the formal drive as a moral constraint), culture’s “task,” as Schiller puts it, is to intensify each drive to the point where they have a moderating effect on one another. While Schiller’s notion of formal drive’s connection with universal laws is plainly of Kantian inspiration, he takes cues from Fichte’s conception of reciprocity to elaborate a notion of freedom that requires, not the subordination of one drive to the other, but their coordination.

Without denying the utopian character of this liberating task of coordination, Schiller counters skepticism toward it by invoking the experience of play. Construing play as an experience in which both drives, that is, feelings and thought alike, merge, he declares that “man only plays when he is in the fullest sense of the word a human being, and he is only fully a human being when he plays” (Letter 15). Whereas the sensuous drive is preoccupied with life and the formal drive with form, the play drive, as Schiller calls it, reconciles these disparate drives in its preoccupation with its own distinct object, beauty, defined as a living form. Thanks to this definition, Hegel later emphasizes, Schiller

15. For sources of Schiller’s use of play (Lessing, Kant, Ramdohr), see Frederick Beiser, Schiller as Philosopher: A Re-examination (Oxford: Clarendon Press, 2005), 142–3; see Letter 27 for a genealogy of play, extending from physical play (in overflowing nature) to free play (in human fantasy and association) and, ultimately, aesthetic play, capable of transforming sexual desire.
perform the “great service of having broken through the Kantian subjectivity and abstraction and having dared to go beyond it, grasping unity and reconciliation as the truth intellectually and realizing it artistically.”16 In this aesthetics of play, beauty cannot be adequately understood in strictly subjective or objective terms. As a form, it points to the subjective or, more precisely, imaginative dimension (spatial and/or temporal configurations) in terms of which Kant characterizes beauty. But for Schiller, the playwright-philosopher, this form is not an empty form without purpose, the preoccupation of a tasteful play of faculties. Instead, beauty is a living form and only by virtue of this objective, organic, and purposeful dimension does it yield the experience of play that is definitive of human nature, the key to the means and end of human existence.17

The real, historical prospects for an aesthetic education of mankind – for a revolution not only in name – turn on the possibilities of creating playful experiences of beauty, experiences capable of generating, regenerating, and consummating the freedom that is, at least ideally, the destiny of mankind.

There remains, however, the considerable problem of explaining how the playful experience of beauty is possible at all, given that it allegedly unites (coordinates and facilitates) opposites (matter and form, passivity and activity, sensuousness and thought). In the final installment of the Letters – and in a move that anticipates much of German idealism and Romanticism – Schiller responds to this problem by invoking the will. The noncontradictory unity of the human spirit resides in the will inasmuch as it is not merely distinct from the two basic, opposed drives but also enjoys complete freedom relative to both of them. Although opposed, each of two basic drives pursues its own object and, hence, does not act directly on the other. Schiller accordingly declares: “In a human being there is no other power than his will” (Letter 19). In a direct departure from Kant, Schiller understands this freedom of the will not as the freedom proper to someone with intelligence alone, but as a freedom grounded in the “mixed nature” of human beings and, indeed, as an effect of nature, one capable of being furthered or thwarted by natural means. What Schiller dubs the “aesthetic condition” negates and is accordingly free of the sensuous and rational determinations characteristic of our physical and moral conditions respectively (Letter 20). Yet, precisely by being – like the sublime object of tragedy – beyond moral constraints, beauty has the capacity to restore our freedom regularly to us, while providing a paradigm of self-determination arising out of indeterminacy.

17. “Sie [Schönheit] ist also zwar Form, weil wir sie betrachten; zugleich aber ist sie Leben, weil wir sie fühlen. Mit einem Wort: sie ist zugleich unser Zustand und unsere Tat” (Letter 25/Essays 164).
Indeed, the aesthetic condition is necessary if human beings are ever to move beyond “the dismal state of nature” and the demands of “animal self-love”; in other words, human beings are sensual and, hence, cannot be made rational until they have first been aesthetic (Letters 23–4). In yet another, obvious counterpoint to Rousseau,18 Schiller accordingly declares: “Man in his physical condition merely suffers the dominion of nature; he emancipates himself from this dominion in the aesthetic condition, and he acquires mastery over it in the moral” (Letters 24).

Schiller considers the transition to the aesthetic condition the more difficult of the two transitions (inasmuch as its emancipatory character anticipates the moral condition). He explains the transition through the notion of “aesthetic semblance.” When basic needs have been met, human beings tend to indulge in the sheer semblances (Scheine) of things, a tendency underlying the play-drive and the mimetic proclivity to shape sights and sounds into an “aesthetic semblance” pleasing in itself. The very essence of arts is semblance and semblance is aesthetic only if it is “honest (expressly renounces all claims to reality) and autonomous (dispenses with all support from reality)” (Letter 26). To the extent that aesthetic semblance takes hold for individuals or whole peoples, it performs the essential, humanizing task of demarcating and securing the distinctiveness of truth and morality. On the final pages of the Letters, Schiller draws the political consequences of his account as he introduces the notion of “the realm of aesthetic semblance” or the “aesthetic state” (ästhetischer Staat). Beauty's capacity to transform sexual desire into love also signals its capacity to resolve competing desires in society at large. Only in an aesthetic state can we confront each other, not as enforcers of our respective rights (“the fearful kingdom of forces”) or as executors of our wills (“the sacred kingdom of laws”), but as free and equal citizens: “the third joyous kingdom of play and of semblance” (Letter 27).

Modernity and the promise of poetry

Schiller’s final major work in aesthetics, On Naïve and Sentimental Poetry (1795–96) contrasts the naturalness of naive poets, typified by ancient writers such as Homer, with the more self-conscious and, in this sense “sentimental” style typical of modern writers such as Ariosto. In this somewhat idiosyncratic use of the terms, “naive” signifies a direct, not an unsophisticated manner of writing; “sentimental” does not mean mawkish but self-reflective. Whereas the naive style is straightforward with an air of objectivity and without any intrusion by the author, the sentimental poets cannot refrain from introducing their own subjective feelings and opinions into the writing. Schiller puts the difference

18. See Beiser, Schiller as Philosopher, 157–61.
in terms of naturalness (“The poet either is nature or will seek it. The former constitutes the ‘naïve,’ the latter the ‘sentimental’ poet”), task (“The sentimental poet does not complete his task, but his task is an infinite one”), cause-and-effect (“Sentimental poetry is the progeny of detachment and stillness, inviting us to them; naïve poetry is the child of life and it also leads us back to life”), dependency (“Thus, while the naïve genius is in need of some external support, the genius of the sentimental poet consists in nourishing and purifying himself on his own”), and one-sidedness (“spontaneity overrides sensitivity in the sentimental poetic spirit as much as sensitivity overrides spontaneity in naïve poetry”) (Essays 200, 234–5, 241). Perhaps the central contrast lies in the fact that the sentimental poet alone calls attention to a particular sense of the difference between reality and his ideas and idealizations. She does so by mocking reality in pathetic or playful satires, by mourning the absence or loss of the ideal in elegies, or by celebrating its future realization in idylls.

Despite frequently casting the difference between naïve and sentimental poetry in historical terms, Schiller traces it to antithetical modes of poetic consciousness, ancient or modern, and even between contrary traits within a single poet (e.g. Goethe). Prefiguring Hegelian dialectics, he also introduces the difference in terms of a journey that individuals as well as mankind as a whole must make: “Nature makes a human being one with himself, art separates and divides him; by means of the ideal he returns to oneness” (202). Revisiting this parallel at the end of the essay, he concedes “that neither the naïve nor the sentimental character, considered in itself, can completely exhaust the ideal of beautiful humanity, an ideal that can only emerge from the intimate union of both” (249). Schiller is less sanguine about the prospect of such a union than he is at the conclusion of Letters. Underlying the poetic difference between the naïve and sentimental is, he submits, a fundamental and debilitating psychological antagonism resolved only in “a few, rare individuals” – the difference between permitting nature (realists) or reason (idealist) to determine theory and practice. Indeed, the essay ends with a clear echo of the Terror as he grimly notes the far greater danger presented by the false idealism of a visionary than by the false realism of those who only believe what they can touch. Yet even on these final pages Schiller remains confident in poetry’s paradigmatic capacity to reconcile basic oppositions. The sides of all such oppositions, epitomized poetically by the difference between the naïve and the sentimental, ultimately come

19. Comedy “moves toward a more important goal”: freedom from passion and the clarity, composure, and good humor entailed by that freedom (Schiller, Essays, 209).
together – “in their difference from and need of one another” – in the concept of the poetic (249).

II. IRONIC FREEDOM: SCHLEGEL ON ROMANTIC POETRY

Getting over the obsession with objectivity: explaining the Romantic turn

*The Greeks and the Romans* (finished in December 1795, although not published until January 1797) is the fruit of Schlegel's early efforts to do for Greek poetry what Winckelmann had done for the plastic arts of antiquity, namely, demonstrate its paradigmatic capacity to exhibit the ideal, objective form of beauty operative in nature. In the preface, Schlegel acknowledges that his study would have been much improved, had he been able to read *On Naïve and Sentimental Poetry* before his study went to press. He notes, in particular, how Schiller's essay shed new light on the limitations of classical poetry and expanded his insight into “interesting” poetry (KFSA 1, 209). Schlegel uses “interesting” as a metonym for “modern” (a usage that springs in part from his appropriation of Kantian conceptions of the disinterestedness and freedom involved in the experience of beauty, to characterize Greek poetry's achievement). “Interesting” denotes an unflattering and ultimately incongruous characteristic of the goal of modern poetry: unflattering because it is a criterion for restless, self-absorbed moderns unsatisfied with the ancient, objective standard of beauty, and incongruous because it is an unlimited and subjective, unprincipled and ultimately unattainable goal. In other words, for a certain stripe of modern aesthetes, Schlegel contends, it is more important for art to be interesting than for it to be beautiful, even if what makes it interesting is quite individualistic or subjective and permanently transient, not least for the individual who initially finds it interesting. In this sense, mixing genres and even mixing philosophy with poetry can make for interesting art.21 The dominance of this orientation toward interesting poetry is, Schlegel submits, a self-destructive and thus passing crisis of taste.22 By contrast, as Schlegel puts it, “Greek poetry has actually attained the ultimate limit of the natural formation of art and taste, this supreme epitome of free beauty”; for all times, it is “the paragon of art and taste,” containing “a complete collection of examples for all original concepts of art and taste” (KFSA 1, 287–8, 293, 307). Not surprisingly, Schiller characterized this early work of Schlegel as a bit of “Graecomania.”

22. KFSA 1, 211–15, 228, 245–9, 275, 318, 311.
However, in the course of 1796, the same year that marks the inception of a feud with Schiller (in which neither author seems to have distinguished himself), and even before the publication of his early paean to Greek poetry, Schlegel is already altering considerably his attitude toward modern poetry and the prospects of an aesthetics with transhistorical, objective principles of criticism. In the so-called Lyceumfragmente of 1797, he explicitly criticizes the obsession with objectivity (Objektivitätswut) characteristic of his earlier studies and begins to contrast modern poetry favorably with ancient (e.g. “In the ancients one sees the completed letter of all poetry; in the moderns one intimates the spirit coming to be”; “The ancients are masters of poetic abstraction; the modern have more poetic speculation”) (KFSA 2, 155, 158, 160). In publications over the next two years (see below) that further repudiate neoclassicist tendencies in poetry and criticism, he gives his most potent and influential declaration of the ideal of Romantic poetry as the “only” poetry – “since in a certain sense all poetry is or should be romantic” (KFSA 2, 183).

To what extent a reading of Schiller’s study of “naive” and “sentimental” poetry prompted the change in Schlegel’s attitudes toward ancient and modern literature – or even a template for his contrast of classical and Romantic poetry – is a longstanding controversy traceable to remarks by Goethe. What is uncontroversial is the far greater impact that the terms “Classical” and “Romantic” have exercised on literary studies, even if Schlegel extols their harmonization and, indeed, characterizes the outlook of Romantic poetry as “a classicism growing without limit” (KFSA 2, 183, 298–9). To be sure, the sentimental poet, like the Romantic, is bent on an infinite striving, a goal exceeding the self-sufficiency and completeness exemplified by naive or Classical poetry. Yet, while similar concerns preoccupied Schiller and Schlegel, there are also patent differences, epitomized – as I argue below – by the contrast between play and irony respectively.

Given these differences, there is reason to look elsewhere for the sources of the shift in Schlegel’s attitudes. Frederick Beiser argues that this shift can be traced, not so much to Schiller’s influence, as to philosophical concerns of an epistemological cast. Beiser accordingly pins the shift on Schlegel’s growing disillusionment with what he originally took to be the promise of Fichte’s foundationalism (his “claims to first principles and a complete system”) for establishing the objective science of aesthetics and criticism that eluded Kant.²⁵ In reflections in the winter of 1796–97, Schlegel comes to the conclusion that an infinite regress plagues any pretense to first principles, and that we, nevertheless, can and should endlessly perfect our principles of criticism without exception, doing so in a process of self-criticism that is an ongoing and open-ended part of inquiry.²⁶

For every concept, as for every proof, one can ask for a concept in turn and a proof of it. For this reason, philosophy, like an epic poem, must begin in the middle, and it is impossible to present it and give an account of it piece by piece in such a way that the first [principle] is completely justified and explained. It is a whole and the path to knowing it is not a straight line but a circle. (KFSA 18, 518)

*Progressive universal poetry: witty, fragmentary, and transcendental*

This process of self-critical writing requires what Schlegel understands as *wit* (*Witz*): an inspired capacity to discern unseen similarities and communicate such “abbreviated wisdom” in a form that befits it as an individual insight into an infinite, developing whole (KFSA 18, 89). Schlegel accordingly characterizes wit, on the one hand, as “an explosion of a tethered spirit,” the work of “a thick, fiery reason,” “a prophetic capacity,” what the Romans called having “nose” for things, the “principle and organ of universal philosophy,” and, on the other hand, as “the unconditioned social spirit.”²⁷

The suitable form for communicating this wit – at once compendious, complementary, and in need of complementing – is the *fragment*. A fragment is not simply an anecdote, epigram, or aphorism – each of which might be understood as complete in itself in splendid isolation. Despite similarities with these forms of writing, fragments are self-conscious indications of incompleteness, gestures to a whole that can only be fathomed, if at all, by an endless,

---

²⁶. KFSA 18, 3–15, 505–21. Notably, after early misgivings with Kant’s lack of principles for criticism, Schlegel can be seen as returning to a Kantian position here.

precarious approximation. In this sense, the fragment is the signature style of some of Schlegel’s most influential writings, including his entries to Athenaeum (e.g. “Fragments,” “Ideas”). This journal, the main literary and philosophical organ of what came to be known as the “Romantic school” or “early German Romanticism,” is the fruit of a circle of close friends: Novalis, the Schlegel brothers, Caroline Schlegel, Friedrich Schleiermacher, Ludwig Tieck, Dorothea Veit, Wilhelm Wackenroder.

Shortly after insisting (in the Athenaeum Fragments) on the normative character of any definition of poetry (Fragment 114), Schlegel issues his most famous gloss of Romantic poetry, characterizing it as “a progressive universal poetry” (Fragment 116). In a direct reversal of views expressed in The Greeks and the Romans, he challenges traditional concerns about preserving purity of genre (epic, drama, and lyric) and construes a broad range of works (including the novel, essay, and even some philosophical and historical writings) as poetry in the proper sense of the term. The universal character of Romantic poetry lies, at least in part, in its refusal to identify poetry with any particular genre or marks of a piece of a writing that can be simply read off it (e.g. meter, rhyme, etc.). But the sense of its “universality” extends even further since its aim is not simply to unite the separate genres and put poetry in contact with philosophy, but – among other things – to mingle and fuse “poetry and prose, genius and criticism, the poetry of the educated and the poetry of the people, to make poetry alive and social and to make life and society poetic, to poeticize wit, to fill and saturate the forms of art with matters of genuine cultural value” (KFSA 2, 182).

The progressive character of Romantic, that is, genuine poetry is tied to the fact that it is self-reflective. Self-reflection is a transcendental notion in the Kantian sense that it is the condition that enables (and accordingly ranges over, transcends) every other consciousness (unreflected or not, self-styled as poetic or not), and in the Fichtean sense that, unlike any other consciousness or object of consciousness, its reality consists precisely in its ideal, self-reflective activity.

28. August Wilhelm Schlegel (1767–1845), Friedrich’s brother and coeditor of the Athenaeum, is also known for his contributions to German Romanticism, not least through his criticism, poetry, and gifted translations of Calderon, Shakespeare, and other Romance-language authors. Through the widespread publication of his lectures on fine art, dramatic arts, and literature, given in Berlin and Vienna, he played a major role in spreading the basic ideas of Romanticism across Europe. In 1818 he became a professor of literature and art history at the University of Bonn where he would spend the rest of his life, producing notable works of criticism and inaugurating studies of Sanskrit writings.

29. Heinrich Heine, Die romantische Schule (Hamburg: Hoffmann & Campe, 1833); Rudolf Haym, Die Romantische Schule: Ein Beitrag zur Geschichte des deutschen Geistes (Berlin: Gaertner, 1870); Behler, German Romantic Literary Theory, 31ff. The Athenaeum contains, in addition to the noted fragments, Schlegel’s notable study of Goethe’s Wilhelm Meister, essays on philosophy and religion, and “Dialogue on Poetry.”
Schlegel incorporates each of these senses of “transcendental” into his understanding of Romantic poetry: “There is a kind of poetry whose essence lies in the relation between the ideal and real, and which therefore by analogy to philosophical jargon, should be called ‘transcendental poetry’” (KFSA 2, 204). Just as any transcendental philosophy, to be worthy of the name, must be critical, so, too, in whatever transcendental poetry depicts, it must depict itself as well and “be at once poetry and poetry of poetry” (ibid.).

At the same time, however, progressive as it is, Romantic poetry’s transcendental character also differs fundamentally from those Kantian and Fichtean senses. It differs in being polyvalent, algorithmic, and historical. That is to say, the poem not only is the reflection of the poet and the poetry but also holds the potential for reflection of all sorts on that reflection or, better, for endless, ongoing, and thereby “progressive” self-reflection. Romantic poetry can, as he puts it, “hover on the wings of poetic reflection, in the middle between the portrayer and the portrayed, free of all real and ideal self-interest, raising that self-reflection again and again to a higher power, multiplying it in an endless series of mirrors.”

For Schlegel, it bears iterating, Romantic poetry is by no means the antipode to philosophy; to the contrary, it is integral to philosophy’s telos. “For in philosophy the path to science goes through art alone, just as the poet, by contrast, becomes an artist only through science” (KFSA 2, 216). In this sense, Schlegel’s understanding of the transcendental character of Romantic poetry directly challenges the transcendental philosophies of Kant and Fichte. Just as Hamann twenty years earlier chastised Kant for thinking of categories and concepts independently of the historical language in which they are expressed, so Schlegel’s identification of the poetry with transcendental self-reflectiveness challenges the purity of the transcendental self-consciousness, whether it be conceived as the ever-present possibility and thus enabling condition of consciousness of objects (Kant) or as the reality that posits itself in the very act of thinking (Fichte). As noted earlier, he compares philosophy to an epic poem, always having to start in medias res, a whole that we can come to know only by a circular path. In this spirit, anticipating views that figure strongly for the next two centuries in philosophy (think of the Husserlian zigzag or the hermeneutic circle), he criticizes the philosophy of his contemporaries for being too linear, for “not being sufficiently cyclical” (KFSA 2, 171).

---

30. Schlegel, KFSA 2, 182–3. As for the title “Romantic,” it bears recalling that Roman is the German for “novel” and that the Romantics appreciated highly imaginative, genre-mixing, and ironic fantasies typified by such Romance-language writers as Dante and Cervantes – the author of “the only thoroughly Romantic novel,” in Schlegel’s view (KFSA 16, 176); Behler, *German Romantic Literary Theory*, 168–9.
Schlegel’s repudiation of his earlier obsession with objectivity does not entail
that criticism is unprincipled. Although critics lack access to “some universal
ideal,” they can determine the “individual ideal of each work” and ought to
judge the work in terms of that ideal; in other words, “criticism compares a
work with its own ideal” (KFSA 16, 179, 270). Determining that ideal, while
never complete, requires that we understand the poet, indeed, understand the
poet better than she understands herself, including her confusions. At once
echoing Pliny and presenting the basic argument for comparative literature,
Schlegel adds that we can understand the poet in such a manner only if we
are poets ourselves and immerse ourselves in the poet’s history and historical
context, including the entire literary repertoire on which the poet, wittingly or
unwittingly, draws.

Irony as transcendental buffoonery, religion, and the realist turn

The vocation of man, Schlegel writes, is to wed the infinite with the finite, even
though their complete coincidence is “eternally unattainable.” What sustains
and arouses the feeling of their “inextinguishable conflict” is irony, the “sublime
urbanity of the Socratic muse” and “an actually transcendental buffoonery”
(KFSA 2, 152, 160). The images of both Socrates and the buffoon of the Italian
stage capture the sense of someone overlooking the scene from within, rising
above (transcending) everything conditioned in it, including one’s own art, in
the process destroying any illusions about it, by mimicking its mannerisms
(buffoonery). In just this manner a sense of irony informs the process (subjectiv-
ty) and the work (objectivity) of Romantic poetry. As the task of sustaining
the feeling of the conflict, irony demands of the poet and the poem a specific
sort of self-discipline, a self-restraint that is “the result of self-creation and self-
destruction.” This sense of irony is also a direct expression of the fusion of
philosophy and poetry mentioned earlier. For while Schlegel regards philos-
ophy as irony’s “homeland” and irony as a “philosophical capacity,” he thinks
that poetry can elevate itself to it and, indeed, it is the self-limiting, “skeptical”
character of irony that liberates the poet from overestimating her creation, from

*31. For a discussion of this principle of understanding the author better than she understands
herself in the context of hermeneutics, see the essay by Eric Sean Nelson in The History of
Continental Philosophy: Volume 2.
32. Schlegel, KFSA 2, 241; 16, 168; 18, 63. Schlegel exemplifies this sort of criticism himself in
essays on Boccacio, Forster, Jacobi, Lessing, Wieland, and, above all, Goethe.
33. Schlegel, Neue philosophische Schriften, J. Körner (ed.) (Frankfurt: Schulte-Bulmke, 1935),

classic” to the point of irony, a constant alternation of self-creation and self-destruction.
falling prey to her own proclivities (naive or sentimental, objective or subjective). “Irony is philosophically witty” and “In transcendental poetry,” Schlegel declares, “irony dominates.”

In “Ideas,” Schlegel counterposes poetry as a realism with philosophy as an idealism and the role of irony, the combination of the real with the ideal, falls to religion or, better, a religion and a humanity yet to come. Thus, after arguing that “logic can develop into philosophy only through religion” and that “only someone who has his own religion can be an artist,” Schlegel advises that “there is as yet no religion” (KFSA 2, 257, 260, 264–5). Religion takes shape linguistically in the form of myth and, accordingly, Schlegel calls for the creation of a new mythology, one that fills the absence left by the old mythology’s demise, an absence that forced modern poets inward. While short on details, Schlegel describes this new mythology as “a new realism,” no less boundless than the idealism of the age from which it emerges (KFSA 2, 259, 312–15).

III. CONCLUSION

For all their differences, the aesthetics of Schiller and Schlegel have much in common. Placing philosophical speculation at the center of criticism and literature, each draws critically on the transcendental philosophies of Kant and Fichte. Each writer struggles to come to terms with modernity’s increasingly rationalistic, artificial, and alienating character in contrast to antiquity’s presumed naturalness. At the same time, without denying Greek poetry its paradigmatic status, both extol the distinctiveness of modern poetry. Neither fails to appreciate the moral and political import, however indirect, of art and literature. What is at stake in literature for both of them is humanity’s defining, self-liberating potential.

Yet their differences are no less marked. “Sentimental poetry,” for example, is hardly synonymous with “Romantic poetry.” The realism of Romantic poetry has in fact more affinities with the naturalism of naive poetry than the moralism characteristic of sentimental poetry – a difference exemplified by their assessments of Shakespeare, whom Schiller considered a natural poet and Schlegel extolled as a Romantic poet. Mention has already been made of the fact that Schlegel’s distinction between “Classic” and “Romantic” has, in Dilthey’s words, “proven more fruitful” than Schiller’s distinction. Dilthey and others attribute this development to basic differences in their project. Schiller analyzes the

35. KFSA 2, 152; Ingrid Strohschneider-Kohrs, Die romantische Ironie in Theorie und Gestaltung, 2nd ed. (Tübingen: Niemeyer, 1977), 36, 44.
essence of poetry into two basic forms and, although he does so with an eye to freeing modern poetry from the criteria of Greek poetry, his understanding of those forms is shaped by aesthetic considerations framed more by anthropology than by history. By contrast, Schlegel’s point of departure and method, indeed, his philosophy itself, is thoroughly historical; he understands modern, Romantic poetry as the outgrowth of classical poetry and as an organic, unfinished unity that partakes and reflects the organic, unfinished unity of culture (a culture, moreover, without European borders).  

The differences between these aesthetic legacies are patent when we compare Schiller’s concept of play with Schlegel’s concept of irony. In both cases, a sense of aesthetic freedom is achieved in the face of an underlying dualism via a reciprocal relation between finite and infinite. Yet for Schiller, the play drive famously joins opposing drives, the sensory-passive-material drive with the rational-active-formal drive, yielding an aesthetic condition, the counterpart to beauty, the “happy equilibrium” in which “no trace of the division remains behind in the whole” (Essays 138, 166). The content and aim of aesthetic education is “to shape [auszubilden] the whole of our sensory and spiritual powers in the greatest possible harmony” (146 n.). Schiller understands the aesthetic condition – means and end of the aesthetic education – as a matter of opposing and thus negating both sensory and moral needs in order to arrive at a kind of equanimity, equivalent to what he labels “a canceling of time in time” and a “capacity of carrying out what is infinite within the finite” (126, 165). “In the aesthetic condition, the human being is accordingly naught [Null]” (147).  

By contrast, Schlegel demands of the poet an awareness of the ineradicable division of conditioned and unconditioned that determines her every work and does so in every detail, entailing a constant process of “self-creation and self-annihilation.” From the vantage point of this Romantic irony, there can only be an ongoing process of self-overcoming reflection and there can be no pretension to an endgame of some harmonious totality. While the playfulness of aesthetic semblance (encompassing poet, poem, and reader) is a liberating

Richard Brinkmann, “Romantische Dichtungstheorie in Friedrich Schlegels Frühwerken und Schillers Begriffe des Naiven und Sentimentalischen,” Deutsche Vierteljahrsschrift für Literaturwissenschaft und Geistesgeschichte 32 (1958); Wilhelm Dilthey, Leben Schleiermachers, in Gesammelte Schriften, XIII, Martin Redeker (ed.) (Göttingen: Vandenhoeck & Ruprecht, 1970), 243–4. Some other differences are worth noting: Schlegel, coming from a renowned literary family, was steeped in ancient literature, reading it with ease in the original; the same could not be said for Schiller (Behler, “Einleitung,” KFSA 1, CLXXIV); Schiller expressed his eventual disenchantment with the French Revolution while Schlegel still championed it; see Beiser, The Romantic Imperative, 48–9. A decade before his work on Sanskrit and the wisdom of India, Schlegel urges poets to look to India for “what is supremely Romantic” (KFSA 2, 320).  

38. See Strohschneider-Kohrs, Die romantische Ironie, 228.
equilibrium, Romantic irony is liberating precisely by instantiating the disequilibrium between this experience and reality. If Schiller’s notion of sublimity and the aesthetic condition prefigures a Nietzschean freedom beyond good and evil, Schlegel’s Romanticism anticipates the self-overcoming to which Zarathustra calls us.

Yet, as Schlegel himself notes, irony, while essential, is not the whole of Romantic poetry. His depiction of it as “a wonderful, eternal alternation [Wechsel] of enthusiasm and irony” suggests that irony needs the play of the aesthetic condition and semblance – even if only because it, like modern art, is a “rebellion against semblance.” So, too, in what might well be a nod to Schiller, Schlegel stresses Romantic poetry’s dependence on a “naive profundity” allowing the “semblance” of an imaginary world to shine through. “The beginning of all poetry is to cancel the course and the laws of reason thinking reasonably and transport us again to the beautiful confusion of fantasy” (KFSA 2, 319). This beginning is, however, only the beginning; irony is the transcendental buffoonery that poetizes the poem, the realistic reminder that the play of aesthetic semblance is mere play, a reproduction of “the endless play of the world.”

I. INTRODUCTION: THE EMERGENCE OF THE OTHER AS A PROBLEM IN GERMAN IDEALISM

According to Kant, “human reason has this peculiar fate that in one species of its knowledge it is burdened by questions which, as prescribed by the very nature of reason itself, it is not able to ignore, but which, as transcending all its powers, it is also not able to answer.”\(^1\) Nowhere is this fate more evident than in the great metaphysical questions concerning freedom, immortality, and God. These questions necessarily arise in human experience and reflection on it, yet they also exceed the capacity of reason to determine cognitively and are peculiarly subject to metaphysical illusion. This illusion arises not when we are thinking obscure matters, but when we are thinking clearly; metaphysical illusion is difficult to detect. For on the one hand, nothing is easier than to think about freedom, the soul, and God. But Kant warns us that to think is not the same as to know. That is because concepts without perceptions are empty. Thought is finite and must wait upon objects to be given to it in perception and intuition. Thus for Kant topics like freedom and God are thinkable and conceivable, but since they are not given in empirical intuitions, they are not knowable. Kant holds that cognition is restricted to mundane phenomena and the necessary laws governing their operation.

However, having closed the door to a transcendent metaphysics of the supersensible, Kant opens another door to the metaphysical issues of God, freedom,
and immortality, to wit, through practical reason, freedom, and faith. According to Kant the critical philosophy denies knowledge in order to make room for faith, practical faith. But while practical faith and freedom are important, and while Kant holds that through freedom we do gain access to the noumenal realm, this access is for practical purposes only. It is not theoretical knowledge of any supersensible object(s). In determining the bounds of cognition and proscribing any cognitive transcendence of such boundaries, Kant’s position raises a question whose answer seems obvious, but turns out to be much more complicated, to wit, how do I know I am free? We confront a paradox: If I know that I am free, I must know myself as a conditioned phenomenal object subject to causal-mechanical necessity. Therefore if I know I am free, then paradoxically I am not free because qua phenomenon I am subject to the necessity formally prescribed to phenomena by the structure and agency of rationality itself.

Kant’s solution to this antinomy is to apply his doctrine of denial of knowledge in order to make room for faith, and his notorious distinction between appearances (phenomena) and things in themselves (noumena). As far as the self-consciousness of freedom is concerned, for Kant the outcome is that there is no cognitive access of the self to its freedom. I not only do not know, but cannot know that I am free. Instead, according to Kant the consciousness of freedom is mediated by the moral law: the moral law is the ratio cognoscendi of freedom, and freedom is the ratio essendi of the moral law. In other words, I discover that I am free through obligations and imperatives imposed by reason and the moral law. But the moral law is not a natural law that holds necessarily whether it is cognized or not. Rather, only a being who is free is capable of apprehending a moral imperative and the moral law. A stone has no sense of any moral imperative or obligation.

Thus for Kant there is no knowledge of freedom; instead the consciousness of freedom is mediated by practical categorical imperatives. But the consciousness of freedom is important, not only for Kant’s ethics of autonomy, but also because it implies personhood, and grounds Kant’s systematic distinction between things and persons. A thing is a use object. A use object is one that does not contain its own end, but rather is a receptacle for the end of an other, that is, a person. In contrast, a person is a being that, as free, contains its own end. Its end is to be self-determining, autonomous. Thus to use a person is morally evil, because that is to treat a being that is capable of being and containing its own end, merely as a receptacle for the end of an other.

It is evident that Kant thinks that there are persons, and communities (cf. kingdom of ends). It is equally evident that like freedom and God, persons

and communities exceed the boundaries of cognition, and are to be treated as “objects” of faith, moral faith. However, since the transcendental constitution of cognition extends only as far as mundane phenomena, there is strictly speaking no cognition possible of freedom, God, others, and communities.

One of the sharpest critics of Kant and German idealism in general was Friedrich Heinrich Jacobi.3 Jacobi, a student and translator of David Hume, takes a Humean position that we are confronted with a disastrous choice between a false reason and no reason at all, that is, that reason and philosophical cognition are self-subverting. His criticisms of Kant are among the most influential, on both his contemporaries and subsequent generations. For example, take Kant’s notorious doctrine of the thing in itself: according to Jacobi, without it one cannot be a Kantian philosopher, but with it one cannot remain a Kantian. Kant’s position thus subverts itself. Further, since according to Kant to know is to condition, it follows that to know God is equivalent to providing conditions to/for the unconditioned. Jacobi thus walks through the door opened by Kant’s denial of knowledge in order to make room for faith. For his affirmative doctrine of immediate knowing or Gefühlspphilosophie, Jacobi offers a mixture of Humean impressions and Kant’s practical faith. He agrees with Kant that God is beyond the capacity and limits of cognition and rather a matter of practical faith or immediate knowledge.4 Jacobi conceives faith as an immediate certainty “which not only needs no proof, but excludes all proofs absolutely and is simply the representation agreeing with the thing being represented. Conviction by proofs is certainty at second hand …. Conviction based on rational grounds must itself derive from faith.”5

Moreover, the reference of faith in Jacobi’s sense is not restricted to the supersensible or the idea, or God. Rather, faith has a much broader common-sense reference:

Through faith we know that we have a body, and that there are other bodies and other thinking beings outside us. A veritable and wondrous revelation! … We become aware of other actual things … with the very same certainty with which we become aware of ourselves, for without the Thou, the I is impossible.6

---

*3. Jacobi’s criticism of Kant is discussed in detail by Richard Fincham in this volume.
4. Immediacy for Jacobi means that such “knowledge” is invulnerable to criticism.
6. Ibid., 231, emphasis added.
Faith thus is taken in a broader sense than the religious or theological; it becomes synonymous with immediate knowing of our bodies, others, and God.\(^7\) If for Kant both the self-consciousness of freedom and the existence of others is problematic, for Jacobi they are absolutely certain, immediate givens.

Confronted with the antinomy between Kantian agnosticism concerning others, and Jacobi’s claims concerning equiprimordial, immediate knowing of self and others, Fichte believed it necessary to raise two related questions: (i) How do I know that I am free? (ii) How do we know that there are others? Fichte’s answer to both of these questions is the concept of recognition, which posits not merely a correlation between self and other, but the significant claim that my knowledge of my freedom is not a self-objectification of theoretical cognition that Kant had denied, but rather is mediated to me by the other. Recognition by other makes me available to myself as a totality in a way that I cannot achieve on my own. The self depends on the other present in its ownmost self-relation for its own self-knowledge. Fichte thus introduces the thesis of a mediated autonomy, a mediated self-relation, a mediated self-knowledge.

How does this dependent independence fit within a program of transcendental philosophy? According to the latter, any object is relative to the subject. Anything that is for the subject, exists through the subject; this basic proposition is the central doctrine of critical or transcendental idealism. Note, however, that the dependence of the self on its other for the consciousness of its freedom and independence challenges such idealism. For where idealism holds that all objects are relative to the subject, in recognition the self grasps itself as relative to the other as well. Moreover, the other confers on me a self-knowledge that I cannot give or provide myself. The relation between self and other is not asymmetrical, as idealism holds, but is reciprocal, jointly constituted. The other is the condition of my own self-consciousness of freedom, and in my consciousness of my freedom I am a dependent independence. How then do we know that there are others? That is Fichte’s question, and the problem of integrating the mediation of the self to itself by the other becomes a major problem in the development and transformation of idealism into a philosophy of spirit.

In what follows, we take up Fichte’s question, and show how Fichte’s struggles with this question both anticipate the later philosophy of Edmund Husserl, who likewise sought to develop a theory of the other, and illustrate similar problems and deficiencies found in Husserl’s transcendental phenomenological philosophy. Conversely, viewing Fichte’s struggle with his question through a Husserlian lens allows us to see that Fichte and German idealism are not necessarily restricted to the doctrine of critical or transcendental idealism, but

---

likewise have a phenomenological-intuitive moment. This means minimally that the other is both given and constituted. Any adequate account of intersubjectivity has to do justice to both aspects of the problem. At the most general level this is the problem of the relation of thought to existence. However, the methodological commitment of Fichte to the transcendental idealism he inherits and takes over from Kant privileges the subject, and this privileging of the subject contradicts Fichte’s own phenomenology and prevents him from developing an adequate account of the other. His idealism thus remains subjective. To accept this criticism of Fichte as a valid one, means that one at the same time sees the impossibility of transcendental idealism as an account of the other, and the necessity of a move to a philosophy of spirit constituted by reciprocal recognition, and to an objective idealism or holism: the view developed by Schelling and Hegel.

II. FICHTE ON THE OTHER

Johann Gottlieb Fichte was among the first to identify the other as a philosophical problem. In his early Vocation of the Scholar, Fichte writes:

There are a few questions which philosophy must answer before it can become Wissenschaft and Wissenschaftslehre …. Among these questions are the following: … How does the human being come to assume and recognize that there are rational beings similar to it outside of it, since such beings are not at all immediately or directly given to or present in its pure self-consciousness? … The relation of rational beings to each other I term Gesellschaft. But the concept of Gesellschaft is not possible except on the presupposition that there actually exist rational beings outside of us …. How do we come to such a presupposition …?9

---

8. Johann Gottlieb Fichte (May 19, 1762–January 29, 1814; born in Rammenau, Germany; died in Berlin) was educated in the theological faculty at the University of Jena (1780), transferred to the faculty of law at Leipzig in 1781, before becoming a private tutor (1784–90). He began the study of Kant, whose primacy of practical reason produced a revolution in Fichte’s own thought. In 1791, Fichte produced his Critique of all Revelation, which Kant recommended for publication, and which, owing to a publisher error, was taken as Kant’s own philosophy of religion. When Fichte was revealed as its author, his academic career took off. He held appointments at the University of Jena (1794–99), the University of Erlangen (1805) and the University of Berlin (1810–14), and was a private scholar in Berlin (1799–1804).

9. Johann Gottlieb Fichte, Über die Bestimmung des Gelehrten (1794), in Fichtes Werke VI, I. H. Fichte (ed.) (Berlin: de Gruyter, 1971), 302; published in English as Some Lectures Concerning the Vocation of the Scholar, in Fichte: Early Philosophical Writings, Daniel Breazeale (ed. and
The last question is important because it brings into focus the problem of the other and its significance for philosophy. The other is a condition of the Wissenschaftslehre; yet the other is to be interpreted and explicated within and by means of the Wissenschaftslehre.

We begin with a paradox: Idealism asserts the primacy of the subject, and the corollary primacy of freedom. The rule is: no subject, no object. For the object is transcendently constituted by the subject. Fichte says “All being, whether of the ego or the non-ego, is a determinate modification of consciousness; and without consciousness there is no being.” But Fichte also makes a claim that appears to contradict this axiom of idealism: it is impossible, he says, to begin with freedom, because the self depends on the recognition of the other for the consciousness of its freedom.

Fichte writes: “The question was, how may the subject find itself as an object?” This question has a history. It reflects Kant’s delineation of the problems of self-knowledge (paralogisms) and of the self-consciousness of freedom. According to the first Critique, freedom – the capacity for self-originated causality – is possible. But Kant leaves open the question whether there actually is such freedom. As the condition of possible objects of experience, the transcendental subject cannot be itself an object of experience, and thus cannot be an object of knowledge. According to Kant, neither the transcendental subject nor freedom can be known, because to know means to objectify, and what is objectified is conditioned and subject to phenomenal necessity. Kant affirms the possibility of freedom, but only for practical purposes. Thus the free self must assume, but cannot know that it is free. In the second Critique, Kant asserts that the consciousness of freedom is mediated by the moral law. The moral law is the ratio cognoscendi of freedom, and freedom is the ratio essendi of the moral law.

Fichte proposes an alternative explanation to the problem of knowing that one is free. According to Fichte, the self cannot give itself the consciousness of freedom; rather, freedom is intersubjectively mediated. The first and third propositions of the Grundlage des Naturrecht run thus:

§1 A finite rational being cannot posit itself without ascribing to itself a free causality ....

10. Johann Gottlieb Fichte, Grundlage des Naturrechts nach Principien der Wissenschaftslehre (1796), in FW III, 2; hereafter cited as GNR; published in English as Foundations of Natural Right, Michael Baur (trans.) (Cambridge: Cambridge University Press, 2000), 4; hereafter cited as FNR.
11. GNR 33; FNR 32.
§3 The finite rational being cannot ascribe to itself a free causality in the world of the senses, without ascribing freedom also to others, and therefore without assuming other finite rational beings besides itself.\textsuperscript{12}

The other makes the subject available to itself in an original way by summoning (\textit{Auffordern}) the subject to freedom. The summons to responsibility is not something that the self can give to itself; instead, the summons of the other makes the self available to itself as a totality, and this bestowal makes possible the self’s discovery of its own freedom. Thus Fichte writes: “How and in what sense is the subject determined to free causality, in order to find itself as an object? Simply insofar as it finds itself summoned to action, as someone who is capable of acting freely, and who could equally fail to act.”\textsuperscript{13}

The summons (\textit{Aufforderung}) requires the irreducible independence of the other. The other who summons one to freedom and responsibility cannot be originally constituted by the subject because the summons of the other precedes and founds the subject’s consciousness of freedom. Since the other summons and obligates the subject’s freedom, the other must precede, occasion, and grant the subject its consciousness of freedom. The fact of being summoned constitutes a phenomenological proof of the existence of the other: “If such a summons to action actually occurs, a rational being besides and outside of the self must be assumed as its cause, and so it is absolutely necessary to posit a rational being outside the subject.”\textsuperscript{14}

Further, this other must be an intelligent rational being, for only such a being can summon me to responsible free action. The influence of the other is not a causal one, but an influence compatible with freedom and intelligence, namely a summons or invitation. The summons is an action directed toward and respectful of the rational free agent as an end in itself. Fichte maintains that “The summons to free self-activity is usually called education.”\textsuperscript{15} As a corollary Fichte insists that “the human being (and so all finite beings generally) becomes human only among others. Self and other stand in a relation of potential reciprocity.” This relation he calls recognition: “The relation of free beings to each other is therefore a relation of reciprocity through intelligence and freedom. Neither can recognize the other, if both do not reciprocally recognize each other, and neither can treat the other as a free being if both do not reciprocally treat each other with respect.”\textsuperscript{16}

Volume 1
Ludwig Siep, sensing an incompatibility between Fichte’s treatment of recognition in his *Grundlage des Naturrecht* and his transcendental program in the *Wissenschaftslehre*, explains it by distinguishing two levels: the level of transcendental explanation and the level of ordinary consciousness. Recognition is not a *Begriff* or category, but an action of consciousness (*Bewussteinshandlung*), and so must be susceptible of transcendental explanation. But what would transcendental explanation of recognition and the other look like? Addressing this issue, Fichte takes up the question of the other and not only explores issues that anticipate Husserl, but maintains views that, with one exception, are strikingly similar.

### III. HUSserl: THE LIFE-WORLD AS THEME AND PRESUPPOSITION OF TRANSCENDENTAL REFLECTION

Husserl carried out a lifelong struggle against the reduction of all meaning to facts, that is, positivism. From his early writings to his late *Crisis of European Sciences*, Husserl sought to show that positivism decapitates reason and suppresses the fundamental problems of reason. Positivistic science identifies the life-world as a collection of facts, and downgrades the human life-world – freedom, embodiment, others, and values – to something merely subjective. Reality is acknowledged only as a mathematical construct. Husserl sought to expose the displacement and downgrading of the life-world in favor of “pure facts” and “pure theory.” Such moves are reductive and truncate both philosophy and the sense of reality. This impoverished reality sense is the crisis of European culture.

The way out of the crisis is to correct the scientific inversion and displacement of the life-world. The first phase of Husserl’s critique of science is to show that it presupposes and is grounded in the life-world. Science is but a garb of ideas that we construct for the life-world. The life-world thus becomes a major topic in Husserl’s later phenomenology, a topic not without ambiguity.

As is well known, Husserl’s elaboration of his program is marked by tensions between his transcendental method of explication, which focuses on subjective meaning-bestowal, and the ontological sense of the primordial life-world to which he calls attention in his critique of science. The life-world is presupposed by theoretical science as the subsoil of ordinary meaning and intersubjective

---

*18. Husserl’s philosophy is discussed in detail in the essay by Thomas Nenon in *The History of Continental Philosophy: Volume 3*. 

138

Volume 1
communication. Husserl writes: “The life-world is the world that is constantly pregiven, valid constantly and in advance as existing, but not valid because of some purpose of investigation, according to some universal end. Every end presupposes it, even the universal end of knowing it in scientific truth presupposes it, and in advance.”

Husserl maintains that the life-world is a realm of immediate evidences that we neither construct nor constitute. All theoretical inquiry presupposes this original environment and immediate evidence in the sense that, if ordinary life-world interhuman communication were invalid or merely subject-relative, then science itself would be invalidated. If phenomenology were to displace the life-world or declare it invalid, then phenomenology would have nothing to describe except its own machinations, and thus would become formal and empty.

Yet Husserl also insists that phenomenological method is transcendental, and that the life-world itself is transcendentally constituted. Transcendental phenomenology is to be a science of the life-world, and not to be confused with the mundane natural science of empirical psychology. Explication within the phenomenological epoché, is always explication of sense, not metaphysical-causal explanation. This explication of sense consists in a reversal of ordinary life-world consciousness – which intends and focuses on objects. As Husserl indicates, “By virtue of our present method of epoché, everything objective is transformed into something subjective.” Instead of explaining the world by causal analysis as in natural science, phenomenology inquires into the world as phenomenon, and seeks to uncover its primordial sense by examining the meaning-bestowing acts through which that sense is constituted.

The point is not to secure objectivity but to understand it. One must finally achieve the insight that no objective science, no matter how exact, explains or ever can explain anything in a serious sense. To deduce is not to explain. To predict, or recognize objective forms … – all this explains nothing but is in need of explanation. The only true way to explain is to make transcendentally understandable.

On the one hand, the life-world is the pretheoretical foundation of all scientific and philosophical praxis. On the other hand, the explication of the life-world is provided by transcendental phenomenology. But does transcendental phenomenology ground the life-world or presuppose it? If transcendental

---

phenomenology presupposes the life-world, why is it not dragged into the subjective-relative sphere with everything else? Would not that make “pure theory” an illusion? How can Husserl contend (as he does) that the life-world is transcendently constituted? In order to deal with this issue, Husserl speaks of a special sort of constitutive activity, namely, passive genesis. The life-world is not actively constituted; it is not a deliberate artificial construct. Its sense is pregiven. All that transcendental phenomenological reflection can do is uncover the pregiven sense the world already has.22

Some critics claim that Husserl’s transcendental method, while successful as a critique of natural science, is shipwrecked on his equal insistence on the irreducible priority of the life-world. According to transcendental idealism, the transcendental subject takes priority over the sense(s) it constitutes. Its relation to sense is asymmetrical. But according to ordinary consciousness, relations of self and world, self and other are inherently two-sided and reciprocal. Can these be reconciled? Husserl’s answer to this difficulty is to affirm both sides of a paradox: human subjectivity is both transcendental, that is, a subject intending the world, and an object in the world (self- and other-constituted).23 Husserl refuses to choose finally one side or the other. Both are necessary.24

Husserl struggles to make good his affirmation of both sides of the paradox in his account of intersubjectivity in the fifth Cartesian Meditation. Affirming the paradox generates two opposing requirements: (i) all sense is constituted by the transcendental ego as part of its self-explication, and (ii) the other must be constituted as other. In ordinary life-world experience, one person is just as “real” as another; each is self-presencing and presenting and not reducible to a representation. Neither takes absolute priority over the other. However, the reflective turn of transcendental phenomenology commits Husserl to a first-person account; in phenomenological reflection only one is the “primordial I,” and all the rest are “others.” This implies a fundamental asymmetry between the primordial I and the other. The other as constituted is not self-presenting or self-manifesting. The excess of sense attaching to the experience of the other must have its roots in “my” primordial experience.

Husserl accounts for intersubjectivity through the concepts of pairing and appresentation, that is, an analogical transfer of sense. Husserl denies that appresentation is an inference or an argument from analogy. It is something

24. One price of this paradox is that the human ego and transcendental ego are called ego by equivocation. Husserl himself does not always observe this sharp distinction. He blurs it in a reference to Fichte: “Can the ego which posits itself, of which Fichte speaks, be anything other than Fichte’s own?” (Crisis, 202).
like a mediate apprehension, an apprehension of the other mediated by his body. Husserl never succeeded in clarifying this mediate apprehension or its status. Interpreters such as Paul Ricoeur tend to interpret the apperception of the other as a kind of analogy, or analogical argument. But this is incorrect, for Husserl denies that apperception is an argument from analogy.\(^\text{25}\)

Consider the following text, which shows how the two requirements of Husserl’s phenomenology, the descriptive-realistic, and the constitution-idealistic, come together.

Let us assume that another man enters our perceptual field. Under the primordial reduction this means that in the perceptual field of my primordial nature there appears a body \([Körper]\) which, so far as primordial, can only be a determinate modification of myself (an immanent transcendence). Since in this nature and in this world my own body \([Leib]\) is the only body \([Körper]\) that is or can be constituted originally as an organism \([Leib]\) (a functioning organ), that other body \([Körper]\) over there – which, however is also given as an organism \([Leib]\) – must have derived this meaning through an apperceptive transfer from my body-organism \([Leib]\) and in a way that excludes a truly direct and primordial justification (that is, by perception in the strict sense of the term) of the predicates belonging to that organism \([Leiblichkeit]\) in its specificity. From this point on, it is clear that only a resemblance established with my primordial sphere that connects the other body \([Körper]\) with my body can provide the foundation and the motive for conceiving that body “by analogy” as another organism \([Leib]\).\(^\text{26}\)

In this passage, we can see apperception as a kind of analogy at work in experience. The body of the other is \textit{like} mine, an organism; it is not a mere machine or \textit{Körper}. Note that the passage both sets up an analogy, and that the analogical transfer of sense runs asymmetrically from my own to the alien. On the one hand, the other must somehow already be present prior to the construction of the analogy as the condition of its construction, for if the other were not

\(^{25}\) Paul Ricoeur tends to treat apperception as an argument from analogy (see \textit{Husserl: An Analysis of his Phenomenology}, Edward Ballard and Lester Embree [trans.] [Evanston, IL: Northwestern University Press, 1967], 126–7). He acknowledges that it becomes transformed into something more, to wit, a transfer into another life in imagination and in sympathy (\textit{ibid.}, 129). However, Husserl flatly denies that apperception is an argument from analogy or inference; see \textit{Cartesian Meditations}, 111.

already given in passive genesis, we could not even construct the analogy. On the other hand, the other’s presence is a contradictory one whose meaning seems exhausted in its exclusion of itself from primordial presence. Ricoeur comments on the above passage:

Right up to the end the descriptive spirit and the requirement of constitution tend to meet but fail to blend into each other, for according to the idealistic requirement of constitution, the other must be a modification of my ego, and according to the realistic character of description the other never ceases to exclude himself from the sphere of my monad.27

We will discover a similar problem of the nonmerger of the two requirements in Fichte.

The problem in Husserl’s account is that only one ego, the primordial ego, is presented. All others are appresented, and this appears to mean a derivative mode of presence. This asymmetry creates difficulties. As Ricoeur observes, all other analogies proceed from object to object in the same sphere of experience, but here in the pairing of alter ego with primordial ego, the transfer of sense is asymmetrical, that is, it is always from the own to the “alien.”28 Assuming that this one-way transfer of sense succeeds, is the other still other? On the other hand, if it does not succeed, then does the other not amount to a failed cognition?

There is a further problem arising from the asymmetry between primordial ego and alter ego: all communal reciprocity must be constructed upon this asymmetry.29 This is the well-known weakness of Husserl’s phenomenological sociology. The primordial asymmetry appears to undermine the reciprocity that is insisted on by ordinary consciousness. Ricoeur claims that “one must renounce the asymmetry of the relationship me-other required by [Husserl’s] monadic idealism” in order to account for the reciprocity and equalization required by empirical and sociological realism.30 These problems in Husserl’s execution of his project in Cartesian Meditations may succeed only in demonstrating that, so conceived, the project is impossible.31

27. Ibid., 130, emphasis added.
29. Ibid., 131.
30. Ibid., 136.
31. Fortunately the Cartesian Meditations is not Husserl’s only attempt, and probably his least successful attempt, to present an account of intersubjectivity. In his posthumously published studies on intersubjectivity, Husserl’s approach is through an analysis of empathy, Einfühlung, Mitgefühl. See Gerd Brand, Welt, Ich und Zeit (The Hague: Martinus Nijhoff, 1955).
IV. THE STANDPOINTS OF LIFE AND OF REFLECTION IN FICHTE’s
INTRODUCTIONS TO WISSENSCHAFTSLEHRE

Husserl’s paradox of subjectivity frames a similar issue and problem in Fichte. There is a phenomenological dimension in the systematic program of German idealism. Implicit in Kant, phenomenology becomes explicit in Fichte, and yet more explicit in the title of Hegel’s first book, the Phenomenology of Spirit. In his second introduction to the Wissenschaftslehre in 1797, Fichte distinguishes between the standpoint of life and the standpoint of the philosopher. This distinction corresponds roughly to the Husserlian distinction between Lebenswelt and the standpoint of transcendental philosophical reflection. Fichte articulates the distinction thus:

In the Wissenschaftslehre there are two very distinct series of spiritual action: that of the ego which the philosopher observes, and that of the observations of the philosopher. In opposing philosophies … there is only one line of thinking, namely that of the philosopher, and the content of his thought is not itself understood to be thinking and reflective, but rather as mere Stoff.32

There are two standpoints: the natural consciousness and the philosophical consciousness reflecting on and interpreting the former. Ordinary consciousness is described and explained by the philosopher, and the philosophical consciousness depends on and is rooted in the experience of ordinary consciousness. The claim that there are two series, each necessary and irreducible, is precisely the claim of Fichte’s transcendental idealism. As Fichte puts it, “The type of realism that presses itself upon all of us – including the most resolute idealist – when it comes to acting, i.e., the assumption that objects exist outside of and quite independently of us, is contained within idealism itself, and is explained and derived within idealism.”33

This distinction between the standpoint of transcendental idealism and the standpoint of ordinary consciousness allegedly “contained” within the former, raises the question of the relation between thought and being, between philosophical reflection and experience in the broadest sense. How does thought, that is, reflection, go beyond itself? This question becomes especially urgent in a transcendental program that focuses not on objects in the world but on the

32. Fichte, Zweite Einleitung, in FW I, 454.
33. J. G. Fichte, Second Introduction to Wissenschaftslehre, Daniel Breazeale (trans.), in Introductions to Wissenschaftslehre and Other Writings Daniel Breazeale (ed. and trans.) (Indianapolis, IN: Hackett, 1994), 38 n. Hereafter cited as IWL followed by the page number.
conditions of possibility of experience. Assuming that this program is successful, does it yield anything more than an empty formalism? This issue becomes even more acute in regard to the problem of the other: is the transcendental, is “I-hood [Ichheit],” inherently solipsistic? Husserl’s nightmare was that phenomenology may vanquish garden-variety Cartesian solipsism, only to discover that solipsism emerges again at the transcendental level.

In the Second Introduction, Fichte characterizes the two standpoints as apparently opposite and contradictory: in an important note, he writes: “It is only in his own name [i.e. from the standpoint of philosophy] that the philosopher asserts that ‘everything that exists for the I exists by means of the I.’”34 It is difficult to imagine a stronger or more ambiguous statement of idealism: what does “exists by means of the I” mean? Is it a metaphysical claim that the subject creates being? That all being is relative to the subject? An epistemological claim, to wit that we can know only what we can make? A transcendental claim that invokes the I as the condition of possibility of experience? All of the above? Whatever it may mean, it is clear that the philosophical standpoint inverts the claim of ordinary consciousness. Fichte explains:

The I that is explained within his philosophy however, asserts that “just as truly as I exist and live at all, there also exists something outside of me, something that does not owe its existence to me.” Basing his account on the first principle of his philosophy, the philosopher explains how the I comes to make such an assertion. The philosopher occupies the standpoint of pure speculation, whereas the I itself occupies the standpoint of life …35

Fichte sharpens Husserl’s paradox into an explicit opposition. How can these opposing claims – “everything for the I exists through the I” and “there exists something or someone outside of and independent of me” – be reconciled?

If the two standpoints are mutually contradictory, they cannot coexist side by side, but rather appear to cancel each other out. Yet Fichte insists that “[t]he standpoint of life is comprehensible only from the standpoint of speculation.”36 According to Fichte, the apparent realism of ordinary consciousness “has some basis, since it forces itself upon us as a consequence of our own nature, but this is not a basis that is known and understandable [from within the standpoint of life].”37 Experience, in short, is not transparent or intelligible by itself.

34. Ibid.
35. Ibid.
36. Ibid.
37. Ibid.
Like the dwellers in Plato’s cave, ordinary consciousness does not understand itself; philosophy is necessary to comprehend it, and for this comprehension philosophy must go beyond experience. It apparently leaves the cave. But if the philosophical comprehension of experience means to negate or invert it, then the philosophical standpoint would seem to be charging ordinary consciousness with error.\textsuperscript{38} Philosophy then would not explain experience, so much as correct or displace it.

If this were what Fichte meant to suggest, his speculative or transcendental philosophy would be just one more theoretical science that downgrades the life-world as merely subjective, and finds it to be the “primordial error.” Fichte and Husserl would thus part company.

However, this is not what Fichte means. In a cryptic remark, Fichte informs us that “The standpoint of speculation exists only in order to make the standpoint of life and science comprehensible. Idealism can never be a way of thinking; instead it is nothing more than speculation.”\textsuperscript{39} This suggests that philosophical speculation does not displace the life-world, but is somehow relative to and dependent on it. The philosopher, \textit{qua} human being, inhabits the life-world and lives in the natural attitude. The philosophical standpoint is not a life-world standpoint, but a deliberately and artificially sustained one. Moreover, as an abstraction, it does not really leave the cave. Fichte maintains \textit{both} that ordinary consciousness requires and needs philosophy for its comprehension, \textit{and} that philosophy presupposes and depends in some sense on the life-world. The task of philosophy is phenomenological: “Therefore it describes the entire way which the former [viz., ordinary consciousness] has taken, but in reverse order. And the \textit{philosophical reflection, which can merely follow its subject, but prescribe to it no law, necessarily takes the same direction.”\textsuperscript{40} Here Fichte sounds a note astonishingly like Husserl’s declaration that phenomenological explication does

\begin{verse}

\textsuperscript{39} IWL 38 n.

\textsuperscript{40} Fichte, \textit{Wissenschaftslehre}, in FW I, 223; published in English as \textit{Science of Knowledge}, Peter Heath and John Lachs (ed. and trans.) (Cambridge: Cambridge University Press, 1982), 199. Cf.: “phenomenological explication does nothing but explicate the sense this world has for us all, prior to any philosophizing, and obviously gets solely from our experience – a sense which philosophy can uncover but never alter” (Husserl, \textit{Cartesian Meditations}, 151). Cf.: “We shall see that in natural reflection, as opposed to the artificial reflection of transcendental philosophy, we are able, in virtue of its laws, to go back only so far as the understanding, and then always encounter in this something given to reflection… but we do not become conscious of the manner in which it arrived there. Hence our firm conviction of the reality of things outside us, and this without any contribution on our part, since we are unaware of the power that produces them.” (Fichte, \textit{Wissenschaftslehre}, in FW I, 234; \textit{Science of Knowledge}, 208).
\end{verse}
nothing but explicate the sense this world has for us all, prior to any philosophizing: a sense that philosophy can uncover but never alter. Philosophical reflection is a reconstruction in thought of the meaning of experience. It cannot displace the latter. Both standpoints are necessary.

But how can this be? This question cannot be answered from Fichte’s introductions to the Wissenschaftslehre. Instead we must turn to the Wissenschaftslehre novo methodo of 1796/99. These lectures are a new – but by no means final – statement of Fichte’s Wissenschaftslehre. This work aims at a new, more complete and systematic presentation that incorporates Fichte’s account of the Aufforderung in the 1795 Grundlage des Naturrechts and 1796 System der Sittenlehre.

V. WISSENSCHAFTSLEHRE 1796/99: FOUNDATIONS OF TRANSCENDENTAL PHILOSOPHY

Fichte offers a programmatic clarification of the relation between ordinary consciousness and transcendental philosophy. He tells us that “by itself transcendental philosophy creates nothing … it has no desire to become a way of thinking that could be employed within life; instead it observes an [actual] I which embodies within life this system of thinking described by transcendental philosophy.”41 The sharp delineation of the transcendental standpoint from the standpoint of ordinary consciousness creates several problems: how is the philosopher as a human being within the ordinary standpoint, able to raise himself to the transcendental standpoint? This is the question concerning the motivation for going beyond ordinary consciousness, that is, the possibility of philosophy itself. Second, the sharp delineation suggests that the two standpoints “are diametrically opposed to each other.”42 But this is not the case; Fichte expressly declares “these two viewpoints must not be absolutely opposed to each other … but must be united.”43 This is a stronger claim than he previously made, which was simply that both standpoints are necessary and not incompatible. Now they must be united.

How can this be? Fichte claims that even though they may appear contradictory owing to the inversion of one by the other, the two have different objects and thus their words have a different sense. The idealist philosopher observes the way in which reason becomes determinate, individuated in an actual rational being. But:

42. FTP 472.
43. Ibid., 473.
the situation is different for the observed individual than it is for the philosopher. The individual is confronted with things, human beings, etc., that are independent of him. But the idealist says, “There are no things outside of me and present independently of me.” Though the two say opposite things, they do not contradict each other …. When the idealist says “outside of me,” he means “outside of reason”; when the individual says the same thing, he means “outside of my person.” This implies a revision of the earlier formulation, that everything for the I exists by means of the I. The earlier formulation undercuts not only the Kantian doctrine of the thing in itself, but also the thesis of ordinary consciousness concerning the world and others. Fichte’s reformulation of the transcendental viewpoint is that there is nothing outside of reason. This is compatible with the ordinary consciousness thesis that there are persons. The claim that there are others outside of me qua person, does not mean that these others are outside of reason. What are the implications of this revision for our issue?

This revision reflects both Fichte’s thesis of the primacy of the practical, and his discussion of the Aufforderung, or summons. Fichte maintains that the practical standpoint:

enables one to see why and to what extent the ordinary view is true and why one has to assume that a world exists. Speculations do not disturb the idealist … and do not cause him to commit errors …. One has not yet achieved a clear understanding, has not yet obtained the true philosophical view of things … so long as one continues to think and expect that daily life is something altogether different from life as it is characterized from the speculative standpoint.

On the contrary, Fichte assures us, “the results of experience and speculation are always in harmony.” This is a statement of Fichte’s faith; it is a promissory note. To determine whether Fichte’s assurance and confidence on this point is

44. Ibid., 105–6.
45. Fichte’s strategy here is not unlike Kant’s in the third antinomy: the apparent contradiction can be removed by distinguishing different senses of the language and corresponding different senses of the object. The question, however, is what the spatial term “outside” means, and whether it is even appropriate in transcendental philosophy.
46. FTP 106.
47. Ibid.
justified, we must press on to a consideration of his views in more detail. I shall focus on an ambiguity in his account of the Aufforderung and freedom.

VI. FICHTE’S ACCOUNT OF THE AUFFORDERUNG OR SUMMONS

The status and location of the Aufforderung in Fichte’s Wissenschaftslehre is one of the most vexing questions. In his introduction to the English translation of Grundlage des Naturrechts, Frederick Neuhouser notes that Fichte identifies the relation of right as a necessary condition of self-consciousness, only to run into the problem that membership in a community based on right is not only a contingent decision, but one that might be decided negatively. In short, community might be optional. This creates the problem how an arbitrary, optional, and contingent membership in a certain type of community could be a necessary condition of self-consciousness. Fichte subsequently revises his position: since right is grounded in recognition, and since recognition in turn presupposes the Aufforderung, it is the Aufforderung, not right, that is a necessary condition of self-consciousness.48 While the concept of right is supposed to belong to Fichte’s Realphilosophie, of which the Naturrecht is part, the concept of Aufforderung seems to belong to the transcendental conditions of Realphilosophie (right).

Before turning to our examination of Fichte’s discussion of the Aufforderung in Wissenschaftslehre novo methodo, let us first recall Fichte’s phenomenological descriptions of ordinary consciousness and the experience of being summoned to freedom.

Recall first of all his discussion of the face of the other in his Lectures Concerning the Vocation of the Scholar. Fichte’s “face” anticipates certain features of Levinas’s discussion in Totality and Infinity.49 The difference is that Levinas asserts the ethical primacy of the other, while Fichte seems to maintain that self and other exist in reciprocity. But both agree that the face has broad ethically obligating significance. The face summons me to responsible freedom. Second, consider Fichte’s candid raising of the issue of intersubjectivity in his Grundlage des Naturrechts, which he characterizes as “a vexing question for philosophy which, as far as I know, it has not yet anywhere resolved.”50 He elaborates:

how do I know which particular object is a rational being? How do I know whether the protection afforded by ... universal legislation

48. FNR, xviii–xix.
50. FNR, 75.
befits only the white European, or perhaps also the black Negro; only the adult human being or perhaps also the child? And how do I know whether it might not even befit the loyal house-pet? As long as this question is not answered, that principle [of right] has no applicability or reality.\footnote{Ibid.}

Fichte observes that this question does not await some technical philosophical resolution, but is already decided by ordinary consciousness: “Surely there is no human being who, upon first seeing another human being” would not expect an:

immediate reciprocal communication. This is the case not through habituation and learning, but through nature and reason … However, one should not think – and only a few have to be reminded of this – that the human being must first go through the long and difficult process of reasoning we have just carried out, in order to understand that a certain body outside him belongs to a being that is his equal. Such recognition … either is achieved instantaneously without one being aware of the reasons for it … or [it] does not occur at all.\footnote{Ibid., 75–6. I have altered the word order in the last sentence.}

Philosophy does not produce the \textit{Aufforderung} or create intersubjectivity. But it is supposed to make sense of it, comprehend it and its necessity genetically. The central problem is: How does consciousness transcend itself? “One can summarize the entire task of the \textit{Wissenschaftslehre} in this single question: How does the I manage to go outside of itself?”\footnote{FTP 388.} The \textit{Aufforderung} by other seems to propose a solution to this question – but only from the perspective of ordinary consciousness.

The \textit{Wissenschaftslehre novo methodo} continues the distinction between the two series, the ideal and the real, first distinguished in \textit{Aenesidemus} and in the Introductions to the \textit{Wissenschaftslehre}. While Fichte assures us that both are compatible and both are necessary, in \textit{novo methodo} he gives much less attention to ordinary consciousness than to the transcendental side. Again, the two series are contrasted: the transcendental-speculative according to which nothing is outside of \textit{reason}; and ordinary consciousness according to which others are transcendent to and independent of me as \textit{person}. The \textit{Aufforderung} is on the boundary between the two. This makes it both important and next to impossible to determine whether in a given passage Fichte is considering the transcendental
or the empirical-phenomenal aspect of the issue. He makes a sharp distinction and yet has to transgress it repeatedly.

So here is a rough statement of how the two standpoints appear to be opposed, the inverse of each other, in spite of Fichte’s assurances that they are compatible and can merge. In the experiential-empirical aspect of the summons, the other – the summoner – takes priority over the one summoned. The summons, in Fichte’s description, “appears to come from a rational being outside ourselves.”

That is, the summons immediately implies the existence of the summoner as its condition. The summons to self-activity grants a certain relative priority to the other person. The other summons poses a question, and I find myself questioned, that is, summoned to act freely. Fichte describes the summons “from below” as follows:

> As the ground of the summons that occurs within me, I necessarily think of a free acting that actually occurs outside of me. This, which is a determining subject and also determinable, is an actual free being outside of me. This determining subject is necessarily free, since what is discovered in this case is supposed to be an instance of acting, which can be explained only with reference to a free intellect. Ordinary human understanding immediately makes just this inference. It says, “I am questioned; therefore a questioner must exist.” Furthermore, it is entirely justified in saying this.

For ordinary consciousness, the summons implies the existence of the summoner. Fichte asserts that ordinary consciousness is entirely justified in this inference.

However, the transcendental standpoint inverts the ordinary consciousness standpoint. From the transcendental standpoint, “all external influence is completely eliminated, for otherwise we would be dogmatists.” Here freedom has priority. “The I is what acts upon itself, and by virtue of this self-directed activity, it is a willing subject.” Acting upon itself means that the I is self-reverting activity. What the ordinary consciousness takes as a summons by the other must from the transcendental viewpoint be regarded as self-determination, the I acting upon itself, that is, as auto-affection. Fichte seems to be thinking of the categorical imperative here: in the categorical imperative, the I summons itself.

54. FTP 74.
55. Ibid., 454, emphasis added.
56. Ibid., 339.
57. The empirical will first arises from the pure will, and the pure will is the categorical imperative; ibid., 293.
58. Ibid., 74, 422.
Further, from the transcendental point of view, freedom is described negatively as not being determined. Fichte refers to Kant: "Kant said (and so do we) that freedom, negatively defined, is the power to be the first rather than the second member of a series. It can be positively described as the power to make an absolute beginning."\(^{59}\) Pure freedom is radically indeterminate. It is the power to determine itself out of this radical indeterminacy; as radically indeterminate, it has the power to be first. As radically indeterminate, freedom is the power to make an absolute beginning and determine itself. As transcendental, freedom is asymmetrically related to what it constitutes. Transcendental analysis inverts the relation between self and other present in the summons qua *phomenon*. Transcendently the subject (will) is prior, not the other.

This inversion of ordinary consciousness constitutes an antinomy. According to ordinary consciousness, the consciousness of freedom originates through the summons of the other. Freedom is experienced as being summoned by another to act. The summons means that my freedom cannot possibly be first, or absolutely self-originating. Individual freedom of persons presupposes not only others, but community. However, transcendently viewed, freedom is the power to be first, to make an absolute beginning; freedom is radical autarchy. Nothing can be prior to freedom. But if freedom is absolutely self-originating, how could it possibly be compatible with, much less need or require an *Aufforderung*, a summons by another to act? If nothing can be prior to self-originating freedom, how could such freedom need, require or exist in community? For community would have to precede my freedom as its condition, and that seems impossible because it would contradict freedom’s original indeterminacy.

*Both sides of this antinomy are necessary.* For ordinary consciousness, we are conscious of our freedom as not self-creating or as not the *causa sui*; we discover our freedom to be mediated by others – we are questioned, summoned to act. In this request, question, or solicitation, we discover our freedom to respond or not. The other who summons us renders us determinate; the other appears primary, and our freedom is not an unmotivated absolute self-generation, but a response to a request, a solicitation, a summons. In short, “The summons would contain within itself the *real ground* of a free decision … i.e., it would be the determining agency that intervenes between what is determinable and what is determinate …. *Something is posited in the summons which is not posited in mere determinability,*”\(^{60}\) to wit, the other as real ground of the summons.

On the other hand, *transcendental analysis* focuses on the equally crucial point that the response to the other has to be our own, has to be self-generated, even if we refuse the summons. Unless our response to the summons were self-

\(^{59}\) Ibid., 423.

\(^{60}\) Ibid., 356, emphasis added.
generated, it would be heteronomous, or an automatic response to an external stimulus. But the summons is not a merely external stimulus; rather, it is a condition in which we are called to be self-generating and self-active in a moral sense. Transcendently the summons appears to be like the categorical imperative. Autonomous self-determination requires both that we impose categorical imperatives on ourselves, and that we must ourselves be the real ground of our moral activity. Thus the summons is a situation in which we must be both passive and active: “Here we encounter ‘determinate determinability,’ freedom in combination with a passive state of being affected.”

How does Fichte propose to resolve this apparent antinomy? Like Husserl, Fichte affirms both sides of it. For example, in *Naturrecht* he claims that freedom has a divided ground, partly “external” to the subject in the summons – the “real ground” – and partly “internal” to the subject, that is, the “ideal ground.”

This division of real and ideal grounds implies an intersubjective mediation of freedom. What we might expect Fichte to do is to take up the problem of how the ideal ground and real ground of freedom can be correlated and reciprocally conditioning. That was Schelling’s approach, in which Schelling flirted with the doctrine of pre-established harmony as a way of grounding and explaining the correlation. This is a questionable metaphysical solution that probably undermines the very freedom it attempts to explain. It also obscures Fichte’s discovery that autonomy is not absolute, but mediated.

Another alternative would be to show that these grounds, although divided, are not finally self-sufficient, but are reciprocally mediating and codetermining. That effort would be consistent with Fichte’s observation that “reciprocal interaction is the category of categories.” And it could make good on Fichte’s claim that persons may be “outside” each other without being “outside of reason.” What might emerge would be an account of the interhuman or “between,” that

---

62. FNR 39; GNR 41. This means that freedom or autonomy is a mediated one. Mediated autonomy means that freedom has a divided ground, partly in the subject and partly in the other: “The ground of the action of the subject lies immediately in the being outside of it, and in the subject itself …. Had that other being not acted and summoned the subject to activity, the subject would not have acted. Its action as such is conditioned by the action of that being outside of him” (GNR §4, 41; FNR 39–40).

63. F. W. J. Schelling, *System des transzendentalen Idealismus* (Hamburg: Felix Meiner, 1962); published in English as *System of Transcendental Idealism* (1800), Peter Heath (trans.) (Charlottesville, VA: University of Virginia Press, 1978), 155–75. Schelling identifies the issue quite clearly: “how … by pure negation, can anything positive be posited in such a way that I am obliged to intuit what is not my activity … as the activity of an intelligence outside me. The answer is … to will at all, I must will something determinate … but this is inconceivable unless already with my individuality … limiting points have been set to my free activity … by actions of intelligences outside of myself” (*ibid.*, 166–7).

64. FTP 421.
is, a mutual recognition where each party jointly and reciprocally plays the role of mediator to the other, and the role of extreme. The result could be a “syllogism of recognition” in which ideal and real grounds can neither be identified nor separated; that is, they must be dialectically related and reciprocally mediating. This is the path that Hegel takes.

But Fichte does not, as far as I can see, pursue this path in the novo methodo. He raises the issue of correlation between ideal and real grounds, only to reject the very idea of correlation because it implies an inadequate conception of the unity of the I. The Aufforderung implies that something is posited in the I that is not posited in mere determinability. This implies some agency that intervenes in the I and serves as the mediator, the “awakener” of the ideal ground in the I. The apparently external basis of the Aufforderung and its contingency implies that the unity of the I is pieced together. Fichte believes that while such a view has “a certain amount of truth,” it is inadequate because it introduces an unacceptable contingency into the unity of the I. Instead, Fichte believes that the I must be grasped as the unity of synthesis and analysis. Unity is not a given; rather, it must be achieved. This means that “separation occurs in and through the unification, and unification occurs through the separation.”

The latter statement is a promising beginning because it connects union and separation, necessity and contingency, as necessary conditions and moments. But Fichte does not show how or why separation occurs, that is, a one becomes a many, and how the many resolve into the one. Nor does he take up the problem of the unity of necessity and contingency, union and separation, within the I. Instead, he demands unity and focuses on the unity of analysis and synthesis. As we will see, the term for this unity of synthesis and analysis is the will, that is, practical reason. To anticipate, Fichte maintains the primacy of the will over the apparent “externality” of the Aufforderung, and demotes Aufforderung to the status of a phenomenon. The Aufforderung is reduced to being the sensible

65. Ibid., 364–5.
66. Ibid., 368.
67. Ibid., 365. The text presents difficulties noted by Breazeale. The K manuscript reads that the unification of the I is “first divided without being able to be united.” The H version has “it is first divided for the possibility of a union.” Ives Radrizzani conjectures that in K “ohne” is a mistranscription for “um,” hence, K should read, “first divided in order to be able to be united.” At issue is how serious the negation is. If negation means simply that division is the possibility of union, and union the possibility of division, the two are made symmetrical. But this leaves out the crucial idea of synthesis being the overcoming of a resistance that surely is Fichte’s central emphasis in the primacy of the practical. So the “first divided without being able to be united” conveys precisely the idea of a resistance that must be overcome. To suppress this difference collapses the Ursprungliche Duplicitaet of Ichheit into sheer identity.
68. Ibid., 365.
manifestation of the categorical imperative. Thus Fichte obscures his own important discovery of the Aufforderung, namely, that autonomy is mediated and achieved in union with other. The unity of the I, which is supposed to be a unity of self and other, of synthesis and analysis, turns out to be a subjective unity.

Fichte acknowledges a problem at this crucial step of his argument:

Haven’t we … gone astray? We have analyzed the concept of a summons, but we arrived at a second concept…. We have discovered that what comes first is not the concept of the summons, but rather an act of willing. There is no moment at which consciousness first arises; consciousness is an act of willing.69

How is it possible to affirm both Fichte’s idealist concept of the will/categorical imperative and his intersubjective concept of the summons? Who summons whom? Does another subject summon me? Or do I summon myself? Ordinary consciousness moves from the summons to the existence of the summoner, and Fichte maintains that the inferential process of ordinary consciousness is entirely justified. Yet from the transcendental standpoint the move is from willing oneself as a moral agent to the summons.70 This implies that from the transcendental standpoint, the other who summons the I to activity is displaced; the real ground of freedom collapses into the ideal, short-circuiting mediation. The I summons itself.71 As we will see, Fichte himself says this.

VII. BEYOND FORMALISM: FROM INDETERMINATE DETERMINABILITY TO DETERMINATE SELF-INDIVIDUATION

Fichte asserts that the spirit of our philosophy is this: (there is) nothing outside of me, no alleged thing in itself can be the object of my consciousness. The only object for me is I myself.72 Consequently, for reason, there is no limitation by others; all limitation is self-limitation, otherwise we have dogmatism,

---

69. Ibid., 369.
70. Fichte refers to some version of the categorical imperative, which he does not hesitate to interpret theoretically.
71. It should be noted that on the very next page he contradicts the above contention that the will, not the summons comes first, when he writes that “consciousness begins with consciousness of a summons” (FTP 370). I do not know whether this means that Fichte is careless, inconsistent, or simply that the text of the lecture manuscript is corrupt. Perhaps this inconsistency is a result of his distraction by the Atheismusstreit.
72. FTP 332.
heteronomy. The original limitation of the will, or practical reason, is expressed by the categorical imperative, which sets for the will a moral task. This means that the limitation from which consciousness arises is not inflicted on me; it is one which I have assigned to myself.\textsuperscript{73} According to Fichte, the categorical imperative or self-summons is only a first step in self-limitation; the self-summons remains abstract, indeterminate, even formal; it is not yet actual because it lacks determinacy and a determinate goal.

The moral task I assign myself requires individuation. In other words, practical self-determination involves a move from what is indeterminately determinable to what is determinate.\textsuperscript{74} In this move from the determinable to the determinate Fichte situates a quasi-transcendental argument for intersubjectivity, that is, a mass of rational beings. Transcendental intersubjectivity is a condition of individuation:

I cannot discover myself apart from similar beings outside of me … for I am an individual. It makes no sense to say “I am an individual” unless others are thought of as well. Accordingly my experience begins with a realm of rational beings to which I myself belong; and everything else follows from this.\textsuperscript{75}

The practical imperative of moral self-consciousness originates with an act of self-selection from a mass of rational beings. Fichte apparently interprets Kant’s \textit{Faktum der Vernunft} as providing access not only to freedom, but to a mass of rational beings as the condition of free self-limitation and individuation. The practical imperative implies that reason is self-individuating. But reason cannot be understood solipsistically or reduced to a merely first-person egological standpoint as in Husserl. According to Fichte: “individual reason cannot account for itself on the basis of itself alone. This is the most important result of our inquiry. No individual rational being can subsist for itself. It subsists only in the whole, by means of the whole, and as a portion of the whole.”\textsuperscript{76} The mass of rational beings clarifies Fichte’s assertion that there is nothing outside of reason. Reason cannot be individual in a solipsistic sense; rather, reason is indeterminate rational mass, a potential for communalization and individuation. Fichte claims that a mass of rational beings precedes and conditions my free self-limitation in the categorical imperative; it is the mass of rational beings from which I select myself. This mass of rational beings is the transcendental

\begin{itemize}
\item \textsuperscript{73} Ibid., 342.
\item \textsuperscript{74} Ibid., 351.
\item \textsuperscript{75} Ibid., 304, emphasis added.
\item \textsuperscript{76} Ibid., 352.
\end{itemize}
condition of possibility both of my self-selection and of rational/moral individuation required but not supplied by the categorical imperative.

Individuation implies and presupposes other rational beings from which I select and individuate myself. Rational self-individuation implies others who are not me and from which I select myself. Reason is or signifies a primordial mass of rational beings from which both self and other simultaneously distinguish themselves from each other and thus both individuate and communalize themselves. This is a transcendental argument from indeterminate determinability to self-individuation and communalization.

It is worth noting that Fichte’s transcendental argument for self-limitation reverses the direction of sense-transfer later established in Husserl’s analysis of pairing between ego and alter ego. As we have seen, Husserl’s account is first-person: there is only one primordial ego; all others are appresented. Thus the transfer of sense is from the primordial first-person ego to the alter ego, from the own to the alien. But Fichte, in spite of his talk about I-hood (Ichheit), is not committed to a first-person account of the transcendental. He is committed only to an account of the rational will before which both empirical I and other are equivalent and reciprocal. Thus for Fichte, to say “I am an individual,” makes no sense unless others are thought of as well. In other words, to say “mine” as Husserl does in the reduction to ownness makes no sense unless saying “yours” also makes sense. For Fichte, “mine” and “yours” are determinate, reciprocal concepts, and the mass or community of rational beings is a condition of such determinacy, reciprocity, and individuation. That is a stronger claim, and I would submit a more defensible claim than Husserl is able to make. But it requires abandoning the first-person transcendental subject.

Note, however, that this claim that individuation begins with a selection from a mass of rational beings seems not only to resolve the intersubjective problem, but to suppress it. For if reason is already some sort of transcendental intersubjectivity/community-mass, it is difficult to see how the other could arise as or be a problem — precisely because individuation is already determined as self-selection vis-à-vis other from this community-mass. Fichte endorses this suppression when he remarks that “the sensible world is only a certain aspect or way of looking at what is intelligible.” For Fichte, individual and community are reciprocal concepts. If that is the case, there would be no problem of the alter

---

77. The term Fichte uses is “mass of rational beings,” but that is cumbersome and far from clear; rational beings do not usually hang around in masses. On the other hand, Fichte is not yet speaking of an actual human community. So my compromise term, “community-mass,” is not simply a mass and not a community. It is that from which the I selects itself and individuates itself.

78. FTP 350.
ego in Husserl’s sense. The *Aufforderung* in which I am summoned by another would be somehow grounded in transcendental intersubjectivity and reciprocity.

Nevertheless, it is not clear that Fichte’s significant differences from Husserl here make any difference in the final analysis. For Fichte’s claim that reason is a mass of rational beings does not mean that the mass or community of rational beings (ends) is present. Rather, it is noumenal, that is, it is thought of or inferred. Fichte writes:

> I do not perceive the reason and free will of others outside of me; this is something I only infer from appearances in the sensible world. Consequently these other rational beings belong not within the sensible world, but rather within the intelligible one, the world of noumena.\(^{79}\)

Fichte contends that:

> rational beings are merely thought of. By means of thinking, I project them into the manifold of appearances in order to explain these appearances to myself … I think of them in order to introduce unity into appearances and into my overall experience. Reason, freedom and rational beings: these therefore belong within the intelligible world, among the noumena.\(^{80}\)

With his admission that the community of rational beings is not experienced or intuited but rather inferred and/or projected, Fichte contradicts his earlier claim that there is a community of rational beings conditioning self-individuation. The inference from the sensible presence of another’s body to another noumenal presence seems questionable, and if questionable, then the possibility of solipsism emerges, this time on the transcendental level. How can community serve as the experienced condition of rational self-individuation if it is merely an inference or projection of the rational subject? Of course Fichte might reply that such rational community may be a practically necessary assumption, like Kant’s postulates of practical reason.\(^{81}\)

---

81. Fichte writes: “I select myself from a mass of reason and freedom outside of me; thus it would appear as if this freedom outside of me were merely something thought of by me. This is not the case … It is indeed true that a rational being outside us is only a noumenon, something thought of by us. Yet this is something I must infer only from the phenomena” (FTP 448). But what justifies this transphenomenal inference? The claim that it is the body of the other that justifies this inference does not really help, because that seems to end in the fallacy of
postulates, the status of the content of the postulate remains unclear. In respect to its form a postulate is relative to a subject, and has no being beyond or independent of the postulating subjectivity. But the ontological status of the content of the postulate/projection – the community of rational beings – remains unclear. Yet this is the point on which everything turns. Fichte’s language of projection/postulation and the relativity of the postulate to the postulating subject, the requirement of an inference – all this reinstates limits of cognition similar to those on which Husserl’s account also shipwrecks. If the other has to be inferred or postulated, this seems to deny the subject has any experience of that independent mass of rational beings from which it selects itself. Without the condition of indeterminate determinability provided by a mass of rational beings from which I must select myself, there could be no individuation.

To be sure, Fichte wants to argue that the self-individuation of reason in practical activity and the Aufforderung to freedom are not only compatible, but merge. He strives valiantly to bring off this merger. According to Fichte, “The world of experience is erected upon the intelligible world. Both worlds – the intelligible thought world and the world of experience (discovered) – occur simultaneously; neither can exist without the other. These two worlds are reciprocally related to each other within the mind.” This means that individuation is a two-step process, even if the two steps must be simultaneous instead of sequential. He maintains that individuation through the categorical imperative is only a first step toward individuation. That is, although I oblige myself to become a moral individual, my self-imposed categorical imperative remains indeterminate. The transcendental analysis of moral individuation as indeterminate points to the necessity of a complementary Aufforderung for its determinacy and actualization in the sensible world. The determinate goal of free activity is supposed to be supplied by the Aufforderung. In the summons I discover myself as a subject that ought to act. The summons to free activity renders the “ought” [of the categorical imperative] determinate and thus sensible. The summons also renders freedom determinate by supplying a determinate goal:

What is given me through the summons is a series of elements through which some goal is conditioned, and I am supposed to complete the series .... The other person initiates this series and

---

four terms, to wit, that the other is related to his body as I am related to mine, as Max Scheler pointed out; see Nature and Forms of Sympathy, Peter Heath (trans.) (London: Routledge & Kegan Paul, 1970), 240–41.

82. FTP 305.
83. Ibid., 450.
proceeds to a certain point, and this is the point where I have to begin
… he summons me only to carry it to its conclusion.84

The summons qualifies my determinability; it includes “the perception of myself
as determined to act upon and in reciprocal interaction with other rational
beings …. Here we encounter ‘determinate determinability,’ i.e., *freedom in
combination with a passive state of being affected.*”85 Thus the summons qualifies
and completes the categorical imperative. The summons provides a determinate
goal, which it is my responsibility, not to *originate* absolutely, but to *continue* or
*complete.*

Thus Fichte tries to show that freedom, while practically and morally self-
originating, is also self-limiting, and that transcendental self-limitation coin-
cides with the summons (i.e. limitation) by other. The summons connects
the ordinary consciousness standpoint with the transcendental standpoint by
connecting the body of a being outside of me with the concept of a rational
being. I infer, Fichte says, “the existence of a rational being outside of me from
my own freely produced limitation, i.e., from the task of limiting myself.”86
However he fails to show how the inferred or postulated existence of rational
being outside of me is experienced as a *condition* of the task of determinate self-
limitation and individuation. If such rational being/community is experienced
as present, a postulate or an inference would be superfluous. But if such being/
community must be inferred, inference seems inadequate to establish its pres-
ence, and rather presupposes it.

VIII. TOWARDS AN EVALUATION

Fichte contends that consciousness resembles a circle of conditions in which
what is determinable within the ideal series and what is determinable within the
real series must mesh and be determined by each other.87 What is determinable
in the ideal series is the realm of rational beings from which I select myself as
an individual; what is determinable in the real series is the world within which I
express myself as an individual.88 The sensible realm is thus founded on the intel-
ligible, and Fichte strives to show that the two merge. Fichte tries to show that
moral self-limitation and limitation by the *Aufforderung* of the other coincide.

Freedom in combination with a passive state of being affected is the decisive point and meaning of the *Aufforderung*.

But do self-limitation and limitation by other coincide? This is the very point at issue. The critical question is the place of the summons by other in this circle. Does the unity of *Ichheit* include the real ground of the summons, such that there is nothing outside of reason? That is the transcendental requirement. If so, then the real ground of determinate determinability would be included in the ideal ground, that is, reason. But then Fichte's position appears to become one-sided: the other who summons me to responsible action would be displaced, for all rational limitation is self-limitation. So the I as rational will summons itself; the unity of I-hood (*Ichheit*) apparently excludes any other (external to reason) who summons.

On the other hand, as Fichte also points out, the real ground of the summons is *not* included in the ideal ground, that is, in I-hood (*Ichheit*). The real ground of the summons “is not posited in mere determinability.” Consequently the summoner must in some sense be “outside” *Ichheit* and thus “outside of reason.” The summoning other must be external, and the unity of *Ichheit* as an indeterminate determinable become determinate, would appear to be “pieced together,” that is, a synthesis or a “We.”

Fichte remains faithful to the transcendental requirement of autonomy: there is nothing outside of reason. This means that the sensible is founded on the intelligible or the noumenal. What is first is not the summons but willing. However, as rational will, the I summons itself. Fichte's transcendental account of the summons appears to displace the summons – and summoner – by reducing them to “phenomena” of the will. Fichte writes: “This summons to freedom is only the sensibilized form of the summons to act upon and interact with other rational beings. *Summoned by myself* to engage in acting, I find myself within a determinate sphere.” Here Fichte alters the form and meaning of the summons from “summons by other” to “summons by oneself.” Not only is the other displaced, but Fichte states that I “attach” the determining subject to the summons.

Günter Zöller has observed that a realist interpretation of the solicitation or summons is implausible: “Yet the solicitation is not really an appeal issued from outside the individual but is the individual’s ‘clandestine’ representation to itself of its own finite being under the form of the solicitation.”† Zöller’s reading of

---

90. FTP 452 n.G, emphasis added. On the other hand, Fichte contradicts this: “this task of limiting oneself is a summons to engage in a free activity (for it does not appear to come from the individual; instead it appears to come from a rational being outside of us)” (*ibid.*, 74).
the summons seems correct. The other who summons me is a phenomenon; however transcendentally-practically considered, I summon myself.

If the other who summons me turns out not to be other, or to be myself as other, this would mean that Fichte fails to establish a correlation of the transcendental with the empirical, of philosophy and life-world. Instead he reduces the other to, or displaces the other by, the will. The Aufforderung by other is a phenomenal expression of the self-summons in categorical imperative. If this is correct, then Fichte fails to demonstrate his claimed harmony of the philosophical standpoint with ordinary consciousness. Contrary to Fichte’s express declaration, ordinary consciousness would not be justified in its view that the other summons me; rather that view would be in error.

If so, then Fichte would have failed to achieve his systematic project in the novo methodo. The claimed harmony of the ideal and real series masks an asymmetrical subordination of real to ideal. That subordination may accord with the primacy of the practical and the requirement of a certain sort of autonomy. But such autonomy seems to exclude community rather than found it. Even if there were a noumenal community, it would still be asymmetrically related to the empirical community that it founds. This asymmetry implies that Fichte fails to make good on his claims that reciprocity is the category of categories and that autonomy is mediated. Rather, reciprocity is founded on and asymmetrically related to an original unity. The unity of this original duplicity trumps, or rather defines, synthesis. The other, who by summoning me, codetermines my determinability, is ultimately subordinate to or perhaps even excluded by the requirement of strict autonomy, to wit, that all limitation must be self-limitation. Precisely because the unity of the Ichheit trumps synthesis, the other remains a postulate, the I does not become a We, and the unity of the I, although universal, remains subjective.

MAJOR WORKS

I. CHILDHOOD AND YOUTH

Friedrich Wilhelm Joseph Schelling’s philosophical trajectory was launched already in his earliest childhood. For Schelling was very much a philosopher “by nature,” emerging as fully formed as Mozart. By the age of nineteen he was writing with the same authority that he commanded until his death in 1854, at the age of seventy-nine.

After his birth in Leonberg (close to Stuttgart), Schelling’s father, a Lutheran pastor and noted Orientalist, took a position in the tiny cloister-community of Bebenhausen, amid the thickly forested hills north of Tübingen. As a schoolboy Schelling learned Greek, Latin, Hebrew, and Arabic, to which he eventually added French, English, Spanish, Italian, and even some Sanskrit. This heavily

1. Friedrich Wilhelm Joseph Schelling (January 27, 1775–August 20, 1854; born in Leonberg, Germany; died in Ragaz, Switzerland) was educated at the theological seminary at the University of Tübingen (1790–95), receiving his doctorate in 1795; and went on to postgraduate study in natural science, mathematics, and medicine at the University of Leipzig (1795–98). His influences included the Upanishads, the Bible, Lao Tsu, Sophocles, Socrates, Plato, Aristotle, Plotinus, Kabbalah Writings, Aquinas, Dante, Eckhart, Michelangelo, Raphael, Boehme, Luther, Bruno, Spinoza, Baader, Bengel, Georg Creuzer, Fichte, Goethe, Hamann, Hegel, Hölderlin, Jacobi, Kant, Kiemeyer, Leibniz, Lessing, Novalis, Oetinger, Schiller, Arthur Wilhelm Schlegel, Friedrich Schlegel, Swedenborg, and Vico (by way of Herder). He held appointments at the University of Jena (1798–1803), University of Würzburg (1803–1806), Erlangen University (1820–27), and the University of Munich (1827–41), and was Member of the Bayerische Akademie der Wissenschaften and Director of the Kunst Akademie in Munich (1806–20), and Privy Counsellor and member of the Preussische Akademie der Wissenschaft in Berlin (1841–45).
philological formation ultimately contributed to one of his major philosophical innovations, the distinction he made in his later years between negative philosophy, on the one hand, which has its source in pure reason, and positive philosophy, which draws its insights from art, literature, and the religious scriptures of all ages and traditions. In addition to a linguistic sensitivity for how the written and spoken word transcends its conceptual content, the young Schelling gained from his father an appreciation for Protestant mystics such as Bengel and Oetinger. Their mixture of theosophy and alchemy blended devotion to nature with the general Pietism of the age, yielding a “nature mysticism” that seems appropriate to the bucolic setting in which he found himself. If years later he accorded natural language apriority to the concept, he even more emphatically accorded nature apriority to language: thus his contention, for instance, that the “Book of Nature” is the deepest source of positive philosophy.

While his relevance today is assured in part by the way his idea of the nonconceptual or “positive” moment in history continues to survive in Heidegger’s Ereignis (“event of appropriation”), Habermas’s Lebenswelt (“life-world”), Deleuze’s “transcendental empiricism,” and Žižek’s “indivisible remainder,” more recent interpretations of Schelling’s thought view his importance primarily in the light of the current ecological crisis. Schelling’s capacity continuously to resurface (even after continuously being declared “dead”), and to do so in astonishingly diverse ways, reflects the kind of genius that, as Kant pointed out, gives rise to inspiration rather than imitation. The fact that he left behind no established school has oft en made him seem unimportant. To others, it serves to confirm the authenticity of a thinking that always has to be thought anew. Heidegger regarded Schelling as “more profound” than Hegel, but presumably

2. Johann Albrecht Bengel (1687–1752) was considered to be the most important eighteenth-century Württemberg Pietist, known above all for his eschatological millennialism.

3. Friedrich Christoph Oetinger (1702–82) was a disciple of Bengel who, in contrast to his teacher, criticized allegorical readings of Scripture as drawing attention away from the reality of spiritualized bodies.

6. See Judith Norman and Alistair Welchman, “Introduction: The New Schelling,” in The New Schelling, Judith Norman and Alistair Welchman (eds) (London: Continuum, 2004), 1. The image of a Schelling who is always able to assume a new form also pervades another anthology that has a similar title: Schelling Now, Jason Wirth (ed.) (Bloomington, IN: Indiana University Press, 2004). Taken together, these two volumes provide enormous resources for anyone who wants to understand the relevance of Schelling for contemporary continental philosophy.
not more “important.” Eric Voegelin went even further, effectively according him a rank equalled or surpassed only by Plato, Aristotle, and Aquinas.8

When, at the age of fifteen, Schelling enrolled in the theological seminary of the University of Tübingen, he had already acquired an intense but highly unconventional religiosity that emphasized the possibility of inward spiritual transformation and encouraged a skeptical attitude toward the institutionalized structures of church and state. According to legend, he was assigned a dormitory room in the Tübingen Stift together with Hegel and Hölderlin, both of whom were several years older than Schelling but quickly came under the spell he cast. The three students developed an unorthodox reading of Kant that minimized the critical limitation of reason and emphasized instead the revolutionary potential of transcendental reflection: insofar as reason can look away from the objects of experience in order to investigate itself, it remains free of the strictures that constitute objectivity within the web of experience. Convinced that Kant, rightly read, would prove the catalyst for a transformation of spirit fully as radical as the political revolution then unfolding in France, they were in the best possible position to greet the arrival on the scene of Fichte in 1793. But whereas Fichte envisioned spiritual revolution primarily in terms of Kant’s moral philosophy (with its rejection of Eros), Hegel, Hölderlin, and Schelling were prepared to announce the orgasmic return of the repressed. Instead of celebrating reason’s capacity to free us from nature (as if nature were simply the sum total of the objects of experience), they regarded reason as the revelation of a luminosity immanent within nature.

It is Schelling who seized on this idea with the greatest degree of depth and clarity, carrying it to the point of an exuberant pantheism that remained characteristic for him throughout his long career, so much so that it has to be understood not as the result of influences received but as the basis for why he was open to those influences in the first place. With regard to Kant, for instance, Schelling quickly moved from the first to the third Critique, passing over the Puritanical interlude of a moral philosophy that castigates our most natural inclinations. As for his reading of the ancients, Schelling’s pantheistic predisposition led to his early commentary on Plato’s Timaeus.9 Composed while he was still a student

---

in Tübingen (and published first in 1994), the commentary was animated not only by an appreciation for the beauty of the cosmos but by the intuition that Plato's real innovation was not the doctrine of creation, but the conviction that a dark and inchoate and nonetheless inexorably self-forming matter constitutes the hidden condition for nature as a whole. To speak of nature is always to speak of that which precedes creation, whether human or divine. This dynamic materialism has to be understood as Schelling's most original and lasting impulse; it was by no means the passing whim that Hegel's later caricature made it seem to be (the idea that Schelling was the gifted but undisciplined “Proteus” of philosophy). Here Heidegger's judgment has its place: “seldom has a thinker fought so passionately, from the beginning, for his one sole position.”

In addition to Plato, Kant, and Fichte, the fourth philosopher who contributed to the discussions in the Tübingen Stift was Spinoza. Given his reputation for atheism (in the context of the lively Pantheism Controversy ignited by Jacobi\(^ {11} \)), Spinoza exerted an obvious fascination for young theology students. As is well known, for Hegel he came to represent the possibility of taking rationalism to the point of a metaphysical monism anchored in a strong conception of the philosophical absolute. For Schelling, on the other hand, the lure of Spinoza had more to do with the latter's metaphysical materialism. His Spinoza was a metaphysical materialist who saw in nature not simply the abstract form of unity, but a whole complex reality of modes and affeets that would spring to life for anyone capable of transcending the idea of substance.\(^ {12} \) Such a Spinoza could be viewed as a kind of latter-day Socrates who challenged conventional ways of thinking, denying orthodoxy with the confidence of one who has his own vision of the divine. And indeed, as young students in the Tübingen Stift, Schelling, Hegel, and Hölderlin were in full agreement that philosophical thinking demanded the boldest possible denial of orthodoxy, together with the capacity to envision the approaching “Kingdom of God.”

What distinguished the three young thinkers from Fichte was a decisively this-worldly emphasis that embraced nature as fully as history. In terms of concrete philosophical insights, they criticized Fichte for not realizing that his

---

*11. For a discussion of the Pantheism Controversy, see the essay by Richard Fincham, in this volume.

narrow identification of the absolute with subjectivity rendered it unattainable. To attain the absolute would mean the utter disappearance of the world – *and thereby the disappearance of subjectivity as well*. This amounts not only to the realization that consciousness and subjectivity are unthinkable apart from a relationship to an object, but also to the deeper insight that the underlying identity of subject and object therefore has to be unconscious. For Schelling, the tendency to identify this unconscious source with nature provided him with a thought that sustained a career lasting almost sixty years.

**II. THE EARLIEST PUBLICATIONS**

By the time he was twenty, Schelling had published short essays that attracted the attention of Fichte, most notably *On the I as Principle of Philosophy* (1795). Fichte was so appreciative of the essay that two years later he helped secure its author a professorship at the University of Jena, where the two philosophers entered into a brief but active collaboration. Because of this connection, it is hardly surprising that Schelling’s earliest phase is usually described as a purely Fichtean form of subjective idealism. What this overlooks is the degree to which Schelling insisted that the “I,” precisely when it is invoked as the “principle of philosophy,” has to be understood on the basis of its transreflective origin: a move that entails a rapprochement between Fichte and Spinoza, together with the positive recognition that, regardless of how the freedom versus determinism debate fares within the empirical order, the absolute can be understood only as the free and unconditioned ground of nature and spirit alike. Schelling views this ground, the meeting place of nature and spirit, as necessarily *unconscious*.¹³ What freedom means in this context, he does not fully explain.

This explanation is the task of another early work that Fichte did not so actively embrace: *Philosophical Letters on Dogmatism and Criticism*, also from 1795. Often understood as an attempt to synthesize the philosophies of Spinoza and Fichte, the *Philosophical Letters* is in fact an attempt to use a single insight to gain distance from both of these thinkers. Schelling argues in the essay that a one-sided idealism and a one-sided realism lead to the same consequence: mystical surrender of the self into an absolute beyond all consciousness (whether this is construed as pure ego or as thing-in-itself). With regard to the issue of the nature of reality as such, he agreed with Fichte that the idealist’s faith in freedom and the realist’s attachment to nature both generate equally viable metaphysical

---

167
Volume 1
systems. In other words, the question of the truth of reality is left without a theoretical resolution. Again like Fichte, Schelling understood this to mean that we must philosophize out of the practical standpoint. But whereas for Fichte this simply meant acting “as if” freedom were the ultimate reality, for Schelling the antinomy could not so easily be set aside. Instead of representing simply two theoretical alternatives, idealism and realism actively clash, constituting thereby the founding condition of life. Tragic drama comprehends this more effectively than philosophy (with its distaste for contradiction) ever can. Oedipus is free and determined at the same time: this is the source of his tragic end. Philosophical speculation arises as a necessary response to the human dilemma, compelling us into a search for a logically coherent system that we can never finally command. The real goal of speculation should therefore be the return to life itself, a return that the young Schelling regards as simultaneously a return to nature. The Fichtean ideal of a kingdom of spirit that will one day contain or even eradicate nature represents a failure to understand the necessarily finite nature of freedom, a Schellingian theme most recently resurrected by Jean-Luc Nancy. What it means is that, while human beings can indeed prove themselves free by operating on the basis of Fichte’s “as if,” they should not delude themselves with dreams of a realized kingdom of ends that fully embodies such freedom, for nature always wins in the end.

Championed (most persuasively by Manfred Frank) as the philosopher of radical freedom, a kind of early-nineteenth-century predecessor of Sartre, Schelling’s real endeavor was somewhat different: to understand freedom in its finitude – and this means in its relationship to nature. This is what separated him first from Fichte and later from Hegel. If Hegel has come to represent that empire of reason (and of political power) that promises to contain and ultimately to abolish tragedy (just as Fichte dreamed of containing and ultimately abolishing nature), then Schelling anticipates Heidegger as the prophetic voice that warns of tragedy’s renewal. Where necessity rises above freedom is where nature shows its life. At the same time, it is where freedom reveals itself in its

fragility as a specifically human freedom, more the ever-recurring struggle to be free than the final accomplishment of freedom.

III. NATURPHILOSOPHIE (ONE)

Called by Fichte to Jena, Schelling quickly completed two major works that were well out of Fichte's range: Ideas for a Philosophy of Nature (1797) and the still untranslated Von der Weltseele (On the world soul; 1798). These contributions to a philosophy of nature won him the admiration of Goethe in nearby Weimar and membership in the Romantic School that had gathered at Goethe's feet: Novalis, Schiller, the brothers Wilhelm and August Schlegel (the latter then married to Schelling's future wife Caroline), Schleiermacher, and Tieck. The same young man who had been placed in such close proximity to Hegel and Hölderlin had now been thrust into the inner circle of Germany's most luminary minds. He taught shoulder to shoulder with Fichte and was in constant dialogue with the Romantics. When Fichte was dismissed from the university on the charge of atheism, the young Schelling assumed the mantle of German philosophy. His response was characteristic, and in its imprudence seemed utterly oblivious to the dangers of tragic hubris: in 1799, he penned and published a poem, the Epikurische Glaubensbekenntnis Heinz Widerporstens (Heinz Widerporstens's Epicurean confession of faith), which contains a frontal attack on conventional Christianity while advocating in its stead a pantheistic religiosity that finds God “in stone and moss, in flowers, metals and all things.” Even Goethe expressed shock, but also his lasting respect, inviting the twenty-four-year-old Schelling to join him and Schiller in ushering in the New Year of a new century.

To explain why such a man might find the idea of tragedy compelling, two observations can be made. First, by grounding freedom in a transreflective absolute, Schelling anticipated the idea that Heidegger later calls “thrownness.” Instead of identifying freedom with autonomous self-determination, he understood it as a self-determination that arises from an unconscious origin. Before it can ever make anything of itself, the self first has to arrive on the scene. Life is suffered before it is lived. With this intuition, Schelling encountered the idea of fate or destiny. This leads to a second observation: Schelling's own life offered confirmation for his philosophical insight. To find himself acclaimed at such an

19. The lyric poet Novalis (1772–1801), whose real name was Friedrich von Hardenburg, and the playwright Johann Ludwig Tieck (1773–1853), were two of the most significant representatives of German early Romanticism. While Novalis tended toward mysticism, Tieck was more worldly and helped introduce Shakespeare to German literary circles. [*] Schiller and Wilhelm Schlegel are discussed in this volume; Schleiermacher is discussed in an essay by Eric Sean Nelson in The History of Continental Philosophy: Volume 2.
early age the philosophical genius of an emerging new epoch was above all else to have found himself. The idea of genius implies giftedness, what Kant famously called the “Gunst” (or favor) of nature, rather than autonomously willed productivity. When Schelling took up his Naturphilosophie (such a fixed concept that I will retain the German instead of using the English “philosophy of nature”), he was not simply expanding Fichte’s idealism. Instead, he was seeking to uncover the preconscious origins of the self – and to do so in a way that would account for his own profound sense of destiny. The accomplishment of tragedy is that while revealing the self-deception of one who feels himself sovereign over the world, it simultaneously reveals the groundedness in nature that is itself the real source of genius.

On the face of it, it might appear that the Naturphilosophie was Schelling’s attempt to illuminate the natural conditions of the self in order that he himself (or we ourselves) might gain greater control over them. Psychoanalysis, which has deep roots in Schelling’s philosophy, is certainly often understood in this way, as if reflection itself were the goal of life.20 But “mere reflection,” we are told, “is a spiritual sickness in mankind.”21 These words from the Introduction to the Ideas for a Philosophy of Nature constitute one of Schelling’s truly fundamental thoughts. What he was searching for was not a system of nature that could be understood by a thinker somehow hovering outside it, but an account of his own strong sense of identity with nature. The idea of the organic, borrowed in large part from Kant’s Critique of Judgment, is the idea of a natural entity that carries its form within itself. It is not the human understanding that imposes from the outside the form of plant-ness on to a plant, for the form must already be given within it if the plant is to have life. Purposiveness in the organic world is not to be explained by attributing it either to a creator-god or to the epistemological subject; instead it is purposiveness within the natural order itself, that “purposiveness without purpose” that has its highest revelation in the accomplishment of genius, a productivity that goes so far beyond what could ever be intended that it is incapable of comprehending itself. The cure for the “spiritual sickness” of reflection is the realization that philosophical knowledge is carried by a not-knowing that imbeds the philosophizing subject within the blind subjectivity of nature. As self-production it is genuine subjectivity. But it is blind subjectivity, for even when it comes to light in the human understanding it never knows

itself fully. Purposive order arises from nature and is recognized in its purposiveness by the human understanding. The same understanding that grasps the forms of nature realizes that it has not created them: order in nature is always first and foremost order in nature — and therefore has to be disclosed from nature herself. This leads to an insight fully consistent with Schelling’s understanding of tragedy:

Nature speaks to us the more intelligibly the less we think of her in a merely reflective way … So long as I myself am identical with nature, I understand what a living nature is as well as I understand my own life; I apprehend how this universal life of Nature reveals itself in manifold forms, in progressive developments, in gradual approximations to freedom. As soon, however, as I separate myself, and with me everything ideal, from Nature, nothing remains to me but a dead object, and I cease to comprehend how a life outside me can be possible.\(^{22}\)

Only the mind that has overcome its reflective division from nature realizes the full extent of its inner union — or that “Nature should be Mind made visible, Mind the invisible Nature.”\(^{23}\)

While much of the science may be dated, Schelling was able to graft a tremendously wide range of empirical observations on to his speculative metaphysics of nature. He depicted the universe as an organic whole caught between the forces of expansion and contraction (light and gravity), and then went on to show how derivative forces were also constitutive of the microcosmic order. He believed that the cosmic “breathing” that gives life to nature as a whole is concretely expressed in a series of natural polarities that range from the electric and magnetic forces animating the chemical process to the sexual polarity that underlies and sustains organic reproduction, and from the internal division between sensation and irritation within animal life to the way the atmosphere as a whole is constituted out of a tug-of-war between oxygen and carbon dioxide, itself expressive of the interdependence of plant and animal. Against the mechanical (or clockwork) conception of the universe, Schelling’s view was dynamic and anticipated important features of the post-Newtonian physics of the twentieth century (above all the understanding of matter as crystallized energy). It restored, within a more modern context, the Platonic and Aristotelian view that nature has nothing “inert” within it, but is instead the actualization of the slumbering potency of matter, a potency that ultimately is identical with

\(^{22}\) Ibid., 35–6.
\(^{23}\) Ibid., 42.
pure privation or prime matter. Against the emerging atomic theory, the early Naturphilosophie advanced the view that matter itself is an always-wavering equilibrium of opposed forces.

Despite Schelling’s objections to the strongly Newtonian bias of most nineteenth-century natural science, there are still important areas of confluence with some important new developments. Faraday’s experimental confirmation of Oersted’s electromagnetic theory is a case in point: Oersted was a student of Schelling, who was fully justified in asserting that the origins of electromagnetic theory lay in Schelling’s own 1799 First Outline of a System of the Philosophy of Nature. Similarly, new research reveals that evolutionary theory in biology is much closer to some of Schelling’s central concerns (e.g. the developmental diversification of species) than has hitherto been realized. Even so, the Naturphilosophie has to be understood first and foremost as a sustained critique of the mechanical presuppositions of modern science and of its tendency to reduce (in its passion for measurement) the physical to the mathematical. For Schelling, space and time are mathematically determinable only as a dynamic and self-generative system of number, and for precisely this reason they are not to be reduced to the fixed grid of a Cartesian coordinate system. He implicitly agreed with Leibniz’s intuition that calculus rather than geometry has to be understood as the representative mathematical system. The interplay between forces of expansion and contraction gives birth to number even as it gives birth to space and time – and to thought even as it gives birth to matter.

This dynamic conception of nature is primordial in the strictest sense and governs even the conception of God. A powerful thunderstorm is never a mere symbol of divine fury to the degree that it is internally constitutive of the divine life itself. Nature is everywhere alive, implicitly if not explicitly. If modern science operates on the assumption that life is an accidental disruption of the dead inertness that constitutes the true being of nature, Schelling assumes the opposite: the more alive something is the more real it is. Inert matter exists only to the degree that the highest form of life is not so much consciousness as divine awakening. A dead universe is the deposit of a universal organism. When it erupts with life, it is effectively completing its own unconscious version of what the philosopher experiences consciously in the act of recollection. His “evidence” for this is not empirical but intuitive, the realization that the existence of a perceptible universe presupposes an original productivity. While the typical natural scientist finds no mystery in presence as such, and is satisfied to assume that, in one form or another, the universe has “always been there,” the philosopher of nature realizes that on the deepest level presence itself has to be experienced as an utterly improbable insurrection against the void – even if this is fully natural and has

been going on forever. In the language of Spinoza, *natura naturata* (or nature as object) has to be understood as the product of the dynamic forces that together make up *natura naturans* (or nature as creative subject). Schelling assumes that the universe exists in order to express its primordial productivity by giving birth to life – something that it does over and over, and on the most disparate planets and in the most disparate times.

Two centuries earlier, Giordano Bruno had been burned at the stake for such ideas. And in his own time, Fichte’s dismissal from the University of Jena proved that the danger of persecution was still a clear and present one, with no one prepared to distinguish the pantheist from an atheist. In such an environment, Schelling persisted in a battle that had two opposing fronts. On the one hand, he opposed the emerging empirical sciences, convinced that, by restricting themselves to what is simply given to experience and ignoring the metaphysical question of origin, they adopt a solipsistic standpoint without even knowing they do so. Given that no observer can observe another’s subjective act of observing, empiricist epistemology is solipsistic and inherently nihilistic, yielding a desolate view of a universe populated by dead atoms and robotic contraptions.

The charge of solipsism (which he typically directed against the naive Kantian) could seem strange, given that Schelling’s own answer to the question of how knowledge of nature is possible is the one he learned from Leibniz: the monad has “no window” – and therefore contains all of nature *within* it. One wonders, of course, how an internally directed and absolutely nonempirical intuition (Schelling’s famous *intellectual intuition*) can serve as the basis for overcoming solipsism. How can self-knowledge serve as the basis for understanding that the things we see are truly things *outside of us*? Schelling’s answer is that what the self knows is its own *reality*, and thereby its own givenness, its own “having been produced by something other than itself.” The deepest ground of the self is transreflective, which is why he first introduced the notion of intellectual intuition, absorption in this ground, with the striking sentence: “We awaken from intellectual intuition as from a state of death.” Although he evokes the philosophy of Leibniz, he dismisses even the theoretical possibility that a monad could ever fully elevate unconscious perception into consciousness. This reveals the second front on which he did battle. As clearly as his *Naturphilosophie* was opposed to the viewpoint of the natural sciences, it was also opposed to religious orthodoxy. God cannot be understood as a separate and self-conscious entity. The intuition into the transreflective ground of the self has universal implications (holding for God as well as for man). In this respect, as important as Leibniz is for Schelling, it is Spinoza who gets the last word. Schelling reveals himself then as a most peculiar kind of idealist: always a materialist in the end.

---

25. SW I, 325.
IV. SYSTEM OF TRANSCENDENTAL IDEALISM

If this is the consequence of the Naturphilosophie, it seems somewhat difficult to reconcile with the work that followed – the System of Transcendental Idealism (1800) – which returns to the language of Kant and Fichte and appears to be forthrightly idealist in conception. The method of the work has been made familiar by Hegel's Phenomenology of Spirit (1807): the philosopher's understanding of subject–object identity is allowed to “run ahead” of and guide a narrative description of how self-conscious spirit emerges from animal sensibility. Because this emergence is presented as spirit's progressive recollection of the original act whereby the “absolute I” surrendered itself to nature, the entire treatise appears to be a fairly straightforward attempt to “deduce” reality from the principle of self-consciousness. Two things have to be remembered, however. First, while insisting that his entire project is sustained by intellectual intuition (subjectivity's ability to somehow “see itself”), Schelling has not forgotten his initial comparison of the intuition with death. The primordial “I” is precisely not the awakened “I” of self-consciousness. As a result, the assumption of a thoroughgoing identity between subject and object is just that: an assumption (or, as he calls it, a postulate). This leads to the second point: the purpose of the entire development is to reveal the necessity of concretizing intellectual intuition by showing how it first comes to life not in a subjectivity that has rendered itself fully transparent, but in a flash of recognition that accompanies a work of genius. Intellectual intuition realizes itself in an aesthetic intuition, through which a subject (the creative artist) comes to glimpse an independent subjectivity operating within the work standing before it. Against Hegel, who argues that spirit ultimately learns to see itself in the world as a whole, Schelling argues that spirit encounters itself as objectively given only in that miraculous moment when a work of art is viewed as mysteriously completing itself. The intuition can be communicated only to the degree that certain observers of art are able to view the work from the vantage point of the creative process that gave birth to it in the first place. To experience art in this way is to glimpse the absolute and to gain hope of humanity’s final reconciliation – but not in the form of a universally communicable science. If Hegel learns from Schelling, there is still an abyss that separates them.

The hermeneutic goal of the System of Transcendental Idealism is the disclosure of an unconscious productivity at work in humanity. The outline of the System reveals a consistency with the central claim of the Philosophical Letters. In the first stage of the new work, which relies heavily on Kant's first Critique, the focus is on theoretical necessity: to know the world theoretically is to know the impossibility of changing it (Oedipus’s fate is determined). This is followed by a second series of reflections that take up the contrasting position of practical
philosophy (the Kantian and Fichtean ideal of autonomy): we are reminded that nothing can really be known apart from the world we actively shape (Oedipus struggles to change his fate). This antinomy between freedom and necessity is never explicitly resolved. The substantiality of the theoretically known world depends on the indemonstrable supposition that there are things-in-themselves. The contrasting practical supposition of freedom is equally indemonstrable. It is the work of art (the free creation that experiences itself as a work of necessity) that lives out this tension. Whereas the Philosophical Letters discussed this in terms of tragic drama, Schelling now makes the claim that art in general (not logic!) is the proper organon of philosophy. Because artistic creation is an active shaping of what is simultaneously a necessary and objective endowment of nature, it involves a form of knowing that, transcending both theoretical and practical reason, alone reaches the truth. Aesthetic intuition is unveiled as the highest form of reason insofar as it allows us consciously to create forms even as they are unconsciously given to us through inspiration. Like Nietzsche in The Birth of Tragedy, Schelling looks to paintings such as Raphael’s Transfiguration of Jesus for the artistic self-representation of what this means. And like Nietzsche, he understands this in terms of the tension between the Apollonian and the Dionysian.26

The idea also serves as the basis of Schelling’s philosophy of history: humanity creates out of its hidden drives and desires, realizing thereby what human nature has always already constituted as its hidden destiny. Although similar to Kant’s idea of “social unsociability” and Hegel’s “cunning of reason,” Schelling’s version of the story places even more emphasis on unconscious productivity, and (anticipating Freud and Lacan) rejects the fantasy of a rational utopia that will one day free itself from such forces. Thus, even in the System of Transcendental Idealism, it is nature that ultimately prevails. If Schelling follows Fichte in regarding the transcendental self as the initially unconscious activity of self-production, he distinguishes himself from Fichte by identifying this activity with nothing less than the entire broad sweep of both natural and world history. The “I” that makes itself into “me,” is not the “I” that I identify with my conscious self: instead, it is nature herself, which, having made herself into me, is yet far more than I myself could ever fathom. The fundamental position has not changed at all.

Like Hegel, Schelling had the courage to seek the philosophical comprehension of the absolute. This was their common project, to understand God. But what that God is — and what his “kingdom” might be — appears profoundly different, depending on whether one views it through the lens of reason or the lens of tragic drama. This is not to suggest that Schelling simply decided to “set aside” reason. The one thinker of his age from whom he is most intent on distinguishing himself is Jacobi, the strident opponent of Spinoza who understood Kant as proving both that there is an unconditioned absolute and that, because it is inaccessible to reason, it should be approached only through faith. In opposition to Jacobi’s fideism, Schelling was convinced that reason is a powerful enough instrument to reveal its own limits. Even if one were to accept the Hegelian identification of reason and reality, reason itself will show that there is no “reason” why reality must be rational. For that matter, there is no reason (or no prior reason) for why anything at all should exist. Schelling’s commitment to rationality was sufficient for him to provide powerful and coherent arguments for why philosophy, if it is to follow reason into its final consequences, must end by embracing the tragic view. He remained committed to that view even during the brief period of his active collaboration with Hegel (1801–1803), after the latter had been summoned to Jena to serve as his assistant. Instead of designating this period as his “system of identity” (which implies a radical shift of perspective), it makes more sense to follow Schelling’s own lead in calling it too Naturphilosophie.

Hegel’s influence, such as it was, can perhaps be inferred from the fact that in 1804 Schelling completed a work entitled System of Philosophy in General and of the Philosophy of Nature in Particular. This is significant given that he so frequently commented on the impossibility of completing a system of philosophy, which is presumably why, whenever he put forward a “system,” he almost always qualified it in some way, offering a “First Outline” (1799) or nothing more satisfying than “My System” (1801). If the 1804 system appears to be the important exception to this tendency, it is noteworthy that Schelling withheld it from publication.

A look at the 1801 Presentation of My System of Philosophy provides a clue for why Schelling persisted in calling his philosophy as a whole by the name Naturphilosophie. The dominant figure of the entire system is the image of magnetic polarity, which combines opposition with unity, insofar as negative and positive poles attract rather than repel one another. A complete magnet is given, moreover, even if one or the other pole is severed from the rest of the magnet (the severed positive pole will “sprout” a negative pole at its base). In other words, the negative is contained in the positive and the positive in the
negative. Schelling sees precisely this as holding for the relationship between consciousness and nature (subject and object). No objective sphere can be conceived that does not have at least the seed of subjectivity within it (the world is simply not as emphatically alien to consciousness as thinkers in the modern era have generally assumed). In other words, objective nature is alive with the possibility of spirit. And consciousness, in turn, is always turned toward some kind of an object. The goal behind all of this is to make clear that the sum of all opposing forces constitutes a point of identity in which all opposition is reconciled, not dissimilar to the way, in the natural series of numbers, negative and positive infinity “add up” to an identity with the zero that stands between them. The relationship between negative and positive forces in nature prefigures the relationship between subject and object that grounds the consciousness of reality. In fact, the lower so consistently prefigures the higher that the full multiplicity of what exists can be understood as everywhere one and the same, now slumbering, now awake.

Hegel’s famous statement in the Preface to the Phenomenology of Spirit that the system of identity refers to a “night in which all cows are black” has to be read in light of the fact that the system he ridicules is one he initially shared with Schelling. Indeed, the very phrase he used had been coined by Schelling, in order to indicate that identity is so far from being a “black night” that it contains within it the full dynamism of nature and spirit. It represents, moreover, the final and most impressive blossoming of Neoplatonism in the history of Western thought. Within Neoplatonism, the deepest impulses of both rationalism and mysticism are brought together and reconciled. The One that contains reality within it is the Unbedingte or unconditioned. More literally translated (and in accord with Schelling’s understanding of the term), it is the “un-thinged,” the primordial No-thing that, because it yearns for existence, is yet not nothing. As the common origin, the One serves both as the ontological ground and as the basis for all of rationality. Although empirically inaccessible, it is the object of intellectual intuition, that inner “seeing” that reveals the very essence of the absolute. As No-thing (or pure unity, the One), it is simultaneously free of all objectivity, so that the object of intellectual intuition is a “non-objective” object indistinguishable from the self-developing subject that underlies and sustains both the appearance of reality and the intuitive perception of that appearance. The paradox of a subjectivity that, while pure, is yet its own “object” is a paradox rich enough to sustain a vision of dialectical self-development that provides an account for the full creative unfolding that is nature. The No-thing is always both itself and “everything.” As the infinite ground, the No-thing disappears in the appearance of finite objectivity; yet at the same time it preserves itself by gathering itself into the Beyond, from which it always emerges victorious. Even in a world where “there is no nothing,” everything is destined to die.
The figure of a no-thing that becomes something places us on the threshold of a philosophy of will (whereby will is understood metaphysically as representing the capacity of not-being to become being). More importantly, in terms of Schelling’s own development, we are at the stage when intellectual intuition is no longer presented as an act of self-abandonment so radically nonobjective that it can only be known by the trace it leaves behind in the work of art. It is now understood as an act that can both be completed and sustained, which is precisely what makes Schelling a Neoplatonist. This is not to say that he follows Plato in characterizing intellectual intuition as a direct cognizing of pure form. Instead, he joins Fichte in borrowing from Kant’s idea of the productive imagination, emphasizing less the determinacy of form than the indeterminacy of the activity that gives birth to form. Intellectual intuition is the self-apprehension of the infinite subject within the finite subject. While this emphatically requires self-abandonment on the part of the philosopher, it is a self-abandonment that provides an opening – and a consciousness – for the self-discovery of the absolute. Schelling understands that which awakens in this self-discovery either as “God” or as the “universe.” His philosophy is Naturphilosophie to the degree that he sees no difference between the two. In a formulation from 1806, he presents this intuition as the final overcoming of the Cartesianism that still infected Kant and Fichte: “The ‘I think, I am,’ has from the time of Descartes been the most fundamental error in knowledge; thinking is not my thinking, and being is not my being, for everything belongs only to God or to the universe.”27 This “God or the universe” reveals the continuing presence of Spinoza in Schelling. In terms of his philosophy, what it means is that the word “unity,” for instance, can simultaneously refer to God, the unity of reason, and to the physical force of gravity, which holds the universe together. 

Naturphilosophie is first and foremost a celebration of the divinity of the universe. It is the work of a supremely happy man, composed during the years of his marriage with Caroline (whose former husband August Schlegel remained a close friend of the family). Schelling presents nature as the throbbing heart of an Aristotelian God, who within himself (within his profoundly female inner essence) remains above the fray, assuring by his very indifference the ultimate harmonizing of a universe only temporarily bound by strife. Philosophy has completed itself in religion, attaining its sought-after knowledge only when the philosopher has been silenced into pure seeing.

It is thus appropriate that the more systematic works of this period were accompanied by a literary supplement. In 1802, a dialogue appeared under the title Bruno or On the Natural and the Divine Principle of Things. Its literary form serves as an indication that the ideal of completed rationality has somehow 

27. SW VII, 148.
been disrupted. This becomes explicit in another work of the period, which was planned as a supplemental dialogue. Published in 1804, Philosophy and Religion introduces the idea of a catastrophic fall, a shattering of identity that goes beyond the dialectical movement of the concept. Within the philosophical idea, God and nature are one. Within the world we inhabit, they have somehow been torn asunder. The Naturphilosophie forms the background for a philosophy of history that includes nature within it, and resurrects Schelling’s deepest insights into the tragic nature of being as such. Behind the cheerful Neoplatonist lurks the tormented Gnostic. If the Aristotelian God is lost in repose, then the God of this universe is something – or someone – else entirely. If nature, contained in God, is the holy and the beautiful, then that same nature, cast forth from God, is the horrific. This thought, shattering enough in itself is merely the prelude for Schelling’s most difficult and yet most characteristic thought: the barbaric principle of nature must itself be comprehended as something contained within God, as the ground of his very possibility.28

VI. THE MIDDLE PERIOD

After a brief stay at the University of Würzburg (1804–1806), Schelling became the secretary of the Academy of Art in Munich, where he stayed from 1806 to 1820. In terms of his personal life, the most important event of that period was the death of Caroline in 1809. The dark presentiment that can be read out of the 1804 essay on religion had now received its confirmation. The break with Hegel thereby became final and irresolvable. It was Schelling alone who carried the burden of realizing the fragility of the absolute, which he now regards as somehow infected by the dark and mysterious nature of the finite. The philosophy of light and understanding has given way to something both darker and more ominous. The year 1809 was not only the year of Caroline’s death, but it was also the year of Schelling’s last significant publication, the Philosophical Investigations into the Essence of Human Freedom. Human freedom, conceived as the possibility of choosing evil, has as its condition an unruly impulse within nature itself.

While Schelling is often presented as if he simply shifted his attention away from nature to the realm of freedom, nothing could be further from the truth. As has been emphasized already, his concern was not simply to think through the possibility of freedom, but to understand that freedom in its finitude – as

a specifically human freedom. Because nature is what constitutes the limit to freedom, it remains as central in this essay as in his previous Naturphilosophie, which is why he begins his discussion with the observation: “The entire new European philosophy since its beginning (with Descartes) has the common defect that nature is not available for it and that it lacks a living ground.”

This “living ground” Schelling transposes into God himself: “It is nature – in God, a being indeed inseparable, yet still distinct, from him.” What makes the ground a “living” one is its unruly character, the utter darkness of its deepest root, which Schelling later calls the Unvordenklichkeit des Seins (the unprethinkable nature of being). By placing primordial nature “in God,” he accomplished a new kind of theodicy, one that essentially “excuses God” for permitting evil, insofar as it recognizes that God has had to make the same struggle that man makes: God too suffers the “unprethinkable” of his own existence. The darkness within nature is thus a darkness within the absolute itself. Just as he had once referred to nature as the “transcendental past” of human consciousness, he now views both nature and history as constituting what in God himself must be past, but which for us is the nightmare of the present. Not only temporality, but pain and evil are internal conditions that God had to overcome in order to “become” God. They are what Schelling calls the ground of God’s existence, what God quite literally had to “work through” in order to elevate himself into existence. The language of the absolute, the self-sufficient foundation of rational metaphysics, has given way to the new and more religious language of God, whose divinity has to be disentangled from the dark inscrutability of his origin. Through spiritual clarification, the primal will slowly frees itself from its blind craving. Because he envisions the ground of this craving as primordial nature (here his materialism is central), he is able to present the process of clarification in the language of alchemy. His boyhood reading of Oetinger finally bears fruit, expanded and deepened by his new encounter with the writings of Jakob Boehme, the seventeenth-century cobbler whom Schelling regarded as proving that a philosopher can be schooled in and by nature alone.

If the essay on Human Freedom represents a philosophy of will, not the autonomous will of Kant and Fichte, but a will rooted in the blind cravings and yearnings of nature itself, Schelling’s next project was to attempt to unfold this view

30. Ibid., 27.
31. Jakob Boehme (1575–1625) was the originator of the natural mysticism that was later revived by Bengel and Oetinger. Although he had no formal education, his works had a profound impact on the philosophy of German idealism and the entire tradition of Christian theosophy.
into a comprehensive system. From 1811 until 1820 (roughly the years in which Schopenhauer was writing the *World as Will and Representation*), he worked on a long narrative description of the life of God in what he envisioned as his main work: *The Ages of the World*. The word “narrative” serves as an indication that while Schelling aims at the comprehensiveness of a system, he is not trying to build a scientific system in the manner of Hegel. Whereas Hegel says that the name philosophy (as a desire for wisdom) should give way to the name science (as the possession of wisdom), Schelling very explicitly says the opposite, insisting that the word philosophy appropriately describes a scientific endeavor that is always more of a “striving toward knowledge than knowledge itself.” The outline of his work confirms its open-endedness. Divided into “past, present, and future,” it can be read as proposing a treatment of everything that happened before the creation of the world, everything that must happen until the world passes away, and, finally, everything that will happen after the end of the world. But the mode of that treatment varies as time itself varies (the “past is known, the present recognized, but the future is never more than divined”). Given the indeterminacy of the future, it is little wonder that Schelling never completed the project, which collapsed, leaving a long series of fragments, none of which were published until after his death. It was a monumental failure that can be traced in the several thousand pages that have survived (hundreds of additional pages were destroyed in a Second World War bombing of the University of Munich library). What we have is enough to secure the conception of a God who created a world to relieve his own “inner torment.” God separated himself from nature, leaving us stranded in a godless world. While he wrote very little on the epoch of the “future” (his *Stuttgart Seminars* from 1810 and his dialogue *Clara*), we have enough to see that his hope for a future reconciliation involves not simply the possibility of our own redemption, but the redemption of nature as a whole. Schelling’s “heaven” is a world inhabited by bodies, translucent bodies, a transfiguration that has been anticipated in our greatest works of art.

All of this is not quite as speculative as it might sound. Schelling has his own dialectic, his elaborate theory of powers or “potencies” (*die Potenzenlehre*), that enables him to traverse this much territory. The movement is threefold. In the beginning, there is pure potency, as that which is nothing in particular precisely because it could be anything whatsoever. This potency he calls the “will that wills nothing,” observing from the existence of our world that it must have succumbed to self-will, the “will to be something.” This is the catastrophic fall mentioned above, the inexplicable “fact” that cannot be deduced from pure potency, but can only be inferred from the existence of the world in which we find ourselves. In

other words, existence itself is primordially an accident (Urzufall). Indeed, this is what constitutes the “inner torment” from which God frees himself. The way he does this is by elevating himself to a higher potency (just as in mathematics, one elevates a number to a higher “power”). The will that “wills nothing” is now an embodied will, stepping forth in our own world as a Buddha or a Christ. But given the necessity with which our world must try to discard the higher potency (e.g. the crucifixion of Christ), a third potency is rendered necessary, promising an age in which humanity as a whole is delivered from the ravages of self-will. While a short description of this development reads like a philosophy of history, the movement that Schelling has in mind “preceded the world” and can be expressed in purely formal terms according to the formula:34

\[
\begin{align*}
\frac{A^3}{A^2} &= (A = B) \\frac{B}{A}
\end{align*}
\]

If \( A \) is the pure potency (or will that wills nothing), then \( B \) is its contraction into self-will. On the basis of this contraction, \( A \) is able to “step forth” as \( A^2 \). This can be likened to the emergence of the incarnate God. \( A^3 \) represents the God that reveals itself as \( A^2 \) sacrifices itself. As spirit it can infuse all things. To place the entire movement in the power of \( B \) is Schelling’s way of signifying the primordial accident of existence. It also gives expression to his fundamental materialism.

There is little question but that Schelling experienced self-will as an “inner torment.” In any event, while from 1794 to 1809 he had published steadily, he now continued to write as prolifically as ever – but he kept his output hidden from the public. His silence gave testimony to the darkness that had come to engulf him. Despite his marriage, in 1812, to Pauline Gotter, who bore him three sons (including K. F. A. Schelling, the editor of his complete works), Schelling’s mood was one of profound loneliness – and grief for the loss of Caroline. The tragic fall that he had always regarded as a function of the blind necessity at the heart of being had struck him personally. He did not experience this as the end of freedom, but as a confirmation of its finite nature. Freedom shows itself not as autonomous self-determination, but as struggle.

VII. THE LATE PHILOSOPHY

Fortunately, his silence was not complete: he preserved his lectures for posterity. In 1821, he delivered an important address, “On the Nature of Philosophy as Science,” at the University of Erlangen, where he began teaching again in

34. Ibid., 84.
1823. He remained there for four years before moving back to Munich where he received an appointment from King Ludwig I in 1827. He taught at the University of Munich until 1841, when, with much fanfare, he was assigned by King Frederick William IV of Prussia to Hegel’s old Chair of Philosophy at the University of Berlin, which he retained until 1846. He continued to present occasional lectures at the Prussian Academy of Science until 1852, at which point he withdrew from public life altogether and prepared himself for death.

“On the Nature of Philosophy as Science” is a profound and innovative philosophical exercise, a suitable gateway into the last phase of Schelling’s career. Its premise is that the will to system derives from an original asystaton or disharmony. The condition is tragic: the need for system derives from a conflict between equally legitimate systems that somehow must coexist. As in the Philosophical Letters of his youth, Schelling does not seek to reconcile irreconcilable differences, but instead seeks a restoration of health, which he describes as coming free of system. Just as physical health remains oblivious to the variety of organic systems that come together to constitute the organism as a whole, so the spirit must free itself from the idolatry of ideological thought structures.

Schelling regards this liberation from system as possible, precisely because he understands spirit as itself primordially free: it is one subject that, alive in the entire history of thought, is bound to no single one of its creations. Philosophical wisdom is a real possibility, but only in the form of that knowing ignorance, which we associate with the name of Socrates. Wisdom is Gelassenheit (release-ment), literally a letting go of every conceivable ideological certainty – a surrender that must ultimately extend to the religious belief in God.

That which Dante saw written on the door of the inferno must be written in a different sense also at the entrance to philosophy: “Abandon all hope, ye who enter here.” Those who look for true philosophy must be bereft of all hope, all desire, all longing. They must not wish for anything, not know anything, must feel completely bare and impoverished.35

This is a kind of philosophical “dark night of the soul” that culminates in wisdom and health. The death of an individual’s convictions is the precondition for the ecstatic awakening, within the individual, of the absolute subject that lives through all individuals.

In the language of tragedy, Oedipus must be destroyed so that Dionysus can reveal his own freedom, which is the freedom to hide himself behind the mask of Oedipus – and the freedom to enter any other form once that mask is shattered.

Although the name “Dionysus” does not occur in the 1821 lecture, it does figure heavily in the primary project that occupied Schelling during the last twenty to thirty years of his life: the elaboration of a monumental philosophy of mythology and revelation, in which he sought proof of the emergence of divinity from darkness. By interpreting Christ as Dionysus’s entry into history, Schelling is able to bring the pagan impulses of his own youth in alignment with a Christianity freed from its own ideological biases. What is true of the variety of intellectual systems is true of the variety of religions in the world: they must be experienced as coalescing once the exclusivity of their various claims is overcome.

It is thus within history itself that Schelling found hope and overcame the melancholic tendencies of his middle period. While he made use of the Joachite idea of three ages (Father, Son, and Holy Spirit), he was careful to present the third age in the language of eschatological hope rather than Messianic certainty. In this, he differed once again from Hegel. In fact, although the possibility of philosophical (or nonsectarian) religion had become the main focus of his later years, the Schelling of this period is remembered above all for his critique of Hegel.

When he was called to Berlin, there is no doubt that (despite his nonsectarian inclinations) Schelling was chosen as a representative of traditional religion. His appointment was thus viewed as a contribution to the spirit of Restoration. This misses much, however. First, his philosophy of history is much more oriented around the future than around the past. Unlike Hegel’s, it is essentially open-ended. This can be verified, moreover, in terms of the concrete impact of his lectures. Thinkers such as Bakunin, Burckhardt, Engels, Feuerbach, Humboldt, Kierkegaard, Marx, and Ranke were unified in rejecting Schelling’s dark theologizing. At the same time, they absorbed his implicit materialism, internalized his critique of Hegel, and understood this much of his distinction between “negative philosophy” and “positive philosophy”: the future belongs not to the philosophy of the concept, but to a philosophy that opens itself to history and transformation. Instead of encouraging our obsessive focus on what we can control and predict, a vibrant philosophy must set us free. The Kantian–Fichtean myth of autonomy is the last barrier to overcome, insofar as true freedom is the ability to stand face to face with tragic necessity.

This entails the avowal that the mystery of being always retains priority over its rationality. Reaching beyond Marx and Kierkegaard, Schelling looks forward to Nietzsche and Heidegger. Anticipating the latter’s talk of the “end of metaphysics” and the possibility of “a new beginning,” Schelling brought philosophy to the brink of epochal rupture. When reaching back to Plato and Aristotle, his purpose was to renew philosophy by appropriating the foundational energy of a lost, but retrievable origin.
The last period of his career was controversial in his own time (was it reactionary or revolutionary?). It remains so. But, given the contemporary “clash of civilizations,” this latest phase of his long career may be the most important for us today. For the idea of philosophical religion offers the possibility of freeing religion into its essence, which lies beyond sectarian division and is ultimately a matter of spirit and understanding. If much of Schelling’s vision seems dark and inscrutable, it is only because he was so profoundly committed to truth. To understand reality we have to free ourselves from the Hegelian tendency simply to define it as what is inherently knowable. True understanding has to break through to the recognition that reality is always yet “something more” – thus the early turn to nature, art, and poetry – and the subsequent emphasis on the unfathomable ground of the absolute itself. Schelling’s refusal to let the pursuit of truth turn into flight from reality is what makes him a philosopher of enduring importance. His tragic recognition of finitude is what keeps his spirit alive. Schelling died on August 20, 1854, in Bad Ragaz (Switzerland).

**MAJOR WORKS**

*Darstellung meines Systems der Philosophie,* from *Zeitschrift für spekulative Physik,* edited by F. W. J. Schelling (1801), vol. 2. Published in English as “F. W. J. Schelling: Presentation of My System...”

BIBLIOGRAPHICAL NOTE

A very detailed (211 pages) multilanguage bibliography of works by and on Schelling can be found at www.philosophie.uni-bremen.de/uploads/media/Schelling-Bibliographie-2004.pdf (accessed June 2010).
Arthur Schopenhauer was one of the most cosmopolitan philosophers in history. He traveled extensively around Europe and mastered German, Greek, Latin, French, Spanish, and English. But he was also one of the few great Western thinkers to study, admire, and incorporate Hindu and Buddhist writings and topics into his philosophical system. He had a relatively lonely childhood, and his father's death in 1805 – probably by suicide – fuelled his pessimistic outlook on life and humanity. Contrary to his contemporary Hegel, whom he despised, he sees the world as the emanation of a blind, purposeless, and irrational will, which dominates the world, including human beings. Embittered by the lack of success of his own magnum opus, The World as Will and Representation, he chose to lecture at the same hour as Hegel at the University of Berlin, where Hegel was the celebrated Professor of Philosophy. Whereas Hegel's lecture was attended by hundreds of students, the unknown Schopenhauer was left with only a handful. He immediately decided to abandon his lecturing “career.” When cholera reached Berlin in 1831, however, Schopenhauer left for Mannheim, where he stayed only a few years, and then moved to Frankfurt, where he would spend the rest of his life. There the dawn of his fame (or what he himself called “the comedy of his fame”) would begin, while Hegel stayed in Berlin and passed away during the cholera

---

1. Arthur Schopenhauer (February 22, 1788–September 21, 1860; born in Danzig, Poland; died in Frankfurt, Germany) studied natural sciences at the University of Göttingen (1809–11), and philosophy at the University of Berlin, where he attended Johann Gottlieb Fichte's lectures (1811–13), and completed his doctoral degree at the University of Jena (October 1813). In addition to Fichte, his influences included Buddha, Plato, Aristotle, Shakespeare, Spinoza, Locke, Berkeley, Hume, Kant, Goethe, Fichte and Schelling, and he was appointed “Privatdozent” at the University of Berlin (1820).
epidemic. Thanks to John Oxenford – who anonymously published an article in *The Westminster and Foreign Quarterly Review*, entitled “Iconoclasm in German Philosophy” – Schopenhauer eventually received the recognition he had been seeking for so long. The philosophy faculty of the University of Leipzig established a prize competition on his philosophy, and by 1857 lectures were being delivered in many renowned German universities. The sculptor Elisabeth Ney came from Berlin to make his bust. Arthur Schopenhauer died peacefully in Frankfurt at age seventy-two on September 21, 1860, in his flat overlooking the river Main.

It is more or less a commonplace in the history of philosophy that Schopenhauer’s originality lies in his analysis of the self and the world as the product of an irrational, unconscious, and purposeless drive, called “will,” and in his fascinating – semi-Platonic and semi-Kantian – metaphysical account of how the will manifests itself in (or as) the phenomenal world, comes to realize the pointlessness of its own horrific manifestations, and finally abolishes itself into sheer nothingness. In Schopenhauer’s view, the whole organic and inorganic world is ultimately governed by an insatiable, blind will. Life as a whole is purposeless: there is no ultimate goal or meaning, for the metaphysical will is only interested in manifesting itself in a myriad of phenomena that we call the “world” or “life.” Human life, too, is nothing but an insignificant product or “objectivation” of the blind, unconscious will and because our life is determined by willing (i.e. by needs, affects, urges, and desires), and willing is characterized by lack, our life is essentially full of misery and suffering. We are constantly searching for objects that can satisfy our needs and desires and once we have finally found a way to satisfy one desire, another one crops up and we become restless willing subjects once again, and so on in an endless whirlpool of willing, suffering, momentary satisfaction, boredom, willing again, and so on. Life is not a good thing. The only way, Schopenhauer argues, to escape from these torments of willing is by “seeing the world aright,” as Wittgenstein would have it, that is, by acknowledging the pointlessness and insignificance of our own willing existence, and ultimately by giving up willing as such – which in fact really means abandoning our own individuality, our own willing selves – which is momentarily possible in aesthetic experiences of beauty and sublimity, and permanently achievable only in the exceptional ethical practices of detachment, mysticism, and asceticism, in which the will to life is eventually denied and sheer nothingness is embraced – either through harsh suffering or through sainthood.

I do not believe that his metaphysics of the will is the main reason why we should still read Schopenhauer’s truly inspiring account today. Nonetheless, there are numerous valid reasons why we should still study Schopenhauer’s philosophy, not least because of his lasting contribution to the philosophy of value, but here I set out to examine a perhaps somewhat lesser known part of his philosophy: his theory of perception and cognition. Acknowledgement of this
A strand of his thought moves Schopenhauer away from the German idealism of Schelling, Hegel, and other contemporaries and takes him back to the company where he (or so I contend) more properly belongs: the British empiricists, such as Berkeley, Hume, Locke, and Reid, and of course Kant, whom he revered with immense adoration. I shall first expound Schopenhauer’s thesis of the “intellectual” character of intuitive perception and the role of the senses, and then briefly contrast this with his account of aesthetic perception and cognition (ästhetische Anschauung und Erkenntnis).

I. PERCEPTION AND UNDERSTANDING

The gist of Schopenhauer’s account of perception is that all intuitive perception (Anschauung) is intellectual, that is, only through the understanding’s application of the concepts of time, space, and causality can the world “stand out as perception extended in space, varying in respect of form, persisting through all time as regards matter.” The senses alone do not suffice to offer perception, since they “furnish nothing but the raw material, and this the understanding first of all works up into the objective grasp and apprehension of a corporeal world governed by laws, and does so by means of the simple forms … space, time, and causality. Accordingly, our daily empirical intuitive perception is intellectual.”

He emphasizes, however, that “This operation of the understanding … is not discursive or reflective, nor does it take place in abstracto by means of concepts or words; on the contrary, it is intuitive and quite immediate” (FR 78).

Schopenhauer uses this view of the “intellectual” nature of perception to argue for the ideality of the perceived world. He proclaims himself to be a true follower of Kant’s transcendental idealism from the first sentence of his magnum opus, The World as Will and Representation: “The world is my representation.” Many people have taken this to mean: “something does not exist unless it is mental.” However, this is not what Schopenhauer intends. Schopenhauer’s basic

---

2. Arthur Schopenhauer, The World as Will and Representation, E. F. J. Payne (trans.) (New York: Dover, 1969), vol. I, 12, see also vol. II, 19; hereafter cited as WWR followed by the volume and page or section numbers, some modifications to Payne’s vocabulary throughout.
4. Nevertheless, this misconception has had serious consequences for the reception of Schopenhauer’s thinking, especially in Anglo-American philosophy in the early years of the twentieth century, which was particularly squared off against the idealism studied in British universities up until the end of the nineteenth century. (Bertrand Russell and G. E. Moore were both schooled in the Hegelian tradition, a tradition that they later repudiated.) The fate to which Fichte, Schelling, and also Schopenhauer fell probably had much to do with
idea is that there is “no object without a subject, and no subject without an object.” In the first paragraph of *The World as Will and Representation*, he writes that there is no truth more certain than the truth that states that the whole world is merely an object in relation to a subject. The subject is clearly the “supporter of the world, the universal condition of all that appears, of all objects, and it is always presupposed; for whatever exists, exists only for the subject” (WWR I, 5). The subject does not belong to the world, but is, as Ludwig Wittgenstein will say, the *limit* of the world, and can never become an object of consciousness. Like Hume, Schopenhauer suggests that the subject can never be encountered in the world, and praises Descartes, Berkeley, and especially Kant, as the first thinkers to acknowledge the crucial importance of the subject. He distinguishes his position from skepticism, realism (which he calls “dogmatic”), and idealism, which he accuses Fichte of.

Fichte held that the “non-ego” must be derived from the “ego,” “as the web from the spider” (WWR I, 33). Whereas Fichte’s idealism “makes the object the effect of the subject” (WWR I, 13), Schopenhauer argues that subject and object necessarily presuppose one another. Subject and object are not related to each other as cause and effect. The law of causality applies only within the world of representations and objects, and cannot be applied to explain the relation between object and subject. Fichte’s idealism unjustly turns the object into the effect (Wirkung) of the subject. This is unacceptable for Schopenhauer, because they both imply one other *a priori*: object and subject precede all cognition, and therefore also the causal knowledge based on the understanding’s principle of sufficient reason:

> [T]he perceived world in space and time, proclaiming itself as nothing but causality, is perfectly real, and is absolutely what it appears to be; it appears wholly and without reserve as representation, hanging together according to the law of causality. This is its empirical reality. On the other hand, all causality is only in the understanding and for the understanding. The entire actual, i.e.,

---

5. “Therefore no truth is more certain, more independent of all others, and less in need of proof than this, namely that everything that exists for knowledge, and hence the whole of this world, is only object in relation to the subject, perception of the perceiver, in a word, representation” (WWR I, 3).
active, world is therefore always conditioned as such by the understanding, and without this is nothing. … The whole world of objects is and remains representation, and is for this reason wholly and forever conditioned by the subject; in other words, it has transcendental ideality. But it is not on that account falsehood or illusion; it presents itself as what it is, as representation, and indeed as a series of representations, whose common bond is the principle of sufficient reason.  

(WWR I, 14–15)

Unfortunately, instead of providing arguments, he seems to take this (basically Kantian) position for granted, and confines himself to arguing, against the skeptic, that objects of perception causally interact on us, and that this causal action exhausts their (empirical) “being.” As Schopenhauer puts it in the passage just quoted from *The World as Will and Representation*: “the perceived world in space and time, proclaiming itself as nothing but causality, is perfectly real, and is absolutely what it appears to be; it appears wholly and without reserve as representation, hanging together according to the law of causality.” (WWR I, 14–15). Schopenhauer maintains that complete causal knowledge of objects (of perception) is possible, and that this is all there is to be known about such objects: there is no essence, substrate, or whatever “underlying” them – at least not in the world as representation. The phenomenal world is ultimately nothing less than a series of perceptual objects, insofar as they causally act on us. Thus because the idea of causal agency and the concept of causality are furnished by the understanding, perception is always the product of the understanding, although it is obviously triggered by sensations.

Even more worrisome is that he does not merely fail to supply a convincing argument for his version of transcendental idealism but also regularly identifies the world as representation with a dream, which seems to lead him to precisely the kind of (Fichtean) idealism he absolutely wanted to avoid. In these passages, Schopenhauer is especially inspired by Plato, Calderón de la Barca,6 and Shakespeare: waking and dreaming are as pages from the same book.7 Although Schopenhauer tends to describe life as “a long dream,” by no

---

6. Pedro Calderón de la Barca (1600–1681) was a Spanish Golden Age poet, writer, and dramatist. He is perhaps best known for his play *La vida es sueño* (Life is a dream), a philosophical allegory that turns on the conflict between free will and fate.

7. “Life and dreams are leaves of one and the same book. The systematic reading is real life, but when the actual reading hour (the day) has come to an end, and we have the period of recreation, we often continue idly to thumb over the leaves, and turn to a page here or there without method or connexion. We sometimes turn up a page we have already read, at others one still unknown to us, but always from the same book” (WWR I, 18).
means does he deny the existence or authenticity of empirical reality. Rather than maintaining that the whole of existence is a dream, Schopenhauer points out that there is no sufficient criterion that enables us to absolutely distinguish dream from reality, except for the empirical fact of waking up. His Kantian-inspired transcendental idealism, which assumes that the epistemic capacities of the subject determine the structure of the phenomenal world, is compatible with empirical realism. Just as in Kant, transcendental ideality is combined with the epistemic authenticity of empirical reality. As Schopenhauer puts it in the second volume of *The World as Will and Representation*: “In spite of all transcendental ideality, the objective world retains empirical reality. It is true that the object is not the thing-in-itself; but as empirical object it is real. It is true that space is only in my head; but empirically, my head is in space” (WWR II, 19).

Schopenhauer agrees with Kant that experience is dependent on the nature of the cognitive faculties and that the world of all actual and potential experience is dependent on the knowing subject, such that the world cannot exist by itself independently of the cognizing subject. Schopenhauer calls the theory of realism, which claims that our experience is a perfect copy of the world in itself, an “empty castle in the air,” in which serious philosophers cannot have any faith. That the objective world, the world of objects, would exist independently even if there were no subjects, seems perhaps prima facie acceptable; however, it is only thinkable in abstracto. As soon as one tries to imagine such a world, one ends up in the paradoxical view that what one is imagining is precisely the opposite of what one intends, that is, a world free from an imagining subject.

8. See WWR I, 16. Schopenhauer arguably offers a sound hypothesis, since he merely wishes to point out that there cannot be a logical refutation of the presupposition that the whole of life is a dream. For a similar line of reasoning, see Bertrand Russell: “There is no logical impossibility in the supposition that the whole of life is a dream, in which we ourselves create all the objects that come before us. But although this is not logically impossible, there is no reason whatsoever to suppose that it is true; and it is, in fact, a less simple hypothesis, viewed as a means of accounting for the facts of our own life, than the common-sense hypothesis that there really are objects independent of us, whose action on us causes our sensations” (*The Problems of Philosophy* [Oxford: Oxford University Press, 1989], 10).

9. “The only certain criterion for distinguishing dream from reality is in fact none other than the wholly empirical one of waking, by which the causal connexion between the dreamed events and those of waking life is at any rate positively and palpably broken off” (WWR I, 17).

10. “[P]hilosophy is essentially idealistic. Realism, which commends itself to the crude understanding by appearing to be founded on fact, starts precisely from an arbitrary assumption, and is in consequence an empty castle in the air, since it skips or denies the first fact of all, namely that all we know lies within consciousness.” (WWR II, 5).

11. “If accordingly we attempt to imagine an objective world without a knowing subject, then we become aware that what we are imagining at that moment is in truth the opposite of what we intended, namely nothing but just the process in the intellect of a knowing being who perceives an objective world, that is to say, precisely that which we had sought to exclude” (WWR II, 5).
Schopenhauer’s arguments are not really very convincing, though: he is right to hold that the representation of a world free from a subject presupposes a subject – for it presupposes an imagining mind – but not that the existence of a world independent of a subject also does. Schopenhauer unjustly relies on the (Berkeleyan) thought that what we can experience can exist only in relation to our experiencing of it.

Schopenhauer does not, however, simply endorse Kant’s famous statement that “intuitions without concepts are blind.” Although he praises Kant’s “Transcendental Aesthetic,” he is quite critical of the way in which Kant deals with intuitive perception. This becomes quite clear from the following crucial excerpt:

“Our knowledge,” he [Kant] says, “has two sources, receptivity of impressions and spontaneity of concepts: the former is the capacity of receiving representations; the latter is the capacity for knowing an object [Gegenstand] through these representations. Through the first an object is given to us, through the second it is thought.” This is false, for according to this the impression, for which alone we have mere receptivity, which therefore comes from without and alone is really “given,” would be already a representation, in fact even an object. But it is nothing more than a mere sensation in the sense-organ, and only by the application of the understanding (i.e., of the law of causality), and of the forms of perception, of space and time, does our intellect convert this mere sensation into a representation.

(WWR I, 438–9)

Schopenhauer aims to show that Kant starts with an empirical intuition that is given to us without telling us how this is done, and without clarifying how exactly the thought that a certain intuition is given can be united with Kant’s “Transcendental Logic,” which treats the understanding as the unifying factor of our intuitive perceptions (see WWR I, 437–51). Schopenhauer also takes offense at Kant’s rather confused usage of terms such as Anschauung, Perzeption, and Wahrnehmung. He is definitely right to criticize Kant’s vague and occasionally even ambiguous use of terms like this (see e.g. the use of “Perzeption” in Critique of Pure Reason, A 320/B 376–7). Nevertheless, Schopenhauer himself frequently uses the concepts “perception” and “intuition” interchangeably (see e.g. FR §21), and also obviously underestimates Kant’s explicit recognition of the role of the understanding in transforming sensation into perception. Kant further divides

12. See especially WWR I, 437: “The Transcendental Aesthetic is a work of such merit that it alone would be sufficient to immortalize the name of Kant.”
objective perception into intuition, which is always immediate, and concept, which is always mediate. Yet, from this, Schopenhauer wrongly concludes that, on Kant’s account, this must imply that the understanding (with its categories) has no crucial role to play in the constitution of perceptual objects.

Schopenhauer characterizes the understanding’s activity as phenomenologically “immediate” instead of inferential (or “discursive,” as he usually calls it) (FR 78; WWR I, 12). The understanding connects subjective sensations (Empfindungen) with an external cause. His essay On the Fourfold Root of the Principle of Sufficient Reason offers a subtle and detailed account of the distinct functions of the understanding. In the case of visual perception, for instance, the understanding sees to it that the visual image, which is basically an affection of the retina, is first reversed; then it is converted to only one perception, further broadened to three dimensions, and, finally, correctly situated in time and space. The most important task of the understanding is to ensure that the subjectively and successively experienced perceptions are held to be the effect of an external cause. This occurs on the basis of the sole category that Schopenhauer retains from Kant’s complex system of the twelve a priori categories, namely, causality:

[A]ccording to his [Kant’s] own and correct discovery, the law of causality is known to us a priori, and is consequently a function of our intellect, and is therefore of subjective origin. … Therefore the whole of empirical intuition thoroughly remains on a subjective ground and basis as a mere happening in us, and nothing from it that is completely different and independent can be brought in as a thing-in-itself, or demonstrated to be a necessary assumption.

(WWR I, 436)

On the basis of the a priori form of space, this affect or sensation in the organism is ascribed to a cause that lies outside the organism. Thus a world of objects is created by the activity of the understanding through the application of the a priori forms of time and space, and the category of causality. The understanding creates a world of objects with the aid of the raw materials that the senses provide. Thus, thanks to this – phenomenologically immediate – activity of the understanding, a world of objects, situated in space-time, emerges:

This operation of the understanding … is not discursive or reflective … on the contrary, it is intuitive and quite immediate. For only by this operation and consequently in the understanding and for the understanding does the real, objective, corporeal world, filling space in three dimensions, present itself [stellt sich … dar]; and then it proceeds, according to the same law of causality, to change in time
and move in space. Accordingly, the understanding itself has first to create the objective world, for this cannot just step into our heads from without, already cut and dried, through the senses and openings of their organs. (FR 78)

However complex this process may be, it nonetheless evolves unconditionally. The understanding does not have a merely synthetic function that brings together various sense impressions in an image or a bundle of sensations. Intuitive perception is a process, whereby the understanding makes sure that affects or sensations are connected with their respective external causes, so that we become conscious of a world of objects. Phenomenologically, we perceive the objects “immediately,” that is, without being conscious of the complex activity of the understanding’s supplying the category of causality. After all, many empirical experiments point out that, for instance, what we see is a reversal of the image that the rays of light deliver to the retina. For example, were seeing merely the subjective sensation of the rays of light on the retina, then we would have the impression that objects are turned upside down.

Although Schopenhauer’s account of perception and the role of the understanding is quite illuminating, the following critical remarks are called for. First, Schopenhauer unjustly identifies the (subjective) sensations with the physiological elements that he offers to explain their origin and nature. This move is far from evident and ultimately circular. Although the physiological aspects of his theory are interesting, Schopenhauer never actually makes clear how it is possible, for instance, that the manifold of the light’s affects on the retina can provide anything like an “image.” To conclude on the basis of the inadequacy of the sensory image that the activity of the understanding—which Schopenhauer identifies physiologically with the brain—is necessary, offers no solid argument against epistemological theories that do not appeal to the constitutive role of the understanding, but only a methodological detour with respect to Kant’s transcendental approach. As Paul Guyer has persuasively argued, Kant’s transcendental method has now been refined and supplemented by a phenomenological method.13 Schopenhauer’s thought that sense impressions, considered physiologically, do not correspond with the objective intuition of a world of physical objects, is not an argument for the a priori activity of the understanding, but may as well reveal the deficiencies of such a physiological approach. For that matter, it is important to note that Schopenhauer presupposes that the images in

---

retina would be those that the physiological subject receives. This cannot be the case, since these “double images” (Doppelbilder), which, moreover, are “turned upside-down,” are available only to the scientists carrying out the research on visual perception but not to ordinarily perceiving subjects.

Furthermore, the physiological and optical theories that set out to explain what happens when rays of light pass through the eye’s lens do not imply that one somehow perceives upside-down images that one must consequently invert. The physiological issue “how can we see” cannot as easily be identified with the epistemological issue concerning the nature of specific abilities and achievements important for the execution of a specific activity, namely seeing, as Schopenhauer seems to suppose.

Finally, how can perceptual objects both be a construct of the subject and provide the causal ground for this subject-related activity? There is a whiff of paradox here again, which can perhaps only be weakened if: (i) the naturalizing tendency of this epistemology is abandoned, although Schopenhauer is clearly not inclined to do this; (ii) one accepts that the physical objects that provide the “raw” material for objective intuitions are fundamentally different from the intuitions constructed on the basis of sensory perception; or (iii) one is prepared to carry through a complete naturalization of the power of cognition and dispense with a priori structures altogether.

Schopenhauer would probably answer rather bluntly that the assumption of an empirical reality external to the subject is clearly “an empty castle in the air,” which serious philosophers cannot rely on (cf. supra). Through its physiological facets Schopenhauer’s theory is a meritorious supplement to Kant’s epistemology, but the strength of his naturalistic arguments is undermined by persistently defending the transcendental ideality of the world as representation.14

II. THE SENSES

Since he believes that Kant’s Critique of Pure Reason gives too much attention to pure intuition and abstract judgment and reasoning, Schopenhauer wants to offer a more detailed account of intuitive perception and the role that the senses play in this activity. It is to Schopenhauer’s credit that he develops several

14. As Ernst Cassirer claims. See: “Not the world, but the emergence of subjective eyesight in the world is the fact which he truly describes and for which he sets out to find a hypothetical interpretation. The merit of his doctrine lies in the preparation of physiological optics; but the price paid for this achievement in natural sciences is that it has yielded an arbitrarily narrow and limited characterization of the critical theory’s pure concept of a priority” (Das Erkenntnisproblem in der Philosophie und Wissenschaft der neueren Zeit, volume III [Hildesheim: Georg Olms, 1971], 433, my translation).
interesting physiological hypotheses in connection with sensory perception. Although Schopenhauer thinks that he thus mainly provides a critique of Kant's theory of perception, he primarily offers a phenomenological supplement to it, instead of preparing a real departure from Kant’s theory.\(^\text{15}\) Without fully admitting it, Schopenhauer’s account is clearly inspired by Kant’s *Anthropology from a Pragmatic Point of View*, and attempts to integrate these more psychological and physiological ideas into his own philosophy of the will. Before broaching his fascinating account of *aesthetic* perception, we shall first examine his hierarchy of the senses, which is remarkably close to the one Kant expounds in the *Anthropology*. Here, we shall focus on the senses that Schopenhauer considers to be the “most noble” of all: hearing and sight.

**The sense of hearing**

Schopenhauer was extremely sensitive to noise, and contends that the less noise one can stand, the more intellectually gifted one is. The amount of noise we can bear is inversely proportionate with intelligence. Schopenhauer says that, “therefore, when I hear dogs barking unchecked for hours in the courtyard of a house, I know what to think of the mental powers of the inhabitants” (WWR II, 30).

The relation between intellectual talent and the inability to bear noise – which he perceives in Goethe, Kant, and Jean Paul,\(^\text{16}\) – is not merely anecdotally interesting. In the first place, this is evident in the pains Schopenhauer takes to corroborate this view with scientific arguments:

[T]he sensation of hearing does not originate in the labyrinth or in the cochlea, but only deep down in the brain where the two auditory nerves meet, through which the impression becomes single. But this is where the *pons Varolii* encloses the *medulla oblongata*, and thus at the absolutely lethal spot, by injury to which any animal is instantly killed, and from which the auditory nerve has only a short course to the labyrinth, the seat of the acoustic perception. It is just because its source is here, in this dangerous place, from which all movement of limbs also arises, that we start with a sudden bang. This does not occur at all with a sudden illumination, e.g., a flash of lightning. … From this origin of the auditory nerve is also explained the great disturbance that the power of thought suffers through sounds. Because of this disturbance, thinking minds, and

\(^{15}\) As Paul Guyer argues. See note 12.

\(^{16}\) Jean Paul, born Johann Paul Friedrich Richter (1763–1825), was a belletrist renowned for his *Vorschule der Ästhetik*. Schopenhauer refers to him frequently.
people of great intellect generally, are without exception absolutely incapable of enduring any noise. (WWR II, 29)

Schopenhauer spares no effort to corroborate his philosophical ideas through scientific insights. Much less effort does he take to inform the reader about the rather peculiar position that hearing occupies in his account. On the one hand, hearing is, along with sight, the noblest sense; on the other, unlike sight and touch, hearing is not capable of creating an objective intuition with the aid of the understanding. Moreover, hearing is the sense of language and of reason, the faculty of abstract reasoning, and it distracts great minds very easily from their noble art of thinking. This is rather puzzling, and the confusion is only enhanced by Schopenhauer’s assertion that “tones can excite pain immediately, and can also be directly agreeable sensuously without reference to harmony or melody” (WWR I, 200). Yet being immediately pleasant or unpleasant is the criterion by which smell and taste are branded as merely subjective senses. Why would this “sense of reason” still be called objective and even “noble,” if it immediately brings an affective response along with it?

The sense of sight

Together with Goethe, Schopenhauer carried out important scientific experiments on visual perception and color, and he even wrote an intriguing but little read work on that theme: On Vision and Colors. In his theory of knowledge, but also in his aesthetics and his ethics, sight and intuition play an incredibly important part. Schopenhauer is without doubt a philosopher of the eye: not only the eye in the biological sense, but also of the mind’s eye. Moreover, visual metaphors abound in his discourse. Metaphors and other figures of speech connected with the eye, with mirrors and mirroring, with images and imaging, with intuition and (in)sight, are a true obsession.

Schopenhauer does not, however, offer a consistent and unproblematic account of the nature of visual perception. Seeing is sharply distinguished from the rest of the senses, because the eye, in contrast to the other organs, is not directly connected with the will. In this sense, sight is the aesthetic organ par excellence, because it can be affected without this affection being experienced

17. “Sight is an active, hearing a passive sense. Therefore, sounds affect our mind in a disturbing and hostile manner, the more so indeed, the more active and developed the mind. They can destroy all ideas, and instantly shatter the power of thought” (WWR II, 28). Reason is the abstract power of thinking that receives what the understanding and the senses deliver, and is thus bound to the perceiving ear. Reason transforms empirical intuitions into abstract concepts.
immediately as pleasant or unpleasant, as is the case in the “pure” pleasure experienced by the sight of beautiful colors:

The wholly immediate, unreflective, yet also inexpressible, pleasure that is excited in us by the impression of colours … as for example in stained glass windows, and even more by means of clouds and their reflection at sunset – this pleasure, I say, ultimately rests on the fact that in the easiest manner, in a manner that is almost physically necessary, the whole of our interest is here won for knowledge without any excitement of our will. We thus enter into the state of pure knowing, although in the main this consists in this case in a mere sensation of the retina’s affection. But as this sensation is in itself wholly free from pain or pleasure, it is without any direct excitement of the will, and thus belongs to pure knowledge.

(WWR II, 375)

Schopenhauer holds that visual perception is the easiest way to be able to experience purely aesthetic pleasure, which is – as we shall see – of a peculiar kind, since it is experienced without the will being stirred, that is, without affect. Unlike the other senses, and by its specific direct sensory activity alone, sight is incapable of calling up a pleasurable or nonpleasurable sensation in the organ; it has no direct connection with the will.18 Neither hearing nor touch, nor smell or taste, taken in themselves, seem capable of such a neutral affection, for they are too intimately connected with the will to be able to be affected without producing an affect, that is, a sensation of pleasure or displeasure. Apart from the disturbing paradoxes involved in this view, Schopenhauer also suddenly seems unaware of the common experience of the especially painful and unpleasant feeling caused by, for example, driving out of a dark tunnel directly into blazing sunlight. However, to Schopenhauer’s defense, one might argue that what Schopenhauer here describes as a neutral affection of the eye, is a possible but not a necessary result of the activity of our eyes. Seeing something may be neutral, in the sense that it is not pleasurable or painful, but that is not necessarily so. On the other hand, one might wonder whether the sense of hearing might not also be capable of producing the pure aesthetic pleasure that Schopenhauer describes, for instance, when listening to beautiful music.

18. “For sight, unlike the affections of the other senses, is in itself, directly, and by its sensuous effect, quite incapable of pleasantness or unpleasantness of sensation in the organ; in other words, it has no direct connection with the will. Only perception arising from the understanding can have such a connection, which then lies in the relation of the object to the will” (WWR I, 199).
The philosophically more serious predicament is how to distinguish sight in this manner from the other senses. The privileged position that he clearly ascribes to seeing is contradicted by a remark concerning touch in comparison with hearing:

In the case of hearing, this is different: tones can excite pain immediately, and can also be directly agreeable sensuously without reference to harmony or melody. Touch, as being one with the feeling of the whole body, is still more subject to this direct influence on the will; and yet there is a touch devoid of pain and pleasure.

(WWR I, 199–200, emphasis added)

In light of the above efforts to sharply distinguish the qualities of sight from the other senses, this is, to say the least, surprising. Here the sense of touch, which is so closely related to the feeling of one’s own body, seems as equally able to produce the kind of affectively neutral perception, which seemed at first sight to be the privilege of the sense of sight. Schopenhauer considers sight and touch as the only truly objective senses, because they are the only senses that are alleged to be able to create an objective intuition of the external world with the help of the understanding. This is not only confusing, as it threatens to disturb his hierarchy of the senses and especially seems to underestimate the sense of hearing discussed above, but also because an unprecedented privilege is attached to the transcendental form of space. Moreover, it is hardly clear why and how the activity of touching something, which is intimately connected to the experience of one’s whole body, can be genuinely neutral, and (phenomenologically speaking) it is even untenable in the case of the sense of sight (cf. the example of the harsh sunlight).19 Thus there is a striking ambiguity in Schopenhauer’s use of the term “objective”: now he uses it in the sense of “being capable of realizing an objective intuition, i.e., perception of an external object” and then it can also mean something altogether different, namely “not immediately connected to an affective stirring of the will.” To be able to properly ground his distinction between the value and the function of the sense, Schopenhauer would need to provide arguments for the idea that both senses of the term “objective” imply one other, which he does not.

Two final worries must be addressed. First, in Fourfold Root we read that “perceptions of sight ultimately refer to touch, and sight can be regarded as an imperfect touch extending to a distance and making use of the rays of light as long feelers (Taststangen)” (FR 81). Schopenhauer does not shy away from

19. This can be contrasted with Schopenhauer’s remarks about the especially favorable effect of sunlight on the aesthetic quality of buildings.
disturbing his own hierarchy of the senses. The activity of seeing is considered as a kind of touching, which uses the rays of light as *feelers*. If this is so, one might wonder how the sense of sight can still maintain its privileged position of being the only (or at least the ideal) sense capable of producing pure, will-less, aesthetic perception.

Moreover, Schopenhauer maintains that visual perception occurs unconsciously and is thereby inevitably accompanied by two systematic forms of “deceit” (*Täuschungen*). These are most strongly present in seeing. The first is the illusion of immediacy (time), and the second is the illusion of proximity (space). The first is arguably grounded in the fact that visual perception hardly needs time to take place or that there seems no time lapse between the stimulation of the eye and the experience of the perceived object. According to Schopenhauer this applies exclusively to seeing, because in the dark, for instance, one must touch an object for a long time before one perceives what kind of object one has before oneself. Seeing occurs “directly” or “immediately,” Schopenhauer says, since:

> the unconsciousness with which the transition from the sensation to its cause is brought about really occurs only with perception in the narrowest sense, with *vision* or *sight*. On the other hand, with every other perception or apprehension of the senses the transition occurs with more or less clear consciousness; thus in the case of apprehension through the four coarser senses, the reality of the transition can be directly observed as a fact. (WWR II, 23)

Is Schopenhauer’s claim that only sight falls prey to this illusion of immediacy correct? When one feels a pain in the index finger of one’s left hand from the sting of an insect, then one localizes this pain immediately in the index finger of one’s left hand, although here too quite a considerable physiological route will have been followed, for the pain cannot be localized without the intervention of the nervous and cerebral system. Although the place where one feels the pain is certainly the index finger on one’s left hand, still, one would not feel pain if the nerves of the finger were blocked, even though the insect had definitely stung the finger.20 There are also people who feel pain in limbs they no longer have. We can also still see objects that are no longer there, such as stars that were extinguished long before we were even born, but that we are nevertheless still able to perceive. Although the star that one perceives seems directly present, and

---

20. Schopenhauer seemed aware of this phenomenon. See: “Moreover, the apparent immediacy of perception, resting on its entirely intellectual nature, by virtue of which, as Euler says, we apprehend the things themselves as lying outside us, has an analogy in the way in which we feel the parts of our own body, especially when they experience pain, as is generally the case as soon as we feel them” (WWR II, 25).
although one has the feeling that one has direct contact with it, this perception remains the same whether or not this same star is actually still “there.”21 This occurs in every (visual) perception, even that of the lamp on my desk: the lamp itself seems to be “out there” – just as the stars that I see when I am now looking out of my window, but the perceived lamp can only occur through the activity of the eyes and the understanding (the brain). Even the “starry heaven above me” is ultimately nothing but a brain phenomenon.22

For Schopenhauer, this “illusion … that the sensation itself gives us the objects directly” thus originates from the “perfection” of the eye and the “exclusively rectilinear action of the light.”23 Schopenhauer justly emphasizes the immediacy of visual perception, but one might again object that this is not the exclusive privilege of the sense of sight. Thus, for instance, the same can be said about the sense of touch, although it does seem harder in the case of olfactory perception. The pleasant stimulation caused by the perfume of someone passing by can make someone realize immediately that it is Acqua she smells, just as one could see on the basis of the shape of a bottle lacking a label that it is a bottle of Acqua. Yet that is not the kind of immediacy Schopenhauer refers to. What he wants to make clear is that there is no conscious inferential step made from the sensation (Empfindung) of the bottle through my eye to the objective intuition (Anschauung) of the specific bottle, whereas this does occur in the case of someone’s stimulated nasal organ, even if only through the activity of sniffing: someone’s olfactory system is stimulated by a certain odor, which one finds pleasant or unpleasant, and to which one consciously attaches the property “perfume, specifically, Acqua di Giò by Armani.” In a certain sense, the illusion of immediacy, which is strongest in visual perception, is also the most deceitful.

21. Bertrand Russell gives the example of our perception of the sun. The sun that I see at this moment is the sun of about eight minutes ago. “[I]t takes about eight minutes for the sun’s light to reach us; thus, when we see the sun we are seeing the sun of eight minutes ago. So far as our sense-data afford evidence as to the physical sun they afford evidence as to the physical sun of eight minutes ago; if the physical sun had ceased to exist within the last eight minutes, that would make no difference to the sense-data which we call ‘seeing the sun’” (Russell, The Problems of Philosophy, 16–17).

22. See, for instance, WWR II, 3, 24, 47, 286, 403.

23. “The fact that in the case of seeing the transition from the effect to the cause occurs quite unconsciously, and thus the illusion arises that this kind of perception is perfectly direct and consists only in the sensation of sense without the operation of the understanding – this fact is due partly to the great perfection of the organ, and partly to the exclusively rectilinear action of light. In virtue of this action, the impression lends itself to the place of the cause, and as the eye has the capacity of experiencing most delicately and at a glance all the nuances of light, shade and colour, and outline, as well as the data by which the understanding, in the case of impressions on this sense, takes place with a rapidity and certainty that no more allow it to enter consciousness than they allow spelling to do so in the case of reading. In this way, therefore, the illusion arises that the sensation itself gives us the objects directly” (WWR II, 24).
Schopenhauer’s position does not escape a certain circularity here: the epistemic importance of the understanding is derived from the complexity of the most significant type of sense, namely vision, which is itself only explained on the basis of the operation of the understanding. Yet Schopenhauer’s theory undoubtedly has the merit of supplementing Kant’s theory of knowledge with a gripping account of how perception occurs and what the specific roles of the senses are. It is, therefore, surprising that this rich conception of empirical cognition and perception plays such a dispensable part in his discussion of aesthetic consciousness, to which we now turn.

III. AESTHETIC PERCEPTION AND COGNITION

Schopenhauer holds that the intellect, which he identifies physiologically with the brain, is an instrument or tool of the will. The will has created brains to help organisms survive. As I have argued above, empirical cognition of the world is always within the forms of space and time, and the category of causality imposed by the subject. Following Hume instead of Kant this time, Schopenhauer holds that the subject’s intellectual imposition of space, time, and causality on experience is driven by human needs, interests, and affects. The intellect is governed by the will: it is merely the will’s tool.24

Again following Hume, Schopenhauer thus contends that one’s intellect can be and often is disturbed by the will, that is, by affects, urges, needs, inclinations and passions:

In our enemies we see nothing but shortcomings, in our favorites nothing but merits and good points, and even their defects seem amiable to us. … What is opposed to our party, our plan, our wish, or our hope often cannot possibly be grasped and comprehended by us, whereas it is clear to the eyes of everyone else; on the other hand, what is favourable to these leaps to our eyes from afar. What opposes the heart is not admitted by the head. … Thus is our intellect daily befooled and corrupted by the deceptions of inclination and liking.

(WWR II, 217–18)

The will affects our judgments and clouds our thoughts, and our intellect always functions in the service of the will. Everything that takes place without the intellect – an organism’s procreation, development and preservation, the healing

24. For the intellect as the instrument or tool (Werkzeug) of the will, see WWR I, 292; II, 205, 214, 215, 220, 225, 229, 398, 641.
of wounds, the critical stage that brings about salvation during an illness, the instinctive skills of animals, and so on – turns out infinitely better than what happens with the help of the intellect. Thus Schopenhauer distances himself completely from the “ancient and universal error” of the Western tradition, which reveres intellect and reason as the most perfect hallmark of humanity.

For Schopenhauer, however, the intellect is “at bottom tertiary, since it presupposes the organism, and the organism presupposes the will” (WWR II, 278).

Still, Schopenhauer believes that cognition that is not in the service of the will remains possible. Schopenhauer calls this kind of cognition aesthetic, for it occurs when we are touched by the beauty (or sublimity) of an object: a landscape, a sunset, a painting, a poem, and so on. Aesthetic perception entails that one becomes conscious of oneself as a pure, will-less, timeless subject of knowledge. In aesthetic consciousness, the “real self” – that is, the self as willing – appears to have vanished and has been replaced, as it were, by a “better” or “higher” consciousness. This:

consists in knowledge turning away entirely from our own will, and thus leaving entirely out of sight the precious pledge entrusted to it, and considering things as though they could never in any way concern the will. For only thus does knowledge become the pure mirror of the objective inner nature of things. (WWR II, 367)

I lose myself entirely in the perceived object and the ordinary rules about experience and knowledge need no longer apply. “Everything is beautiful only so

---

25. “If the intellect were not of a secondary nature, … then everything that takes place without it, in other words, without the intervention of the representations, such, for example, as generation, procreation, the development and preservation of the organism, the healing of wounds, the restoration or vicarious repair of mutilated parts, the salutary crisis in diseases, the works of animal mechanical skill, and the activity of instinct in general, would not turn out so infinitely better and more perfect than what takes place with the aid of the intellect, namely all the conscious and intended achievements and works of men. Such works and achievements, when compared with those others, are mere botching and bungling” (WWR II, 269).

26. “The remarkable phenomenon that in this fundamental and essential point all philosophers have erred, in fact have completely reversed the truth, might be partly explained, especially in the case of the philosophers of the Christian era, from the fact that all of them aimed at presenting man as differing as widely as possible from the animal. Yet, they felt vaguely that the difference between the two was to be found in the intellect and not in the will” (WWR II, 199).

27. On the pure will-less subject of knowledge, see especially WWR II, 367–75.

28. “[We] sink ourselves completely therein, and let our whole consciousness be filled by the calm contemplation of the natural object actually present. … We lose ourselves entirely in this object, to use a pregnant expression” (WWR I, 178). See also: “Only through the pure contemplation described above, which becomes absorbed entirely in the object, are the Ideas
long as it does not concern us” (WWR II, 374), that is, it does not concern our “real self,” for in aesthetic contemplation our willing self has been discarded. The ordinary operations of our perceptual and cognitive faculties are suspended and we reach a superior state of mind.

We usually discern the objects around us by means of (empirical) concepts: this is how we ordinarily perceive external objects and become empirically aware of the world. Aesthetic consciousness or awareness is superior, for we enter a state of unusual tranquility, in which individual striving, suffering, desiring, and worrying no longer occur. The sight of the aesthetically pleasing object makes us “objective,” Schopenhauer says, “that is to say, in contemplating it we are no longer conscious of ourselves as individuals, but as pure, will-less subjects of knowing” (WWR I, 209; see also WWR I, 195 and passim). This heightened, “objective” state of consciousness discards the embodied, willing self and frees us from the pressures and torments of willing and from what Plato calls the “desires and fears and all sorts of fancies and a great deal of nonsense” caused by the fact that we are embodied creatures (Phaedo 66a–b).

Nevertheless, although Schopenhauer’s idea of the “better consciousness” is obviously reminiscent of Plato’s pure knowledge of the soul, there are striking differences in their analyses of the nature of beauty and aesthetic experience. For Plato, an experience of beauty is a festive celebration of Being: it is to feel alive. Plato holds that beauty ultimately satisfies eros, whereas Schopenhauer provides a quite different account of the aesthetic experience. Instead of soothing the will by satisfying it, aesthetic perception is purified of all willing, that is, of our interests, passions, affects, and needs. Aesthetic experience cannot occur without an awareness of the disappearance of the willing self, and “with it its suffering and sorrow” (WWR II, 371). Thus a will-less, aesthetic experience is by definition pleasurable, for it occurs only when the sufferings, caused by the will, disappear from consciousness. Aesthetic perception offers no fulfillment of our personal desires, but is detached from our desires, and therefore offers freedom from the thralldom of our endless willing, striving, and, by implication, our suffering. Hence, the aesthetic state of mind cheers and comforts, as our will is momentarily stilled:

30. In this respect, Kant’s analysis of beauty is closer to Plato’s than Schopenhauer’s. See Immanuel Kant, Critique of Judgment, §1, Akademie-Ausgabe V, 204.
31. A more extended account of the differences between Plato’s and Schopenhauer’s views of the experience of beauty can be found in my “Schopenhauer on Aesthetic Understanding and the Values of Art,” European Journal of Philosophy 16 (2008).
The storm of passions, the pressure of desire and fear, and all the miseries of willing are then at once calmed and appeased in a marvelous way. For at the moment when, torn from the will, we have given ourselves up to pure, will-less knowing, we have stepped into another world, so to speak, where everything that moves our will, and thus violently agitates us, no longer exists. (WWR I, 197)

Schopenhauer does not, however, consider aesthetic perception merely as a heightened state of awareness, but also as a superior kind of cognition: “we have given ourselves up to pure, will-less knowing,” and “the colour and form of things stand out in their true and full significance” (WWR II, 373, emphasis added). Aesthetic experience has no mere therapeutic value, but also a high cognitive value. Since ordinary empirical cognition is always guided and even determined by personal needs, affects and interests – in short, by our will – it is, Schopenhauer holds, necessarily inferior to cognition that occurs independent of them. Ordinary people are usually confined to the inferior, distorted kind of knowledge. By contrast, it is a sign of “the gift of genius” to be able to attain (and maintain) the superior state of dispassionate, “pure perception” and cognition:

the capacity to remain in a state of pure perception, to lose oneself in perception, to remove from the service of the will the knowledge that originally existed only for this service … the ability to leave entirely out of sight our own interest, our willing, and our aims, and consequently to discard entirely our own personality for a time, in order to remain pure knowing subject, the clear eye of the world.

(WWR I, 185–6)

This kind of superior cognizance, freed from the will’s urges, automatically implies that we “relinquish the ordinary way of considering things … and let our whole consciousness be filled by the calm contemplation” of the object, and “continue to exist only as pure subject, as clear mirror of the object” (WWR I, 178). Yet it also yields knowledge of what the object truly is: aesthetic consciousness is not merely an escape from the torments of willing and, hence, suffering, but also (and perhaps more importantly) an insight into what things really are. As Schopenhauer puts it, “we no longer consider the where, the when, the why, and the whither in things, but simply and solely the what” (WWR I, 178). Aesthetic, will-less perception – which Schopenhauer identifies with Spinoza’s notion of knowledge “sub aeternitatis specie,” that is, from the standpoint of eternity – offers insight into the timeless kernel of things, that is, the universal essences of the perceived objects, beyond mere appearance. Schopenhauer calls these eternal essences the (Platonic) Ideas, the “eternal forms” behind the mere
appearances of common empirical cognition. Although Schopenhauer here clearly moves beyond Kant’s analysis of aesthetic disinterestedness, and adopts the more Platonic vision of knowledge of eternal forms or Ideas, identifying Schopenhauer’s conception of the Ideas with the Platonic original may be too hasty.

Two considerations seem to stand in the way of identifying Schopenhauer’s Ideas with their Platonic counterparts. First, whereas Plato held that knowledge of the eternal forms of things involves conceptual thought and ratiocination, Schopenhauer maintains that reason is an instrument of the will that helps us survive as living organisms in the natural world. For Schopenhauer, the timeless Ideas are not known through abstract reasoning, but in and through perception (Anschauung) of natural objects or works of art, combined with an idealizing act of our imagination. Whereas “the common, ordinary man … can direct his attention to things only in so far as they have some relation to his will,” and “always demands only knowledge of the relations, the abstract concept of the thing is sufficient”; in aesthetic cognition, however, one “strives to grasp the Idea of each thing, not its relation to other things” (WWR I, 187–8). Thus the Ideas – that is, the alleged objects of aesthetic cognition – are known by a peculiar type of imaginative perception, which does not involve any concepts at all. This statement clearly echoes Kant’s thought that a pure aesthetic judgment cannot be based on (determinate) concepts, but also radically departs from Kant, for Schopenhauer claims that an aesthetic experience is first and foremost a kind of objective insight, whereas Kant argues that it is based on a reflecting judgment, which is grounded in a disinterested feeling of pleasure or displeasure, and does not contribute to cognition at all.32 Although the gap between Kant’s and Schopenhauer’s aesthetics may not be as big as some commentators suggest,33 Schopenhauer’s discussion of the will-less, timeless state of consciousness – which is purportedly the essence of the aesthetic attitude – is definitely more Platonic than Kantian. Still, as noted above, Schopenhauer’s so-called “(Platonic) Ideas” appear less Platonic than Schopenhauer is prepared to admit.

A further worry about a hasty identification of Plato’s and Schopenhauer’s theories of Ideas is that, for Plato, the Ideas are not merely the eternal universals behind the mere empirical appearances of things, but also the ontological foundation of the whole world, whereas in Schopenhauer’s view, the Ideas are situated metaphysically “between” the thing-in-itself (the will) and the empirical

32. “[T]he presentation is referred solely to the subject and is not used for cognition at all, not even for that by which the subject cognizes himself” (Immanuel Kant, Critique of Judgment, §3, Akademie-Ausgabe V, 206). See also ibid. XX, 222–3.

33. See, for example, Christopher Janaway: “The vision behind Schopenhauer’s theory of aesthetic experience is Platonic, not Kantian” (Beyond Selflessness: Reading Nietzsche’s Genealogy [Oxford: Oxford University Press, 2007], 194).
appearances. The Ideas are not the fundamental components of reality, but the most adequate objectivations or manifestations of the one ultimate essence of the world, namely will. Schopenhauer argues that, since the forms of space and time, and the understanding or intellect (operating according to the principle of sufficient reason), ground and even “construct” the world as representation, this world is divided into numerous distinct objects, and is therefore characterized by plurality. Those categories do not apply to the thing in itself, which belongs to the noumenal world, hence (Schopenhauer argues) the thing-in-itself cannot be characterized by plurality. Schopenhauer reasons as follows:

1. the forms of space, time and the categories of the understanding – the principle of sufficient reason – create the objective world (the world as representation);
2. the world as representation therefore consists of multiple representations or different objects;
3. the principle of sufficient reason is limited to the world as representation;
4. the principle of sufficient reason does not apply to the thing-in-itself (the noumenon);
5. the thing-in-itself beyond all phenomena cannot be characterized by multiplicity;
6. the Ideas are characterized by multiplicity;
7. the Ideas cannot be the noumenal thing-in-itself.

These claims face a number of problems, not least because they are further enmeshed in Schopenhauer’s basic metaphysical view that the thing-in-itself is the will, which automatically implies that the will ought to remain unknowable, and Schopenhauer does not (always) recognize this. Moreover, his analysis of empirical perception is combined with and, I would add, unnecessarily clouded by his semi-Platonic account of the Ideas, which he argues to be the adequate objectivations (or manifestations) of the metaphysical will. Schopenhauer seems rather confused when he contends that the Platonic Ideas reveal the antagonistic nature of the metaphysical will, which they express by struggling to conquer their spot in the universe and by fighting the other Ideas to be able to manifest themselves as clearly as possible in the empirical world.

For the purposes of his aesthetics, however, it is quite unnecessary to think that the Platonic Ideas are the “adequate objectivations” of the thing-in-itself, that is, the will. Instead, what might ground aesthetic cognition is the idea that, although we are confronted with empirical objects, it is possible to view those

---

34. An exception can be found in WWR II, 198, where he concedes that “being known of itself contradicts being-in-itself.”
empirical objects in a way that transcends their merely empirical characteristics. The thought would then be that aesthetic cognition requires an impersonal “universal standpoint” through which not only the perceived object but also the self or “I” is viewed, as it were, from nowhere. The individual object does not vanish, but is – as Robert Wicks aptly puts it – “perceived in light of its universal significance.” How this universal point of view is to be attained by creatures whose nature is essentially willing, which inclines them to perceive, think, and judge from their own egocentric (and even egoistic) viewpoint, remains nonetheless puzzling. The doctrine about the Platonic Ideas is rather extravagant and may even be superfluous, but to dismiss it does not automatically dispense with an aesthetics founded upon will-less contemplation and “objective” cognition.

IV. CONCLUDING REMARKS

Even without thorough scrutiny of Schopenhauer’s metaphysics of the will, his accounts of (ordinary and aesthetic) perception offer a critical supplement to empiricist and Kantian theories of cognition and perception. His analysis of the role of the understanding in perception may be closer to Kant’s than he conceded, yet his subtle analysis of the role of the senses, expounded above, nonetheless adds a more scientifically plausible and physiologically corroborated account to Kant’s transcendental conception of perception and understanding.

Schopenhauer also makes a radically un-Kantian move, when he suggests that the intellect is driven by human willing, that is, needs, urges, affects, and desires. The understanding is no mere transcendental faculty, but a so-called natural phenomenon: the cerebral system helps the organism survive, and express (and fulfill) its desires, needs, and wishes. The brain helps the will appear in the phenomenal world. In aesthetic perception, however, the cerebral system gives up, as it were, this subservient role and now operates detached from the will. This will-less, aesthetic cognition is pleasurable, not merely because it offers relief from the sufferings that inescapably trouble the “willing self,” but also because it procures a heightened state of awareness that transcends ordinary cognition of the phenomenal world and, moreover, generates a deeper insight into the timeless universals behind the mere appearances of things. Thus Schopenhauer not only moves beyond Kant’s transcendental epistemology, supplementing it with an illuminating account of ordinary perception, but also overcomes Kant’s

36. See my “Schopenhauer and the Objectivity of Art,” in A Companion to Schopenhauer, Vandenabeele (ed.).
aesthetics by showing that the value of an authentic aesthetic experience cannot be reduced to the value of the (disinterested) pleasure it affords.

Über die vierfache Wurzel des Satzes vom zureichenden Grunde, 1813, 1847. Published in English as On the Fourfold Root of the Principle of Sufficient Reason, translated by E. F. J. Payne. La Salle, IL: Open Court, 1974.
Georg Wilhelm Friedrich Hegel\(^1\) was born in 1770 in the southern German city of Stuttgart. The members of the generation into which Hegel was born – he shared his birth year, for example, with Ludwig van Beethoven, Friedrich Hölderlin, and William Wordsworth – found themselves in a world perched on the edge of upheaval. Because of rising populations, increasing literacy rates, and economies that were not keeping up with the expectations engendered by these movements – and because this generation grew up in the middle of a movement that came to be known as “the Enlightenment” – very early in their lives they came to interpret their own prospects in terms of the idea that they themselves would be living unprecedented lives, that the lives of their parents and grandparents, for example, would offer them no particular guidance for the shape their own lives would take. The French Revolution, which occurred during their late teenage years, was the cataclysmic social and political event that would shape much of the world around them; it confirmed their view that they were a new generation in history destined to perform revolutionary acts of which their predecessors could not have dreamed.

---

1. Georg Wilhelm Friedrich Hegel (August 27, 1770–November 14, 1831; born in Stuttgart, Germany; died in Berlin) studied philosophy and theology at the University of Tübingen (1788–93). His influences included Aristotle, Fichte, Goethe, Hölderlin, Kant, Rousseau, Schelling, Schiller, and Spinoza, and he held appointments as: a private tutor in Bern (1793–97) and Frankfurt (1797–99); Privatdocent at the University of Jena (1801–1806), where he was named Professor Extraordinarius in 1805; editor of the Catholic newspaper *Bamberger Zeitung* (1807–1808); headmaster of the Aegidien-Gymnasium in Nuremberg (1808–16); and a professor at the University of Heidelberg (1816–18) and the University of Berlin (1818–31).
Hegel's parents determined fairly early in his life that their academically gifted son was destined for the Protestant ministry in the duchy of Württemberg (where Stuttgart was located). However, instead of being sent off to a “cloister school” (a boarding school to train young men to attend one of the Protestant seminaries in Württemberg), he was allowed to attend the local Stuttgart Gymnasium (a university preparatory school). The Stuttgart Gymnasium had a more humanistic and Enlightenment oriented curriculum than any cloister school, and this offered the young Hegel an education in the arts and sciences he could not otherwise have had.

It thus should not have been surprising that almost immediately on arriving at the seminary in Tübingen, Hegel himself decided that he did not want to become a minister, but he was prevented from transferring to studies in law by his father. Importantly for him, though, while at Tübingen he shared a room with two other budding seminarians who had also decided that they too would never become the Protestant ministers they were supposedly destined to be: Friedrich Hölderlin (who was to go on to become one of Germany’s most famous poets) and Friedrich W. J. Schelling (who was to compete with Hegel for the title of Germany’s leading philosopher). The three shared not only their distaste for their supposed future careers, but also an enthusiasm for the French Revolution, together with a passion for both ancient Greek literature and philosophy and the new philosophy being developed by Immanuel Kant. In their friendship and companionship, each of the three profoundly shaped the intellectual futures of the others.

I. JENA 1801–1807

Unlike his friend Schelling, who staged a meteoric rise to intellectual fame almost immediately after graduation from the seminary, Hegel had a rather difficult time in getting himself established. He was a house tutor for well-to-do patrician families, first in Bern and then in Frankfurt, and after a painful decision to abandon a projected career as an independent “man of letters,” he joined Schelling at Jena in 1801. There he became an unsalaried teacher working on some common projects with Schelling, who was by then a fully paid full professor. His financial support at the time consisted in a small inheritance he acquired after his father’s death in 1799 and the meager fees he could charge students for attending his lectures. Hegel began developing his own views in Jena, first as a follower of Schelling’s own program in post-Kantian philosophy, and then increasingly taking an independent direction as the years went by. After Schelling’s departure from Jena in 1803, Hegel was increasingly under pressure to produce a book so that he could manage to find a salaried position as
a professor somewhere in Germany. He wrote out several drafts of such a book, only to put each new draft aside as ultimately unsuitable to what he was trying to say. In 1807, he published his first great work, the *Phenomenology of Spirit*, a long book that he seems to have written virtually as a first draft in the year of 1806.

II. PHENOMENOLOGY OF SPIRIT (1807)

Hegel claimed that the *Phenomenology of Spirit* was to be the “Introduction” to his whole system of philosophy, which was supposed to follow immediately after the publication of the *Phenomenology* (but which in fact had to wait for several more years). Later on, his students noted that he always referred to the *Phenomenology* as his “voyage of discovery,” the book in which he found his own voice and which launched the distinctively Hegelian philosophical outlook.

The book was controversial from the date of its publication, and it has never ceased to be so. Not merely was Hegel himself inspired by it to go on to flesh out his whole system from its basis, countless others since then – from Marx to Cassirer to Heidegger to Sartre and Merleau-Ponty, to name just a handful of people affected by it – have taken it to be the work in terms of which one had to fashion one's own thought. Not unsurprisingly, the book itself has spawned all kinds of different and often inconsistent interpretations (since it has, also unsurprisingly, given rise to Marxist, neo-Kantian, existentialist, and hermeneutical-Heideggerian interpretations of its content). Hegel claimed, rather ambitiously, that his book was not merely another philosophy book responding to problems in academic philosophy but in fact that modern European life after the French Revolution itself required such a philosophy book for it to make good on its own aims and promises. To that end, Hegel began the book with a set of densely argued chapters having to do with the kinds of issues one normally encounters in a graduate seminar in the philosophy faculty. In the chapter labeled simply, “Consciousness,” Hegel argued that all attempts at locating a kind of firm starting-point for thought in any kind of direct awareness of the world, something that would be self-sufficient on its own and that required nothing else to secure its own authority, all failed because of internal contradictions and failures within those attempts themselves. This was one example of what he took to calling “dialectical thought,” where a position is rebutted not by showing that it fails to take into account certain facts nor by its failing to match up with,

3. For a discussion of Hegel’s first French interpreters, see the essay by John Russon in *The History of Continental Philosophy: Volume 4*.
say, widely held beliefs or common sense, but by virtue of the way it inherently generates within the terms it has set for itself mutually contradictory results that cannot themselves be resolved or accommodated within those terms. Thus, all attempts to show that we could know certain truths about the world or ourselves by way of an unmediated direct acquaintance with those things or truths (and on which we could supposedly then build a more complex edifice of thought) rested on a promise that could not in principle be fulfilled.

What, therefore, the chapter on “Consciousness” is supposed to have shown is that all such putatively direct awareness is itself necessarily bound up with a kind of self-consciousness, a way of taking ourselves to be involved in setting the bounds of normative authority instead of having it, as it were, automatically set for us by the objects of direct experience. Or, to put it in more Hegelian terms, the kind of immediacy we find in our ordinary experience of the world turns out to be itself mediated by a more complex way of understanding ourselves and our place in that world.

**Self-consciousness**

The next chapter in the book was thus labeled simply “Self-Consciousness.” There Hegel argued that the entire context of all our intentional acts and our cognizant awareness both of ourselves and the world has as its normative fabric a set of acts of recognition among agents.4 There Hegel argued, first, that all forms of self-consciousness inherently involve our consciousness of others as also self-conscious – that all our subjective perspectives on things inherently involve seeing others as also having such subjective perspectives – and thus all self-consciousness is inherently social; and, second, that there is no “natural” or automatically given set of social rules that structure such recognitions, so that there is, at least at the outset of human history, always a struggle over such recognition, which amounts to a struggle as to who is to set the rules that are to have the authority to structure such recognition. Since there is no natural way to resolve such a dispute, the conception of human self-consciousness as inherently social begins with a conception of the very struggle itself over such authority. When one of the participants in the struggle shows himself willing to make this into a life or death struggle, and one of the participants out of fear of death (and not from any more rational or universal grounds) submits to the authority of the other, one has the familiar human relationship of mastery and servitude.

---

4. “Recognition” is here the translation of the German term Anerkennung, where it means something like “bestowing a normative status,” such as when one country diplomatically recognizes another, and not the more usual English sense of “recognition,” where it has the meaning of psychologically identifying something as what it is, as when one says that “I recognized you as among the people in the audience.”
(This is often called the dialectic of “master and slave.”) However, such a resolution of the struggle is as unstable and self-undermining as was the resolution of the more abstract questions raised in the “Consciousness” chapter. The master demands recognition of his authority from the slave, but it is precisely because the slave has no such authority to bestow such recognition that he cannot fulfill the master’s demands for it. Likewise, the master claims a self-sufficiency for himself, but he then becomes completely dependent on the labor of the slaves forced to work for him. The slaves, on the other hand, acquire a more nuanced view both of themselves and their world since they have to learn to submit their own, more immediate set of desires, to the purported normative authority of the master. This gradually leads the slaves to a new consciousness of themselves as only contingently and not authoritatively subject to the commands of the master: to the realization, that is, that the masters rule only by force and not by reason or divine right.5

Hegel finished his chapter “Self-Consciousness” by showing how the ancient Greeks and Romans found themselves gradually compelled to take up the philosophies of stoicism and skepticism as ways of affirming the kind of “inner” freedom that the slaves had discovered in their work for the masters. This led, so Hegel argued, to a kind of “unhappy consciousness” in which the people of late antiquity and early Christian Europe came to understand themselves as under the “mastery” of a divinity that had withdrawn from them. In that condition, they thus experienced a profound alienation of themselves from their own organic embodiment, from the source of the authority of their self-conscious lives, and from their own political communities. However, in learning to construct the perspective of a “God’s eye” view on things, they also managed to recreate for themselves a newer version of the more ancient Greek conception of reason as being “all reality,” and with that, they laid the building blocks of modern European life.

Reason

Hegel followed the chapter “Self-Consciousness” with a very long chapter titled simply “Reason,” in which he took on various developments in the sciences since the Renaissance, which he finished off with a somewhat humorous examination of the emerging pseudo-sciences in his own time of physiognomy and phrenology (that is, attempting to come up with lawlike relations between character

---

and moral dispositions with the shapes of the face or bumps on the skull). Such crudely naturalistic reductions of human mindedness (or “Geistigkeit,” as Hegel called it) were themselves illustrative of how the more serious and subtle naturalistic reductions of human life all go wrong. The naturalist reduction in effect says that all things are to be explained as events instantiating causal laws, and that only natural scientific method is adequate to carry out such explanation; such reduction, in effect, only says in more subtle ways what the phrenologist says more crudely, namely, that “consciousness is a bone.” They all fail to explain how it is that one would ever have the normative authority to make such explanations in the first place.

The rest of the “Reason” chapter explores various ways in which attempts at constructing a more rational (in the modern sense) way of life in early modern Europe each dialectically broke down, that is, each defined itself in terms that were at odds with itself and which made such ways of life unlivable for their participants. Strikingly, almost all of Hegel’s examples of these come not from philosophy texts or history textbooks but from various literary sources, some of which Hegel had to have been reading as he was composing the chapter itself. In that series of subchapters, Hegel illustrates various failures of modern ways of life that understand themselves to be taking an individualist view of the relation between agents and reasons and among agents with each other. A Faustian view of knowledge as the power to get what one wants turns out to result in a tragic, unintended submission to a kind of unforeseen necessity. A way of life that understands itself as a collection of agents finding their destiny in what the “hearts” of each compel each individual to do ends in a kind of madness wherein each ends up thinking that it is the world around him that has gone insane. A moralistic, aesthetic self-understanding of oneself as a knight of virtue in an otherwise self-centered individualist world ends in the self-discovery of the self-styled knight of virtue that he is just as self-centered as is his opponent. Finally, an overly theatrical conception of one’s own self-sufficiency and authenticity that puts one’s own subjective sincerity and interiority at the top of the normative ladder itself ends up with a realization of how such a view not only invites a deception of others about one’s real motives (and thus also invites hypocrisy) but even more disastrously leads to a self-undermining self-deception about who one is in the first place.

The chapter ends with a short and often criticized dispute with what seems to be an overly formalistic interpretation of Kant’s conception of morals. Hegel’s point, as he makes clear at the end of the chapter, is that any such attempt at making individuals the prime legislators of moral principles — any attempt to make moral principle a matter of individual human autonomy — falls apart in the very terms by which it explicates itself to itself. Reasons for action must have an independence from the agent for them to be reasons; yet, so it seems, the
demand for individual autonomy – so successfully put on the table by Rousseau and Kant – is itself also a non-negotiable condition of modern agency. Modern life itself thus seems trapped in a competing set of demands that cannot, at least on first reading, be negotiated.

*Spirit*

That provoked Hegel into introducing a new chapter, which was even longer than the preceding one, titled simply “Spirit.” In “Spirit,” Hegel makes the case for what it would mean to say that reasons are relative to a form of life and still have a status that is independent of any individual act of will. The chapter is overtly historical in its movement, and its basic theses are central to Hegelianism. First, there is his view that “shapes of spirit,” that is, “forms of life” (two alternative formulations of the same phenomenon that Hegel often gives) are differentiated by what they take to be normatively authoritative for themselves (or, to put it more loosely, by how they understand their ground-level commitments about what it means to be a human agent). Second, such “shapes of spirit” change over historical time. Third, the development and changes in such “shapes of spirit” can therefore be comprehended as a kind of progress within that movement which is marked internally to the historical succession of such shapes.

To show this, Hegel begins with an account of ancient Greek life in which in the ancient polis each individual, in a manner analogous to that of a Leibnizian monad, understands himself or herself to be mirroring the whole within his or her own limited spheres and as thus having the authority to carry out the unconditional demands of his or her own sphere because of the very authority of that whole mirrored within his or her own station in life. The result of each acting in such a way was thus understood by the ancient Greeks to result in a spontaneously produced and beautiful harmony of social life. The problem with such a form of life, so Hegel famously and controversially argued, was that for it to work, it both had to produce “individuals” who did what they had to do and who could brook no negotiation over such unconditional demands, and it had to destroy the very individuals it demanded of itself when they became the individuals they were required to become. Sophocles’ tragedy *Antigone* perfectly illustrated this, so Hegel claimed. In the play, Antigone’s uncle, Creon, has taken rule of the city and has forbidden anybody to perform the required burial rites on Antigone’s dead brother. This brother had attempted to take the crown that he thought was rightfully his (which Creon had already assumed) and had died in doing so. As his sister, Antigone finds herself unconditionally compelled to perform the required burial rites and at the same time unconditionally compelled to obey her ruler (who is also a male relative with the right of command over her), and she is forced to choose which of the two duties she is
to fulfill. She is apprehended by Creon’s forces and condemned to death by him, a decree that brings a whole set of tragic incidents down on Creon’s own family. The chorus tells Antigone near the end of the play that her downfall lies not merely in her having defied Creon but in her assumption of a kind of autonomy for herself that is strictly forbidden to all Greeks and especially to women.

The rest of the chapter consists in a dazzling and, admittedly, obscure analysis of why, first, Roman life – which understood itself as the successor to Greece – undermined itself by way of its own contradictory demands on itself, then of how early modern and modern European life in its own cultivation of individuality and aristocratic glory generated a new set of self-imposed contradictions and tensions. This is followed by an analysis of how Enlightenment ideals of a rational life failed to make themselves livable by imposing very abstract ideals on its adherents that were themselves at odds with themselves. The internal collapse of this order into the chaos of the French Revolution cleared the way for a new and more adequate self-understanding for modern Europeans. At the same time, these abstractions also necessarily resulted in the Jacobin Terror, since in undermining all the claims that “tradition” or “nature” had made, they at first had nothing with which to replace the older order except for the competing claims of different factions as to who “really” spoke for the nation. Pushed to its logical conclusion, the abstractly formulated ideal of “being rational” offered no more guidance than that of a kind of abstract utilitarianism that could only understand individuals as eliminable parts of a whole, not as creatures with dignity on their own.

In fact, even though the French Revolution found its social expression in the revolution itself, it found its best articulation, so Hegel went on to claim, in Kantian and post-Kantian philosophy, where the ideals of the “absolute freedom” that had ended up with the zealots of the guillotine were shown in fact to issue in the ideal of a kingdom of ends in which each individual was both sovereign and subject. However, orthodox Kantian principles were themselves also too abstract to function as genuine guides to action, and the rigorist demand by Kantians that one do duty for duty’s sake (mirrored by the rather cruel rigorism of Robespierre’s version of how true virtue required a crass utilitarian sacrifice of individuals for the good of the whole) inevitably led to a kind of hypocritical “play-acting” about what one’s “real motives” were. The harshness of the demands of both Robespierrian and Kantian virtue provoked a modern kind of withdrawal from the demands of morality itself, in which “beautiful souls” maintained their own self-styled integrity by combining the refusal to act with a harsh judgmental moralism about those around them who did. Hegel ended the chapter with a kind of dramatic narrative of how two such beautiful souls come to see this as an impossible way of life and, in a secular reenactment of Christian morality, each forgives each other for their
own one-sided condemnation of the other and reconciles himself to the fact they are all, as it were, sinners.

Religion

“Spirit” was followed by an even longer chapter with the title “Religion.” In that chapter, Hegel sketched out what it would mean to think of religious life as a kind of collective reflection on what absolutely matters to humans and what they understand themselves to be in the terms of such reflection. As with the other chapters, a short summary necessarily fails to do even faint justice to what Hegel has to say there. He ambitiously sketches out a program for understanding how humans take the divine at first in their prehistory as something ineffable in nature, then as “out there” beyond nature, and then in terms of how divinity is to be understood anthropomorphically in Greek religion (the one phase in human history where beauty and truth coincided). In Greek anthropomorphic religion, the union of the conceptual ideals of divinity and the reality of religious practice matched up with each other in the sensuous depiction of the Greek gods in poetry and statuary. Greek religion was thus an “art-religion,” but it in turn provoked a kind of inward turn that issued in the new conception of the subjective point of view of individuals as having more authority than before and therefore not in principle being fully and exhaustively expressible in sensuous, artistic shapes. With its idea of God becoming flesh, Christianity became the religion that brought the demand for the expression of subjective individuality into concrete religious practice, and Hegel took the Christian idea of Kenosis – of God emptying himself of his divinity in order to take on human shape – to be the appropriate metaphor for thinking about how “spirit” had emptied itself of its Greek ideals only finally to take on a reconciled, more human shape in modern life. Christianity was thus the “revealed religion,” the end of the line of the development of human religious self-understanding.

But just as Christian religion – as the religion of a God-Man who spoke in parables and who, through his disciples, left his words behind for others to contemplate – inevitably required theology to make sense of itself, likewise in turn theology, by submitting the claims of religion to the tribunal of reason, inevitably required philosophy to make sense of itself. With the Kantian assertion of the autonomy of the philosophical faculty from the theological faculty in universities, the appropriate understanding of the final religion, Christianity, was thus subordinated to that of modern philosophy, which itself (and not religion) embodied and exemplified what Hegel rather portentously called “absolute knowledge,” the title of the last and very short chapter of Hegel’s book.

The book was immediately recognized as a major and original contribution to the already overheated philosophical and cultural debate swirling around
Germany at the time of its publication. (Hegel himself claimed to have written
the last chapter on the eve of the battle of Jena, where Napoleon humiliatedly
defeated the vaunted Prussian army in about a half hour and thereby put to rest
the dreams on the part of many Germans of ever restoring the rather humor-
ously named Holy Roman Empire of the German Nation.) Indeed, an early
reviewer of the *Phenomenology* noted that if Schelling was, as many had taken
to calling him, the “modern Plato,” then in light of his new book, Hegel should
be called the modern “German Aristotle.”

Unfortunately for Hegel, this did not lead to any job openings for him, and
with his inheritance now finally exhausted, he was forced to take a job editing
a pro-Napoleonic newspaper in Bamberg from 1807 until 1808, when an old
friend managed to land him a position as the rector and philosophy teacher
at a college preparatory school in Nuremberg. Hegel settled into his new life,
but he never gave up hoping for a university position. He even married into
the Nuremberg patriciate while living there, and he became quite a figure in
Nuremberg social life.

## III. SCIENCE OF LOGIC (1812–16)

Between 1812 and 1816 he managed to write and publish the second part of
his system, *The Science of Logic*, which helped to further cement his reputa-
tion as one of Germany’s leading thinkers. The book is as obscure as is his
*Phenomenology*, and it is rendered even more murky by the fact that it self-
consciously deals in logical and metaphysical abstractions rather than in the
richly characterized “shapes of life” that were the backbone of the earlier work.
In his first few years in Jena, Hegel had written several drafts of such a “logic”
in which he had tried to show how everything depended on how one came to
grips with two issues that exercised philosophy since at least the time of Socrates
and Plato. First, there was what he called in Jena the “original relation,” that is,
what seemed like the fundamental, ground-level distinction between thought
and what thought was about (or “thought” and “being” as he called it). Without
that distinction between thought and what it is about, which is independent
of thought, there can be no such thing as truth. By the time he got around to
writing his published *Logic*, he argued instead that such an “original relation”
was in fact not so fundamental and that the more fundamental thought, as it
were, was that of *truth* as the world being the way we *say* it is. Such a “thought”
of the unity of thought and being itself was perfectly captured by the category
of “being” itself, that is, of the most general concept we have of the world as it
is when we think of it truly. Since we potentially go wrong when we think it
as being one way as opposed to another, the only adequate expression for this
most primitive conception of truth is simply the thought of being as what simply “is” and nothing more (an idea articulated thousands of years before by the Presocratic Greek philosopher, Parmenides, when he comments that “Thinking and being are the same” [fragment III]). However, in its very articulation, that rather simple conception of “being” turns out to be equivalent to the thought of “nothing,” and since it cannot be true that being is different from nothing and is the same as nothing, the original category of all logic, indeed, of all conceptions of truth itself, is therefore thrown into motion as thought attempts to re-establish its harmony with itself and to deal with the contradiction it has just incurred on itself. The dialectic that had been shown to be at work in human self-understanding in the Phenomenology thus also made its appearance in the Logic in, as it were, pure thought’s attempt to grasp what it is for it, thought, to be true. As the Logic develops, each potential unconditional grasp on the part of thought of itself as having this or that structure – that is, of having given an exhaustive account of itself that had no other conditions outside its account – illustrated, so Hegel argued, Kant’s claim in the Critique of Pure Reason that reason, when it pushes itself to such unconditional accounts of itself, issues forth in contradictions, or “antinomies” as Kant called them. Kant’s mistake was to think that reason could not overcome those basic contradictions in a richer, more fully dialectical account of itself, and Hegel took his Logic to be the proof that it was capable of doing so.

Hegel divided his Logic into three books. The first one, “Being [Sein],” was the exposition of how an account of thought and being in terms of individual existents was itself self-undermining when it took itself as absolute (or “unconditional” in Kant’s sense). Such an nominalist (or “individualist”) account of thought and being itself concluded in an account of an infinity of individuals that itself made no sense in the terms in which such an infinity had to be expressed with that limited kind of “logic.” The second book, “Essence [Wesen],” treated the logic inherent to the complex unity of thought-and-being-as-held-together-in-one-thought-of-that-unity, and it resulted in various accounts of the relation between the two as consisting in the relation between appearance and reality, or of superstructural appearance as explained by substructural reality and the like. Such a “logic” culminates in something like a Spinozistic conception of the absolute as “substance” and of appearance as something like Spinozistic modes of that substance.

However, such an account in “Essence,” so Hegel argued, contradicted itself when it tried to explain how it was that Spinozistic thought could ever possess the normative authority it needed to show that such an account was true and not simply something that a thinker was caused to think. For that kind of absolute account, one needed another “logic,” which formed the third book, titled “Concept [Begriff],” in which the traditional Aristotelian logic finally made its
appearance (rather late in a book with the title *Science of Logic*). There Hegel came to terms with the second issue that had vexed philosophy since the time of Socrates and Plato. Since its inception, logic treated the relations among concepts, particularly as they had to do with inferences, and the entire structure of Aristotelian syllogisms was meant to bring out the structure of those conceptual relations as they appeared in judgments. However, in many judgments, if one were to judge truthfully, one had to determine if a certain particular “fell under” the concept. (If one said, “the rose is red,” one had to determine if the particular was indeed a rose and if indeed it was red.) Since logical compulsion was a matter of relations among concepts, it followed, so it seemed, that the relation between a concept and a particular falling under it could not in principle be a matter of logical compulsion, and if it was not logical compulsion, then it was not rational compulsion, and if it was not rational compulsion, then the ideas of truth and falsity could not apply. To that, Hegel responded that it therefore had to be the case that something similar to Kant’s infamous idea of a “schematism” of categories in the *Critique of Pure Reason* had to be at work in our dealings with the world, and that besides the formal “subjective” logic of syllogisms, there had to be a material “objective” logic of how we understood in the most general terms what it meant for our concepts to have particular instances. (In Kant’s “schematism,” Kant argued that in order to apply the pure categories to experience, we needed to have a set of principles by which to make the application, and this set of principles had to be such that it did not find itself trapped in a vicious regress of having to apply rules to apply the rules, *ad infinitum*.) To have a grasp of a concept is thus not merely to be in possession of something like a rule of inference but also to be in possession of something like an ability to see what it is required of us to be truly grasping what the world is like when we make a judgment (a kind of logical reworking of the Aristotelian doctrine of *phronēsis*, good judgment, in Aristotle’s ethics). The grasp of how both these “subjective” and “objective” logics work together is itself the grasp of how norm and reality fit or do not fit together, or what Hegel called the “absolute Idea,” which in his terms, was defined as the “unity of concept and reality.”

IV. ENCYCLOPEDIA OF THE PHILOSOPHICAL SCIENCES (1817–31)

In 1816, as the third volume of the *Logic* was appearing, Hegel finally got what he had long yearned for: he was offered the professorship of philosophy in Heidelberg. While there, he published in 1817 another book in which he finally provided at least the outline of his entire system. (Hegel intended it to be an abstract overview of his entire system that he could use as a textbook for his lectures; the abstract examples could then be fleshed out orally.) He called it the
Encyclopedia of the Philosophical Sciences, and it was divided into three sections. The first was an outline of his newly published Science of Logic. (The Encyclopedia version of the “logic” has come to be known as the “lesser logic” and the longer, prior Nuremberg text as the “greater logic”; the small differences between the two texts have agitated Hegel scholars ever since.) The next was titled, “Philosophy of Nature,” and the third simply “The Philosophy of Spirit.” Puzzling to followers of Hegel’s thought at the time was the omission of the Phenomenology from this system, and the way the first three chapters of the earlier Phenomenology reappeared instead as very short sections in the middle of the third section of the Encyclopedia. In an expanded edition of the book in 1825, Hegel even noted, without much explanation, that the 1807 Phenomenology was “no longer” the introduction to the system and had been replaced by the new introduction to the Encyclopedia itself. But Hegel never disavowed the Phenomenology, and to this day, the relation of the 1807 Phenomenology to the post-1817 “System” remains a matter of no small dispute among Hegelians and Hegel scholars.

V. ELEMENTS OF THE PHILOSOPHY OF RIGHT (1820)

In 1818, Hegel moved to Berlin to assume a professorship there in philosophy (as Fichte’s successor). It was at this point that he became the intellectual celebrity known simply as “Hegel.” His lectures were attended by hundreds of students and by notables from around the city, and he came to exercise a kind of intellectual authority of which probably many professors dream but that close to zero ever achieve. He also became a highly controversial figure, since there were those in Berlin who saw him as bordering on being a dangerous subversive whereas there were others who saw him simply as an obsequious toady to the authoritarian Prussian government. Which one of those was the real Hegel itself became a matter of heated historical dispute, whose fervor is only recently cooling down.

The argument about the “real Hegel” came to its flashpoint in 1820, when Hegel published his Philosophy of Right, the mature statement of his political philosophy. The 1807 Phenomenology, which offered itself as the statement of the genesis and justification of modern life, had been silent on that matter, and the 1817 Encyclopedia had only hinted at the outlines of Hegel’s own thoughts on the matter (although in fact Hegel had laid out the 1820 book in some lectures given at Heidelberg before he came to Berlin). In that book, Hegel divided his theory, as was typical, into three parts. He began with an introduction that argued in good post-Kantian fashion that the only unconditional claim on the will was that it be free, that is, that it can only be obligated by a law that it can comprehend as having been given to itself by itself. However, such a free will should not be conceived in more Kantian terms as the will of an autonomous individual abstracted out
of the fabric of mutual recognition (*Anerkennung*), nor should it be taken in Kantian terms as exercising a kind of special causality that somehow escapes the constraints of the causality of the natural world. Rather, it should be construed as acting in light of reasons that are both “one’s own” and which can be legitimated by appeal to reason itself and not by appeal merely to tradition, nature, or ecclesiastical authority. To be free, Hegel said, was to be “at one with oneself” (*bei sich*) within the fabric of recognition by others; it was, that is, to combine a kind of modern reflectiveness – a willingness to submit any claim to scrutiny – together with a kind of absorption in a daily life structured around social facts that offered individuals satisfying and rationally defensible plans of life that oriented them in shaping their lives in terms of their temporal limits (birth, maturation, aging, death) so that the shape of life could be acknowledged as “their own.”

The first such division was that of “Abstract Right,” where Hegel gave his own dialectical explanation about why the now familiar triad of modern rights to life, liberty, and property were in fact required as ways in which such freedom as “being at home with oneself within the fabric of recognition by others” could be made more specific and concrete. The next division was that of “Morality,” in which Hegel reiterated his criticisms of Kantian ethical theory as being too formalistic and in which he also argued that such a “moral point of view” had tensions and contradictions internal to itself that meant that it would inevitably fail as any type of exhaustive account of an individual’s or a community’s ethical life. The post-Christian and post-Kantian system of “morality” as the appeal to one’s conscience and to one’s own insight in grasping the rational compulsion of a moral principle (rather than blindly having to accept it out of the duty of “obedience” to an ecclesiastical or political authority), necessarily, so Hegel argued, led to a system of moral impasses, such as “lifeboat” examples where one has to decide whether to sacrifice an individual for a greater good. Thus, Hegel thought that within the modern system of “morality,” there could be no moral theory, strictly speaking, that reconciled these competing claims.

The reconciliation could come about, so Hegel argued, by showing how these ineliminable tensions and contradictions in “moral” life could in fact be made livable by understanding their place in a larger framework of institutions and social practices which he called “ethics.” Such institutions and practices form

---

6. Such examples in contemporary philosophical discussions are called “trolley car” cases, where one has to decide how to prevent a runaway trolley car in a way that involves foreseeable deaths as a result of one’s actions; Hegel’s own use of such examples occurs in his lectures on the subject and not so much in the text of the *Philosophy of Right* itself.

7. The actual term Hegel used is the ordinary German term, *Sittlichkeit*, which was to supplement *Moralität*; the usual term of art for rendering *Sittlichkeit* as Hegel uses it into English is “ethical life.” In ordinary German, the two mean roughly the same thing (as do “morality” and “ethics” in English). The slight difference between them has to do with the idea of *Sitte* as the
the “living good,” as Hegel describes it, a set of social facts that provide individuals with very specific goods (involving both maxims and ends of action). Such social facts provide individuals with independent ways of imagining and judging the lives they are to lead. As modern goods, they establish the conditions under which individuals can be “at one” with themselves by providing them with a plan, as it were, for how life is lived out over time (from childhood to adulthood, from being a child to being a parent), and they thus function as realizations of freedom in the modern world. 

Such social, “ethical” facts are to be thought of as instantiations of the “Idea” in Hegel’s sense. The “Idea” in Hegel’s sense is, as we noted, the supposed concept of the unity of concept and reality, that is, the union of norm and fact that is authoritative or “unconditional” for a form of life. In the ethical sense, it is the concept of how our ideals mesh with how we take the world to be (that is, with whether the world is to be understood as fundamentally thwarting the realization of our ideals, of being neutral to their realization, or of assisting in their realization). Part of Hegel’s very ambitious and complicated thesis in the Philosophy of Right is that modern social institutions and practices in fact make the realization of the modern ideal of freedom not only possible but actual: that the natural and social world of modern life fully cooperates, as it were, with the realization of the unconditional demand to be free.

To that end, Hegel argued that the status of the modern family functioned as such a realization of freedom in the way the partners to the marriage were to choose each other freely on the basis of mutual compatibility and emotional complementarity (instead of the union being something more like an economic or dynastic arrangement among the families of the wedding partners) and with its equal emphasis on the raising of children to be independent and to make a life for themselves. Likewise, the rise of a modern civil society with careers open to talent, a market organization held in check by various regulatory agencies, and a set of professional organizations that hold their members to ethical standards function as a way in which the modern aspiration to being “one’s own person” is actually and not just ideally realized in day-to-day life. Finally, the modern constitutional state, with a figurehead monarch and a set of representative institutions, provides the social space for a conception of citizenship that

mores or ethos of a form of life. Hegel drew on the idea of ethos embedded in Sittlichkeit to indicate the distinction between what he thought were two different concepts. Unfortunately, this makes rendering the distinction in English all the more difficult. A more literal rendering of Sittlichkeit would be “moreness” or “ethos-hood,” both of which are painfully and obviously unsuitable.

8. The term “Idea” – a translation of the German Idee – is almost always capitalized in English translations so that it may be distinguished from the more common use of “idea” in English, which captures some of the German sense of “Vorstellung.”
both realizes a way of being “at one with oneself” in the modern nation-state and revivifies the ancient Greek ideal of civic participation in a context much larger and more expansive than the face-to-face dealings of the ancient polis (the city-state) could manage.

Hegel’s Philosophy of Right was clearly a defense of the emerging “bourgeois” order in nineteenth-century European life. (Karl Marx was right about that.9) It also had little to no room for the emerging claims of feminism (which Hegel rather haughtily dismissed), and it had no overt room for democracy of any recognizable modern type (which, under the conditions of modernity, Hegel thought would amount to mob rule and the dominance of demagogues). Hegel did, however, argue for representative government (which he thought would be fulfilled by bringing in the early modern Estates and professional organizations known in Germany as “Corporations,” a prediction on his part that turned out to have little historical currency). Hegel also dismissed the American example as too young, too small, and too far away to serve as a model for Europe. His main points were that the unconditional demand of modern life was that of freedom itself, that freedom had to be understood not as the exercise of a non-natural causal power but as the capacity to lead one’s life in terms of reasons with which one was at one with oneself in social space with others, and that it was only through an examination of practices and institutions that we could find a way in which the competing claims of “Abstract Right” and “Morality” could be reconciled and fashioned into a livable form of life.

Unfortunately, Hegel brought down the wrath of people who might otherwise have been sympathetic to him with two unfortunate claims in his “Preface” to the book. First, he took a potshot at an old nemesis of his, Jacob Fries (1773–1843), who had been released from his professorship at Jena in 1819 because of his political views; Hegel expressed more or less a kind of satisfaction that this fate had befallen Fries. Hegel and Fries had basically held each other in mutual contempt since they were both in Jena, and although some of Fries’s views were indeed abhorrent – he was an atrociously fierce anti-Semite, even though he was also a kind of weakly communitarian liberal – many felt that this was kicking a man when he was down, and this hardened some of their suspicions about Hegel’s own commitment to reform movements in Germany. More importantly, Hegel insisted in the “Preface” that his philosophy was centered on the proposition that “What is rational is actual; and what is actual is rational.” The assertion involved much Hegelian jargon (such as the claim about something being “actual,” or wirklich), but its point was Hegel’s major thesis in the

---

9. For a discussion of Marx’s response to Hegel, see the essay by Lawrence S. Stepelevich, in this volume, as well as the essays by William Clare Roberts and Terrell Carver in The History of Continental Philosophy: Volume 2.
book, namely, that the modern world of social institutions and nature as we now grasp it through the progress of the natural sciences not only make it possible to actualize freedom in the modern world (where “actualize” in that context would mean roughly making a kind of normative ideal into reality) but that the modern social and natural world promotes this. Nonetheless, a great number of reviewers and readers took it to mean what on the surface it looks like it means, namely, that everything that currently exists is right, and what is right is what currently exists, which would certainly be as clear a statement of a reactionary and almost Pollyanna-like view of the world as anything could be.

The criticism personally stung Hegel, and he tried to correct the impression, but the charge stuck for a long time, and it continues to be a bone of contention today. The worry over what Hegel meant by this later divided the groups that came to be known as the “Left Hegelians” from the “Right Hegelians.” This idea of Left and Right Hegelianism came from a quip made by Hegel’s student, David Friedrich Strauss* (later to become famous for his own rather atheistic-Hegelian Life of Jesus) when he joked that Hegel’s school had divided itself analogously to the way that the initial leaders of the French Revolution had divided themselves according to those who sat on the left of the table (the Jacobins) and those who sat on the right. The “Left Hegelians” tended to take the proposition of the rational being the actual (and vice versa) as stating that the world had to be remade in light of the rational demands of philosophy, whereas the “Right Hegelians” tended to take the view as a restatement of the goodness of God’s providential order.

VI. THE POPULAR BERLIN LECTURES: 1818–31

After the publication of the Philosophy of Right, Hegel published no more new books, contenting himself with expanding his Encyclopedia (which went into two more editions), with writing numerous articles on various topics, but mostly with devoting himself to his lectures. The “lecture” at Berlin during this period was part and parcel of the Romantic reinvention of the university. The professor was to give his audience the cutting-edge summary of where research on his topic stood at the present moment, and he was to present, more or less, to the audience an embodied picture of ideas working themselves out in the personality before them. Hegel’s own dialectical approach to philosophy – of building ideas out of the seemingly incompatible claims of other ideas – was well suited for this end, and Hegel, who was a stuttering, mumbling, and otherwise difficult

*10. For a discussion of Strauss, see the essay by William Clare Roberts in The History of Continental Philosophy: Volume 2, as well as that by Lawrence S. Stepelevich in this volume.
lecturer, found that his Romantic audience instead took his fumbling hesitancies as the very manifestation of genius itself struggling to give itself expression.

Hegel’s lectures were never published in his lifetime, but student notes of them soon began to circulate as a valuable commodity in Germany. After his death, his students and friends gathered up as many of those lecture notes as they could along with Hegel’s own rather fragmentary notes to himself for use in his lectures, and they published them as separate volumes in Hegel’s posthumously published *Collected Works*. Those published versions of the lectures hardly meet the philological standards of our time. In them, there is no distinction made between what is a student note and what is Hegel’s own text. Moreover, since these lectures were given in different forms over different periods of time, they sometimes involve changes of mind and developments that do not appear in the published versions as changes or developments at all but simply as part of a supposedly unitary text that is supposed to read as if it had all been composed by Hegel himself all at once.

However, the texts based on Hegel’s lectures at Berlin on various aspects of his system did as much, if not more, to add to his fame as did any of his published works. His lectures on the “Philosophy of World History” attracted huge crowds, and both his “Lectures on the Philosophy of Religion” and his “Lectures on Aesthetics” continue to be among the seminal texts in the field. (The twentieth-century art historian Ernst Gombrich, himself a staunchly anti-Hegelian figure, even credited the lectures on aesthetics with more or less inventing the discipline of art history itself.)

In his lectures on the philosophy of world history, Hegel returned to the case he had made in his 1807 *Phenomenology*, but he was now outfitted with the ideas he had developed since that time. Thus, he argued to his audience that we must understand forms of life as succeeding each other in history, that each form of life is distinguished from another by how it thinks of itself, that how it thinks of itself can be expressed as its “Idea” (as the view of what the unconditional relation between norm and fact was for that form of life), and that with the advent of historical consciousness itself in ancient Greece, there was progress to be marked in the succession of forms of life in history, which could be seen as progress in understanding the “Idea” itself. Taking Aristotle’s formula for differentiating political regimes – roughly, the rule of “one” in monarchy, the rule of “some” in aristocracy, the rule of “all” in democracy – Hegel argued that the way we mark progress when we philosophically examine the succession of forms of life in history is something along the lines of Aristotle’s distinction. The East, he claimed, recognized only “one” as free (the emperor, the pharaoh), ancient Greece and Rome recognized “some” as free (male aristocrats), but the modern Christian world in principle recognizes “all” as free. Moreover, the development of history in Europe since the advent of Christianity is the successive and
painful attempt to work out the institutions and practices that would actualize
the abstract Idea of the freedom of all.

Hegel thus argued that we should understand the civilizations of the East
(China, India, and Japan) as in effect “stalled” forms of life. Their “Idea” remained
too abstract to provide any impetus for further development, and thus they
were unchanging, seemingly forever mired in the same conception of norma-
tive authority that they possessed when they first made their appearance on the
world stage. The civilizations of the Near East peaked with the Egyptian de-
velopment of its own “Idea,” which both brought the abstract “Ideas” of the East
to fulfillment and thereby brought itself down by making the contradictions in
them manifest. In good Romantic fashion, Hegel argued that the so-called Greek
miracle consisted in taking up those Egyptian ideas and incorporating them into
itself, which in turn necessitated their changing them into a more dynamic reli-
gious and political conception of the reality of human freedom. However, since
the “Idea” behind Greek life was still undeveloped, the Greeks also maintained
a commitment to slavery, and the type of individuality that Greek conceptions
of heroism demanded could find no place in the small, tight and enclosed world
of the polis. Suffering under its own contradictions, ancient Greece finally gave
way to the more imperial and legalistic power of Rome. However, Rome, like
Greece, could only recognize “some” as free, and the demands for full citizenship
in the Roman Imperium put stresses on its institutions that it could not handle.
The increasingly inward turn brought on by the Roman inability to deal with its
own contradictions led it finally to collapse under the rule of the religion it had
itself provoked, namely, Christianity.

Modern Europe was in effect the result of trying to work out in more concrete
terms the Christian message that freedom was the “essence” of all human beings,
and it came to the fore in the French Revolution’s complete and violent over-
throw of the ancien régime together with the rather rapid replacement of the
instability of the revolution by a more stable set of modern institutions (those
discussed in the Philosophy of Right).

Hegel’s views in his philosophy of history were undoubtedly Eurocentric,
and he sometimes displayed in his lectures on the subject not merely both his
prodigious learning and his capacity to synthesize large amounts of dispar-
ate material but also an unattractive tendency to make non-European ways
of life look even worse than the already tainted accounts of them on which he
was drawing made them out to be. (This was especially true of his lectures on
African civilization, where he exaggerated the already exaggerated aspersions
on African culture made in the literature available to him at the time.) He also
apparently used the phrase “the end of history” at least once in his lectures
(although not in his own notes on the subject), meaning by such a phrase that
in outline the main “headline” of history was now finished: history had moved
from the recognition of the freedom of one, to some, and now to all, and what thus remained to be done was not itself a particularly philosophical task but the hard labor of fashioning social and political institutions that would in fact adequately realize that ideal.

In his lectures on art, Hegel argued similarly. Just as forms of life change, so do styles of art, and it matters to us that there are such changes in style because art itself matters to us. Art matters to us because it is one of the three ways in which human beings reflect on what it is to be a human being, which in modern parlance we have come to see as being “minded,” that is, as geistig. Art presents in singular sensuous works various interpretations of what it is to be a minded creature and of what ultimately matters to such minded creatures, and like all other human artifacts, it can be understood only historically. Each work of art appears as the way in which a certain “content” – a view of what it means to be “minded” – appears in a certain “form,” and when the content “shines through” the form in a way that is adequate to the content, we have a beautiful, irreplaceable work of art. There are thus three and only three forms of art, Hegel argued. There is the symbolic form of art, in which the content that is seeking expression is itself so indeterminate and murky that its expression in any particular form is somewhat arbitrary; all the arts of the East and Near East, so Hegel claimed, are symbolic in this sense. There is the classical form of art, where the content seeking expression can find its perfectly adequate expression in particular forms; such is ancient Greek art, where the gods can be presented perfectly in statuary as embodiments of beauty (that is, as beautiful humans who never age or die) and where the heroes can be presented in poetry as the embodiment of what it means to be a perfectly free agent at one with oneself. However, since the dynamic of Greek life pushed it into taking on a conception of subjectivity, of the “infinite” interiority of each human life, their art eventually comes to realize its own shortcomings within itself. The dynamic of Greek life led it to a set of very basic civilizational problems for which there could be no purely aesthetic answer to the question: how can we be free? That demanded a real answer, not a new form of art. Romantic art, Hegel’s term for all Christian and post-Christian art, is taken up with the impossible project of representing mindedness in purely sensuous form, and the dissolution of such a Romantic project, which Hegel thought to be taking shape in his own day, made the status of appropriately modern art all the more up for grabs.

Because of his thesis about the very real difficulties a modern form of art has in being art, Hegel was said to have enunciated an “end of art” thesis analogous to his “end of history” thesis. However, Hegel never speaks of the “end of

*11. Hegel’s lectures on aesthetics are also discussed in the essay by Gary Shapiro in The History of Continental Philosophy: Volume 2.
art,” although he does say that in terms of its normative authority, art will never again possess the status it had for the Greeks (about which he seems to have fully accepted Herodotus’s claim that it was the poets – Homer and Hesiod – who gave the Greeks their gods). One of the very striking features of the lecture series is Hegel’s in-depth discussion of the particular arts – architecture, sculpture, music, painting, and literature – where Hegel’s own rather spectacular critical talents are on display.

In his lectures on the philosophy of religion, Hegel also replayed the themes of his earlier *Phenomenology*. There are changes in the history of religion that trace the changes in forms of life, and we can thus be said to be marking progress in religious consciousness just as we are marking progress in politics and art. Religion, like art and philosophy, is a mode of “Absolute Spirit,” Hegel’s jargon for the practices through which people reflect on what it means to be human in general. Although politics is also such a reflection, it is more limited and particular in its scope since the themes of politics are often quite local and bound to the tradition or geography of a people (and it thus belongs to what Hegel calls “objective spirit”). There are thus always political issues that are of great interest to locals but of no real interest to humanity at large, whereas the themes of art, religion, and philosophy are always of universal human interest even though, of course, the particular works of art are always mediated by the very specific ways of life, times, aspirations, and details of the form of life out of which they emerge.

The lectures on the philosophy of religion helped to cement Hegel’s fame both in his own time and in our own, and they remain a source of controversy. Interpretations of them run the whole gamut of possible positions. They have been taken as a synthesis of Protestant religious views that corresponds to Aquinas’s equally comprehensive synthesis of Catholic views, and they have also been taken as an expression of how atheism is the culmination of all religious views. Although Hegel himself always and sometimes rather vehemently maintained that he was to be regarded as a Christian, and he took particular affront at those who would label him otherwise, this has not stopped people since his own day from accusing him of exactly the charge he denied. He rather famously spoke of the death of God in relation to the Christian ideas about Jesus of Nazareth, and he specifically denied the idea of personal immortality (claiming instead that immortality belongs to humanity as a whole, not to individuals). If nothing else, this made him an unorthodox Christian. Moreover, Hegel’s God seems to be Aristotle’s God as Aristotle speaks of him in the last part of the *Nicomachean Ethics*. This is a God whose life is that of the contemplation of eternal truths, and we emulate him most closely and are therefore closest to the happiness of the gods when we pursue philosophical contemplation itself. It is this God that Jesus of Nazareth embodied, and it is his glory that
his crucifixion revealed. (On the last page of his *Encyclopedia*, Hegel even cited a passage from Aristotle’s *Metaphysics* to the effect that the life of God consists in mindedness contemplating its own structure.)

Hegel’s own wife even claimed to be shocked when she read the lectures in their posthumous form, and she claimed that the views she found in them were not the views of the man with whom she had lived so long. Hegel’s own complicated reinterpretation of Christian theology quickly became part of the Hegelian aftermath, as the “Young Hegelians” (among them, Friedrich Engels) took Hegel to have announced the “end of religion” just as he had supposedly announced the “end of history,” whereas some of his other admirers defended him as Christianity’s greatest thinker.

Hegel’s least influential series of lectures had to do with the “philosophy of nature,” even though the subject was near and dear to him. Nature *per se* has no history, even though our “Ideas” of nature quite obviously have such a history. Nonetheless, any “Idea,” as the concept of what the union of norm and fact would be, must incorporate a specific conception of the natural into itself. Against the Romantic “natural philosophers” of his own day, Hegel argued that a close inspection of the actual results of the natural sciences of the time showed that the Romantic conception of nature was wrong, and that there was nothing in nature itself, as understood by the results of the natural sciences, to undermine any of the claims made by the line of thought in his own version of post-Kantianism. What the empirical natural sciences show to us is that there are three different types of explanation for what is going on in the natural world. First, there are mechanical explanations, where we explain the whole in terms of the causal interactions of its parts (each of which is identifiable independently of its place in the whole under consideration – such as that of a planetary system). Second, there are chemical explanations for how different substances have an affinity or lack of affinity for each other in various combinations of them and how those combinations can therefore produce new chemical bodies; the chemical “whole” thus plays an explanatory role different from what it does in mechanical explanation. Finally, there are biological explanations that are teleological, that is, where the parts cannot be identified as organic parts outside their place and their function within the organic whole in which they function, in the way that a liver cannot be understood as a liver without understanding the functional role it plays in an organism. In their contemporary results, the empirical sciences, Hegel happily concluded, mirror in a loose way the various divisions of the *Science of Logic*.

Hegel also had some rather quirky views on a variety of specific topics concerning the natural sciences – for somewhat odd reasons, he refused to believe, for example, that water really was just H₂O – and he often took sides in contemporary scientific debates with the rather unfortunate consequence that,
more often than not, he turned out to have chosen the losing side. He denied that there could be evolutionary explanations of the origin of life or the species, since he accepted by and large an idea prevalent at the time that each species was so perfectly fitted to its environment that any gradual change in its structure would cause it to die out. All these quirks along with his willingness to speak out on scientific issues made him less than popular with Berlin’s natural scientists, who somewhat resented Hegel’s fame and his claims for the primacy of his own philosophy of nature in the university curriculum. Hegel himself even joked to the students at his lectures on the subject about how nonseriously he was taken by the natural scientists, but he held on to the belief that in that field too, his day would come.

VII. THE HEGELIAN LEGACY

Hegel’s legacy in European philosophy is hard to overestimate. In his own lifetime, Hegel’s impact rapidly went beyond the confines of Prussia and reached into all areas of intellectual life. However, famous as he was, his influence quickly waned. Hegel died suddenly in 1831, during the so-called second cholera pandemic, and by the mid-1840s his influence had virtually collapsed. However, his presence in European philosophy never vanished, and his key ideas of the necessity of understanding things dialectically rather than presenting things as following quasi-deductively from some single master principle (such as the categorical imperative) has continued to show up in various European thinkers. Marx claimed to be inspired by him and even boasted that he found Hegel standing on his head (as an idealist) and he put him upright (made him into a materialist). Likewise, his insistence that we must understand matters socially and historically, and that we must show how ideas relate to the going concerns of our times (including those of the natural sciences) have had much more of a life in European thought than they have in anglophone philosophy, where the approach to philosophy has typically been inclined to the ahistorical and analytical rather than the historical and social. At various times, parts of his system have been declared definitively “dead” while other parts are supposedly “living,” but exactly what is dead and what is living has itself changed over the period of the twentieth century. It is probably no surprise that Hegel has never really vanished from philosophical thought. He has remained a presence in Heideggerian, Gadamerian, and Derridian philosophy12 in our own time.

and he is now making a reappearance in what can broadly be called analytical philosophy.\textsuperscript{13}

If anything, what has inspired European philosophy since Hegel is the rejection of one of Hegel’s key claims about his entire philosophy. Hegel claimed that his system amounted to a true statement of “infinity,” that is, of the unconditioned, which Kant thought reason sought but could never achieve. For Hegel, on the other hand, true “infinity” is to be found in the normative structure of reason itself as it underwrites its own claims to absoluteness in giving accounts of itself, something that is supposedly illustrated or even enacted by the Hegelian system itself. For modern thought, so Hegel claimed, he had constructed a system in which nothing has to be simply “given” or simply taken on authority. Likewise, as a form of life, modern life is self-authorizing, and Hegel’s system thus claimed to be the paradigmatically modern system of thought. However, from Marx to Heidegger, the opposite – and perhaps peculiarly, even more Kantian – claim has prevailed. We are irreducibly finite, so they say, in our orientation; we always start from somewhere, and that “somewhere” will always be something “given” that we must simply accept without being able to give any further authorization for it. For these thinkers who have put “finitude” at the center of their thought, Hegel is the philosopher who shows us most clearly where we go wrong when we aim at such self-authorization, and we study Hegel to learn from his mistakes and to learn about the temptations that lead us there. Contra Hegel, these thinkers assert that there is no such self-authorization and that searching for it carries a distinct danger within itself. (This has been especially pronounced in the lines of thought represented by Heidegger, Schmitt,\textsuperscript{14} Foucault, and Derrida.) More recently, Hegelians have started to reply to that charge, but the jury is still out on whether their replies are convincing to what Hegel would describe as the shape that “spirit” has now assumed, a mode of thought that rather forcefully insists on its own finitude over and over again.

Translations

In 1815, after the defeat of Napoleon, the victorious nations of the “Holy Alliance” met at the Congress of Vienna to determine the future of Europe. It intended nothing less than the restoration of the political order that had existed in pre-Napoleonic Europe. In France, the Bourbon Monarchy was soon restored, and in the various states of Germany, the old stabilizing union of church and state was revived. Thereafter, and not unexpectedly, the established clerical and political aristocracy saw any reform movement as a dangerous threat to their traditional hold on power. In Germany, the forces of restoration, to insure that there be no return of the disruptive reforms embodied in the “Napoleonic Code,” relied not only on censorship and prison, but on the support of a conservative clergy whose own fortunes depended on political stability. However, and again not unexpectedly, this intransigent fixation of clerical and political conservatives generated even further resentment among those who sought to discard the obsolete residue of the medieval world. Prince Metternich, who had presided over the Congress of Vienna, was clear enough about what the proceedings foretold: that “Old Europe was at the beginning of its End … and a New Europe was coming into being.” Finally, in March of 1848, the long suppressed anger of the “Vormärz” generation broke forth in open rebellion. What had began as a restoration ended in revolution and the emergence of what we now term “modernity.”

In 1815, in that same year of the Congress, a small group of students at the University of Jena, where Hegel had once taught, gathered into a league set on

establishing the goals of German unity and democratic freedom. They called themselves the “Burschenschaften” (“student fraternities”), and in late 1817, having expanded into several thousands, these “Patrioten” gathered to celebrate the victory over Napoleon at Leipzig and the three-hundredth anniversary of the Protestant Reformation. A noisy celebration took place at the Wartburg Castle, where Luther had translated the Bible into German. Within several days, the students replaced their patriotic speeches with more active displays of nationalistic excitement. As Luther had burnt the Papal letter, so the students set about burning books they considered as opposed to German freedom and unity. Hegel, then Professor of Philosophy at Heidelberg, was quite critical of the whole hectic affair, and let it be known.

I. HEGEL AND HIS STUDENTS

During this time of unrest, Hegel had published a small work: The Proceedings of the Estates Assembly in the Kingdom of Württemberg 1815–1816. In it, and quite fitting to its rather noncommittal title, Hegel set forth a temperate and mediated opinion regarding the reconciliation of individual freedom and state unity, of the new forces of reform and the old order, or, as the students had it, of “democracy and aristocracy.” The Proceedings, along with his complaining of the excesses of the Wartburg Festival, could not but please the more liberal officials in Berlin, who had long sought his appointment to the Chair of Philosophy at the university. In their hopes that Hegel’s reasonable approach would help calm, at least among the students, their disruptive mood, they again offered him the position. Earlier, in 1816, he expected to be offered the appointment, but it was delayed by the then Minister of Culture who seemed to have had reservations concerning the “obscurity” of Hegel’s philosophy. This time, it being offered, Hegel accepted. In the fall of 1818, the Chair, which had remained vacant since the death of Fichte in 1814, was given over to Hegel. For his admirers among the liberal officials in Berlin, such as the new Minister of Culture, Karl von Altenstein, and the Minister of Education, Johannes Schultz, the appointment insured that a temperate and respected academic voice would be heard – and so it was.

It was true that Hegel’s voice would be moderate, as his whole philosophy was based on the reconciliation of opposites, and for him the most prevalent error of thought was to engage in the futile and endless play of polar opposites: of taking one exclusive side in an “either/or” debate. For anyone acquainted with Hegel,

---
the mantra “Thesis-Antithesis-Synthesis” comes to mind. Although Hegel did avoid the formula, labeling it “a lifeless schema [geistloses Schema],” it does nevertheless represent the central principle of all his philosophy, which has the overall intention of overcoming and reconciling contradictions. Philosophy is, but the movement of reason, the act of fully self-conscious thought that in its act reveals the contradictions latent in ordinary or natural understanding – of what Hegel termed “healthy common sense.” In his schemata, the first act of reason, of dialectical reason, was a negative and critical act, one that merely revealed the contradictions concealed in ordinary thinking. This first critical step was then followed by the reconciliation of the contradictions that had come to light; this reconciliation was the act of “speculative reason.”

For Hegel, the uncritical acceptance of any “one-sided proposition … can never give rise to a speculative truth.” No one-sided, either/or judgment, no definitive and exclusive statement presented as either true or false, can be accepted as a “speculative” truth – which is to say, a philosophical truth. Since philosophical or speculative truths cannot be cast into simple disjunctive propositions, they cannot be adequately expressed in common language, into judgments wherein either one side or the other is taken as either exclusively true or false. Such exclusive truths can serve only as the dialectical beginning of what, finally, can be developed into speculative truths. Truth is a consequence of reconciling contradictions rather than finding truth in one or the other of exclusive alternatives, it is the result of an inclusive “both/and” manner of thought rather than asserting exclusive “either/or” statements. Indeed, Hegel well realized the difficulty involved in presenting a speculative truth: “Speculative truth … means very much the same as what, in special connection with religious experience and doctrines, used to be called Mysticism.” This “mystical” truth, in all of its reconciliatory ambiguities, seemed to make Hegel’s philosophy, at least among the liberal officials in Berlin, well fitted for the role of mediating the political debates that disturbed Germany after 1815. But it was not until shortly after Hegel’s death in 1831 that the full influence of this ambiguity was openly expressed, an expression that was not in the least intended or desired by the officials in Berlin.

But there is also another fundamental principle underlying Hegelian thought that, once again in its ambiguity, allowed for the justification of either a conservative or a liberal worldview. It is cast in his famous formula, “What is reasonable is real, and what is real is reasonable [Was vernünftig ist, das ist wirklich; und

5. Ibid., 121.
was wirklich ist, das ist vernünftig].”6 In effect, this formula allowed Hegelians to decide whether or not the present state of affairs, cultural and political, was or was not rational. If not, then the present state was “unreal.” If, however, the present social circumstances were considered “real” then they were also rational, were justified. It all depended on what one would take as the basic criterion: what was real (actual) or what was rational (reasonable). Needless to say, there were more than a few who doubted the reasonability of the Prussian monarchy.

On arriving in Berlin, Hegel immediately began to compose his Philosophy of Right, which was published in 1820. In agreement with his earlier views as they were expressed in The Proceedings of the Estates Assembly in the Kingdom of Württemberg, he wrote:

The state is the actuality of concrete freedom …. The principle of the modern states has prodigious strength and depth because it allows the principle of subjectivity to progress to its culmination in the extreme of self-subsistent personal particularity, and yet at the same time brings it back to the substantive unity [of the state].7

In sum, the “modern state” is the reconciliation, the synthesis, as it were, of two apparent opposites: “self-subsistent personal particularity,” or autonomous individuals with the “substantive unity” of the state – a compromise between anarchy and totalitarianism. However, the ambiguity of this particular reconciliation became evident when it was later asked if the Prussian monarchy was indeed a “modern state”: in short, whether or not it was a “true” or “rational” state and so deserved to be taken as a “real” state. Those whose roles were legitimatized by that state thought it was. But there were others, drawn mostly from the young and unemployed academics, who did not think so. How these liberal Hegelians viewed the matter of the relationship between the real and the rational is clearly set forth in an example given by Friedrich Engels (1820–95): “In 1789, the French monarchy had become so unreal, that is to say, it had been robbed of all necessity, so non-rational, that it had to be destroyed by the Great Revolution – of which Hegel always speaks with the greatest enthusiasm.”8

It was not long before the young, and to use a modern term, the “disenfranchised” Hegelians, soon understood that “the conservatism of this mode of

---

outlook [Hegelian] is relative; its revolutionary character is absolute – the only absolute it admits."9

But if there was a potential political revolution concealed within Hegel's philosophy, there were also heretical possibilities. Certainly the Pietistic Christians suspected that he covertly intended to have the “Absolute Idea” or even human self-consciousness accepted as a new God,10 and that his philosophy might well be nothing more than an atheistic humanism – or, if pressed for more specific labels, perhaps a modern form of Valentinian Gnosticism.11

Adding to the dangerous aspect of his philosophy, the younger faculty at the university, as well as a growing body of students, began to look on Hegel as being a spiritual leader. The force of his “mystical” doctrines, such as the present actuality of the Absolute Spirit, which could be taken as God, literally “converted” his students into disciples. For them, “to become an authentic Hegelian,” it was necessary that “a person had to undergo an existential transformation, a philosophical ‘rebirth.’”12 An example of this “rebirth” is evidenced in the testimony of Bruno Bauer: “Hegel alone has given back peace and certainty to my unsteady spirit. From the first moment I heard them, his lectures held me chained and seemed to present nothing new but only the explanation of that of which knowledge is inherent in each of us.”13

Wilhelm Vatke (1806–82), later a theology professor at the university, was even more impressed by Hegel's lectures. As he wrote to his brother, “You will think I am insane when I tell you that I see God face to face, but it is true. The transcendent has become immanent … Oh, if I could only describe to you how blessed I am.”14

Confronted with this new “blessedness,” the leading Pietist, Ernest Hengstenberg (1802–69), warned his fellow clerics that it was very possible that this devotion to “Hegelian philosophy will in the near future develop into a much more diabolical force than the declining rationalism … It is our holy duty to watch out and to attack immediately.”15 Even before Hegel's death, one of his followers, Ludwig Feuerbach (1804–72), revealed the effects of that

---

9. Ibid., 12.
“diabolical force” in his work *Thoughts on Death and Immortality* (1830). As one commentator noted, the work is simply “a straightforward denial of the Christian belief in personal immortality, a plea for recognition of the inexhaustible quality of the only life we have, and a derisive assault on the posturing and hypocrisies of the professional theologians of nineteenth-century Germany.” However, the work was hardly noticed, since the press run was confiscated by the state censors, and its young author abruptly dismissed from his teaching post. And so, despite this early sign of how Hegelianism might be read by a Hegelian, the philosophy retained its official reputability.

On the day of Hegel’s funeral, almost all of Berlin’s leading figures, both academic and political, heard and seemed to agree with what was said of him. There were two official eulogies. In the first, the theologian Philipp Konrad Marheineke (1780–1846), rector of the university, proposed that absolute reason had indeed been rendered incarnate in Hegel, and that it was his philosophy alone that finally resolved the ancient contradiction between the infinite God and the finite world:

In a fashion similar to our savior, whose name he always honored in his thought and activity, and in whose divine teaching he recognized the most profound essence of the human spirit, and who as the son of God gave himself over to suffering and death in order to return to his community eternally as spirit, he also has now returned to his true home and through death has penetrated through to resurrection and glory.

The second eulogy, by Professor Friedrich Förster (1791–1868), followed the same tenor and meaning as the first: “Indeed, he [Hegel] was for us a helper, savior, and liberator from every need and distress, for he saved us from the bonds of madness and selfish egoism.” As a recent biographer of Hegel writes of these final words: “It was now clear that Hegelianism … had become something more than just an academic doctrine.”

It was not long after the funeral that the conservative Hegelians, without the personal and powerful support of Hegel, found themselves faced with the difficult task of demonstrating that his philosophy could indeed justify the

rationality of the Prussian state. After the French Revolution of 1830, German authorities were less inclined to fully validate a philosophy that might well prove to be a source of social unrest.20

For a brief time, there had been hopes among the conservative Hegelians that their academic world might accommodate speculative philosophy with the official world ruled by orthodox religious and political conservatives. But this was not to be. The delicate ambiguities within Hegelianism, which, for a time, allowed accommodation, proved too fragile to endure a sudden and open shock which clearly revealed to the Prussian authorities that Hegelianism could well serve as the philosophical basis for both atheism and socialism.21

II. DAVID FRIEDRICH STRAUSS

In 1835, a brilliant theological study was published, with the rather innocent title of *The Life of Jesus Critically Examined.*22 It was written by the young and little-known theologian David Friedrich Strauss,23 a recent graduate of the Protestant Seminary in Tübingen. Today it is difficult even to imagine the wave of public and political anger that erupted on the appearance of Strauss's work.

Thrown like a fire-bomb into the tinder-dry pietistic forest of Württemberg, it was indeed not surprising that the *Life of Jesus* ignited a conflagration which quickly spread through the whole of Germany. What in fact roused the anger of the orthodox was not the Hegelian conclusion … but the fact that Strauss’ book – if its conclusions be accepted – would demolish the whole historical foundation of the Christian faith. The bastion of which the Reformation had been built now seemed to have been completely undermined, and the mighty fortress about to collapse. Those who had set their faith on the biblical Christ now learnt that practically nothing could be known about the historical Jesus. God, Christ, the Bible – all

*21. Many of the figures and issues discussed in what follows are also treated in the essay by William Clare Roberts in *The History of Continental Philosophy: Volume 2.*

23. David Friedrich Strauss (January 27, 1808–February 8, 1874; born and died in Ludwigsburg, Württemberg, then Germany) was educated at the University of Tübingen (1825–30) and the University of Berlin (1831–32). His influences included Hegel, Kant, Schleiermacher, and Spinoza, and he held appointments at the University of Tübingen (1832–33) and the University of Zurich (1839).
appeared to have been overthrown by the intensity of the daring frontal assault, so that like the temple of Jerusalem, not one stone remained upon another.\(^{24}\)

But of all those disturbed by Strauss's *Life of Jesus*, few were more disturbed than the Hegelians who held academic posts – the “accommodationalists.” Unhappily, the suddenly notorious Strauss had candidly admitted that “From the beginning, my critique of the life of Jesus was closely tied to the Hegelian philosophy.”\(^{25}\) This was enough for Hegel’s detractors to prove what they had always suspected – that he was a serious danger to the established order – and it signaled the beginning of the end of official support for Hegel’s philosophy.\(^{26}\)

Strauss’s work had indeed the markings of a Hegelian. The famous triad appeared in his reconciliation of the antithetical views regarding the gospel narratives, in particular the treatment of the miracle stories. On one side stood the “naturalists,” such as Heinrich Paulus (1761–1851), who maintained that the miracles could be explained by recourse to purely natural causes. On the other side stood the “supernaturalists,” orthodox believers who took the miracle stories as literally true. But for Strauss, neither faith (which was in itself no rational explication) nor strained attempts to explain putative miracles as merely the effect of natural causes, were satisfactory. The key to his Hegelian reconciliation of the two antithetical views was found by taking each of the “miraculous” episodes in turn and demonstrating that in every instance they were ultimately the products of a fusion between a real natural event and the subjective religious inspiration of the one who took the event as a miracle. The product, the miracle, Strauss termed a “Myth.” Myths were not falsehoods, but merely a form of religious perception. Naturalistic attempts to explain miracles, as with Paulus, had been encouraged by the success of empirical science since the Enlightenment, which took “objectivity” as its normative stance. However, this very objectivity had led to the discounting of the important role that religious subjectivity played in creating the miracle stories. Strauss, who proceeded to critically examine every episode in the life of Jesus, concluded that the whole of the gospel narratives were fundamentally mythic creations grounded in the Messianic expectations of the Old Testament authors, and generated under the press of religious

---

enthusiasm. The basic stories were fictional, but “without evil design.” As Strauss had it, “In ancient times, and especially amongst the Hebrews, and yet more when this people was stirred up by religious excitement, the line of distinction between history and fiction, prose and poetry, was not drawn so clearly as with us.” The result was a mythic history. Neither supernatural nor a misunderstood natural happening, the Christian miracle stories were merely natural events that had been elevated into a supernatural history by an expectant religious mentality.

But there was something even more important in its consequences than Strauss’s employment of the triadic formula to reconcile the seemingly contradictory opposition between natural and supernatural arguments regarding the miracle stories. This had to do with the very nature of God, and it was also an attempt to reconcile the traditional contradictions between the finite and the infinite. Strauss was the first to clearly argue that Hegel’s philosophy had given reason for apprehending the Christian God, even in the person of Christ, as inherent in human nature. His proposal, once its conclusion was accepted, became the fundamental rationale for atheistic humanism, a conclusion that could not but undermine, if not finally destroy, the established political and religious forms of his day. In Strauss’s argument, the Hegelian mediation between the infinite and the finite meant, when used as a paradigm for the relationship between God and Man, that the infinite simply could not be contained within a singular finite being (Christ), and would of its nature disperse itself as the human species.

Humanity is the union of the two natures – God become man, the infinite manifesting itself in the finite, and the finite spirit remembering its infinitude … It is Humanity that dies, rises, and ascends to heaven, for from the negation of its phenomenal life there ever proceeds a higher spiritual life; from the suppression of its mortality as a personal, national, and terrestrial spirit, arises its union with the infinite spirit of the heavens.

In sum, if “the key to the whole of Christology” was to be found in simply understanding that the miraculous events marking the life of the historical Jesus were but mythic representations of the actual history of humanity, then the proper object of devotion was not the God-Man but rather the Human God, humanity.

29. Ibid., 780.
The Leben Jesu provoked a “panic-stricken terror” among orthodox believers, and “Strauss became a notorious celebrity overnight, and was everywhere regarded as the arch-fiend of the true Christian faith.” Insofar as the ancient link between church and state seemed threatened by Strauss's work, he was further damned as an anarchist and a danger to political stability. It was a combination of curses that would soon apply to all of those Hegelians willing to accept Strauss’s evaluation of the gospels and the reduction of God to Humanity.

III. BRUNO BAUER

Under increasing pressure, and wishing to distance themselves from Strauss’s radical reading of Hegel, the “Old” Hegelians looked to a brilliant young professor, the recently appointed Bruno Bauer. He had displayed his ability not only having earlier received, from Hegel himself, a prize for a writing on aesthetics, but in a series of well-regarded articles on biblical theology, which were published in such journals as the Jahrbücher für wissenschaftliche Kritik (Yearbook for Scientific Criticism), which was sometimes humorously referred to as the “Hegel-Gazette.” But as it turned out, the Hegelians had made a very bad choice in selecting Bauer as their champion.

Bauer immediately embarked on a series of articles in the Jahrbücher that had the impossible task of attempting to prove the logical inexorability of the Virgin Birth. The extremely complex and abstruse argument that Bauer presented had little consequence, and it was not long before Strauss responded. Not only did Strauss dispose of Bauer's effort to explain the Virgin Birth in Hegelian terms, but he went on to create the well-known classification of Hegelians “using the traditional analogy” as “Right,” “Center,” or “Left.” Bauer was, in taking the historical Jesus as a historical fact, justified by speculative philosophy, placed on the “Right.” For Strauss, the categorizations were not a matter of politics, but rather how the life of the historical Jesus might be taken in the light of Hegel’s absolute reason: as either fully in accord with it, or partially in accord, or not at all. In time, the ambiguous “center” was discarded, and the classifications were

simply reduced to either “Right,” which was identified with the conservative “Old Hegelians,” or the more radical “Left” or “Young Hegelians.”

Bauer, whose efforts Strauss publicly dismissed as “nothing but a trite and childish play” and privately ridiculed as a “foolish piece of pen-pushing,” was not long in coming to realize that Strauss's views were grounded in a correct reading of Hegel's philosophy. Within the decade Bauer had transformed himself into the opposite of what the Old Hegelians had expected, and by the late 1830s had become the “leader of the Young Hegelians in Berlin.” In 1839, while still at the University of Berlin, he found a student, and then a friend in the young Karl Marx (1818–83). Together they planned to edit a “Journal of Atheism” but Bauer was suddenly transferred to a new, and hopefully less sensitive teaching post at the University of Bonn. However, by 1842, his outspoken atheism resulted, after a debate among several German universities regarding the limits of academic freedom, in the revocation of his license to teach. The new Prussian monarch, the ultra-conservative Frederick William IV (1795–1861), who had ascended the throne in 1840, was not in the least tolerant of Bauer or, for that matter, any of the liberal Hegelian schools. Unhappily for Marx, whose name was closely linked with Bauer's, he saw his hopes for an academic career suddenly vanish. Needless to say, Bauer had lost all chance of a future teaching post, and so he shared the fate of many of his Young Hegelian colleagues: he spent the remainder of his life in a struggle against poverty.

Bauer's leading role among the radical Hegelians was greatly enhanced by his 1841 publication, *Trumpet of the Last Judgment Against Hegel the Atheist and Antichrist: An Ultimatum.* The anonymous author, seemingly a devout Pietistic clergyman, presented a case against the conservative Hegelians that went well beyond anything that Strauss, or anyone else, had undertaken – or perhaps ever has. It is an exhaustive, brilliant, and often vehement criticism of any reading of Hegel that would attempt to accommodate his philosophy to either orthodox religion or political stability.

As if ambitious to be even more the opponent of religious orthodoxy than Strauss, Bauer then embarked on a series of critical studies dealing with both the Old and the New Testaments. He ultimately argued that the historical Jesus had never existed, being nothing more than a Jewish Messianic fiction. As to

35. See Löwith, *From Hegel to Nietzsche*, 50ff.
37. Harris, *David Friedrich Strauss*, 80.
Bauer’s quality as a biblical scholar, Albert Schweitzer (1875–1965) noted that: “Bauer’s Criticism of Gospel History is worth a good dozen Lives of Jesus, because his work, as we are only now coming to recognize, after half a century, is the ablest and most complete collection of the difficulties on the Life of Jesus which is anywhere to be found.”

In his biblical studies, Bauer had more in mind than a simple critique of accepted religious belief; rather, he was interested in establishing the theoretical foundation for the exercise of total human freedom. In taking note of Strauss’s unrestrained treatment of that most sacred subject, the life of Jesus, Bauer embarked on a total and complete critique of all given religious and political principles, a critique that he termed “The Terrorism of Pure Theory.” This unimpeded and irreverent critical rejection of all that claimed to be either holy or traditional was the true expression of human life. Freedom was to think as one desired, “without preconditions [Voraussetzunglos].” This “Theory” seems to have been inspired by his reading of such earlier Enlightenment philosophes as the atheist Johann C. Edelmann (1698–1767). In any case he “felt himself to be Edelmann redevivus.” For Bauer, it seemed absolutely necessary to rid human consciousness of any trace of reverence toward the present practices of religious and political life, both of which were the expressions of obscure thoughts and simple ignorance. Together these forces had collapsed into the present oppressive false synthesis known as “The Christian State.” To leave this manifest contradiction unexposed and unquestioned insured the continued suppression of human self-consciousness and freedom. In short, adherence to the present state of political and religious thought was fundamentally inhuman. Nevertheless, Bauer, despite his admiration for the atheistic mind of the Enlightenment, never accepted the claim of that age that posited mathematical and empirical knowledge as superior to speculative reason. Bauer remained, as did all of the Young Hegelians, fundamentally a Hegelian.

Bauer’s commitment to the theory of radical criticism gave him little reason to practically engage in any actual and immediate attempt to revolutionize or rationalize the then existing state of religion or politics. His chosen role as “Critic” entailed only that he reveal the inhuman and alienating doctrines inherent in religion, and thereby, with that revelation, critically dissolve them. This purely cognitive action stood over and against any practical engagement to recast the given reality, and:

Thus the critic renounces all joys of society, but its sorrows too remain distant from him … The philistines who still throw stones at him, misinterpret him, and attribute impure motives to him … are not ridiculed by him, for it is not worth the effort, but are calmly looked through and sent back to their insignificant significance.44

His cynical passivity allowed him to avoid taking part in the failed revolution of 1848, although his radical doctrines, as those of his fellow Young Hegelians, had contributed to the foundations of that revolution. However, being sensitive to the charge that his theorizing was simply an impotent academic exercise, Bauer defended his “Terrorism of Pure Theory” by maintaining that, in time, it would generate a new and modern consciousness, one totally free from the stifling irrationality of the old religious belief. To this end, and to the end of his life, he devoted himself to writing a series of theological and political studies directed to the destruction of the “inverted world [verkehrte Welt]” in which he lived. His believed that his studies would ultimately prove to be a true “Philosophy of Action”: “Theory, which has helped us so far, will always remain as our only help in freeing ourselves and others … In time the illusory being [of religion] will be overthrown, and freedom, which Theory has given us, will be raised into a power which will give the world a new form.”45

As early as 1843, Marx had turned away from the “theoretical” revolution of his former teacher, Bauer, and had aphoristically noted that “It is clear that the arm of criticism cannot replace the criticism of arms. Material force can only be overthrown by material force; but theory itself becomes a material force when it has seized the masses.”46 In that same year, Marx and his new-found friend Friedrich Engels wrote a lengthy and bitter satire directed against all theoretical criticism: The Holy Family; or, Critique of Critical Critique: Against Bruno Bauer and Company.47 Bauer, not intimidated, soon responded with an article that tied Marx and Engels to Feuerbach, and declaring them to be nothing more than covert religious believers.48

IV. AUGUST VON CIESZKOWSKI

In 1838, the same year in which Bauer published his first critical study of the Bible, a short work was published that deserves the adjective “seminal.” It was entitled *The Prolegomena to Historiosophy [Prolegomena zur Historiosophie].* Its author was August von Cieszkowski (1814–94), a member of the Polish aristocracy who had emigrated to Berlin after participating in the abortive uprisings of 1830. Its importance rests on its effect in completely expanding the debate over Hegelianism from one of mere theological interest into one that would take it as a revolutionary doctrine set on changing the whole course of human history. Cieszkowski was quite clear as to his intentions: “We thus announce a new era for philosophy … The future fate of philosophy in general is to be practical philosophy or, to put it better, the philosophy of praxis, whose most concrete effect on life and social relations is the development of truth in concrete activity.”

Hegel, whom he considered “the hero of the newest philosophy,” had introduced this new era, one in which:

Mankind has finally reached that stage of self-consciousness where it no longer considers the laws of its normal progress and development simply as concoctions of zealous and self-deceiving scholars but rather as faithful portrayals of the absolute thought of God, as manifestations of objective reason in universal history.

Cieszkowski’s philosophy of history reflected that of Hegel insofar as God was no longer a distant and transcendent “Other” but was immanent in, and revealed within, the course of history. As Hegel had noted in his own lectures, “History is the unfolding of God’s nature.” However, for Cieszkowski, Hegel, for some inexplicable reason had not articulated that “organic course of its idea” in terms of the dialectical triad. Hegel had divided history into four ages: Oriental, Greek, Roman, and the Christian Germanic. But given this undialectical schemata, the central question as to the “end of history,” its final reconciliatory stage,
was not addressed: what of the future? These fixed sequential ages could hardly, for Cieszkowski, address the fullness of history, which evidently and without doubt did not cease with the state of actual affairs in Germany at the time. The problem was in Hegel's own failure to apply his own triadic dialectic toward comprehending God's meaning within history. For Cieszkowski, the stages or moments of human history which alone clearly and simply expressed the triadic dialectic were those most commonly used: past, present, and future. This triad, whose thesis was the past, and whose antithesis was the present, and whose synthesis was the future, was perfectly appropriate in expressing Hegel's "absolute thought of God." In short, Cieszkowski had recognized that which Hegel had ignored: the future. The history of the world was now to be recast into three grand ages. The past, which in history begins with Adam and ends with Jesus, was one of practice, of simple and unreflective engagement with the world. The second era was that of theory, of other-worldly concerns, and it reached from Jesus to Hegel. The third era, whose advent began with the death of Hegel and which will be of infinite duration, is one in which practice and theory, previously in the contradiction of past and present, would be resolved in the synthesis of "praxis." All that which had hitherto been accepted as true must now be put aside in the face of a new world coming into being, and this new world, in its eternity, will finally conclude the history of mankind. In this new period the ancient antagonism of theory and practice would be resolved, and a new era would emerge, an era informed by a "philosophy of praxis" whose task will be to produce "truth in concrete activity."

No doubt the effect the Prolegomena had on the Hegelians was enhanced by its subtle evocation of the "Third Reich," that "Kingdom of the Holy Ghost" announced by Joachim of Flores (1145–1202). Indeed, among almost all of the prophetic Young Hegelians, with the exception of Max Stirner, a new age did seem immanent, and they felt called on, as Feuerbach has it, "to found a Kingdom, the Kingdom of the Idea." This eschatological excitement pervades even in Marx's "scientific socialism." In this, revolutionary history is set forth in three ages: primitive communism, class society, and final communism. The new age will be one in which the utopian classless society will have displaced the alienating and evil age of capitalism – a "false consciousness" that perversely worships the "divine power of money." The persistence of this triadic and apocalyptic paradigm is not surprising, not only considering the great number of discontented students of theology in Germany at the time of the Young

55. Max Stirner (real name Johann Kaspar Schmidt) (October 25, 1806–June 26, 1856; born in Bayreuth, Bavaria; died in Berlin, Germany) was educated at the University of Berlin, University of Erlangen, and University of Königsberg, and was influenced by Hegel.

Hegelians, but also taking into account that this “fantasy of a third and most glorious dispensation had …, over the centuries, entered into the common stock of European social mythology.”

V. MOSES HESS

In 1841, a further enhancement of the triadic eschatological perspective was introduced by Moses Hess (1812–75), who has been taken as the “Prophet of Communism and Zionism.” In his influential work *The European Triarchy*, Hess proposed a union of the liberalizing elements found in the three most advanced nations of Europe: Germany, France, and England. This new international union of national cultures would press beyond the petty interests of nationalism and proceed to establish a new world order based on the shared principles of German philosophy, French politics, and English economics. In time, Hess’s vision of a unified world unhampered by the irrational drives of nationalism would find political reflection in the international aspirations of Marxism.

Hess, unlike Marx, never disowned his Jewish ancestry, and indeed saw in the history of Judaism the very center of European history. Just like Cieszkowski, he divided world history into three periods, but periods symbolically marked by Jewish history: the first being that of Adam, the second that of Jesus, and the third by Baruch Spinoza (1632–77). This third period was one that marked the advent of a spiritual revolution that would be brought forth by practical action. Spinoza, whom Hegel had rightly recognized as a central philosophical figure, had set forth his thought in the form of a guide for action, the *Ethics*. For Hess, Spinoza’s work would trace the theoretical path toward the rebuilding of the old order of nations, and serve as the spiritual rebirth of mankind. This would be the true reading of Hegel’s fundamental principle: “What is reasonable is real, and what is real is reasonable” meant not that the world as it exists is reasonable, but that reason will prevail – and the present age stands at that millennial threshold. In the new age, humanity will live, as inspired by Spinoza’s own amor

intellectus dei, according to a “law of love” in which “freedom and order do not collide with each other.”

Hess, like Cieszkowski, also admired Hegel's thought – but in much the same critical way. Both thought it too theoretical and speculative to be of any use in creating a world in which human alienation from self and other would be abolished. Hegelian philosophers had to turn their attention from theory to action, and to leave the realm of mere speculation in order to join in the construction of that future world. They should now realize that “German philosophy has achieved its task: it has led us to the total truth. Now we have to build bridges which would again lead us from heaven to earth” – it was time for praxis. The result would be the victory, through popular sovereignty, of a communism in which, as he proclaimed in his manifesto, *The Philosophy of the Deed*: “The majesty and sovereignty of the One has transformed itself into the majesty and sovereignty of Everyman … In place of hierarchy and class structure, in place of fettered individuals, representation and the competition of individuals come forth.”

Needless to say, just as Marx had dismissed Bauer’s “Terrorism of Pure Theory” as an exercise in mere thought, so he immediately rejected Hess's call for a “law of love” for a similar reason: it was nothing but the expected proposal of an all-too-idealistic German philosophy that was under the illusion that thinking was the same as acting. Hess's visionary proposals for a new age were labeled in *The Communist Manifesto* as “True Socialism.” With their usual scorn reserved for any proposals for social reform other than their own “Scientific Socialism,” the efforts of the “True Socialists” were rejected by Marx and Engels as but:

> a robe of speculative cobwebs, embroidered with flowers of rhetoric, steeped in the dew of sickly sentiment, this transcendental robe in which the German Socialists wrapped their sorry “eternal truths,” all skin and bone, severed to wonderfully increase the sale of their goods among such a public.

For Marx, any realistic revolutionary program, as opposed to an impotent philosophical idealism, could develop only when philosophy itself came to recognize

---

63. See ibid., 48.
that the material world, the economic world, was the primary reality on which all else is based. In its final form, this became known as “Dialectical Materialism.”

VI. LUDWIG FEUERBACH

Feuerbach,\(^6^7\) whose early atheistic work *Thoughts on Death and Immortality* had cost him his university post, had nevertheless persisted in his task of recasting Hegel’s philosophy as a humanism, and in time became a regular and important contributor to the *Hallische Jahrbücher*. This radically liberal journal, founded in 1839 under the dedicated editorship of Arnold Ruge (1802–80), was set upon transforming the Young Hegelian movement into an effective political movement. The *Jahrbücher* was widely considered to be “the most eminent publication in German journalism and the most effective organ of that side of the Hegelian school that made the peaceful empire of absolute idealism into a fighting and conquering system.”\(^6^8\)

One of the most influential of the articles to appear in the journal was Feuerbach’s 1839 essay “Towards a Critique of Hegel’s Philosophy.”\(^6^9\) It marked a decisive and definitive turn from Hegel's philosophy of spirit, and established the basis of what Feuerbach would soon term *The Philosophy of the Future*.\(^7^0\) In the essay, Feuerbach criticized Hegel’s philosophy not only because of its dismissal of the physical world, of empirical reality and sense perception, but also because of its claim to absolute truth. As to this latter point, “If the Hegelian philosophy were the absolute reality of the idea of philosophy, then it would have been necessary that reason stop in the Hegelian philosophy and time itself come to an end.” In that time has not come to an end, Hegel’s philosophical system did not exhaust the possibilities of philosophy. A new philosophy was needed for a new time, a philosophy of the future.

In 1841, the same year in which Bauer initiated his exhaustive critique of the biblical narratives, Feuerbach’s *The Essence of Christianity* was published. Many years later, Engels could still recall the excitement that followed its appearance:

---

67. Ludwig Feuerbach (July 28, 1804–September 13, 1872; born in Landshut, Bavaria; died in Nuremberg, Germany) was educated at the University of Heidelberg (1823–24), University of Berlin (1824–26), and University of Erlangen (1826–28). His influences included Bacon, Hegel, Kant, Leibniz, and Spinoza.
With one blow it pulverized the contradiction, in that without circumlocutions it placed materialism on the throne again. Nature exists independently of all philosophy. It is the foundation upon which we human beings, ourselves products of nature, have grown up. Nothing exists outside of nature and man, and the higher beings our religious fantasies have created are only the fantastic reflection of our own essence … we all became at once Feuerbachians.71

With The Essence of Christianity, the Young Hegelian movement passed beyond the confines of a debate over the historical truth of Christianity into a new realm that proposed that mankind was both its own creator and its own savior.

At first reading, it might seem that his work presents nothing less than a total rejection of Hegel’s philosophy, but this would be mistaken. Even on the personal level, Feuerbach always considered himself deeply indebted to Hegel, as it was “he who was my second father … Hegel was my teacher, I his student: I do not lie when I say that I acknowledge this fact today with thanks and joy.” And, on the philosophical level, although Feuerbach replaced the speculative idealism of Hegel’s philosophy with his own sensuous humanism, he always understood that “Hegelian philosophy is the culmination of speculative, systematic philosophy.”72 This culmination was the necessary dialectical base and prelude, the thesis as it were, of the future advance of philosophy – which Feuerbach had revealed.

Feuerbach directly begins The Essence of Christianity by rejecting “completely all absolute, idealistic, self-sufficient speculations – speculation that reflects only on itself.”73 He follows this by proposing that his “new” philosophy has revealed that it was not the “Absolute Idea” or the “God” of speculation and religion that was the true object of human worship and concern, but rather it was simply “Man” as experienced within the context of others, within the dialectic of the “I” and the “Thou.” Feuerbach’s radical humanism was the reverse of traditional theism. The distant and infinite God of traditional belief was simply an illusion, a projection of an alienated and magnified mirror-image of “Man”: “Religion is a dream, in which our own conceptions and emotions appear to us as separate existences, beings out of ourselves” (EC 204). The absolute God of religion is ultimately nothing more than the projected nature of man, for “The absolute to man is his own nature” (EC 5). Again and again, in finely crafted and often emotional arguments, Feuerbach sets out his fundamental thought: that

all which is found in traditional religion, in its beliefs and its God, finds its birthplace in the life of man, in the natural and actual world. It is only now that mankind has realized that it is itself the God that it has so long worshipped and loved. In the brief final chapter of his work, Feuerbach concludes his argument:

We have shown that the substance and object of religion is altogether human; we have shown that divine wisdom is human wisdom; that the secret of theology is anthropology; that the absolute mind is the so-called finite subjective mind. … The necessary turning-point in history is therefore the open confession that the consciousness of God is nothing else than the consciousness of the species; … that there is no other essence which man can think, dream of, imagine, feel, believe in, wish for, love and adore as the absolute, than the essence of human nature itself. … If human nature is the highest nature to man, then practically also the highest and first law must be the love of man to man. Homo homini Deus est: – this is the great practical principle: – this is the axis on which revolves the history of the world.

(EC 270–71)

But this “highest and first” law has long been concealed, and the alienated and all too hostile God of the Christian theologians has long dominated humanity, and if they seem unable to understand human love, it is because what they worship as God is nothing other than their own alienated being.74 This is the theological tradition that Feuerbach’s “new philosophy” would exorcise, a Christian theological worldview that is grounded in the exclusive “egoistic” mind of Judaism – which looks on the actual world as only a useful commodity:

Utilism is the essential theory of Judaism. The belief in a special Divine Providence is the characteristic belief of Judaism; belief in Providence is belief in miracle; but belief in miracle exists where Nature is regarded only as an object of arbitrariness, of egoism, which uses Nature only as an instrument of its own will and pleasure. … [T]hese contradictions of Nature happen for the welfare of Israel, purely at the command of Jehovah, who troubles himself about nothing but Israel, who is nothing but the personified selfishness of the Israelitish people, to the exclusion of all other nations, – absolute intolerance, the secret essence of monotheism.

(EC 113–14)

With this, Feuerbach joined in the general discussion of the “Jewish Question [Die Judenfrage],” which occupied, for a time, the work of both Bauer and Marx.75 In 1843, Marx took up Feuerbach’s description of Jewish “selfishness” and gave it an economic twist: “Money is the jealous god of Israel, beside which no other god may exist.”76 In that same year, he also reviewed two of Bauer’s articles concerning the question, and adds a few questions and some answers of his own: “What is the profane basis of Judaism? Practical need, self-interest. What is the worldly cult of the Jew? Huckstering. What is his worldly god? Money.”77

But for Feuerbach, if, as Christians maintain, their “love” has replaced Jewish selfishness, this Christian love is only a perversion of true love, a deflection of the real sensuous and actual love of the “I” and the “Thou.” Human love is “the middle term, the substantial bond, the principle of reconciliation between the perfect and the imperfect … the divine and the human. Love is God himself and apart from it there is no God” (EC 48). And so, only by this true idealistic love can humanity reveal itself to itself as the true God. It is this fully human love that “makes Man God, and God Man” (ibid.). Unlike true human love, Christian belief has misdirected love, has turned it away from its true object, Man, and has set up the abstract and unreal God of tradition as the only object of worship and love. And so, with Christianity, “even love, in itself the deepest, truest emotion, becomes by means of religiousness merely ostensible, illusory, since religious love gives itself to man only for God’s sake, so that it is given only in appearance to man, but in reality to God” (EC 274).

Love, as Feuerbach understands it, is not limited to mankind, but extends to all of nature itself, and comprehends that nature as “sacred.” To see that the sensuous world is, in its very being, “holy” is the key that unlocks the mysteries of the Christian sacraments. The revelation of the hidden truths within these sacraments emerges when the natural elements of the sacraments, such as water, bread, and wine, are taken as related to human need, as human objects, and not merely taken as the insubstantial symbols of another, and alien, reality. Christian sacraments, mysteries of faith such as Holy Communion, are but the displaced realities of human life taken from that life and given to God. The final words of The Essence of Christianity are: “let bread be sacred for us, let wine be sacred, and also let water be sacred! Amen” (EC 278).

The Essence of Christianity was shortly followed by two short works that were designed to clarify and restate its central themes. Preliminary Theses on the

77. Ibid., 34.
Reform of Philosophy appeared in 1842, and Principles of the Philosophy of the Future in the following year. The first work consists of several dozen pages of brief aphoristic paragraphs concentrating on the one-sided idealisms of earlier philosophies, and of Hegel’s philosophy in particular. Its intention was to show that Hegelian philosophy was, fundamentally, a theology, a final and conclusive statement of Christian alienation:

The Hegelian philosophy is the last refuge and the last rational mainstay of theology. … The Absolute Spirit of Hegel is none other than abstract spirit, i.e., finite spirit that has been separated from itself; just as the infinite being of theology is none other than the abstract finite being.

The second work, Principles of the Philosophy of the Future, has sixty-five numbered paragraphs, all devoted to the explication of the character of Feuerbach’s “future” philosophy: “The new philosophy makes man – with the inclusion of nature as the foundation of man – the unique, universal and highest objects of philosophy. It thus makes anthropology, with the inclusion of physiology, the universal science” (§70), or “The true dialectic is not a monologue of a solitary thinker with himself; it is a dialogue between I and Thou” (§72). By 1843, with these two works that summed up the central points in his The Essence of Christianity, Feuerbach reached the peak of his influence among the Young Hegelians.

His lucid and radical replacement of the alien Christ of faith, the “God-Man,” with the realistic and concrete “Man-God” of present humanity, found full agreement with the young Marx, who then held that there was “no other path to truth and freedom but through the Fiery Brook [Feuer-Bach]. Feuerbach is the Purgatory of the present.” Feuerbach’s writings were “the only writings since Hegel’s Phenomenology and Logic which contain a real theoretical revolution” and “The positive, humanistic and naturalistic criticism begins with Feuerbach.”

82. Marx, Early Writings, 64.
In 1844, Marx was considered a Feuerbachian, and he set about preparing a work based on this “philosophy of the future,” which, left unpublished until 1932, has been known as Marx’s *Early Economic and Philosophic Manuscripts.* The work was first translated into English in 1961, and was welcomed by liberal Marxists such as Eric Fromm (1900–1980), who were uncomfortable with the identification of Marxism with Stalinism. The work provided them with a new discovery: a humanistic “Young Marx” quite different from the materialistic “Old Marx” of *Capital* and “Scientific Socialism.” The publication of the *Manuscripts* provided a means to “diminish the irrational and paranoid attitude that sees in Marx a devil and in socialism a realm of the devil.” Marx was now to be seen as a humanist, and his thought no longer set within a “purely economic category,” and it became “very important to understand Marx’s fundamental idea: man makes his own history; he is his own creator.”

Marx’s major contribution to Feuerbach’s philosophy, as found in the *Manuscripts*, was to propose that Money was the alienating God of the world. It had the perverting power of changing “fidelity into infidelity, love into hate, hate into love.” But if this alienating force, this “divine power of Money” were to be exorcized, “Then love can only be exchanged for love, trust for trust, etc.” In brief, what the inhuman God of Christianity was to Feuerbach, so the inhuman power of Money was to Marx.

But his admiration of Feuerbach was short-lived. By the spring of 1845, not long after he had drafted his *Economic and Philosophic Manuscripts*, he suddenly turned against Feuerbach. As Louis Althusser has it, there was a sudden “epistemological break” in Marx’s philosophy. Marx’s unexpected objections to Feuerbach were cast in the form of eleven brief statements later entitled the *Theses on Feuerbach.* They remained unpublished until, in 1893, Engels appended them to his own work *Ludwig Feuerbach and the Outcome of Classical German Philosophy*. The first sentence of the first thesis sets the tone of the whole: “The chief defect of all hitherto existing materialism – that of Feuerbach
included – is that the thing, reality, sensuousness, is conceived only in the form of the object or of contemplation, but not as human sensuous activity, practice [Praxis], not subjectively." Marx’s inclusion of the term “Praxis,” derived from Cieszkowski, indicates that despite his turn from the epistemological idealism of the Young Hegelians, Marx nevertheless retained their moral idealism, which had as its goal the transformation of the given social reality into a “higher” and more rational world. This moral idealism found expression in his well-known final thesis: “The philosophers have interpreted the world in various ways; the point however is to change it.”

VIII. MAX STIRNER

It has been well argued that the sudden transformation of the Feuerbachian “Young Marx,” into the “Old Marx” of “Scientific Socialism” was effected by his reading of The Ego and His Own.91 As to Feuerbach, his inept attempt to refute Stirner’s critique92 was soon followed by a withdrawal from further debate over the “Man-God.”93 Stirner’s work, The Ego and its Own,94 had the singular intention of revealing that radical and atheistic humanism, such as that proposed by his contemporaries, was nothing more than an inverted form of religion, a form that in time would prove to be even more destructive of individual autonomy than orthodox religion itself. The principle intention of The Ego was to indicate that the ideals of liberal and radical reformers were nothing other than their own alienated ideas set over and against themselves as new objects of worship. Nothing had been gained by the atheistic and humanistic struggles against a transcendent God other than “bringing him down to earth in the guise of ‘Man.’”95 The “revolution” was but a rotation of divinity, with a new earthly God rising up to take the place of the old Christian God. It all depends upon how one thinks. A servile and unsure Ego cannot be the “Owner [Eigner]” of itself, but rather its ideas, and so ideals, will be merely “accepted” ideas, accepted from a more persuasive other. The revered “fixed ideas” that have long been accepted

95. Ibid., 246ff.
by unsure and nongoistic individuals, such as “humanity” or “Man,” have, in
traditional religion, been subordinated to the highest idea, which is “God.” It
is no advance in self-worth to replace, to revolve, this God of tradition with
another God, such as “humanity” or “Man” – individuals still do not own their
ideas, it is still religion. The “pious atheists” such as Feuerbach and Bauer, had
failed to realize this.

The human religion is only the last metamorphosis of the Christian
religion. For liberalism is a religion because it separates my essence
from me and sets it above me, because it exalts “man” to the same
extent as any other religion does its God or idol, because it makes
what is mine into something otherworldly, because in general it
makes some of what is mine, out of my qualities and my property,
something alien – namely, an “essence”; in short, because it sets me
beneath man, and thereby creates for me a “vocation.”

For Stirner, the whole course of Hegelianism after Hegel not only led to the total
alienation of the individual from himself, to the radical separation of one’s actual
unique individuality from its supposed “essence,” but has set up this abstraction
as a new object of worship. It is now requisite “that I must become a ‘real generic
being [wirkliches Gattungswesen].’” As Marx had used this same language, he
was also implicated in Stirner’s revelation of the profound religiosity concealed
within such Feuerbachian declarations as “Man is to Man the supreme being.”

Stirner’s detailed restatements of his central thesis confirmed his knowledge
of both the persons and the doctrines of Young Hegelianism – and his scorn of
them. Arnold Ruge, with his editorial experience, judged it to be “the first read-
able book in philosophy that Germany has produced.” As one commentator
had it, Stirner’s book was “calculated to unnerve,” and it did seem to “unnerve”
Marx.

In the fall of 1844, Engels received a press copy of the work from Moses
Hess. In the early 1840s, Stirner and Engels had been friends, “Duzbrüder,” in
Berlin. Both were then members of an informal group of writers and academics,
led by Bauer, and known as “The Free Ones” (die Freien). Engels was favorably
impressed not only by Stirner himself, who “had obviously, among the ‘Free
Ones’ the most talent, independence, and diligence,” but even recommended

96. Ibid., 158.
97. Ibid.
Jahren 1825–1880 (Berlin: Weidmann, 1886).
that his new-found friend Marx read *The Ego and Its Own*, as perhaps it might be of service to the communists. Marx, however, more insightful than Engels, immediately recognized that Stirner had written a work that effectively ended the logical course of the Young Hegelian reading of Hegel, and in particular Feuerbach’s “philosophy of the future.” As Marx was then identified with that philosophy, it meant that Stirner had to be dealt with. And so it was that both he and a corrected Engels decided once again “to settle accounts with our former philosophic conscience.”101 Once again they set about writing another diatribe against Young Hegelian theorists. Stirner, who had remained unmentioned in *The Holy Family*, which had been written in the fall of 1844, suddenly became the central target of a new polemic, written a few months later: *The German Ideology: Being a Criticism of Recent German Philosophy and its Representatives*. In the course of its 800 or so pages, there were more of them directed to the refutation of Stirner’s work than were contained in that work itself. Even Marx’s admiring biographer, Franz Mehring, had to admit that *The German Ideology* was of a “rather puerile character.”102 It remained unpublished until 1932.

Indeed, Stirner seems to have deserved such titles as “The last of the Hegelians,”103 “le dernier maillon de la chaîne hégélienne,”104 “The last offshoot of Hegelian philosophy,”105 or “The last metamorphosis of German Idealism.”106 His work can be said to have put an end to Young Hegelianism, and had terminated, as Engels had it, “the decomposition process of the Hegelian School.”107 Even Stirner considered himself to have put an end to the Young Hegelian school.108

IX. REVOLUTIONARY ACTION

In February 1844, shortly after Marx had read Stirner’s work, the first and last issue of the *Deutsch-Französische Jarhbücher* was published in Paris. It had two editors: Arnold Ruge, the former editor of the *Deutsche Jahrbücher*, and Karl Marx, former editor of the *Rheinische Zeitung*. The *Deutsch-Französische Jarhbücher* was a final attempt by Marx to reconcile theory and practice. It was

102. Ibid.
intended, as Ruge understood it, to encourage “the intellectual alliance between France and Germany,” in short to link French political action, as evidenced in such as Pierre-Joseph Proudhon (1809–65), with “the logical acumen” of Hegelian philosophy: “a sure compass in the metaphysical regions in which Ruge saw the French drifting at the mercy of wind and wave.”

The failure of the journal, financially and ideologically, was soon followed by an acrimonious divorce between the editors. Marx then became a contributor to the Vorwärts, a radical socialist journal being published in Paris edited by a group of expatriated German socialists and revolutionary communists. However, in January 1845, French authorities, pressured by the Berlin government, suppressed the journal and issued orders of expulsion to most of its contributors. Marx and Engels, along with such early communist leaders as Mikhail Bakunin (1814–76), were ordered to leave France immediately. Marx chose exile in Brussels, where he was soon joined by Engels. In the spring of 1846 and by 1847, the members of the communist colony in Brussels had reached “considerable proportions,” and a formal “Communist League” was established. Its declared ideal was the overthrow of bourgeois society, which was understood as completely dominated by class and capitalist interest groups, and then to form a classless society in which there would be neither class distinctions nor private property. As the league became more active, and founded or joined with other like-minded organizations throughout Europe, it became imperative to establish a clear statement of their common principles and goals. By late 1847, Marx and Engels had, by virtue of their writings and energetic roles in the various meetings of the league, gained some authority among the various factions. They were asked to prepare something on the order of a “catechism,” which soon became The Communist Manifesto. It was published in February 1848. And so, as Engels had it, the German working class became “the inheritor of German classical philosophy.”

In March of 1848, the long-anticipated revolution against the Prussian monarchy took place in Berlin. Unclear as to any object other than a general rebellion against the established order, it failed. None of the central figures of the Young Hegelianism school played any significant role in that particular revolution. But their radical philosophies, emerging from Hegel’s ambiguous speculations and reformed into ideologies, found their final expression in the universal revolution we call “modernity.”

111. Ibid., 139.
In recent years Claude-Henri de Saint-Simon, Charles Fourier, and Pierre Joseph Proudhon have not received the critical attention they deserve. This neglect is partly due to all three sharing the fate of being summarily categorized as “utopian socialists” whose ideas have little purchase on the “real world.”¹ François Dagognet suggests that their atypicality, the fact that not one of them was the product of a methodical, institutionalized education, also contributes to their being sidelined. Indeed, all three were unconventional autodidacts who, not having being trained in any systematic fashion, did not engage to any great depth with the history of philosophy.² This lack of formal academic credentials and their unconventional writing styles are possibly further reasons for their not having been taken seriously up to now. However, for us today in a society that may be in crisis, the time is perhaps ripe for revisiting these three thinkers whose ideas have not only historical significance, but also contemporary currency.

¹ This fate is mainly due to the largely dismissive analyses of Marx and Engels; for standard accounts of this critical reception, see Ruth Levitas, *The Concept of Utopia* (Hemel Hempstead: Philip Allen, 1990), ch. II, and Vincent Geoghegan, *Utopianism and Marxism* (London: Methuen, 1987), chs I, II.

The eighteenth century was “critical and revolutionary,” the nineteenth century will be “inventive and organizatory,” proclaims Claude-Henri de Saint-Simon in 1808 (I VIE 92). The previous century’s enlightened combat against the prejudices, superstitions, and inequalities of the ancien régime necessitated the divisive destruction of societal structures. Saint-Simon considers the task of the nineteenth century to be that of reconstructing society by combining and counterpointing the various forces of all those who produce, of all those who actively create and sustain social relations and exchanges (I IND 13; I LHG 111). Far from being a reactive restoration of things past, or a compromise with actual

3. Claude-Henri de Rouvray, comte de Saint-Simon (1760–1825), born in Paris, was the distant cousin of the Duke of Saint-Simon (the writer of memoirs at the court of Louis XIV). Despite his privileged background, Saint-Simon led a most unconventional life: he fought in the American War of Independence (1779–83); he educated himself by frequenting the teachers and students of hydraulics and hydrodynamics at École de Mézières (1783–85), those of physics and physiology at the École polytechnique (1798–1801), and of medicine at the École de medicine (1801–1805). In 1790, to demonstrate his revolutionary commitment, he publicly renounced his title and adopted the ordinary name of Bonhomme while also becoming very rich by speculating with cheaply procured church property that been confiscated by the republican state (1790–97). However, he did get in trouble with the authorities and was imprisoned at Saint-Pélagie, then in Luxembourg prison. From 1805 to 1816 he lived a materially precarious life having socialized exuberantly and lost the support of financial backers: as a result his former servant, Diard, gave him shelter and sustenance for four years but when he died Saint-Simon was again lacking basic resources to the point where he almost died of hunger. In 1823, while materially more secure and beginning to produce his writings, he nevertheless attempted suicide and lost an eye as a result. Despite this checkered existence his ideas had influence: he is the precursor of the positivist school of thought and of the social sciences. The Saint-Simonian movement was also founded on the day of his burial in Père-Lachaise cemetery by his so-called “disciples” Enfantin, Bazard, and Pierre Leroux. [*] For further discussion of Saint-Simon in relation to the emergence of sociology, see the essay by Alan Sica in The History of Continental Philosophy: Volume 2.

4. Abbreviations used throughout are explained in the major works listed at the end of the chapter. Saint-Simon’s works are collected in his Œuvres, E. Dentu (ed.), 6 vols (Paris: Editions Anthropos, 1966), and are cited by volume number in the Œuvres, followed by the abbreviation and page number.

5. Saint-Simon’s political radicality is evident in his remarks about society being “upside-down” as those who exercise power do not have the “capacity” to be socially productive, but are instead economically parasitic on the work of others (II QUE 211–34, II ORG 17–26). See Pierre Musso, Télécommunications et philosophie des réseaux (Vendôme: Presses Universitaires de France, 1997), 126–33, for an analysis of how the French Revolution was perceived by Saint-Simon as having only changed political content but not having fundamentally restructured society: “the invisible force of those who produce” is still subordinated to the all too apparent and powerful state apparatuses and their profligate representatives.
postrevolutionary remnants, Saint-Simon’s project is dynamic and avant-garde; it both pursues and is energized by the immanent prospect of future happiness and well-being. Indeed, Saint-Simon announces that: “The golden age of the human species is not at all behind us, it lies before us; it is in the perfection of the social order” (I REORG 247–8; SW-SS 136).

For Saint-Simon, thinking the future is no self-indulgent or escapist exercise in social dreaming, as the future is deducible and its realization lies within our grasp. The term “utopia” is often employed, suggests Saint-Simon, when one “feels vaguely uncertain about the possibility or impossibility of the execution of a new system of social organization.” Consequently, “utopian” is not an applicable term for his vision of the future manifestation of society as he sees historiographic method lending form and force to his predictive analyses (II ORG 63). Instead of summoning a sense of where and who one is and of the general state of affairs in the world from the present time, which is “the least solid basis” for understanding anything (V TGU 287), the procedure he adopts consists of fixing his eyes on the distant “remnants of a past which is fading and the germs of a future which is coming to life” (III SI 69). By fostering a keen sense of society as a mutating movement through time, variously shaped by different methods for conceptualizing the world, structured by different dominant regimes and their underlying opposing forces, a “series of terms” emerges that provides the compositional elements of the future (I COR 122, V MSH 14). By situating ourselves along this tensile line of communication between historical periods stretching into the past and out to the future, we are given a better and clearer sense of ourselves as productive “capacities,” that is, both as the containers through which the “march of civilization” passes, and as potentialities that can actively contribute to the world to come.7

Just as it is impossible for us to change the “primitive impulse” that set our planet off and us with it on its rotating orbit around the sun, it is equally beyond

6. See V OS 137–8 for the avant-garde role of the “men of imagination” who, together with the scientists and industrialists will bring about “all the conditions necessary for the satisfaction of the moral and physical needs of society.” Saint-Simon’s reinvestment of these military terms (the avant-garde, standard, march) toward pacific ends is an important aspect of his thinking. In his “combined order” of the near future (after the “downfall of philosophy” when “amorous freedom” reigns), Fourier also mobilizes those militaristic energies to produce “beneficent armies,” which carry out the grand projects so dear to Saint-Simon such as bridge and canal building, draining marshes, leveling mountains, and so on (TFM 176). Proudhon was also an important thinker of peace as a future-oriented project for society; see for instance his analysis of confederation as a way of organizing people which precludes the dangers created by standing armies (FED 177).

7. See Musso, Télécommunications et philosophie des réseaux, 94–9, and Le Vocabulaire de Saint-Simon (Paris: Ellipses, 2005), 12–14, for this double meaning of “capacity” in Saint-Simon’s works.
our means to elude the “force” that “progress” exercises over us (II ORG 119). However, the great shift that the gradual acceptance of Copernicus, Galileo, and Kepler’s discoveries represented was far from being just negative: to be sure, humans had to renounce their anthropocentric assumptions, but what they gained was the invigorating experience of what it means to be susceptible to “the force of demonstration” (II ORG 67). This “vivacious” force proved even stronger than the repressive powers of those whose vested interests were best served by the maintenance of the more immobile, geocentric model of the universe (ibid.). It also proved to be even stronger than our common senses, which seem to tell us that the earth is flat, static, and centrally positioned in relation to the other celestial bodies. Our susceptibility to scientific demonstration heralds a new age of “positive ideas” that have real – “palpable, certain, present” – bearing on this world (II IND 38). Rather than ideas remaining conjectural abstractions that are arbitrarily revealed to us from above, scientific ideas that have emerged from actual observation of the world solicit our active engagement with them and it (II ORG 154). Saint-Simon proclaims that the old static hierarchies have now been overturned and consequently people will no longer be regimented as they were under the ancien régime. Instead they begin to combine themselves into associations; they are no longer to be commandeered by military powers but need only to be benevolently led; no longer regarded as passive “subjects,” they can affirm themselves as “societary” producers (II ORG 150). The “general tie of social organization” now provides the base for a morality that is terrestrially informed instead of a religious belief that holds sway and impinges on humans from above. This grounding of spiritual power enables humans to evaluate things, actions, and ideas in terms of the contribution made to “general prosperity” (II ORG 86, 107). Galileo definitively proved that the earth is small and that it rotates along with many other planets around the sun. Good sense corroborates the implications of this astrological demonstration by telling us that nature has not been tailored to human needs (II ORG 100). The way is thereby cleared for our desires to be focused henceforth on how best to administer things (rather than to govern other humans), on how best to work with and against nature so as to produce social happiness for all. Similarly, realizing ourselves to be historically constituted by the “march of civilization” means that history can no longer be perceived as the exclusive biographical domain of “sovereign families” whose power is endorsed by theology (II ORG 72). History is no longer perceived as befalling a “passive” and for the main part “obedient” majority from above; it traverses society as

8. The influence of Saint-Simon’s ideas on the work of his sometime secretary, August Comte, is evident.
a whole. Instead of being “blindly pushed along” by this irresistible force of “progress,” we can “obey this law (our true Providence) in full knowledge of the facts,” consciously enabling the production of that which is of “positive utility” to society (II ORG 19, 119).

Scientific discoveries reveal that dynamic principles are everywhere at work in the world, whether this be in the form of the constant circulation of blood within living beings or the episodic darting of electricity from thunderbolts in the skies (II ORG 155). Saint-Simon was intensely interested in the general implications for society as a whole of this all-pervasive mobility, which he perceives as both consolidating the epistemological revolution of Copernicus’s cosmic investigations (the earth moves) and as reinforcing the general sense of history as a powerful mobilizing force to be appropriated. He realizes that societies too can be seen to move in various ways: he observes how mass movement is communicated from without when people are instrumentalized by governments, and how, by contrast, it can be generated from within when people, galvanized by a common “will, interest, and conviction,” spontaneously set themselves into motion. In the former case, the people “necessarily exercise an action which has no fixed and determined relation with the general course of things.” In the latter instance, however, people “infallibly steer themselves in the direction of the human spirit” and a powerfully combined momentum toward the future is created (I IND 106–7). The emergence of this synergetic force produces the hope of a healthier collective future.

When defining the “physiological salvation” of personal happiness, Saint-Simon writes: “No jouissance is equal to that of feeling oneself to be a virtual

10. See my comments below about how Saint-Simon’s ideas should not be seen as a defense of liberal laissez faire economics which bows down to so-called “market forces.” For his criticism of half-hearted liberals who make compromise deals with feudalizing powers such as Bonaparte’s, see II ORG 234–5.

11. For Émile Durkheim, Saint-Simon “was the first, to have understood, before Guizot, the full social importance of communal movement and the links between the Revolution and contemporary questions.” He therefore saw Saint-Simon as “the founder of socialism,” defined not only as a body of practical thought having as its aim the improvement of the plight of the masses, but also as a system that “goes beyond the question of the working class” in its advocacy of “a connecting of economic functions to the directing and conscious centers of society as a whole” (Le Socialisme [Paris: Presses Universitaires de France, 1971], 45, 49, 154; published in English as Socialism and Saint-Simon, Charlotte Sattler [trans.] [Yellow Springs, OH: Antioch Press, 1958], 15, 19, 127). Bruno Viard, Anthologie de Pierre Leroux: Inventeur du socialisme (Lormont: Éditions Le Bord de l’eau, 2007), 11–12, points out that Durkheim is wrong to attribute the etymology of “socialism” to 1835 England and the world of Robert Owen (Durkheim, Le Socialisme, 59; Socialism, 30). The term itself should be attributed to the Saint-Simonian dissident, Pierre Leroux, who, in 1834, used it in a pejorative way to refer to the systems “of the so-called disciples of Saint-Simon and Rousseau,” which sacrifice individualism in their search for a quasi-totalitarian organicity.
force and of giving a harmonious impulse to the different parts which constitute the organized mass” (V MSH 67). Physiology, the scientific study of living things, offers to the dawning epoch the model for understanding the individual, and, by extension, society as a whole, as complex organizations (V MSH 37). Composed of interconnected networks, both kept alive and enriched by the fluid production, distribution, and consumption of various substances (blood, oxygen, nutritional matter), nervous and electrical impulses (sensations, ideas), and products ranging from the basic to the luxurious (II ORG), individuals and society as a whole are to be regarded as “industrial bodies” in movement. Personal happiness is social well-being and both are produced through industry: “Industry is one single and vast body whose limbs interact and which are, as it were, in solidarity with each other; the good and bad which affects each part, affects all the others; everywhere it is the same interest, the same need, the same life” (I IND 137; SW-SS 161).

The best social organization is that which renders the life conditions of the majority as happy as possible by procuring for them the maximal means and facilities to satisfy their needs (V QOP 56). The optimized social organization is therefore the one that promotes industry and those who do and can potentially carry it out. Saint-Simon coins the noun “industrialist” to signify all those who “work to produce or to make available to different members of society, one or more material means to satisfy their needs or physical tastes.” Therefore the industrial class embraces work activities as diverse as those of farmers, wheelwrights, locksmiths, hat manufacturers, merchants, scientists, and artists (IV CATE 3–4). Whereas parasitic idlers, such as the landed gentry who profit from hereditary property rights, siphon off what is produced by the work of others, all industrialists make a direct contribution to societary work; they make connections and facilitate the circulation of life-maintaining and -enhancing goods.

Saint-Simon suggests that the “march of the human spirit” has been enabled by two alternative sciences: the physics of unorganized bodies or brute matter (corps bruts) and physiology, the study of organized bodies that struggle against

---

12. As Dagognet, in *Trois philosophes revisitées*, points out, physiology is *the* emerging science that greatly influenced not only Saint-Simon in his attempts to rethink social relations, but also Fourier and Proudhon. For Dagognet this common point of reference is one of several reasons for revisiting the recently much neglected work of all three.

13. See II QUE 211–34 for an analysis of the parasitic hornets that feed off the useful work of the worker bees. For Saint-Simon’s emphasis on “useful work” see III SI 178. Bearing in mind the stress placed by him on “useful work,” which positively contributes to the detailed life of society as a whole, his references to natural phenomena, his generous sense of “industry” and his aversion to the military, one would probably have to place Saint-Simon, perhaps rather surprisingly, closer to William Morris (see his “Useful Work and Useless Toil,” in *News from Nowhere and Other Writings* [London: Penguin, 2004]), than to Edward Bellamy (see *Looking Backwards* [Harmondsworth: Penguin, 1986]) in the utopian studies canon.
one another for ascendancy.\textsuperscript{14} For over a century the brutiers have hogged the post of avant-garde without discovering anything new. These “sad calculators” perceive the world as essentially composed of isolated bodies, and the only way they would be able to imagine something more constructive is by juxta- or superposition.\textsuperscript{15} Their approach to the world has nothing to offer an age plagued by fractious discontent and raging war (V MSH 36–40). The model proposed by physiology is potentially more conciliatory as it establishes complex links and pays attention to concerted efforts rather than “brutishly” breaking connections down or oversimplifying them. It can also contribute more to a pacific project for future society, concerned as it is with the existence of a general and organized well-being. Like physiologists, industrialists too must now take the lead as they also promote fluid interconnectivity; they must be positively encouraged to be innovative so that they produce artifacts that are qualitatively fine and enriching for society in general. For Saint-Simon, it is therefore no minor detail that society in the future will create as one of its vital organs a Chamber of Invention whose mission will be to stimulate projects that further social well-being. Such projects include the large-scale public works of land reclamation and the construction of roads and canals. However, these operations are not solely considered as essential means for facilitating global commerce and communication; they are also esteemed as vital sources of pleasure. Newly built thoroughfares will cross the nation’s most picturesque landscapes and these terrains will be set aside as “places of rest for voyagers and of pleasurable sojourn for neighboring inhabitants.” These gardens will house museums of local produce as well as the industrial products of surrounding regions. They will also contain residences for artists, and musicians will inspire inhabitants with the passion needed to develop “the greater good” (II ORG 51–3). Luxury was once reserved for the privileged few and it therefore functioned just as an aggravation of social injustice and instability. In the nineteenth century, the “progress made by the exact sciences and the fine arts” means that “present circumstances” are ripe for “making luxury national.” Saint-Simon states that luxury will become “useful and moral when it is enjoyed by the whole nation” (II ORG 53). In addition to producing luxurious pleasures, the Chamber of Invention also bolsters society’s sensibility of the passage of time by organizing public festivals of hope and memory. Such collective festive occasions are crucial for maintaining a dynamic sociopolitical system that continues to think about itself in terms of its “capacity,” that is, not only as containing the past, but as a potential force for positive future change.

\textsuperscript{14} See Musso: “every phenomenon can be reduced to the history of the struggle of its elements … every phenomenon is genesis; every fact is constructed” (Télécommunications et philosophie des réseaux, 81).

\textsuperscript{15} See V PHY 177, and Juliette Grange, Saint-Simon (Paris: Ellipses, 2005), 18–30, on not seeing society as an “agglomeration” of separate units (nor as a vitalist whole).
Saint-Simon’s valorization of the production of “industrialists” in his new society should be understood neither as a celebration of unbridled productivism as somehow good in itself, nor as an advocacy of laissez faire deregulation of “market forces” at all costs so as to maximize the “free” circulation of goods. Industrial activity that does not think the future, that is oblivious to its long-term social, or indeed environmental, impact, is just movement lacking direction.\textsuperscript{16} It is a machine turning in the agitated space of the present, which is, as we have seen, the “least solid basis” for constructive thought and action, being highly “vulnerable to the influences of the smallest circumstances” (V MSH 287). Like his disciples, Saint-Simon certainly envisaged grand engineering projects, whether they be the construction of the Suez Canal, a dam across the Nile, or long-distant railways networks, as contributing to making the globe into a terrestrial paradise for the “well being of all” (V QOP 82; V OS 137–8).\textsuperscript{17} But simply to classify him as the advocate of technocracy,\textsuperscript{18} to associate him merely with the institutionalization of elitist meritocracy in the form of powerful technical experts who are dangerously disconnected from social and environmental issues and lacking in culture, would be a mistake, for his sense of “social utility” is broad and rich and all those who actively contribute to the weaving of valuable social relations count for him (III SI 178). A friendly sales assistant,

\textsuperscript{18} The \textit{Oxford English Dictionary} attributes the term “technocracy” to W. H. Smyth’s 1919 “Industrial Management.” It further cites \textit{Mind} LVI.164 (1947): “Such notions as social and economic planning, technocracy … the denial of natural rights and individual liberties, etc., are due to them [sc. French utopians, St. Simon etc.] more than to Godwin or the utilitarians.” See also the entry for 1965, taken from H. G. Armytage’s \textit{Rise of Technocrats}: “St. Simonians were the first technocrats: apostles of the religion of industry.” See also: “Sociologically the future society is a society of scientists, artists, managers and technicians – something, in fact, very close to the ideal industrial society imagined by Saint-Simon and his disciple Comte, as Wells acknowledges. But it does not share their dangerous predilection for administration over creativity” (Krishan Kumar, “Introduction,” in H. G. Wells, \textit{A Modern Utopia} [London: Dent/Everyman’s Library, 1994], xxxvii–xxxviii). Kumar’s reading is not only unsatisfactory as a reading of Saint-Simon, for whom administration’s prime function was to enable creativity, but also as a presentation of the relationship between him and Comte. Saint-Simon explicitly objected to Comte’s reduction of his ideas to the “scientific” to the exclusion of the spiritual, that is, communally shared “moral ideas” (see, e.g., Musso, \textit{Saint-Simon et le saint-simonisme}, 80–82). For other critical revalorizations of Saint-Simon work as being nonreducible to technocratic thinking, see Dagognet, \textit{Trois philosophes revisitées}, 161, and Musso, \textit{Télécommunications et philosophie des réseaux}, 194.
an attentive bus driver, an inspiring song writer, or a communicative scientist would all be seen by him as doing useful “industrial” work.¹⁹ Not only do they carry out essential tasks on which the work of others depends, but they have also made human affects, happiness, and general well-being (which includes being stimulated by ideas and implicated in the world around us) their business. Accordingly, far from lauding the drilled performances of rather anonymous and ascetic action men, Saint-Simon devotes much thought to the cultivation of simple human pleasures and passions through artistic creation (III NC 161).

Keenly aware of the social sclerosis inflicted by self-perpetuating institutions such as academies that become worlds unto themselves,²¹ Saint-Simon advocates the celebration and recognition of independent “men of genius” who provide inspiring focal points for all (I LHG 14, 16). He also speaks out forcefully against another form of “tradition” – hereditary property relations – which often fix land forever in the hands of those who do not actually work it (II IND 170). This institutionalization of the “right of increase” is a recipe for disorder.²² Indeed, the social and economic neglect of the agricultural worker, exposed to the precariousness of tenancy, greatly preoccupied him (II IND 85). Society should learn to respect those who produce social wealth rather than be impressed by those who personally just have it (I IND 186). Investing in agriculture as the

¹⁹. For an analysis of the reduction of the definition of “industrialists” to engineers and bankers by the disciples of Saint-Simon, see Musso, Saint-Simon et le saint-simonisme, 183. See also Musso for the decreasing emphasis placed by the Saint-Simonians on the social in their promotion of networks (ibid., 178).

²⁰. Saint-Simon's pacifism, an absolutely fundamental and interesting aspect of his system, rules out any connivance with the formatted products of an “industrial army.” See I REORG 150–248 for his peace plan for Europe and analysis of Abbé Saint Pierre; II IND 149 for his suggestion that the army is already becoming politically and socially redundant; II ORG 60 for his injunction to the Chamber of Invention to take into account the eventual phasing out of the military altogether. See also Pierre Musso, La Religion du monde industriel (Gémenos: Éditions de l’aube, 2006), 217.

²¹. Given Saint-Simon's critique of the deadening effect of institutionalization, it is ironic that his “disciples,” most of whom had not been directly acquainted with him, were closely associated with L'École Polytechnique and L'École des Ponts et Chaussées, which have become, along with the other grandes écoles, significant impediments to social change. For the Saint-Simonian movement, see Picon, Les Saint-Simoniens.

²². Saint-Simon caustically remarks that property rights have become so ingrained that even during the severe food shortage of 1794, when the people were starving to death, the property of the well-fed rich was respectfully left inviolate (II ORG 146). However, in the long term, social unrest is bound to erupt owing to this lack of connection between the land and those who are intimately invested in it as a source of nutrition for all. Saint-Simon therefore calls for property relations to be “reconstituted and founded on the bases which can render it the most favorable to production” (II ORG 59). Proudhon's work on property and the abuses that the landlord's “right of increase” (droit d’aubaine) entails can be seen as following on from such remarks by Saint-Simon (even if he repeatedly criticizes Saint-Simonianism on property relations, see, for example, Qu’est? 336, WisP? 150).
most important industry would mark the shift from powerful humans abusing their subordinates, to humans in brotherly solidarity exploiting the planet (II IND 107): “The desire to command men has gradually transformed itself into the desire to make and remake nature as we like” (II ORG 127). However, this “exploitation” of nature has to strive for sustainability as the direction we are heading toward is the future, and for Saint-Simon, who makes constant reference to fluidity, the prospect we ultimately face is the drying up of water reserves on earth. He hauntingly evokes the predicament of the last man to drink the last drop of water on this planet who is nightmarishly conscious that, when he finally swallows it down, his imminent death will also be the death of his whole species (V MSH 295–6). The importance accorded to water in the work of Saint-Simon probably also informs his choice of the beaver (rather than the ape) as the animal closest to the human in his outline for a “science of man” (V MSH 49–50). Beavers move between land and water; they are fluent in both environmental media. They also demonstrate group intelligence as their work – their grand projects of sophisticated dam building – is social, being carried out for the colony as a whole. The “mutual aid” necessary for group work requires more intelligence than single acts of individual significance only (V PHY 179). Their high level of intelligence arises from their complex organic organization:

The animal which is the best organized, i.e., the most organized, is the most intelligent. The animal which is the most organized is the one into whose structure enters the most tubes, with the most variety of dimensions, which are placed respectively in the greatest number of positions and containing in circulation fluids with different densities. The more an animal is organized, the more its organization is composed of distinct apparatuses … (V MSH 49–51)

---

23. As will be demonstrated, both Fourier and Proudhon have much to add to Saint-Simon’s concerns about the future of natural resources. Proudhon, in particular, can contribute to this specific consideration of the precious nature of water and its relation to property rights (see e.g. WisP? 70–71; Quest? 216–18).

24. See Musso, Télécommunications et philosophie des réseaux, 381; Saint-Simon et le saint-simonisme, 7–8, 10, 14–15, for Saint-Simon’s spiritual and intellectual engagement with water and rheology.

25. The term “mutual aid” evokes the work of the anarchist Peter Kropotkin (1842–1921), who regarded this principle to be the active and evolutive agent within nature as a whole, rather than the reactive and rather deadly fight for survival emphasized by many social Darwinians; see Peter Kropotkin, Mutual Aid: A Factor of Evolution (Mineola, NY: Dover, 2006).

26. As we will discuss below, Proudhon will define “order” along these lines. “Order” for him is far from being something uniform, fixed, united; instead it presupposes “division, distinction, differentiation” (CREA §2). Chaos is “homogenous, identical, undifferentiated” (CREA §21).
The pluralistic world of industrious beavers, nowadays an endangered species, provides us with an image of what Saint-Simon had in mind for the society of the future.27

II. CHARLES FOURIER

Saint-Simon communicated his vision for the future up to his last breath, gasping to his faithful disciples the following parting words: “to do great things, one must be impassioned … my whole life can be summarized by one thought: to ensure for all men the freest development of their faculties.”28 For Charles Fourier29 also the passions were potential forces of radical social change to be nurtured, not repressed as is the wont of so-called “civilization.”30 Indeed he wrote:

27. Beavers also figure prominently in Fourier’s thinking: they represent a “practical hieroglyph” of association (while peacocks feature as association’s “visual hieroglyph”) (TFM 282). That is to say that, if we understand beavers “analogically,” we can see them depicting “families rallying together for combined large-scale works” (TUU I, 436). As free creatures, beavers delight in work (along with bees, wasps and ants), unlike humans, for whom work is drudgery (TUU I, 516). Everything in beavers’ (and ants’, bees’, and wasps’) existence “is romantic” as they work “uniquely by attraction” (TUU I, 211). For not just industry, but also art as beginning with animals such as beavers, see Jacqueline Duhême and Gilles Deleuze, L’Oiseau philosophique (Paris: Éditions du Seuil, 1991), 38. Even more than Saint-Simon, Fourier makes a strong case for a re-evaluation of our relationship to animals, and of ourselves as animal-relational (or becoming-animal): “Let’s open the great book of nature. If it is true that everything is related [lié] in a system of movement, how do chickens and ducks relate to our passions? What effects do they depict?” (TUU I, 237). See also Proudhon (TdeP 177) for how, while living among his fellow creatures, in the midst of the “organized milieu” that is nature “with all [its] sorts of animal, vegetal, mineral creations,” the “free man” can nevertheless still lay claim to his own inviolability.

29. The son of a rich cloth merchant, Charles Fourier (1772–1837; born in Besançon, France; died in Paris) developed a damning critique of mercantile capitalism and led a life of compelled frugality and self-inflicted solitude. Perhaps surprisingly, given the colorful nature of his exuberant ideas, his life was in general rather unremarkable. He lived in Lyons, the city of the radical silk-workers (les canuts) during the revolutionary period 1789–93, an experience that included his losing a large part of his inheritance owing to requisitioning by the government; and he became a traveling salesman, which involved attending the major European trade fairs, an experience which increased his insight into commercial practices. Fourier’s theories were the product of his experience and imagination and not the result of any formal education (his studies finished at sixteen) or sustained independent reading. As from 1815, thanks to an annuity he acquired after his mother’s death, he was able to devote himself entirely to the elaboration of his ambitious projects for economic and social reform. Gradually his ideas attracted followers who were determined to put them into practice, most notably Victor Considérant (1808–93) and Jean-Baptiste André Godin (1817–88).

30. Rejecting the notion of “scientific socialism,” Durkheim instead places “passion” at the source of the socialist movement: “Passion has been the inspiration of all these systems. They were
The philosophers say that the passions are too lively, too fiery; in truth they are weak and languid. All around one sees the mass of men endure the persecution of a few masters and the despotism of prejudices without offering the slightest resistance … their passions are too weak to permit them to derive audacity from despair.

(quoted by Simone Debout in TQM 25)³¹

The passions are the live wires combining the bodily and the cerebral, which permit us not just to have a body (and to think about what that object might mean or how it might communicate with the head) but to be a body, or several (Raoul Vaneigem in HPA 9, 11).

According to Fourier, when enlightened philosophers appeal to an abstract, disembodied notion of reason that all humans are supposed to have in common, they are in effect thwarting qualitative social change as they stultify those very mechanisms, the passions, that exist to combine us into social harmony. A creatively dynamic social whole is produced, not in spite of the passions, but in a finely tuned concert with them as long as they are expansively developed in what he calls a “progressive series” (TQM 128; TFM 15). Indeed, Fourier flouts “civilized” society’s logical certainties when he claims that whereas one cannot associate three families, one can easily associate three hundred (TUU I, 25).

³¹ Those involved in the events of May 1968 shared Fourier’s conviction that the passions are forward-moving forces that demand, and are maybe even capable of bringing about, what “reality” rules to be “impossible.” All were convinced that one of our major problems is that we desire too little (NMI&S 57) and that the little “we” desire is manufactured for us by dream factories. Hence the 1968 slogan: “I take my desires for reality because I believe in the reality of my desires” (cited by Philippe Darwin, Le Petit livre rouge de mai 1968 [La flèche: City Editions, 2008], 41). For the connection between Fourier, 1968, radical politics, and the definition of the human as homo passionnel rather than (the Marxist) homo oeconomicus, see Réné Schérer in Réné Schérer and Geoffroy de Lagasnerie, Après tout (Paris: Éditions cartouche, 2007), 42, 124–5, 131. For the importance of “not at any moment renouncing the affirmation of oneself as author of oneself and of one’s acts [and one could add, of one’s hopes and dreams] so as not to become a larvae and an object,” see Schérer and Lagasnerie, Après tout, 161. Proudhon would no doubt have agreed fully with Schérer on this crucial issue of self-affirmation.
As a consequence, “the moment an association is formed, the stronger and more numerous the passions are, the more easily will they harmonize with each other” (TQM 126; TFM 13). Social harmony cannot arise from a commonality of stock characteristics that “we” are all supposed to share. Instead it emerges from the proliferation of intensely divergent passions through which the individual unit, itself an artificial and egotistical construct of a brutalizing world of commercial speculation and social exploitation, is refracted as if through a prism. Nature, including humans, was originally no monoculture (NMI&S 113). The colorful, multifaceted embodied personality that is therefore able to re-emerge in Fourier’s radical social experiment, is predisposed to, and can “intermesh with” (engrener), a range of people with and against whom they can nurture their diverse, sometimes bizarre and hybrid tastes, interests, and predilections.

What is crucial to the workings of passions as agents of social combination is the scale of the association: the bringing together of “1,500–1,600 persons of graduated inequality of fortune, age and characteristics, of theoretical and practical knowledge” to live in a phalanstery would provide the optimal condition for the cultivation of the passions in all their enlivening variegations (TUU II, 316). Smaller social groupings – especially that of the nuclear family, that breeding ground for emotional regression, formatted thinking, and institutionalized inequality – would not provide enough contrasting elements for a sufficiently detailed refinement of the passions into a range of groups and

32. For the unnatural nature of monoculture, see: “the earth itself wants to be sowed variously, to alternate its productions: plants want to alternate what they reproduce in the form of seeds, seedlings and runners, etc; the soil wants various exchanges and transports of earth; all of nature therefore wants variety” (NMI&S 113). See my remarks below about the standardization of nature by the agricultural food industry.

33. Fourier remarks that “primitives” in the barbaric age enjoyed more freedom than “civilized” humans, or rather the men did, for women the situation was far less propitious (TUU I, 38). As will be addressed later, Fourier was acutely aware of “women’s issues” and his views on the liberation of women were most progressive.

34. A “phalanstery” is the large building in which the utopian community, or “phalanx,” would live.

35. Elsewhere Fourier gives the figure of 800–810 people (TQM 271; TFM 160).

36. On one level, Fourier is not against social “inequality”; rather the opposite. Indeed, he states that the progressive series should be “unequal in every way” (TQM 398; TFM 290). However, he is definitely against the social (including sexual) discrimination against women, the aged, and children. He is a staunch believer that all should be able to live passionately. For this to be possible it would therefore be more correct to say that he favors social differences but attacks those (economic, social psychological) factors that result in the exclusion of many (the poor, women, the young, old, infirm, and so on) from material and sensual well-being. In time, because of the universally transformed living conditions in Fourier’s world, fundamental material inequalities will in effect have ceased to matter.
For contrast and coordination, intersplicing and grafting, to take place, shaded multiplicities of individualities are required. This radically different notion of what order can consist of necessitates not only an extended and more generous notion of social grouping than that of the nuclear family, but also a more substantially structured, less abstract principle of social organization than that bestowed by the overgeneralizing and nondynamic term “rights of man.”

Societary order, which implies well-being and happiness (Fourier is adamant that only disorder can arise from poverty and unhappiness), is produced through the proliferation of “exceptions,” not generalities. Nature demonstrates this operation in its use of “twilight” forms and substances that both provide instances of graduated transition and create, through their interstitial interjections, difference. Fourier gives the examples of “lime as the link between fire and water; amphibians, the link between fish and quadrupeds; the nervous system, the link between body and soul.” Just as the “exception” is the general law behind nature’s order, so too must it become the organizing principle of human society (TUU I, 304).

Consequently, whereas in so-called “civilization” the passions are “unleashed tigers” that furiously devour society and the individual (TUU I, 354), in Fourier’s societary order they feature as forces that can be refined, nuanced, and articulated for human happiness and well-being and for social “compacity” (NMI&S 18). It is therefore important for Fourier to differentiate carefully between them so as to reveal how their pent-up complexity and sophistication is wasted in today’s “civilized” society. Accordingly, he categorizes twelve basic types of passion: five “material,” four “affective,” and three “distributive.”

---

37. Fourier’s criticism of Owen’s philanthropic projects stems from this consideration: New Lanark represented for him a “half association” based on small households, wherein there was no scope for “mixed series,” which are indispensable for social harmony. Other criticisms concerned Owen’s preaching of egalitarianism, a “political poison in Association” in Fourier’s eyes; this went hand in hand with his ascetic moralism (whereas Fourier’s promoted luxurious living for all). Another weakness was Owen’s neglect of agriculture, “the principal social lever” (TUU I, 109–11, 344).

38. For the lack of connection (hence lack of dynamic) between the well-meaning but nonseeing words of universal “human rights” and the actual situation of those people who are rightsless and home-less, see Duhême and Deleuze, L’Oiseau philosophique, 36. For the resonance of many of Fourier’s preoccupations with those of Deleuze and Guattari, see Réné Schérer, L’Écosophie de Charles Fourier (Paris: Anthropos, 2001), and “Le Séjour de l’errance,” Chimères 25 (1995); and Franck Malécot, “Charles Fourier et l’utopie,” in Charles Fourier, Du libre arbitre (Paris: Editions des Saints Calus, 2003), 109–38.

39. “Compacity” is the putting into play of a minutely distinguished variety of subtle shades of tastes (NMI&S 246). Contrary to egalitarian presumptions, this hot-house culture of refinedly nuanced tastes does not destroy the social, but it is rather the “bait” or “lever” that instead furthers social cohesion inasmuch as, in this extreme proliferation of difference, an individual’s “free will” will necessarily be able to find its social complement.
The five “material” passions, or sensory appetites, cultivate and intensify the particularities of the five senses. The passions of sight, hearing, touch, taste, and smell, each one exquisitely developed in its particularity and in its affinities with the others, are united as luxurism (TQM 197; TFM 84). As was the case for Saint-Simon, luxury is reprehensible only when it is an aggravating factor of social injustice and disorder that is distributed only to the few. However, when propagated for society as a whole to varying degrees and actively nurtured as a source of well-being, luxurism is a crucial mechanism since wealth and pleasure appear to all.\footnote{40} Morality preached the virtues of frugality, the need for ascetic self-constraint. Ideologues tried to coerce their citizens into becoming revolutionary converts by means of dematerialized ideas.\footnote{41} By contrast, the society of the near future will attract its associates with the charms of opulence to its ways of living and being. It should be noted, though, that the material luxury that Fourier celebrates is not to be equated with the excesses of today’s consumer “culture,” excesses that are explicitly criticized by Fourier.\footnote{42} For instance, he distinguishes between his societary gourmands, who practice a sophisticated “gastrosophy” that permits their highly sensitized palate and stimulated digestive tract to appreciate five meals and two snacks per day without losing their appetite, and “guzzling gorging gluttons”\footnote{43} such as Vitellius and Nero (TFM
Gastroosophy is not the art of eating a lot; instead it is the celebratory cultivation of the culinary art, which is the most revered form of aesthetic expression in Harmony, the era of universal happiness which he discerned to be within our reach. It provides the pivot for agricultural work. It can also whet the appetite for learning about, for example, the chemical, biological, and cultural processes at work within us and at large in the world around us. In Fourier’s phalanx those varieties of produce would be cultivated that have been wiped out by an economy driven by standardization (the drive towards simplisme) and profit margins.

As we have already seen, Fourier’s economy favors sectarian tastes and pursuits. Accordingly, those agricultural workers who are, for instance, pear growers, would divide into specialized subgroups to cultivate such varieties as butter pears, bergamots, russets, and hybrids such as quinces (neither pear nor apple, but both, as well as being something else). Pears would also be nurtured for their sensual qualities, for their flourishness, compactness, softness, crispness, hardness. The rivalries and emulation that flourish between the various varieties of taste, affinity, etc.”

In his *Essay on Liberation* (Boston, MA: Beacon Press, 1969), Herbert Marcuse envisages a “passing from Marx to Fourier,” seen as signaling a move away from state – toward libertarian – socialism (ibid., 22). A (not negligible) aspect of this momentum would be that: “art would capture some of its more primitive ‘technical’ connotations: as the art of preparing (cooking!) cultivating, growing things, giving them a form which neither violates the matter nor the sensibility – ascent of Form as one of the necessities of being, universal beyond all subjective varieties of taste, affinity, etc.” (ibid., 32).

Like Saint-Simon, Fourier thinks that “civilization” has woefully neglected agriculture; indicative of its general neglect of socially productive work (TQM 397; TFM 289). Scathing of pastoral attempts to romanticize the rustic, Fourier states that one must be clear: agricultural labor in “civilization” is horrendous and repugnant (TUU II, 812). Indeed, Fourier is far from advocating a simple and basic “return to nature.” The phalanstery is no primitivist retreat. He is not averse to employing sophisticated technology to render work less unattractive: for instance, he states that, in laundry-rooms, “numerous arrangements will be made to shorten the work by means of mechanical devices of all sorts” (UV 327). For Proudhon also the importance of agriculture (and of small-scale industry) must be reinvented – not just returned to – so as to have a more just, and therefore more pacific and happier, future for all.

For more on pears, apples, and quinces see TQM 398–400; TFM 290–93; see also UV 47 for the "Pear-Growers’ Series.”
subgroups of pears growers would nourish their passionate zest for their tasks, which have been transformed into attractive pursuits. This motivating combination of pleasure and useful work substantially helps to produce finely cultivated, high-quality ingredients that are in turn prepared by various culinary groups with penchants for particular preparations side by side in collectivized kitchens (TQM 275–6; TFM 164). The gastronomic meal therefore will consist of an array and assortment of exquisite dishes. The social arrangement of the phalanx means that at each meal there is a graduated variety of dining guests (TQM 270–71; TFM 159). This residential variety guarantees that the dining hall is always filled with the sounds of lively discussion and the gaiety of social exchange.

Variety nourishes and thereby increases variety, beginning with the differentiated production of the various ingredients right through to its appreciative consumption. The societary meal thereby becomes a fully fledged festive occasion and creative event. By contrast to meals in the privatized spaces of the “civilized order,” Fourier reassures us that meals in the phalanx are always enlivening occasions, lasting no more than an hour, which energizes their consumers, increasing their collective appetites for further pursuits. He tells us that “the days will never be long enough to satisfy all the intrigues and joyous reunions of which this new order will be full. The body, by means of [dietary] hygiene and variety, will barely tire and from birth Harmonians will require little sleep” (TUU I, 193).

---

49. That is to say, in Fourier’s world farming the fields has become a radically different activity from the grueling, back-breaking agricultural work of the past.

50. For the absurdity and waste (cultural and social as well as economic and ecological) involved in living in isolated households see TQM 236–7; TFM 123; see also UV 130 on the “prodigious saving of labor” by the “gathering together of minor domestic jobs.” Fourier’s ideas on waste are echoed in other key “utopian” texts such as Edward Bellamy’s Looking Backwards (1888) and Charlotte Perkins Gilman’s short stories, for example, “Her Housekeeper” (1910).

51. Even at third-class tables in the phalanx, there will be “at least thirty or forty” dishes and “a dozen different kinds of drink” to choose from. A communitarian way of living and working makes this splendid variety possible. Fourier’s celebration of “consumer choice” is very different from the capitalist model experienced by us today. See, for example, Simone Debout Oleszkiewicz’s introduction to NMI&S 14 and, again, Vaneigem’s excellent introduction to HPA.

52. The Harmonians are “constantly on the move” (TQM 288; TFM 178). The stress placed by Fourier on the dynamic lifestyles of his phalansterians is important as it goes to illustrate how his community is neither static, sedentary, nor indeed isolated (closed). For a compelling article on nomadism and Fourier (as well as Kant), see Schérer, “Le Séjour de l’errance.” For more on these subjects in relation to universal hospitality, see Schérer, Zeus hospitalier (Paris: La table ronde, 2005), esp. 118–29.

53. Much more would need to be said about how the societary order furthers the material passions: for example, the pleasures of sight are fostered by the care paid to visuism; the emphasis placed on flowers (TUU II, 563) is an acknowledgement of the sensual (but also educative) importance not only of the delights of the eye, but also of the strength and insinuating subtlety of
Far from fetishizing the consumer as “individual,” Fourier in effect dismisses what he would consider to be a merely “simple mode” of egotistical indulgence (TUU I, 506). The individual is an illusory extrapolation from the social, an effect produced by a materialistic industry financially interested in speculating on one’s insecurities. In an at once conventionalizing, but also socially atomizing way, “commodity culture” aggravates a reactive need to feel special or better than others. Fourier therefore recalibrates our social relations, with ourselves and with others, in his analysis of groupism, defined as our naturally expansive propensity to form groups. The supposedly “integral” individual is “essentially false” – as indeed is a couple – as only in a group (which is composed of at least three people) can the twelve passions be fully developed (OC XI, 320–21). Groupism unites the four affective passions of ambition and friendship, love, and family. In civilization, it is the latter passion that is over-emphasized. In Fourier’s Harmony, family is the passion emphasized least insofar as the family is a group of “forced or material bonds, not a free, passionate gathering, dissoluble at will” (TQM 193–4; TFM 80). Indeed, in the family, the child is “constantly harried by the admonishments of their parents,” if not downright maltreated (TQM 194; TFM 76). This constitutive coercion bodes badly for future “filial love,” and the categorically imperative appeal to Duty (a man-made fiction, according to Fourier) generates just as little a response in the child. Friendly sympathy and kindness would be a more fertile and effective way of nurturing positive bonds between adults and children. Hence, in the societary order, children are far less determined by family ties and, as a consequence, far less badly behaved.

---

54. Fourier’s term for the divisive and dividing society we live in is l’industrie morcellée. It is fuelled by speculation (agiotage).
55. The twelve passions have 810 keys. For a detailed analysis of the mathematical-musical complexities of Fourier’s passionate attraction, see Patrick Taculsel, Charles Fourier, le jeu des passions (Paris: Desclée de Brouwer, 2000).
56. Most unlike Fourier, Proudhon was a staunch supporter of the patriarchal family (indeed, his views on women are objectionable). Nevertheless, this definition by Fourier of what constitutes a productive and happy group bears similarity with his conception of cooperative mutualism. For the (debatably overstated) differences between Proudhon’s ideas and Fourier’s notion of association, see, for example, CAP I, 162–3, and SW-P 61–3.
57. For Fourier “Duty” is merely man-made, whereas attraction comes from God (TQM 189; TFM 75).
children spend all their time at home crying, breaking things, quarrelling and refusing to work. However, as soon as they join the progressive Series or Series of groups they will work all the time, compete spontaneously among themselves, and eagerly find out as much as they can about agriculture, manufacture, science, and the arts. They will be productive and profitable whilst thinking that they are just enjoying themselves. Once fathers experience the effect the new order has on their children, they will find them adorable when they are in Series and detestable when they are in [the] incoherent households [of “civilization”].

(TQM 127; TFM 14)\(^{58}\)

This apparently magical transformation of the brattish child is achieved not by changing its passions, but by precisely working with them instead of against them. The potential of passions for social engagement is promoted and their invigorating energy is positively encouraged.

Just as the fate of the child and the parent is bleak in the traditional family structure, so too are the prospects for future happiness of the married couple itself: indeed “discord and tedium” generally results from isolated households locked into traditional modes of (re)production (TQM 230; TFM 116).\(^{59}\) The female particularly suffers from the patriarchally biased family structure, a dismal fate that greatly preoccupied Fourier.\(^{60}\) Indeed, he is remarkable for his emancipated stand on the question of women’s rights, an issue that he considers is woefully neglected by those supposed “enlightened philosophers with their

---

58. Fourier is a major theorist of education, whose ideas in this field and indeed in many others, deserve to be better known in the Anglo-American world. For two good attempts to introduce them into circulation, see David Zeldin, The Educational Ideas of Charles Fourier (London: Frank Cass, 1969), and Réné Schérer, Vers une enfance majeure (Paris: La fabrique éditions, 2006). Schérer is not only one of the best commentators of Fourier (along with Debout) but a major thinker in his own right (lamentably untranslated in English).

59. Proudhon claims that Fourier’s critical negation of the traditional (patriarchal) household is totally unacceptable on two accounts: first, because he unleashes “tendencies which are disorganizing and antisocial,” and second as, despite defending private property, in dismantling the family he gets rid of the “organic element,” the “soul,” of property itself (CONTRA II, 352). Proudhon’s ideas on sexual difference are lamentably out of tune with his challenging and topical ideas on property, which remains, of course, a key issue for women’s rights. By contrast, Fourier’s ideas on love chime as contemporaneous with, for instance, Hardt and Negri’s view that: “The modern concept of love is almost exclusively limited to the bourgeois couple and the claustrophobic confines of the nuclear family. Love has become a strictly private affair. We need a more generous and more unrestrained conception of love … [to] conceive [of] love as a political act that constructs the multitude” (Antonio Negri and Michael Hardt, Multitude: War and Democracy in the Age of Empire [New York: Penguin, 2004], 351ff.).

60. Fourier has been credited by modern scholars with having originated the word “feminist”; see Leslie F. Goldstein, “Early Feminist Themes in French Utopian Socialism: The St.-Simonians and Fourier,” Journal of the History of Ideas 43(1) (January–March 1982), 92.
“rights of men.”61 He inveighs against those “modern philosophers … [who] are concerned with *ethics* yet who neglect to acknowledge and demand the *rights of the weaker sex*, the oppression of whom destroys the very foundation of justice” (TQM 303; TFM 192) (as does slavery62). Just as the child reveals itself to be a different creature outside civilization’s incarcerating structures, so too does the female:

> To attempt to judge women by the defective character that they display in Civilization is like trying to judge the nature of man by the character of the Russian peasant who has no conception whatsoever of honor or liberty. It is like judging beavers by the sluggishness that they show in captivity, whereas in a state of liberty and coordinated labor they become the most intelligent of all quadrupeds. The same contrast prevails between the enslaved women of Civilization and the free women of the Combined Order. (UV 174)

However, in addition to these important gender issues, his radical ideas on sexuality in all its polymorphous perversity are also pertinent and challenging. Acutely sensitive to, and vocal about, human issues relating to gender, sexuality, class (poverty gives the lie to enlightened ideas about rational and cultural “progress”63), Fourier is additionally one of the rare thinkers who discusses the scandalous exclusion of the aged from socially productive life:

> There is nothing more distressing than the lot of children and old people in the civilized order: there are no suitable jobs for the very

---

61. Writing in 1808, after the revolutionary Terror and with the Napoleonic wars still raging, such bloodshed was for Fourier consequential proof of what happens when the “visions of philosophers are put into practice.” His alternative view of a possible future should be understood as a *pacifist* reaction against the deadly destruction caused by historical conflict. The differences, tensions and rivalries encouraged by Fourier are not deemed to be incompatible with the peaceful coexistence that ultimately underlies the *raison d’être* of his social program of rights for all. See, for instance, “The task [facing the initial six progressive households] would be a very peaceable one, and instead of laying waste to the earth in the name of the rights of man, it would involve the peaceful establishment of the rights of women” (TQM 233; TFM 119).

62. According to Fourier, God wants associates not slaves (TUU I, 26). The liberation, not only of women, but of slaves, is therefore perceived by Fourier as essential if the “progressive series” is to be formed (TQM 134; TFM 21).

63. Poverty should be history for Fourier. He declares that poverty is the “most scandalous social disorder”; its praises might well be sung by ascetic moral philosophers but this eulogy amounts either to sheer hypocrisy, or to intellectual and sensual mediocrity (TQM 292–5; TFM 181–5). Fourier shares this refusal to accept poverty as a social inevitability with Saint-Simon and Proudhon.
old and the very young, with the result that childhood and old age become a burden on the social body. Children are nevertheless cherished for the services they will render in the future, whereas old people, from whom nothing is expected except a legacy, are unwelcome, despised, ridiculed behind their backs, and hounded into the grave. There is still some respect for them in rich families, but among the peasantry and the mass of the people there is nothing sadder than the fate of the old. They are degraded, openly rebuffed, scorned, and everywhere made to feel that their lives are useless.

(TQM 235–6; TFM 122)

Work is useful, for the young and old alike. As with Saint-Simon, Fourier makes a strong case for the social function of work, which has the capacity to bind us in valorizing and pleasurable ways into collegial teams and collaborative associations. The “right to work” for all should have been considered by “modern philosophers” to be a basic human right, as “without [it] all the other rights are useless” (TQM 302; TFM 192). Everyone should have the right to present themselves to society and to say:

“I was born on this earth. I ask to be admitted to all the sorts of works that are carried out here and for the guarantee to enjoy the fruits of my labor. I ask for the instruments necessary to carry out this work to be advanced to me, as well as some subsistence by means of compensation for the right to steal that simple nature gave me”; Every Harmonian, however ruined he might be, will have the right to make this speech in his native country and his request will always be received. (TUU I, 467)

Accordingly, in hospitable Harmony, people of all ages, as well as of all fortunes and misfortunes, find their place as it is the passionate proclivities (which embrace work) that are the generators of like-minded and like-bodied groupisms, not the arbitrary distinctions between the young, adult, and aged, (or even that between “men” and “women”). The new pleasures of Harmony will thus “be for people of all ages,” all sexes, and all classes (TQM 264; TFM 152).

When unbridled and expressed collectively, the passions can transcend the conventionally encoded relations of “civilization,” which lock us as individuals

---

64. With the proviso that the work is useful work and not useless toil, to employ Morris’s crucial distinction (Morris, News from Nowhere, 285–306).

65. See also TUU I, 427: Fourier says that, despite talk about human rights, the fact that the “right to work” has been neither recognized nor granted should have been sufficient to prove to us that something serious is amiss with so-called “civilization.”
into the fictitiously impermeable categories of age, sex, and class.66 When thus in full flight, the passions heighten the pleasures of the five senses; they create the elective affinities of shared goals (ambition) and of friendship, and they also necessarily radically reconfigure the affects arising from love affairs and family relations. Additionally, the passions produce three distributive mechanisms for the four affective groups. The Cabalistic is the penchant for intrigue within the group and emulative rivalry with other groups. The Cabalistic passion thereby motivates the various intimately associated groups to excel in their particular production or activity. The exclusive character of the Cabalistic passion is countered by the alternating Butterfly passion that introduces another form of, and rhythm to, social distribution and interaction. The Harmonian flutters from activity to activity, joining different groups, creating amicable ties with a variety of different people according to a diversity of interests. Thereby this “dissemination of workers of one specialized group into a hundred other groups” also sows the seeds for an elaborate “intermeshing” whereby richly differentiated social ties can spring up and grow (UV 50–51; OC VI, 85; NMI&S 111; TUU I, 195).67

Once again (as was the case with Saint-Simon) a radically different understanding of what work is and can do is required: “attractive work,” comprising short (two hours maximum) working sessions on any one particular task, stimulates the body and the mind and fosters social interaction and productivity. By contrast, the long stretches of time favored by the “mercantile spirit” exploit workers’ energies to their depletion. According to Fourier, locking workers into the same repetitive, monotonous tasks does not ultimately even make economic sense (TUU I, 107; UV 231–2). Indeed, he is convinced that the societary order, which works with the natural resources of the passions, will increase productivity fourfold by soliciting willing diligence as well as “establish[ing] a system of distribution which will assure the lower classes of a proportional share in the increased wealth and a minimum sufficient for a decent life” (UV 127).68

66. Malécot, “Charles Fourier et l’utopie,” 115–16. For an instance of unconventional amorous proclivity and how it can breach the divides of age, see the anecdote about Valère and Urgère (TUU I, 199–201).

67. By specializing in just one activity, the worker develops a protectionist, reactionary, sedentary frame of mind (TUU II, 808). In Harmony the Butterfly passion, which keeps people constantly on the move, is the mechanism that prevents such a corporatist mindset from taking root.

68. Like Saint-Simon, Fourier has his eye on those who are parasitically unproductive in “civilized” society. These fall essentially into three groups: first, there are, of course, those who are idle owing to wealth or to unemployment; second, there are those who waste their energies owing to atomized industry, which needlessly duplicates the individual carrying out of tasks that could easily be performed more efficiently for the group as a whole; third, there are those who do socially useless work. The latter category consists of occupations such as working for
interest in the generalized wealth and well-being of others, in work as socially productive, is aided by the exalted Composite passion, which “electrifies” groups with its waves of contagious enthusiasm (NMI&S 109).

The thirteenth passion, which is the passionate stem for the other twelve, is *Unityism*. This passion is defined by Fourier as:

> the inclination of the individual to harmonize his own happiness with that of everything around him and of the whole human race, which today is so hateful. It is a boundless philanthropy, a universal well-being, which will not be able to develop until the whole human race is rich, free and just … (TQM 195; TFM 81)

Unityism, which shifts the social emphasis away from the egotistical individualism of incoherent “mercantile” spirit toward that which is collective, is in accordance with the forces of attraction that are at play and at work in the world as a whole. Fourier cites Laplace, who stated: “If there exists truths which appear to us to be detached from each other, it is because we are ignorant of the link [lien] which unites them as a whole” (TUU I, 438). 69 Newton’s demonstration of gravity shows this persisting “ignorance” to be unjustified for Fourier (and Laplace) insofar as this demonstration revealed one of the dynamic “links” that transverses universal matter. This Newtonian discovery needs to be extended to embrace the animal, the social, and the organic (defined as “the laws by which God distributes properties such as form, color, smell, etc., to all created or future substances in the various globes” (TQM 149; TFM 36). This working-through of the laws of material attraction to embrace all aspects of life on this planet (and others) necessitates a radical redefinition of what is meant by the social: “By analogically observing nature we see that all social harmony, from that of the planets and fixed stars to that of bees and beavers, is revealed and directed by attraction” (TUU I, 436).

Up to now we have tended to regard nature as something “in itself,” separated from us by a mysterious “veil of brass,” and divided against itself in the forms of the army (an organization that just bleeds the social body), or manufacturing shoddy goods, or working as a mercantile intermediary who dishonestly profits from commercial exchange. When work is not only a right for all but also an attractive pursuit that has evident social benefits for all, there will be no unproductive parasites (UV 130–33). For Fourier as the first socialist thinker of the “right to work,” see UV 137–8.

69. Fourier insists that *everything is harmoniously related* in the universe (TUU I, 226).

70. Fourier surmised “that the attractions and properties of animals, vegetables and minerals might be co-ordinated on the same level as those of man and the stars” (TQM 129; TFM 16).
of isolated species. We are now told to understand ourselves in terms of and through nature’s vast range of “hieroglyphs.” Accordingly, he quite exquisitely analyses, for example, “the bright yellow tuft on the head of a cockatoo” as an “emblem of an unhappy marriage,” or the cauliflower as “an ocean of flowers” symbolizing “the young lover” (UV 407, 411). This conceptualization of nature might strike us as simply anthropomorphic, especially given his statement that “without analogy nature is no more than a vast patch of brambles” (UV 410). However, the meanings that nature is seen to have for us are not simply a reflection of human concerns; they engender in turn a complex transformation of the human. We begin to understand the interrelatedness of the universe as a mutating whole pulsating with passionate attractions. Fourier writes: “Every created product, cedar or oak, cat or dog, as hieroglyphic, emblematic, can present either internally or externally, fifty or hundred tableaux of the effects of our passions and our social relations” (OC VIII, 253). We are induced to redefine ourselves as essentially nonessential, primarily “passionate,” rather than rational, creatures.

In addition, we are coaxed into associating ourselves in a “new alliance” with other living and nonliving forms (animals, vegetables, and minerals as well as the planet itself) as equally desiring, responsive, and dynamic becomings. This “new alliance” breaks with the approach of human instrumental reason with its

---

71. Abbé Barthélemy’s claim that “Nature is concealed under a brazen veil, that the united efforts of men and ages can never lift up the extremity of this covering” is often repeated by Fourier, to be every time categorically rejected by him. See, for example, TQM 216, 395; TFM 103, 288.

72. For Fourier the “passionate attraction is the impulsion given by nature anterior to reflection which persists in spite of the opposition to reason, duty and prejudice” (NMI&S 85).

73. As Schérer, in his introduction to L’Écosophie de Charles Fourier, writes: “the earth is not only the milieu for the living but is itself living” (ibid., 6). Drawing on the work of Félix Guattari (Les Trois écologies [Paris: Éditions Galliée, 1989]), Schérer continues: “it appears that only an ecosophy is capable of maintaining a desiring and productive tension between the human and nature” (L’Écosophie de Charles Fourier, 22). See also Vaneigem (in DLA 11) on how the advent of a “new alliance with nature” – evidently with these words he is evoking Ilya Prigogine and Isabelle Stengers (La Nouvelle alliance [Paris: Gallimard, 1986]) – would “announce the end of a system founded on the frenzied exploitation and pillage of natural resources.” As Walter Benjamin, Illuminations, Harry Zohn (trans.) (New York: Schocken Books, 1969), 261, pointed out when discussing the merits of Fourier’s ideas about our place in and relation to the universe, the exclusion of a new dialogue with nature by an instrumental reasoning is not just the preserve of capitalism but was also one of the faults of state communism. My use of the Deleuzian term becomings is justified as for Fourier, and apparently God, the universe has to be seen in movement: “God is the enemy of uniformity, he intends movement to be in perpetual change (TQM 305; TFM 194). [*] Deleuze is discussed in detail in an essay by Daniel W. Smith in The History of Continental Philosophy: Volume 6, while Guattari’s work on ecology is treated in the essay by Jonathan Maskit in The History of Continental Philosophy: Volume 8.
“divided-up industry” (industrie morcellée) that fails to think coherently, that is, to think the whole, and that therefore has a detrimental impact on the environment. Indeed, Fourier is remarkably prescient about, for example, the negative effects of deforestation, the erosion of mountains and slopes, and, as we have already seen, the gustatory and social effects of neglecting agriculture: all results of the lack of “joined-up thinking” (TUU I, 64, 361, 407, 413; TUU II, 352). However, perhaps rather more challenging for those already ecologically minded are his ideas, for example, about heating up the poles to make them habitable (for humans), his plan to “perfect a regime of artificial feeding” for babies, and increasing by tenfold the quantity of fish available for consumption by conserving them in “reservoirs with fertilizers,” that is, intensive fish farming (!) (TUU I, 401, 401; NMI&S 207). Despite these somewhat problematic ideas about environmental changes, he makes an equally strong case for the catastrophic decline of the planet due to our being sluggishly out of sync with the combined movements of the universe. Our “social tardiness” sickens the planet, he tells us (TUU I, 568).

In Le Nouveau monde industriel et sociétaire (The industrial and societary new world), Fourier describes the way the peasant dairy farmers of the Franche-Comté, his native region, organize themselves:

The peasants of the Jura, seeing that, with the milk of one single household, one couldn’t make a cheese called gruyère, banded together, taking their milk each day to a common workshop [atelier] where the contribution of each one was noted down on a wooden stick. From the collection of all these little quantities of milk an abundant cheese is produced at little cost in a vast vat. (NMI&S 43)

Given our “pompous” pretensions in the field of “economism,” Fourier asks the rhetorical question: how come the nineteenth century has been unable to nurture these preexisting “little seeds [germes] of association” so that they grow into a “full-fledged system [un système plein]”? (OC XI, 356; NMI&S 43). If there is no systematic cultivation of these alternative ways of social and economic interaction, Fourier tells us, any project for societal improvement will remain a utopia, a mere “dream of The Good without the means of execution, without an efficient method” (OC XI, 356). If society does not undergo a radical transformation, if it does not reassess what is valuable and what is not, then no substantial progress will be made. Fourier paints a bleak picture of the present and what will be the future if theory does not become practice:

All over the place people desert the countryside to go to the cities, to invest in public funds, to speculate at the Stock Exchange, whilst the
ant-hills of the merchants, of whom there are twenty times too many, absorb all the capital. Deceitful competition further stimulates the corruption to the point that bread itself is poisoned by sulphates. In the meantime utopian philosophers sing the praises of enlightened progress. (OC IX, 356)\(^74\)

III. PIERRE-JOSEPH PROUDHON

Like Fourier, Pierre-Joseph Proudhon\(^75\) was a native of the “relatively recently annexed and still independent spirited” Franche-Comté, a region of cheese- (and clock-) making.\(^76\) Both like and unlike Fourier, he also appeals to the model of the small-scale workshop run according to what he called “mutualist” principles as a conducive basis for a radical reorientation of society and its values along decentralized and, by extension, federalized lines.\(^77\) Proudhon’s first biographer,

---

74. As we have already pointed out, Fourier clearly highlights the topical issues of the abandonment of manufacturing industries of which the most important is agriculture and the rupture of direct contact with nature and the concomitant degradation of quality foodstuffs. In this succinct passage, he is also emphasizing the live subject of the preponderant importance accorded to, and the dangerously inflated influence of, banks and bankers.

75. Pierre-Joseph Proudhon (1809–65; born in Besançon, France; died in Paris) was of working-class, even peasant origins despite being labeled “petit-bourgeois” by Marx. His father worked in a brewery, his mother was a waitress and as a small boy he himself worked in the fields tending crops and livestock in the Jura. He was later by trade a typographer, printer, and journalist. While an apprentice (compagnon) traveling around France (1830–32), he presented himself to the mayor of Toulon and unsuccessfully claimed his right to work as a citizen of the world. His declaration in 1840 that “property is theft” made him notorious. In 1848 his experiences as parliamentarian reinforced his growing aversion to party politics. He was imprisoned in Saint-Pélagie and then at the Conciergerie from 1849 to 1852 for his opposition to Louis Napoléon Bonaparte. Proudhon is the father of libertarian socialism or societary anarchism (as opposed to state socialism), the founder of the People’s Bank, a promulgator of mutualist systems and self-government and a far-sighted thinker of federalism. His ideas were particularly influential during the 1871 Paris Commune and the radical French trade union, the CGT (Confédération Générale du Travail), directly recognized his influence by naming their daily newsletter La voix du peuple and monthly newspaper L’atelier.

77. When reflecting on why it might be that Fourier, Proudhon (and Considérant), all originating from the Franche-Comté, became “social inventors,” Christian Guinchard also evokes their most probable awareness of “the collective rural experience of cheese-making” which necessitated the association of several producers in a system of “reciprocal loans of milk” (Christian Guinard, “Besançon et Mulhouse – I: Deux mémoires sociales déterminantes,” La Grande Relève [May 2005], http://economiedistributive.free.fr/spip.php?article769 [accessed June 2010]). See also the website http://artic.ac-besancon.fr/histoire_geographie/new_look/Ress_thematiq/thematiq/utopies.htm (accessed July 2010). Michel Anthony’s introduction to
Charles-August Sainte-Beuve proclaimed that his ideas would perhaps triumph one century after his death. Michel Ragon, writing after the fall of the Berlin Wall and reflecting on the dismal failure of monolithic state communism it represented, considered that the late twentieth century was even more propitious than the 1960s for the ideas of a Proudhon and for libertarian socialism generally to take seed. Following on from our analyses of Saint-Simon and Fourier, it remains for us to look at Proudhon’s ideas and their currency for us now.

We have seen how Fourier lamented the lack of systematic initiative needed in society at large to disseminate the “seeds of association” that were capable of fermenting social change. While in effect sharing many of Fourier’s basic convictions, Proudhon would no doubt balk at the idea of a “fully fledged system” being at all desirable. In an 1841 letter to his friend Antoine Gauthier he wrote:

You ask me to give you an explanation about how society is to be reconstituted. … [But] it is not a question of imagining in our heads this valuable site of utopian resources opens with the words: “the Franche-Comté is the land of utopians and of utopias ....”

78. Proudhon died in 1864. A few years later, during the 1871 Paris Commune, workers were seen clutching copies of Proudhon’s De la capacité politique des classes ouvrières, and his friend, Gustave Courbet, whose radical realism he championed in Du principe de l’art was attempting to put Proudhon’s ideas about mutualism to work in his capacity as President of the Federation of Artists (see Bertrand Tillier, in Gustave Courbet [Paris: ADAGP, 2007], 19–28). One century later (1968), nine to ten million French workers were on strike. One of the symbols of this generalized contestation was the occupied “workers’ fortress” on the Île Seguin, the Billancourt Renault factory. A few years later (1972–73), the watch-making LIP factory in Besançon (Proudhon’s birthplace and home for many years) was taken over and self-managed by the workers themselves until the forces of official “order” moved in to reclaim it and thereby save the authority of the state (and status quo). During this period Proudhonian ideas about workers’ mutualist associations, about work itself as a “collective force,” about what property is and could become, about the problems engendered by centralized statism (whether capitalist or communist) are definitely at play. For the inspiring story of LIP, see Maurice Joyeux, “Chez LIP: On fabrique; on vend; on se paie” (At LIP: We make; we pay ourselves; we sell) available at http://incревablesanarchistes.org/articles/1968_81/lip_1973.htm (accessed July 2010) and the important documentary film by Christian Rouard, Les LIP, l’imagination au pouvoir (Les Films d’Ici, 2007). For how the anarcho-mutualist working practices of the Franche-Comtois cheese-makers was exported in the eighteenth–nineteenth centuries to the Besançon clock-making workshops and thereby to LIP, see Guinchard, “Besançon et Mulhouse.”

80. Proudhon’s relation to Fourier was perhaps overdetermined: having supervised the printing of Le Nouveau monde industriel et sociétai re and thereby become well acquainted with his writings, he admitted that “for six weeks [he] was captive of this bizarre genius” (see George Woodcock, Anarchism: A History of Libertarian Ideas and Movements [Cleveland, OH: Meridian Books, 1962], 102–3). He subsequently seemed to take almost every opportunity to criticize him, notably with regard to his radical ideas about amorous relations.
a system that can then be presented. … This is not the way to reform the world. Society can only be corrected by itself … social science is infinite, no-one possesses it entirely … no-one on earth is capable of giving a complete system from start to finish that only has to be implemented. This would be a most damnable lie.81

For Proudhon the most a “social scientist” can do is to present “examples, a method,” not a blueprint for a better world or a doctrine to be inculcated. Hence, in his notorious 1846 letter to Marx,82 while confirming his commitment collaboratively to “discover the laws of society,” he wrote:

simply because we are leaders of a movement, let us not instigate a new intolerance. Let us not set ourselves up as the apostles of a new religion, even if it be the religion of logic or of reason. … Let us never consider any question exhausted, and when we have used our very last argument, let us begin again if necessary, with eloquence and irony. On this condition I will join your association with pleasure, otherwise I will not. (SW-P 150–51)

Proudhon was indefatigably committed to the idea and practice of independent living, working, and thinking, hence his deep suspicion of any systematized, institutionalized, and hierarchized party politics.83 However, this advocacy of individual liberty is far from being asocial or antisocial; for Proudhon it offers precisely a means by which a new form of sociability can be produced.84

As we have already seen, Fourier’s vision of what societary “association” could become was radical and challenging. However, Proudhon is keen to differentiate most categorically between what he perceives as a Fourierist-style “association”

*82. For a discussion of Marx and Marxism, see the essay by Terrell Carver in The History of Continental Philosophy: Volume 2.

83. Proudhon gives a bleak picture of his parliamentary experience as “people’s representative.” He depicts his time in office as a period during which, far from directly communicating with and acting for his voters, he was isolated from them, locked into committee meetings that propagated agendas that were out of sync with the faster moving events in the outside world (CONF 124). This experience explains his conclusion that “all parties without exception, in so far as they seek power, are varieties of absolutism” (quoted in Woodcock, Anarchism, 15).

84. Woodcock, Anarchism, 99, describes Proudhon’s form of anarchism as that of a “social individualist” whereas, by contrast, Max Stirner’s is that of “an egoistic individualist.” See also Woodcock’s subsequent analysis of La Création dans l’ordre de l’humanité for how the social is the matrix or “serial order” within which “each man’s personality must find its function and fulfillment.”
and his model of “mutualism.” The crucial differences can be understood as being both temporal and psychological. Proudhon writes: “Whilst we are considering association, let us note that mutualism intends men to associate only insofar as this is required by the demands of production, the cheapness of goods, the needs of consumption, and the security of the producers themselves” (SW-P 62; CAP I, 163, emphasis added). This “only insofar” introduces restrictions to the mode of participation in the social contract that is mutualism, which are absent in Fourier’s model. First, Fourier’s association presupposes (without necessitating or coercing in any way) a participation that – albeit most varied, dynamic, libertarian, and transformative – nevertheless presumably endures in a temporal continuity. By contrast, Proudhon’s mutualism has temporal flexibility and episodicity structurally built into its definition. Mutualism is therefore defined as “an act by which two or more individuals agree to organize among themselves, within certain limits and for a given time [dans une mesure et pour un temps déterminé], the industrial force we call exchange.” This temporal restriction and variability accompanies, second, a psychological distinction. Proudhon continues:

Consequently [the individuals] undertake mutual obligations and reciprocal guarantees for a certain number of services, products, benefits, duties, and so on which they are in a position to obtain and render, knowing themselves to be in all other respects totally independent [se reconnaissant du reste parfaitement indépendants], both in what they consume and what they produce.

(SW-P 97; IDEE 132, emphasis added)

This distinction between the individual and the greater social body (which might in the case of a particular transaction involve just one other person) is for Proudhon a crucial safeguard against the individual being “gobbled up” (englouti) by the “communitarian ocean” (CAP I, 87; SW-P 60, translation modified).85

Evidently, given his commitment to the “passionate series” that entails an ever finer detailing of subgroups engaged in exquisitely subtle rivalry, Fourier wishes his community to be everything but an undifferentiated and homogeneous totality. His projected world would certainly not appear to bear any relation to the interpellated and policed populations of governmental states, whether overtly totalitarian or supposedly “democratic.” Nevertheless, Proudhon detects within all associations, rightly or wrongly, a “systematized outlook [une pensée

85. As discussed above, Fourier envisaged a much greater scale of social interaction, of at least 800 people.
Social communion and human solidarity is not a case of that passionate attraction which, according to Fourier, ought to flare up like fireworks in the setting of the series of contrasting groups from the intrigues of the cabalist tendency in man and the changes of his butterfly tendency. It is an inward pleasure, to be found as much in solitary meditative reflection as in the bustle of the workshop. It results from the worker’s sense that he is making full use of his faculties – the strength of his body, the skill of his hands, and the agility of his mind; it comes from his sense of pride at overcoming difficulties, at taming nature, at acquiring knowledge, and at guaranteeing his independence. It is a sense of communion with the rest of the human race through the memory of past struggles, through identity of purpose and the equal sharing of well-being.

(SW-P 81–2)

Here Fourier’s envisaged associative participation is presented as a constant solicitation to an ever enthusiastic and active involvement in a continuous present. His ideal community is characterized as producing pleasures that are capable of responding in an immediate and direct fashion, and that are communicable to those who surround the individual person.86 Proudhon’s notion of social communion is not lacking in sensuality, but, compared with Fourier’s, the discrete space accorded to the pleasures of the body (and the mind) allows them to communicate less with their immediate surroundings, to be less present, more taciturn and reserved. They can engage with a different temporality, maybe reaching out into the past to those who are no longer immediately there. History, memory, and human relations to time generally play a much greater role in Proudhon’s thinking than in Fourier’s.

When facing the present and looking forward to the future, the modus operandi of the mutualism provides a temporary and temporalizing structure or framework within which individual liberty is produced, sustained, and even increased (IDEE 150). Preconditions for this renewal of commercial transactions, which is concomitantly a radical overhauling of society’s conventional practices and values, are: first, that commutative justice replaces distributive justice and, second, the contract must be synallagmatic, or reciprocally binding. “Commutative justice” or “the rule by contract or in other words, rule

86. Guérin, Ni Dieu, ni maître, 87.
by economics and industry” must replace the “rule by laws” (SW-P 96; IDEE 132). This replacement marks the passage from a hierarchizing system of governance wherein the infantilized governed await their respective and proportionate deserts to be dispensed to them, to an egalitarian framework where each “undertake mutual obligations and make reciprocal guarantees.” As Proudhon so passionately and convincingly tells us:

To be governed is to be watched over, inspected, spied on, directed, legislated for, regimented, penned in, indoctrinated, preached at, controlled, assessed, evaluated, censored, commanded by those who have neither the title, science, nor virtue. … To be governed, is to be, at each step, by every transaction, with every movement, noted, registered, recorded, priced, stamped, eyed up and down, classified, patented, licensed, authorized, annotated, reprimanded, hindered, reformed, put straight, corrected. (IDEE 309)

Governance perpetuates a patriarchal hierarchy and the family should precisely not therefore be taken as the model for society as a whole (IDEE 127). In the family, the child eventually revolts against this parental authority as she or he begins to reason for herself or himself. Acts of disobedience mark his or her growing maturity. Proudhon explains how this refusal just to accept rules and regulation without first independently evaluating them, has the potential to transform the wider power structure. “If [one] obeys no longer because the king commands but because the king proves [his right to command], it may be said that henceforth [one] will recognize no authority and that [one] has become [one’s] own king” (Qu’est? 425; WisP? 207). Henceforth one is not accepting the governance of one’s will by some external sovereign authority. Instead, one is recognizing the immanent legitimacy of the law in that particular instance and according to the consideration needed, if it indeed is, to those who administer that particular affair so that they can carry it out (Qu’est? 433; WisP? 212). The term consideration is Saint-Simon’s, which he defines as “the voluntary permission given to those who do some things that you judge to be useful to partially

87. Hence Proudhon’s well-grounded reservations about the cultic worship of The Father, Enfantin. He states that those “fraternal socialists who take the family as the element of society all end up with a dictatorship” (IDEE 127). For his opinion that Saint-Simon’s ideas have been “strangely distorted by his disciples,” see SW-P 90–91. Proudhon elsewhere staunchly defends the family as if it is a bastion of value. He is challengingly contradictory on this issue, but for Proudhon contradiction is not a weakness or failing, but an irreducible and progressive force.

88. Given Proudhon’s reactionary views on women (for one example, see SW-P 254–6), I insist on maturing minds being within both male and female bodies!
dominate you” (with regard to that particular issue) (I LHG 42). In a scientific age capable of proving truths deduced from observation, it may now be thought that the loci of traditional authority “are worthy of no consideration” (Qu’est? 426; WisP? 208). Proudhon hammers home the conclusions we should be drawing for ourselves:

The law was made without my participation, in spite of my absolute disagreement, in spite of the harm that it makes me suffer. The State does not deal with me; it does not exchange anything with me; it holds me to ransom. Where then is the bond of conscience, reason, passion or interest which obliges me in any way? (IDEE 152)

Such free thinking spells the end to government.

This idea of governmentality as an institution to be dismantled has been perennial or, more precisely, is immortal: Proudhon suggests that “an idea cannot perish, it is always reborn from its contradictory [sic]” (IDEE 142). Hence, in reaction to the events of the French Revolution, which ended up consolidating a centralizing state, it was inevitable that someone like Saint-Simon would reignite the “incorruptible seed” that is the idea (IDEE 142, 145). He clearly saw that the system of government belonged to a past feudal age and that it should be replaced by talented administrators who facilitate the flow of industrious activity and exchange. As discussed above, he felt that this view was in tune with the forces actively at work within society as a whole. In 1823–24, he wrote:

Those who are administered, governed, in this population have adopted industrial principles which serve as a guide to their actions. They only obey those combinations which reconcile the interests of the contractual parties. They think that the public fortune must be administered in the interests of the majority. They have a horror of privileges and rights of birth. (IV CATE 34–5)

89. See also Musso, Le Vocabulaire de Saint-Simon, 17–19, who formulates the idea of consideration as “the voluntary gift of a ‘position of domination’ granted by the governed to ‘those who do things that they judge to be useful.’”

90. See the analysis above of Saint-Simon’s investment in the vivacious “force of [scientifically-based] demonstration” as a means of social liberation. For the extent of the liberation that is anticipated, see Proudhon: “The Gods have departed, the kings are withdrawing, privilege is disappearing, everyone counts himself one of the workers” (SW-P 170).

91. See also CAP I, 80, on the power of ideas.

92. For further analysis of how administration replaces governance, see III SI 151; II ORG 187; IV CATE 7, 43ff.). Given how in current society administration often takes the form of deadening bureaucracy antithetical to lively intellectual activity, Saint-Simon’s writings open the prospect of it being conceived more creatively.
Proudhon depicts how the idea of the “negation of government” has traveled through time, periodically illuminating a particular period, such as Saint-Simon’s, until it is finally – in this case some thirty years later – fully adopted by someone who carefully nurtures it and then, when it is ripened, flings it “like a meteor into the electrified masses” (IDEE 145). Proudhon’s theory of mutualist exchange, already nominally present in Saint-Simon’s writings, is seen as charging the idea of nongovernance with the extra galvanizing energy it needs to make a real impact on the already changing world.

However, being sensitive to questions of time, Proudhon also makes it clear that the most topical idea of mutualism (which, as he well knew, was already working in Lyon, notably among the radicalized silk-workers [les canuts] of the Croix-Rousse) is also a return to a venerable “primitive practice.” He explains that:

The theory of mutuality or of mutum, i.e., of exchange in kind, whose simplest form is the loan for consumption, is, from the point of view of the collective being, the synthesis of the two ideas of property and community, a synthesis as ancient as the elements that constitute it.

(CONTRA II, 411)

The practice of mutualism is the result of a “six thousand year long meditation on this fundamental proposition: A = A” (ibid.). The directness of the exchange promotes “sincerity,” in contrast to the deceitful speculation and commodified mystification propagated by parasitic intermediaries such as merchants with their money interests. Requisite credit should be obtained, not by borrowing at interest, but by workers organizing themselves to create their own networks of mutual guarantees as an act of solidarity. As Proudhon recognizes, credit does not have to take the form of money: “anything that has an exchange value can be an object of exchange.” Alternative economies to capitalism are possible.

---

93. Proudhon convincingly suggests that one reason why the force of Saint-Simon’s ideas was lost was because his own “disciples” misunderstood them. They failed (or refused) to see that “the producer [the active agent within society] is the negation of government, that organization is incompatible with authority.” In effect the Saint-Simonians reintroduced distributive, thereby abandoning Saint-Simon’s commutative, justice.

95. For mutualism as the law of talion no longer associated with vengeance and criminality but now serving “the tasks of labor and the good office of free fraternité,” see SW-P 60 and CAP I, 87. For it as the putting into practice of “do as you would be done by,” see IDEE 153.

96. Guérin, Ni Dieu, ni maître, 82.
One such scheme was his very own “People’s Bank,” which proposed a reformed banking system that exactly did not operate with capital but with vouchers. Its declaration read that it had “as its base the essential gratuity of credit and exchange, [and] as its aim the circulation of values not the production of them, and as its means the mutual consent of producers and consumers” (SW-P 76).

The society envisaged by Proudhon positively encourages the proliferation of economic exchanges while actively working against the monopolistic accumulation of capital. Proudhon clairvoyantly sees the dangers of global monopolies but he remains confident that, because of its constituent variabilities – temporal, extent, purpose … – and because of the liberty of each involved that is preserved, even boosted by it, mutualism, by its very nature, breaks down those monolithic and all-encompassing bodies over which individuals have no control.97 He reiterates that:

Mutuality presupposes the division of land, the division of properties, the independence of work, the separation of industries, the speciality of functions, individual and collective responsibility according to whether the work is individualized or grouped, the reduction to a minimum of general costs, suppression of parasitism and misery. (CAP I, 88)

A “moral person,” with needs, rights and duties intact (although not necessarily constantly the same), remains at the end of every exchange that is simultaneously the beginning of another (IDEE 223).98 This nonalienation of the person in every transaction amounts to a society wherein it is “as if my will repeated itself to infinity” (ibid.). This serial repetition of the individual will in the social serves not only to reinforce it, but also to reveal the illusory nature of an individuality outside the social that would have its very own “continuity of conscience, permanence of intimate sense, and indefatigably wakeful ego” (CREA 141).

As we have already seen, with mutuality the will is not “held to ransom” by external sources of sovereign authority as it is in a governmental system (IDEE 152, quoted above). However, it does possess a keen awareness that everything it produces is “already struck [frappé] by a mortgage to society” (Qu’est? 283; WisP? 115). This primordial indebtedness occurs because we consume well before we begin to produce. When we finally begin producing we are therefore already in debt to the work produced by the collective force that has preceded us, and that continues laterally to support our industrious endeavors.

97. For how global monopolies must surely eventually burst to form smaller “republicanized” entities, see CONTRA II, 411.
98. For the series needs leading to rights leading to duties, see Qu’est? 434; WisP? 213.
Proudhon succinctly states that “in relation to society the laborer is a debtor who of necessity dies insolvent” (Qu’ est? 283; WisP? 116). Even the actualization of an individual’s potential derives the nourishment it requires to flourish from the “universal intelligence and general knowledge slowly accumulated” through time: “Whatever may be then the capacity of a man, once this capacity is created it does not belong to him. Like the material fashioned by an industrious hand, it had the power of becoming and society has given it being” (ibid.). The conclusion to be drawn is therefore that the facts underpinning labor as a social activity fundamentally destroy the right to property (whether material or intellectual) as something we integrally own.

This reasoning led Proudhon in 1840 to his notorious statement: “Property is theft!” (Qu’ est? 129; WisP? 13).99 In place of property, he reinstates the primordial right of possession. This right recognizes from a moral perspective the physico-geographical facts that science demonstrates. One such fact is the spheric shape of the planet, which means that land is limited and must therefore be shared (Qu’ est? 72–3; WisP? 18–19). It also recognizes how indispensable and therefore precious natural resources are and how, in times of increased population levels, redistribution must occur.100 Possession is a right that is temporary, not fixed (Qu’ est? 210; WisP? 66). It readjusts its claim to the things on this planet, not according to the claims of distributive justice whose dictum runs “to each according to his capacity; to each capacity according to its results,” but according to the contractual obligations of commutative justice that recognizes that “there is a place for everyone under the sun” (Qu’ est? 215; WisP? 69).

Proudhon subsequently revisited the question of property in Theory of Property (1863–64). Having previously claimed that “property-owners, robbers, heroes, and sovereigns” were all synonymous terms, he now imagined a transfigured form of property, purified of the “right of increase” (droit d’aubaine), that could provide a counterweight to the centralizing and interfering tendencies of the state (Qu’ est? 428; WisP? 209; TdeP 189).101 Even if its motivations are still essentially egotistical and reactionary, once seen in the context of an ongoing

---

99. Proudhon’s ideas on property are so richly explorative and topical that they deserve tomes of commentary; for example, for pertinent ecological concerns about the appropriation of the earth, water, air, and light, see Qu’ est? 216–22; WisP? 70–74. For an evocative account of the aura of property worthy of Walter Benjamin, see Qu’ est? 289–90; WisP? 119–20.

100. This argument echoes Kant’s in the essay “Concerning Perpetual Peace,” but there is no evidence that Proudhon had actually read it.

101. Proudhon defines “right of increase” in the following way: “Increase receives different names according to the things which produce it: farm-rent [fermage] for lands, house-rent [loyer] for houses and furniture, rent for life-investments, interest for money, benefice, gain, profit (three things which must not be confused with wages or the legitimate price of labor)” (Qu’ est? 289; WisP? 119). Fraser translated le droit d’aubaine as the “right to escheat,” which is not accurate.
combat against an all-invasive state, property emerges as an anarchistic force, even in spite of itself. By stubborn principle it is irreverent, anti-unitary, and rebellious to external authority (TdeP 144).102

This revision of his position can be seen as evolving out of his better understanding of the processes of life itself. In his 1853 Philosophy of Progress he wrote:

Progress … is an affirmation of universal movement, and thus it is the negation of immutable forms and formulae, of all doctrines of eternity, permanence and impeccability, etc., applied to any being whatsoever. It denies the permanence of any order, including that of the universe itself, and the changelessness of any subject or object, be it spiritual and transcendental.

(SW-P 247, translation modified)103

The problem with his adoption of possession in the 1840 What is Property? as the solution to property’s abuses is that it functioned as a synthetic, “superior term” that purported to resolve the conflicts engendered by proprietorial inequity, and to silence the contradictory claims made to justify ownership (TdeP 52). The abolition of property is not the definitive answer to society’s problems as its eradication would remove a crucial source of “dynamic tension” and thus have an immobilizing effect on society as a whole.104 While still militating for radical social reform, Proudhon, as we saw earlier in his letters to Gauthier and Marx, is deeply suspicious of any supposedly definitive solutions and systems. He accordingly returns to the subject of property and tackles it again this time in all its paradoxical complexity: “property is theft … and liberty.”105 By so doing, he recognizes that the egotistical retrenchment that often besets property-owners and the bureaucratic inertia that often overcomes the machinery of state are

102. Having consistently condemned absentee-landlordism, he also recognizes that property-owners have to maintain their assets, especially if they are in the form of land, and that this maintenance is a repeated, even daily, act of creative “re-making” (IDEE 219). Thought of in this light property enters into a dialogue with nature and thereby stands as a powerful counterforce to industrialization. However, given his commitment to contradiction as a life-force and his refusal of simplistic “answers” to complex – because changing – situations and problems, Proudhon then concludes Theory of Property with the following words: “When I see all those gates and walls outside of Paris which prevent the poor pedestrian from enjoying the view of the countryside and the feel of the land, I get violently irritated … I admit that my dignity as man bristles with disgust … If ever I find myself to be a property-owner, I’ll make sure that God and men, notably the poor, pardon me!” (TdeP 245–6).

103. See also Woodcock, Anarchism, 26–7, for Proudhon’s understanding of the processes of life and history as almost Heraclitean (and as non-Hegelian/ Marxist). See also CONTRA II, 413, for Proudhon’s nonlinear account of time and history.

104. Hervé Trinquier in CREA I, 14.

105. For Woodcock (Anarchism, 98–133), Proudhon is the “man of paradox”; see ibid., ch. 5.
two opposing absolutes from which can “spring up political movement, social life itself, just as a driving, luminous, vivifying spark, lightning, is released from two contrary sources of electricity” (TdeP 193). Out of these antinomies, their conflicts and precarious equilibrium, comes growth and development; any fusional resolution or the elimination of one of the terms would be the equivalent of death (TdeP 52). 106

“Society seeks order in anarchy,” suggests Proudhon, just as the various processes of life do (Qu’est? 428; WisP? 209). Order does not result from “a hierarchy of functions and faculties” but instead it is constantly recreated out of the reiterated balancing and complex organization of “free forces” (CAP I, 86). Whereas the traditional discourses of religion, morality, science, and law seek to impose a masterly language that purportedly unites, englobes, and sums up their subjects, the task of politics, as Proudhon sees it, is to “separate from the point of view of interests and material inevitabilities, everything that can be separated as does nature” (FEDITAL 218–19). Nothing should be left undivided (FED 122). These societal processes of separation, such as increasing federalization that Proudhon sees as the future of politics, are serial and pluralistic devolutions that accompany the various forces of life itself. 107 In the state, massive units are difficult to mobilize and therefore prone to inertia. They benefit from being broken down into smaller, nimbler entities that are able to respond to, and engage with, external bodies in a quicker and more fluid way. Just as the organs of animals derive their “strength [puissance] and harmony” from an organized “separation” of their constituent parts and materials (FED 162), 108 so too would societal structures benefit from being broken down into smaller, nimbler entities that are able to respond to, and engage with, external bodies in a quicker and

106. The abolition of private property can lead straight to the brutality of collectivization as evidenced in the Soviet Kolkhoz. For Proudhon’s analysis of peasants’ gut rejection of the “societary,” see IDEE 232. The abolition of the state is also not necessarily Proudhon’s desired aim: in FED, 108–9, he envisages more a transfigured state whose “authoritative attributes” are finely specialized, restricted, and minimized, and that is less directly involved in societal affairs, rather than no state at all. As Trinquier says, Proudhon’s “utopia” is not a world without conflict but a “world wherein the liveliest of oppositions can develop and organize themselves freely” (Trinquier in CREA I, 19).

107. Federalism is perceived by Proudhon as being the logical outcome of mutualism: “When it is translated into the realm of politics, what we have hitherto termed mutualism or guaranteeism is called federalism. The entire political and economic revolution is summed up in this simple synonym” (SW-P 111).

108. This parallel between society and organisms is, however, an analogy. I would not go so far as Grange (Saint-Simon, 41) in suggesting that Proudhon had “a conception of natural social spontaneity” for the reason that the serial interrelations he envisages are deliberately negotiated through contracts, a fact that is crucial for creating and maintaining individual liberty.
more fluid way. The science of physiology again provides key insight into how political and social systems could be improved for the future advantage of all.

IV. CONCLUDING REMARKS

When Proudhon advocates the replacement of “constituted political powers [pouvoirs]” by “organized economical forces,” he joins Saint-Simon and Fourier in their passionate commitment to social change (IDEE 193). Like them he revolts against ideologues who, seeking to implement their “uniform social plans … where everything is simplified and resolved,” attempt to homogenize our political, social, and cultural lives by imposing formatted practices and ideas (TdeP 228–9). This authoritarian drive to sameness is for all three the equivalent of reducing the body, with all its variety of arterial and venal tubes, tendons, nerves, gazes, and so on, to “one unique, solid, resistant matter” such as bones. Societal ossification is the inevitable outcome. For all three, future happiness and well-being depend on the creation of a social order that positively encourages the “plurality of elements, the struggle of elements, the opposition of contraries” and whose only synthesis is that of “undefinables and absolutes” (TdeP 229). All three give us a challenging reinterpretation of work as a positive social activity to which everyone should have the right.

“Continental philosophy” is itself a contested concept. For some, it is understood to be any philosophy after 1780 originating on the European continent (Germany, France, Italy, etc.). Such an understanding would make Georg von Wright or Rudolf Carnap – respectively, a Finnish-born philosopher of language and a German-born logician who taught for many years in the US – a “continental philosopher,” an interpretation neither they nor their followers would easily accept. For others, “continental philosophy” refers to a style of philosophizing, one more attentive to the world of experience and less focused on a rigorous analysis of concepts or linguistic usage. In this and the accompanying seven volumes in this series, “continental philosophy” will be understood historically as a tradition that has its roots in several different ways of approaching and responding to Immanuel Kant’s critical philosophy, a tradition that takes its definitive form at the beginning of the twentieth century as the phenomenological tradition, with its modern roots in the work of Edmund Husserl. As such, continental philosophy emerges as a tradition distinct from the tradition that has identified itself as “analytic” or “Anglo-American,” and that locates its own origins in the logical analyses and philosophy of language of Gottlob Frege. Whether or not there is in fact a sharp divergence between the work of Husserl and Frege is itself a contested question, but what cannot be contested is that two distinct historical traditions emerged early in the twentieth century from these traditions’ respective interpretations of Husserl (and Heidegger) and Frege (and Russell). The aim of this history of continental philosophy is to trace the developments in one of these traditions from its roots in Kant and his contemporaries through to its most recent manifestations. Together, these volumes present a coherent and comprehensive account of the continental philosophical tradition.
that offers readers a unique resource for understanding this tradition’s complex and interconnected history.

Because history does not unfold in a perfectly linear fashion, telling the history of continental philosophy cannot simply take the form of a chronologically organized series of “great thinker” essays. And because continental philosophy has not developed in a vacuum, telling its history must attend to the impact of figures and developments outside philosophy (in the sciences, social sciences, mathematics, art, politics, and culture more generally) as well as to the work of some philosophers not usually associated with continental philosophy. Such a series also must attend to significant philosophical movements and schools of thought and to the extended influence of certain philosophers within this history, either because their careers spanned a period during which they engaged with a range of different theorists and theoretical positions or because their work has been appropriated and reinterpreted by subsequent thinkers. For these reasons, the volumes have been organized with an eye toward chronological development but, in so far as the years covered in each volume overlap those covered in the subsequent volume, they have been organized as well with the aim of coordinating certain philosophical developments that intersect in a fashion that is not always strictly chronological.

Volume 1 begins with the origins of continental philosophy in Kant and the earliest responses to his critical philosophy, and presents an overview of German idealism, the major movement in philosophy from the late eighteenth to the middle of the nineteenth century. In addition to Kant, the period covered in the first volume was dominated by Fichte, Schelling, and Hegel, and together their work influenced not just philosophy, but also art, theology, and politics. This volume thus covers Kant’s younger contemporary Herder, and his readers Schiller and Schlegel – who shaped much of the subsequent reception of Kant in art, literature, and aesthetics; the “Young Hegelians” – including Bruno Bauer, Ludwig Feuerbach, and David Friedrich Strauss – whose writings would influence Engels and Marx; and the tradition of French utopian thinking in such figures as Saint-Simon, Fourier, and Proudhon. In addition to Kant’s early critics – Jacobi, Reinhold, and Maimon – significant attention is also paid to the later critic of German idealism Arthur Schopenhauer, whose appropriation and criticism of theories of cognition later had a decisive influence on Friedrich Nietzsche.

Volume 2 addresses the second half of the nineteenth century, in part as a response to the dominance of Hegelian philosophy. These years saw revolutionary developments in both European politics and philosophy, and five great critics dominated the European intellectual scene: Feuerbach, Marx, Søren Kierkegaard, Fyodor Dostoevsky, and Nietzsche. Responding in various ways to Hegelian philosophy and to the shifting political landscape of Europe and
the United States, these thinkers brought to philosophy two guiding orientations – materialism and existentialism – that introduced themes that would continue to play out throughout the twentieth century. The second half of the nineteenth century also saw the emergence of new schools of thought and new disciplinary thinking, including the birth of sociology and the social sciences, the development of French spiritualism, the beginning of American pragmatism, radical developments in science and mathematics, and the development of hermeneutics beyond the domains of theology and philology into an approach to understanding all varieties of human endeavor.

Volume 3 covers the period between the 1890s and 1930s, a period that witnessed revolutions in the arts, science, and society that set the agenda for the twentieth century. In philosophy, these years saw the beginnings of what would grow into two distinct approaches to doing philosophy: analytic and continental. It also saw the emergence of phenomenology as a new rigorous science, the birth of Freudian psychoanalysis, and the maturing of the discipline of sociology. Volume 3 thus examines the most influential work of a remarkable series of thinkers who reviewed, evaluated, and transformed nineteenth-century thought, among them Henri Bergson, Émile Durkheim, Sigmund Freud, Martin Heidegger, Edmund Husserl, Karl Jaspers, Max Scheler, and Ludwig Wittgenstein. It also initiated an approach to philosophizing that saw philosophy move from the lecture hall or the private study into an active engagement with the world, an approach that would continue to mark continental philosophy’s subsequent history.

The developments and responses to phenomenology after Husserl are the focus of the essays in Volume 4. An ambiguity inherent in phenomenology – between conscious experience and structural conditions – lent itself to a range of interpretations. While some existentialists focused on applying phenomenology to the concrete data of human experience, others developed phenomenology as conscious experience in order to analyze ethics and religion. Still other phenomenologists developed notions of structural conditions to explore questions of science, mathematics, and conceptualization. Volume 4 covers all the major innovators in phenomenology – notably Sartre, Merleau-Ponty, and the later Heidegger – as well as its extension into religion, ethics, aesthetics, hermeneutics, and science.

Volume 5 concentrates on philosophical developments in political theory and the social sciences between 1920 and 1968, as European thinkers responded to the difficult and world-transforming events of the time. While some of the significant figures and movements of this period drew on phenomenology, many went back further into the continental tradition, looking to Kant or Hegel, Marx or Nietzsche, for philosophical inspiration. Key figures and movements discussed in this volume include Adorno, Horkheimer, and the Frankfurt School,
Schmitt, Marcuse, Benjamin, Arendt, Bataille, black existentialism, French Marxism, Saussure, and structuralism. These individuals and schools of thought responded to the “crisis of modernity” in different ways, but largely focused on what they perceived to be liberal democracy’s betrayal of its own rationalist ideals of freedom, equality, and fraternity. One other point about the period covered in this volume is worthy of note: it is during these years that we see the initial spread of continental philosophy beyond the European continent. This happens largely because of the emigration of European Jewish intellectuals to the US and UK in the 1930s and 1940s, be it the temporary emigration of figures such as Adorno, Horkheimer, Lévi-Strauss, and Jakobson or the permanent emigration of Marcuse, Arendt, and Gurwitsch. As the succeeding volumes will attest, this becomes a central feature of continental philosophy’s subsequent history.

Volume 6 examines the major figures associated with poststructuralism and the second generation of critical theory, the two dominant movements that emerged in the 1960s, which together brought continental philosophy to the forefront of scholarship in a variety of humanities and social science disciplines and set the agenda for philosophical thought on the continent and elsewhere from the 1960s to the present. In addition to essays that discuss the work of such influential thinkers as Althusser, Foucault, Deleuze, Derrida, Lyotard, Irigaray, Habermas, Serres, Bourdieu, and Rorty, Volume 6 also includes thematic essays on issues including the Nietzschean legacy, the linguistic turn in continental thinking, the phenomenological inheritance of Gadamer and Ricoeur, the influence of psychoanalysis, the emergence of feminist thought and a philosophy of sexual difference, and the importation of continental philosophy into literary theory.

Before turning to Volume 7, a few words on the institutional history of continental philosophy in the United States are in order, in part because the developments addressed in Volumes 6–8 cannot be fully appreciated without recognizing some of the events that conditioned their North American and anglophone reception. As has been mentioned, phenomenologists such as Alfred Schutz and Aron Gurwitsch, and other European continental philosophers such as Herbert Marcuse and Hannah Arendt, began relocating to the United States in the 1930s and 1940s. Many of these philosophers began their work in the United States at the University in Exile, established in 1933 as a graduate division of the New School for Social Research for displaced European intellectuals. While some continental philosophy was taught elsewhere around the United States (at Harvard University, Yale University, the University at Buffalo, and elsewhere), and while the journal Philosophy and Phenomenological Research began publishing in 1939, continental philosophy first truly began to become an institutional presence in the United States in the 1960s. In 1961, John Wild (1902–72) left Harvard to become Chair of the Department of Philosophy at Northwestern University. With a commitment from the provost of the university
and the Northwestern University Press to enable him to launch the Northwestern Series in Phenomenology and Existential Philosophy, Wild joined William Earle and James Edie, thus making Northwestern a center for the study of continental philosophy. Wild set up an organizational committee including himself, Earle, Edie, George Schrader of Yale, and Calvin Schrag (a former student of Wild’s at Harvard, who was teaching at Northwestern and had recently accepted an appointment at Purdue University), to establish a professional society devoted to the examination of recent continental philosophy. That organization, the Society for Phenomenology and Existential Philosophy (SPEP), held its first meeting at Northwestern in 1962, with Wild and Gurwitsch as the dominant figures arguing for an existential phenomenology or a more strictly Husserlian phenomenology, respectively. Others attending the small meeting included Erwin Straus, as well as Northwestern graduate students Edward Casey and Robert Scharff, and today SPEP has grown into the second largest society of philosophers in the United States. Since those early days, many smaller societies (Heidegger Circle, Husserl Circle, Nietzsche Society, etc.) have formed and many journals and graduate programs devoted to continental philosophy have appeared. In addition, many of the important continental philosophers who first became known in the 1960s – including Gadamer, Ricoeur, Foucault, Derrida, Lyotard, and Habermas – came to hold continuing appointments at major American universities (although, it must be mentioned, not always housed in departments of philosophy) and, since the 1960s, much of the transmission of continental philosophy has come directly through teaching as well as through publications.

The transatlantic migration of continental philosophy plays a central role in Volume 7, which looks at developments in continental philosophy between 1980 and 1995, a time of great upheaval and profound social change that saw the fruits of the continental works of the 1960s beginning to shift the center of gravity of continental philosophizing from the European continent to the anglophone philosophical world and, in particular, to North America. During these years, the pace of translation into English of French and German philosophical works from the early twentieth century as well as the very recent past increased tremendously, and it was not uncommon to find essays or lectures from significant European philosophers appearing first in English and then subsequently being published in French or German. In addition, the period covered in this volume also saw the spread of continental philosophy beyond the confines of philosophy departments, as students and faculty in centers of humanities and departments of comparative literature, communication studies, rhetoric, and other interdisciplinary fields increasingly drew on the work of recent continental philosophers. Volume 7 ranges across several developments during these years – the birth of postmodernism, the differing philosophical traditions of France, Germany, and Italy, the third generation of critical theory, and the so-called...
“ethical turn” – while also examining the extension of philosophy into questions of radical democracy, postcolonial theory, feminism, religion, and the rise of performativity and post-analytic philosophy. Fueled by an intense ethical and political desire to reflect changing social and political conditions, the philosophical work of this period reveals how continental thinkers responded to the changing world and to the key issues of the time, notably globalization, technology, and ethnicity.

The eighth and final volume in this series attempts to chart the most recent trends in continental philosophy, which has now developed into an approach to thinking that is present throughout the world and engaged with classical philosophical problems as well as current concerns. The essays in this volume focus more on thematic developments than individual figures as they explore how contemporary philosophers are drawing on the resources of the traditions surveyed in the preceding seven volumes to address issues relating to gender, race, politics, art, the environment, science, citizenship, and globalization. While by no means claiming to have the last word, this volume makes clear the dynamic and engaged quality of continental philosophy as it confronts some of the most pressing issues of the contemporary world.

As a designation, “continental philosophy” can be traced back at least as far as John Stuart Mill’s *On Bentham and Coleridge* (1840), where he uses it to distinguish the British empiricism of Bentham from a tradition on the continent in which he sees the influence of Kant. Since that time, and especially since the early twentieth century, the term has been used to designate philosophies from a particular geographical region, or with a particular style (poetic or dialectical, rather than logical or scientistic). For some, it has been appropriated as an honorific, while for others it has been used more pejoratively or dismissively. Rather than enter into these polemics, what the volumes in this series have sought to do is make clear that one way to understand “continental philosophy” is as an approach to philosophy that is deeply engaged in reflecting on its own history, and that, as a consequence, it is important to understand the history of continental philosophy.

While each of the volumes in this series was organized by its respective editor as a volume that could stand alone, the eight volumes have been coordinated in order to highlight various points of contact, influence, or debate across the historical period that they collectively survey. To facilitate these connections across the eight volumes, cross-referencing footnotes have been added to many of the essays by the General Editor. To distinguish these footnotes from those of the authors, they are indicated by an asterisk (*).

Alan D. Schrift, General Editor

Terrell Carver is Professor of Political Theory at the University of Bristol, UK. He has published extensively on Marx, Engels, Marxism, and the philosophy of the social sciences. He is the editor of the Cambridge Companion to Marx (1991) and translator of Karl Marx: Later Political Writings (1996). His book The Postmodern Marx (1998) has recently been translated into Chinese.

Evgenia Cherkasova is Associate Professor of Philosophy at Suffolk University in Boston, Massachusetts. Her scholarly and pedagogical interests include ethics, moral psychology, philosophy of art, and existentialism. She is the author of numerous essays on Dostoevsky, Kant, Russian philosophy, and philosophy of literature. Her most recent publication is a book entitled Dostoevsky and Kant: Dialogues on Ethics (2009).

Daniel Conway is Professor and Head of Philosophy at Texas A&M University. He is the author of three books on Nietzsche – Nietzsche’s Dangerous Game (1997), Nietzsche and the Political (1997), and Reader’s Guide to Nietzsche’s On the Genealogy of Morals (2008) – and a former editor of the Journal of Nietzsche
Studies, and the editor of the Routledge Critical Assessments volumes on Kierkegaard (2002) and Nietzsche (1998). His current research comprises an investigation of the confrontations with modernity articulated, respectively, by Marx, Kierkegaard, and Nietzsche.

Alastair Hannay is Emeritus Professor of Philosophy at the University of Oslo. He was for many years editor of Inquiry and is author of Mental Images: A Defence (1971, 2002), Kierkegaard (1982, 1999), Human Consciousness (1990), Kierkegaard: A Biography (2001), Kierkegaard and Philosophy (2003), and On the Public (2006). He has translated several of Kierkegaard’s works and is a Fellow of the Royal Society of Edinburgh as well as a Member of both the Royal Norwegian Scientific Society of Science and Letters and the Norwegian Academy of Science and Letters.

F. C. T. (Tim) Moore held the first Chair of Philosophy at the University of Hong Kong from 1979 to 2000, and is now Emeritus Professor. Working in the areas of the philosophy of the social sciences, the history of philosophy (especially French philosophy), the philosophy of mind, and computer-assisted logic learning, he is the author of numerous journal articles and contributed chapters, as well as several books, including The Psychology of Maine de Biran (1970), The Psychological Basis of Morality: An Essay on Value and Desire (1978), and Bergson: Thinking Backwards (1996). He was also responsible for two volumes, working from the original manuscripts, of the collected works of Maine de Biran: Sur les rapports du physique et du moral de l’homme (1984) and Essai sur les fondements de la psychologie (2001).

Eric Sean Nelson is Assistant Professor of Philosophy at the University of Massachusetts-Lowell and has taught at the Universities of Memphis and Toledo. He has published various articles on ethics, epistemology, hermeneutics, and phenomenology in nineteenth- and twentieth-century European philosophy,
and is the coeditor of two anthologies: *Addressing Levinas* (2005) and *Rethinking Facticity* (2008).

**William Clare Roberts** teaches philosophy and political theory at McGill University. He has written essays on Marx, the history of Marxism, Aristotle, and the political thought of Arendt and Strauss. He is currently working on a book on postmodern appropriations of Aristotle in the Marxist and Heideggerian traditions.

**Alan D. Schrift** is the F. Wendell Miller Professor of Philosophy at Grinnell College. In addition to his many published articles or book chapters on Nietzsche and French and German twentieth-century philosophy, he is the author of *Nietzsche and the Question of Interpretation: Between Hermeneutics and Deconstruction* (1990), *Nietzsche's French Legacy: A Genealogy of Poststructuralism* (1995), and *Twentieth-Century French Philosophy: Key Themes and Thinkers* (2005). He has edited five collections on a variety of topics, including *The Logic of the Gift: Toward an Ethic of Generosity* (1997) and *Modernity and the Problem of Evil* (2005). In addition to serving as general editor of the eight-volume *The History of Continental Philosophy*, he serves as general editor of *The Complete Works of Friedrich Nietzsche*, the Stanford University Press translation of Nietzsche's *Kritische Studienausgabe*.

**Gary Shapiro** is Tucker-Boatwright Professor in the Humanities-Philosophy at the University of Richmond. Two of his current writing projects focus on Nietzsche's political thought and on the philosophical meaning of the last four hundred years of land art. He has published *Nietzschean Narratives* (1989), *Alcyone: Nietzsche on Gifts, Noise, and Women* (1991), *Earthwards: Robert Smithson and Art After Babel* (1995), and *Archaeologies of Vision: Foucault and Nietzsche on Seeing and Saying* (2003), in addition to many articles on Hegel, aesthetics, American philosophy, and other subjects. Shapiro has also coedited the collections *Hermeneutics: Questions and Prospects* (with Alan Sica; 1984) and *After the Future: Postmodern Times and Places* (1990).

**Alan Sica** is Professor of Sociology and founder of the Social Thought Program at Pennsylvania State University. He was editor of the American Sociological Association journal, *Sociological Theory*, for five years, and is currently editor of the ASA book review journal, *Contemporary Sociology*. He has published a number of books concerning social thought, Max Weber, hermeneutics, and the 1960s, and has been writing about social theory for thirty-five years.
INTRODUCTION

Daniel Conway

This volume charts the most influential trends and developments in European philosophy in the tumultuous period 1840–1900. Particular emphasis is placed on the theoretical responses to, and anticipations of, the revolutionary fervor of the period. The main figures of the period are situated with respect to the following indices: their relationships to the dominant paradigm of Hegelian philosophy; their debts and contributions to the theme of revolution; their participation in the dawning self-awareness of modernity as a unique historical epoch; their contributions to the emerging project of conducting a critique of modernity; and, finally, their contributions to the current elaboration of the dominant themes and discourses of continental philosophy.

This historical period is essential, we believe, to the development and articulation of those projects – including deconstruction, psychoanalysis, postmodernism, poststructuralism, phenomenology, hermeneutics, negative theology, postcolonial studies, postdemocratic political theory, and transhuman philosophy – that are now widely regarded as integral to the identity and self-understanding of continental philosophy. The period 1840–1900 merits careful study not only for the insights and innovations it birthed, but also for its incubation of so many of the ideas and questions that are central to the currently dominant expressions of continental philosophy.

It has become customary in recent years to frame the development of European philosophy in the nineteenth century as an extended, serial response to the magisterial achievements and expansive influence of Hegel. While this response admits of significant variation across a number of spheres of human endeavor – including religion, art, politics, law, and economics – a single theme tends to prevail: Hegel is understood to have articulated a definitive position or
stance that is believed to verge on, or aspire to, comprehensive totality. He is understood to have done so, moreover, on the strength of his dauntingly potent historical–phenomenological method – popularly, if inaccurately, known as the dialectic – which many critics regard with elevated suspicion. To capitulate to Hegel, his critics occasionally insist, is to surrender to the totalizing impulse his system supposedly manifests. The consequences of doing so, his critics further insist, include an increasingly normalized and homogeneous existence, which, some might claim, we have a moral duty to resist.

According to proponents of this general line of interpretation, Hegel’s philosophy is not simply the powerful expression of a creative intellect attuned to the dynamic rhythms of historical development. It also represents – and, more ominously, celebrates – the victory of those darker impulses to which the modern epoch was (and remains) uniquely vulnerable. These impulses travel and coalesce under a variety of names, but they are generally agreed to have funded the most disturbing political monstrosities of European modernity. That any such identification is patently unfair to Hegel is worth noting, but it is also beside the point of this introduction. For better or worse, Hegel’s philosophy has come to stand for an unacceptable degree of accommodation on the part of Europeans to form, structure, order, security, homogeneity, authority, or totality.

This general approach to the development of nineteenth-century European philosophy has proved to be both familiar and productive. Recent years have witnessed a proliferation of successful academic courses and seminars devoted to the theme of “Hegel and his critics,” and the nineteenth century is well known to scholars and students for its spirited debates, big ideas, and grand ambitions. The richness and diversity of these curricular innovations, and of the sweeping historical narratives they embroider, faithfully attest to the reach of Hegel’s influence, even if the drama they stage is occasionally contrived. This general approach is endorsed, moreover, by many of those thinkers who are integral to the development of philosophy in the nineteenth century. Feuerbach, Marx, Kierkegaard, Nietzsche, and Peirce, to name just a few figures of significance, all understood themselves to be responding, either directly or indirectly, to Hegel. In all of these cases, moreover, Hegel’s standing as the philosopher of the modern period – and, so, as the perceived guardian of assorted orthodoxies – instilled in his critics an unusual level of energy, audacity, and combativeness. German philosophy in particular was dominated by Hegel, although his shadow extended well across the continent as a whole.

1. A representative statement of this concern is expressed by Isaiah Berlin, who includes Hegel among those “rationalist metaphysicians” whose anticipation of “a final harmony in which all riddles are solved, all contradictions reconciled” leads them to favor “monism” over the “pluralism” that Berlin advocates. Isaiah Berlin, Four Essays on Liberty (New York: Oxford University Press, 1970), 168–72.
A further attraction of this approach is that it fits the stormy tenor of the times. As Hegel himself was fond of pointing out—most notably, perhaps, with respect to his brush with “world-spirit on horseback” (aka Napoleon)—the political and cultural developments of the century appeared to confirm the larger outlines of his philosophical system. Several of these developments bear noting here: the emergence of the modern nation-state; the acceleration of research in science and technology; the unprecedented mobility of Europeans and the subsequent mixing of social classes; the exportation of European culture (and aggression) via imperial expansion; and the flattering reflection of European culture to be glimpsed in the ongoing struggle to civilize the native peoples and landscapes of the Americas.

The career of philosophy in the nineteenth century reflects in many respects the excitement and turbulence of the times. Freed for the most part from the constraints of academic manners and political patronage, the major figures of the period forwarded daring, irreverent hypotheses, very much in the spirit of Hegel’s own philosophy. Grand, sweeping theories were in vogue, and philosophers endeavored to comment instructively on such general themes of vital interest as the nature of the human condition, the meaning of life (and death), the future of humankind, the limits of reason, the aims and bounds of science, and the proper scope of freedom. In many cases, as we will see, the leading philosophers of the period channeled and lent voice to the utopian muse that has inspired so much of Western philosophy. Indeed, despite the emergence in the nineteenth century of several enduring schools of suspicion, the leading figures of the period had not yet abandoned the perennial philosophical quest for the ideal society to which human beings might aspire. In short, that is, the dream of pan-European Enlightenment was not yet extinguished.

The leading philosophers of the period furthermore regarded themselves as both qualified and entitled to weigh in on the scientific debates of the day. Indeed, there was not yet a general sense among European philosophers that science was somehow beyond their ken. In some cases, in fact, the leading philosophers of the period considered themselves to be toiling at the very forefront of scientific research. This was especially true with respect to the nascent “human” sciences, including sociology, history, political economy, and psychology. Thinkers as diverse as Marx, Nietzsche, Comte, Dilthey, and Peirce understood themselves to be contributing productively (if diversely) to the determination of the method that would place the emerging “human” sciences on a firm foundation. Here it bears noting, in fact, that the very concept of science (Wissenschaft) was contested, and successively refined, throughout the nineteenth century. At the beginning of the century, scholars were inclined to apply the term science quite generally, and to virtually any identifiable body of received knowledge. By the end of the century, however, the scope of science had
been narrowed considerably, and the distinction between the “natural” sciences and the “human” sciences had become widely accepted.

To be sure, this general approach to the development of nineteenth-century European philosophy also has its limitations. As we have seen, for example, this approach can have the effect of distorting Hegel’s philosophical aspirations and accomplishments. As these distortions verge on caricature, moreover, Hegel comes to represent a veritable army of straw men. This state of affairs admits of considerable irony. The name of the philosophical champion of spirit (Geist) has become a shorthand designation for any comprehensive interpretation, apparatus, or regime that either threatens or promises to crush the human spirit. Similarly, the philosopher who dared to track the maturation of human freedom, who located the demonstrable superiority of Western civilization in its elaboration of (and support for) political institutions that reflect the creativity and will of the citizens they serve, has become synonymous with any comprehensive campaign to circumscribe individual expressions of freedom. Accordingly, the political philosopher who sought to defend the ethical relevance of the family and the indispensable contributions of the “corporations” is now seen as the apologist par excellence for the hyper-organized, ultra-efficient, pan-surveillant, über-policing modern nation-state. Finally, the former Tübingen seminarian who demonstrated how and why God might have entered time is now regarded as the arch-nemesis of appeals to faith, miracles, petitionary prayer, divine intervention, and all other irrational elements of religious practice and experience.

Another limitation of this approach is that it can tend toward unhelpfully reductive strategies of interpretation. A sprawling philosophical enterprise is all too easily compressed into a single big idea, and a voluminous corpus of writings is all too easily condensed into a few pithy slogans. In some cases, this reductive approach is applied to the century as a whole, especially if Hegel is taken to represent the prevailing (Apollonian) impulse toward integration and systematization while his critics are variously taken to represent the (Dionysian) impulse toward disintegration and dissolution. In fact, as we will see, this impossibly neat depiction of nineteenth-century European philosophy fails to capture the divided allegiances, shifting boundaries, complex genealogies, and cross-currents of influence that produced the rich, unruly diversity of thought that characterizes the period 1840–1900.

For all the clarity afforded us by its most enduring caricatures, the career of nineteenth-century philosophy was marked by ambiguity, uncertainty, and, occasionally, outright confusion. With respect to so many important points of

---

2. Several of these straw men are exposed by Jon Stewart in Idealism and Existentialism: Hegel and Nineteenth- and Twentieth-Century European Philosophy (London: Continuum, 2010).
contention, the leading philosophers of the period simply did not know what to think. Part of the problem was that they struggled to digest an overwhelming influx of knowledge about their world. The period was rife with scientific advances, anthropological and ethnological discoveries, empire-driven contact with alien peoples and civilizations, and technological innovations – all of which influenced the development of European philosophy. Even the “big ideas” that are so often attributed to the central figures of the period remained a source of significant mystery to their authors. Feuerbach and Marx, so clear in their opposition to Hegel, are anything but clear about the sensuous character of existence to which philosophers, ideally, should attend. Dostoevsky and Kierkegaard, so perspicacious in reckoning the failings of contemporary Christendom, were notoriously elusive on the question of how to constitute – much less to sustain – a life of genuinely Christian faith and practice. Nietzsche, so insightful in his spot-on critique of the bloated idols of late modernity, is uncharacteristically inelquent with respect to the nebulous “future” of philosophy. In this light, perhaps, the true, collective genius of nineteenth-century European philosophy may be seen to be largely diagnostic – as opposed to prognostic or prescriptive – in nature.

In recognition of these limitations, we have employed a modified, hybrid approach to the development of European philosophy in the period 1840–1900. Following the familiar strategy outlined above, we have tracked the lively commerce in big ideas for which the nineteenth century is well known. At the same time, however, we have attempted to detail the complex background against which this commerce transpired. Toward this end, we have devoted entire chapters to the major figures of the period, including Feuerbach, Marx, Kierkegaard, Dostoevsky, Nietzsche, and Peirce, while also placing these figures in the broader context of the philosophical movements branded in their names. In addition, we have devoted entire chapters to several thematic developments of central importance – for example, in hermeneutics, spiritualism, sociology, science, mathematics, and art. In all of these chapters, finally, we have taken care to situate the highlighted theories, insights, innovations, and debates in their historical, social, political, and cultural contexts.

As our unifying theme, we have focused on the revolutionary fervor that alternately informed, structured, interrupted, fragmented, and guided the development of European philosophy in the period 1840–1900. This theme is apposite, we believe, for a number of reasons. First of all, the period under consideration was shaped by revolutions of various kinds, from the political struggles of 1848, through the intensifications of the industrial and scientific revolutions, to the geopolitical revolution that was marked by the rise of a unified Germany at the conclusion of the Franco-Prussian War. This theme thus accommodates the general sense of urgency that infused the philosophical debates of the period.
Rightly or wrongly, the philosophers working in this period believed that something important and worthwhile was at stake in their deliberations. This belief was revolutionary, moreover, inasmuch as they deemed something essential to European modernity to be either missing, dormant, damaged, or awry. The apparent victory of the Hegelian system signaled the need for philosophy to acquire a new focus and direction, lest the great promise of European modernity come to naught. Indeed, several of the thinkers surveyed in this volume understood themselves to be issuing devastating, if not fatal, challenges to the status quo in politics, religion, science, art, and virtually every other sphere of human endeavor.

Second, the theme of revolution captures the contrarian spirit of the period. Many of the philosophers examined in this volume are joined by a common commitment to the suspension of traditional pieties and to the interrogation of received orthodoxies. For these thinkers, nothing was so hoary or venerable as to escape scrutiny and criticism. The penetrating power of reason, channeled by the emerging scientific method, was employed to unmask all manner of sham and humbug. In fact, many of the philosophers treated in this volume shared the conviction that European modernity was other than it appeared. It was up to them, they further believed, to acquaint their fellow Europeans with the reality that lay hidden beneath the beguiling appearances. In short, it is no accident that this period nurtured the overlapping careers of the three great masters of suspicion – Marx, Nietzsche, Freud – and of several others who merit a similar designation.

Finally, the theme of revolution is recommended by the contributions of the philosophers surveyed in this volume, many of whom were actively engaged in what they or others described as revolutionary innovations, movements, or causes. In some cases, of course, the call to revolutionary activity was explicit, literal, and unmistakable. In other cases, the revolutionary response in question was either nascent or imperceptibly under way. In still other cases, a revolution in thinking and practice had already taken hold, obliging the philosopher(s) involved to interpret this revolution on the fly. As we shall see, the revolution in question was presented by some as real, practical, and of determinate consequence, while from others the revolutionary impulse received a more figurative or allusive formulation.

In general, however, the philosophers treated in this volume presented themselves as responding to the exigencies of a perceived condition of crisis. In some cases, the crisis was perceived as current, while in other cases it was understood

---

3. This common orientation to a crisis is helpfully elucidated by Richard Kearney in his “Introduction,” in Modern Movements in European Philosophy, 2nd ed. (Manchester: Manchester University Press, 1994).
to be gathering or imminent. Although the nature of the crisis was diversely characterized – for example, as either material or spiritual, secular or religious, practical or theoretical, quotidian or eschatological – in most cases philosophy was expected to play a unique, leading role in addressing the crisis in question. (In some cases, to be sure, philosophy was chastised, called to order, and/or challenged to evolve in response to the perceived crisis.) For the most part, in fact, the task of philosophy was seen to lie in providing an interpretation of the crisis in question and, subsequently, in preparing European modernity to address this crisis, whether by adapting to it, deflecting its advance, avoiding it altogether, or accelerating its constituent contradictions.4

Chapter 1 charts the development and divergence of “Right” and “Left” articulations of Hegelianism, with a particular emphasis on the contributions of Ludwig Feuerbach.5 In this chapter, William Clare Roberts explains how Feuerbach attempted to situate himself within the roiling debates of his day, focusing in the process on Feuerbach’s elaboration of a nuanced interpretation-cum-reception of Hegel’s account of the maturation of Geist in world history. Known primarily for his influence on the young Marx, Feuerbach played a major role in the elaboration and defense of humanism as the hidden truth of Christianity (and, so, of Hegel’s account of the movement of history). Rather than treat individual human beings as finite shapes of divine Spirit, Feuerbach identified the God of Christianity as an externalized objectification (or psychological projection) of as-yet-unclaimed perfections of distinctly human provenance. As Roberts ably demonstrates, the interpretation of Christianity for which Feuerbach himself is best known to twenty-first-century audiences was made possible by what Feuerbach regarded as his more important contribution: a new approach to, and direction for, philosophy itself. As envisioned by Feuerbach, the task of philosophy is to lead human beings – potentially for the first time – to engage the world in the sensuous totality of its existence. In doing so, human beings stand to glimpse – albeit ever so obliquely – the concrete truth of their communal existence (i.e. their species-being).

Chapter 2 continues this developmental narrative, documenting the contributions of Karl Marx and the subsequent rise of Marxism. Focusing on Marx’s aversion to the antipolitical, ideological abstractions of philosophy, Terrell Carver portrays Marx as a social critic and political activist – more closely allied with journalism than German philosophy – determined to publicize and promote class-based antagonisms throughout Europe. Carver traces the birth of

---

4. As can be seen in many of the essays in The History of Continental Philosophy: Volume 3, this theme of crisis continues in the work of many of the important philosophers in the early decades of the twentieth century.

5. These developments are treated in a different context in the essay by Lawrence S. Stepelevich in The History of Continental Philosophy: Volume 1.
philosophical Marxism to the founding efforts of Friedrich Engels, Marx’s friend and collaborator, noting that the subsequent development and exportation of Marxism was contrary to Marx’s own antiphilosophical wishes. The inequities of capitalism were best addressed, Marx believed, not through the elaboration of philosophical theories (e.g. of alienation), but through the effective organization of disaffected workers. As presented by Carver, Marx appears not only as the great critic of speculative, ideological philosophy, but also as the (reluctant) inspiration for a new, eminently practical articulation of philosophy in Europe and beyond.

Chapter 3 introduces the reader to another outspoken critic of European modernity, the Danish philosopher Søren Kierkegaard. Expertly guided by Alastair Hannay, the reader is introduced in this chapter to a thinker bent on fomenting what might be called a revolution of the spirit. Convinced that contemporary Christendom had strayed dangerously far from the founding insights of Christianity, Kierkegaard embarked on an ambitious campaign to persuade his fellow Danes – via direct and indirect forms of discourse – to aspire for the first time to a life of genuinely Christian faith and practice. In order to do so, he realized, he would need not only to encourage his readers to cultivate habits of introspection and inwardness, but also to loosen the grip on them of the social and cultural institutions that were emblematic of European civilization in the modern epoch. Toward this latter end, Kierkegaard launched a blistering, unrelenting attack on the Danish state church, which, he alleged, had become a pawn of larger forces responsible for the growing secularization of northern Europe in the nineteenth century. Kierkegaard is perhaps most famous for a series of pseudonymous writings in which he brought the full complement of his literary, philosophical, and psychological gifts to bear on a cluster of problems centered on the difficulties involved in leading a life of Christian devotion in late modern Europe.

Chapter 4 documents the contributions of another influential critic of the established practice of Christianity in the modern epoch. The great Russian novelist Fyodor Dostoevsky – who is not typically included in surveys of nineteenth-century European philosophy – was motivated by a set of concerns not unlike those that prompted Kierkegaard to take up his own pioneering investigations into psychology, religion, and politics. Indeed, Dostoevsky’s contributions to the development of European philosophy were significant, if largely indirect. As presented in this chapter by Evgenia Cherkasova, Dostoevsky appears as a gifted novelist, to be sure, but also as a keen observer of the social conventions and cultural mores that uniquely characterize the modern epoch. He proved to be an astute critic of modern political movements and institutions, a fearless explorer of the unconscious springs and irrational currents of “civilized” human behavior, a sympathetic expert on the psychology of religion, and
a dedicated chronicler of the paradoxes engendered by the desire for freedom. As Cherkasova persuasively maintains, Dostoevsky deserves to be considered, alongside Marx, Nietzsche, and Freud, as one of the “masters of suspicion” who taught scholars and intellectuals of the twentieth and twenty-first centuries to detect the hidden motives, libidinal investments, unacknowledged expectations, and unconscious conflicts that inform and enliven all spheres of human endeavor.

Chapter 5 is devoted to a philosopher who was deeply (and gratefully) influenced by Dostoevsky: Friedrich Nietzsche. At one time a professor of classical philology (at Basel), Nietzsche resigned his university appointment and fled the stifling confines of European academe. Adjusting to the itinerant life of the independent scholar, Nietzsche went on to write a number of important books that eventually became influential for the development of philosophy on the European continent and beyond. Nietzsche is presented here as a persistent critic of the supposed triumphs and accomplishments of European modernity. Where other observers of the European scene claimed to discern evidence of progress, development, maturation, and growth, Nietzsche claimed to detect symptoms of regress, decay, dissolution, and disintegration. Late modernity, he insisted, was a fundamentally decadent epoch, incapable of projecting its highest values and ideals into a meaningful and sustainable future.

The focus of this chapter falls on Nietzsche’s famous teaching of the death of God, by means of which he endeavored to report a crisis of confidence in the basic system of beliefs that supported Christian morality. Owing to the death of God, he maintained, European culture would soon find itself slipping into chaos and confusion, as its highest values – for example, God, Truth, Beauty, and so on – continued to suffer a precipitous devaluation. The goal he identified for philosophy in the twilight of the idols was to determine, soberly and scientifically, what the death of God was likely to mean for the future of humankind. Indeed, although he understood the death of God to augur a protracted period of disruption, uncertainty, dislocation, and calamity, Nietzsche cautioned against the presumptive conclusion that humankind simply cannot negotiate the vagaries of a godless cosmos. Those human beings who survive the death of God, he believed, will be advantageously positioned to renew the promise of European civilization.

Chapter 6 charts the development of hermeneutics, which comprises the science or method or art of interpretation. The author of this chapter, Eric Sean Nelson, places particular emphasis on the signal contributions to the development of nineteenth-century hermeneutics by Friedrich Schleiermacher and Wilhelm Dilthey. Already well known to scholars of biblical and classical texts, hermeneutics became influential in this period for its actual and proposed applications to research in philosophy, theology, and the emerging “human” (or
social) sciences. As philosophers and social scientists grappled with the problem of how to ground or orient their incipient programs of empirical research, they increasingly turned their attention to the method and practice of hermeneutics. In this respect, a perceived strength of the hermeneutic method lay in its attunement to those subjective, affective inflections of human language and behavior – as well as their historical and cultural contexts – that distinguish human beings from the nonhuman objects studied by natural scientists.

Deeply indebted to the culture and literary tradition of German Romanticism, Schleiermacher sought to develop an “art” of understanding that would prevail in the face of chronic, inertial misunderstanding. For him, the promise of hermeneutics lay in its capacity to accommodate one’s prereflective intuition of the “singular” and the “infinite,” which he later came to associate with the subjective recognition of one’s utter dependence on God. It was imperative to express and communicate these affective and intuitive dimensions, Schleiermacher believed, for these alone could provide human beings with the orientation they would need to deflect an otherwise corrosive rationalism and skepticism. Although similarly concerned to elucidate the process or method through which interpretation leads to understanding, Dilthey endeavored to employ hermeneutics to shore up and expand the as-yet-shaky foundations of the nascent “human” sciences. For him, the value of hermeneutics lay in its capacity for further understanding through a careful interpretation of human experience and behavior in relation to their contexts and structures. Notwithstanding their differences in temperament and approach, both thinkers articulated the famous “hermeneutic circle,” which describes the movement of understanding, from general to particular and back again, as it approaches and approximates the truth of the text or lived-experience under consideration. As Nelson instructively observes, the development and influence of hermeneutics continue to inform debates central to the articulation of European philosophy.

Chapter 7 documents the contributions of the “French spiritualists,” a group of philosophers who shared a common suspicion of materialism and a common inclination toward idealism, especially with respect to the emerging “human” sciences. The author of this chapter, F. C. T. Moore, helpfully situates the school of French spiritualism against the backdrop of nineteenth-century science. Reacting to what they regarded as misplaced enthusiasm for a mechanistic paradigm in the emerging “human” sciences, the French spiritualists resisted the impulse to establish the science of psychology, for example, on the basis of either materialism or determinism. An important influence on the development of French spiritualism was Marie François Pierre Gonthier de Biran (Maine de Biran), who, in stark contrast to the Cartesian valorization of reason, emphasized the role of the will in the conscious activity of human agents. Bucking the increasingly influential trend toward reductive theories and
explanations of human behavior, Maine de Biran insisted on the scientific relevance of the “life of the spirit.”

Of the French spiritualists themselves, Félix Ravaisson and Jules Lachelier deserve mention for their criticisms of materialism and their insistence that the “human” sciences must account for feeling, will, enthusiasm, freedom, and other subjective indices of human behavior. Charles Renouvier, who is occasionally associated with the school of French spiritualism, in fact represents a return to a Kantian framework for understanding the relationship between philosophy and science.

Moore closes this chapter by documenting the contributions of the eminent philosopher Henri Bergson, who not only served as a bridge figure to twentieth-century philosophy, but also famously developed what might be called a “spiritualist” response to the increasingly influential theory of evolution. Despite being far more favorably disposed toward science than his brethren among the French spiritualists, Bergson nevertheless shared their suspicions of simplistic and reductive appeals to material principles of explanation. Rejecting both materialism and vitalism in its crudest forms, Bergson aspired to design and conduct biological and psychological investigations that would accommodate both spirit and matter. As Moore suggests, we may thus conclude that Bergson's proposal of “creative” evolution expresses something of the spirit of French spiritualism.

Chapter 8 documents the birth and development of sociology in the latter half of the nineteenth century. The author of this chapter, Alan Sica, explains that sociology emerged in this period as a response to the pressing need to develop a scientific method that would allow scholars to collect and interpret the unruly data of the so-called “human” sciences. Sica deftly charts the genealogy of sociological research, from its origins in the investigations of Herbert Spencer and Henri de Saint-Simon, through the innovations of Auguste Comte, Émile Durkheim, and Max Weber, to its consolidation in the early twentieth century as a scientific (and academic) discipline in its own right. Whereas Spencer is perhaps best known for the teleological inflections of his contributions to “social Darwinism,” and Saint-Simon for his utopian faith in the progress and prosperity to be enjoyed by a society guided by science, it was Comte who recoiled most decisively from the crypto-theological failings of speculative philosophy. His influential “Law of the Three Phases” was designed to show, pace Hegel (and others), that the full maturity of humankind lay in its graduation from a reliance on metaphysics to an appeal to positive facts and empirically confirmed data. Comte's famous positivism was meant not only to place the nascent “human” sciences on a firm empirical foundation, but also to elevate the sociologists themselves to positions of quasi-religious leadership within society.

Durkheim in turn aimed to identify, and build on, those basic insights of Saint-Simon that he (and others) felt Comte had not properly acknowledged. In
doing so, Durkheim hoped to recover for the “human” sciences some measure of the philosophical sophistication that, according to him, Comte had sacrificed. This trend was continued by Weber, who reserved for philosophy an indispensable role in determining the criteria for evidence and truth in the “human” sciences. As Sica demonstrates throughout this chapter, the leading social theorists of the period borrowed liberally from their philosophical brethren. Thus it should come as no surprise that the development of sociology in this period so closely parallels related developments in the history of European philosophy.

The theme of Chapter 9 is the development of science and mathematics in the latter half of the nineteenth century. In this chapter, Dale Jacquette tracks several of the most important innovations in scientific method and its mathematical foundations. Central to this account are his treatments of the proliferation of scientific research projects and of the dramatic—and occasionally contentious—expansion of the domain perceived as appropriate to, and ripe for, scientific investigation. In addition to providing a broad overview of the period, Jacquette helpfully draws our attention to several significant developments in scientific method and practice, including John Stuart Mill’s contributions to the empiricist method of inductive reasoning, Bernard Bolzano’s contributions to a neorationalist philosophy of science and mathematics, Comte’s development of his positivism, and Gottlob Frege’s contributions to scientific semantics and philosophy of mathematics.

As previously noted in Chapters 6 and 8, this period also witnessed the emergence of the distinctly “human” (or social) sciences, wherein scientific methods were applied, with varying results, to the data encoded in human behavior. As Jacquette demonstrates, the consolidation of research methods and protocols was accompanied by a growing sense of dissatisfaction with the established “laws” of nature. From this contentious, tumultuous situation would arise the influential twentieth-century challenges to classical Newtonian science.

Chapter 10 is devoted to the emergence and development of pragmatism in the latter half of the nineteenth century, with special emphasis on the seminal contributions of Charles Sanders Peirce. As presented here by Douglas R. Anderson, Peirce is best understood as both an appreciative reader and a respectful opponent of Hegel. While indebted to Hegel’s focus on dynamic processes of historical development, Peirce resisted Hegel’s decision to discount the enduring significance of the universal categories of “Firstness” (or qualitative immediacy) and “Secondness” (or otherness). According to Peirce, that is, Hegel’s preoccupation with the logical sublation of opposing theses, which Peirce understood in terms of his own category of “Thirdness” (or mediation), prompted him to ignore, or deny, the perdurance of the categories of Firstness and Secondness.

Pragmatism thus emerged, and subsequently developed, not as a rejection of Hegel’s method, but as a unique reception of this method. It was left to the
pragmatists, Peirce believed, to fulfill the promise of German idealism and to steer Hegel's method into closer conformity to the emerging paradigm of evolutionary science. As subsequently modified by William James and John Dewey, pragmatism began to take on the form in which it is still familiar today. Indeed, the contemporary influence of pragmatism on the development of European philosophy thus completes the feedback loop that began with Peirce's engagement with Hegel.

In Chapter 11, Gary Shapiro closes our volume with a detailed survey of aesthetics and art history in the period 1840–1900. Reflecting the revolutionary fervor of the period, practitioners (e.g. Richard Wagner) and theorists (e.g. Karl Marx) of art proposed revolutionary advances of their own, with respect both to the goals and methods of artistic production and to the proper cultural role of aesthetic theory. As in previous chapters, the focus is placed here on the rejection of established norms and conventions and the subsequent introduction of innovative practices and approaches. Establishing the uniquely modern provenance of the study of aesthetics, Shapiro documents the contributions and concerns of the post-Hegelian generation of European philosophers, including Karl Rosenkranz, F. T. Vischer, Søren Kierkegaard, Robert Zimmermann, and others. Deftly guided by Shapiro, the reader is introduced to the rapidly shifting scene wherein European artists perfected their craft while theorists and critics replaced shopworn pieties with bold, new, experimental measures of evaluation. From Nietzsche's investigation of the “physiology of aesthetics” to the management of nature by landscape gardeners, the latter half of the nineteenth century witnessed a veritable proliferation of new artistic forms and genres.

As these chapters and their authors variously confirm, the period 1840–1900 saw the fruition of those insights, questions, and challenges that are now deemed central to the core ventures of contemporary continental philosophy. By way of conclusion, it may be worthwhile to review several general lines of influence and inheritance from the nineteenth century. First, we may trace the broadly interrogative approach and generally critical stance of continental philosophy to the unmasking and debunking projects that were launched in the nineteenth century. The groundbreaking criticisms developed by Feuerbach and Marx, for example, were instrumental to the articulation of a critique of modernity and of the seemingly “natural” institutions that sustain its supposed “progress.” From the pioneering investigations conducted by Kierkegaard, Dostoevsky, and Nietzsche emerged the fully developed schools of psychoanalysis that we now associate with Freud, Jung, Reich, and Lacan. From the seminal contributions of Schleiermacher and Dilthey grew the philosophical hermeneutics practiced by Heidegger, Gadamer, Ricoeur, and their contemporary followers. The current surge of interest in negative theology, the death of God, post-Holocaust ethics, and the new atheism would be unthinkable apart from the contributions
of the great nineteenth-century critics of institutionalized religion, including Feuerbach, Marx, Dostoevsky, Nietzsche, and Comte.

Second, continental philosophy owes its abiding attunement to alterity, in all of its innumerable and incommensurate incarnations, to the expansive investigations conducted by the leading thinkers of the nineteenth century. The period 1840–1900 was marked by an explosion of contact with, and interest in, the various others of European modernity. As scientists gathered new data, explorers encountered new cultures, and previously segregated nations, peoples, and classes began to intermingle, European philosophers were generally keen to acknowledge – although not always to include – the others to whom they were introduced. The ongoing debates about what would and would not “count” as true science, or real philosophy, we might speculate, accustomed philosophers on the continent to contested disciplinary borders and permeable (if not porous) disciplinary boundaries. European philosophers, we might further speculate, grew to expect their efforts at categorization and classification to require regular updates and revisions, especially when presented with those others whose unique existence defied the standard systems of classification.6

Third, continental philosophy owes its generally inclusive orientation – which we may characterize as multidisciplinary, historically contextualized, politically engaged, scientifically informed, and hermeneutically sophisticated – to the leading thinkers and trends of the nineteenth century. As we have seen, the major figures of the period were not reluctant to enter scientific debates and controversies, and they contributed throughout the century to the continued refinement of scientific methods and practices. In this respect, contemporary continental philosophy may trace its lineage to the efforts of Marx, Nietzsche, Dilthey, Comte, Weber, and Peirce, to name just a few. To be sure, this orientation is also indebted to the resistance mounted by nineteenth-century philosophers to prematurely reductive applications of scientific principles of explanation. The debates surrounding the founding of the “human” sciences were very much concerned to preserve something that is irreducibly human – whether it be freedom, will, or spirit – in the face of increasingly popular mechanistic and deterministic worldviews. In this respect, contemporary continental philosophy is deeply indebted to the labors of the “Left” Hegelians, the French spiritualists, the early sociologists, and the early pragmatists.

Finally, we might conclude, continental philosophy owes its relentlessly inquisitive and self-reflective temperament to the pioneering thought experiments conducted by the leading philosophers of the nineteenth century. In general, the lines of questioning initiated by the nineteenth-century “masters of

---

*6. The crossing of disciplinary borders is a guiding theme of the essays in The History of Continental Philosophy: Volume 7.
suspicion” – Marx, Nietzsche, and Freud, although other figures (e.g. Feuerbach, Kierkegaard, and Dostoevsky) are equally worthy of this designation – were instrumental to the development of the critical strategies and techniques that are associated with the most visible and influential contemporary expressions of continental philosophy, including deconstruction, postmodernism, and poststructuralism.  

7. I wish to thank Alan Schrift for his general guidance of the History of Continental Philosophy series and also for his efforts in support of this particular volume. Without his patience, good will, and editorial acumen, this volume would not have been completed. I also would like to thank Dana Lawrence for her editorial assistance in the final stages of the project. Finally, I would like to dedicate this volume to the memory of my mother, Mary Joan Kavanagh Conway, who died as this project was nearing its completion.
To those left cold by the bombast, internecine polemics, and melodrama of post-Hegelian German philosophy, it might seem either that Hegel’s students failed to attain the height of their master, and so fell into obscure partisan squabbles, or else that the entire project of German idealism contained the germs of this debacle from the beginning, and that it serves as a reductio ad absurdum of the whole tradition. Both of these views were common among the post–Hegelians themselves. The first reaction is characteristic of those who came to be known as Right Hegelians. These set themselves the task of conserving the truth of Hegel’s philosophy, and defending it against misapplications, misappropriations, and misinterpretations. The second reaction is the developed response of the more radical among the Left Hegelians, Feuerbach and Marx especially. Thus an air of dissatisfaction and restlessness permeates the entire post–Hegelian scene. To the extent that this dissatisfaction continues to characterize philosophical and political discourses, we remain within that scene.

This essay will investigate this scene of restlessness with special attention on the role of Ludwig Feuerbach. Feuerbach is generally treated as the joint between Hegel and Marx, and this essay will to some extent reinforce that tendency by beginning with Hegel and ending with Marx. Nonetheless, Feuerbach is certainly much more than a mere transitional figure, in that he articulates a response to

---

1. Ludwig Feuerbach (July 28, 1804–September 13, 1872; born in Landshut, Bavaria; died in Nuremberg, Germany) was educated at the University of Heidelberg (1823–24), University of Berlin (1824–26), and University of Erlangen (1826–28). His influences included Bacon, Hegel, Kant, Leibniz, and Spinoza, and he held no university appointments.

the post-Hegelian ferment that endures as a recurrent, live option. Marx is certainly not the necessary consequence of Feuerbach’s premises; one can start down the path with Feuerbach and travel as far as one wishes without arriving at Marxism. One of the objects of this essay is to identify the point of rupture that separates Feuerbach’s position from that of Marx. Whether Feuerbach’s position is satisfactory, as opposed to unique and viable, is a separate question, and one that this essay will not seek to answer. Instead, it will identify the problem to which Feuerbach responds, trace in some detail the critique of theology and philosophy by which he responds to that problem, and highlight the distinctive features of his response, by which Feuerbach can be differentiated from Right Hegelians, other Left Hegelians, and Marx.

I. PERSONALITY, SPIRIT, AND THE PROBLEM OF INCARNATION

In order to appreciate Feuerbach’s problem, it is helpful to be cognizant of certain aspects of the historical and cultural context of his writings, aspects that are not explicitly acknowledged within those writings, but that function nonetheless as the backdrop against which Feuerbach wrote. Feuerbach was seduced into philosophy by Hegel himself, and left behind his studies in theology to devote himself to Wissenschaft (philosophical science). He was never to secure the academic post he desired, however, for he was blacklisted after failing sufficiently to guard his authorship of the anonymous Thoughts on Death and Immortality, which argued against the immortality of the personal soul. The ensuing death of his academic career was not due merely to his book’s offensiveness to religious orthodoxy. The personality of the soul – its individual and irreducible selfhood – was one leg of the three-legged stool of German order, together with the personality of God and the personality of the king. Warren Breckman has demonstrated that this discourse of personality colored all of the controversy surrounding Hegel and the Young Hegelians. This is because German personalism sustained an elaborate homology between the uniqueness of a personal God, the indivisible and quasifamilial sovereignty of the king, and the singularity of each subject. As Breckman reminds us, “the works of the Young Hegelians unified theological, political, and social themes in large measure because they were written within a context in which this unity was

*4. This philosophical context is the subject of many essays in The History of Continental Philosophy: Volume 1; see, in particular, the essays by Terry Pinkard and Lawrence S. Stepelevich.
taken for granted.” 5 Therefore it is necessary to examine in more detail both the personalism of German politics and theology and the aspects of Hegelian and post-Hegelian thought that elicited such a powerful defensive reaction. It is crucial to understand, in other words, how German idealism came to be seen as a threat to the German order. 6

During and after the Pantheismusstreit (pantheism controversy) – the debate between F. H. Jacobi and Moses Mendelssohn about whether Enlightenment rationalism necessarily entails pantheism and fatalism – the line of demarcation between enlightenment and reaction was Spinoza’s definition of God as substance, or the totality of nature. It was Jacobi’s exchange with Mendelssohn that cemented the identification of Spinozism with what Jacobi called “nihilism,” and counterpoised to it the intuitive and emotional certainty in “a transcendent personal intelligence” (MYH 26). 7 Already in Jacobi, the transcendent personality of God is also keyed to the transcendent personality of the human individual. After Napoleon’s defeat, Restoration political thinkers such as Carl Ludwig von Haller decisively asserted the personality of the sovereign to be the third leg of the stool, and Pietist reactionaries and the later Schelling unified all three into the Christian personalism that functioned as the de facto state ideology of Prussia right up to 1848. 8

Without delving too deeply into Hegel, it is a fairly straightforward matter to show that his philosophy of spirit is deeply – although not simply – opposed to each branch of orthodox personalism. In his early essay “The Spirit of Christianity and its Fate,” he had argued for the incompatibility of Christianity and personalism. According to Hegel, Christ himself was explicitly “against personality, against the view that his essence possessed an individuality opposed to those who had attained the culmination of friendship with him.” 9 This view did not change, and is reiterated in his Lectures on the Philosophy of Religion. Although his endorsement of monarchy in The Philosophy of Right dramatically separates him from the Left Hegelians, Hegel’s monarch was not the personal monarch the conservatives wanted, but a mere functionary of the state, a “decider” whose decisions carried not personal authority but only the impersonal authority of

the constitution and its laws. On theological and political grounds, then, the conservatives had good reason to count Hegel as an opponent.

It is in relation to the third aspect of personalism, however – the transcendent personality of the individual – that the complexity and depth of Hegel’s opposition to personalism comes to the fore. The personality defended by the conservatives was a willful personality, self-contained and sovereign within its own domain. This personality has a place in Hegel’s thought, to be sure. Yet it is not the truth of personality, but only an abstract, legalistic moment to be overcome. Just as God the Father is not the truth of God, so, too, the self-contained, sovereign person is not the true person; only Geist (spirit) is fully and actually a self-conscious subject. When Hegel introduces spirit in the *Phenomenology*, he writes:

> A self-consciousness, in being an object, is just as much “I” as “object.” With this we already have before us the Notion of Spirit. What still lies ahead for consciousness is the experience of what Spirit is – this absolute substance which is the unity of the different independent self-consciousnesses which, in their opposition, enjoy perfect freedom and independence: “I” that is “We” and “We” that is “I.”

As opposed to the abstract, legal person, spirit is the concrete person, the person constituted as a subject by a consciousness of its intersubjective reality. This person is not sovereign or willful, for it comes to know itself only through the ethical and rational life it shares with others. Spirit does not transcend and rule over its own private domain, but is always outside itself. In Jean-Luc Nancy’s apt phrase, spirit “trembles in desire.” Or, as Judith Butler puts it, “if we are to follow *The Phenomenology of Spirit*, I am invariably transformed by the encounters I undergo; recognition becomes the process by which I become other than what I was and so cease to be able to return to what I was.”

Hegel’s identification of spirit as the truth of personality could not have pleased any of the parties in the theological–political disputes roiling Germany,

---

10. As Breckman puts it, “At the core of both the theological and political discourses of personality was an intense concern with the nature and conditions of indivisible unitary will – in short, with the nature of sovereignty” (MYH 63).

for all camps relied, at one point or another, on abstract personality. The political reactionaries stressed the sovereign personality of the king, and the religious reactionaries stressed the same in God. But political liberals were equally invested in the personality of the individual political subject. Attachment to and rejection of the spiritualization of God, of the state, and of the subject, therefore, became the shibboleths of Hegelianism and anti-Hegelianism, respectively. Left and Right Hegelians were as one in their adherence to spirit. What divided them was the question of how to interpret spirit, a question that came unmistakably on the scene with the 1835 publication of David Friedrich Strauss’s *The Life of Jesus Critically Examined.*

In the denouement of his argument, Strauss presents the standard Hegelian Christology – every element of the “evangelical history” is “deduced” dialectically from “the concept of God and man in their reciprocal relation” only to diagnose it with a fatal contradiction:

If reality is ascribed to the idea of the unity of the divine and human natures, is this equivalent to the admission that this unity must actually have been once manifested, as it never has been, and never more will be, in one individual? This is indeed not the mode in which Idea realizes itself; it is not wont to lavish all its fullness on one exemplar, and be niggardly towards all others: it rather loves to distribute its riches among a multiplicity of exemplars which reciprocally complete each other – in the alternate positing and sublating of individuals.

(LJ 48)

With this text, the division between Left and Right Hegelians sprang into existence fully formed, like Athena from the head of Zeus. Whereas Right Hegelians (such as Philip Conrad Marheineke and Karl Rosenkranz) emphasized the differentiation within spirit, and valorized certain historical instantiations of spirit as the actual manifestations of the idea, Left Hegelians followed Strauss in denying equally to all particular historical shapes of spirit the privilege of

I have silently expurgated Massey’s editorial insertions, such as brackets and interpolated German words. Hereafter cited as LJ followed by the page number.
actualizing the idea. It is the play of history as an infinite totality that alone incarnates the “infinite spirit” of God, and no incident or moment of that play can, to the exclusion of other moments, condense and hold the infinite within itself.

That this Left Hegelian interpretation amounts to an absolute humanism was made obvious by Strauss from the beginning:

Humanity is the union of the two natures – the incarnate God, the infinite Spirit alienated in the finite and the finite Spirit recollecting its infinitude; … it is the worker of miracles, insofar as in the course of human history the spirit more and more completely subjugates nature, both within and around man, until it lies before him as the inert matter on which he exercises his active power. Humanity is the sinless one because the course of its development is blameless. … It is Humanity that dies, rises, and ascends to heaven, for from the negation of its natural state there ever proceeds a higher spiritual life; from the sublation of its finitude as a personal, national, and terrestrial spirit, arises its union with the infinite spirit of the heavens.

(LJ 48–9)

There are two dilemmas constitutive of Strauss’s spiritual humanism, dilemmas that will in turn frame Feuerbach’s own construction and development of a spiritual or transcendental anthropology. The first is the dilemma between Strauss’s dispersal of spirit into the infinite play of the species and his obvious commitment to a progressive historical development. If no “particular point in time” can incarnate infinite spirit, how can human history tell the tale of a “more and more” complete spiritualization? It would be easy enough to resolve this first dilemma were it not for a second; on the one hand, Strauss wants to deny any particular incarnation of the infinite within history, but, on the other, he does not want to relapse into a Kantianism that would posit the idea as merely ideal, as approximated but never realized. Infinite spirit cannot be contained within history as a local phenomenon, but nor can it stand outside history as an eternal ought.

In his works on teleological judgment and history, Kant had formulated a concept of the species that clearly foreshadowed the post-Hegelian scene.16 He had claimed that the “natural capacities” of humanity, insofar as they are destined for rational employment, “are to be completely developed only in the species, not in the individual,” and that:

---

*16. Kant’s philosophy is discussed in detail in the essay by Thomas Nenon, as well as several of the other essays on reactions to Kant’s philosophy in The History of Continental Philosophy: Volume 1.
[Nature] requires a perhaps incalculable sequence of generations, each passing its enlightenment on to the next, to bring its seeds in our species to the stage of development that completely fulfills nature’s objective. And the goal of [man’s] efforts must be that point in time, at least among the ideas of men, since the natural capacities must otherwise be regarded as in large part purposeless and vain.17

For all Hegelians, this fails to satisfy, as Hegel’s Preface to The Philosophy of Right attests. The promise and satisfaction of Hegelian philosophy was the “warmer peace” with historical actuality that it brought.18 For Strauss, that peace took the form of history conceived as a progressive totality that, its progress notwithstanding, had always already constituted the identity of God and the human species. God is not incarnated within that history because it is only the totality in its play that makes the divine materially present. The progressive spiritualization of nature is not progress toward an eschatological completion, either within or outside history, but the ever-triumphant expansion of the totality itself.

Strauss’s formulation of spirit was the final nail in the coffin of Hegelianism so far as its conservative critics were concerned, and it made the position of the Right Hegelians a very difficult one, for they had to defend their more conservative Hegel against both the conservative anti-Hegelians and the Hegelian Left. It seemed as if they had no ground on which to stand, their adversaries having already divided the whole terrain – Christianity to the right, Hegelianism to the left – between themselves. There will later be a resurgence of a quasi-conservative position from within the ranks of the Left Hegelians themselves – that of Bruno Bauer19 – but Bauer’s conservatism was a secular, elitist neo-

---

19. Bruno Bauer (September 6, 1809–April 13, 1882; born in Eisenberg, Saxe-Altenberg; died in Rixdorf, Germany) was educated at the University of Berlin (1828–34). His influences included Hegel, and he held appointments at the University of Berlin (1834–39) and University of Bonn (1839–42). His major works include: Kritik der evangelischen Geschichte der Synoptiker und des Johannes, Dritter und letzter Band (1840–42); (anonymously) Die Posaune des jüngsten Gerichts über Hegel, den Atheisten und Antichristen (The Trumpet of the Last Judgment against Hegel the Atheist and Antichrist: An Ultimatum; 1841); Das Entdeckte Christentum: Eine Erinnerung an das 18. Jahrhundert und ein Beitrag zur Krisis des 19 (Christianity Exposed: A Recollection of the 18th Century and a Contribution to the Crisis of the 19th; 1843); Die Judenfrage (The Jewish Problem; 1843); Christus und die Cäsaren: Der Ursprung des Christentums aus dem römischen Griechenthum (Christ and the Caesars: The Origin of Christianity from Romanized Greek Culture; 1879).
conservatism. Christian Hegelianism was, after Strauss, treated generally as an oxymoron. Therefore we can turn to Feuerbach, who turned Strauss’s argument into a critical technique by which he sought to revolutionize humanity’s self-conception.

II. FEUERBACH’S ANTHROPOLOGY OF SPIRIT

If Feuerbach is known for one thing, it is for coining “species-being” (Gattungswesen), the term so important for the young Marx. Species-being is the sort of being, human being, that is – and is conscious of what it is – only in and through its relations with the other beings of the same species. Hence it would not be an exaggeration to say that Feuerbach’s concept of the species-being is nothing more than Hegel’s spirit – “I” that is “We” and “We” that is “I” – under a different name. That Feuerbach’s central philosophical concept differs from Hegel’s only verbally is not nothing, however. Indeed, Feuerbach would say this verbal difference amounts to an essential difference, for it brings out the relation between thought and language, a relation over which Feuerbach seeks to break absolutely with Hegel. Feuerbach takes Hegel to identify thought and language, reason and demonstration, and his first open criticism of Hegel attacks precisely this purported identity.

Feuerbach’s essay Zur Kritik der Hegelschen Philosophie, appearing in 1839, articulates two basic criticisms of Hegel. First, Feuerbach argues that Hegelian philosophy “is defined and proclaimed as absolute philosophy; i.e., as nothing less than philosophy itself, if not by the master himself, then certainly by his disciples – at least by his orthodox disciples – and certainly quite consistently and in keeping with the teaching of the master” (TCH 97). This claim, Feuerbach replies, is refuted by the same reasoning Strauss used to refute the claim that God was incarnated in Christ. No infinite species realizes itself in a single individual. Such an incarnation would, indeed, amount to “the end of the world,” emptying all future time of any meaning or history (TCH 98). Second, Feuerbach argues that all modern philosophies, including Hegel’s, “presuppose philosophy; that is, what they understand by philosophy to be the immediate truth”

20. Ironically, Bauer had, at twenty-six, been chosen by Marheineke to deliver the Right Hegelian critique of Strauss’s Life of Jesus. The ink was barely dry when Bauer went over to the Left. In a further irony, Strauss very quickly abandoned much of his Hegelianism. The fourth edition of his book – the 1842 edition translated into English by George Eliot – contains very little Hegelian terminology.

22. I will return to the relation between incarnation and history in Feuerbach’s writings below.
The Logic and Phenomenology of Spirit do not begin, according to Feuerbach, by addressing “sensuous consciousness” – the other of philosophy – but by addressing philosophy itself (TCH 114). In other words, Hegel offers no inducement to sensuous consciousness to get on board with his philosophical project in the first place. His philosophy remains solipsistic.

Both of these criticisms depend on Feuerbach’s denial that thought and language are identical. Feuerbach’s argument for this denial takes the form of three appeals to experience. His first appeal is to the communication between teacher and student. A “quick-witted person,” he reminds us, “can be ahead of his demonstrating teacher” (TCH 105). This shows us that “forms of communication, modes of expression, representations, conceptions” are only “forms in which thought manifests itself,” not “active forms of thought, not causal relations of reason” (TCH 104 n.1). The teacher does not “instill his thoughts in me like drops of medicine,” and the philosopher cannot “really produce philosophers” (TCH 105). Rather, the teacher presupposes the self-activity of the pupil’s understanding: “he only embodies and represents what I should reproduce in myself in imitation of him” (TCH 105–6). Thus linguistic, demonstrative thought, including the dialectical presentation of Hegel, “is only the translation into an idiom comprehensible to us of a highly gifted but more or less unknown author who is difficult to understand,” the “genius for thinking” in all of us (TCH 105 n.1).

Second, Feuerbach appeals to the process of writing. To write is to present thought, but “[t]hought is prior to the presentation of thought” (TCH 107). Hegel knew before beginning the Logic, for example, that it would culminate in the absolute idea, and yet the Logic in its presentation does not begin with this knowledge. Feuerbach concludes:

This contradiction between the thinker who is without needs, who can anticipate that which is yet to be presented because everything is already settled for him, and the needy writer who has to go through a chain of succession and who posits and objectifies as formally uncertain what is certain to the thinker – this contradiction is the process of the Absolute Idea which presupposes being and essence, but in such a way that these on their part already presuppose the Idea. … That is why the Idea’s lack of self-knowledge at the beginning is, in the sense of the Idea, only an ironical lack of knowledge.

(TCH 112)

In other words, Hegel is an unwitting ironist, an ironist who cannot admit his own irony in the face of his self-seriousness. He is a self-denying “actor” and “artist” (TCH 105–6). Such is the case with all philosophers who communicate their
thought. Every linguistic presentation, including Hegel’s dialectic, is communication; hence language – and not merely the propositional language of the understanding – is distinct from thought.

Finally, Feuerbach appeals directly to sensuous consciousness, which, he claims, treats language as a mere means, a tool that sensuous consciousness picks up and discards as it is a help or a hindrance. This is why the opening of Hegel’s *Phenomenology* – which claims to begin with sensuous certainty of the “this” and the “now”23 – fails to address sensuous consciousness at all. Feuerbach has sensuous consciousness respond to Hegel:

> Enough of words, come down to real things! Show me what you are talking about! To sensuous consciousness it is precisely language that is unreal, nothing. How can it regard itself, therefore, as refuted if it is pointed out that a particular entity [the presence of consciousness] cannot be expressed in language? (TCH 114)

Whether these criticisms have any real impact on Hegel is unimportant for present purposes. What they reveal about Feuerbach, on the other hand, is critical. Feuerbach’s skepticism about systematic presentation and his conviction that language stands outside thought as a mere instrument ought to prepare one to read *The Essence of Christianity* with an eye to what it does not say. If Hegel is unwitting in his irony and unable to acknowledge it, Feuerbach is well aware that he cannot help but be ironic himself. The silent currents of thought that circulate behind his presentation, even as they are communicated by his presentation, are what must concern the reader. As Feuerbach himself wrote to his friend Christian Kapp in November 1840, just as he was finishing *The Essence of Christianity*, he is a “cryptophilosopher.”24

Thus, when Feuerbach writes, in the preface to the second edition, that *The Essence of Christianity* “contains a faithful, correct translation of the Christian religion out of the Oriental language of imagery into plain speech,”25 the reader must remember that this is a translation from one set of representations into another set of representations, from concrete, sensuous images into “abstract images” (EC 77). That this translation is possible, and that Feuerbach has set it forth, is itself supposed by him to provide a demonstration in deed of “the real, complete nature of man” (EC xiv–xv). The act of translation indicates without elucidating the reality of the spirit – the species – behind the letter. The “principle”

of Feuerbach’s “new philosophy” is “verified practically, i.e., in concreto” by the translation of religion into speech (EC xiv). The essence of Christianity speaks in Feuerbach’s book, and confesses by this spoken self-representation that its imagistic representation in the hearts and minds of its adherents is no more its essence than is its new, verbal representation. The essence is what speaks, not what is spoken, and what speaks is “Man” (EC xv–xvi).

Since the essence of Christianity is the essence of all religion, and also the essence or principle of Feuerbach’s new philosophy, it follows that Feuerbach is not the enemy of religion. Feuerbach’s philosophy agrees completely with religion: “it has in itself the true essence of religion – is, in its very quality as a philosophy, a religion also” (EC xxiv).26 Rather, the enemy of religion is theology, or – what amounts to the same thing – the old, pre-Feuerbachian philosophy, especially Hegel’s. By a profound reversal, Feuerbach agrees with the orthodox Right that Hegelianism is the mortal enemy of religion, of spirit, and of “man.” What Hegel’s orthodox critics did not notice, however, is that they, too, are arrayed against religion and on the side of Hegel. The opposition of the theologians to Hegel is the opposition of one sort of anti-religion to another sort of anti-religion.

Theology and philosophy are anti-religious and anti-human because, whereas religion “is the immediate object, the immediate nature of man” (EC xxii), theology and philosophy are “the reflection of religion upon itself” (EC xviii), a reflection that makes “real beings and things into arbitrary signs, vehicles, symbols, or predicates of a distinct, transcendent, absolute, i.e., abstract being” (EC xx). Theology and philosophy take the representation of religion to be the essence of religion, and thereby make out the real essence to be a mere representation of the representation. If religion is “the dream of the human spirit” (EC xix, translation modified), it is a spontaneous dream, and so is innocent.27 Theology, however, takes the dream to be the reality, and tries to derive the dreaming spirit from its dream. Philosophy compounds the sin by translating the sensuous dream-images into the abstract word-images of metaphysics, while continuing theology’s attempt to derive the dreamer from the (now abstract) dream. Against this image fetishism of theology and philosophy, Feuerbach proposes to defend religion in its complex reality. Against his age, “which prefers

26. See also Ludwig Feuerbach, Principles of the Philosophy of the Future, Manfred H. Vogel (trans.) (Indianapolis, IN: Hackett, 1986), §64. Hereafter cited as PPF followed by the section number.
27. Wartofsky is excellent on this point: “Feuerbach is neither a positivist nor an atheist, in the ordinary (and narrower) senses, but rather an emergentist, for whom religion is a serious (and dialectically necessary) expression of a certain stage of human self-understanding” (Feuerbach, 6).
the sign to the thing signified,” he wants to reduce “the appearance of religion” to its essence, and to explain the dream from out of the dreamer (ibid.).

The dreamer is human spirit, the human individual in its constitution by and consciousness of its species-being. In religion, this spirit dreams only of itself. Thus Feuerbach defines religion itself as “identical with self-consciousness – with the consciousness which man has of his nature” (EC 2). But if religion is self-conscious spirit, what need is there for Feuerbach’s new antiphilosophy? If religion already confesses all of its secrets without thereby ceasing to be religion (EC 57–8), what does Feuerbach’s translation of that confession into speech accomplish? It is easier to say what it does not accomplish. It certainly does not do away with religion. For this reason, the standard account, according to which Feuerbach is a critic of religion, is simply wrong if critique is taken to be an external, negating stance. Feuerbach affirms religion, defends it against theology and philosophy, and asks of it only that it openly avow what it already is: absolute humanism. Feuerbach has long been taken to be an empirically minded materialist, as well as a critic of religion. The Vienna Circle positivists lumped him in with Hume, Bentham, and Comte as a predecessor of their own “hedonism and positivist sociology.” Even those who stress his Hegelian heritage tend to portray him as moving toward sensationalism, nominalism, and positivism as he matured. While it should be clear from the above that he is far from being a textbook secularist, the question of how to understand Feuerbach’s epistemological statements – his insistence on the priority of sensation, for example – remains unanswered. I think it is better to see Feuerbach as a proto-phenomenologist than as a proto-positivist, anticipating the thought of Husserl and Merleau-Ponty rather than Mach and Ayer. His phenomenological humanism distinguishes him from his Left Hegelian peers, and outlining its distinctive positive features will be the focus of the final section.

28. Compare Louis Althusser, “On Feuerbach,” in The Humanist Controversy and Other Writings (1966–67), François Matheron (ed.), G. M. Goshgarian (trans.) (London: Verso, 2003). Althusser argues that Feuerbach differs from all “enlightenment” critics of religion (beginning with Epicurus) in that these all attribute religion to “partial and, usually, aberrant effects of human nature,” while, for Feuerbach, “religion is not only an index of the distinction between man and the animals, but that which constitutes man’s humanity, the human essence in its adequation” (ibid., 91–2).

The central tenet of *The Essence of Christianity* is Feuerbach’s formula, “God is the mirror of man” (EC 63). In this, Feuerbach seeks to encompass two realizations. First, God is the peculiar object of the human being, the inescapable object of human apprehension. Second, this object is nothing other than human being objectified; everything that is in God is in human species-being, if not in each and every particular human being. According to Althusser, “the term ‘object’ … sustains the entire edifice of Feuerbach’s theory,” and it is the objective character of human being that opens it to the sort of anthropological study Feuerbach undertakes, perhaps the first philosophical anthropology in the modern sense. Therefore, in order to understand the import of Feuerbach’s central tenet, it seems necessary to analyze his notion of the object.

Working backwards, Feuerbach denies the possibility of a Cartesian or Fichtean ego, an immediately self-relating subject, explicable via introspection. Consciousness has access to itself – is self-consciousness – only by way of its consciousness of objects. This is the origin of his claim that “for my thought, I require the senses, especially sight” (EC xiv). The true nature of a human being is not inside, but outside. Not only the truth of statements about nature in general, but the truth of statements about human nature, is in objects, not in the subject. The subject has an inside only because it has an outside that it has introjected. Feuerbach is most explicit about this in his *Principles of the Philosophy of the Future*, where he writes, for example, that “a real object is given to me only where a being that affects me is given to me and where my self-activity … finds its boundary or resistance in the activity of another being” (PPF §32). This discovery of the boundary of one’s own subjectivity is precisely the experience of being passive. Thus, Feuerbach continues, “only where I am transformed from an ‘I’ into a ‘thou,’ where I am passive, does the conception of an activity existing apart from me, that is objectivity, arise” (ibid.). In other words, only by being an object can I experience objects, only by being an object can I be a subject. Being active – and here Feuerbach means thinking – implies being passive, that is, sensitive, and being sensitive further implies being sensible. This is the anchor of Feuerbach’s philosophical anthropology, since anything and everything objective and sensible about human life can serve as a way into the active subjectivity of human species-being.

But there is yet this further wrinkle to Feuerbach’s rather elliptical argument. Being an object is not co-extensive with sensation or passivity in the everyday

---

31. See Wartofsky, *Feuerbach*, 206–10, for a good discussion.
32. See also PPF §32.
senses of those terms, at least not in the original significance of being an object. I am truly or originally an object only when I am the object of another subject, when I am a “thou” to another “I.” Intersubjectivity is, in other words, a condition for the possibility of subjectivity. Thus he claims that the object is “originally” only another “I” (PPF §32). This excavation of the conditions for the possibility of the thinking subject Feuerbach takes to mark the fundamental divide between his new philosophy and all other philosophies of the modern age. The “I” is constituted only as a “thou,” the subject only as an object, thinking activity only as sensuous passivity.

As a consequence, Feuerbach argues that thought, the activity of the subject as such, must take its place within these conditions of its possibility. In one sense, this “must” is simply descriptive. Human beings cannot but think in an intersubjective context, and in light of an experiential history; there is nothing we can do about it. But Feuerbach also formulates this “must” as a series of “categorical imperatives”:

Desire not to be a philosopher, as distinct from a man; be nothing else than a thinking man. Do not think as a thinker, that is, with a faculty torn from the totality of the real human being and isolated for itself; think as a living and real being, as one exposed to the vivifying and refreshing waves of the world’s oceans. Think in existence, in the world as a member of it, not in the vacuum of abstraction as a solitary monad, as an absolute monarch, as an indifferent, superworldly God; then you can be sure that your ideas are unities of being and thought. (PPF §51)

How might these imperatives be fulfilled? How does one think in the world as a member of it? The world is nothing other than the totality of possible objects, of which each human being is one. But the original object is itself a subject. Therefore the totality of possible objects is, in this original sense, the totality of subjects. In other words, the world is identical with the species. Realizing that I am, in Wartofsky’s phrase, “species-identical” with my object is the definition of thinking as a member of the world.33 Human beings look around the world and find nothing but their humanity looking back at them.

Feuerbach seems to mean this in several senses. In one sense, he writes, “The certainty of the existence of other things apart from me is mediated for me through the certainty of the existence of another human being apart from me” (PPF §41). In this sense, certainty is always an intersubjective phenomenon; what is real is what is socially vouched as real. In another way, every object, by

being an object for human consciousness, is a humanized object. Thus, “Even the moon, the sun, the stars, call to man gnôthi seauton [know thyself]. That he sees them, and so sees them, is evidence of his own nature” (EC 5). Finally, in a closely related manner, human senses are, according to Feuerbach, “elevated above the limits of particularity and its bondage to needs,” in that they know no limits. All human senses are, therefore, “intellectual and scientific acts” (PPF §53). Thus the nature that every possible object shows to us is an infinite nature, a nature that knows no bounds. Human being cannot escape itself into some other; wherever it goes, there it finds itself. Human being is its own “absolute horizon.”

But none of this reveals the process whereby human beings are to go from finding their species-being always already mirrored back to them from every object to realizing that is what they are finding, and thereby fulfilling Feuerbach’s imperatives. Feuerbach’s new philosophy is needed because we do not recognize ourselves in our original object. We look in the mirror and see God – the infinite spirit – but we fail to see that we are looking in a mirror. We do not recognize ourselves in God because we do not see the mirror as a mirror. The problem is that “[m]en first see objects only as they appear to them and not as they are; they do not see themselves in the objects, but only their imaginations of the objects” (PPF §43). Imagination and fantasy, like discursive thought, are abstract. Sensuous intuition and feeling are concrete. But we don’t find ourselves immediately at home in the concrete. Rather, we have to work to actually see what is in front of our faces. Feuerbach writes:

Immediate, sensuous perception comes much later than the imagination and the fantasy. … The task of philosophy and of science in general consists, therefore, not in leading away from sensuous, that is, real, objects, but rather in leading toward them, not in transforming objects into ideas and conceptions, but rather in making visible, that is in objectifying, objects that are invisible to ordinary eyes. (PPF §43)

Truly religious eyes are actually better at seeing than are “the eyes of the anatomists or the chemists,” and yet Feuerbach wants to replace even these with “the eyes of philosophers,” understood in his new sense, of course (PPF §41). “Historical epochs arise,” he writes, “where that which before was only ideated and mediated becomes an object of immediate and sensuous certainty” (PPF §38). The becoming visible of the mirror-function of the object would, it seems, mark the epoch to end all epochs, for in becoming visible as a mirror, the object

would show us to ourselves as we really are. Our objects, being so many mirrors, would reflect to us our essential nature.

No process has been outlined, however, whereby we could come to see the mirror as a mirror. Because the human subject is constituted only intersubjectively, we must expect that such consciousness can come only socially; the intersubjective context must matter. Feuerbach also tell us explicitly that “[o]nly in feeling and in love … is the infinite in the finite” (PPF §33). Thus we can expect further that the realization cannot be a merely rational one; it must be felt. Thus Feuerbach becomes himself a preacher and exhorts us:

The single man for himself possesses the essence of man neither in himself as a moral being nor in himself as a thinking being. The essence of man is contained only in the community and unity of man with man; it is a unity, however, which rests only on the reality of the distinction between I and thou. (PPF §59)

The conditions that authenticity must be communal and must be felt only reinforce what Feuerbach’s critique of Hegel already said: even new philosophers cannot really produce other philosophers. Feuerbach cannot simply tell the truth and expect that the telling will make the truth manifest to his readers. The telling is only an abstract image of the concrete fact. But the fact itself is attested only by the act of translating it into new images. This, finally, is what Feuerbach means by praxis: the act, renewed again and again, of taking the confession of the species, and then publishing the transcription of the confession. This transcription never incarnates the species, nor does it trap the species in amber. Rather, it only witnesses the excessiveness of the species vis-à-vis any of its manifestations. It thereby is meant to provoke our wonder at and love of our own species-being.

This confessional practice is Feuerbach’s distinctive contribution to post-Hegelian philosophy. The post-Hegelian scene is constituted by the various attempts to discover a happy relation of individual consciousness to the totality, conceived initially as infinite spirit, then as species. In the beginning, Strauss tried to dissolve the problem by denying the possibility of such a happy relation. No exemplar realizes the species; the individual consciousness is the unhappy consciousness. In the end, Max Stirner35 tries again to dissolve the problem, but in the opposite direction, by completely subjectivizing spirit. Stirner was a quiet figure on the margins of the Left Hegelians gathered around Bruno Bauer until

---

35. Max Stirner (Johann Kaspar Schmidt) (October 25, 1806–June 26, 1856; born in Bayreuth, Bavaria; died in Berlin, Germany) was educated at the University of Berlin, University of Erlangen, and University of Königsberg. His influences included Hegel, and he held no academic appointments. His major works included *Der Einzige und sein Eigentum* (*The Ego and Its Own*; 1844).
he published his polemical and sensationalistic book *The Ego and Its Own* in 1844. Taking Feuerbach's opposition between word and thought to the extremes of nominalism, Stirner argued that Feuerbach's “man” is just as abstract and ideal as the Christian God, and hence just as opposed to the concrete existence of the unique individual, which alone is real. Because these abstract ideas—God, state, humanity, proletariat—are rooted in the artistic externalizations of unique individuals, they are, in fact, merely so many disguises under which individuals affirm themselves egoistically. Stirner therefore urges his readers to abandon their hypocrisy and self-denial, to recognize and embrace the egoism that really drives even their acts of self-abnegation, and to assert the identity of individual and species. The close of his book is Stirner’s apotheosis:

They say of God, “Names name me not.” That holds good of me: no *concept* expresses me, nothing that is designated as my essence exhausts me; they are only names. Likewise they say of God that he is perfect and has no calling to strive after perfection. That too holds good of me alone.36

Self-consciousness comes to equal the unique consciousness that can appear only in an infinitely self-satisfied individual.

Caught between these two extremes, both temporally and argumentatively, Feuerbach tries to hold them together. Like Strauss, he insists on the reality of the infinite, but, like Stirner, he insists on the possibility of satisfaction. In the experience of love evoked by the true religious–philosophical practice of confession, the veil between individual and species separates and a nonalienated expression of species-being shines through. The veil of history can always serve as a ground for these pinpricks of nonalienated love. The mirror can, at any moment, appear as mirror, thereby bringing us back to the ineluctable truth of our species life.

The post-Hegelian scene, then, is dominated by a problem Hegel thought he had overcome: the problem of how the universal and rational idea is or comes to be present in the particular and confused persons, events, and movements of sensuous experience. Marx breaks with this scene only when—or, more precisely, to the extent that—he abandons spirit, identifying it with an ideological reflection of capital, whose incarnation must be resisted through revolutionary action, not sought. This is the perhaps only half-conscious point of his scribbled promissory note in the margins of the notebooks posthumously published as *The German Ideology*, that “Communism is for us not a state of

affairs which is to be established, an ideal to which reality [will] have to adjust itself. We call communism the real movement which abolishes the present state of things.”37 The extent to which Marx actually succeeds in elaborating this denial in a coherent revolutionary practice is not for this essay to judge. What is clear is that such a coherent revolutionary practice could not be a continuation of Feuerbach’s confessional project by other means, a translation of one manifestation of the species into another, both of which manifestations equally fall short of the spiritual activity that effects the translation itself.

**MAJOR WORKS**

---

I. MARX AND PHILOSOPHY

Karl Marx\(^1\) did not write philosophy as a philosopher, nor would he have been pleased to be read in this way. From his earliest published works, which were topical and provocative newspaper reports and opinion pieces, he dedicated himself to political activism, holding the view that academic philosophers were too little engaged with social questions, and that philosophy as a profession and a genre would never engage properly with the politics of thoroughgoing social change. The interpretation of some of his works as philosophical, or as stating philosophical doctrines or using concepts of philosophical interest, developed in his later lifetime, and was the work of others. In the first instance this was done by Friedrich Engels (1820–95), his lifelong friend and occasional collaborator, who provided a biographical and philosophical context for Marx, so that he could be read in this way. In works of his own, and republished texts by Marx, Engels summarized Marx’s life and thought for the reading public in this manner, while also maintaining that Marx was a political activist of worldwide and epoch-making significance.

After Engels’s death Marxism emerged as a comprehensive philosophy and political practice through which many of the twentieth century’s most important social and economic transformations were envisioned and pursued. By the 1930s, however, some of Marx’s works and ideas were taken up by professional

\(^1\) Karl Marx (May 5, 1818–March 14, 1883; born in Trier, Rhenish Prussia; died in London, UK) was educated at the University of Bonn (1835–36), University of Berlin (1836–41), and University of Jena (PhD, 1841). Hegel is the primary philosophical influence on his work.
phosphores, at times and to some degree independently of the Marxist philosophical tradition, and often with rather less political fanfare. It must thus be understood that reading Marx as a philosopher, and interpreting his works and ideas as philosophy, is an exercise at odds with their original context as interventions into the politics of the time, as he construed it. Nonetheless, Marx has become a familiar figure in various philosophical traditions, including continental philosophy, and it is the purpose of this essay to explain how and why this happened, and what substantive claims and doctrines have been constructed on this basis.

II. EARLY LIFE AND SUBSEQUENT CAREER

Marx was born into the professional classes of converted Jews who had been afforded civil rights under the Napoleonic occupation of the Rhineland during the French Revolutionary Wars (1792–1802). These reforms survived to an extent during the era of restored monarchical and princely regimes that followed the Congress of Vienna (1814–15). During this period the impetus for anti-monarchical campaigns for representative and responsible government grew steadily, culminating in the European revolutions, albeit short-lived, of 1848.

Marx had a classical “gymnasium” education in the days when philosophy covered the known and important forms of knowledge. The principal controversies of the time did not presuppose an opposition between it and science; rather, science was comprehended within it as natural philosophy. The intellectual and political diremption running through contemporary works and debates in philosophy was between “free-thinking” philosophical inquiry and the orthodoxies of confessional Christianity. The latter were themselves the principal way through which authoritarian sovereignty and minimal public accountability were promoted by the mutually supportive political establishments of church and state. The struggles between faith and reason were both personal and political. Marx’s early life has almost always been read as more aligned with reason than with faith, although his parents were in no way radicals. Karl was encouraged by his father to study at university, first at Bonn, and then at Berlin, in order to become a lawyer.

Given the near absence of public political life in the patchwork of German kingdoms, principalities, and city-states, and the phobias concerning republican ideas and revolutionary violence promoted by the post-Napoleonic regimes, academic philosophy represented a somewhat insulated realm where free-thinking could take place. However, open confrontations with the truths that were the bedrock of Christian faith, and therefore of the moral and political order as such, had to be avoided. Atheism, or even the kind of skepticism that
would question the tenets and position of Christianity, was an obvious ground for exclusion and dismissal in the universities and the professions. As a Jew, Marx’s father had to become a confessing Lutheran in order to continue practicing law, and some of the “free-thinking” historians and philosophers of the time, including associates of Marx, never obtained the academic positions they sought, or in some cases were dismissed from positions they already held. While the procedures involved were not full-blown inquisition and persecution, the atmosphere and results were clearly restrictive and punitive, rooted in fundamentalism and bigotry. In his university days Marx became associated with free-thinkers in history and philosophy, in particular with appropriations of philosophy for radical political purposes.

The common methodological thread in “free-thinking” was historicization. This was derived from the late eighteenth century onward through the pioneering historical and archaeological researches of German scholars into ancient civilizations and languages. Its effects are profoundly political. One way of claiming and maintaining power is to declare some states of affairs to be natural or necessary, and thus protected by fact, logic, and morality from change. When a history is provided for these phenomena – typically in law, politics, or the economy, and particularly when this history provides comparisons across times and cultures – then the claims of logical or moral necessity and of conformity to an unchanging nature no longer seem credible. Historicization shows that in human institutions at different times there have been different legal, political, and economic systems, justified by different philosophies, religions, and “time-honored” traditions. By eschewing clear statements endorsing the political and economic arrangements of the present, and failing to re-affirm the revealed truths of Christian confession, new histories could promote destabilization in contemporary power structures and open up perspectives on social change. Perhaps current certainties would pass away, as previous ones had done. Perhaps the rejection of past certainties could not be explained away with smug assurances about the secure certainties of the present. Owing to the enforcement of political and religious orthodoxies at the time, there were few published works as bald as this. Instead, a considerable amount of careful ambiguity in language, content, and requisite assurances was the order of the day, since freedoms of expression were not protected. The whole idea of a right to such protection was itself subversive.

Given the appropriation of classical Roman and Greek philosophies into European culture and legal systems, begun in the early Middle Ages and thus the bedrock for the schools and universities that Marx attended, nonradical historicization was little questioned. This was because it was familiarly combined

with Christian principles and practice, and not seriously challenged by alternative orthodox histories and philosophies derived exclusively from the Bible and other fundamentalisms of the Christian churches. However, a landmark work during the time of Marx's intellectual development addressed itself directly to the historical basis of Christian faith, in particular the life and teachings of Jesus. Then, even more radically, another book propounded a theory of the anthropological processes through which religions of any kind had been produced within societies up to the present. These two books were David Friedrich Strauss’s *The Life of Jesus Critically Examined* (1835), and Ludwig Feuerbach’s *The Essence of Christianity* (1841).³ These works went through an impressive number of controversy-provoking editions in Marx's youth, with a fourth edition of Strauss’s book published in 1840, and a second of Feuerbach’s in 1843.

Strauss’s work applied a rigorous historical method to the Gospel accounts of Jesus’s life. This was precisely the kind of skepticism that the defenders of orthodoxy were uncomfortable with, and the results were much as they had feared: there were no facts to be had from the Gospels themselves, or indeed from any other reliable sources. While sounding like history and eyewitness reports, much Gospel discourse was merely repetition of earlier texts of prophecy, claiming fulfillment. Feuerbach’s work was more radical and more philosophical, proposing a mechanism of projection throughout history (and indeed speculatively, in prehistory) through which humans assuaged their anxieties by constructing fictive supernatural beings. These beings were themselves only the repositories of projected human qualities and activities (courage, love, anger, war, etc.) around which religious practice and institutional power were produced. Humans were thus in thrall to an alien realm supposedly over and above their mundane existence.

Both Strauss and Feuerbach, however, proposed versions of philosophy that would effectively transcend confessional Christianity, at least for the educated classes where free-thinking had the wherewithal to flourish, and thus they would avoid an overt rejection of familiar moral values and the ultimate horror of valueless nihilism. Strauss’s solution was a kind of pantheism, where goodness pervades the universe, of which rationalized Christianity was an instance. Feuerbach’s was a religion of humanity, where human values were recognized and respected as exactly that. The Christian establishment regarded both new systems as many steps too far, and both philosophers entered a pariah realm where their readers were radicals, and the two were clearly on the wrong side of respectable philosophizing.

---

³ Strauss’s and Feuerbach’s works are discussed in detail in the essay by Lawrence S. Stepelevich in *The History of Continental Philosophy: Volume 1*. 

38
Volume 2
By historicizing philosophy itself, and expanding the content of philosophy to include history and culture in all aspects, G. W. F. Hegel (1770–1831) had set all these problems up.⁴ Writing in language of deliberate ambiguity, though, he was able to achieve the eventual production of his work as a system, comprising published volumes and other materials that were still in editorial production following his death. While his early works excited suspicion that the realization of the rational and the real, as he understood these developmental phenomena in the world, was driven forward by the French Revolution (1789–99), the mature works were generally read as much more sympathetic to the conservative ideals of the restored Prussian monarchy. In the later Hegelian and post-Hegelian world, it was clear, then, that politics and social questions generally were now central to the philosopher’s work and vision, rather than excluded or marginalized as ancillary. Hegel had equated knowledge with the philosophization of human historical experience in its entirety, rather than with philosophy as an abstract account of truth and judgment. From the Hegelian perspective, there was no reason to exempt confessional Christianity from occupying a position in the development of Geist or – in the usual clumsy English translation, “spirit” – which in Hegel’s discourse stood for the driving force within human development. Thus the protected zone for matters of faith was no longer obviously intact and so exempt from philosophical scrutiny.

Keeping the authoritarianism of both church and state in place was a major political project pursued by the rulers of the time, and evinced in numerous antiradical scares and exemplary punishments. It was evident in politicized academic appointments, notably that of the philosopher Friedrich von Schelling (1775–1854) to the Berlin Academy in 1841.⁵ His mission was to deradicalize the Hegelian legacy and to discourage the radicalism brewing among “Young Hegelians”⁶ (an echo of “Young Germany,”⁷ a liberal literary nationalism flourishing a few years previously). Marx’s interest in Hegel was thus compulsory, in the sense that any student of the time would need to engage with the great German master. This engagement was necessarily political, because the content and current position of the landmark philosophical system was itself a political issue in almost the only public space – the universities – where debates about politics, however rarefied, could take place, albeit within the coded terms of philosophical engagement.

⁴ For a discussion of Hegel’s philosophy, see the essay by Terry Pinkard in The History of Continental Philosophy: Volume 1.

⁵ Schelling is discussed in an essay by Joseph P. Lawrence in The History of Continental Philosophy: Volume 1.

⁶ The Young Hegelians are discussed in this volume in the essay by William Clare Roberts, and in the essay by Lawrence S. Stepelevich in The History of Continental Philosophy: Volume 1.

⁷ “Young Germany” is discussed in Alastair Hannay’s essay in this volume.
During his student days Marx undoubtedly contemplated an academic career on the model of some of his younger teachers and associates, such as Bruno Bauer (1809–82). However, by the time he submitted his doctoral dissertation “Difference Between the Democritean and Epicurean Philosophy of Nature” by post to the University of Jena, he can have had few hopes of obtaining a university position at all. His topic was far from purely academic, however, since he argued against philosophical determinisms that excluded change, and for philosophies where indeterminacy made change possible, thus using philosophy as a convenient metaphor for politics. Moreover his political liberalism – which in context was a subversive radicalism – had pointed him in the direction of the “social” questions of reform and economic transformation. Transformation of the social and political order, as had occurred to an unprecedented degree under the French revolutionary regimes, was of course out of the question, and obviously punishable as sedition.

Unsurprisingly, Marx’s alternative career move was into liberal journalism in 1842–43, during a brief window of supervised toleration allowed by the Prussian monarchy. Following the politically motivated closure of his Rhineland newspaper, Marx moved rapidly into expatriate politics, starting in Paris in 1844 and transferring to Brussels the following year. The young radical was by then a self-declared socialist and communist, deriving his views primarily from French utopian works of the 1830s, updated in the early 1840s to include the hardships of the emerging class of industrial workers. He was also an activist for constitutions based on popular sovereignty, representative and responsible government, and elements of male suffrage within the political system. He thus worked in alliance with middle-class liberal groups, advocating representative and responsible government and socioeconomic policies to benefit poor workers. While his communism looked forward to a classless, cooperative society – ideas having their origins in Plato’s works and Thomas More’s Utopia (1516) – his political project was essentially one of pushing liberals leftward, toward a transformative engagement with the economic structures that produce modern class inequalities. He participated as a radical journalist in the vicissitudes of the ’48 revolutions in central Europe, and after the swift collapse of the liberal republican regimes, he emigrated to England in 1849, one of many central European ’48-ers in exile. He remained there as a German-speaking émigré for the rest of his life, making only brief trips to the continent, and working as a journalist and publicist for working-class political struggles worldwide. Only later on in the 1870s

9. For a detailed account of the political context of this period, and of Marx’s perspective within it, see David Leopold, The Young Marx: German Philosophy, Modern Politics, and Human Flourishing (Cambridge: Cambridge University Press, 2007).
did he acquire – from his writings alone – a public reputation as a revolutionary, although his activities as a journalist in 1848–49 had been a long way from even partisan activism, let alone violence and street-fighting.

III. AUTOBIOGRAPHY AND POLITICAL ENGAGEMENT

Written in 1859 when he was nearly forty-one, Marx’s own account of his life and works up to that point is contained in the “Preface” to his preliminary study, A Contribution to the Critique of Political Economy. These few paragraphs pick out a somewhat different selection of texts to explain his career trajectory than are found in, say, the narrative accounts constructed by Engels in Marx’s later lifetime, and then again by many others after his death. The list also differs from any standard or specifically philosophical account constructed today. This is precisely because so much more material has become available and current over the years, as opposed to the very limited number of published and accessible works to which Marx could refer his readers at the time, hardly any of whom would have heard of him. Most importantly, in this account Marx clearly presents himself as a social critic and political activist, rather than a philosopher in any sense. He puts little emphasis on the works through which he has been posthumously understood as a philosopher, making no mention of certain now-famous ones at all.

Marx begins, not with his academic dissertation in philosophy, but with an allusion to some of the very few articles\textsuperscript{10} that he wrote and published in his time as a liberal journalist on, and then editor of, the Rheinische Zeitung (Rhenish Gazette), a legal and therefore moderate paper in Cologne. These were campaigning accounts informing readers about the hardships of workers in the peasant and wine-growing communities of the area, and also opinion pieces on free trade and protective tariffs, which were being discussed in the Rhine Province Assembly, a purely advisory and nonelected body. Alluding to his published criticism of other writers, who were guilty of “an echo of French socialism and communism, slightly tinged with philosophy” (CW 29: 262), Marx then recounts how he had to withdraw into his study following forcible closure of the paper. He then embarked on “a critical re-examination of the Hegelian philosophy of law,” self-publishing an introduction in 1844: “Contribution to the Critique of Hegel’s Philosophy of Law:\textsuperscript{11} Introduction” (\textit{ibid.}). His lengthy \textit{Contribution to the

\textsuperscript{10} For a detailed discussion of Marx’s early journalism, see Heinz Lubasz, “Marx’s Initial Problematic: The Problem of Poverty,” \textit{Political Studies} 24(1) (1976).

\textsuperscript{11} Hegel’s \textit{Philosophie des Rechts} (1821) has an alternative and more familiar English translation as \textit{Philosophy of Right}. 
Critique of Hegel’s Philosophy of Law itself survived only in manuscript form and was left wholly unremarked and unpublished until the twentieth century.

This is the point in oft-repeated biographical narratives at which posthumous accounts that frame and justify Marx as in some sense a philosopher, or at least a major contributor to philosophy, generally take hold. It is also the point at which his engagement with Hegel is framed as a detailed critique of the latter’s political philosophy as such, allied to a critique of his overall dialectic as a general method. Marx’s method of critique is thus generally counterposed to Hegel’s as a landmark in post-Hegelian continental thought.12 And – given Hegel’s overt idealism – some kind of Marxian materialism is consequently initiated as a necessary philosophical contrast. However, Marx’s critical use of Hegel was no simple reversal or inversion, and certainly never a reversion to the ontological materialisms and epistemological empiricisms that Immanuel Kant (1724–1804) had so notably critiqued a generation or so earlier.

Marx’s own view of this conjuncture in 1859 was rather different from the posthumous accounts that paint him as a philosopher engaged in revising Hegel’s ideas at length. Marx himself tells his readers that his focus in 1843–46 was on “legal relations” and “political forms” (CW 29: 262), and that these – which were evidently the important political problems for him – could not be effectively comprehended as Hegel had attempted, that is, “on the basis of a so-called general development of the human mind” (ibid.). Rather, Marx explained that from Hegel he had appropriated the concept of “civil society” (bürgerliche Gesellschaft), itself taken from “English and French thinkers of the eighteenth century,” and he had concluded that the “anatomy” of this “has to be sought in political economy” (ibid.). This was a science, or in Marx’s terms Wissenschaft or rigorous study, of the production, exchange, distribution, and consumption of the goods and services of ordinary life on an individual, national, and international basis. It notably divided “civilized” society into classes by wealth and income, rather than by hierarchies based on rank or status.13

In his “Preface,” Marx then historicizes these processes in a way that was more or less common both to some notable political economists, such as Adam Ferguson (1723–1816), and to Hegel himself. However, in opposition to conventional thinking, Marx emphasized that distributive differences in terms of wealth and income were derived from the sphere of production – its technological forces and property relations – and so were not simply reflections of different abilities

12. For an alternative framing that emphasizes Marx’s intellectual debts to Aristotle, see Scott Meikle, Essentialism in the Thought of Karl Marx (London: Duckworth, 1983).
13. Political economy was the precursor to the economics of today, which is generally regarded as having its origin in the “marginalist” revolution in the 1870s. Economics established a clear, mathematical focus on prices, whereas the earlier study had centered on philosophical investigations into the nature of value, money, and profit.
to consume goods and services on the market. Thus his political perspective on change and reform was more radical and thoroughgoing than any adopted by the political economists, precisely because for him mere redistribution of goods and services would never suffice to resolve the social question of inequality. Instead a thoroughgoing transformation of the social relations of production would be required in order to derive the greatest benefits for all from the extraordinary productivity of modern industry, which he could clearly see on the horizon.  

His perspective was decisively marked off from Hegel's by a practical concern with the nitty-gritty of “material interests” (CW 29: 262) as outlined in his journalism, rather than with any supposed philosophical reversion from idealism to an oppositional materialism. Indeed Marx's engagement with any philosophy as such was secondary to, or explicitly in aid of, his chosen political project, a politically motivated critique of political economy.

Amplifying this point, Marx goes on to mention published works that are specifically “material” in this way, and not generally rated by philosophers for philosophical content: a “brilliant essay on the critique of the economic categories”15 (CW 29: 264), and a book, *The Condition of the Working-Class in England*16 (1845), both by his friend Friedrich Engels. He pointedly noted that Engels had come to the same conclusion as himself, but “by another road,” that is, *not* through any detailed engagement with Hegel's works on the “social” question, but rather through critical investigation and empirical research of his own (CW 29: 264). Marx next includes his polemical engagement with the then famous French socialist Pierre-Joseph Proudhon (1809–65),17 *The Poverty of Philosophy* (1847),18 published in French, and his own French-language “Speech on the Question of Free Trade” (1848).19 This latter work is now little read, marking the fact that philosophical interest in Marx has generally won out over interest in his “economic” writings.

In equally brief fashion Marx also mentions the *Manifesto of the Communist Party* (1848), jointly written by Engels and himself, but in 1859 quite unavailable to his readers. Significantly in the context, the *Manifesto* was a work whose
political message would attract difficulties with censors and readers alike. For this reason the politically substantial portions of the 1859 “Preface” are effectively an extremely boiled-down and considerably restrained version of the ideas and arguments put forth ten years earlier in the anonymous pamphlet. In 1848 Marx had made explicit his communist commitments, echoing his short published work of 1844 “Contribution to the Critique of Hegel’s Philosophy of Law: Introduction.” Nineteenth-century socialism and communism were not then consistently distinguished from each other, and in any case these diverse movements comprised a wide variety of views on human nature, ideal societies, and political tactics. Communists, such as Marx, were generally more radical in focusing on working-class politics and calling for large-scale, revolutionary change, using violence if need be.

Marx’s political program can be succinctly summarized as one based on the promotion of class struggle in modern industrial society, where bourgeoisie and proletariat represent opposing class structures at a particular moment in history. He contrasted this with a timeless opposition of wealth and poverty, or a supposedly justified inequality reflecting incentives and rewards, and sacrosanct rights to property. Influenced by Engels’s early critical work on political economy, Marx took the view that modern mechanized industry was so productive that very soon human needs could be satisfied with little labor input. However, the current ownership of these enterprises by “private” persons was in radical contradiction with their “public” origin and potential as industrial resources. This contradiction was not merely conceptual, but real in the sense that the knowledge and systems giving rise to this productivity were not the creation of particular individuals who could own them in some sense that others must necessarily respect. Rather, those individuals were all themselves products of society in various ways, and so the products collectively produced by knowledge and systems developed in society should rightly belong to all. Moreover Marx conceived this as a dynamic scheme in which rising productivity would be built on greater use of machines in producing goods and services, and there would therefore be less employment available in the economy as a whole as economic development proceeded. The class structure would assuredly become simpler, as intermediate classes below the bourgeoisie would fall into the proletariat, and actual numbers within the bourgeoisie itself would decline to a small fraction of society as a whole. Social revolution made by the vast majority would necessarily democratize not just governmental structures, but economic ones at the workplace and at points of distribution for goods and services.

Summarizing Marx’s own summary of the guiding principle for this analysis, as he put it in the 1859 “Preface,” is rather more difficult. On the one hand, he generalizes that humans in society enter into relationships – property and
work relations, for instance – that are independent of their individual wills, yet are human constructions, of course, subject to change in history, sometimes profoundly and dramatically so. On the other hand, he argues that in the modern world he can foresee that humans could take charge of these changes in a different and highly self-conscious way, managing a society where abundance can be produced and distributed to the benefit of producers, rather than for the benefit of leisured classes who own or otherwise control productive resources. Overall he links economic and political structures in varying modes to the kinds of technologies and practices through which production occurs in the first place, referring to this as a real foundation. From this real basis there arises a legal and political superstructure, to which there are in correspondence definite modes of social consciousness, that is, political views and commonplaces, broadly understood as ideological, in Marx’s sense of the term (CW 29: 262–3).

Ideology in Marx’s view referred to ideas and doctrines that in practice help one class to oppress and exploit another. They appear – often in the work of philosophers and other prominent writers and essayists – as generalizations supposedly applicable to all mankind, or at least to all individuals that make up a given society. These “truths” were typically specious claims that ruling or dominant classes were necessary for there to be society at all, or that some classes or ruling orders had necessarily to care for others and to make decisions on their behalf. Ideological generalizations of this kind are – from Marx’s perspective – misleading, rather than false, selectively tendentious rather than thoughtfully political, mystifying rather than enlightening. Marx thus did not have an ideology himself, but rather – in his own terms – an outlook or conception that made ideology visible. Perhaps the single phrase that best sums up Marx’s outlook on history, society, and politics is the one where he asserts that “the mode of production of material life conditions the general process of social, political and intellectual life” (CW 29: 263).

This synchronic schema then gives way to a diachronic one, in which Marx suggests that there have been four epochs in history that exemplify this: ancient, Asiatic, feudal, and modern bourgeois society. Changes from one social formation to another (and not necessarily inevitably or in this particular order) have arisen from conflicts between productive forces and productive relations. This happens particularly when the property system restricts technological and other workplace developments that enhance productivity and innovation. This was already in evidence as patchwork and antimarket feudal property relations in Marx’s own time were already being abolished in favor of “private” ownership of productive resources, in particular land, water, and mineral rights of unrestricted use. Bourgeois society, Marx says, will be under pressure from similar contradictions as increasing productivity reduces employment and therefore consumption, and the dysfunctionality of a market system based on “private”
ownership will become evident. This will be the last form of society in which such class antagonism will be a necessary feature, and its successor social formation will provide for collective control of production and distribution for the benefit of all, rather than for the benefit of the propertied few. In this text, subject to censorship at the time, proletarian revolution could not be mentioned, but the implication is clear (ibid.).

The manuscript works of 1845–46 that Marx also mentions in his 1859 “Preface,” but skips over – tantalizingly – as “self-clarification” (CW 29: 264), are the ones that have excited the attentions of philosophers to an increasing and now dominant degree. These were first published in part in the 1920s and subsequently transmitted in variously edited book-length versions, beginning in a German-language edition of 1932. The materials were posthumously – and now controversially20 – entitled The German Ideology. Marx describes them as a “critique of post-Hegelian philosophy” (ibid.), but seems little engaged with either the details or with explaining exactly why and how he had engaged in such a critique. The 1859 “Preface” does not actually mention dialectic or even method at all, and indeed Marx’s other comments on these matters are very few and far between. When Engels was writing his own philosophical work on Feuerbach and latter-day Feuerbachians many years later in the 1880s, he dismissed the old manuscripts of 1845–46 as “useless,”21 save for a very short one, which he published, in edited form, as “Theses on Feuerbach” (1886).22 The Economic and Philosophic Manuscripts of 1844, standardly recommended since the 1960s in order to understand Marx as a philosopher, are not mentioned at all.

22. CW 5: 6–8; for Marx’s original version, see CW 5: 3–5.
Engels was Marx’s publicist, and he worked hard to make Marx visible. One way of doing this, and so it seems – gaining political capital of a certain kind, was to make Marx a philosopher. Marx was decisively linked with Hegel, and therefore in a positive sense with philosophy and with philosophers, when Engels wrote his own biographical notes on Marx’s career and ideas. This was also in 1859, as both were then engaged in introducing Marx’s first substantial published work in his projected multivolume critique of political economy, A Contribution to the Critique of Political Economy. Engels’s project in his 1859 review of Marx’s slim volume was to publicize the expertise of the then unknown author, and to précis his ideas in order to excite a readership. Rather understandably, Engels very prominently attached Marx’s name to Hegel’s, since the latter was obviously the greatest philosopher – and German philosopher – of recent times.

Engels explained how Marx had rectified Hegel’s political shortcomings by radicalizing his thought, and how he had built on the notable achievements of his system. In Engels’s account, Marx was thus similar to Hegel as a systematizer of all knowledge by means of a universal method. However, Marx was said to have inverted the master’s distinctive and reputedly powerful dialectic. In particular, Marx could account for the historical development of human society through a linked scheme of economic and political stages, but root this argument in a material world of human productive activity – as opposed to a “spirit” world of mere philosophical speculation. For Marx, class politics thus replaces the apparently autonomous development of “spirit” (CW 16: 472–5).

Engels also distinguished a logical from a historical method in Marx, while declaring them ultimately compatible and of unquestionable validity (CW 16: 475–6). While Engels could précis Marx’s distinctive outlook on historical and political development, introducing the phrase “materialist conception of history” (CW 16: 469), his three-part review was never completed. The promised section on the critique of economic theory, commercial practice, and political support structure – which was the point of Marx’s new book – was never produced. Engels thus initiated a commonplace disjuncture between what is of philosophical interest, and what is rather separably “economic.” This review was the point from which Marxist philosophy was secured, with Marx in pride of place as Hegel’s successor intellect. The whole idea that Marx was a philosopher, and that his work makes sense when reconstructed as a philosophy, dates from this period, rather than from Marx’s driving political intentions and the politicized context of philosophy itself under the illiberal regimes of the 1830s and 1840s.

Engels was thus effectively the founder of Marxism as a comprehensive system derived from a universal method. He developed this outlook, particularly in influential works of the late 1870s and early 1880s, and then definitively during the twelve years in which he outlived Marx. The most important of these was *Anti-Dühring: Herr Eugen Dühring’s Revolution in Science* (1878), and its reprise in the editorially constructed *Dialectics of Nature* (1925). This latter was derived from unpublished notebooks and manuscripts, and was produced with suitable flourishes by a Russo-German team of Marxist scholars anxious to link Marxism with scientific certainty. Engels was thus made central to Marxist philosophy – in his own lifetime and then posthumously – through his reading, presumed authoritative, of Marx as a matter-in-motion materialist from whom only a correspondence theory of truth could proceed. This philosophy was thus widely publicized as Marx’s materialist inversion of Hegel’s idealism, and the basis of the so-called materialist dialectic. This latter was resolved into three universal laws applicable to nature, history, and “thought” or logic. These three laws of “dialectics” were: law of unity and struggle of opposites – a foundational assumption that all entities and processes contain within themselves opposite properties or terms; law of transformation of quantity into quality – purportedly explaining how purely quantitative and continuous changes to an entity or process can cause discontinuous changes that we understand as qualitative transformations in substance; law of negation of the negation – purportedly explaining how change and development proceed by successive negations, each one taking the resulting positive to a higher level.

From the beginning, Marxist philosophy was marginalized by professional philosophers and regarded with suspicion. This was precisely because of the way it purported to embody and validate a political commitment to a revolutionary transformation of society. The extent to which class struggle and transformative politics required this particular philosophy, or indeed any philosophy at all, was rejected even as a question by academic philosophers. This was because they claimed objectivity and universality, rather than political partiality and practical action, which were suspect orientations on the face of it. In that way the philosophical classics of Marxism are not themselves usually seen as classics of philosophy in academic circles. These Marxist classics included G. V. Plekhanov’s (1856–1918) *Fundamental Problems of Marxism* (1908), V. I. Lenin’s (1870–1924) *Materialism and Empirio-Criticism: Critical Comments on a Reactionary Philosophy* (1909), J. V. Stalin’s (1878–1953) *Dialectical and Historical Materialism* (1938), and Mao Zedong’s (1893–1976) *On Contradiction*

The last was a major revision emphasizing the fluidity of contradictions over the other organizing concepts of what came to be known by the 1920s as “dialectical materialism,” or “diamat.” Those philosophers outside the schools of Marxism who did not immediately dismiss Marxist philosophy on grounds that it was political typically dismissed the systematizing generalities of dialectical materialism and its variants as vacuous redescriptions of any entity or process in crypto-Hegelian jargon.

V. CHALLENGES TO MARXIST ORTHODOXIES

It is also the case that, from the beginning, Engels’s dialectics was challenged from within the Marxist camp by revisionist writers such as Eduard Bernstein (1850–1932) in his Evolutionary Socialism (1899), and Hegelianizers such as Antonio Labriola (1843–1904) in his Essays on the Materialistic Conception of History (1896) and Socialism and Philosophy (1897), Ernst Bloch (1885–1977) in his Principle of Hope (1918) and György Lukács (1885–1971) in his History and Class Consciousness (1923). These challenges were on grounds that the scientific determinism promoted by Engelsian orthodoxies was depoliticizing, and, moreover, either false to the fluidities and contingencies of reality, or at least to those of social – as opposed to material – phenomena.

The Institute for Social Research, known as the Frankfurt School, was a notable and systematic attempt to replace Engels’s outdated materialism with newer forms of science and philosophy, eclectically conceived. The school dates from the 1930s when its constituents made very early use of Marx’s newly published Economic and Philosophic Manuscripts of 1844 and The German Ideology, neither of which had been incorporated by Engels into his Marxist dialectics and materialism, nor used by Hegelianizers of the previous generation. This is particularly reflected in Herbert Marcuse’s (1898–1979) Reason and Revolution (1941), which re-analyzes the relation of Marx to Hegel, and in other antifascist projects that were critical of capitalist society. Working in the post-Kantian tradition of aesthetic and cultural criticism, Max Horkheimer (1895–1973) and Theodor W. Adorno (1903–69) generalized from Marx’s critique of capitalist society to a critique of Western civilization and rationalism in their Dialectic of Enlightenment (1947), and again in Adorno’s Negative Dialectics (1966). Incorporating aspects of psychoanalysis into a Marxian perspective

on capitalist society, Marcuse produced the hugely influential works *Eros and Civilization* (1955) and *One Dimensional Man* (1964).

Working in similar ways, and with numerous interconnections, Marxist philosophers writing in French appropriated Marx in a selective and critical fashion, very closely allied with their political adherence to the Communist Party in France and their suspicions of the Marxist orthodoxies propounded by the Communist Party of the Soviet Union. They followed the early Hegelianizers in reading Marx in ways that undermined the materialism and determinism fostered by the later Engels. The Russian Marxist philosopher Alexandre Kojève lectured in Paris on Hegel’s *Phenomenology of Spirit* (1807) during the 1930s and conjoined his focus on the so-called “master–slave” dialectic with allusions to Marx’s *Economic and Philosophic Manuscripts of 1844*, only recently published. These lectures and the general outlook on Marxism were hugely influential in French philosophy, in particular with relation to a further critique, that of German phenomenology, where ideas from Marx – rather than from deterministic Marxism – were used to amend its “existential” focus on consciousness and individual experience. Interpretations of Marx’s views on laboring activities in social settings, and on the constraints imposed by class structures in capitalist societies, featured in philosophical works such as Jean-Paul Sartre’s (1905–80) *Critique of Dialectical Reason* (1960), drawing on the earlier essay “Search for a Method” (1957), and in the writings of other philosophers, such as Maurice Merleau-Ponty (1908–61), and sociologists such as Henri Lefebvre (1901–91).

The common thread was the application of Marxian notions of social production, class structure, and ideological critique to cultural criticism, social science, and historical research. As a result these areas of intellectual endeavor were substantially revised and redefined.

However, the most important thinker and activist succeeding to these unorthodox efforts was Antonio Gramsci (1891–1937), a Communist Party worker in Italy during his short lifetime. His lengthy *Prison Notebooks* were circulated in parts after the Second World War and published in a collected edition in 1975. Rejecting Hegelian teleologies, but retaining a historicization of knowledge,

32. Merleau-Ponty is discussed in the essay by Mauro Carbone in *The History of Continental Philosophy: Volume 4*.

33. Gramsci is also discussed in Thornhill’s essay in *The History of Continental Philosophy: Volume 5*.
Gramsci argued against a materialism of matter-in-motion, or analogies thereto. Marxism should not claim access to an ideal realm reflected in philosophy as a matter of objective truth, but should opt instead for a “praxis” account, where the intersubjective categories of practical life and cultural understanding themselves constitute the human realm where political judgments must take place.

Gramsci’s critique was therefore essentially one of Engels’s reading of Marx both as a philosopher and as a materialist, but was necessarily and interestingly constructed from much the same textual materials as Engels had used, rather than from hitherto uncirculated manuscripts. Moreover, like Marx’s work, Gramsci’s was written to resolve the political issues of the time, specifically the difficulties of negotiating a communist consciousness within the worker and peasant classes in a newly industrializing country. This was of course the same problem that Marx had set for himself. As a philosophy, rather than as the meditations of a political activist, Gramsci’s thought is a postwar reconstruction. But it is one that set the terms, ironically, not so much for a reading of Marx’s well-known works largely independent of Engels, as Gramsci himself had done, but rather for a philosophical “new Marx,” who was derived from manuscript materials that were widely circulated in translation in the postwar period.

VI. THE “HUMANIST” MARX

The postwar international political and economic settlements set the stage for the practice and promotion of philosophy that was profoundly different from prewar circumstances. The intense politicization and polarization of class politics was subsiding, and the professional tendency to dismiss politicized philosophies out of hand, or to dismiss philosophies that concerned themselves with political, historical, and economic issues, gradually waned. The political commitment characteristic of Marxist philosophers, and their use of Marx’s texts and interest in what came to be known as his “theory of history,” became respectable, if not necessarily universally accepted. The Lysenko affair, wherein Stalinist dialectics came to direct science in the USSR with disastrous results, together with a declining faith in the Soviet system among “progressive” intellectuals, marked the end of even hostile concern in Western philosophical circles with “diamat.” The continental tradition in philosophy, itself largely a postwar construction, admitted Marx and his historicizing and Hegelianizing successors, but not the dialectics and materialism promoted by Engels in his most deterministic and positivistic writings and correspondence.

Isaiah Berlin’s prewar book Karl Marx: His Life and Environment (1939) prefigured these developments in a remarkable way. While acknowledging the “diamat” of the time, Berlin (1909–97) simply sidelined it and read the available
texts of Marx within the historical context of liberalizing revolutionary movements fighting for social and economic transformation in mid-nineteenth-century Europe. Eventually Berlin's work, and his contextualizing successors, made Marx, and a philosophical interest in Marx, increasingly visible in philosophical circles and, in principle, separable from Marxist doctrines derived from Engels. Given Berlin's own visibility in academic circles at the highest level (All Souls College, Oxford) and his gifts in writing and broadcasting for an educated and middle-class audience, it is unsurprising that the politics in portrayals of Marx in this tradition was safely in the past. It was also, with suitable caveats, well insulated from Cold War “red scares” and other contemporary issues.

In the postwar period, Marx was also re-read independently of Engels's systematizing materialism and determinism, but in a much more Hegelian manner than in Berlin's rendition of his thought. Bertell Ollman's (1936– ) and Norman Levine's (1931– ) studies elaborated the way that Marx, self-consciously or otherwise, drew on Hegel's understanding of language as composed of inter-relational rather than precisely demarcated terms. The philosophical point is both anti-empiricist and sociologically holistic, arguing that Marx's views on language and society match, because language and society match. The Hegelian heritage can thus be stripped of the very mystifications about which Marx had complained, namely the apparently suprahuman or quasireligious source of movement and change implied by Hegel's entity – or metaphor – of Geist.34

Concurrently with these developments in reading Marx came new texts to read, in particular the Economic and Philosophic Manuscripts of 1844 and The German Ideology manuscripts of 1845–46. Both were suited to the construction of Marx's work as a philosophy. This was because the discourse of the manuscripts themselves appeared philosophical in comparison with the detailed historical works, polemics, and economic critiques that – according to standard typologies – had succeeded this “early” phase. Marxology then took up questions of continuity, development, and innovation within this burgeoning field that was preoccupied with making sense of Marx rather than Marxism.

Philosophers, whether identified with Marxism in any sense or not, were generally content to receive these works as of obvious philosophical interest, and to leave contextualizing questions to the side, including the ones surrounding the production of these rather disparate manuscripts themselves as edited and readable entities. However, it is also true that contextualizers produced accounts of these works as philosophy, but equally as a stage on a journey to more empirical concerns that left philosophy behind. Both ways of receiving these texts failed to

set out clearly the context of the 1840s in which philosophy itself was a contentious practice, and to grasp clearly Marx’s radical ambitions for transforming what would count in liberal and radical circles as practical and progressive views and tactics concerning the social question. The philosophical “new Marx” was thus somewhat depoliticized. Philosophers were excited in the postwar period by the young Marx’s terminology of alienation, estrangement, species-being, and other so-called humanist ways of setting out his concerns.

These elements of the “humanist” Marx were largely expounded, rather than rigorously debated, in works that constructed the “new Marx” philosophically. These included numerous studies of alienation as a critical category figuring importantly in the Economic and Philosophic Manuscripts of 1844. The common threads in the “theory of alienation” that was constructed for Marx from these early manuscript materials is that the modern industrial worker is alienated or separated from the product of labor, productive activity itself, fellow workers, and “species-being.” Alienation as a concept derives from an array of preexisting German philosophical terms describing an essential fissure with “oneness,” which is regrettable and requires resolution or transcendence through transformation. Marx’s apparent contrast is with craftwork, where a worker knows his work in the object, understands and controls the productive process, has cooperative relationships with fellow producers and known consumers, and is at one with the universal human experience of producing goods and services. This is not to say that Marx in any way endorsed craftwork as a solution to any social questions whatsoever in the world of modernizing industrial production and consumption, but rather that this kind of (largely unpublished) philosophical analysis could help him to understand the socialist and communist critique through which political issues of proletarian poverty were then being addressed.

However, there were dissenting voices. In Marx and Human Nature: Refutation of a Legend (1986), Norman Geras (1943– ) offered a more critical perspective on this way of philosophizing the “early Marx,” arguing that it was a mistake to attribute a philosophy of human nature to him at all. Leszek Kołakowski’s (1927–2009) three-volume study, Main Currents of Marxism: Its Rise, Growth and Dissolution (1978), argued from a wholly contrary perspective that there was no “humanist” Marx. Kołakowski’s view was that Marx’s thought was in essence seamless not only with Engels’s and with Soviet “diamat” but also with

---

the policies and practices of authoritarian and oppressive self-styled Marxist parties and regimes.

VII. “OTHER” MARXES

There are, of course, further ways of engaging philosophically with Marx, and therefore with Marx as a supposed philosopher. In *For Marx* (1965), Louis Althusser (1918–90) published a notable critique of both the orthodox Engelsian “diamat” reading of Marx, and the new “humanist” one. He sought instead to find the philosophical and chronological point at which Marx “broke” with a philosophy centered on the human subject and then launched into a science that could be specified in philosophical terms. In Althusser’s view this was a science of structures, explaining how human subjects are hailed or “interpellated” into existence, one way or another, and also an explanation of how such structures occur in historical succession. While ultimately unsuccessful in finding such a point where this self-styled anti-Hegelian science succeeded philosophy in Marx’s work, or specifying its existence philosophically in a way that was independent of Marx’s supposed attempts to realize this achievement, Althusser’s assimilation of Marx into the French structuralist tradition was formidably influential. Structures, of course, could be identified as continental in some sense derived from Kantian critiques of British empiricisms. These were rooted by contrast in accounts of perception taking individuals to have essential and defining presocial capacities in their essence or nature. For a time in the 1970s, Althusserianism was said by many radical philosophers to be a more productive way of examining social life than either liberal individualisms emphasizing choice, or Engelsian teleologies of historical and ontological certainty.

The analytical or rational-choice school of Marxist thought, inaugurated in the mid-1970s by G. A. Cohen (1941–2009), Jon Elster (1940– ), John Roemer (1945– ), Robert Brenner (1943– ), Erik Olin Wright (1947– ) and others, took a quite different approach. While internally various, the common thread was a rejection of what its adherents termed Hegelianism, and thus of the continental tradition as such, on grounds that it was methodologically unrigorous, as indeed was French structuralism, in their view. By contrast, rigor was identified with a variety of presuppositions and methodologies, among them an individualism of a rational and economic character (rather than any kind of humanism), a method of propositional hypothesis and evidential testing (derived from the logical positivism and philosophy of science of the Vienna Circle of the 1930s),

*36. For a detailed discussion of Althusser, see the essay by Warren Montag in *The History of Continental Philosophy: Volume 6.*
and a claim to clarity and precision in language (derived from the “linguistic
turn” in Oxford philosophy of the later 1950s). Marx’s role from this perspec-
tive was to have contributed two notable puzzles to be resolved in a decidedly
noncontinental way.

One puzzle was the validity (or not) of his “guiding principle” as articu-
lated in the 1859 “Preface” (CW 29: 262). These few paragraphs famously but
ambiguously derive epochal change in human society from linked transforma-
tions in the forces and relations of production, contradictions that are in turn
reflected in political struggles for class dominance. H. B. Acton (1908–74) had
produced an influential critique in The Illusion of the Epoch: Marxism-Leninism
as a Philosophical Creed (1955), arguing that Marx was logically muddled and
empirically incorrect. Analytical Marxists essentially elaborated and reworked
this. The other puzzle was the validity (or not) of Marx’s theory of exploitation,
rooted in the value-theory of commodity production and exchange as outlined
in the opening sections of his late work, Capital: A Critique of Political Economy,
Volume 1, Book 1: The Process of Production of Capital. Mainstream economics
had no truck with this, but then analytical Marxists wagered that perhaps Marx
could be shown to be right after all.

The first puzzle was addressed by Cohen in a major work where a “rigorous”
version of Marx’s prose was produced and defended. But Cohen’s later verdict
was that Marx’s theory, stated that way, was ultimately false.37 The second
puzzle was addressed in a “rigorous” way by Roemer and others, adopting strict
assumptions from economic modeling and game theory. This produced exploi-
tation as a logical result, but the initial assumptions were precisely the ones that
Marx himself had always argued were constitutive of capitalist exploitation in
the first place, so in the absence of alternative ones, there was thus no critical
purchase.38

One notable debate in which academic philosophers engaged with Marx’s
texts and with Marxist philosophers – albeit those imbued with the “new Marx”
of the postwar period – was the “Marx and justice” controversy of the later
1970s and early 1980s. This was the first time that Marx’s texts were selectively
deployed and then debated in a nonsectarian, although not completely depo-
liticized, way. Justice and morality are of course topics in philosophy with an
ancient tradition of debate, through which any number of ontological, episte-
mological, and ultimately political positions have been articulated. Marx’s texts,
selectively quoted, were said to pose a puzzle within this tradition in two ways.

37. G. A. Cohen, Karl Marx’s Theory of History: A Defence (Oxford: Clarendon Press, 1978); Self-
University Press, 1982).
One puzzle was the apparent contradiction in his views. On the one hand, he had apparently argued that morality was epiphenomenal to the material processes through which human society constructs itself, and he had certainly dismissed contemporary philosophizing about politics as mere moralizing that could never be effectual. This seemed to follow from the dismissive (unpublished) comments that Marx had made in *The German Ideology* that all morality was ideological, because it was mere moralizing that covertly served the interests of the possessing classes. But on the other hand, he clearly had a political project to assist with the destruction of capitalism, on grounds that the exploitation inherent in it was to be condemned, and a successor communistic system to be instituted – violently, if necessary – for the benefit of all. How could such a political, and indeed personal, program not be rooted in a theory of morality, and an ethical vision? This seemed to follow because of Marx’s overt espousal of the proletarian cause, precisely as an effect of class interest, albeit the one that he had announced to be a human universal, and indeed species-defining characteristic.

The other puzzle was that Marx had apparently dismissed justice as an effect of the capitalist system, precisely because its rules of equal treatment were applied through supposedly consensual contracts between laborers and capitalists, exchanging a day’s work for a day’s pay. But his commitment to communism evidently entailed a commitment to a distributive scheme. In the *Manifesto of the Communist Party* he had said, “we shall have an association, in which the free development of each is the condition for the free development of all” (CW 6: 506), and in the “Critique of the Gotha Programme,” he offered a maxim: “From each according to his abilities, to each according to his needs!” (CW 24: 87). How could this not entail a theory of justice? Or was Marx merely inconsistent, by accident or design?

The debate drew on a wide variety of Marx’s texts, reflecting the increased availability and respectability of standard and collected texts of Marx and Engels, particularly in English translation, that occurred from the 1960s onwards. In general, contributors were aligned with Marx, not as Marxists or as anti-Marxists, but as scholars respecting his gestating status as a major philosopher who could be examined in a reasonably neutral way, unaccompanied by political dogmatizing. The resolution of the “Marx and justice” debate was not a clear or consensus position, but rather a typology of defensible answers linked to the different kinds of theories that would count, on the one hand, as morality or justice, and on the other hand, the different kinds of philosophical positions that could plausibly support them.39 Notably in the debate Marx had re-arrived on the philosophical scene in textual readings construed independently of previous

Marxisms. But it is also the case that this mainstream anglophone position was constructed in a way that did little to link him directly to any post-Kantian position in the continental tradition.

However, philosophers who took a broader view in contextualizing the “new” Marx as a philosopher drew on the full range of texts available from the 1960s. They produced a series of notable studies, all of which took the Hegel–Marx relationship as central, and therefore they necessarily engaged continental philosophy. Reading Marx as primarily interesting as a critic of Hegel, commentators have extracted a substantive account and critique along the following lines. On the plus side, in his works Marx praised Hegel for presenting basic human social institutions – ethical relationships, family structures, economic organizations, and governmental forms – as historically varied, malleable, and developmental. But on the minus side, Marx took Hegel to task for a teleology of progress that was merely asserted and couched in rather mystical terms, and for his evident view that human life and change was all ultimately a matter of ideas. These were presented as a movement of abstractions, rather than in an empirically plausible historical account of socioeconomic and political practices, particularly those through which most people have actually lived their lives. At the time, right-wing Hegelians asserted the truth of the master’s philosophical presumptions and conservative politics, whereas left-wing “Young Hegelians” adopted the vision of historical change and progressive development through conceptual negation. Unlike both, Marx’s new political philosophy historicizes human development in specifically economic and everyday practical terms rather than in merely ideational terms such as morality, ethics, religion, philosophies, and the like, and it puts itself into overt engagement with processes of social change through struggle, specifically class struggle. Class struggle takes place, overtly or covertly, between different classes within a structure, where class itself is rooted by definition in intergenerational patterns of wealth and poverty. These structures were often defended at the time as natural and necessary, or conversely as open enough for exceptional individuals to rise up from poor circumstances. Marx’s thinking was that both these claims are implausible. In line with socialist and communist social criticism of the time, Marx finds that Hegel’s work apologizes for middle-class wealth and power, and constructs a state that secures this

privilege over “the people” whom Marx construes as workers, not as the unruly rabble that Hegel obviously feared.

While Marx rejected right-wing Hegelian views as merely reactionary, he ruthlessly criticized left-wing Hegelians in print for failing to get beyond a movement of concepts to a history and politics of genuine revolutionary confrontation. Both Hegelian schools were dismissed by Marx as “German ideologists,” thinkers who unwittingly promoted a class perspective – that of the bourgeoisie or property-owning class – while apparently philosophizing in universal, abstract terms about humanity. The universal human subject, Marx countered, was the proletarian or homo faber, “man the worker.” The proletariat collectively would produce the most decisive change in human history, through which human productive instruments and processes would be put to the service of all on the basis of need, rather than serving the interests of property owners and their heirs alone.

For contextualizing commentators the methodological puzzle that arises, then, is how exactly Marx had appropriated Hegel’s dialectic, and, given his decisively different political and orientation, why exactly he wanted to. Hegel’s dialectic is difficult to summarize, and the commonplace triad thesis–antithesis–synthesis is a particularly bad attempt. Rather, dialectic for Hegel indicates that conceptual relations are fluid and – somehow – in motion, and the overall effect is to produce a philosophy that emphasizes change. Hegel’s philosophy addresses itself systematically to the constitutive ideas through which social life is lived in different ways at different times. Marx objected to what he termed a mystification in Hegel’s discourse, namely that ideas somehow “move” and that human lives are some kind of consequence or effect of this motion-through-contraries. Hegel’s reconciliation of all negation as ultimately progressive struck Marx as quasi-religious, and politically smug. Nonetheless as a mode of critical thinking founded on assumptions of change and development, rather than timeless truths or descriptive certainties, Marx found Hegel’s dialectic very stimulating and highly useful.

In this way, then, the twentieth-century reception of Marx as a philosopher follows the general outlines set by Engels in 1859: Marx is said to be a world-class philosopher, worthy critic of the great Hegel, and very much Feuerbach’s superior in that regard. The crucial terms for articulating this view set out by Engels in 1859 also remain much the same by name at least, if not necessarily by content: materialism, idealism, and dialectic. They go along with a supposedly helpful set of metaphors through which Marx is said to invert Hegel and in that way to have extracted a rational kernel from a mystical shell. However, the selection of texts, philosophical issues, and political projects are necessarily very different from Engels’s, and differ somewhat among the academic commentators themselves, as one would expect.
VIII. POSTMODERN “TURNS”

As a modernist thinker Marx has largely been rejected by self-styled postmodernists within the continental tradition of philosophizing. This philosophical “turn” is centered on historicizing the categories of consciousness through which the phenomena of human experience are intersubjectively constructed, and on producing language-centered accounts of meaning and communication. These emphasize the discourses through which certainties are claimed and enforced out of what is necessarily contingent and indeterminate. If taken in an Engelsian sense, Marx’s work is clearly a modernist discourse of power/knowledge through which an authoritarian politics has unsurprisingly been practiced, in fact promoting the interests of communist elites in Marxist countries rather than those of the supposedly favored working class. If taken in an alternative humanist sense, Marx’s work is clearly rooted in prelinguistic universalizing presumptions about human life and consciousness that reproduce Eurocentric modernist structures of capitalist dominance, political claims to liberation notwithstanding.

The classic critique of both positions is that of Ernesto Laclau (1935–) and Chantal Mouffe (1943–),41 which counterposes Gramsci’s flexible and contingent constructions of cultural power to alternative readings of Marx, including Gramsci’s own.42 What is new in their work is the assimilation of Gramsci’s view that political consciousness is a cultural project, not an inevitable economic result, to the view that the discourses through which consciousness is articulated and changed are themselves the media of persuasion and power, rather than propositions to be tested for truth and thus (supposedly) efficacy. This of course is an application of a wider redefinition within the continental tradition as to what philosophy is, what its proper concerns are, what is mainstream, and what is “dangerous,” an attribute generally attached to alleged relativisms that postmodernists incur yet celebrate.

If Marx were to be re-read as himself a postmodern thinker, however, this would itself be an exercise that many would dismiss out of hand as an anachronism or, if not, certainly at odds with the certainties that, so it is presumed, his texts expound, and through which his political project proceeded (even if he himself were never an authoritative political actor). Marx would have to be re-understood as a thinker allowing contingency and indeterminacy in human

---

41. Laclau and Mouffe’s work is discussed in detail in the essay by Lasse Thomassen in The History of Continental Philosophy: Volume 7, and in the essay by Emily Zakin in The History of Continental Philosophy: Volume 8.

historical development, admitting necessary and inevitable uncertainties in his own generalizing theories, and focusing peculiarly on language itself as the means through which social relations are constructed as power relations, not simply as the medium through which knowledge of the human social world appears if the correct methodology is employed.

Reading Marx against the grain of his previous reception as a modernist is not quite as difficult or improbable as it sounds. As presented above, his intellectual and political trajectory from as early as 1842 was toward the social question of class power and oppression rather than to philosophizing as an activity abstracted from such practical concerns. For him this was swiftly resolved into an investigation of the discourses through which contemporary knowledge of these matters was generated. Specifically this meant accounts in natural philosophy (both Hegelian philosophizing and contemporary political economy). His lifelong project from an early stage was thus a “critique of the economic categories,” in his own turn of phrase. Natural philosophy and political economy represented both specialist discourses (whether of Hegelian accounts of civil society or of economic accounts of production, consumption, and class division) and everyday discourses, through which newly emerging commercial and industrial societies articulated their legal systems, histories, and political systems – indeed the common currency of daily life. On this view, Marx’s economic work represents not an analytical discourse of certainty but a complex and parodic re-presentation of economic science as a discourse that constructs and sustains a class structure. On this postmodern reading, Marx’s historical works then appear as investigative and exploratory, drawing out contradictions between events as he understood them and his own generalizing theories, always aiming for progressive political effect. Understood in this way, his theories and predictions do not exclude negative, regressive, or catastrophic outcomes, which he sometimes mentions. Marx is thus grounded in a view not only of language as constructive but of human activities as performative: they name what they act out, and they act out what they name.

IX. NOTHING OUTSIDE THE TEXT

Reading Marx in this way, as indeed reading him in any way, involves a selection of texts that have themselves increased dramatically in number over time and have also been through diverse and controversial contextualizations and

---

43. Marx to Lassalle, February 22, 1858, in CW 40: 270.
editorial treatments. Even the production of large-scale uniform editions of published and manuscript works, letters, and notebooks involves overt or covert categorizations and necessarily controversial introductions and disciplinary framings (e.g. those of Engels or succeeding editors). This has a distinct effect on the way that Marx can be constructed as a philosopher (or not), and in the continental tradition (or not), given that uniform texts are a medium that “evens out” texts, making everything look like grist to the mill. A facsimile edition, say of pamphlets or letters, would by contrast emphasize the quotidian and often ephemeral character of political interventions that were only later philosophized into doctrines, propositions, or other discourses that speak directly to overtly philosophical concerns. Philosophical treatments of Marx tend to emphasize the 1859 “Preface” as a supposed methodological work at the expense of Capital, Volume 1 as a so-called “economic” one; or the Economic and Philosophic Manuscripts of 1844 as a supposed “humanist” work as opposed to so-called political works, such as the Manifesto of the Communist Party; or The German Ideology as a supposed “philosophical” work, in preference to so-called historical works, such as The Eighteenth Brumaire of Louis Bonaparte (1852). Works that are newly published and circulated, as many of Marx’s were after the turn of the twentieth century, often excite interest and commentary, suggesting that what is to be found in these unfamiliar works cannot be located elsewhere. Given Marx’s capacity for developmental repetition, and the vast quantity of his output, this is really rather unlikely.

X. AN ANTIPHILOSOPHY

Overall, Marx’s relationship to philosophy, and thus to any continental tradition, is highly problematic at the outset, although there are affinities with other antiphilosophical philosophies, as it were. These can be found, for example, in certain parallels between the later Ludwig Wittgenstein (1889–1951), who made remarks that are critical of philosophical puzzle-setting as the kind of activity devoted (ineffectually) to resolving what need never have been doubted or made problematic in the first place. Marx, of course, was disinclined to find certainties in the commonplace antiskeptical small change of ordinary life, as Wittgenstein did; rather the reverse, as his project was to argue that these are areas of mystification where political power accumulates in the hands

45. CW 11: 99–197.

*46. For a detailed discussion of Wittgenstein, see the essay by John Fennell and Bob Plant in The History of Continental Philosophy: Volume 3.

of exploiting classes. However, in terms of scorn for philosophers who were addressing political issues abstractly and ahistorically yet claiming truth and certainty, there is a certain family resemblance.\(^{48}\)

Taken as a philosopher, at least in most of the ways described above, Marx falls within a continental tradition critical of empiricisms. Yet his thoroughgoing indictment of Hegelian (or indeed any) subjective idealism thus raises an issue for constructions of a continental tradition that require a central focus on mind, consciousness, and the self, as does phenomenology.\(^{49}\) His focus not just on society but on the specifically economic processes therein, sometimes identified – provocatively – as “material,” begins to raise questions about empirical aspects of social life and empirical knowledge thereof, such that a philosophy could possibly emerge. The issue here is that Marx’s writings that are taken to be of most philosophical interest were themselves produced as an antiphilosophy, yet were written in the terms through which certain philosophies were articulated at the time. Thus they may easily be read anachronistically today as speaking to us in locutions that we familiarly characterize as philosophical. Marx’s own political project, however, represents a challenge not just to philosophy itself but to our traditional conceptions of disciplinary boundaries, and indeed to what is or is not acceptably academic or political. This is because it is rooted in concerns that are central to some philosophies but not argued through by him as a philosophical project with an audience of philosophers or students of philosophy in mind. While Marx relied on philosophers and philosophical methods in interpreting the world in political and economic terms for himself and his intended public, it seems unlikely that he regarded philosophizing as itself the kind of activity through which transformative social change could be effected. Indeed, the thrust of his scathing critiques of the philosophers of his time was that they either ignored the need for social change, or mistook the nature and scale of the problems. Marx himself was not particularly successful in unifying his critique of contemporary, class-based society with the kind of communist transformation that he and his (rather few) colleagues envisioned. While his self-styled Marxist successors in the political arena were rather more effective in practical terms, it is questionable whether the ideas involved really bore much resemblance to his in any sense. Paradoxically Marx has been highly but posthumously successful as a philosopher, appropriated by – and reconstructed as such within – a surprising range of traditions, including the continental one.

(Dordrecht: Kluwer, 1986) for an early attempt to use Marxist philosophy to make the phenomenological tradition more overtly social, economic, and political; the work was published first in French in 1951.
MAJOR WORKS

The works below are arranged in chronological order of writing, where they are manuscript works that were posthumously published in the twentieth century; works published in Marx’s lifetime are included in the list in chronological order of first publication.

**Kritik des hegelschen Staatsrechts.** Unpublished ms. 1843. Published in English as *Contribution to the Critique of Hegel’s Philosophy of Law*, in CW 3: 3–129.

**Thesen über Feuerbach.** Unpublished ms. 1844. Published in English as “Theses on Feuerbach” in CW 5: 3–5.

I. THE WORKS AND THEIR CONTEXT

Søren Aabye Kierkegaard, now considered one of the most important writers of the nineteenth century, was born in Copenhagen, the youngest of a family of seven, five of whom died before he was twenty-one, as did his mother. Kierkegaard was brought up strictly both at school and at home, where his father, who was once in feudal bondage but retired as a highly successful tradesman at the age of forty-one, attended personally to his family’s upbringing. After his father’s death in 1838 at the age of eighty-one, Kierkegaard and his surviving elder brother inherited a considerable fortune. His long-delayed theological studies completed, he became engaged to Regine Olsen, and one year later received his doctorate with a dissertation *On the Concept of Irony with Continual Reference to Socrates* (1841). Scandalously, and to his own unending personal disquiet, he broke off his engagement immediately afterward and, renouncing an academic career, left for Berlin, where, on the first of four visits to that city, he began the pseudonymous authorship on which his international fame chiefly rests.

Apart from a first publication, *From the Papers of One Still Living* (1838), in which he had criticized a novel by Hans Christian Andersen (1805–75), and the doctoral dissertation three years later, Kierkegaard’s main authorship is divided into two series: the pseudonymous works and the signed “edifying” (or

---

1. Søren Kierkegaard (May 5, 1813–November 11, 1855; born and died in Copenhagen, Denmark) was educated at the University of Copenhagen (1830–40; degree in theology), pastoral seminary (1840) and became a Magister (later Doctor) in 1841. He was a freelance writer (1841–55), whose influences included Aristotle, Hamann, Hegel, Luther, and Socrates.
“up-building”) and later “Christian” discourses. The two series were written in parallel, publication from both sometimes occurring simultaneously. The first pseudonymous work was *Either/Or: A Fragment of Life* (1843), which became an immediate success. It was quickly followed in the same year by *Repetition* and *Fear and Trembling*. Then in 1844 there followed *Philosophical Crumbs* (originally translated as “Fragments”) and *The Concept of Anxiety*, and in 1845 *Stages on Life’s Way*. Kierkegaard intended to bring the pseudonymous series to a close with the lengthy *Concluding Unscientific Postscript to the Philosophical Crumbs* (1846), but following a famous feud with a satirical weekly and abandoning plans for retirement to a country pastorate, he chose to take up his pen once more.

Notable among the several publications that ensued were the signed *Works of Love* (1847) and two further pseudonymous works. The former expounds an ideal of unselfish, Christian love, while the first of the latter two, *The Sickness unto Death* (1849), offers a systematic analysis of progressively deliberate renunciations of a Christian conception of human fulfillment, all of them characterized as forms of despair and, in the second part of the work, as sin. In *Practice in Christianity* (1850) the same pseudonym resumes the theme of the paradox of the God-Man (that the eternal should have become historical), central in the earlier *Philosophical Crumbs*. Through its emphasis on the degradation suffered by Christ, and against the background of what Kierkegaard saw as an absence of any corresponding self-denial in the Danish clergy, this reworking of the paradox theme paved the way for an open attack on the Danish state church, provoking a conflict that reached its peak at the time of Kierkegaard’s untimely death, in 1855, at the age of forty-two.

On the map of cultural history, Kierkegaard appears, along with Karl Marx, as an archcritic of Hegel. He is also cited as the father of existentialism and more. On closer inspection these identifications speak more of the reception at a later time than of his impact in his own. Kierkegaard’s immediate targets are now recognized as having been the Danish Hegelians, first among them Johan Ludvig Heiberg and Hans Lassen Martensen, rather than Hegel himself. However, since Kierkegaard was well read in Hegel and the Hegelian “right wing,” it would be rash to conclude that Kierkegaard’s concern with philosophy and his times was confined to his settlement with local contemporaries. In order to arrive at a more accurate picture of Kierkegaard’s place in the world of nineteenth-century thought, and a more focused portrait of Kierkegaard himself as thinker, it pays to take into account the context both of his writings as a whole and of their wider cultural and polemical origins.

---

*2. For a discussion of existentialism, see the essay by S. K. Keltner and Samuel J. Julian in *The History of Continental Philosophy: Volume 4.*
Alongside its place as a prosperous trading center, Copenhagen in Kierkegaard’s time was a lively marketplace of ideas. These two sectors are not disconnected, with concentrated wealth both motivating and supporting scientific and cultural progress and generating new political pressures. The previous century’s transition from an agrarian economy to one based on trade (and centered in Copenhagen) generated an increasingly concerted liberal opposition that put an outdated monarchical system of government on the defensive. Freedom of expression and suffrage had become topical issues, and so, too, the problem of creating stability in a society whose current support system belonged to the past. Not least, there was now the question of where to look for authority and guidance: to the church or to philosophy and reason?

II. KIERKEGAARD AND HEGEL

In his student years Kierkegaard, like most of his contemporaries, succumbed to the strong appeal of Hegelian thinking. The five-years-older Martensen later recorded that Schleiermacher’s and Hegel’s names “were [the] two … that glittered in the scientific world and denoted the zenith of the era’s knowledge.” Schleiermacher (1768–1834), the great Romantic interpreter of religion, had visited Copenhagen the year before he died, but in Kierkegaard’s early formative period Hegel had become the dominant influence. Hegel himself had died in 1831, the year Kierkegaard took his two-part first-year university examination (the first part with distinction in Latin, Greek, Hebrew, and history and exceptional distinction in lower mathematics, and the second with exceptional distinction in theoretical and practical philosophy, physics, and higher mathematics). A few years earlier his closest mentor Poul Martin Møller (1794–1838) had held introductory courses on Hegelian philosophy at the newly instituted King Frederick University in Oslo (Christiania). And just following Hegel’s death, Heiberg (1791–1860), the most powerful, and in many ways most gifted, cultural personality in Copenhagen in Kierkegaard’s lifetime, provided Copenhagen’s intellectuals, in lectures and in writing, with extraordinarily clear summary versions of Hegel’s thought. Heiberg, a theater director and stage writer, had

---

5. Schleiermacher’s work is discussed in detail in the essay by Eric Sean Nelson in this volume.
even managed (in the unpublished “Grundlinien zum System der Ästhetik als speculativer Wissenschaft”) to extrapolate, from his attendance in the summer of 1824 of Hegel’s lectures in Berlin, a version of the latter’s aesthetic theory that anticipated the actual publication more than a decade later of the lectures themselves. As for Martensen (1808–84), he was an astute and up-and-coming academic who was temperamentally Kierkegaard’s opposite. By the time of the latter’s untimely death, Martensen had become primate of Denmark. Early on, prior to a three-year spell in Germany on a research grant, he had on his own suggestion tutored Kierkegaard on Schleiermacher. He returned in 1836 as a convert to Hegel, giving a highly successful series of lectures, some of which Kierkegaard himself attended and on which his notes (and those of others) are preserved.

At this time Kierkegaard showed no sign of antipathy toward Hegelian philosophy. In fact his teacher and friend Frederick Christian Sibbern (1785–1872) spoke later of Kierkegaard himself as having been “Hegelianized.” We also have Kierkegaard’s own word for it. In a journal entry from 1850, he confesses to having been “influenced … by Hegel and everything modern,” so enduringly that as late as his dissertation of 1841 he had been “Hegelian fool” enough to criticize Socrates for having regard only for individuals and not seeing the significance of the collective for ethics.

Too sharp a focus on Kierkegaard’s later obvious opposition to Hegelian thought tends to bring much out of focus, not least the subtle and largely hidden interaction between Kierkegaard as a writer who disdained the academic style and Martensen, who self-consciously represented it. The work most often cited as the *locus classicus* of Kierkegaard’s anti-Hegelianism is *Concluding Unscientific Postscript* (subtitled “A Mimic, Pathetic, Dialectic Compilation: An Existential Contribution”). However, the fact that *Postscript* was written at a time when Hegel’s own influence in Germany had sharply declined speaks for some caution in regarding it simply in this light. It is true that in a retrospective “report to history” published posthumously, Kierkegaard appears to confirm the standard view when he says that *Postscript* was designed to guide people “back” from the Hegelian “System,” but circumstances indicate that it is plausible to read this

---

8. Søren Kierkegaard, *Synspunktet for min Forfatter-Virksomhed: En ligefrem Meddelelse, Rapport til Historien* [The point of view of my work as an author: a direct communication,
as an inclusive reference embracing the continuing debate in Denmark among those who were still pursuing Hegelian ideas on their own account.

What appear to be strong arguments for making Hegel directly the focus of Postscript often prove on inspection not to be so. One such argument points to the fact that the work calls itself “unscientific.” Taken in context, this can indicate a demonstrative rejection of the Hegel of Enzyklopädie der philosophischen Wissenschaften. Yet “Wissenschaft” and the Danish “Videnskab” refer far more widely than to what Hegel labels his “science.” They refer to scholarship in general and to what might be called the philosophy of mind (which incorporated many concepts drawn from theology) of the time. It is therefore just as natural to take the contrast here to be with the scholarly approaches to Postscript’s topic detailed and dismissed in the work’s relatively brief first part. These are rejected because they treat what is a subjective problem as if it were objective. Disturbingly for the aforementioned arguments, the working title that Kierkegaard adopted until at least half-way through his preparation of this work was “Concluding Simple-Minded Postscript,”9 suggesting that the book was promoting a democratic point of view, undermining the assumption that the work’s advertised task, how to become a Christian, was reserved for those with sufficient intellectual talent. Why he changed the title is not clear, but perhaps, as the text unfolded under his pen, he realized that it was indeed for this intellectual audience that the book was being written. By amply demonstrating an ability to speak to the elite in its own terms (to mimic them), but doing so in a deliberately “unscholarly” vein, the author might hope to catch that elite’s ear and convey to it, from above rather than below, so to speak, that its expertise was not required.

The association of the label “unscientific” with mimicry suggests another such argument. It has been proposed by several commentators that what appears to be the substantial content of Postscript is intended as a parody of Hegel, an interpretation that brings Hegel directly in focus. What these commentators in effect claim is that Postscript adopts a Hegelian conceptual apparatus simply in order to demonstrate its inappropriateness for the task at hand. One version of the argument finds a piece of deliberately false reasoning in the pseudonymous Johannes Climacus’s account of becoming a Christian. It says that although the work makes every appearance of providing a criterion of Christian faith, the one offered by Climacus fails so conspicuously (to those able to see this) to guarantee Christian faith as its object that the whole thing must be seen as an

elaborate joke. Another version, drawing on a fashionable interpretation of the ladder metaphor in Wittgenstein’s *Tractatus Logico-Philosophicus* (1921), construes what appears to be a philosophical project of clarifying what it is to be a Christian as a deliberate *reductio ad absurdum* of the project itself, it being stated at the start that there is no doctrine or method available, simply a practical task. According to both versions, the reader is supposed to detect nonsense beneath the appearance of sense. Supporters of such arguments point to three things: first, the fact that Climacus is a self-ascribed humorist; second, his insistence that the task that concerns him is a practical and not a theoretical one; and third, Climacus’s sudden “revocation” of *Postscript* in its conclusion. It is then inferred that the point of the latter is to say that once you understand *Postscript*, you can simply put the book away and forget it, for there is nothing there that can help you with the practical task of becoming a Christian.

That Kierkegaard had at this time no reason to fasten his polemic on Hegel suggests there may be alternative explanations for all three facts, as indeed there are. The role of humorist, as Climacus himself defines it, in no way disqualifies him from speaking meaningfully and in general terms of what becoming a Christian is and is not. The humor that he himself fictively represents (at, as he says, the boundary between ethics and religiousness) is such as to distance him from the actual task, analogously to the way in which he saw philosophers who seek to solve the matter in thought and understanding also distancing themselves from it, although in their case with a misplaced seriousness. Climacus’s humor contrasts with the earnestness of the real task itself. In his remarks toward the close of *Postscript*, Climacus admits that for all his talk, here and in the previous *Crumbs*, of seeking a point of departure beyond that of Socrates, he himself has come no further. In the earlier work, the Socratic and more-than-Socratic positions are simply “A” and “B,” the former assuming, as in traditional metaphysics, that the eternal preexists human being and can be retrieved in thought, while in the latter human cognitive capacity is confined to time and history. In *Postscript*, the two positions reappear as religiousness A (the religiousness of “immanence”) and religiousness B (“paradoxical” religiousness). For Climacus, the humorist able to talk in general terms of the paradox and without bearing witness himself to what appropriating it personally implies, the eternal is still something “behind” rather than ahead of him, as in the religiousness of immanence. From an existential point of view, however, the eternal can exist only in a frame of mind (in “inwardness”) in which the individual faces the future with

---

finite purposes subordinated to an eternal *telos*. As for the mimicry admitted in *Postscript*’s subtitle, although that is something that may well be used in the service of parody, it differs from the latter. Mime is closer to burlesque, itself a good characterization of much of what we find in a polemical work by a self-styled humorist.

### III. REVOCATION

But why then the revocation? Those who see the whole work as a jest might consider reading this too as a joke. But commentators may also bear in mind that this apparent lack of nerve on the part of the author is not something specific to *Postscript*. There is a step in the same direction in Kierkegaard’s first (and signed) publication, *From the Papers of One Still Living*. Its very preface has a postscript, “for readers who might possibly be worse off for reading the preface.” Kierkegaard goes on: “they could of course skip it, and skip so far that they skipped over the dissertation too, which wouldn’t matter.”

This seemingly flippant remark is open to many interpretations. It might conceal anything, from an author’s natural fear of being misunderstood to the hope that he will be read only by those capable of the kind of concern he wishes to implant (in this early work the importance of having a life-view, something he criticizes his contemporary, Hans Christian Andersen, for lacking). That the pseudonymous Climacus appends a similar postscript, in this case to a postscript, is likewise open to several interpretations. There is the motto of the work (*Philosophical Crumbs*) to which it is the postscript: “Better well hanged than ill wed,” a wish to be spared the imperial attentions of those concerned with the world-historical advance of thought. Or the revocation might be seen as not so much the author’s withdrawal of the work as the author’s withdrawal from the work, a matter usually explained by pseudonymity. Here, however, that seems not to be what the still pseudonymous author would have us bear in mind. Rather, assuming that the positive content of the work is not nonsense, but makes sense to those who “have a sense” of the eternal in the way indicated above, Climacus may be saying that, to those with this sense, the book will not be saying anything new that they need to be told, while if they do not possess that sense, there is no use in their going back over it again in order to try to acquire it.

---

One unfortunate effect of the parody and jest argument is to draw attention away from what now seems undeniable, namely that Kierkegaard himself inherits and draws heavily on the Hegelian apparatus. As is natural for someone early influenced by Hegel, Kierkegaard’s first criticisms take the form of a careful dissection of dissertations and journal articles by contemporary German and Danish academics. His comments, almost always concerned with the need to separate religion from philosophy, are serious, probing, and indeed generally philosophical except when commenting on Heiberg and Martensen, where animus is present. On the dissertation of a theology student, Adolph Peter Adler (1812–69), who had also converted to Hegelianism on a visit to Germany, he speaks (in 1840) of Hegel as “a conclusion,” but then “only of the development that began with Kant.” Through Hegel “we have arrived in a deeper form at the result which previous philosophers took as their immediate point of departure, i.e., that there is any substance to thinking at all.” This even sounds as though Kierkegaard accepts Hegel’s criticism of Kant’s critical philosophy for leaving the objects of knowledge “in-themselves” out in the cognitive cold. But he adds that “a properly anthropological contemplation is still to come.”¹³ Five years later, in Postscript, this reservation had developed into the thought of a new “in-itself” intractable to thought, namely “existing,”¹⁴ an an sich at the subject end, as it were, replacing the Kantian one that Hegel closed off at the object end.

The argument in Postscript might be roughly summarized as follows: if we take thought to be the instrument with which philosophers establish essential truth, and accept that Hegel has overcome the regrettable “skepticism” in which Kant’s critical philosophy is forced to leave the world-in-itself beyond the reach of thought, we now find our very existence separating being from thought once more, the elusive an sich now the very medium in which we have our own being. The terms philosophy employs to define its own task are the Aristotelian oppositions of the finite and the infinite, the temporal and the eternal, the contingent (historical) and the necessary. Where Hegelians purport to be able to reconcile these, through the operation of mediating between the opposites in a higher understanding, Climacus insists that the oppositions confront us in our lives as a tension defining an ethical space in which reconciliation is possible only within the individual’s “God-relationship.” Mediation, he constantly and humorously repeats, is an operation possible only for those too distracted to see that, besides being thinking beings, they also exist.

This is the basis on which becoming a Christian is to be understood. Christianity offers the existing individual a reconciliation of the finite and the infinite in acceptance of the absurd notion of the God-Man, or the eternal in time. For the understanding, such a concept is an offense. The term Climacus uses, “repulsion,” is drawn from Hegel’s *Science of Logic* but borrowed by Hegel in turn from Kant. It becomes evident, therefore, that the thought expressed in Kierkegaard’s most nearly philosophical pseudonyms follows a pattern meritig the description “dialectical.” It is concerned with the need to make oppositions clear in order, in this case, to reconcile them not in any advance in thinking, as in the case of that other dialectical thinker, Hegel, but in appropriating the both appealing and repellent Christian idea in one’s own existence.

Johannes Climacus owes his name to a seventh-century abbot who acquired it as author of *Scala paradisi* (Divine ascent). Kierkegaard also used the name in the title of a manuscript of an unpublished cautionary tale written while *Either/Or* was in press (Johannes Climacus or *De Omnibus Dubitandum Est* [Everything is to be doubted]). There its possessor is a young student who unsuccessfully seeks eternal consciousness by way of philosophy. In the two works later assigned to him as a pseudonym (*Philosophical Crumbs* and *Postscript*), readers are urged in the language of philosophy to see that philosophy is not the way. Appropriating the Christian idea is a personal project for which the only encouragement or authority is an active interest in an “eternal consciousness” (for Climacus, Christianity’s promise of an “eternal happiness”). The claimed merits of a proffered position can be judged only on the basis of a present ability to grasp in one’s person the force of arguments, examples, and ironic observations in its favor. The “stages” (aesthetic, ethical, and religious), developed in the pseudonymous series culminating in *Postscript*, can indeed be said to form a kind of “divine ascent.” These works present characters in a dialogue of sorts in which the inadequacies of a “lower” position are brought to light, together with the hint of a need for one that is “higher.” However, to follow that need requires a radical change of vision. Someone who maintains a preference for the cultivated melancholy and hedonistic opportunism of the aesthete reveals an undeveloped sense of the nature of the rewards (self-identity, an inner history, public recognition) brought to light by the ethicist. Similarly, failure on the part of the ethicist to see the moral claims of the “exceptional” individual, not covered by the norms of a visible virtue, is due to a failure to appreciate the position of the single individual. It is from this latter position of the single individual, making room for a sense of a need for redemption, that the Christian promise can first be appreciated.

The method employed in the pseudonymous series from *Either/Or* to *Stages on Life’s Way* is what Climacus in *Postscript* calls “indirect communication.” Since Christianity is not a doctrine that one follows, its content or “truth” can be grasped only subjectively in the form of an “existential communication.” The
teacher does not teach but prompts the novice, not, however, as with Socrates in Plato’s *Meno* for the novice to discover what he already knows, but to enable the single individual to face the eternal in the future in the creative form of his or her own actions. Reaching that point is the topic of the “dialectic” pursued by Climacus in his elaboration of the thesis (taken from the eighteenth-century German philosopher and dramatist G. E. Lessing) that you cannot determine an eternal happiness on the basis of contingent historical fact. Increasing awareness of the opposition between time and eternity introduces urgency or “pathos,” which reaches its extreme in the transition from religiousness A to religiousness B in the realization that the absolute can be found only in the unintelligible idea – which Kierkegaard calls in *Postscript* “the absurd” – that the eternal itself has entered time, so that the focus must now be on something historical.

V. KIERKEGAARD AND MODERNISM

The characterization of Kierkegaard as a dialectical thinker invites a reading of him as a modernist, like Kant and the paradigmatic Hegel before him. In this he can be compared to his near-contemporary and fellow critic of Hegel, Karl Marx (1818–83), who also had a Hegelian past. For both writers, reality continued to reveal itself most cogently and truthfully in the form of oppositions whose ultimate resolution forms the goal of human life proper. For Marx the tensions are found in the working arrangements of society, and the corresponding resolutions require political action on the part of those collectives best placed to grasp the situation and to bring them about. The tensions that Kierkegaard brings to mind concern dilemmas faced by individuals in their personal confrontation with life and independently of such historical variables as the political and economic situation. Some recent commentators prefer to read Kierkegaard as a prophet of postmodernism, but it is impossible to ignore the indications or analogies that suggest quite strongly that his authorship is at core modernist though aimed at introducing a not hitherto envisaged radical form of faith.

Up to and even including the infamous attack on the church and “Christendom,” that “theatrical” version of Christian observance prevailing in Denmark into which he spoke of introducing true Christianity, Kierkegaard’s aim looks much like an alternative to Hegel’s, replacing the Hegelian absolute with another (although also, as in Marx too, another kind of) single truth on which, now in faith, every individual’s understanding can converge. However, with Kierkegaard one may raise the same question as can be asked of Marx:

---

15. Marx’s relation to Hegel is discussed in the essay by Terrell Carver in this volume, as well as in the essay by Lawrence S. Stepelevich in *The History of Continental Philosophy: Volume 1*.
what happens to the Hegelian metaphysics? In Marx it can be seen to reduce, in the end, to theories of social and political development, theories that can be confirmed or proved false by comparison with the facts. Does something analogous happen in the case of Kierkegaard’s use of the familiar oppositions? The fact that the finite/infinite, temporal/eternal, possible/necessary contrasts form the basis of Kierkegaard’s analysis of despair in the late *The Sickness unto Death*, together with the fact that despair itself is subsumed under the concept of sin, speaks against such a view.

That commentators and interpreters may not want to leave it there is understandable when they come upon certain comments by Kierkegaard himself, such as that made on completing his late works: that he must now “dare to believe that [he] can be saved through Christ from the thrall of melancholy in which he has lived” (adding “and I must try to be more sparing with my money”). The thought that Christian belief is a response to a profound existential need parries, as it were, the official Kierkegaardian line that you have to see Christianity from the point of view of that need if you are to recognize its true nature. This complementary thought leads in the direction of a Feuerbach who would translate the metaphysical vocabulary into that of a human pathology that transcribes religious ideals into expressions of corresponding deficits in the human condition, leaving the latter with no “eternal possibility.”

At the very least, comments such as the above by Kierkegaard can hint at some sense of the way in which a Hegelian and a Kierkegaardian way of asking questions about human fulfillment differ in what might be called their teleological mood. It is a not uninteresting fact that Hegel himself in his earlier years expressed views very close to those with which Kierkegaard came to oppose the Hegelians. The suggestion has been made that Hegel’s early comments on God, religion, and the individual (in the *Theological Writings*) earn him and not Kierkegaard the title of father of existentialism. The French philosopher Jean Wahl (1888–1974) was prompted to remark on the “curious phenomenon” that Hegel was a “precursor of his own criticism and of the most violent anti-Hegelianism ever formulated”; or, still more curious, a precursor of the anti-Hegelianism of the one-time Hegelian Kierkegaard.

To an anti-Hegelian, this circumstance can indicate that the mature Hegel’s thought is a failure to follow up an important intuition about human life. The entire Hegelian philosophy, and metaphysics itself, or reason, might then take on the appearance of a diversion, a convenient but illusory substitute for the

---

*17. For a discussion of Jean Wahl’s interpretation of Hegel, see the essay by John Russon in *The History of Continental Philosophy: Volume 4*.
kind of satisfaction Christianity offers to those able to dispel the clouds and see their situation clearly. In one of his notebooks Kierkegaard contrasts the "greater honesty in even the bitterest attacks on Christianity in the past," which still left it "reasonably clear what Christianity is;" with "the danger with Hegel," that he "changed Christianity – and by doing so got it to conform with his philosophy." Pointing to his own time, he adds that it is "characteristic of an age of reason in general not to let the task remain intact," and that "[t]he hypocrisy of reason is infinitely insidious," which is why it "is so difficult to catch sight of."19

In its attempt to reinstate the task, Postscript presents the human condition as in a kind of constant state of emergency. The exclusively finite nature of the world, as we know it, confronts an innate longing for fulfillment (an eternal closure perhaps). The work’s "dialectic" attempts to bring this to the fore and advert to the fact that the distinction between finite and infinite has continually been obscured or "mediated" by Kierkegaard’s Danish contemporaries. In order to reintroduce an element of revelation that Hegel’s bias in favor of philosophy disallowed, Martensen had gone so far as to introduce a speculative theology that mediates between philosophy and religion, thereby muddying the distinction between religion and philosophy that it had been Kierkegaard’s constant preoccupation to keep in view. Martensen is not mentioned by name, but readers, and especially Martensen himself, would have had little difficulty in making the reference, just as, even if they had not been told, they would have immediately recognized the educationist, historian, and reformist pastor N. F. S. Grundtvig (1783–1872) as the butt of the arguments in a section in the Postscript’s first part entitled “On the Church.” Kierkegaard describes Martensen in his journals as “asseverative” and as “not at all a dialectician.”20 The latter might be read as implying that, in this respect, Kierkegaard himself was the better Hegelian.

VI. A NEED FOR DISTANCE

That Kierkegaard did not involve himself openly in the exchanges that interested him in the intellectual debates of the time, but only from the sidelines and in an evasively unscholarly style underlined by the literary device of pseudonymity, could be explained by his taking the differences with his would-be colleagues to be too comprehensive, or their positions too entrenched, to offer common ground. That would allow us to bracket Kierkegaard along with Dadaists and the

Theater of the Absurd, or even Aristophanes— not such a far-fetched idea in view of his one foray into this field,21 as a critic of an entire and still well-established intellectual tradition. It would also speak for the parody interpretation. But if, as indicated, there was much that Kierkegaard had philosophically in common with his contemporaries, the explanation could just as well be his own appreciation of where his creative, and not just his destructive, talents lay.

It is easy from the vantage point of Kierkegaard’s acknowledged importance to forget that while most of his illustrious contemporaries in Golden Age Denmark had strong intellectual ties with Germany and sought a response in German culture, he himself wrote exclusively in his native tongue, one that he claimed was particularly well suited to his creative powers. The fact that after defending his dissertation Kierkegaard rejected his teacher’s suggestion that he apply for a position at the university indicates that he was already aware of the uses to which literary writing could be put. His examiners had already noted expressions of a kind inappropriate to the academic setting.

This, however, invites the thought that Kierkegaard himself may nevertheless have had some feelers out in the direction of Germany. His life as a student and writer falls almost exactly within the period (c.1830–50) in which the Young Germany movement (Junges Deutschland) flourished. This group of young writers sought to pursue their goal of political and social justice through a belles-lettres or “poetic” approach, something that would in itself appeal to the Kierkegaard of the “aesthetic” production. But his aims differed from theirs. In a comment in that posthumously published “report to history,” and parallel to the corresponding comment on Postscript and the System, Kierkegaard describes this production as designed to draw readers “back from the aesthetic and toward becoming a Christian.”22 The Young Germans looked on Christianity as just another aspect of petrified convention to be demolished. This would make the dialectical Kierkegaard want to distance himself from the movement and from any inclination for its Danish offshoots to enroll him in their cause. Yet, for the aesthetic Kierkegaard, the example was there to be followed and his library records indicate that he kept himself well abreast of the Young Germans. He would also be alert to their criticism of the later Romanticism. Here again Kierkegaard would have to be on the defensive; the dialectical Kierkegaard’s stress on the passion of faith can easily trap the unwary reader into thinking that Kierkegaard has much in common with the Romantics, and in his younger days he had indeed expressed his appreciation of J. G. Hamann (1730–88), and of the

---

22. Kierkegaard, Synspunktet for min Forfatter-Virksomhed, 106.
humor that allowed that figure of the counter-Enlightenment to rise above his time. But it is clear from what his dialectical alter ego writes that the passion in question is not one that brings you, as Schleiermacher would claim, to the object of faith itself; it merely puts you in the proper position to begin the task of faith. Focused as it is on Christianity, *Postscript* demolishes any belief in the possibility of arriving at a saving truth, whether achieved (as discussed in Part One) through objective means (history, idealist philosophy, or the mere test of time) or (as in the major part of the work) in the form of some truth-guaranteeing quality of experience. For Climacus, subjectivity is a passionate state of what might be called truthfulness in which the meaning of Christianity becomes apparent although without the force of revelation. The democratic aspect of Kierkegaard’s positive remarks on Christianity, that it is available to all equally and requires no special intellectual talent, would have gained an appreciative ear with the Young Germans, but the *Postscript* project of making explicit what it takes to become a Christian would not have found its place on an agenda drawn up by a movement many of whose most prominent members were in any case Jewish. It is nevertheless thinkable that, sensing the surface similarities between his and their approaches, Kierkegaard would feel the need to stress the differences. He might do this simply in order to escape identification with the Young German cause, or with any cause for that matter, preferring to chisel out alone his polemical notion of “the individual,” the “category through which,” as he says, “in a religious respect, this age, history, the human race, must pass.”

VII. PSEUDONYMITY AND THE INDIVIDUAL

But what kind of radical was Kierkegaard himself? In his time and locally he appeared to be the opposite. In the ongoing transition to constitutional monarchy, Kierkegaard consistently opposed the rapid introduction of liberal reform, not, however, because he had monarchical sympathies but because he claimed that the ideals that politicians opposed to the established order were unreal because untried. This did not necessarily even mean that he opposed the ideals themselves, but Kierkegaard seems consistently to have believed that ideas and ideals have to be generated in the hearts and lives of individuals. An idea has to acquire form, and form for Kierkegaard is a matter of enthusiasm. In *A Literary Review*, written while *Postscript* was in press, he says that the age of the French Revolution possessed form because in its ideals it had passion: “In the world of individuals, remove the essential passion, the one purpose, then everything becomes an insignificant featureless outwardness; the flowing

current of ideality stops and the life that people share becomes a stagnant lake – and that is rawness [i.e. lack of form].” In that signed work Kierkegaard nevertheless gives revolutionary zeal only qualified approval; it is better than the cool prudence of modern life where everything is settled by something else, be it reason, a committee, the ballot box, a way of life in which passion has to find its outlets in shapeless and short-lived eruptions not informed by a constant ideal. But as with the qualified approval given to the monastic movement by Johannes Climacus (in *Postscript*), that it shows passion but concentrates it in a conspicuous kind of solitude that belies its alleged focus on the eternal, so too Kierkegaard in the *Review* regards revolutionary activity as a misplaced passion for the eternal concentrated here in time. The true revolution will be undertaken by unrecognizable revolutionaries working in indirect ways to bring the passion of the infinite back to individuals. As for the actual turmoil about to beset Europe in 1848, Kierkegaard remained aloof.

Kierkegaard’s own focus on the individual struck many, and not just Martensen, as exaggerated. But in the time to come it was this radical aspect of Kierkegaard’s thought that captured the imagination. In the early 1920s, Kierkegaard was translated into several languages, including Russian, and was widely read in both academic and literary circles in Germany, where as a student the Hungarian and later communist apologist Georg Lukács (1885–1971) was an admirer (and later critic). But it was not until the late 1920s and the 1930s, through the intermediaries of Karl Jaspers (1883–1969), Martin Heidegger (1889–1976), and Jean-Paul Sartre (1905–1980), the second of whom is heavily indebted to the Danish thinker, that Kierkegaard became a familiar point of reference among intellectuals and was heralded as the father of existentialism. In a theological context Kierkegaard was perceived as the creator of a radical faith with a new, spare theology. This latter exerted a powerful influence on the Swiss theologian Karl Barth (1886–1968). In the United States, Kierkegaard acquired a solid Lutheran following, while in more recent times a focus on the variety and complexity of his writings, his recourse to pseudonyms and the refusal of his writings to fit into the traditional academic and literary categories, has attracted

the attention of those who see Kierkegaard as a precursor of postmodernism and perhaps even a prophet of styles of thought and literary expression still to come.

However, this emphasis, too, like that on the Hegel critique, easily distorts the fuller picture. It is easy, for instance, to overemphasize the importance of the pseudonyms and to lose sight of what pseudonymity makes possible. As for the first, several pseudonyms were adopted by Kierkegaard only at the last moment. This is true of such central pseudonyms as Johannes Climacus, Vigilius Haufniensis, and Anti-Climacus, for whose appropriation of the authorship Kierkegaard offers explanations in his journals. Some pseudonyms come within the category of private jokes. “Victor Eremita” (Triumphant Recluse), he explains later, signified that the author of Either/Or, having given up all plans for marriage, was “already in a monastery” while writing a work that included over three hundred pages in its defense.28 “Hilarius Bogbinder” (Hilary Bookbinder) serves to combine the initially two separate parts of what became the one-volume Stages on Life’s Way. A pseudonym that has provoked much speculation is “Johannes de silentio” author of Fear and Trembling. That is hardly surprising since, as Kierkegaard predicted, this would be his most widely read book and by itself “enough to immortalize my name.”29 Kierkegaard’s own comments confirm what might be one’s first guess: that Johannes de silentio tries hard to talk about that of which one cannot speak. He was initially considered for authorship of some comments on the art of divine oratory in connection with conveying what one means by saying as little as possible in the way of “results,” or, as one may perhaps put it, in respect of what is or may be the case.30 Fear and Trembling (a “dialectical lyric” in which the poet prepares the ground for the polemicult) sets up Abraham as a counterinstance to Hegel’s ethics. From Johannes’s point of view, which may be Martensen’s or for that matter most people’s, but could also be called Hegelian, anything that might justify Abraham’s intended sacrifice of Isaac is beyond the sayable, which is to say that no generally acceptable justification can be given. In his notes Kierkegaard distinguishes Johannes de silentio from Johannes Climacus as concerned with the “formal definition” of the absurd, while the latter handles the absurd itself as an object of belief.

Regarding the role of pseudonymity, some recent commentators have pointed out that far from being an author’s way of withdrawing his or her factual personality from the written text, it can be a diversionary tactic allowing much more self-revelation than would otherwise be acceptable or, in Kierkegaard’s case,

29. Ibid., vol. X2, A15; Papers and Journals, 425.

80
Volume 2
strategically desirable. It seems clear that Kierkegaard found in his own life material for a kind of philosophizing that ran directly counter to the objectifying spirit of his times. Climacus is, as he says, a relation of his, one aspect of his more than usually complex personality, part of an individual life developing also in the form of an authorship that resulted from a kind of inner dia- or even multi-dialogue. Climacus addresses a task that the real author might accept was also his own but that, under pseudonymity, he need not admit to be undertaking. The (aesthetic, ethical, and religiousness A and B) stages or “spheres” of existence whose development from Either/Or to Stages is recounted and commented on in a section of Postscript (“A Glance at a Contemporary Effort in Danish Literature”) have an admitted autobiographical base but are literary products in the service of religion, at least as Kierkegaard retrospectively assures us in the posthumously published “report to history” and elsewhere. In this light the pseudonymous authorship may be seen to complement as well as to stand in clear contrast to the writings of Young Germany. The contrast is underscored even further by the edifying and Christian discourses that appeared alongside under Kierkegaard’s own name and were addressed, under the guise of “that single individual,” to his once fiancée Regine Olsen and dedicated to his father Michael Pedersen Kierkegaard, a man of a simpler faith than that of the luminaries of Golden Age Denmark. These discourses, in a strongly oratorical and compelling form, present stark, cut-to-the-bone readings of a wide range of scriptural texts.

Those who see the separation of texts from their authors as an extension of other forms of desirable freedom, and, perhaps in view of what Climacus has to say about indirect communication, have interpreted the pseudonymity as signaling Kierkegaard’s total personal withdrawal from the texts, as if his aim was to let readers make of his writings what they may. Or even, if the expression of that aim too is an infringement, as if what the texts say is whatever the reader by right and opportunity can make of them. But then they face the problem of what it means to talk of indirect communication. For indirectness is still a relation and assumes that the author is still somehow there, if only indirectly. Another interpretation of the pseudonymity would allow the author to be there in the background hoping for a reader disposed to see things in the way that motivates the authorship. The point of the pseudonymity would then be twofold: to disown any rapport with a reader lacking that disposition, and to prevent the reader who possesses it from appealing to the real author as an authority for accepting what is written, since any acceptance has to be the reader’s alone, as part of his or her own Bildung or development.

VIII. THE RELIGIOUS PREMISE AND ITS PROSPECTS

The issue of Kierkegaard’s modernity or otherwise is also contested. Some will see the answer depending on whether or not, or to what extent and in what form, the “religious premise” is placed in abeyance. Others may see it rather as a matter of whether Kierkegaard’s version of Christianity so departs from anything that could count as modernism as to be either a reversion to something premodern or a pointer to some new and even postmodern version of Christian religiousness. The issue might also be seen in the light of indirect communication. What if the indirect communicator’s hope in this case was that the reader see things in the light of the kind of experience in which notions of repentance and grace assume meaning for the individual? This would bring the Climacus of 1846 into line with the early Kierkegaard of 1835. If that were granted, then the further question would be whether, within that frame, it was possible to read Kierkegaard as having abandoned what has been called the “reassuring framework of a classical, Aristotelico-Hegelian metaphysics of infinity” or, alternatively, as having exploited it in a radically new fashion, even one that makes its reassurances less reassuring and less easy to come by.

The extraordinary richness of Kierkegaard’s writings, both the published texts and the Nachlass now made available, permits the reader to pursue his thoughts and insights in many directions, some perhaps still unsuspected. The religious “premise,” which has led some sympathetic commentators to focus on Kierkegaard the literary innovator, rather than the religious thinker, may harbor still untold possibilities, as indicated by recent interest in Kierkegaard shown by a dedicated defender of reason – Jürgen Habermas – who now dares to herald a “post-secular” age. Although just these innovations may cause some to hesitate (also on Kierkegaard’s own behalf) to call Kierkegaard a “philosopher,” philosophy itself – existential, postmetaphysical, or postsecular – will surely continue to find in his writings a valuable resource for renewal, this in spite of Kierkegaard’s own railing against the profession as he found it in his time. Philosophy may even find reason there, one way or the other, to revise its own professional parameters.

Kierkegaard’s works are collected in Søren Kierkegaards Skrifter, edited by the Søren Kierkegaard Research Centre. Copenhagen: Gads Forlag, 1997–. Hereafter SKS.

Kierkegaard’s Journals and Notebooks. Edited by Niels Jørgen Cappelørn, Alastair Hannay, David

The nineteenth-century Russian writer Fyodor Dostoevsky¹ hardly needs an introduction. His stories, which masterfully weave together philosophical reflections, unique personalities, and gripping plots, have earned the author praise as a literary genius, a prophetic political thinker, a keen psychologist, and an expert on human nature and the human condition. His work inspired generations of intellectuals, among them prominent figures of the continental tradition including, among others, Friedrich Nietzsche, Sigmund Freud, Martin Heidegger, Jean-Paul Sartre, Albert Camus.

Even the most cursory look at Dostoevsky’s legacy reveals an immense body of work in many disciplines and languages; consequently, any brief account of the novelist’s contribution to the development of ideas in Russia and Europe is bound to be incomplete. My presentation of the topic of Dostoevsky and Russian philosophy will be thematic rather than genealogical. I will begin with a brief overview of the novelist’s historical–intellectual milieu and then proceed to explore Dostoevsky’s artistic treatment of two philosophical questions: the limits of rationality and the problem of freedom. Renowned features of Dostoevsky’s oeuvre, these themes are also central to many of the diverse sources composing continental philosophy. For the purposes of this essay, I limit textual references to two seminal pieces – *Notes from Underground*, which was published shortly after the novelist’s return from exile in Siberia, and the “poem” about the Grand

¹. Fyodor Dostoevsky (November 11, 1821–February 9, 1881; born in Moscow, Russia; died in St. Petersburg) was educated at the St. Petersburg Academy of Military Engineering (1837–41). His influences included Balzac, Fourier, Gogol, Petrashevsky, Pushkin, Sand, and Schiller.
Inquisitor from the monumental novel *The Brothers Karamazov*, the crown of his literary career.

I. PHILOSOPHICAL REVELATION AS POLITICAL ACTION: PHILOSOPHIZING À LA RUSSE

The nineteenth century in Russia was an epoch of instigation and rapid growth of extremely diverse ideas and movements. They ranged from mystical–religious visions to socialist utopias; from idealism to “scientific” materialism; from moderate reformist programs to extreme nihilist and anarchist manifestoes. Many of these movements were characterized by active engagement with contemporary European philosophy – predominantly German idealism and French social–political thought – and its creative, often quite radical, interpretations. Ubiquitous censorship and constant governmental persecution of free-thinking did not stifle private philosophical discussions. To the contrary, they intensified the intellectuals’ profound dissatisfaction with their country’s socioeconomic conditions and their eagerness to put new ideas into practice. Long before Russian thinkers had heard of Feuerbach or Marx, they were determined to forgo theoretical speculations about the world in favor of changing it.

For young Dostoevsky and his contemporaries, philosophical education, study of European thinkers, and exchange of ideas commonly took place in informal settings: private conversations, literary salons, and kruzhki (circles or discussion groups). Having emerged from heated debates, ideas and theories found expressions in popular essays, novels, sociopolitical commentaries, literary criticism, and philosophical correspondence. William Barrett in his study of existentialism observes:

> precisely because Russia … had no developed tradition of professional or professorial philosophy there was no insulating screen between the questions and the personal passion such questions ought to arouse. The absence of a philosophical tradition, however, does not mean necessarily the absence of philosophical revelation: the

---

*2. Several of the essays in *The History of Continental Philosophy: Volume 1* address these German and French philosophical developments.*

*3. It is interesting to note that in the preceding years (late 1700s–early 1800s) the Russian language itself was considered *dialectus vulgaris*, not suitable for literary or philosophical purposes. In her book *Fiction’s Overcoat* (Ithaca, NY: Cornell University Press, 2004), Edith Clowes traces the development of Russian philosophical discourse in an atmosphere of opposition created by many intellectuals who did not believe in the possibility of expressing philosophical ideas in their native language and would rather communicate in German or French.*
Russians did not have philosophers, but they did have Dostoevsky and Tolstoy.  

From the very beginning of his intellectual career Dostoevsky was deeply immersed in the contemporary discussion. As a young writer he was sympathetic to Romantic and utopian socialist ideas, and in the late 1840s he belonged to the infamous Petrashevsky circle, an ill-fated secret society of young intellectuals. His involvement resulted in his arrest, imprisonment, and a subsequent death sentence, which, however, was commuted at the very last moment to hard labor and exile in Siberia. By his own account, the terrifying experience of being subjected to a mock execution instilled in him an insatiable feeling of the fullness of life that never failed him, even at the most unbearable moments of loss and despair. Conspicuous in his post-Siberian writings are profound meditations on human existence in the face of death coupled with a sense of passionate life affirmation.

In 1861, on his return to St. Petersburg, Dostoevsky published *Notes from the House of the Dead* – a thrilling fictional account of his Siberian impressions, offering unique insight into the criminal psyche, its violent, self-destructive impulses, and its all-too-human longing for appreciation. This book marks the birth of Dostoevsky the psychologist, or the “realist in the highest sense,” as he later came to characterize himself. The tragic, dark, and irrational traits of humanity he observed in Siberian prison continued to inform his later works. *Notes from the House of the Dead* was soon followed by Dostoevsky’s celebrated *Notes from Underground* (1864), which, one hundred and fifty years later, is still praised as one of the most poignant portrayals of modernity and its discontents.

II. DOSTOEVSKY’S UNDERGROUND

A peculiar blend of confession, psychological struggle, buffoonery, and philosophical dispute, the *Notes* is written from the perspective of a spiteful “anti-hero” who rages against the contemporary rationalist, determinist, and socialist-utopian projects. Because of its uncompromising exploration of the irrational in human nature and its precise, if bizarre, formulation of the paradoxes of freedom, *Notes from Underground* is considered a classic of existentialist literature. It is this book that deeply impressed Nietzsche, who ranked Dostoevsky as the only psychologist from whom he had something to learn. Nietzsche considered his accidental discovery of the French translation of the

---

Notes in a bookstore one of the “most beautiful strokes of fortune in [his] life,” not least because the novelist’s lacerated prose apparently challenged the philosopher by “off ending [his] most basic instincts.” Let us take a closer look at the story and its narrator.

The nameless protagonist, the “underground man,” is an intellectually agitated loner who is up in arms against some of the most influential philosophical ideas of his time. Characteristically, his attacks on “the statisticians, sages, and lovers of mankind” take the form of a personal polemic with both individual thinkers (among whom one easily discern Rousseau, Kant, and Hegel) and whole intellectual movements. In striking contrast with both Rousseau’s *l’homme de la nature et de la vérité* and Kant’s autonomous rational agent, the anti-hero describes himself as “the man of heightened consciousness”: someone who is painfully aware of the existential angst that accompanies self-reflection but who thrives on contradiction and doubt. The problem of human nature is at the very center of his diatribe and he approaches it by first taking issue with rationality as a proposed final end of humanity and reason as foundational for human existence.

“Reason, gentlemen, is a fine thing,” the underground man argues:

> but reason is only reason and satisfies only man’s reasoning capacity, while wanting is a manifestation of the whole of life – that is, the whole of human life, including reason and various little itches. And though our life in this manifestation often turns out to be a bit of trash, still it is life and not just the extraction of a square root.

Here one of the underground man’s interlocutors is the ideologue of the nihilist–socialist movement in Russia – Nicolai Chernyshevsky – whose theories were largely based on truncated versions of Feuerbach’s historical anthropologism, Comte’s positivism, and John Stuart Mill’s utilitarianism. Chernyshevsky’s “realism” efficiently reduced human nature to a sum of psychological and physiological factors: people were considered good or evil depending on their circumstances and the key to moral development lay in the improvement of social

---

5. For these and other references to Dostoevsky in Nietzsche’s writings and correspondence, see C. A. Miller, “Nietzsche’s ‘Discovery’ of Dostoevsky,” *Nietzsche-Studien* 2 (1973).

7. Nicolai Chernyshevsky (July 12, 1828–October 17, 1889; born and died in Saratov, Russia) was educated at St. Petersburg University (1846–50). His influences included Comte, Feuerbach, Fourier, John Stuart Mill, Proudhon, Ricardo, and Adam Smith. His works include *Aesthetic Relations to Art of Reality* (1855), *What is to be Done?* (1863), and *The Nature of Human Knowledge* (1885).
and material conditions. Along the same lines, his doctrine of “rational egoism” grew from the alleged psychological fact that people invariably act in accordance with their idea of what is beneficial for them. In his novel *What is to be Done?* (1863), Chernyshevsky portrayed a pleiad of “new people” – rational egoists with a socialist vision – determined to build a harmonious society of rational agents who, while seeking their own benefit, would benefit society as a whole. It is against this worldview – which stirred up a whole generation of revolutionaries and whose future admirers included Marx, Plekhanov, and Lenin – that Dostoevsky’s underground man fires his most acid remarks.

How does it happen, he asks, that all these philosophers, in calculating human profits, constantly omit one profit? Yet this omitted “profit” happens to be the most essential, “the most profitable profit,” for which some are ready to go against reason, honor, peace, and prosperity. According to the underground man, this most essential component of human existence is nothing else but *volia* – the Russian word that means at the same time “freedom,” “liberty,” “spontaneity,” “unfettered will,” and “arbitrariness.” Thus, the underground man argues:

One’s own free and voluntary wanting, one’s own caprice, however wild, one’s own fancy, though chafed sometimes to the point of madness – all this is that most profitable profit, the omitted one, which does not fit into any classification, and because of which all systems and theories are constantly blown to the devil. And where did all these sages get the idea that man needs some normal, some virtuous wanting? What made them necessarily imagine that what man needs is necessarily a reasonably profitable wanting? Man needs only *independent* wanting, whatever this independence may cost and wherever it may lead. … I believe in this, I will answer for this, because the whole human enterprise seems indeed to consist in man’s proving to himself every moment that he is a man and not a [piano key]! With his own skin if need be, but proving it. (NU 25–6, 31)

For the underground man, a human being is not merely an arbitrary creature; he is a creature that possesses the power of arbitrariness, which allows him, being “predominantly a creating animal,” at the same time to “swerve aside” and do something completely unfitting, unreasonable, and destructive. But the originality of the underground man’s message consists not in his asserting the existence of such power (although this is still something that some determinists and rationalists would dispute) but in his prescriptive claim: not only does man act out of his *volia*; he sometimes “positively must” (NU 25) live solely by *volia*, be it against reason, security, or even happiness. For the underground man, it is
precisely this primordial freedom for good or evil that makes a person who he is: a human being and not a “piano key” played on by the laws of nature.

The view of a human being as a creature endowed with freedom is not new in the history of philosophy. The question is what one understands by “freedom.” The underground man insists on a radical understanding of free will – volia, sometimes translated as “self-will” – as arbitrary, indiscriminate will, a congenital wild force that finds its expression in anything from the most sublime human deeds to the most base and cruel. Volia could be the attribute of a genius or that of a criminal, for its very nature is transgression, and it does not discriminate between creation and destruction. This view poses a serious challenge to the liberal rationalist tradition, which focuses on identifying freedom with moral autonomy on the one hand and reason on the other. This powerful existential critique is carried over to the issue of human progress in general – historical, technological, moral.

The underground man cannot help but laugh at Rousseau’s nostalgic view of the “natural” state of man and his belief that people can be brought up to rediscover their original goodness in a carefully planned civil community. He is equally dismissive of the views of modern materialists, who associate economic and technological progress with moral development and cessation of violence:

What is it that civilization softens in us? Civilization cultivates only a versatility of sensations in man, and … decidedly nothing else. And through the development of this versatility, man may even reach the point of finding pleasure in blood. Indeed, this has already happened to him. Have you noticed that the most refined blood-shedders have almost all been the most civilized gentlemen …? (NU 23)

Even a cursory glance at world history would show that no unified theory can explain all the conflicting differences, senseless suffering and sacrifice, unjustified violence and destructiveness that accompany both human achievement and failure. Yet philosophers continue to offer such theories, or metanarratives, because, as the underground man notes, “man is so partial to systems and abstract conclusions that he is ready intentionally to distort truth, to turn a blind eye and a deaf ear, only so as to justify his logic” (ibid.). This accusation, voiced earlier by the Romantics, may be equally applied to the nineteenth-century idealists and materialists.

Thus, it is suggestive that Hegel’s description of “human history as an altar on which individuals and entire nations are immolated” appears as a quick

8. To be sure, the underground man takes issue with Romanticism as well. The analysis of his critique of the Romantic tradition lies beyond the scope of the present essay.
remark in an afterword to his grand philosophical vision of the world-historical process in which conflicts get resolved as particular ends get “submerged” in the universal end.9 The Absolute Spirit develops in and through individuals and nations toward self-knowledge, rationality, and freedom;10 and while empirical history may appear tragic and disjointed, it is in effect an embodiment of the necessary dialectical movement of the Absolute.

Dostoevsky’s fictional character belongs to the generation of Russian intellectuals familiar with Hegel’s dialectics and his philosophy of history. In the 1840s it captured the minds of the educated Russians to the extent that some of them would stop speaking to each other if they disagreed over some key passage in Hegel’s work. At the time of the underground man’s writing, many versions of historical progressivism, directly or indirectly influenced by Hegel, were being developed and discussed. The underground man’s response to such attempts is quite blunt: “In short, anything can be said about world history, anything that might just enter the head of the most disturbed imagination. Only one thing cannot be said – that it is sensible” (NU 30). Moreover, even if it turned out to be the case that there is some final, reasonable, noble purpose to the existence of the human race, could this glorious end possibly justify individual sacrifices at the altar of history here and now?

What is at stake here is more than just a theoretical polemic with Hegel, the Left Hegelians or other progressivists. For Dostoevsky and for some of his philosophically inclined characters, the issue is first of all ethically and politically charged. He insists that a universal theory that dismisses the destiny of a particular person has a tendency to degenerate into an ideological dictatorship in the name of justice and future happiness of mankind. In the novels following Notes from Underground, Dostoevsky develops this theme in painstaking detail. Its psychological, ideological, and political implications unfold in the analysis of nihilism and revolutionary terror in Demons (1871–72); the same issue, among others, is presented in its metaphysical and existential complexity in the “Grand Inquisitor,” an extraordinary chapter in The Brothers Karamazov.

---

10. Interestingly, Hegel’s philosophy of history labels whole geographical regions as not capable of attaining “a distinct form in the world-historical process.” Thus, according to Hegel, Siberia is a quintessential Geist – forsaken place. It is ironic that Dostoevsky’s study of Hegel, however fragmentary, took place during his exile in Siberia, “outside history and culture.” László Földényi offers a fascinating discussion of this ironic juxtaposition in his essay “Dostoevsky Reads Hegel in Siberia and Bursts into Tears,” Common Knowledge 10(1) (2004).
The prophetic “poem” about the Grand Inquisitor is a culmination of Dostoevsky’s lifelong preoccupation with a cluster of problems surrounding the human quest for freedom. The ninety-year-old Inquisitor is a literary creation of one of Dostoevsky’s beloved characters, a passionate young philosopher–dilettante, Ivan Karamazov. Ivan tells the story to his brother Alyosha, an aspiring monk.

The poem imagines the second coming of Christ and is set in the dark and gloomy days of the Spanish Inquisition. In the hot streets of Seville, where hundreds of heretics are burned every day, the Grand Inquisitor recognizes Christ and orders his guards to take him to prison. Their conversation–or rather the Inquisitor’s monologue, for Christ is silent throughout the poem–takes place in the dungeon of the Sacred Court. The story of the three temptations of Christ in the desert becomes the pivot of their encounter. The Grand Inquisitor dramatically asserts that in the three temptations, or questions posed by the wise spirit in the desert, “all of subsequent human history [was] as if brought together into a single whole and foretold; three images [were] revealed that will take in all the insoluble historical contradictions of human nature over all the earth.”11

The Grand Inquisitor’s words reveal Dostoevsky’s own perception of the “scale of the event.”12 For him the three questions represent, in the most forceful and concentrated form, the three ultimate challenges of the human condition: the need for material comfort and security; a longing for spiritual guidance that would alleviate the existential anxiety associated with freedom of choice; and, finally, a quest for universal harmony and the unity of all people on earth. All three are also the supreme expressions of a human being’s search for happiness.

The Grand Inquisitor powerfully questions the motivation of his prisoner, who apparently was given the opportunity to address these needs on behalf of humanity but rejected the offer. How could Christ, who loves people and knows their aspirations and weaknesses, refuse to alleviate their physical suffering and their spiritual angst? The cardinal accuses Christ:

---

12. Thus, addressing one of the readers of his Diary of a Writer, Dostoevsky stresses that “in the temptations of the devil are blended three colossal universal ideas and after eighteen centuries the more difficult of these ideas have not and still cannot be settled” (“Letter to V. Alekseev of June 7, 1876,” in Polnoe sobranie sochinenii v tridsati tomakh [Complete collection of Dostoevsky’s writings in 30 volumes], G. M. Fridlender [ed.] [Leningrad: Nauka, 1986], vol. 29(II), 84–5, my translation).
Instead of taking over men's freedom, you increased it and forever burdened the kingdom of the human soul with its torments. You desired the free love of man, that he should follow You freely, enchanted and captivated by You. Instead of the firm ancient law, man had henceforth to decide for himself, with a free heart, what is good and what is evil, having only Your image before him as a guide – but did it not occur to you that he would eventually reject and dispute even Your image and Your truth if he was oppressed by so terrible a burden as freedom of choice? .... Is it the fault of the weak soul that it is unable to contain such terrible gifts? Can it be that you indeed came only to the chosen ones and for the chosen ones?

(BK 255–6)

Initially as a follower of Christ, the Grand Inquisitor himself spent years in the wilderness preparing for the spiritual ordeal. Yet, unlike Christ, he “awoke” and refused to “serve madness” (BK 260). His decision was based on his penetrating knowledge of human nature, which, according to him, Christ deliberately ignored in the name of a higher ideal. He bitterly questions his prisoner as to how he could treat people as equals and expect them to transcend their limited nature. By contrast, the Inquisitor claims to be committed to people's happiness and security and he does not ask for anything that is beyond his subjects' abilities.

The cardinal's monologue deepens into an almost biblical rhetoric when he accuses his prisoner of not loving humanity at all. He goes so far as to suggest that Christ himself must be a messenger from Hell because of the unbearable suffering and unhappiness his Promethean gifts have brought to the poor rebels. What people need, according to the Grand Inquisitor, is not freedom but an illusion of freedom; radical freedom for good or evil not only demands too much; it breeds anxiety, uncertainty, and misery. Furthermore, even for God's elect a quest for spiritual freedom proves to be a double-edged sword: the stronger one becomes, the more susceptible one is to the ideas of spiritual superiority and domination.

The perennial conflicts between freedom and happiness, freedom and security, freedom and human nature, are not resolved within Ivan's poem. According to Dostoevsky's design, The Brothers Karamazov as a whole functions as a response to the Grand Inquisitor. “The burden of freedom” becomes the central theme for later existentialists, most notably for Sartre, who famously proclaimed that we are “condemned to be free.”

forfeit one’s freedom. Indecisiveness, indifference, cowardice, and weakness are not just human traits; they are chosen attitudes. At the same time, no attitude ever defines a human being completely. Even under the direst of circumstances, a human being remains freedom incarnate and no one can deprive him of that. Yet, the Grand Inquisitor’s question still stands: why does one have to live under the curse of freedom? What is wrong with one’s freely choosing a comfortable bondage? In other words, by urging individuals to take full responsibility for their character and destiny, Sartre seems to be putting an unrealistically positive spin on what the Grand Inquisitor brilliantly identifies as the central existential–spiritual challenge of humanity: our burning desire for independence and our inability to bear the burden of ultimate existential responsibility.

It may seem as if at the beginning of the twenty-first century, after the collapse of several sinister totalitarian systems, we have achieved a much better understanding of the consequences of forfeiting freedom in favor of material security and peace of mind. Some protest banners used in the demonstrations in East Germany in 1989 before the fall of the Berlin Wall directly invoked der Gross Inquisitor as a symbol of ideological enslavement, deception, and brazen contempt for humanity disguised as love and care.14 However, despite crucial shifts on the contemporary political stage, it is far from obvious that we have learned enough from Dostoevsky’s psychological and political insights. Dostoevsky clairvoyantly predicted the rise and fall of totalitarian regimes; yet most importantly, he spoke of the totalitarianism of the mind, which, in its many forms, ranges from banal domestic despotism and degrading paternalism to sophisticated operations of self-tempting consciousness that act on behalf of all suffering humanity. This internal enslavement still looms large in the aftermath of the massive twentieth-century struggles for political liberties and economic independence. For example, one is prompted to ask why Russia, the country that produced so many “fanatics of freedom,” the birthplace of modern anarchism and nihilism, the testing ground of all possible revolutionary lunacies, keeps losing its battle with the shadow of the Grand Inquisitor.

At the beginning of the twentieth century, Nikolai Berdiaev15 offers one of the most perceptive commentaries on the phenomenon of totalitarianism. Taking Dostoevsky’s “Grand Inquisitor” as a point of departure, Berdiaev eloquently describes dangerous metamorphoses of libertine mentality into a tyrannical

15. Nikolai Berdiaev (March 6, 1874–March 24, 1948; born in Kiev, Ukraine; died in Paris, France) was educated at the University of Kiev (1894–98). His influences included Dostoevsky, Hegel, Kant, Marx, Nietzsche, and his works included The Meaning of the Creative Act (1916), The Meaning of History (1923), Dostoevsky’s Worldview (1923), The Origin of Russian Communism (1937), and Slavery and Freedom (1939).
Dostoevsky and Russian Philosophy

one. Thus, in the *Origin of Russian Communism* and the *Russian Idea*, Berdiaev exposes the pseudoreligious, messianic rhetoric of Russian revolutionaries and predicts the devastating consequences of the state-sponsored ideological infiltration of people’s conscience. According to Berdiaev, all radical movements in Russia, including nihilism and Marxism, were man-created religions, illegitimate children of Orthodox mysticism. As such, they may all claim the Grand Inquisitor as their forefather. Berdiaev’s brilliant work in Christian existentialism, personalism, and philosophy of creativity during his exile years in Europe (1922–48) exhibit a clear mark of Dostoevsky’s influence. And his heroic attempts at keeping philosophy alive in Bolshevik Russia before he was forced to leave the country reflect his devotion to the individual freedom of conscience which both he and Dostoevsky so passionately defended.

IV. DOSTOEVSKY’S LEGACY: UNDERGROUND AND BEYOND

Dostoevsky’s well-known critique of scientism, positivism, and utilitarian ethics aligns him with the continental tradition, as does his wariness of the alleged power and coherence of rational discourse. He masterfully depicted the precarious metaphysical situation of a modern man who finds himself confronted with a world that defies rational explanations. Reason demands consistency, intelligibility, order; it craves justice and purpose. But life is ambiguous and messy; it does not cater to rational demands. Yet it would be a mistake to view Dostoevsky as an antirationalist, for he does not oppose reason as such. Instead, he rejects the hegemony of abstract reasoning that tends to subsume the paradoxes and controversies of human existence under the laws of necessity and universality. Albert Camus, whose encounter with Dostoevsky has been aptly described as “intellectual intoxication, a life-time attraction, due to a genuine

---

16. As early as 1901, Vladimir Lenin identified Berdiaev as someone he and his comrades “need to smash and not just his philosophy.” Shortly after coming to power, Lenin ordered the arrest and deportation of many writers and scholars, whom he considered “the lackeys of capital.” In the summer of 1922, 160 intellectuals and their families, Berdiaev among them, were involuntarily sent abroad on two German cruise ships that later became known as “philosophy steamers.” See Lesley Chamberlain, *Lenin’s Private War: The Voyage of the Philosophy Steamer and the Exile of the Intelligentsia* (New York: St. Martin’s Press, 2007).

*17. Other representatives of Christian existentialism and personalism are discussed in essays by Felix Ó Murchadha and Andreas Grossman in *The History of Continental Philosophy: Volume 4*.

and deep affinity,”19 made much of this tragic confrontation between the mind and the world. In the exploration of his two major themes – philosophy of the absurd and rebellion – Camus continually chooses Dostoevsky’s characters as his interlocutors because of their unprecedented openness to the absurd and the paradoxical.20

Likewise, many of Jean-Paul Sartre’s novellas and plays invoke both Dostoevsky’s protagonists and his major themes. Sartre’s heroes engage in Dostoevsky-inspired self-experiments when they rebel against conventional values and principles, drive themselves to the limit in political action, and reflect on their own thinking to the point of nausea. The novelist and the philosopher also converge in their penetrating depictions of self-deceiving consciousness and their belief in the dynamic volatility of human personality and intention.

As a champion of paradoxes and contradictions, Dostoevsky is often linked to Kierkegaard, Nietzsche, and Kafka. Kierkegaard once said that “the thinker without the paradox is like the lover without passion – a mediocre fellow.”21 Neither Dostoevsky nor his protagonists could ever hope to be seen as mediocre on this count. Paradox is a driving force behind many transformations of characters and ideas in his novels: hyperconsciousness paralyzes thinking in the underground; Demons and The Brothers Karamazov flesh out horrific mutations of freedom into tyranny and humanism into unabashed misanthropy; libertarian ideas solidify as suffocating dogmas; social reformers prove to be degenerates; and revolutionaries become ruthless dictators.22

These mutations are closely connected with another “continental” theme of Dostoevsky’s art, namely, his preoccupation with the gap between abstract principles and their practical consequences, between conjuring up theories and living them through. Take the underground man’s revolt against “bookishness” and his glorification of “living life.”23 It is, of course, deeply ironic that the denizen of the underground, an avid reader, compulsive writer, and himself a literary creation, would rage against the written word; it is also bizarre to hear the life-affirming speech from someone who spends most of his energy assiduously avoiding life. Yet quite true to his intent to depict a “paradoxalist,”

20. For detailed study of the connection between Dostoevsky and Camus, see, for example, Ray Davison, Camus: The Challenge of Dostoevsky (Exeter: University of Exeter Press, 1997).
23. The “living life” is a theme that runs through all Dostoevsky’s post-Siberian novels. Notes from Underground contains one of its early expressions.
Dostoevsky again entrusts his anti-hero with the task of delivering a speech on a modern intellectual’s terror in the face of life:

[W]e’ve reached a point where we regard real “living life” as almost a labor, almost a service, and we all agree in ourselves that it’s better from a book …. Leave us to ourselves, without a book, and we’ll immediately get confused, lost – we won’t know what to join, what to hold to, what to love and what to hate, what to respect and what to despise. It’s a burden for us even to be men – men with real, our own bodies and blood; we’re ashamed of it, we consider it a disgrace, and keep trying to be some unprecedented omni-men. We’re stillborn, and have long ceased to be born of living fathers, and we like this more and more. We’re acquiring a taste for it. Soon we’ll contrive to be born somehow from an idea.  

(NU 129, 130)

In this passage one hears Dostoevsky’s own voice with an adamant diagnosis of his society and his century. The novelist’s portrayal of tragic estrangement from life and the hypertrophy of self-defeating consciousness, two maladies of modernity, fits quite well with the philosophical sensibilities most clearly pronounced in Kierkegaard and Nietzsche.

As we have already seen, the other leading underground motifs are obvious forerunners of existentialism. The narrator is an impersonation of raging individuality. He insists that some differences cannot and should not be reconciled; that freedom and rationality often clash in a grave conflict; that the human condition is not a sum total of observable social and psychological influences; and that life is irreducible to the laws of nature. The avid rejection of reason as a source of meaning, on both the individual and the global level, would become a common theme in twentieth-century philosophy and literature, as would the underground man’s uncompromising focus on radical freedom, with all the misery and anxiety accompanying it.24

24. Joseph Frank thus characterizes the appeal of the anti-hero: “The term ‘underground man’ has become part of the vocabulary of contemporary culture, and this character has now achieved – like Hamlet, Don Quixote, Don Juan, and Faust – the stature of one of the greatest archetypal literary creations. No book or essay dealing with the precarious situation of modern man would be complete without some allusion to Dostoevsky’s explosive figure. Most important cultural developments of the present century – Nietzscheanism, Freudianism, Expressionism, Surrealism, Crisis Theology, Existentialism – have claimed the underground man as their own or have been linked with him by zealous interpreters; and when the underground man has not been hailed as a prophetic anticipation, he has been held up to exhibition as a luridly repulsive warning” (Dostoevsky: The Stir of Liberation, 1860–1865 [Princeton, NJ: Princeton University Press, 1986], 310).
The underground is also the place where Dostoevsky’s famous narrative style first takes shape. The very manner in which the anti-hero addresses his reader—whether in the form of self-mocking confession, sarcastic questioning, provocation, or insult—was eagerly adopted by twentieth-century authors as a form of literary philosophizing. Indeed, why would someone suspicious of reason’s ability to address vital, painful questions of human existence resort to systematic rational argumentation? As Lev Shestov pointed out, Dostoevsky’s *Notes from Underground* can be considered the most effective and consistent critique of pure reason because it manages to capture the convulsive movements of the irrational and the absurd.

Following Shestov’s lead, Camus in *The Myth of Sisyphus* scorns the “thesis-writers” whose speculations serve to support a preconceived idea but could never reach the depth of insight characteristic of “philosophical novelists.” In his writings and interviews, Camus never fails to credit Dostoevsky as one of the greatest masters of philosophical narration. But what exactly is the style of Dostoevsky’s literary philosophizing? While some commentators emphasize Dostoevsky’s fascination with irrationality and contradiction, others defend the analytical and argumentative aspects of his work.25 Volumes have been written, in the spirit of Mikhail Bakhtin’s classic, *Problems of Dostoevsky’s Poetics*, on the dialogic–polyphonic nature of Dostoevsky’s writing, the style that corresponds to the challenge of depicting the ambiguity of the themes he was set to explore. These features of Dostoevsky’s narrative style have been much studied and there is no need to revisit them here. It is a less popularized connection between Dostoevsky and the acclaimed “masters of suspicion” that I would like to discuss.

In their recent book on Dostoevsky and modernity, Travis Kroeker and Bruce Ward suggest that the novelist should be recognized as a preeminent teacher within the “school of suspicion.” They write:

> Was it not Dostoevsky, before Nietzsche and before Freud, who began to teach readers to observe what a character reveals only in order then to ask: “What is it supposed to hide? From what is it supposed to distract our attention?” The underground man, himself the most striking early instance of the artistic embodiment of *hinterfragen*, prods, even bullies the reader into an attitude of suspicion …. To seek meaning in Dostoevsky’s work is not simply a matter of explicating the consciousness of meaning but of “attempting to decipher its expressions.”26

---

Indeed, Dostoevsky not only practiced the “hermeneutics of suspicion,” but he kept perfecting this technique throughout his career. In the Grand Inquisitor’s monologue and surrounding chapters, it reaches its pinnacle. The story of Christ’s ordeal, the Inquisitor’s own story, and their setting within Ivan’s conversation with Alyosha invite the reader to decipher a whole cluster of hidden motives: the Grand Inquisitor seduces people and he was himself seduced by the wise spirit; the cardinal’s speech, the aim of which is to tempt Christ, is itself a reflection of Ivan’s tempted consciousness. Ivan’s poem becomes an epicenter of his larger argument, whose seductive power is eventually turned on Alyosha; finally, behind all these layers there is Dostoevsky – the tempted and the tempter. In confronting his heroes with the “cursed questions” with which he struggled all his life, the novelist invites his readers to share the struggle and question their own deepest commitments.

With this multilayered narrative methodology, Dostoevsky not only establishes a personal dialogue with the reader but also effectively calls into question the traditional philosophical approach to the problem of truth. While the rationalists put an emphasis on what is being said, their critics would shift the focus on how and by whom it is said. Kierkegaard’s famous rendering of truth as subjectivity drives the point home: the only truth that matters is sustained in the existing individual’s committed, passionate relation to it. It is precisely what Kierkegaard calls “the inward ‘how’” that Dostoevsky is depicting through an extraordinary array of diverse characters. He also speaks directly about one’s relation to one’s truth, if only in the underground man’s merciless internal dialogue with himself:

You thirst for life, yet you yourself resolve life’s questions with a logical tangle. And how importunate, how impudent your escapades, yet at the same time how frightened you are! … You may indeed have happened to suffer, but you do not have the least respect for your suffering. There is truth in you, too, but no integrity; out of the pettiest vanity you take your truth and display it, disgrace it, in the market place …. You do indeed want to say something, but you conceal your final word out of fear, because you lack the resolve to speak it out, you have only cowardly insolence. (NU 38)

As both Kierkegaard and Dostoevsky knew very well, it is not enough to know or tell the truth; one must live it and be truthful to it. Yet Dostoevsky would not be himself if he did not allow this very truth to be subverted as well. The anti-hero remarks snidely: “To be sure, I just made it all up. This, too, is from underground” (ibid.). The seemingly genuine, living words about truth and integrity are dropped like lifeless fossils. By making this happen, Dostoevsky
shows that it would take much more than bloodless moralizing to bring back to life a deprived, unloved, spiteful anti-hero disabled by endless self-reflection.

The distinction between the abstract truth of speculative philosophy and the personal, passionate truth of a living individual separates two incommensurable ways of philosophizing. As I mentioned at the beginning, Russian philosophy, for all the diversity of its subject matter, has always been characterized by engagement and existential commitment. For better or worse, the risk-taking nature of Russian philosophy, its favoring of ideas for which one could live or die, was a powerful symptom of the intellectual climate in which Dostoevsky wrote. This intellectual energy of the epoch was creatively transformed in Dostoevsky’s novels, whose tremendous success in turn inspired many European and Russian thinkers and legitimized the connection between philosophy and literature.

Indeed, it is one of Dostoevsky’s greatest artistic achievements that in his novels he created a unique forum for personal, engaged discussions of the most pressing philosophical questions, the questions that the readers of the twenty-first century still find vitally relevant. In an impassioned speech at the recent International Dostoevsky Symposium, the prominent Dostoevsky scholar Robert Louis Jackson said:

Dostoevsky is ours. We were educated on him, he is native to us, he is reflected everywhere in European development. His moral vision, his spiritual outlook, his profound understanding of the human psyche, his grasp of the deep crises of our times – the crisis of faith, of reason, of the moral principle itself, and of the ideal, and above all his deep humanity and sensitivity to suffering – all this, embodied in the imagery of sublime art – is our heritage.27

Undoubtedly, Dostoevsky’s legacy is present everywhere; for this reason any study that focuses on thematic connections between his art and a whole intellectual tradition (in this case continental philosophy) is bound to be incomplete. In this essay, structured around Dostoevsky’s philosophy of freedom and his critique of rationality, many Russian and European thinkers, as well as many topics, remain unexplored. However, I hope that my brief study nonetheless succeeds, at least in part, in conveying the philosophical depth and complexity of the novelist’s contribution to the development of some distinctly “continental” themes.

MAJOR WORKS

5
LIFE AFTER THE DEATH OF GOD:
THUS SPOKE NIETZSCHE

Daniel Conway

The madman jumped into their midst and pierced them with his eyes. “Whither is God?” he cried; “I will tell you. We have killed him – you and I. All of us are his murderers. But how did we do this? How could we drink up the sea? Who gave us the sponge to wipe away the entire horizon? What were we doing when we unchained the earth from its sun? Whither is it moving now? Whither are we moving? Away from all suns? Are we not plunging continually? … Are we not straying as through an infinite nothing?”

(Friedrich Nietzsche, The Gay Science, §125)

As we approach the close of the first decade of the twenty-first century, no European philosopher of the nineteenth century is more influential, notorious, and controversial than Friedrich Nietzsche.1 Even Marx, who not so long ago was reviled as the gray eminence behind the red menace – and, so, as the scourge of free-market democratic societies throughout the West – is now regarded as far less relevant, and considerably less threatening, than Nietzsche. Whereas Marx is now widely regarded as passé, which may explain why scholars are free to introduce his “revolutionary” ideas to impressionable college students, Nietzsche presents an enduring, dangerous temptation to young people, malcontents, outcasts, loners, free-thinkers, subversives, sociopaths, iconoclasts, and

1. Friedrich Wilhelm Nietzsche (October 15, 1844–August 25, 1900; born in Röcken, Germany; died in Weimar) was educated at the University of Bonn (1864–65) and the University of Leipzig (1865–69). His influences included Burckhardt, Dostoevsky, Emerson, Schopenhauer, Voltaire, and Wagner, and he held an appointment in classical philology at the University of Basel (1869–79).
free spirits. The persistence of his influence and notoriety is attributable to a
diverse array of insights, allegations, pronouncements, and provocations – he
was, after all, a master aphorist and sloganeer – but one teaching in particular
stands out as quintessentially Nietzschean: the death of God. Even those who
know nothing else about Nietzsche know that he dared to announce the death
of God and that he has been memorialized for having done so by poets, play-
wrights, anarchists, and graffiti artists.2

As it is popularly understood, in fact, this signature teaching neatly divides
Nietzsche’s disciples and defenders from his enemies and critics. For those
who have suffered and stumbled under the burdens of divine law, original sin,
Church dogma, and ecclesiastical authority, Nietzsche’s announcement of the
death of God heralds the possibility of a life of unimagined independence and
unprecedented freedom of thought and action. Such readers would happily live
without the constraints, order, and guilt that are popularly associated with God,
organized religion, and morality. For those who have drawn sustenance and
support from the traditions and routines associated with the practices native
to Christianity, Nietzsche’s announcement of the death of God augurs a poten-
tially terrifying slide into relativism, uncertainty, disorientation, and chaos. With
respect to Nietzsche’s teaching of the death of God, both camps agree, one is not
free to remain indifferent. The presumed authority of God has simply meant too
much for too long to too many Europeans for Nietzsche’s readers to fail to form
an opinion one way or the other.

Both camps also agree that Nietzsche fully intended for this teaching to
provoke his readers and to contribute thereby to the realization of its stipu-
lated truth. This teaching is typically received, that is, not as a simple state-
ment of fact, along the lines of a conventional obituary, but as a rallying cry and
galvanizing call to action. The intended perlocutionary effects of Nietzsche’s
teaching are generally recognized as twofold: (i) it is meant to expose the vulner-
ability of Christian authority to internal and external challenges; and (ii) it is
meant to encourage Nietzsche’s readers to probe and exploit this vulnerability,
by any means available to them. As we might expect, the value of these perlocu-
tionary effects is assessed very differently by the two camps. Whereas Nietzsche’s
supporters cheer his efforts to challenge the authority of the Church and the
viability of Christian morality, his critics warn that civil society may not survive
a reckless, intemperate assault on its sustaining institutions. Nietzsche’s teaching
is thus received as enfl aming the embers of rebellion – and, it must be said, of

---

2. Peter Berkowitz, for example, asserts that “The death of God is the great speculation that
drives Nietzsche’s contest of extremes” (Nietzsche: The Ethics of an Immoralist [Cambridge,
MA: Harvard University Press, 1995], 2). He also points out that Nietzsche offers very little
by way of evidence in support of this speculation (ibid., 270–71).
resentment – that lie smoldering within so many of his late modern European readers. Those readers who find themselves drawn to both Nietzsche and Marx, for example, may discover that the source of this dual attraction lies in the anarchic implications of their respective (and very different) confrontations with European modernity.

It is generally agreed, moreover, that Nietzsche did not intend to restrict the challenge encoded in this teaching to the relatively narrow precincts of religion and theology. His declaration of the death of God is understood to report an escalating crisis of confidence that permeates (and weakens) all spheres of endeavor that fall under the general umbrella of late modern European culture. His teaching of the death of God thus issues a challenge to all forms of traditional or conventional authority, regardless of whether they are social, political, aesthetic, cultural, or ecclesiastical in nature. As such, this teaching is understood to underwrite a generic declaration of independence from the established order in all of its familiar manifestations.

That this teaching was intended to provoke is perhaps beyond dispute. But how well known is the content of this teaching? How many of Nietzsche's readers venture beyond their initial impressions of this teaching, whether pro or contra, to explore its intended meaning? Most readers, confident in their immediate, prereflective grasp of the truth or blasphemy this teaching conveys, never pause to ask after the full meaning of the death of God. On the one hand, self-assured atheists, staunch humanists, and confirmed secularists are all certain that Nietzsche, much like Feuerbach before him, meant to expose the God of Christianity as a persistent infantile fantasy, as a psychological projection of those virtues that humankind has been unwilling, until now, to acknowledge as its own. For such readers, the announcement of the death of God is supposed to put an immediate end to a pernicious fiction that has retarded the spiritual and emotional maturation of humankind. On the other hand, devout and sympathetic Christians are just as certain that Nietzsche wishes to subvert the authority of the Church, precisely so that he might deprive civil society of its single most reliable stabilizing institution. They point, plausibly, to the ongoing authority of the Church and to the continued relevance of the altruistic virtues that are integral to the practice of Christian morality.

In both cases, or so it would seem, the rhetorical success of Nietzsche's teaching has been achieved at the expense of a more general appreciation of the philosophical complexity of its motivating insight. As we will see, in fact, Nietzsche's philosophical insight is far less scandalous in its totality than its most provocative rhetorical presentations would tend to suggest. It is not meant, for example, either as an affront to Christian theology or as a challenge, narrowly construed, to the ecclesiastical authority of the Church. Rather than ridicule Christians for their persistent belief in a deceased deity, Nietzsche’s teaching
actually explains both why and how the belief in God has become inextricably entangled with those other beliefs that collectively have sustained the development and expansion of European civilization. As slogans go, in fact, we could do much better. *God is dead* is not nearly as close a fit to Nietzsche’s signal insight as, for example, *The end is near.*

### I. NIETZSCHE’S LIFE

Friedrich Wilhelm Nietzsche was born on October 15, 1844, in the village of Röcken, in Prussian Saxony. The son and grandson of Lutheran ministers, young Fritz spent his early years in and around the local parsonage. Bereaved early on by the premature deaths of his younger brother and father, he was raised in a matriarchal household that included his mother, grandmother, maiden aunts, and sister. Finding solace in his books, his music, and in the Pietism of his family, he acquired early on the serious, reflective cast of mind that would suit him for a life of quiet study and contemplation.3

After the death of his father in 1849, his mother moved the family to the town of Naumburg, where young Fritz attended the local *Gymnasium*. He was later selected for matriculation at the prestigious boarding school in Pforta, where he received a traditional education in classical studies. At the University of Bonn, he initially studied theology before studying classical philology under the direction of Friedrich Ritschl (1806–76), whom he subsequently followed to the University of Leipzig. Largely on the strength of Ritschl’s effusive recommendation, Nietzsche was appointed in 1869 to the Chair in Classical Philology at the University of Basel in Switzerland, even though he had not yet completed the requirements for his doctorate.

Nietzsche’s tenure at Basel was interrupted by military service (as a medical orderly in the Franco-Prussian War), punctuated by recurring bouts of illness, and clouded by a growing sense of disenchantment with the field of academic philology. While posted at Basel, he published a number of books and essays, which failed to attract the (positive) attention he thought they deserved. Citing poor health, he resigned his university appointment in 1879 and was granted a modest pension from the Swiss government.

Nietzsche spent the remainder of his sane life writing books and leading a nomadic existence. In restless pursuit of a more suitable climate for his various

---

maladies – he was unusually sensitive to even slight variations in temperature, atmosphere, and climate – he shuttled regularly between the Upper Engadine region in Switzerland and various destinations in Italy, including Venice, Nice, and Turin.\(^4\) In this prolific postacademic period of his career, Nietzsche slowly began to acquire an international reputation as a thinker and critic.

In January 1889, Nietzsche’s sanity and philosophical career came to an abrupt end. As legend has it, he collapsed into madness while protecting a carriage horse from the cruel blows of its driver.\(^5\) After a brief period of hospitalization in Basel, followed by a year-long period of institutionalization in Jena, he returned with his mother to her Naumburg home. In 1893, Nietzsche and his mother were joined in Naumburg by his sister, Elisabeth, the opportunistic widow of Bernhard Förster, a prominent Aryan supremacist whom Nietzsche had despised. Elisabeth had married Förster against the wishes of her brother, who refused to attend their wedding ceremony and subsequently broke off all contact with them. Shortly after their wedding, Elisabeth and her new husband sailed for Paraguay, where they contributed to the founding of a colony devoted to the protection of the purity of the Aryan race.\(^6\)

Following the suicide of her husband and the failure of their colonial adventure in Paraguay, Elisabeth returned to Germany and promptly set out to capitalize on her estranged brother’s growing fame and reputation. She fostered a cult-like enthusiasm for Nietzsche’s books and teachings, oversaw the founding of the Nietzsche Archive, and eventually convinced their mother to cede to her (and a cousin) the trusteeship of Nietzsche’s writings. At the time of their mother’s death in 1897, Elisabeth had already moved her brother and the archive to Weimar, where she redoubled her efforts to exploit his fame and notoriety.

Nietzsche finally died on August 25, 1900. Against his wishes, he received a traditional Protestant funeral service and burial, authorized by his friend and amanuensis, Heinrich Köselitz (aka Peter Gast). Following his death, Elisabeth oversaw the renovations of the Nietzsche Archive, from which she launched her aggressive campaign to promote international interest in what she understood to be the political expression of her brother’s philosophy. In the process of steering her brother’s teachings into progressively closer conformity with her own (strongly nationalistic) convictions, she offered her brother’s reputation and legacy to admirers such as Mussolini and Hitler, each of whom claimed to

find inspiration in Nietzsche’s writings.7 Elisabeth Förster-Nietzsche died in Weimar in 1935. Her lavish, state-sponsored funeral was attended by none other than der Führer himself.8

II. NIETZSCHE’S WRITINGS

Nietzsche’s first book, The Birth of Tragedy from the Spirit of Music (1872), is now widely esteemed as a classic text of nineteenth-century European philosophy. His seminal insight into the Dionysian roots of Greek tragedy has been confirmed beyond reasonable dispute. In the nineteenth century, however, the received opinion of Professor Nietzsche’s first book was strongly negative, owing in large part to the author’s apparent disdain for the scholarly customs and manners of academic philology. Still, no critic was as unrelenting as Nietzsche himself. In 1886, he issued a new edition of The Birth of Tragedy, as it was to be known henceforth, to which he appended a preface entitled “An Attempt at a Self-Criticism.” In this brief preface, Nietzsche lampooned the romantic sentimentalism of his youth, exposed and lamented the influences of Arthur Schopenhauer and Richard Wagner, and generally chastised himself for continuously misplacing his central insights. Later, in Ecce Homo (1888), he took another swipe at his first book, ridiculing its Hegelian pretensions while celebrating the “tremendous hope [that] speaks out of [it]” (EH:bt 4).9

Nietzsche followed The Birth of Tragedy from the Spirit of Music with his four Untimely Meditations, wherein he articulated his unorthodox (= “untimely”) reception-cum-judgment of four influential intellectual trends of his day: the deflationary, miracle-debunking Christology of David Friedrich Strauss (1808–74), which he exposed as symptomatic of the creeping philistinism of the newly unified Reich (David Strauss, The Confessor and Writer); the Hegelian and neo-Hegelian fascination with history, which he identified as potentially disadvantageous for life itself (The Uses and Disadvantages of History for Life); the pessimism of Schopenhauer, whose salutary influence on his own development he presented as emblematic of genuine education (Schopenhauer as Educator); and the larger cultural significance of Richard Wagner’s move from Tribschen

9. Citations identify Nietzsche’s works using abbreviations as follows: The Antichrist (A); Beyond Good and Evil (BGE); The Birth of Tragedy (BT); Ecce Homo (EH); On the Genealogy of Morality (GM); The Gay Science (GS); Twilight of the Idols (TI); Thus Spoke Zarathustra (Z). Lower case instances of these abbreviations refer to Nietzsche’s reviews of his “good books” in Ecce Homo. Roman numerals refer to parts of a work, Arabic numerals refer to sections rather than to pages, and P refers to prefaces.
to Bayreuth, which was to become synonymous with the annual music festival staged there (Richard Wagner in Bayreuth).

In preparation for his next book, Human, All Too Human (1878–80), 10 Nietzsche abandoned the essay form and began to perfect the aphoristic style for which he is now well known. Human, All Too Human constitutes his first attempt to illuminate the rudiments of moral psychology and moral epistemology. He continued these efforts in his next two books, Daybreak (1881) and The Gay Science (1882), wherein he endeavored to expose the basic “prejudices” (or unexamined presuppositions) of contemporary morality.

Nietzsche’s most influential book was Thus Spoke Zarathustra, which was published in four parts over the period 1883–85. Although originally envisioned as a tripartite work, culminating in the central character’s lyric expression of love for eternity, Zarathustra also comprises a parodic fourth part that places into question the larger aims (and accomplishments) of the book. The central character, modeled loosely on the Persian prophet Zoroaster, is best known for his peripatetic teaching of the Übermensch, which has been widely received as conveying Nietzsche’s postmoral, post-theistic ideal of human (or transhuman) flourishing. Throughout the course of his travels, however, Zarathustra is routinely frustrated by his failure to disseminate this novel teaching to his disciples. Convinced that his obtuse auditors are largely responsible for this failure, he experiments with various forms of delivery and address while attempting to tailor his teaching to the diverse audiences he encounters. These experiments are punctuated by his occasional retreats to, and returns from, the solitude of his mountaintop cave, where he reflects on his pedagogical successes and develops his plans for establishing an improved rapport with his auditors.

As Nietzsche explains in Ecce Homo, he devoted his post-Zarathustran writings to the task of cultivating a sympathetic readership for his Zarathustra (EH:bge 1). Toward this end, he endeavored in his first post-Zarathustran book, Beyond Good and Evil (1886), to expose the illusions, fictions, and prejudices that have dominated the practice of philosophy and science thus far and stalled their progress. In support of this endeavor, he advanced a sustained criticism of the metaphysical oppositions on which philosophers have typically relied for their normative evaluations, recommending instead a more nuanced appreciation for the (non-oppositional) differences that obtain between varying perspectives, shades, and gradations. Having exposed the prejudices at work in

10. When Nietzsche authorized a new, two-volume edition of Human, All Too Human in 1886, he bundled together the original book (now Volume I), the Assorted Opinions and Maxims that he had published in 1879 as an “Appendix” to Human, All Too Human (now Volume II, Part One), and The Wanderer and His Shadow, which he originally had published late in 1879 as a separate work (now Volume II, Part Two). See Young, A Philosophical Biography of Friedrich Nietzsche, 564–66.
contemporary philosophy and science, he then interpreted the currency of these prejudices as symptomatic of the decline and disintegration of European culture. The recommended emigration “beyond good and evil” would happily coincide, he believed, with the renewal of a distinctly European culture.

In On the Genealogy of Morality (1887), Nietzsche advanced his influential hypothesis that contemporary Christian morality is descended from an ancient slave morality, which arose in reaction and response to the oppressive material conditions that both expressed and reinforced the primacy of a historically prior noble morality. Although the material conditions of slavery have largely disappeared from late modern Europe, the servile pedigree of contemporary Christian morality is apparent in its beatification of suffering and inwardness, its praise for the virtues of passivity and hostility toward the virtues of activity, its simplistic opposition of “good” to “evil,” its allegiance to the ascetic ideal, and its orientation to reward (and revenge) in a promised afterlife. By employing terms that immediately recall Hegel’s famous “master–slave dialectic,” Nietzsche hoped to correct for what he perceived to be the undue optimism of Hegel’s familiar story. Without discounting the importance of the struggle for recognition in the formation and maturation of the self, Nietzsche wished to disclose the full, sordid truth of the triumph of the “slave” over the “master.” Rather than lead to the development of self-consciousness and the proliferation of political freedom, the victory of the self-loathing “slave” may eventuate in the eradication of nobility and the extinction of the human species.

The slave revolt in morality is Nietzsche’s term for the process that culminated in the founding of a morality in which unwarranted suffering is honored as the primary index of one’s “goodness.” The noble morality, he explains, was predicated on the virtues of spontaneous self-assertion, uncompromising self-possession, and martial physicality. Noble types naturally and instinctively celebrated themselves (and everything pertaining or belonging to them) as good (gut), while regarding everything and everyone else as common or bad (schlecht). By way of contrast, slavish types always launch their evaluations by first denouncing the hostile external world against which they must struggle. The slaves pronounce their masters evil (böse), and only as an afterthought proclaim themselves good on the basis of the suffering they endure. The most enduring and potent creation of the slave morality is thus a triumph of recategorization: Those deemed good by the noble morality are in fact evil. Whereas someone or something deemed bad by the noble morality is thereby marked as common, other, different, and therefore insignificant, someone or something deemed evil by the slave morality is thereby marked as lacking adequate warrant to continue to exist as such.

The psychological key to the slave revolt in morality is the creative expression of ressentiment (or resentment), which Nietzsche identifies as the propensity of
the slave type to repudiate everything that it is not, as a means of generating affect and thereby distracting itself from its failure to establish an integrated identity. Because the slave type has no coherent self to affirm, moreover, it is utterly reliant on its enabling fantasy of a hostile external world. In order to ensure the permanence of the hostility it detects in the external world, and thereby preserve the intensity of its animating resentiment, the slave type targets as its mortal enemies all earthly exemplars of beauty, nobility, self-possession, and goodness.

In developing his genealogical approach, Nietzsche made novel use of resources and methods drawn from scholarly disciplines as diverse as etymology, psychology, history, psychology, and anthropology. He did so while attempting to pursue his investigations squarely within the emerging paradigm of scientific naturalism. He consequently refused himself recourse to all principles of explanation that appealed to occult forces, supernatural causes, and spectral agencies. Even the venerable conscience, long thought to be “the voice of God in man” (EH:gm), was to be understood as a naturally occurring outgrowth of human psycho-physiology. Toward this end, Nietzsche explained the emergence of human interiority, of which the conscience is emblematic, as resulting from the mandatory inward discharge of instinctual energy. Prohibited from visiting upon others their natural instinct for cruelty, he hypothesized, the earliest civilized human beings were obliged to vent their pent-up aggression against themselves. Under the civilizing influence of this enforced regimen of self-directed aggression, human beings involuntarily acquired with respect to themselves an internal point of reference and a corresponding set of self-regarding relationships and prohibitions, which became popularly associated with the hectoring voice of God.

The typical human experience of interiority thus manifests itself as what Nietzsche calls the bad conscience, inasmuch as this experience pertains exclusively to a reckoning of one’s failings, shortcomings, debts, disabilities, errors, vices, and sins. The suffering one endures as a consequence of this inward discharge of instinctual aggression is thus interpreted as a nagging reminder of one’s unfulfilled promise and unrealized aspirations. From here it is but a short step to the guilty conscience. According to Nietzsche, the experience of guilt is nothing more than a particular, moralized interpretation of the suffering associated with the “bad conscience.” Guilty parties suffer, or so they have come to believe, because they deserve to suffer — owing, supposedly, to an irreparable flaw or defect in the very nature of their being. This interpretation of the pain of the “bad conscience” is ingenious, Nietzsche concedes, for it renders our suffering meaningful and charges us with the impossible task of atoning for our guilt.11

11. On the Genealogy of Morality has recently received considerable attention in the secondary literature. Book-length treatments of note include: my Reader’s Guide to Nietzsche’s On the Genealogy of Morals (London: Continuum, 2008); Lawrence J. Hatab, Nietzsche’s On the
In the following year, 1888, Nietzsche produced several short books that collectively elaborated his critique of modernity and its representative institutions. In these books, he developed his earlier account of European nihilism and advanced his diagnosis of late modernity as a decadent epoch. The crisis of will that he earlier associated with the onset of nihilism is presented in these books as symptomatic of a much larger (and inevitable) process of cultural decay. It is the decay of European culture, he conjectured, that explains the rise and currency of those projects in terms of which European modernity tends to define its putative success, including democracy, liberalism, science, progress, cosmopolitanism, feminism, and secularism. While questions remain about his prescriptions, if any, for treating the decadence he claimed to detect, these books present a deeply skeptical appraisal of the generative and regenerative resources available to late modern European culture.

The first of these books, *The Case of Wagner*, lays out the particulars of his case against Richard Wagner, the great German composer who had exerted such a profound influence on the young Nietzsche. His subsequent estrangement from Wagner, he now explains, was a necessary – if excruciatingly painful – element of his own development as an independent thinker. This development, he now reveals, has positioned him to appreciate Wagner’s magisterial music-drama as symptomatic of the degeneration of German culture, and not, as he had once believed, as indicative of the rebirth in Europe of a genuinely tragic culture. In his next book, *Twilight of the Idols*, Nietzsche took aim at the bloated idols of his epoch, delivering blistering indictments of the contemporary scene in morality, science, politics, religion, literature, and the arts.

Nietzsche followed *Twilight of the Idols* with *The Antichrist(ian)*,12 which was meant to constitute Book One of his proposed Hauptwerk, provisionally entitled *The Revaluation of All Values*. *The Antichrist(ian)* is known both for its angry, no-holds-barred attack on Christian morality, and for its original psychological profile of the historical Jesus. Rather than rush *The Antichrist(ian)* into print, however, Nietzsche decided that he first needed to prepare his German readers for its appearance, which he immodestly believed would be explosive. Toward this end, he quickly penned his faux autobiography, *Ecce Homo*, which he apparently believed would cultivate a readership keen (or at least curious) to

---

12. Nietzsche’s title, *Der Antichrist*, carries the meaning both of the biblical Antichrist (Satan) as well as the anti-Christian (analogous to the anti-Semite).
receive *The Antichrist(ian).* Ecce Homo delivers an idealized – and occasionally fictitious – account of Nietzsche’s life and works, which he endeavored to present as culminating in his accession to his “destiny” as the first immoralist. In this capacity, or so he claimed, he became the first critic to discover and expose the real truth of Christian morality – namely, that it is a decadent morality, bent on eradicating from the world all remaining traces of truth, beauty, nobility, and the natural order of rank.

Nietzsche closed this remarkably productive year with two relatively minor works: *Nietzsche contra Wagner*, in which he diagnosed the decadence of Richard Wagner while documenting his longstanding aversion to Wagner; and *Dithyrambs of Dionysus*, a collection of poems and songs dedicated to Catulle Mendès, the librettist of *Isoline*. His oft-promised Hauptwerk, envisioned first under the title *The Will to Power* and subsequently under the title *Revaluation of All Values*, never materialized. The book that first appeared in 1901 under the title *The Will to Power: Attempt at a Revaluation of All Values* was produced without Nietzsche’s knowledge or consent. Working from a plan developed (and discarded) by Nietzsche for a four-volume Hauptwerk, Elisabeth Förster-Nietzsche, assisted by others (including Köselitz), arranged and edited 1067 entries drawn from his various notebooks. Although *The Will to Power* affords Nietzsche’s readers a wealth of valuable insights into the development of his philosophy over the period 1883–88, it cannot be regarded, as Elisabeth hoped it would, as a reliable statement of Nietzsche’s mature philosophizing. Nor should it be understood to confirm, as Elisabeth also hoped it would, the validity of her wishfully opportunistic, broadly nationalistic interpretation of her brother’s philosophy.

### III. NIETZSCHE’S PHILOSOPHICAL TEACHINGS

The German philosopher Martin Heidegger began his 1940 lecture course on Nietzsche by noting that Nietzsche’s philosophical thinking may be collected

---

13. Nietzsche’s plan was thwarted by the onset of madness, which delayed the eventual publication of these books. *Ecce Homo* did not appear until 1908, some fourteen years after the appearance of the book for which it was meant to create a sympathetic audience.

15. See Young, *A Philosophical Biography of Friedrich Nietzsche*, 534–42.
under “five major rubrics,” each of which affords us a distinct route of entry into Nietzsche’s “metaphysics,” which was the focus of Heidegger’s investigation.16 (Heidegger famously identified Nietzsche as “the last metaphysician of the West,” suggesting thereby that Nietzsche had succeeded in articulating a critique of metaphysics that relied only minimally on the basic presuppositions of Western metaphysics. Presumably, successor critics, including Heidegger himself, would be poised to complete Nietzsche’s attempted overcoming of Western metaphysics, “twisting free” once and for all of its unwanted legacy.17) While Heidegger’s interpretive aims may not coincide with our own, the “rubrics” he identifies nevertheless suggest a useful heuristic for an initial survey of Nietzsche’s contributions to philosophy. These “five major rubrics,” which we will review in order, are nihilism, the revaluation of all values hitherto, will to power, the eternal recurrence of the same, and the overman.18

**Nihilism**

Nihilism is Nietzsche’s term for the general condition in which human beings find themselves beset by a crisis of will, which renders them unable to invest resolute belief in anything, including (or especially) the authority of God (or any other putatively transcendent value). In the shadow of nihilism, in fact, human beings lose the capacity to muster a will for – that is, a commitment to – the very future of humankind itself. Future-oriented projects, especially those of the sort that have founded enduring cultures and civilizations, give way to goals and tasks of a far more modest scope. As life itself is drained of its former meaning, human beings turn ever more aggressively to ascetic practices of self-destruction. Bereft of a goal whose pursuit might justify the suffering that attends the human condition, human beings inevitably will commit themselves to the goal of self-annihilation. According to Nietzsche, the persistence of nihilism thus signals the advent (or activation) of the “will to nothingness,” which he identifies as the last will of human beings, the will never to will again.

Nietzsche often presents his diagnosis of nihilism as pertaining to the history, culture, and destiny of Europe itself. As such, this diagnosis presupposes a particular understanding of the historical development of a unified European culture, the recent disintegration of which Nietzsche links to the current experience of nihilism. Integral to the development of this unified culture, he insists, was the

---

uniquely European reverence for a kind of human being – amoral, creative, and semi-barbarian – whose exploits could inspire both fear and admiration. With the rise of the Church and the spread of its timid virtues, however, this kind of human being – affectionately likened by Nietzsche to a “beast of prey” – has all but disappeared from the cultural landscape of late modern Europe. Although hailed by progressives as indicative of the moral improvement of European culture, the disappearance of these “beasts of prey” strikes Nietzsche as a grave and potentially fatal development: “The sight of humankind now makes us weary – what is nihilism today if it is not that?” (GM I: 12).

Nietzsche’s own relationship to nihilism is widely debated. On the one hand, he is regularly credited with identifying the harrowing prospect of nihilism and rallying his readers to resist its thrall. On the other hand, he is often accused of promoting the spread of nihilism, perhaps in support of his own designs on a legacy of world-historical significance. What is undeniable in this debate is that Nietzsche was and is widely understood by his readers as urging them to hasten or facilitate the collapse of those social institutions that were and are indicative of the decadence of late modern European culture. Those who applaud Nietzsche’s diagnosis and celebrate his candor typically appeal to his image of the wise vintner who prunes an overburdened vine so that it might produce more perfect grapes. Those who refuse Nietzsche’s diagnosis and recoil from his amoral calculations typically point to the anarchic impulses that inform his critique of modernity. These critics maintain, for example, that Nietzsche’s uplifting rhetoric of restoration and rejuvenation serves, at least in part, as a pretext for his more basic pursuit of the joy that attends acts of gratuitous destruction.

Revaluation of all values

Revaluation of all values is Nietzsche’s term for a decisive, pivotal re-orientation of human beings either to their defining values or to the act (or process) of determining and assigning values. The slave revolt in morality, by means of which oppressed human beings convinced themselves (and others) of their genuine preference for the suffering, humiliation, poverty, and destitution they were made to endure, marks one such revaluation of values. For several millennia, Nietzsche maintains, the dominant religious and moral traditions of Western civilization have succeeded in promulgating ascetic, anti-affective values that have placed human beings at odds with themselves and their natural environment. As an expression of these values, Western civilization has promoted ideals of human flourishing that rely heavily on suffering, guilt, self-deprivation, and alienation. While indirectly productive of the art, politics, and culture that define the glory of Western civilization, the reign of these ideals has exacted from

115
Volume 2
humankind a nearly mortal toll. Centuries of self-inflicted aggression have so thoroughly wearied the species that Nietzsche now fears for its future. As we have seen, he understands the historical situation of late European modernity in terms of the ominous re-awakening of the will to nothingness.

Nietzsche both anticipates and claims to work toward the possibility of another revaluation of all values, which effectively would reverse or negate the slave revolt in morality. As envisioned by Nietzsche, the coming revaluation of values would accomplish, first of all, a reversal of the ascetic, anti-affective values that have sustained the metaphysical systems of Western religion and philosophy. The highest value will be re-assigned to what is most real: the body and its affects, the earth and its ecosystems, and the cosmos and its constituent quanta of power. The envisioned revaluation of values also will accomplish a change in the source or provenance of values. Humankind will no longer orient its future to values that reflect a condition of lack, deprivation, or defect, but will take its bearings instead from values that express a condition of surfeit, overflow, and wealth. The precise target of Nietzsche’s revaluation of values is Christian morality, which has succeeded in denaturing human beings and setting them at odds against themselves.

Nietzsche’s understanding of his own relationship to the envisioned revaluation of all values is not entirely clear. On some occasions he presents his writings as preliminary to the envisioned revaluation of values, while on other occasions he presents himself as participating in the envisioned reversal. In the course of explaining why he is a “destiny,” for example, he intimates that he in fact embodies the revaluation of all values, which, he insists, has “become flesh and genius in [him]” (EH: “destiny” 1). As this passage suggests, and as Nietzsche goes on to confirm, his contribution to the revaluation of all values lies in his discovery and subsequent exposé of the truth of Christian morality – namely, that it both promotes and exacerbates the decay of the highest human types. As he also indicates, his contribution to the revaluation of all values also includes his contradiction (or negation) of Christian morality itself (ibid.).

Finally, Revaluation of All Values is the title Nietzsche proposed for his ill-fated Hauptwerk, of which he completed only the Preface and “First Book,” which we know as The Antichrist(ian). He concluded this vituperative book by pronouncing on Christianity a summary “curse,” which he apparently believed would play a decisive, catalytic role in the historical destruction of Christian morality. As such, the “curse” he pronounced on Christianity may have been meant either to inaugurate or to accomplish the anticipated revaluation of all values. Even if his rhetorical aims in The Antichrist(ian) are difficult to sort out, however, he clearly regarded his challenge to Christian morality as contributing uniquely to the re-appraisal of Christianity that would inform the envisioned revaluation of all values.
Will to power

Will to power (Wille zur Macht) is the name Nietzsche gives to his central cosmological hypothesis and to the active principle featured therein. First elaborated in Thus Spoke Zarathustra, this hypothesis maintains that every being, whether animate or inanimate, both shares in and articulates a will to express its native power. Nietzsche thus envisions a cosmos in constant flux, as “centers” of power aggregate, grow, and disaggregate in accordance with the blind, impulsive strivings of their constituent beings. The hypothesis of will to power thus suggests an amoral, chaotic cosmos, whose “quanta” continuously re-organize themselves into transient configurations that promise, at any given moment, the greatest possible expression of power. In an influential passage, Nietzsche speculates that “The world viewed from inside … would be ‘will to power’ and nothing else” (BGE 36).

Although best known as a proposed contribution to physics and/or cosmology, Nietzsche’s hypothesis of will to power appears most frequently – and, some scholars believe, most persuasively19 – in the context of his attempt to account for the basic processes of life itself. When first elaborated in Zarathustra,20 in fact, the will to power is presented as the very essence of life itself (Z II: 12).21 In his post-Zarathustran writings, Nietzsche consistently identifies the will to power – and not the will to self-preservation – as the “cardinal impulse [Trieb]” of all living beings (BGE 13). Every living being, he explains, blindly pursues the optimal conditions under which it might express its native “strength” and thereby achieve the desired “feeling of power” (GM II: 12). Just as surely, he continues, every living being instinctively avoids any impediment or obstacle it might encounter in the path of its pursuit of these optimal conditions (ibid.). He is quick to add, however, that the pursuit of these optimal conditions does not place a living being on “its path to ‘happiness,’ but its path to power, to action, to the most powerful activity, and in most cases actually its path to unhappiness” (GM III: 7). As this last remark is meant to convey, living beings pursue

19. Maudemarie Clark maintains that this restricted, psychological interpretation of the will to power, as what she calls “a second-order drive that [Nietzsche] recognizes is dependent for its existence on other drives,” is all that he may “claim knowledge of” (Nietzsche on Truth and Philosophy [Cambridge: Cambridge University Press, 1990], 227). The extensions and applications of this account, especially into the realms of metaphysics and cosmology, may be more famous and influential, but they amount to unwarranted “generalizations” of his basic psychological thesis (ibid.).

20. The first reference to will to power in Zarathustra appears in Z I: 15. See Thus Spoke Zarathustra, Graham Parkes (trans.) (Oxford: Oxford University Press, 2005), xx–xxii. This reference is not explained until Z II: 12.

21. For a persuasive statement of the objection that Nietzsche already goes astray in presenting life as will to power, see Clark, Nietzsche on Truth and Philosophy, 218–27.
the desired “feeling of power” even at their own expense. In a healthy organism, that is, the will to power always trumps the will to self-preservation.

Although Nietzsche fancied himself an opponent of Darwin, the actual target of his opposition was the “social Darwinism” espoused by those popular figures – he mentions Herbert Spencer and Thomas H. Huxley by name (GM II: 12) – who asserted the primacy of reactive forces in the microcosm of molecular biology and in the macrocosm of European culture. He thus condemned “the whole of English Darwinism” (GS 349), which, he insisted, mistakenly confused the exceptional circumstances of late modernity with the normal circumstances in which human beings have pursued the optimal conditions under which they might accumulate, reserve, and expend their native strength. That bourgeois Europeans value self-preservation above all else is indicative, he allowed, of nothing more than the abject decadence of late modern European culture, that is, of its decline from the norms and standards established in bygone epochs. While it is true that sick and declining organisms naturally seek to preserve themselves, healthy and ascending forms of life naturally seek to accumulate and expend their strength – even at the expense of their own self-preservation.

Eternal recurrence

The teaching of eternal recurrence is presented by Nietzsche as performing a divided office: (i) it advances a model of an amoral, godless cosmos in which all atoms and their transient configurations eternally recur; and (ii) it articulates an emblematic expression of one’s affirmation of life within such a cosmos, stripped bare of all supernatural contrivances and metaphysical comforts. In Nietzsche’s most influential formulation of the idea of eternal recurrence, as found in Section 341 of The Gay Science, his readers are asked how they would respond if they were to learn (from a demon, no less) that their lives have recurred in every detail innumerable times and will continue indefinitely to do so.

Two general lines of response are anticipated: either we will curse the impudent demon, gnashing our teeth in despair (and thereby failing the implicit test...

---

22. As scholars have noted, Nietzsche’s understanding of Darwin was at best sketchy and at worst uninformed. It is not clear that he ever undertook a careful study of Darwin’s theories, and he was in any event far more concerned to combat the pernicious influence of these theories – distorted or not – on science and culture. See, for example, Keith Ansell-Pearson’s excellent discussion in Viroid Life: Perspectives on Nietzsche and the Transhuman Condition (London: Routledge, 1997), ch. 4, “Nietzsche contra Darwin.” See also John Richardson, Nietzsche’s New Darwinism (Oxford: Oxford University Press, 2004), esp. 11–26.

23. Here I depart somewhat from Heidegger’s proposed “rubrics,” preferring the more familiar “eternal recurrence” to the less familiar (although friendlier to Heidegger’s peculiar interpretation) “eternal recurrence of the same.”
of affirmation), or, recognizing the demon as a god, we will rejoice and will the eternal recurrence of our lives in every detail (thereby passing the implicit test of affirmation). This section ends by posing the following question, which has led some scholars to conclude that the thought of eternal recurrence is meant to perform a diagnostic function not unlike that of Kant’s famous “categorical imperative”: “[H]ow well disposed would you have to become to yourself and to life to crave nothing more fervently than this eternal confirmation and seal?” (GS 341). If we assume that becoming well disposed to oneself and to life ranks among the highest goods available to human beings, then the thought experiment described in this section would appear to serve the diagnostic function that is popularly assigned to it. To be capable of affirming the eternal recurrence of one’s life in every detail is thus presented as the single most reliable index of human flourishing.

The teaching of eternal recurrence is apparently meant to express or represent an epiphany Nietzsche experienced in 1881 while walking, as was his wont, in the mountains near Sils-Maria in the Upper Engadine region of Switzerland. “6000 feet beyond man and time” is how he described his experience at the time. Translating this personal epiphany into a communicable philosophical teaching proved to be extremely challenging, however, and Nietzsche’s success in doing so remains difficult to gage. Even today, scholars vigorously dispute what, if anything, this teaching is meant to convey. Part of the problem here is that the teaching of eternal recurrence receives relatively little treatment in Nietzsche’s published writings. It figures prominently in only one book (*Thus Spoke Zarathustra*, whose form is closer to a prose-poem than a philosophical treatise), while in other books it is scarcely mentioned. When the teaching is presented, moreover, it is often placed in the mouths of characters and personae (e.g. the “demon” in GS 341) whom Nietzsche’s readers cannot trust to profess reliably on his behalf. In his autobiography, Nietzsche further confuses his readers by attaching “[his] formula for greatness in a human being” not to the teaching of eternal recurrence, but to the (potentially kindred) teaching of *amor fati* (love of fate) (EH: “destiny” 10). Finally, it is not at all clear how we are supposed to reconcile the cosmology suggested by the teaching of eternal recurrence, wherein each of us is but a “speck of dust” within the perpetually overturned “eternal hourglass of existence” (GS 341), with the broadly ethical implications of its diagnostic function.

24. As Clark points out, the demon does not offer us a choice between these two responses (*Nietzsche on Truth and Philosophy*, 281).

25. This interpretation of the eternal recurrence has been advanced most influentially by Bernd Magnus, *Nietzsche’s Existential Imperative* (Bloomington, IN: Indiana University Press, 1978), esp. 111–54. See also Clark, *Nietzsche on Truth and Philosophy*, 245–86.
Nietzsche describes the idea of eternal recurrence as the “fundamental conception” of his greatest work, *Thus Spoke Zarathustra* (1883–85). (The “tragedy” of Zarathustra is introduced to Nietzsche’s readers in Section 342 of *The Gay Science*, which immediately follows his introduction of the idea of eternal recurrence in Section 341.) Zarathustra’s struggles to embrace this elusive idea, presumably so that he might someday promulgate it to others, furnishes the book with its central dramatic structure.26 Throughout his various journeys and speeches, Zarathustra strives to grow into the role supposedly reserved for him as the teacher of the eternal recurrence.27 While his growth is in many respects remarkable, and even quasi-heroic, the open-ended conclusion of the book (in Part IV) leaves some doubt about the success of his endeavor to embrace the teaching of eternal recurrence.28 In the final scene of the book, he sets out to meet his ideal companions (whom he calls his “children”) and, presumably, to commence the postmoral, post-theistic epoch of human history. Indeed, the dramatic trajectory of the book suggests that a successful meeting between Zarathustra and his “children” could take place only if he has in fact become the teacher of the eternal recurrence. But the book closes on an inconclusive note: the narrator neither confirms nor denies the eventuality of this fateful meeting. We therefore cannot know if Zarathustra has in fact grown into the role reserved for him, or if he has simply failed once again to connect with his chosen audience.

**The overman**

*The overman (der Übermensch)* is the other teaching of Nietzsche’s Zarathustra and, by association, of Nietzsche himself. In *Thus Spoke Zarathustra*, the central

---

27. After Zarathustra completes his seven-day period of convalescence, his companion animals inform him that it is his “fate” to be “the teacher of eternal recurrence” (Z III: 13). He does not respond, however, and nothing that follows this exchange indicates that he accepts their determination of his fate.

28. Such doubts are viable, of course, only if Part IV is understood to conclude *Zarathustra*. For an alternative account of the basic structure of *Zarathustra*, see Loeb, *The Death of Nietzsche’s Zarathustra*, esp. 86–101.
character is initially concerned to acquaint his auditors with the mysterious figure of the “overman,” who supposedly embodies a new ideal of human (or transhuman) flourishing. Upon descending to the marketplace from his mountaintop retreat, Zarathustra devotes his very first public address to his teaching of the “overman,” which he presents as both an alternative and antidote to the moral and religious ideals that have presided over the development of the Western tradition. Whereas these ideals have collectively demeaned humankind, teaching us to despise our finitude and frailty, the overman is presented as a celebration of humankind as it is, including what is most powerful and unique about us. Zarathustra’s teaching of the overman is thus meant to promote and facilitate a life of self-possession, self-mastery, and self-sufficiency, wherein human beings might lay undivided claim to their passions, creativity, physicality, and sexuality.

The teaching of the overman is inextricably linked to Zarathustra’s (and Nietzsche’s) pronouncement of the “death of God,” by which they mean to convey the erosion of theological authority that is specific to the epoch of late modernity. With God out of the picture, or so Zarathustra initially believes, humankind may finally take its rightful place at the value-positing center of the cosmos. Unencumbered by the crushing weight of religious tradition and theological superstition, humankind may finally accede to full maturity as a species. The “death of God” thus furnishes the historical context for Zarathustra’s teaching of “the overman,” which heralds the advent of human beings who are prepared to serve as guarantors of their own value and meaning.

With the exception of his Zarathustra, Nietzsche’s writings scarcely mention the overman. It may be more accurate, in fact, to think of this teaching as belonging more fundamentally to Zarathustra than to Nietzsche. Nevertheless, many readers interpret the teaching of the overman as generally continuous with Nietzsche’s more common references to those higher human beings – typically architects of empire (e.g. Caesar and Napoleon) and artists (e.g. Goethe and Stendhal) – who command our admiration on the strength of their amoral imposition of form and order onto an otherwise unruly existence. According to this line of interpretation, an overman would be anyone who stands to us and our epoch as these exemplars of higher humanity stood to their respective peoples and epochs. While it is indisputable that Nietzsche encouraged his best readers to admire even the most terrifying exemplars of higher humanity, it is not entirely clear that this is what Zarathustra meant, at least initially, for his teaching of the overman to convey. If humanity must be “overcome,” as

29. Upon descending from his mountaintop retreat, Zarathustra concludes his first exchange, with a God-fearing hermit whom he encounters in the forest, by remarking, “Could this be possible! This old holy man in his forest has heard nothing of this yet, that God is dead!” (Z: P2). This means, I take it, that the death of God is a presupposition or condition of Zarathustra’s pedagogy. See Loeb, The Death of Nietzsche’s Zarathustra, 228–30.
Zarathustra apparently believes, then the teaching of the overman may very well point to the emergence of beings who are discontinuous with, and perhaps radically so, the collective perfections of higher humanity. Indeed, scholars remain divided on the interpretive question of whether or not the teaching of the overman should be understood to locate the most promising future for the human species in the achievement of a transhuman mode of existence.\(^{30}\)

While undeniably influential – even notoriously so – in the century following its initial presentation, the teaching of the overman remains somewhat elusive. In evaluating this teaching, we would do well to bear in mind that Zarathustra himself was largely unsuccessful in promulgating it, despite his various attempts to tailor this teaching to the needs and interests of his auditors. Although both Zarathustra and Nietzsche were quick to blame this failing on others (e.g. Zarathustra’s obtuse auditors, Nietzsche’s inept readers), they may bear some responsibility as well. In any event, the failure of Zarathustra and Nietzsche to disseminate their redemptive teaching(s) of the overman is entirely consistent with Nietzsche’s diagnosis of late modernity as an epoch hospitable only to teachings of decadence and despair. If the teaching of the overman is meant to re-acquaint human beings with their estranged passions, bodies, and natural surroundings, then perhaps we should not be surprised that this teaching has fallen thus far on deaf ears.

IV. REVISITING THE DEATH OF GOD

When Nietzsche decided in 1886 to add a Fifth Book to The Gay Science, along with a new preface and some other materials, he also decided to begin this Fifth Book, entitled “We Fearless Ones,” by revisiting the theme of the death of God. Although not advertised as such, this treatment of the death of God is apparently meant to update, and perhaps supplant, the treatment found in the original 1882 edition of The Gay Science. There, as we recall, the death of God was announced by a Madman who proceeded to identify himself and his auditors – and, by extension, all of contemporary humankind – as the murderers of God.\(^{31}\) That his auditors were ignorant of their alleged crime was not indicative of their innocence, the Madman insisted, for a crime of this magnitude takes time to penetrate and inform the awareness of its perpetrators. He thus concluded that

---

30. An exemplary statement of a transhuman articulation of Nietzsche’s philosophy is provided by Ansell-Pearson in Viroid Life.
31. David Owen provides a helpful diagram and supporting analysis of this scene in Nietzsche’s Genealogy of Morality, 51–2. I am also indebted here to the analysis provided by Robert Pippin in Nietzsche, Psychology, and First Philosophy (Chicago, IL: University of Chicago Press, 2010), 47–51.
he had arrived on the scene “too early” to perform his appointed task – namely, that of apprising the murderers of God of their responsibility for the aftermath of this heinous crime (GS 125).

In revisiting this important teaching, Nietzsche apparently hoped to disabuse his best readers of their confusions surrounding his earlier treatment of the death of God. In particular, he apparently meant to clarify that no one is responsible for causing the death of God, even if everyone is responsible for addressing the death of God as the defining event of our time. In short, that is, Nietzsche wanted his readers to know that he does not share the Madman’s preoccupation with identifying, and belonging among, the murderers of God. His preoccupation lies instead with the determination of an adequate practical response to the death of God, a task for which the Madman was, by design, ill suited.

To be sure, much of what the Madman says is recognizably and authentically Nietzschean. That God is dead, that contemporary humankind is largely ignorant of the meaning of the death of God, that the event of the death of God remains “distant” from most human beings, that the future is likely to host upheavals and calamities unknown to human history thus far – all of these insights are corroborated by and throughout Nietzsche’s other writings. To this limited extent, then, the Madman may be said to play the role that is typically assigned to him – namely, that of Nietzsche’s reliable spokesperson. Indeed, the Madman’s teaching overlaps sufficiently with Nietzsche’s own teaching that we generally do not object if scholars attribute the Madman’s words directly to Nietzsche, as if the two were indistinguishable with respect to the teaching of the death of God.

On at least one important point, however, the Madman most certainly does not speak for Nietzsche. On this point, the Madman speaks for himself, revealing in the process the particular illness that afflicts him. Unlike the Madman, Nietzsche does not believe that “we have killed [God] – you and I” (GS 125). He does not believe that God was murdered by anyone, much less by “all of us” together. In fact, Nietzsche regards the death of God not as a deed at all – which might imply a doer or agent – but as an event. God died, as it were, of natural causes. That the dead God was murdered, by the likes of us no less, is the Madman’s own unique contribution to the otherwise Nietzschean story he relates to the crowd assembled in the marketplace. Although the Madman is keen to advertise his self-incrimination as the ultimate expression of responsibility, his admission of guilt is more accurately understood as the ultimate refusal of responsibility. By convicting himself of an irremediable offense, he effectively pronounces his nature to be both fixed and fallen. As he patiently awaits the

---

maturation of auditors who are not likely to gain awareness of their complicity in a crime they did not commit, he may feel free to postpone indefinitely any obligation to determine the true meaning of the death of God. Pronouncing himself guilty—but-not-yet-responsible, he refuses to contribute to the formulation of a practical response to the death of God.33

As this brief sketch of the Madman indicates, Nietzsche's allegory was actually meant to alert us to the enormous difficulties involved in arriving at a sensible, sober reckoning of what the death of God is likely to mean for us.34 So long as we remain susceptible to the Madman's peculiar brand of flattery, for example, we are unlikely to conduct an unflinching inventory of the physiological, psychological, and cultural resources at our disposal. The smug, know-it-all atheists among us are woefully unprepared to assess the meaning of the death of God, but so are the (equally smug) self-appointed preachers of atheism. In either case one is waylaid by the unshakable conviction that one already knows what the death of God will and must mean for us: on the one hand, unqualified liberation; and on the other, irremediable guilt. When these two types of atheist meet, moreover, the difficulties involved in confronting the death of God are only amplified and exacerbated.

We are now in a position to see why Nietzsche may have wished in 1886 to distance himself from the Madman's particular interpretation of the death of God.35 There is simply no good reason to assume, as the Madman does, that humankind is not equal to the task of surviving in a godless cosmos.36 This is something that we simply do not, and cannot, yet know. Nor is there any good reason to believe, as the Madman does, that contemporary human beings played an active, causal role in the death of God. It might be flattering, and even therapeutic, to think of oneself in such grandiose terms, but this belief is in no way warranted. Indeed, virtually everything that Nietzsche says about his contemporary and late modern readers militates against this possibility. We have witnessed the death of God, and we are uniquely responsible for navigating the aftermath.

33. I agree with David Owen that “GS 125 presents a parable of (a failure of) enlightenment,” and I also agree that Nietzsche “calls for an enlightening of the Enlightenment” (Nietzsche's Genealogy of Morality [Stocksfield: Acumen, 2007], 54). The failure here is further attributable, I would add, to the failure of the self-appointed enlightener – namely, the Madman himself.

34. Here I take up the line of interpretation advanced by Pippin, Nietzsche, Psychology, and First Philosophy, ch. 3.

35. I am persuaded by Pippin's claim that Nietzsche wishes “to draw critical attention to, rather than express or identify with, the ‘melancholic’ tone” of the Madman's speech (ibid., 50).

36. As Pippin points out, for example, the Madman's “melancholic” tone is as yet unearned and undermotivated (ibid., 49–51). While the Madman may turn out to be right, taking this as a founding assumption of his pedagogy virtually ensures that he will not muster a creative, viable response to the death of God.
of this event, but we deserve neither the guilt nor the credit that would accrue, supposedly, to the actual murderers of God.

V. AN UNBELIEVABLE BELIEF

Bearing in mind Nietzsche’s likely desire to distance himself from the Madman’s presentation of the death of God, let us turn now to consider an extended extract from Section 343 of *The Gay Science*:

*The meaning of our cheerfulness. –* The greatest recent event – that “God is dead,” that the belief [*der Glaube*] in the Christian God has become unbelievable [*unglaubwürdig*] – is already beginning to cast its first shadows over Europe. For the few at least, whose eyes – the suspicion [*Argwohn*] in whose eyes is strong and subtle enough for this spectacle [*Schauspiel*], some sun seems to have set and some ancient and profound trust has been turned into doubt; to them our old world must appear daily more like evening, more mistrustful, stranger, “older.” But in the main one might say: The event itself is too great, too distant, too remote from the multitude’s capacity for comprehension even for the tidings of it to be thought of as having arrived as yet. Much less may one suppose that many people know as yet what this event really means – and how much must collapse now that this faith has been undermined because it was built upon this faith, propped up by it, grown into it; for example, the whole of our European morality. This long plenitude and sequence of breakdown, destruction, ruin, and cataclysm that is now impending – who could guess enough of it today to be compelled to play the teacher and advance proclaimer of this monstrous logic of terror, the prophet of a gloom and an eclipse of the sun whose like has probably never yet occurred on earth?

Here we immediately note the familiarity of address and reliance on the first-person plural that increasingly characterized Nietzsche’s post-Zarathustran writings.37 The dramatic–rhetorical distance that separated him in earlier writings from the Madman and Zarathustra, respectively, is missing from this discussion.

---

37. He addresses them, inclusively, as “philosophers and ‘free spirits’” (GS 343). His qualification of this designation – they are not free spirits, but “free spirits” – recalls a similar distinction drawn in GM III: 24, where he apparently reserved the designation of free spirit for the Assassins, for whom “everything is permitted.” Not everything is permitted for Nietzsche and his “we.” In particular, they are not permitted to renounce their bedrock faith in truth.
No figure or character speaks for Nietzsche, and the bustling “marketplace” is nowhere in sight. Treating the event of the death of God as a palpably evident condition of the lives of his intended readers, Nietzsche moves expeditiously to explore the meaning of this event. Indeed, the fact of God’s death is simply noted in passing, as if it were scarcely worth mentioning to this particular audience.

As a result, Nietzsche does not labor in this section under the (self-imposed) constraints that ensured the failure of the pedagogy conducted by the Madman. Unlike him, Nietzsche is not alone in his appreciation for the death of God, which means that he is in a position to share the burden of this insight and its attendant responsibilities. It is for this reason, perhaps, that Nietzsche evinces no desire to convince anyone else—much less the “multitude”—that God is in fact dead. The “multitude” will find out soon enough, and its likely response is of little interest to him. Whereas the Madman chose to speak in the proverbial marketplace, moreover, Nietzsche seeks the relative seclusion afforded him by the nearly deserted shore of a newly open sea. Although he does not say so explicitly, Nietzsche addresses his readers as if he were preparing to “go under,” that is, to bequeath his wisdom to those who are worthy to receive it. The seriousness of his enterprise is evidenced, in fact, by his disdain for the idle gossip, incessant commotion, and cheap distractions that are staples of the marketplace. Unwilling to waste his time with the kind of companions collected by the Madman, Nietzsche immediately zeroes in on his target audience, speaking in this passage only to those kindred spirits for whom the death of God already matters.

As this passage confirms, moreover, the point of Nietzsche’s teaching is far more deeply philosophical than his provocative rhetoric would tend to suggest. Speaking here in his own voice, he calmly reports a crisis of confidence in the basic belief structure that informs and supports the prevailing morality of late modern European culture. Here it may be helpful to note that he does not say that belief in the Christian God has become impossible or inconceivable. He is perfectly well aware that belief in the Christian God persists, albeit in diminished intensity, and he fully expects that Europeans will continue, perhaps for centuries to come, to rehearse the familiar motions of Christian practice. If only it were the case, he might have mused, that belief in the Christian God were now as unthinkable as, for example, belief in astrology or the geocentric model of the cosmos.

38. On the relationship of “going under” to death and the consolidation of one’s final audience, see Loeb, The Death of Nietzsche’s Zarathustra, 98–101.
39. Zarathustra urged his auditors to flee the marketplace (Z I: 12), which is precisely what Nietzsche has done here.
In an important sense, in fact, this is precisely the problem Nietzsche wishes to address: belief in the God of Christianity remains both possible and widespread, even though it is no longer credible as such. This means, among other things, that the belief in God cannot be banished, or its clients disabused, by a simple recitation of the facts or the proposal of an alternative belief. Those who believe in the Christian God are not confused or ignorant in any way that is readily or obviously corrigible. Their confusion, if that is the right word, is fully consistent with the regnant system of core beliefs that has authorized the most recent development and advance of Western civilization. In short, readers hoping to parlay the teaching of the death of God into a declaration of the unconditional victory of atheism are likely to be disappointed.

Although Nietzsche is popularly known as an atheist, this particular designation actually tends to obscure the point of his teaching of the death of God.40 What he means for this teaching to disclose is that belief in the Christian God can no longer be counted on to play a central role in sustaining the ongoing development of European culture. This is not to suggest that belief in the Christian God is now worthless or absurd, for it is not. Belief in the Christian God has become “unbelievable” inasmuch as it is now one belief among many that we are likely to hold. As such, this belief is important, significant, and useful (in the sense preferred by the American pragmatists), but its possession no longer serves as a guarantee of our blessedness, redemption, and salvation. Belief in the Christian God remains possible, but it no longer enjoys a privileged, superlative status, no longer commands our full attention, no longer trumps all other beliefs, and no longer authorizes a quest that might consume and hallow a lifetime. The irony, then, is that Nietzsche actually accounts for the conditions under which belief in the God of Christianity could be, and has been, warranted. Of course, with this account comes his assertion that these conditions no longer obtain.

One now believes in the Christian God as one believes in the stock market, in the value of sensible shoes and a favorable first impression, or in the efficacy of regular brushing to avoid tooth decay. Accordingly, the possession of this belief is now understood to require very little effort or preparation, and there is no longer a general sense that it must be earned and cherished, whether by committing oneself to a life of monkish devotion or by risking oneself in the performance of good works. As noted by Johannes de silentio, the pseudonymous narrator of Søren Kierkegaard’s Fear and Trembling, faith in God is now generally believed to be available throughout European Christendom simply for the asking (or the saying), as if it were offered on deep discount at the clearance sale of ideas.41

40. See Loeb, The Death of Nietzsche’s Zarathustra, 226–34; Pippin, Nietzsche, Psychology, and First Philosophy, 47–62.

*41. Kierkegaard is discussed in an essay by Alastair Hannay in this volume.
Indeed, the ease with which faith is now obtained is accurately reflected in the (distinctly limited) meaning it provides to those who believe in God.

Still, we might ask, so what? Is it not possible that a devalued belief in God will be sufficient to support the advance of an increasingly secular culture? The problem, as Nietzsche sees it, is that our regnant system of core beliefs simply cannot survive the demotion in status and intensity suffered by its centerpiece belief. The very project of European culture is dependent for its viability on the superlative status formerly accorded to the belief in God. The oft-remarked stability of this belief in its current, diminished condition, especially by those who only now find it tolerable, is therefore illusory, and dangerously so. As this system of core beliefs buckles, he warns, the culture it has nourished must wither and perish.

In this respect, Heidegger’s interpretation of Nietzsche’s teaching has been particularly influential. According to Heidegger, the teaching of the death of God is best understood as a shorthand designation for the end of the tradition of Western metaphysics that began, supposedly, with Plato: “The pronouncement ‘God is dead’ means: The suprasensory world is without effective power. It bestows no life. Metaphysics, i.e., for Nietzsche Western philosophy understood as Platonism, is at an end.” According to Heidegger, that is, this teaching is meant to announce the collapse of the suprasensory canopy of transcendent ideas in which Western philosophy and religion have consistently endeavored to locate the truth. Now that the belief in God is “unbelievable,” the world of transcendent ideas, long believed to redeem the imperfect world of immanence, must fall to earth.

Nietzsche’s teaching of the death of God thus signals the loss of the security of the future. Today and tomorrow remain secure, which is why so few lives have been changed thus far by the event of the death of God. But “the day after tomorrow” – a figure favored by Nietzsche to capture the unique situation and role in which he and his kindred “free spirits” find themselves (cf. A P) – is no longer secure. What the “death of God” means, then, is that the entire system of morality that has guided the advance of European civilization now wobbles on the verge of collapse. Faithful Christians will be disinherited, to be sure, but so will everyone else, including the smug, know-it-all atheists who believe themselves to be impervious to the reach of this calamity. In other words, the bleak future foretold by the Madman in his marketplace jeremiad remains a distinct possibility.

As we have seen, Nietzsche’s primary concern in GS 343 is not to announce the death of God, which, he presumes, is already well known to his intended audience, but to explore the meaning of this event. Toward this end, he forwards his interpretation of the cheerfulness with which he and his unknown companions have received the initial consequences of this event. Thus far, he observes, they have embraced the death of God as if it were a positive event, opening up for them a new menu of possibilities.

Nietzsche endorses the Madman’s claim that the death of God is so pivotal, so thoroughly world-historical, that its full meaning is not yet available to most human beings. Only now is this event “beginning to cast its first shadows over Europe.” Not belonging to the multitude, Nietzsche and his unnamed companions are not similarly removed from the arrival of this event. Even as they steel themselves for the “long plenitude and sequence of breakdown, destruction, ruin, and cataclysm that is now impending” (ibid.), they face the future with a “cheerfulness” that surprises even Nietzsche. This may change, he concedes, especially when the full meaning of the death of God finally arrives. The ultimate consequences of this event, he realizes, may be very different from its initial consequences.

Still, their cheerfulness is a genuinely hopeful sign. Rather than experience the death of God as an occasion for despair, regret, disappointment, resignation, and the gnashing of teeth, Nietzsche and his unnamed companions instead “look forward to the approaching gloom.” As he now makes clear, he and his unknown companions are advantageously positioned to “guess at” what the Madman claims to know, but they are not tempted to take on the role of the “prophet” or “advance proclaimer” of gloom (ibid.). Unlike the Madman, they have no interest in holding forth in the marketplace or in teaching the intractable multitude. Ingredient to their appreciation of this event, we apparently are meant to understand, is the realization that their own needs for recognition, attention, flattery, and so on must be subordinated to the more general task of preparing humankind to survive the death of God. Unlike the Madman, moreover, they cannot pretend to tremble before the “approaching gloom,” for they find themselves “without any worry and fear for [themselves]” (ibid.). Their cheerfulness may bode well for the future of humankind as a whole, especially if they assume the leading role that Nietzsche envisions for them in the endgame of late modern European culture. If he and his unnamed companions continue to receive the death of God with good cheer – a big if – they (or, more likely, their heirs) may survive the impending collapse of Christian morality.

The significance of their cheerfulness thus lies in their decisive victory over the presumptive pessimism of the Madman and all kindred doomsayers. As we
have seen, the “initial consequences” of the death of God indicate the opposite of what the Madman and his ilk have led us to expect. Rather than descend, as predicted, into chaos, disorientation, self-recrimination, and general disenchantment, Nietzsche and his unknown companions bask in the refulgence of a “new dawn.” While the events described in the Madman’s jeremiad may yet come to pass,43 we have no reason at this point to conclude that humankind is ill prepared to negotiate the aftermath of the death of God.

This victory in turn secures a foothold for the scientific project that Nietzsche endorses, wherein he and like-minded truth-seekers will conduct an unflinching inventory of the cultural, physiological, and psychological resources available to late modern human beings. This is the point of Nietzsche’s recourse in this passage to the familiar trope of the “voyage of discovery,” on which he now bids his unknown companions to join him. Crafting one of the most haunting images to be found in the writings from his post-Zarathustran period, he observes, “At long last the horizon appears free to us again even if it should not be bright…the sea, our sea, lies open again; perhaps there has never yet been such an ‘open sea’” (GS 343). As the seafaring imagery is meant to confirm, Nietzsche and his unnamed shipmates are focused on the task that lies before them. Although they refuse credit (or blame) for the death of God, they accept full responsibility for the aftermath of this event, wherein, they believe, the future of humankind can and will be determined. United in their desire to respond to the death of God – thereby ignoring the petty distractions that waylaid the Madman – they prepare to embark on a perilous voyage of discovery. The horizon may not be bright, as he observes, but an “open sea” now beckons them. Indeed, the simple fact that “the sea, our sea, lies open again” is meant to confirm the meaningfulness – indeed, the urgency – of the scientific project endorsed by Nietzsche.44 They are, as he suggests, “Argonauts of the ideal” (GS 382), intrepid voyagers in search of the undiscovered country that lies somewhere beyond good and evil.

As we have seen, Nietzsche does not hold us responsible for the death of God. He holds us responsible, however, for navigating the aftermath of this event. On this point, in fact, he departs most decisively from the Madman, who convicted himself and his contemporaries of this heinous crime precisely so that they would not be held responsible for its aftermath.45 According to Nietzsche, in fact, we now owe it to ourselves to disown all such irresponsible imputations of responsibility, especially inasmuch as they impede our prepara-

44. See Hatab, Nietzsche’s On the Genealogy of Morality, 160–63.
45. I am indebted here to Berkowitz, Nietzsche: The Ethics of an Immoralist, 16–17.
tions for an honest, truthful appraisal of our capacity for mounting an effective response to the death of God. Nietzsche’s emphasis on the meaning of the death of God thus reflects his wish to shift the focus of the question of responsibility. What matters now is that we address the death of God in a manner that allows us to pursue a meaningful post-theistic existence.46 Far from an unhinged champion of irrationality, Nietzsche places his hopes for the future of humankind in the practice of science, a practice that he envisions as duly expunged of the “democratic prejudices” and sentimental pieties that continue to lead modern scholars astray.

One science in particular claims Nietzsche’s attention: psychology.47 While an inventory of the cultural and political resources available to us is crucial to our survival, Nietzsche attaches a higher priority to the task of conducting an inventory of the resources available within us. If we are to mount an effective response to the death of God, we first need to know who (or what) we are. What sorts of creatures have we become over the course of several thousand years of breeding, training, habituation, and acculturation? How closely do we approximate the kind of memorial animal that nature would deem worthy of continued selection for survival? What powers, passions, potentialities, and plasticities do we now possess, including those that remain as yet untested and unpracticed by us? How likely are we to participate in the creation of new values or the creative recycling of old values? In short, Nietzsche’s goal is to foster in his best readers an attunement to the death of God that will enable them to respond creatively to the demands and challenges of the new, post-theistic cosmos.

A serious attempt at this inventory will require us, finally, to set aside the pieties and prejudices of folk psychology, even at the risk of sacrificing our fragile sense of self-understanding and our bogus sense of self-esteem. We late moderns can no longer afford the luxury of remaining so thoroughly unknown to, and estranged from, ourselves. While much of what we will discover about ourselves is bound to be unflattering and distasteful, we also may be pleasantly surprised – perhaps even empowered – by what we learn about ourselves.

46. I am indebted here to Pippin’s observation (Nietzsche, Psychology, and First Philosophy, 52–9) that our protracted failure to address “the problem of nihilism” is exacerbated, in Nietzsche’s eyes, by our refusal thus far – as exemplified in the Madman’s intricate dance of deferral – to pose the problem to ourselves in such a way that would invite, or at any rate make possible, a cogent, affirmation-worthy response to the death of God.

47. Here too I follow Pippin, who persuasively identifies psychology – in particular, an approach to psychology indebted to Montaigne and the French moralists – as central to Nietzsche’s philosophical project in general and his critique of modernity in particular. Pippin is especially effective in explaining how and why Nietzsche claims to regard psychology as “the queen of sciences” (ibid., 1–21).
Here, too, the cheerfulness displayed by Nietzsche and his unknown companions is significant, for it emerged unexpectedly from their experience of the initial consequences of the death of God. Nietzsche elsewhere refers to cheerfulness as the “reward” that awaits those who, like him, have taken very seriously the vexing problems of morality (GM P7). Far from the opposite of seriousness, that is, cheerfulness arises naturally from a serious investigation of those serious matters that other philosophers take too lightly. Who knows what other surprises may await us, what additional “rewards” we unwittingly may have earned?

Nietzsche thus hopes that his best readers will receive the death of God as befits their legacy as “good Europeans” – namely, as scientists and scholars inspired by the will to truth (GS 357; cf. GM III: 27). He hopes, that is, that they will employ their own will to truth to determine what opportunities and challenges a post-theistic cosmos is likely to present to us. This is why he is so keen in his post-Zarathustran writings to perfect and display what he calls his gay science, which blends scholarly seriousness (Ernst) with buoyant good cheer (Heiterkeit) to ward off fits of premature optimism and unwarranted pessimism. Indeed, he offers his own contribution to the development of a gay science as an example of how he and his unknown companions might avoid the equally nihilistic extremes of pessimism and optimism.

VII. NIETZSCHE’S ENDURING INFLUENCES

Nietzsche believed that it was his fate to be “born posthumously” (A P), and he proved to be prophetic in this belief. Writing in 1899, the Danish critic Georg Brandes observed that Nietzsche’s name had “flown round the world” in the decade following his public lectures on Nietzsche in Copenhagen and his publication of the first scholarly treatment of Nietzsche’s philosophy.48 Read widely and claimed by diverse, feuding constituencies scattered across the political spectrum, Nietzsche became a central figure in the stormy culture of fin de siècle Europe. His influence today is both extensive and multifarious. Six such influences are especially noteworthy:

(i) Nietzsche’s first book, The Birth of Tragedy, is now widely read and cited by philosophers, historians, and classicists. It is especially influential for its ingenious pairing of Dionysus and Apollo as the patron deities of Attic tragedy and as the twin impulses responsible for the overflowing health of the tragic culture

of the Greeks. The Birth of Tragedy is also influential for its heterodox exposé of Socrates as a hyper-rational enemy of tragedy. In general, Nietzsche is acclaimed not only for his unique appreciation of Attic tragedy, but also for his renewed attention to the relevance of ancient Greek culture for modern scholars, artists, and political leaders.

(ii) The psychological insights that informed The Birth of Tragedy were later developed and expanded in support of Nietzsche’s groundbreaking research in the field of depth psychology. In sharp contrast to the models of subjectivity delivered, respectively, by the Enlightenment and German idealism, Nietzsche located the core of human agency in the prereflective operation of the unconscious drives and impulses. He thus treated human psychology as a complicated instance of animal psychology, which, as he understood it, is predicated on the instinctive pursuit of optimal conditions under which an organism may amass, expend, and replenish its native stores of strength. Every animal aims above all else to attain a maximal feeling of power, and all of human psychology can be derived from this simple, naturalistic principle of explanation.

Nietzsche’s investigation of the unconscious, amoral drives that motivate human behavior exerted a profound influence on the development of both depth psychology and psychoanalysis. Particularly noteworthy in this respect is his influence on the pioneering figures in these fields of research, including Sigmund Freud (1856–1939), Alfred Adler (1870–1937), and Carl Jung (1875–1961). These figures in turn propagated Nietzsche’s influence to a host of scholars who were similarly concerned to explore the broader sociological implications of Nietzsche’s psychological insights. Nietzsche’s influence, and especially his controversial diagnosis of the sickliness of late modern European culture, is discernible in the work of Herbert Marcuse (1898–1979), Eric Fromm (1900–1980), Rollo May (1904–1994), and Norman O. Brown (1913–2002).

(iii) Nietzsche is also influential for his attention to the personal, rhetorical, and performative dimensions of philosophy. Well known for his experiments with multiple styles, tropes, voices, personae, and forms of address, he possessed a keen critical eye for the subjective inflections of philosophical discourse. Believing every great philosophy to essay the “personal confession of its author and a kind of involuntary and unconscious memoir” (BGE 6), he sought to

isolate the personal “prejudices” lurking behind seemingly impersonal and ostensibly objective philosophical pronouncements.

Nietzsche is widely recognized for his seminal contributions to the “hermeneutics of suspicion” that spurred the development of literary, aesthetic, political, and cultural criticism in the twentieth century. Generally acknowledged, along with Marx and Freud, as a “master of suspicion,”52 Nietzsche has inspired twentieth- and twenty-first-century readers to challenge orthodoxies across a broad range of human endeavors, including philosophy, science, history, literature, religion, art, psychoanalysis, and politics. His influence in this respect is evident in the writings of postmodern philosophers and critics such as Maurice Blanchot (1907–2003), Paul de Man (1919–83), Gilles Deleuze (1925–95), Michel Foucault (1926–84), Jacques Derrida (1930–2004), and Sarah Kofman (1934–94).53

Nietzsche’s attention to the personal and rhetorical dimensions of philosophy is furthermore consistent with the larger, expressivist sympathies that inform his own philosophizing. Praising as exemplary those rare individuals who assert themselves in defiance of prevailing norms and conventions, he regularly urged his readers toward lives of greater risk, urgency, passion, and authenticity. His influence on the philosophical and literary movements associated with existentialism is well known,54 and this influence largely derives from his general affirmation of unfettered acts of self-assertion – even, it should be added, at the expense of established customs and morality. His influence on the development of existentialism is evident in the writings of Martin Buber (1878–1965), Paul Tillich (1886–1965),55 Heidegger (1889–1976), André Malraux (1901–1976), John-Paul Sartre (1905–80),56 and Albert Camus (1913–60).

(iv) Nietzsche remains influential for his sweeping critique of European modernity. Flatly rejecting the familiar modernist narratives of growth, progress,
amelioration, and maturation, he diagnosed European modernity as irreversibly decadent. He exposed its defining institutions and projects as unmitigated failures, and he disclosed with considerable prescience its growing thirst for blood. He also lamented the disintegration of what he regarded as a distinctly European culture and the concomitant rise of squabbling nation-states bent on imperial expansion. Even a full century after his death, Nietzsche remains one of the most formidable critics of the signature projects of modernity itself. His criticisms were so penetrating, and his diagnoses so astute, that no serious champion of modern ideals can afford to ignore them. The influence of his diagnosis of European modernity is most evident in the work of critics such as Georg Brandes (1842–1927), Oswald Spengler (1880–1936), Sigmund Freud, Leo Strauss (1899–1973), Allan Bloom (1930–92), and Francis Fukuyama (1952–).

The larger sociological implications of Nietzsche's diagnosis of late modern European culture influenced a number of prominent writers of the twentieth century. Authors as diverse as George Bernard Shaw (1856–1950), D. H. Lawrence (1885–1930), Hermann Hesse (1877–1962), Thomas Mann (1875–1955), André Gide (1869–1951), Franz Kafka (1883–1924), and Nikos Kazantzakis (1883–1957) were inspired by Nietzsche to analyze the discontents of the modern world – including repression, guilt, despair, alienation, and anxiety – and to explore the possibility that certain individuals – dare we call them Übermenschen? – might succeed in escaping (or deflecting) the stifling demands of civilization.

(v) Nietzsche’s proffered contribution to a “genealogy of morality” has been enormously influential on philosophers, anthropologists, historians, and other scholars who are keen to purge their studies of history – in particular, the history of morality – of unwanted assumptions, unwarranted presuppositions, and undetected sympathies. Scholars as diverse as Deleuze and Alasdair MacIntyre have acknowledged their debts to Nietzsche’s “genealogical” approach to the history of morality.

Most notably, Nietzsche’s contribution to a “genealogy of morality” was taken up and adapted by the French philosopher, historian, and social critic Michel Foucault. Early in his career, Foucault developed an *archaeological* approach to history that allowed him to identify periods of epistemic convergence across various related sciences and disciplines. Within any such period of epistemic convergence, he discovered, the discursive practices of science not only had a common structure but also expressed significant agreement on the general conditions and criteria of truth, knowledge, and certainty. Later in his career,

---
*57. Foucault is discussed in an essay by Timothy O’Leary in *The History of Continental Philosophy: Volume 6.*
Foucault developed a *genealogical* approach to history that enabled him to investigate the intricate power relations that inform discursive practices. As a genealogist, he tracked the shifting relationships between power and knowledge within particular discursive practices, and he charted the resulting fluctuations in the exclusionary power of these practices. He was especially concerned to conduct genealogical investigations of those discursive practices that were responsible for enforcing the institutionalized definitions of *madness*, *criminality*, and *sexual deviancy*.

(vi) Finally, as we have seen, Nietzsche remains influential for his insight into, and announcement of, the *death of God*. The enduring influence of this insight is apparent throughout the history of twentieth-century literature, drama, music, philosophy, and religion. The influence of this teaching is perhaps most evident in the emergence of negative theology, religious existentialism, and other sustained efforts to rethink the nature and place of religion in the culture of twentieth- and twenty-first-century Europe. It is on the strength of this insight, moreover, that Nietzsche made his greatest contributions to the development and subsequent ramifications of European philosophy.58

I. INTRODUCTION

The thought of the German philosophers Friedrich Schleiermacher1 and Wilhelm Dilthey2 is often assessed and criticized according to the interests and standards of twentieth-century philosophical hermeneutics. This common yet increasingly questioned account is misleading insofar as these two authors have divergent research agendas, approaches, and contexts, including the notion of hermeneutics itself, from each other as well as from later hermeneutical philosophy.3

1. Friedrich Daniel Ernst Schleiermacher (November 21, 1768–February 12, 1834; born in Breslau, Silesia; died in Berlin) was educated at Moravian Brethren institutions in Niesky and Barby (1783–87), and the University of Halle (1787–90). His influences included Fichte, Herder, Kant, Plato, Schelling, Friedrich Schlegel, and Spinoza, and he held academic appointments at the University of Halle (1804–1807) and University of Berlin (1810–34).

2. Wilhelm Dilthey (November 19, 1833–October 1, 1911; born in Biebrich am Rhein, Hesse; died in Siusi allo Sciliar, Italy [Seis am Schlern, South Tyrol]) was educated at the Universities of Heidelberg and Berlin (DPhil., 1864). His influences included A. Boeckh, K. Fischer, Hegel, Kant, John Stuart Mill, L. v. Ranke, Schleiermacher, and F. Trendelenburg, and he held appointments at the Universities of Basel (1866–68), Kiel (1868–71), Breslau (1871–82), and Berlin (1882–1905).

Schleiermacher and Dilthey are frequently mentioned together as representatives of nineteenth-century hermeneutics and hermeneutical philosophy. This portrayal is problematic given the historical breaks and philosophical differences between their positions, and the more limited sense of the term “hermeneutics” in their writings. Despite Schleiermacher’s formative influence on Dilthey, and the centrality of Dilthey’s interpretation of Schleiermacher to his subsequent reception, there are crucial differences between them. Schleiermacher’s thought occurs within the context of the modern appropriation and transformation of traditional metaphysics and Protestant theology. His basic point of departure is the felt intuition of the infinite in his early Romantic works and the feeling of absolute dependence on God in his mature academic works. The latter claim is not only a religious and theological one. The prereflective feeling of God replaces the Cartesian cogito in grounding both knowledge and metaphysics in his Dialectic, and is the only locus of certainty in the face of skepticism.

In contrast with Schleiermacher, whose thought he helped to revive and reinterpret, philosophy took an epistemic, social-historical, and social-scientific turn in Dilthey. Instead of asserting the unity of the world and the sciences, of being and knowledge, Dilthey developed an epistemic pluralism or nonreductive empiricism in relation to knowledge, and moderate skepticism in response to metaphysics. Without the inherent unity of nature and spirit as an object of knowledge, Dilthey differentiated the natural and human sciences according to their contexts, methodologies, and objects. Even if all sciences involve previous processes of interpretation and meaning-formation, insofar as knowing is never free of presuppositions and a larger human context of significance, the human sciences are concerned with self-experiencing and self-interpreting individuals and groups for whom the first-person perspective of relations of meaning is—at least in part—performatively constitutive of practices or how they act and do not act.

The distance between these two authors can be further seen in their attitude toward metaphysics and ancient Greek philosophy. Schleiermacher belonged

to the generation of early German Romanticism that was more empirically and realistically oriented than German idealism. He remained committed to a revised form of Platonic metaphysics, influenced by his engagement with early modern and German idealist philosophy, and translated the works of Plato in an influential German edition still in use today.7 Dilthey, however, interpreted modernity – prefigured in thinkers such as Augustine, who opened up the first-person perspective of already meaningful individual lived-experience (Erlebnis) in contrast to impersonal objective structures of classical ontology – as an irrevocable break with premodern forms of thought, which included Schleiermacher’s dialectics.8 While dialectic was the central philosophical discipline for Schleiermacher, to which hermeneutics was subordinate, epistemic logic in the context of the fullness of social-historical life played the primary role for Dilthey.9 In conjunction with his organic and vitalist yet still causal conception of the universe, Schleiermacher was a post-Kantian thinker of religious transcendence and of the ethical ideal of the highest good that informs and orients ordinary life.10 Dilthey was a philosopher of experiential immanence, as he reformulated the Kantian project as a “critique of historical reason” in his early work Introduction to the Human Sciences. There Dilthey describes a critique of historical reason as “a critique of the capacity of man to know himself and the society and history which he has produced.”11 Schleiermacher’s faith and intuition of the divine lose their priority as they become one way of expressing lived-experience, mood, and worldview, and infinity is transformed into an immanent yet self-interrupting characteristic of life itself that does not necessarily entail a transcendent God.12

---

10. God is transcendent and the world is an immanent organic whole for Schleiermacher, who transformed Spinoza’s metaphysics in an individualistic and vitalistic direction oriented by a transcendent God and the highest good as the realization of individual personality. Compare the discussion of these issues in Frederick C. Beiser, “Schleiermacher’s Ethics,” in Cambridge Companion to Friedrich Schleiermacher, Mariña (ed.), esp. 61, 65, 67, 69.
12. On the argument that Dilthey secularized the feeling of God into the feeling of life, moving from the feeling of faith to a more general “reflexive awareness” (Innewerden), see Scholtz, Ethik und Hermeneutik, 240, 250–51.
Friedrich Schleiermacher led an intellectually and publicly active life as a Romantic literary figure, reformed pastor, theologian, university teacher and administrator, public intellectual, and political reformer. The son of a reformed clergyman, he was educated by the Moravian Brethren, who advocated a strict devotional Pietism, and subsequently at the more liberal University of Halle where he continued his studies of early modern and Enlightenment era philosophy and the classics. He is well known for his youthful associations with German Romantic literary circles and the celebration of religion as an intuition and feeling of the universe and the infinite in early writings such as On Religion: Speeches to its Cultured Despisers, and he is also noted for being the primary proponent of liberal Protestant theology in his mature theological works such as The Christian Faith.

Schleiermacher’s writings concerning hermeneutics are all based on lecture courses and lectures, and consequently have a fragmentary character. They continue and transform the early modern Protestant and Enlightenment trends in hermeneutics from the eighteenth century, which are primarily concerned with the interpretation of biblical and classical texts as well as related to rhetoric and Aristotelian logic.

Hermeneutics is a doctrine of art (Kunstlehre) oriented according to the idea of understanding given the universality of misunderstanding, which is caused by hastiness or prejudice (HC 23). For Schleiermacher, non- or misunderstanding is the ordinary condition, and understanding needs to be pursued in order to be achieved. That is, where the laxer practice of hermeneutics assumes that understanding is automatic and misunderstanding to be avoided, “[t]he [stricter] practice assumes that misunderstanding results as a matter of course and that understanding must be desired and sought at every point” (HC 21–2). As in Kant, the practice of art is not the doctrine of science, nor does art deductively or mechanically apply rules and method. Art can never be solely based on

16. Ibid., 59.
rules insofar as this involves the infinite regress of always needing another rule to apply a rule. Art requires judgment or a sense of appropriate application that is cultivated. Kant clarifies this distinction in the *Critique of Judgment*: whereas science demands determinate judgment, which subsumes a particular under a concept, art calls for reflective judgment, which articulates the general from the particular – that is, without a pregiven rule.\(^\text{18}\)

Art is not the imposition of science on tradition or system on the life-world for Schleiermacher. Art originates in ordinary experience itself. It is always already at work in ordinary understanding to the degree that even the child is engaged in the art of hermeneutics in language acquisition.\(^\text{19}\) Because there is no rule for how to apply a rule, art is a practice of a finite sensuous being. Method alone is inadequate for Schleiermacher and Dilthey, since it is the cultivation of a sense already at work in everyday communication and as such it requires lived-experience.\(^\text{20}\) Although the goal of truth or correctness is an important one in Schleiermacher’s hermeneutics, as Dilthey noted, art and imagination characterize all knowing (HSH 695). Cognitive representation is indispensable to the work of the sciences. Yet it is not itself primary since it is always based on prior feeling. Schleiermacher is consequently already engaged in a critique of a purely representational model of knowledge. Schleiermacher insisted on the priority of feeling in understanding the human agent and, as we shall see, the receptivity and responsiveness of the imagination in interpreting others through their expressions, which is the medium of understanding and interpretation.\(^\text{21}\) To this extent, one strength of “Romantic” hermeneutics – in contrast with its impersonalist opponents – is its recognition of the role of feeling, desire, and affectivity as part of linguistic interaction, interpretation, and

\(^{21}\) Jung, *Hermeneutik zur Einführung*, 64.
individuation. Schleiermacher and Dilthey do not segregate the subjective, psychological, or emotional dimensions of interpretation from their linguistic and social-historical contexts.

Hermeneutics, according to Schleiermacher, is the art of understanding. Understanding is an art to the extent that it is neither fully reducible to nor independent of the application of rules (HC 6). Hermeneutics is an art, concerned with language, through which we interpret texts and indirectly understand others. This art has three levels operating between the minimum degree of reflection in ordinary common discourse and the maximum degree of interpretative and reflective effort in approaching classical or original texts (HC 13): that is, (i) the everyday prereflective use and interpretation of language; (ii) the skilled interpretation of language; and (iii) the reflective interpretation of language. Hermeneutics, which does not constitute the whole of philosophical, theological, and scientific inquiry for Schleiermacher, is concerned with understanding only as it occurs through language: “Language is the only presupposition in hermeneutics, and everything that is to be found, including the other objective and subjective presuppositions, must be discovered in language” (HHM 50).

Dilthey unfolded in his work Schleiermacher’s Hermeneutical System in Relation to Earlier Protestant Hermeneutics of 1860 how hermeneutics is essentially concerned with language. Further, language and language acquisition have, for Dilthey, an interpretive character from the beginning (HSH 745). Accordingly, hermeneutics shares the structure – both the limits and possibilities – of language. If language is always already related to what cannot be said, then the incommunicable does not occur only as a limit for hermeneutical understanding but as a condition that cannot be sublimated and thus positively defines the tasks of interpretation. The object of understanding demands that it be understood immanently from out of itself and accordingly that the one addressed be receptive to the claim being made.

---

22. In Hermeneutics and Criticism (HC 93), Schleiermacher associated divination – as receptivity to others and their individuality – with the feminine, and the comparative approach – emphasizing universality – with the masculine. Philosophers and men tend to one-sidedly stress their own thoughts in approaching others (HC 6, 93, 135). Julie Ellson analyzed the “hermeneutics of desire” and its gendered character in Schleiermacher, who often ethically and aesthetically privileges the feminine, and in Romanticism in Delicate Subjects: Romanticism, Gender, and the Ethics of Understanding (Ithaca, NY: Cornell University Press, 1990).

23. Bowie demonstrates how divination in Schleiermacher is not the emotional-psychological felt projection of Einfühlung, yet misses the expressive-linguistic and social-historical character of interpretation in Dilthey in Aesthetics and Subjectivity, 207.

24. Friedrich Schleiermacher, Über die Religion (Stuttgart: Reclam, 1969), 28; published in English as On Religion: Speeches to Its Cultured Despisers, Richard Crouter (ed. and trans.) (Cambridge: Cambridge University Press, 1988). This connection between responsiveness and immanence is further developed by Dilthey – for example, in the thesis that life needs to be
The further claim that hermeneutics is the art of understanding “the utterance first just as well and then better than its author” seeks to bring to consciousness what remained unconscious in the author (HC 23). This task is driven by the absence of any immediate knowledge of what is within an author \textit{(ibid.)}, and indicates, as Dilthey noted, the need in interpretation to consider the unthought of an author (HSH 707). Articulating the unconscious in consciousness follows the hermeneutical model of receptively determining the indeterminate through interpretation (HC 33, 49), and of bringing to concepts the sensual and preconceptual sources of language (HC 34–8). For Schleiermacher, and to the chagrin of Karl Barth and neo-orthodoxy, even the divine word of the Bible is available only through interpretation (HC 41). Inspiration and enthusiasm cannot eliminate the need for contextualization and mediation in order to articulate God’s word (HC 82). Owing to the potential infinity of interpretation, as both past origins and future possibilities and transformations are not directly given, and “because it is an infinity of past and future that we wish to see in the moment of the utterance,” hermeneutics is an infinite or “endless task” that no synthesis or fusion can overcome (HC 23, 31).

In addition to the interpretation of language that Schleiermacher called “grammatical,” there is also “psychological interpretation” involving receptiveness to the traces of the singularity of the other as they are indicated in communication. As Dilthey argued in his reading of Schleiermacher, the individual and the singular would be lost in a discourse that denies the possibility of psychological interpretation (HSH 717–18). Individuals do not only instantiate a pregiven language, and even as the individual is placed within a general location and context, it is irreducible to it (HC 279). Language is used and created through the language-forming power and style of individuals, such that it is inadequate to consider language purely in propositional or structuralist terms. The emphasis on psychological understanding is subsequently not so much the correct representational reproduction by the interpreter of some “mental content” of the author. The “psychological” concerns the individual side of interpretation just as “grammatical” concerns the structural and more universal side of linguistic mediation as a relational system (HC 8–9, 67). Although psychological interpretation has priority from the perspective of the individual and grammatical from the perspective of language as a systematic impersonal whole, both sides are equal and necessary for interpretation (HC 10). Both varieties of interpretation, which are ends of a continuum rather than contraries, are needed, as propositions can be interpreted in relation to individual life-acts, linguistic systems, and the provisionally and indeterminately given whole of a life that is

\textit{articulated from out of itself – and by Heidegger (\textit{circa} 1920) in describing the hermeneutics of facticity as the self-articulation of life in its enactment.}
the intersection of both moments.25 They are a spectrum and yet each side has
to be grasped in its own terms as one transitions between the grammatical and
the psychological without either one being complete or sufficient in itself and
without there being determinate rules for how these transitions can be accom-
plished (HC 10–11).

Schleiermacher’s approach is no mere “external reconstruction” aiming at
correctness, as Gadamer contended.26 It is oriented toward the question of
truth through receptivity to what addresses and claims us, as hermeneutics is
constructive in order to envision an organic whole (HC 65). Schleiermacher
also noted the integrating and mediating character of language. Although he
emphasized the unifying and conforming power of language and tradition,
Schleiermacher showed the importance of linguistic transformation such as in
the artist of language who each time individualizes language anew (HHM 49),
and in the language-forming power of the new and the individual (HC 12, 86).

Schleiermacher’s approach to language emphasized the differences that occur
in relation to the identity of language; that is, with that which differentiates
languages and, further, with that which resists and withdraws from linguistic
mediation. Hermeneutics concerns language, which is the only presupposition
and defines the scope of hermeneutics (HHM 50). Yet language is not a system
that can close itself to what is other than language in a pure immanence of
linguistic integration or mediation. Despite the limits that language and its inter-
pretation impose, such limits cannot eliminate the infinity of sense, such as the
infinite significance of a book such as the Bible, or the relation of the finite to
the infinite (HHM 53, 55). The incommunicable confronts language on the side
of both the whole and the individual.

Jean Grondin has emphasized the quest for the whole understood as
completeness in Romantic hermeneutics.27 Yet the whole is not so much a
complete system as it is an infinity of intercrossing relations that are ultimately
referred to the nonrelational. In this way, Dilthey characterized three senses of
“whole” in Schleiermacher’s thought: (i) organizing inner form, (ii) system, and
(iii) relational context or Zusammenhang (HSH 679). Whereas organizing inner
form refers to an organic immanent teleology and the idea of a system points to
the completeness of a totality, Zusammenhang indicates the nexus or contextu-
ality that allows singularity to be interpreted in relation to the infinite. If there
is a common quest in “Romantic hermeneutics,” it is characterized more by the
question of the singular and the ineffable than it is by the systematic complete-

25. This is an implication, for instance, of HC 18–19, 92.
27. Jean Grondin, Introduction to Philosophical Hermeneutics (New Haven, CT: Yale University
Press, 1994), 64.
ness of representational knowledge. Dilthey could therefore suggest that individuality is the form of the whole (HSH 709). If we could know the whole, then we would know the whole in its concrete singularity rather than as a universal or concept.

If Schleiermacher’s hermeneutics emphasized the correctness of an understanding to be guided by the theoretical articulation of an art and practice, this is far from meaning that he presupposed correctness as the sole model of truth, since interpretation calls for responsive feeling and imagination. Nor does this imply that the world is inherently and fully comprehensible and intelligible, since as finite beings we relate to the infinite through what Schleiermacher called in various places traces and seeds (*Spuren und Keime*). The notion of trace or seed is helpful for interpreting its use in Schleiermacher and the paradox of speaking about that which cannot be spoken. The trace is that which is given as not being able to be given, the presence of that which cannot be thought as presence, the disclosure of nondisclosedness, the revelation of that which is concealed as concealed.28 This trace does not stand alone as a brute singularity or fact, since it bears a fundamental relationship to the word for Schleiermacher.

**III. DILTHEY: INTERPRETATION AND THE HUMAN SCIENCES**

Wilhelm Dilthey was a philosopher, intellectual and cultural historian, and social thinker, who is most recognized for his contributions to hermeneutics, the human sciences, aesthetics and literary criticism, interpretive psychology, and what later became known as “life-philosophy” (*Lebensphilosophie*). As with Schleiermacher, the hermeneutical tendencies of Dilthey’s thought, which concerned understanding and interpretation as epistemic and social-historical phenomena, should be placed in the larger context of Dilthey’s project.

Dilthey’s primary early work *Introduction to the Human Sciences* (1883) is an attempt to develop a postmetaphysical epistemology of the human sciences, without positivistically truncating human experience, by systematically and historically investigating “the whole of human nature as it is revealed in experience, in the study of language, and in the study of history, and thus seek the connection of these components” (IHS 51). Dilthey developed his analysis of the human investigation of the human world in the context of his early epistemological project of explicating “the empirical without empiricism” in order to

---

unfold a “critique of historical reason” that would clarify, validate, and extend the distinctive forms of inquiry of the human sciences in the context of social-historical life (IHS 165).

The human sciences can be grounded only through immanent self-reflection on experience, based in and interpreting the “feeling of life” or precognitive reflexive awareness, which includes epistemological and psychological inquiry (IHS 174, 227–8). Dilthey argued for a nonreductive experientialism in epistemology, which expanded it beyond cognitive or theoretical knowledge and hence transformed it. According to Dilthey:

All science is experiential; but all experience must be related back to and derives its validity from the conditions and context of consciousness in which it arises, i.e., the totality of our nature. We designate as “epistemological” this standpoint which consistently recognizes the impossibility of going behind these conditions. (IHS 50)

In his critique of reductive forms of empiricism and positivism, Dilthey argued for the irreducible richness and variety of experience understood and articulated from out of itself. Experience is bound to meaning-relating activities and structures that are only understandable in their life-context (Lebenszusammenhang). Dilthey utilized this account of lived-experience to reject traditional and speculative metaphysics. Metaphysics conceives the world through a unified point outside the world, assumed to be inherently intelligible, in order to represent the world as a systematic totality. Metaphysics separates knowledge from its historical context and the “totality of human nature,” whereas what is called for is “historical reflection together with epistemological self-reflection [Selbstbesinnung]” (IHS 52).29

In his Life of Schleiermacher (1870) and Introduction to the Human Sciences, Dilthey interpreted the processes of life immanently and in relation to a dynamic context that is never fully visible. This “inner” perspective of life implies the original givenness from the first-person perspective of co-agents or participants of meaningful social-cultural structures and processes. “Inner” thus refers to the first-person life-context, which is inherently bodily, perceptual, and worldly as well as social-historical, and in which objects are preconceptually “understood.” In contrast, “outer” or “external” refers to the abstraction of objects from their life-nexus in the third-person perspective of observation and explanation characteristic of modern natural sciences (IHS 61–2, 67). Without the metaphysical unity of the world, which has collapsed into paradox and aporia, we are faced

with incommensurable data derived from myriad sources that cannot be conclusively combined insofar as they are explained and interpreted phenomenally and immanently from out of themselves rather than related to an external standard (IHS 61–4). Although Dilthey is repeatedly misinterpreted as an idealist philosopher of spirit or an epistemological dualist, radically opposing causal explanation of nature from the interpretive understanding of human life, the incommensurability of the natural and human sciences does not exclude their overlapping or pluralistic employment in inquiry: “Knowledge of the natural sciences overlaps with that of the human sciences” (IHS 70). Accordingly, for instance, the human sciences are irreducible to causal explanation even as they continue to use it. Third-person causal and structuralist-functionalist approaches in the human sciences, which analyze persons as the results of previous natural causes or as the tools and mechanisms of greater social forces and structures, are legitimate for Dilthey to the extent that they can be related to the perspective of persons as conscious co-agents involved in the formation of social life (IHS 55). Social forces, structures, and processes are in turn necessary for interpreting and explaining the phenomena associated with “spirit” in German idealism, including the individual person, groups, eras, and nations (IHS 56, 58). Nature as a causal order conditions individual and social life, just as that life in turn impacts and reshapes nature (IHS 69). History cannot be understood except through its natural conditions and as the “domination of nature” that is a primary purpose of human social activity from agriculture to technology (IHS 71).

Pluralism is necessary for the human sciences given their distinctive kinds of objects: “the external [or structural] organization of society, the cultural systems [of the reproduction of meaning] within it, and individual peoples” (IHS 93). The latter is the most complex object, since it does not correspond to an entity insofar as there is no such thing as a soul, organism, or essence to a nation or people (IHS 55, 121). Dilthey rejected what is now called “strong holism” in the philosophy of the social sciences, that is, the assertion of the existence of collective entities, while retaining a role for a “weak holism” that allows statements about collective or group phenomena such as an era, generation, or nation. Dilthey’s focus on the context of individual life thus differs from the methodological individualism that reduces individuals to the ahistorical self-interested monadic agents of rational choice.

The primary intention of the human sciences is the empirical description of individuality in its life-context. Consequently, in an argument that would arouse neo-Kantian criticism insofar as they excluded psychology from the cultural sciences in classifying it as a natural science, the human sciences require descriptive and empirical psychology (IHS 109). Psychology is not then purely a natural science, as it involves purposes, norms, and values, as seen, for instance, in
ethical, legal, and other practically oriented claims. The individual presents itself as both the goal and limit of understanding, which is explicative through the expressions and practices of the individual rather than directly intuited or introspected, as individuality evades full disclosure and articulation. For Dilthey, we often know expressions that have a kind of objectivity for understanding while being uncertain of the life being expressed.

During his middle period from 1883 to 1896, Dilthey focused on developing his aesthetics and a descriptive and interpretive psychology, including his argument for the “acquired psychic structural nexus” from the tension and differentiation of self and world in the experience of resistance via reflexive awareness to the fullness and specificity of an individual life. In this context, Dilthey articulated the lived—or performatively enacted rather than purely transcendentally constitutive—“categories of life” or life’s immanent articulation—character that proved so significant for the early Heidegger. The acquired psychic nexus indicates the complexity of overlapping functions of the individual as it develops in a historical situation. Dilthey’s “proof” of the external world through the experience of resistance indicates the thereness and co-givenness of self and world.

Dilthey’s writings from the early 1890s should be interpreted in the context of his articulation of an interpretive psychology occurring in the space and intersection of epistemology and life. In his *Beiträge zur Lösung der Frage vom Ursprung unseres Glaubens an die Realität der Außenwelt und seinem Recht* (1890), Dilthey formulated the basis for such a project by arguing for a phenomenality or immanence prior to the intellectualism of phenomenalism and for the independence of reality from the subject through the resistance and tension of the co-givenness of self and world. Under the traditional guise of an argument for the “external” existence of the world, Dilthey would radicalize this canonical epistemological problem by anticanonically showing the bodily-worldly character of human life. This work suggests a hermeneutics of bodily being in the world that provides the basis for interpretive psychology. Epistemological categories have their basis in the bodily-perceptual and social-historical character of life. Categories such as substance and cause are derived from the pre-intentional and prereflective categories of life through which the world is experienced and expressed.

---

30. On the explicative character of understanding, see Jung, *Hermeneutik zur Einführung*, 84.
Schleiermacher’s “hermeneutical circle” is a model of education or cultivation. As one moves between the particular and general, each movement enriches one’s previous understanding (HC 24). For Dilthey, it is the unending and irreducible intersection of and movement of prereflective elementary understanding and reflective interpretation between self and other, individual and context, and singular and whole. This dynamic of the determinate and the indeterminate is productive of understanding, which is practical rather than theoretical, selective rather than universal, and productive rather than merely reconstructive. Understanding attempts to move from the exteriority of the utterance to the internal first-person perspective of the speaker or writer.

In the final phase of his work, from 1896 until his death in 1911, Dilthey focused on the hermeneutical and social character of sense and meaning in the context of Hegel’s objective spirit, which signifies the constitution of intersubjectivity in and through human practices and products. Dilthey analyzed historical life in The Formation of the Historical World in the Human Sciences (1910) through the relation of lived-experience (Erlebnis), expression (Ausdruck), and understanding (verstehen). He further articulated a “philosophy of worldviews” in order to account for the genesis and conflict of systems of interpretation of meaning in relation to the feeling and nexus of life. Worldviews express the tendency to unify experience even as the conflicts (Widerstreit) inherent in life prevent the closure of life in conceptual systems, since they inevitably face their limits in the antinomies and aporias generated by life itself.

It is in this late period that Dilthey explicated the experiential structures of consciousness in his three preliminary “Studies toward the Foundation of the Human Sciences,” his exploration of the import of the productive systems of historical life for knowledge in The Formation of the Historical World in the Human Sciences, and his final and perhaps best formulation of hermeneutics in “The Understanding of Other Persons and Their Manifestations of Life.” While Rudolf Carnap and others utilized the word Aufbau in the sense of epistemic “construction,” Dilthey stressed the formation-character of both the human sciences and the historical reality that they investigate. That is, the formation

34. Jung, Hermeneutik zur Einführung, 83.
of the historical world refers to its articulation in the human sciences, which themselves theoretically reflect this historical world (FHW 1). Dilthey’s theory of the human sciences is not merely an epistemology (Erkenntnistheorie) in the conventional sense, but a theory of knowledge (Theorie des Wissens) that relates knowing to its context. Whereas epistemology seeks to establish the foundations of conceptual cognition (Erkenntnis), Dilthey places the epistemology of the human sciences within a larger context of the knowledge (Wissen) embodied in social practices and historical forms of life.

Thought can and does generalize, intensify, and transform life, even as it remains bound to the factual and empirical context of that life (FHW 27). Knowledge encompasses not only the conceptual cognition of reality, but also the values and purposes established concerning it. It is inevitably selective and bound to a perspective. Dilthey accordingly situated the human sciences, which are determined by their respective object and how the object is given, in relation to a pretheoretical life-nexus and its forms of elementary or ordinary understanding (FHW 38). These are tied up with the temporality, historicity, and structures of social life; with an epochal “objective spirit.” Objective spirit indicates the ways in which the past has been objectified and continues to shape contemporary practices, and it is analyzed in the human sciences as cultural systems and the external organization of society.

A significant characteristic of the Formation of the Historical World is the development of the notion of “productive system or nexus.” Wirkungszusammenhang suggests a historical efficacy or productivity prior to any analysis of it as either causal or teleological (FHW 4). The human sciences involve the study of dynamic interconnected systems that articulate the intersection of meaning, value, purpose, and force. Dilthey interpreted these temporally, such that meaning primarily concerns how humans are determined by their past, value is based on their present feeling of life, and purpose is projective striving into the future in the face of productive forces (Kräftê) that cannot always be predicted or controlled.37

Understanding, which should be construed verbally as “to understand” (verstehen), is intrinsically interpretive for Dilthey. Since human agents are conscious and reflective beings who are bound to the facticity of their bodies and world, they can cognize themselves and others only indirectly through expressive and interpretive means (FHW 108). Given that we know ourselves and others primarily through actions, life-expressions, and their effects – rather than through introspection or intuition – and that everyday understanding can

face breakdowns and what seems distant or strange, elementary understanding leads to higher forms of understanding and interpretation; that is, hermeneutics. Dilthey’s project of a critique of historical reason proceeds from the context of life in all of its complexity and concreteness to the conceptual cognition of the sciences and, finally, to reflective awareness (Besinnung). This reflection is made possible by the prereflective reflexivity (Innsein or Innwerden) of the human subject and, with its double meaning of “sense” (Sinn) as meaning and bodily awareness, constitutes the basic movement of Dilthey’s thought. Understanding is not merely subjective but mediated through the expressions and practices of human life. It also provides more than a scientific access to objects; it is fundamentally world-opening (FHW 226).

Understanding aims at truth or validity, and such understanding is described as being the most complete (FHW 227). Yet understanding is also concerned with the contextuality and facticity of human expressions. The objectifications of human life in practices and institutions, in behaviors and expressions, are the medium through which we understand and interpret others and ourselves. Dilthey’s phenomenological descriptions of kinds of attitude (Verhaltungsweise), taking a stance (Stellungsnahme), and life-concern (Lebensbezug) show how historical life is both about and matters to the individual in its relational context (FHW 2). The human sciences justifiably strive to this extent for objectivity, universality, and truth.

Objectivity in the human sciences links lived-experiences with the social-historical structures that inform them. Yet this objectivity cannot consist of a mimetic copying of reality “as it is” (FHW 23). The human sciences relate the unique, the accidental, and the momentary to the nexus of norms, values, and meanings operative in social-historical reality. They explicate the intersection of the unique and the general in the “historical presentation of the singular occurrence [die historische Darstellung des einmal Geschehenen].”³⁸ The significance of the singular in relation to its context indicates that Dilthey’s concern is not exclusively epistemological or scientific. It is practical, and the human sciences cannot extricate themselves from this non-“value-free” context. Possibilities for historical vision need self-reflection (Selbstbesinnung) if we are to be truly responsive to our own hermeneutical situation.

---

The word “hermeneutics” retained its early modern meaning and function in the writings of Schleiermacher and Dilthey. Although they intermittently gave the word more extensive meanings, hermeneutics is principally the art of understanding another’s utterance through interpretation (HC 3–5). Hermeneutics is one discipline among other disciplines, correlated in particular with its fellow philological discipline of criticism as the art of evaluating the authenticity of texts rather than a style of philosophizing as a whole (HC 3). It is further subordinate to ethics, which concerns any form of human activity, and dialectic – or the art of thinking – for Schleiermacher. Hermeneutics refers to the exegesis of texts or, more broadly, communicative utterances in terms of their sense and meaning. Whereas earlier Protestant and idealistic hermeneutics stressed the “spirit” of the text, Schleiermacher and Dilthey focus on the individuality, personality or style, and sensibility of the author in his or her historical context. Despite this more limited use of the word hermeneutics, their thought has been retrospectively designated as “hermeneutical” owing to their interest in associated issues of sense and meaning, context and historicity, understanding and interpretation, and in the communicative and explicative dimensions of human life and inquiry.

Even given this potential continuity through issues of interpretation, their responses to such issues are distinct. Schleiermacher and Dilthey emphasized the central role of language in hermeneutics and inquiry but they did not minimize or neglect the material-empirical, social-historical, and biographical-psychological dimensions of human life and knowledge. The art of interpretation is the art of understanding communication, involving the reflective and philosophical elaboration of understanding, within a larger context of intellectual and empirical inquiry. Twentieth-century hermeneutics – beginning with Heidegger’s critical reception of Dilthey in the 1920s – is largely hostile to these merely ontic empirical, historical, and psychological moments in Schleiermacher and Dilthey. Where later hermeneutically defined philosophy stressed the integrating power and truth of language, narrative, and communication to disclose, construct, and mediate the world through basic concepts such as linguisticality (Gadamer), narrativity (Ricoeur), and mutual consensus (Habermas), Schleiermacher and

---

40. On the ethical and dialectical context of hermeneutics, note Schleiermacher, HC 8. One flaw of the twentieth-century hermeneutical reception of Schleiermacher’s hermeneutics is that it ignores its context in his dialectic, the art of thinking in conversation that is the basis of both ethics (to which hermeneutics belongs as a variety of human activity) and physics. On the dialectical context of hermeneutics, also see Bowie, “The Philosophical Significance,” 76.
Dilthey emphasized not only the linguistic character of thought and the disclosive power of language but also its reversals, limitations, and breakdowns. Since everything cannot be said in language given the conflict, facticity, and resistance constitutive of life, and language is as much evocative as representational, all the resources of indirect communication are needed in order to articulate the singularity and affective life of the individual, on the one hand, and the complexity of any given context or nexus (Zusammenhang) of relations, on the other.

Besides the inability to fully determine or signify the individual and the whole in language, which calls forth and demands the interpretive oscillation and circling between them, communication and interpretation were confounded and inspired by the transcendence and ineffability of God in Schleiermacher and the unfathomable and ungroundable immanence of life in Dilthey. This finitude and facticity in relation to the infinite beyond in Schleiermacher, or infinite empirical plurality in Dilthey, orients their intellectual endeavors. Instead of being directly or immediately disclosed to intuition or reason, phenomena require interpretation, which indirectly addresses, articulates, and indicates the singular and complexly mediated phenomena of human existence. Given this context, the work of interpretation is tied to empirical scientific research.

The need for reflectively informed interpretation emerges when elemental or ordinary everyday understanding is confounded by that which is not communicated or understood – whether it is a text (the domain of traditional hermeneutics), the author, other persons, the historical context, life itself, or God. As there is no absolute difference between the transcendental and the empirical, or the ontological and the ontic, interpretation cannot be purely philosophical. Whether in Schleiermacher’s dialectic or Dilthey’s epistemic logic, philosophy thinks through scientific inquiry and cannot be separated from it without dogmatism. It accordingly cannot avoid or bracket empirical and ontic inquiry into the anthropological, natural, psychological, and social-historical dimensions of human life. Whereas traditional hermeneutics is primarily concerned with the explication of biblical and classical texts, understanding and interpretation are increasingly associated – already in Schleiermacher to a lesser degree, and for Dilthey more centrally – with the first-person participant perspective of lived-

experience (*Erlebnis*), epistemic and social-historical reflection (*Besinnung*), and the empirically oriented inquiry of the human sciences (*Geisteswissenschaften*).

It is striking that Schleiermacher and Dilthey conceive of interpretation as aiming both at the individual and the singular *and* at the context and the whole in their relational interdependence. Understanding and interpretation occur to one degree or another as an oscillation between these two poles, as universality demands returning to particularity and particulars require universalization in order to begin to be recognized and understood. The oscillation between the conceptual and the nonconceptual, the universal and the particular, and the individual and the whole became characterized as the “hermeneutical circle,” which Schleiermacher adopted from Friedrich Ast. 44 Rather than being a closed system or hierarchy of meanings, where particulars are subsumed under universals never to be heard from again, interpretation occurs through both contextualization and individuation. It is a potentially infinite iteration of departure and return to its object. Similar to empirical research, interpretation is provisional and can always begin anew as more is learned about the individual and the context.

Interpretation is not only the analysis of language, narrative, or communicative action for Schleiermacher and Dilthey; it concerns “meaning” in all its potential guises and expressions. This includes the disruption and incompleteness of meaning in encountering “non-meaning” and the counter-purposive. This insight is related to the role of the nonconceptual and prereflective in experience, the affectivity and emotional character of lived-experience and understanding, and the priority of music and art as expressions of human life. Instead of highlighting reason or intuition alone, they emphasized the need to address human existence in its fullness and variety, which embraces rationality and affectivity, reflection and the basic “feeling of life” (*Lebensgefühl*). 45

Meaning is “holistic” in the sense of its being relational and interconnected. Yet, in contrast with visions of an impersonal systematic integration in a conceptual or social totality, or the “occult subordination” of every aspect of the text to an esoteric doctrine (HC 17), this is an open-ended, interpretive, and “first-person” holism that is constantly referred back to the experience and interpre-

---

tation of individuals.\textsuperscript{46} Even as the individual is in a sense fundamental, the interpretation of the individual leads back to the context and the potentially universal through the comparative, the generalizable, and the typical. Both the individual and the whole are more or less indeterminate, as interpretations attempt to increasingly articulate their determinateness.\textsuperscript{47} In this process, both sides change, readjust in relation to one another, and are reinterpreted.

The provisional character of interpretation does not only hold for the interpretation of other humans. Self-understanding is more complex and questionable than is usually thought, as the self does not have direct or self-certain access and knowledge of itself. Self-knowledge consequently proceeds through self-interpretation, with all the risks that this involves. The individual does not have direct or unmediated self-knowledge, much less an intuitive self-transparency, as evident in biographical and autobiographical writing. The motto of Dilthey’s unfinished multivolume biography of Schleiermacher is “the individual is ineffable.”\textsuperscript{48} Rather than being statically given as an unalterable boundary, or posited as being outside interpretation, the unsayable occurs in the context of communication.\textsuperscript{49} It is owing to finitude and alterity that all words and expressions call for interpretation and assessment – whether they are our own or even those of God. Andrew Bowie notes that Schleiermacher’s self “is not an absolute point of beginning”; the self is infinitely reflective and interpretive, as it lacks presence to itself and at the same time needs to respond to this lack.\textsuperscript{50}

Meaning is inevitably of “diverse provenance,” or pluralistic.\textsuperscript{51} It involves a multiplicity of elements and sources that entail, for example, addressing and researching the text, the author, the context, and the truth claims of a work in order to interpret and evaluate it. These myriad elements and resources cannot be eliminated prior to the work of interpretation, even as some are highlighted and others remain in the background, depending on the interpretive task. Hermeneutics is methodologically pluralistic in drawing on both generalizing (linguistic) and individualizing (psychological) tendencies, which exemplify the

\end{itemize}

two primary tasks of hermeneutics for Schleiermacher and Dilthey. Likewise, ordinary life is differentiated by a diversity of practical interests, and scientific inquiry by its objects and how they are approached.

V. CRITICISMS AND CONCLUSIONS

Despite the incorporation of many of their insights by philosophers as diverse as Heidegger and Habermas, a number of overlapping critiques of Schleiermacher and Dilthey emerged in reaction to their thought. Owing to their concern with the psychological and aesthetic dimensions of human existence, some critics accused them of “psychologism” and “aestheticism,” that is, the reduction of truth or validity claims to psychological dispositions and the overprioritizing of art as a model of human activity.

Likewise, on account of their attention to the historical nexus or context in which individuals and groups live, act, and produce, they were criticized to varying degrees for “historicizing” texts and experiences in a way that threatened their truth or cognitive validity; for example, the truth of the Bible (by Orthodox and neo-Orthodox theological critics of Schleiermacher such as Barth), the sciences (by positivism and logical positivism), philosophy (twentieth-century hermeneutics), or the very idea of validity itself (by Neo-Kantianism and Husserl).

Finally, because of their accentuation of the ineffable, individual, and affective aspects of human life and on the epistemology, methodology, and rationality of philosophical and human scientific inquiry, opponents of Schleiermacher and Dilthey – especially Gadamer – have criticized their works for being incoherently beholden to positivistic scientism and Romantic aestheticism, Enlightenment rationality and the irrational affirmation of God or life. Nonetheless, insofar as philosophy does not one-sidedly abandon reflection or feeling, reason or

*54. For a discussion of Barth’s theology, see the essay by Felix Ó Murchadha in The History of Continental Philosophy: Volume 4.
imagination, science or art, or universality or individuality, their work continues to be significant in elucidating a nonreductive interpretive experientialism in both knowledge and practical life.

Félix Ravaissone and his protégé Jules Lachelier are the chief representatives of what is known as “French spiritualist philosophy,” sometimes called “neo-spiritualism” or “l’école réflexive” in the nineteenth century. Despite their differences, they had it in common to emphasize the primacy of free action, the priority of organic wholes over their parts, and an overarching role for the divine creator. They rejected materialistic and deterministic views of reality. They influenced Henri Bergson, who succeeded Ravaissone in the Academy of Moral and Political Sciences.

Indeed, it is possible to trace some affinities and influences between Ravaissone and Lachelier and some of their predecessors, contemporaries, or successors, thereby giving a broader reach to the label “spiritualist philosophy,” and providing a context for their work. A full list of authors who could be included among the spiritualists is not offered here, but some scholars would include Charles Renouvier, and may cite Maine de Biran and even Antoine-Augustin Cournot among the predecessors, and Bergson among the successors. But such a way of proceeding has to be treated with caution, because of the very considerable differences between these thinkers.

It is worth noting the contrast between them and Auguste Comte. His positivism rested on a systematic rejection of metaphysics and traditional religion, and advocacy of a form of scientism that could be applied not only to inert matter, but also to social life. Indeed, he is viewed as a founder of sociology. At first sight there could be no deeper divergence than that between spiritualism and the positivism of Comte. Yet curiously, late in his life Comte came to advocate a new religion of humanity, described in his “positivist catechism” based on love and altruism.¹

Positive religion, he claimed, was a natural and normal feature of human life, which needed to be cleansed of previous baggage. Thus, despite the deep divergence between positivism and spiritualism, we seem in the end to observe an affinity, even if it is vanishingly remote.²

Here, the authors named earlier as forming a group around neospiritualism are discussed, but little attempt has been made to provide evidence of actual influences, where they can be documented. Some common themes found in the work of all the writers treated are an emphasis on the will, and rejection of hard forms of determinism or materialism. Let us turn briefly to the background.

I. THE BACKGROUND

The background to the developments in which French spiritualist philosophy has its place is to be found in a rift that arose between thinkers interested in the sciences of life. Increasingly in the eighteenth century the received paradigm of the mechanical philosophy had begun to appear inadequate in this area. There was extensive empirical inquiry and elaborate speculation. The work of Swiss naturalist Charles Bonnet³ is emblematic. He received numerous high honors from European academies for his work on insects, in particular for his discovery of the parthenogenesis of aphids. But later in his life, having become nearly blind perhaps because of intensive use of the microscope, as he himself believed, he engaged in high speculation about the history of life in the world. He was a preformationist, holding that the development of individual organisms, and the general history of life, were determined by preexisting germs, and advocating an evolutionary theory on this basis.⁴ It was only toward the end of the century that the epigenetic approach began to prevail. However, speculation of the sort engaged in by Bonnet and contrary materialistic speculation, as illustrated in the work of Julien Offray de La Mettrie⁵ entitled *L’Homme-machine*

². Comte’s work is discussed in the essays by Alan Sica and Dale Jacquette in this volume.
³. Charles Bonnet (1720–93) was a Swiss naturalist and philosopher. He studied insects and the structure and functions of leaves, and developed what is known as the catastrophe theory of evolution.
⁴. Charles Bonnet, *Considérations sur les corps organizés* (Amsterdam: M. M. Rey, 1762) and *Palingénésie Philosophique* (Amsterdam: M. M. Rey, 1769). The latter work claims that the evolution of life proceeds by catastrophic natural disasters, after which newer and higher forms of life appear from the same germs.
⁵. Julien Offray de La Mettrie (1709–51) was a French physician and philosopher who advocated a materialist account of life. His atheism and materialistic views forced him to leave Paris in 1745 and Holland in 1748. He was welcomed in Berlin by Frederick the Great.
(1748), lacked scientific bases that might lead toward a resolution until, at the end of the century, Antoine-Laurent Lavoisier’s advocacy of oxygen (as opposed to phlogiston) and Alessandro Volta’s work on electricity. For his part, Lavoisier was responsible not only for the discovery of oxygen and hydrogen, which he named, but for a more general reform of chemistry that made it much more apt for the study of processes in living matter. Volta’s invention of the first batteries arose from his attempt to repeat and explain Luigi Galvani’s observation of frogs’ legs twitching under dissection, and he found that an electrical current arose from the two different metals holding the leg in place. Both of these advances, chemical and electric, were rightly seen as important in the study of life. Such developments ushered in a new sort of interest in the will, seen, for instance, in the work of Arthur Schopenhauer, as the rift between materialistic and antimaterialistic approaches to life took an entirely new shape. But we turn now to Maine de Biran, because his interest in the will provides some of the more immediate environment for the work of the spiritualists.

II. MAINE DE BIRAN

The young Maine de Biran had a strong mathematical bent, and it was suggested to him that he should apply for a Chair of Mathematics in 1803. But he did not follow this suggestion, and not much of his surviving work is marked by math-

7. Antoine-Laurent Lavoisier (1743–94) was a French scientist who transformed chemistry; he was executed by the French Revolutionary authorities for allegedly improper use of his privileges as a tax-collector. Alessandro Volta (1745–1827) was an Italian scientist who made important early steps in the understanding of electricity, building on the work of Luigi Galvani.

8. Luigi Galvani (1737–98) was an Italian physician and physicist, and a pioneer of bioelectricity. He studied medicine at the University of Bologna, and in 1762 was appointed a lecturer in anatomy. He later became a professor of obstetrics and, in 1772 was named president of the university.

9. Electricity also provided a link to the early Romantics, as evinced in Mary Shelley’s Frankenstein: or the Modern Prometheus (1818).

10. For a discussion of Schopenhauer, see the essay by Bart Vandenabeele in The History of Continental Philosophy: Volume 1.

11. Marie François Pierre Gontier de Biran (Maine de Biran) was born on November 29, 1766, in Bergerac, France. He studied law at the University of Poitiers before entering the guard of Louis XVI at Versailles. After the French Revolution, he returned to the countryside and, after the Reign of Terror, he held public office under successive regimes. He died on July 20, 1824, in Paris.
ematical concerns, apart from a continuing interest in logic, although he tended to have a psychological rather than mathematical conception of logic. Instead, Maine de Biran made it his life-work to establish foundations for psychology, and through this for the human sciences in general, although in practice his numerous and significant duties in public life under different political regimes in those turbulent times were a significant and almost continuous distraction. For about the last twelve years of his life he worked on a single book that would provide these foundations. But the projected book changed in form and content over this period and was never completed. As Henri Gouhier wrote: “He was a one-book man: but he never wrote the book.” But the work sometimes came quite close to completion, and a scholarly edition of his writings, mostly unpublished during his lifetime, is available today in thirteen parts (twenty volumes), replacing less scholarly and less complete editions produced since the 1840s.

Although initially avowing a robust empiricism, Maine de Biran placed central emphasis from an early date on the consciousness of willed activity, and later in his life a more metaphysical and then mystical and religious direction also came into his work. He was steeped in the work of various predecessors, including Locke and Condillac, as well as numerous scientific and medical writers, educationalists, and other philosophers. Despite the weight he gave to empirical investigation, he did not accept strong reductivist versions of materialism, as evinced, for instance, in the work of La Mettrie or Pierre-Jean-Georges Cabanis.

---

12. I did find among Maine de Biran’s papers in the library of the family chateau near Bergerac a sketchy attempt to prove the trisection of a given angle with ruler and compass. This problem goes back to the ancient Greeks, and much ingenuity was expended on it from ancient times onward. It was only after the death of Maine de Biran that such a construction was proved to be impossible.

13. Henri Gouhier (1898–1994) was a distinguished scholar of philosophy at the Sorbonne, where he taught from 1941 to 1968. Gouhier published a number of books, mainly on the history of French philosophy, including several books on Descartes as well as books on Bergson, Comte, Maine de Biran, Malebranche, Pascal, and Rousseau. He was elected to the Académie Française in 1979.

16. Victor Cousin’s few editions, for instance, were very tardy, and crucially incomplete. He would just pick and choose bits and pieces that he thought represented the “best” aspects of the “isms” that he had crudely identified.

17. Pierre-Jean-Georges Cabanis (1757–1808) was a materialist philosopher and physiologist. He was the author of Sur les Rapports du physique et du moral de l’homme (1802), and was acquainted with many of the most distinguished figures of his day, including d’Alembert, Condillac, Condorcet, d’Holbach, Diderot, Benjamin Franklin, and Thomas Jefferson.
His influence on later thought was varied. In 1821, Antoine-Athanase Royer-Collard, a specialist in mental disorders, requested Maine de Biran’s help in preparing a course of lectures, and Maine de Biran, reworking a previous prize-winning work, sent him the *Nouvelles Considérations sur les rapports du physique et du moral de l’homme*. Royer-Collard’s notes on this were published by his son in 1843 in the second issue of the *Annales Médico-psychologiques*. This journal represented a significant step in the development of empirical psychology in the nineteenth century. So Maine de Biran had a role in the early stages of this science.

It can be claimed also that he was a predecessor of phenomenology, given his insistence that “nothing is present to our consciousness except as a relation.” I have found no evidence that Franz Brentano knew his work, although later phenomenologists – including Maurice Merleau-Ponty and Michel Henry – were acquainted with it.

Maine de Biran from an early stage distinguished between the “animal life” in humans, in which the organism followed its own ways, which were not always present to consciousness, and the “conscious life,” which had at its foundation the awareness of willed effort. This notion was not abstruse; Maine de Biran often illustrated it by the simple example of a person knowingly raising an arm. But such awareness constituted what Maine de Biran called a “primitive fact” presented by “the inner sense.” At the same time, the conscious life presupposed the “animal life,” and Maine de Biran thought that there might one day be a “new Columbus” who would explore the underlayer of our conscious life, so in a certain way anticipating Freud. To these “two lives,” Maine de Biran later added a third level, the “life of the spirit.” It is this last that gives some support to making Maine de Biran a predecessor of French spiritualist philosophy, although the various writings in which these ideas about the “third life” were developed by Maine de Biran were not in fact published until the twentieth century. Thus Maine de Biran cannot have been a predecessor of the spiritualists directly, through their knowledge of his published writings. Nevertheless, it is

---

18. Antoine-Athanase Royer-Collard (1768–1825) was a French doctor who worked with the “insane.” In 1806 he was named chief physician at the Charenton mental asylum, where his patients included the Marquis de Sade. In 1819, he was appointed to the first Chair of *médecine mentale* in the Faculté de Médecine in Paris.

*20. For a discussion of Merleau-Ponty, see the essay by Mauro Carbone in *The History of Continental Philosophy: Volume 4*; Henry in discussed in the essay by Bruce Ellis Benson in *The History of Continental Philosophy: Volume 7.*

arguable that influences may tread more subtle paths, such as those outlined in the notion of the “epidemiology of ideas” recently developed by Dan Sperber.22

III. COURNOT

Antoine-Augustin Cournot (1801–77), by contrast, was a mathematician of note, both in mathematical theory and in applied mathematics, including economic theory. One of his most important legacies is in probability theory. Pierre-Simon Laplace,23 perhaps the hardest of all determinists, had taken the view that the role of probabilistic mathematics was simply to make up for our insufficient knowledge as finite humans of the evolution of the universe. If we were all-knowing we could predict precisely the entire future of the universe from the current position and momentum of all elementary particles using the laws of physics. But Cournot, by contrast, considered that probabilistic techniques were founded in features of the real world, rather than being a substitute for our ignorance of it. He was greatly interested in chance, as an unavoidable aspect of our world. In this he may be considered to have anticipated from a great distance the later advent of quantum mechanics, although, of course, he was far from having any of the empirical findings or underlying theoretical work on which quantum theory would later depend.24

His major work in economics, Researches into the Mathematical Principles of Wealth,25 was to have an important influence in the later development of economic theory, although, to his disappointment, its importance was not

22. Dan Sperber (ed.), “The Epidemiology of Ideas,” special issue of The Monist 84 (2001). The analogy with epidemiology is that despite sound knowledge of the aetiology of various diseases, there is no general epidemiological law to explain their distribution since entirely different factors can affect their spread or failure to spread in different populations and areas. Analogically, and contrary to the claims of memeticists, there are no general principles to explain the spread of ideas. Cases vary considerably, and overt or provable influences through personal contacts or the written or printed word are just one of many different ways in which ideas spread.
23. Pierre-Simon Laplace (1749–1827) was a French mathematician and astronomer who advocated strong determinism. Author of the five-volume Mécanique Céleste (Celestial mechanics; 1799–1825), he contributed to the development of mathematical astronomy, made significant contributions to mathematics and probability theory, and aided in the development of the metric system.
recognized when he published it. Some of his work prefigured the much later development of game theory, including the Nash equilibrium.\(^{26}\)

In later life, he became increasingly interested in “vitalism,” according to which there are laws or principles or forces governing living beings that are distinct from those governing inert matter.\(^{27}\) This was a common enough preoccupation at the time, and indeed, earlier, Maine de Biran already had a considerable knowledge of and interest in eighteenth-century forms of vitalism. Later Bergson was to reject not only crude vitalism but also crude mechanism. Although current biological orthodoxy rejects vitalism in all its forms, some twentieth-century scientists, such as René Thom, D’Arcy Thompson, and C. H. Waddington, have maintained quasi-finalistic positions.\(^{28}\)

But, despite these interests, Cournot is now respected primarily for his important mathematical work. The significant thing he shares with the spiritualists is his rejection of strong determinism.

---

\(^{26}\) Game theory is not about games as we normally understand them, but about any human interactions in which there can be different outcomes for the parties according to what they do. A Nash equilibrium occurs when “players” in a “game” know each other’s strategy, and therefore know what to do. However, the existence of a Nash equilibrium does not guarantee that the players will get the best possible payoffs (which could be achieved if their strategies were different). The most well-known example of this is the “Prisoner’s Dilemma,” in which each of two prisoners will get the best outcome (namely, minimal or no prison sentence) if they both keep quiet under questioning, yet it seems to each of them rational to confess, since if the other keeps quiet a small sentence will result.

\(^{28}\) See, for example, René Thom, *Structural Stability and Morphogenesis: An Outline of a General Theory of Models*, D. H. Fowler (trans.) (Reading, MA: W. A. Benjamin, 1975); D’Arcy Wentworth Thompson, *On Growth and Form* (New York: Dover, [1942] 1992); and C. H. Waddington, *Principles of Embryology* (London: George Allen & Unwin, 1956). D’Arcy Thompson (1860–1948) demonstrated with beautiful diagrams the existence of common and related forms in living organisms that appeared not to be susceptible to ordinary evolutionary explanation. Thom (1923–2002) argued for a form of qualitative dynamics, based on his Fields Medal work in topology, also named by him “catastrophe theory,” which would explain the occurrence of seemingly unrelated forms in nature, such as the forms of the erect penis, the mushroom *Phallus Impudicus*, and certain similarly shaped geological formations. Waddington (1905–75) introduced the idea of “chreods” (necessary paths), that is, the idea that organisms were constrained in their possible paths of development. For instance, he considered that evolutionary processes as conventionally conceived will not produce animals with, say, three, five, or seven legs. These arguments made by distinguished if unconventional scientists are not “vitalist” in the strong sense of appealing to a natural force responsible for what happens in living organisms as opposed to inert matter, as earlier eighteenth- and nineteenth-century thinkers had claimed. But they present quasi-finalist challenges to conventional biological and evolutionary wisdom.
Maine de Biran and Cournot can be shown to have had major and diverse influences on subsequent thought, directly and indirectly. The same can be said of Félix Ravaisson, whose own thought was influenced by, among others, Maine de Biran, Victor Cousin (with whose positions he often found himself in disagreement), and F. W. Schelling (whom he travelled to Munich to meet in 1839). In addition to his interest in the fine arts, drawing on Maine de Biran’s psychological insights and Schelling’s metaphysics, Ravaisson’s writings had a profound influence on both Catholic philosophy and the development of personalism in France. In 1835, Ravaisson won a prize for a study of Aristotle’s metaphysics, leading to later publication of a two-volume work. Ravaisson’s fresh approach to Aristotle’s *Metaphysics* represented a new return to Aristotle’s original thinking, and in the second volume, published nine years after the first volume appeared in 1837, he discussed Aristotle’s philosophy in relation to Greek thought in general. However, Ravaisson’s spiritualism is not Aristotelian in character, except in the role it gives to teleology, a theme later taken further by Lachelier.

Ravaisson’s doctoral thesis about habit should be noted, since an early work of Maine de Biran (one of the very few works published in his lifetime) was about the influence of habit on our thinking, a work in which we see for the first time Maine de Biran’s distinction between “two lives” in us. Maine de Biran’s position depended on his advocacy of a reflective psychology. At this stage of his life, Maine de Biran entirely rejected metaphysical reasoning. Ravaisson describes habit as “the middle term between the will and nature.” This statement is not of itself alien to Maine de Biran’s views, but Ravaisson immediately glosses it in terms of Spinoza’s metaphysical distinction between *natura naturans* (namely what exists in itself and is thought through itself, or God the free cause, or

29. Jean-Gaspard Félix Lacher, dit Ravaisson-Mollien (October 23, 1813–May 18, 1900; born in Namur; died in Paris).
30. Victor Cousin (1792–1867) was a French eclectic philosopher who chose what he thought best of the four “-isms” – by some accounts rationalism, empiricism, spiritualism, and mysticism – among previous philosophers. Influenced by Hegel and Schelling, Cousin was a member of the Council of Public Instruction (1830), of the Académie Française (1831), and of the Académie des Sciences Morales et Politiques (1832). His influence dominated the French educational system, and in particular philosophical education, for a considerable period.
31. Henri Bergson succeeded Ravaisson at the Academy of Moral and Political Sciences, and he delivered in 1904 a *Notice sur la vie et les Œuvres de M. Félix Ravaisson-Mollien* in which he claimed that Ravaisson’s philosophical work had its roots in his reflections on beauty and on works of art.
attributes of substance that show an eternal and infinite essence), and *natura naturata* (namely all that follows from the necessary existence of God). Habit, says Ravaisson, is of the second kind, displaying the work of the first. For this reason, it allows us to escape from nature, and invites an idealist view of reality. This claim is remote from the early thought of Maine de Biran, and is a crucible for the development of Ravaisson’s “spiritualism.”

In 1839, he became Inspector of Libraries; in 1852 he was chairman of a commission on the teaching of drawing in schools (Delacroix and Ingres were members) and had a continuing interest in the nature of beauty. In 1852, Ravaisson became Inspector General of Higher Education (a position he would occupy until 1888), producing in 1867 at the request of Victor Duruy, the Minister of Public Instruction, a report on the state of philosophy in France: *La Philosophie en France au XIXème Siècle*. This report contrasted mechanical and organic modes of apprehension. It also compared the creation of works of art with God’s loving creation of the universe. It rejected outright materialism as a position impossible to sustain and concluded with a theory of beauty, according to which the order and harmony of the whole is prior to and gives sense to the parts.

What is particularly interesting is Ravaisson’s extended critique of the eclectic philosophy of Cousin, which continued to be dominant in the French educational system. This account displays Cousin as an unscholarly and superficial thinker, and Cousin’s aesthetics is picked out for especially strong criticism, since it depicts ideal beauty in an abstract and general way. Ravaisson’s own approach is illustrated in his discussion of the Venus de Milo, which concentrates in detail on the particularity of the work, to the point of arguing persuasively that a mistake had been made in its reconstruction, causing a blemish, namely a violation of Leonardo da Vinci’s rule about figures posed on one foot specifying the relative heights of the shoulders and the line from the knot of the throat to the supporting foot. This is a nice illustration of Ravaisson’s more general claim that philosophy must emphasize the particular (he cites Aristotle to this effect). Thus his statement that the pose of the Venus expresses love and peace, and that teleological understanding is fundamental in fine art, rests on the conviction that the beauty of an object resides in its concrete existence, contrary to the opinion of Cousin.

All this led Ravaisson to concentrate on the old distinction between analysis and synthesis. Analysis, as described and practiced by so many, from Descartes to Bertrand Russell, aimed at achieving understanding by breaking down a phenomenon or problem or object into its constituent parts. A clear

picture of the parts, their nature, workings, and interactions, should resolve any puzzles about the wholes. The alternative and preferred philosophical approach, according to Ravaisson, was synthesis: here we find a constructive approach, which strives toward the infinite. He wrote a “philosophical testament,” of which versions have subsequently been published, although it remained incomplete at his death. Here, he praises enthusiasm, emphasizes the role of feeling in the search for truth, claims that generosity and love are the foundation of education and of social morality, and argues that belief in immortality is natural to humans. What we retain is that this “spiritualist” rested his position, at least in part, on a concern for the concrete.

V. RENOUVIER

Charles Bernard Renouvier was a contemporary of Ravaisson. He is often described as a neo-Kantian, taking up in his own way Kant’s concern with the a priori conditions of knowledge. However, he differed from Kant in many respects, claiming that relations, rather than things, are fundamental. Maine de Biran had already made a similar claim. Renouvier also gave an important role to liberty, in a way quite different from Kant’s treatment of free will. Although he was a founding figure of French neo-Kantianism, these were not Renouvier’s only departures from Kant: he repudiated the notion of things that are not represented (“things in themselves”), and departed from Kant in his treatment of time and space: unlike Kant, Renouvier thought that these could not be posited, by whatever reasoning, without generating the paradoxes of actual infinity.

He rejected the notion of substance. Relation was the basis of representations. He also rejected the notion of actual infinity: reality is finite. Furthermore, certainty rested on liberty. In ethics, it was necessary to take into account the existence of desires and interests to which history testifies. Here, too, he diverged from Kant’s notion of duty.

After his time at the École Polytechnique (1834–36), he published a work on Cartesianism, in which he contended that belief in the reality of the infinite

37. Charles Bernard Renouvier (January 1, 1815–September 1, 1903; born in Montpellier; died in Prades).
*38. For a detailed discussion of Renouvier and Lachelier in the context of neo-Kantianism, see the essay by Sebastian Luft and Fabien Capeillères in The History of Continental Philosophy: Volume 3.
gave rise to contradictions, and argued for “neo-criticism,” which would combine phenomenalism, finitism, and apriorism. Renouvier continued to explore this position throughout his life, the fruits of which can be found in his most influential work, the four-volume *Essais de critique générale* (1854–64). In his later years, Renouvier was drawn to a Leibnizian metaphysical position that, conjoined with his emphasis on liberty and reflective consciousness as defining characteristics of human persons, led him to put forward an early version of personalism.40

### VI. LACHELIER

Jules Lachelier, through his teaching at the École Normale Supérieure from 1864–75 as well as his administrative posts as Inspecteur Général (1879–1900) and president of the *jury d’agrégation de philosophie* (1900–10), was perhaps the most influential philosopher in France for almost forty years.41 Like his teacher Ravaisson, Lachelier considered that naive acceptance of the supposed findings of “science” was dangerous. After all, science did not always deliver hard results, or more precisely, the results it did yield could lead to divergent views of the world and of our place in it. Consider the radical difference about chance between Laplace and Cournot, discussed above. It might be thought, however, that such divergences do not impugn the main merit of the scientific method, namely its objectivity. But Lachelier denied this claim to objectivity, developing a form of idealism in which there was indeed objectivity, but an objectivity that resides in thought. Mind, in this conception, is the underlying reality, and the panoply of the natural world and its order derives from thought. Thought here is not to be construed subjectively. Thus Lachelier developed a position that can be described as a form of Neoplatonism.

We can follow this line of thought by considering the arguments of his doctoral thesis on induction.42 Induction, considered as generalization from specific facts or findings, needed a proper basis. But how is this to be provided? Lachelier devoted ten pages at the beginning of his thesis to John Stuart Mill’s

---

41. Among those who studied with Jules Lachelier (May 27, 1832–January 26, 1918; born in Fountainbleu; died in Paris) at the École Normale were Jules Lagneau (1851–94) and Émile Boutroux (1845–1921), and his influence can be seen in the work of Léon Brunschvicg (1869–1944), Maurice Blondel (1861–1949), and Henri Bergson.

42. Jules Lachelier, *Du fondement de l’induction* (Paris: Librairie philosophique de Ladranga, 1871). This work was dedicated to Ravaisson.
account of this procedure. He claimed that although Mill’s methods might “work,” say for very large numbers of stellar motions over very many years, they failed to account for the very possibility of passing from the particular to the general. We need to start with the One, not the many. “Pure mechanism,” he wrote, “has no real existence, even phenomenally. It is just the limit of resolution of organic living entities in their material conditions.”

Now we must accept the existence of a law of efficient causes established in Kantian style, but this will not by itself justify or explain inductive procedures. A further and more fundamental underpinning is needed. We shall give first place to the concrete existence of teleologically organized individuals. A whole is an end when containing within itself the reason for the organization of its parts (e.g. a stable chemical compound, or a living organism). A number of consequences followed from the existence and recurrence of such wholes. First, such objects presuppose the existence of a law of final causes. Their teleological structure has the form of being willed. In this sense freedom is fundamental in the universe. Second, given that organisms vary in their degree of organization, we are led to discern a hierarchy of beings of increasing order and harmony. Third, we come once more to the underlying reality of thought.

As with other forms of idealism, the question arises: what of material existence? Given that Lachelier takes the existence of self-organizing wholes as a starting-point, are these wholes not material? A pure idealist might say that the material is an illusion: it does not really exist. Yet Lachelier oscillates between his Neoplatonizing arguments and a belief in the reality of matter. As Millet wrote: “Lachelier recognizes that his philosophical system cannot give an account of that principle which is matter, yet he holds on to the system; he is aware that such a problem is fundamental, that matter is irreducible, yet his system leads him to reduce it to non-existence.”

VII. BERGSON

Henri Bergson is discussed elsewhere in this collection. But a brief treatment here will serve to provide a perspective on some of the various authors whose work is outlined above.

We find very varied positions among all these thinkers with regard to science. Maine de Biran, while not trained as a scientist, was well read in numerous

aspects of the physical and medical science of his day, and took it very seriously. Ravaisson, by contrast, was not similarly inclined. For instance, he used his treatment of habit mentioned above as a handle to escape from mechanism, while for Maine de Biran the topic was a first step in the development of a systematic psychology that was to give a strong place to the underground workings of the organism, and give a strong role to empirical investigation. Various scientific disciplines and social-scientific disciplines, according to Maine de Biran, would play a significant part in developing “the science of man.”

Looking ahead to Bergson, we find once more a detailed treatment of topics in the biological and psychological sciences in *Time and Free Will* (1889; dedicated to Lachelier), *Matter and Memory* (1896) and *Creative Evolution* (1907), and of physical science in *Duration and Simultaneity* (1922), which is a treatment of relativity theory. Although we can see some real continuities with the thought of the spiritualists in Bergson’s later work and his growing interest in religion, his respect for and detailed interest in scientific investigation also marks him off from spiritualism. One cannot imagine a spiritualist saying what Bergson said in a lecture on “Philosophical Intuition” in 1911:

> Here, if you like, is a man who, over a long period of time, has followed a certain scientific method and laboriously gained his results, who says to us: “Experience, with the help of reasoning, leads to this point; scientific knowledge begins here; it ends there; such are my conclusions”; and the philosopher would have the right to answer: “Very well, leave it to me, and I’ll show you what I can do with it! The knowledge you bring me unfinished, I shall complete. What you put before me in bits I shall put together. ….” Truly a very strange pretension! How could the profession of philosopher confer upon him who exercises it the power of advancing farther than science in the same direction as science? … Such a conception of the role of the philosopher would be unfair to science. But how much more unfair to philosophy!

Nineteenth-century debates had seen a rift develop between the many advocates of a positivistic and mechanistic view of reality such as Comte, and others, such as the spiritualists, who rejected this view. With Bergson, we return to a less simple position. *Creative Evolution*, perhaps his most well-known work, was not an attack from a “spiritualist” perspective on the biological science of the time,

---

but an informed attempt to put that science in a rather different perspective.\textsuperscript{48} And his book about relativity theory was another major and informed attempt to reconcile his own arguments about duration with the relativistic treatment of simultaneity.\textsuperscript{49}

Thus any attempt to categorize each of these thinkers as scientistic or spiritualistic would be inadequate. Despite their spiritualist aspects, many of them were interested in or contributed to the scientific enterprise. Consider, for example, Maine de Biran’s attempt to provide foundations for psychology, Cournot’s treatment of chance, Renouvier’s emphasis on data as essentially relational and his adoption of finitism, Lachelier’s investigation of regulative principles, and Bergson’s treatment of human reason as an evolutionary acquisition destined for our pragmatic needs.

Few thinkers are static. This is why the doxographic approach to the history of thought, which proceeds by “isms,” is usually unsatisfactory. And it is why we have here indicated connections as well as divergences between the itineraries of the thinkers discussed in order to place the main representatives of “French spiritualist philosophy” – Ravaissone and Lachelier – in a certain intellectual landscape.

\textbf{MAJOR WORKS}

\textit{Antoine-Augustin Cournot}

\textsuperscript{48} For a discussion of Bergson’s \textit{Creative Evolution}, see the essay by Keith Ansell-Pearson, Paul-Antoine Miquel, and Michael Vaughan in \textit{The History of Continental Philosophy: Volume 3}.

\textsuperscript{49} It is worth noting that Bergson did not wish this book to be republished in his lifetime, since he thought that he might not be able to sustain his position with sufficient mathematical expertise.
Jules Lachelier

Félix Ravaisson

Charles Renouvier

Where and when philosophy ends and so-called “classical social theory” begins is not a question readily or credibly answered in simple terms. It is easy enough to ask, for instance: which philosophical streams most forcefully stimulated the thinking of Comte, Marx, Spencer, Durkheim, Tönnies, Simmel, or Weber? Yet for many reasons a precise set of answers that pertains to each is elusive, not least because all were Victorian polymaths who read widely and thought deeply to an extent remote from today’s scholarly world, besieged as it is by electronic diversions. Their minds operated within different spheres of application and comprehension than do ours. They were also egocentric enough (Comte, Marx, and Spencer in particular) to refuse to acknowledge thinkers from whom they borrowed heavily, but whose disciples they did not want to appear to be.

I. HERBERT SPENCER

Consider, for example, the remarkable case of Herbert Spencer (1820–1903), identified in the nonpareil eleventh edition of the *Britannica* (1910) as simply an “English philosopher,” yet now remembered principally as a sociologist or political theorist, and for his indispensable role in the proliferation of “social Darwinism.” Both his *Autobiography* and *The Life and Letters* remain indispensable in connecting the philosophical with the sociological, in showing how they were linked in this quintessential Victorian mind. The former work occupies two thick volumes published in April 1904, the year following his death at eighty-three, totaling 1258 close-set pages. He likely regarded this work, left to languish in a drawer for fifteen years, as relatively trivial when placed beside his genuinely
scientific works. Yet even though it is indeed free of deep psychological insight – his one-sided relationship with Marian Evans (“George Eliot”) merits little attention\(^1\) – the magnitude of detail is in its own way uniquely informative.

We learn, for instance, that Spencer’s relation with philosophical thought was antinomically creative. He dismisses Kant easily:

I found in Mr. Wilson’s house … a copy of a translation of Kant’s *Critique of Pure Reason* … This I commenced reading, but did not go far. The doctrine that Time and Space are “nothing but” subjective forms – pertain exclusively to consciousness and have nothing beyond consciousness answering to them – I rejected at once and absolutely; and, having done so, went no further. Being then, as always, an impatient reader, even of things which in large measure interest me and meet with a general acceptance, it has always been out of the question for me to go on reading a book the fundamental principles of which I entirely dissent from.\(^2\)

He also notes that “belief in the unqualified supremacy of reason is the superstition of philosophers,”\(^3\) and criticizes Comte and the numerous “Comtists” who labeled Spencer a follower of the former in his ideas about sociology. Spencer vigorously denies this in detail and repeatedly,\(^4\) while also dismissing “the schemes of Oken and Hegel, each of whom preceded Comte in the attempt to organize a system of philosophy out of the sciences arranged in serial order.”\(^5\)

Despite all this, philosophy for Spencer remained indispensable in that its arguments – those few that he seemed to have studied – forced him to clarify his own in, for instance, his *Principles of Psychology*, which he realized would have “lacked its organizing principle”\(^6\) without philosophy as its foil.

Like Darwin, his confederate in evolutionary theory, Spencer began life in the midst of an intensely religious family, and carried with him into the study of the natural and social worlds a heavy load of religio-philosophical baggage. It is no accident that “the Unknowable” figures prominently in his early work, *First Principles* (1862), since Spencer believed there were metaphysical questions neither he nor other humans could possibly answer, and should best be left to some external power beyond their ken.

---

4. See e.g. *Ibid.*, 292 n., 518.
If Spencer had died at thirty-two, he would have established himself as a minor speculative thinker, but he persisted through fifty more years of rigorous study as an autodidact, probing and amalgamating biology, education, sociology, political theory, psychology, ethics, and comparative anthropology. By inventing the phrase “survival of the fittest,” he forever connected himself with the Darwinian camp of his walking partner, Thomas H. Huxley (1825–95), and others. Yet one cannot view Spencer’s gigantic *Synthetic Philosophy* (sixteen volumes) without realizing that the merely empirical, measurable, and palpable operated in his system under the sign of a philosophical commitment tending toward the teleological, which surely inspired him in his tireless pursuit of data. That he was attacked late in life by “Spencer smashers” for being insufficiently ardent in his religiosity did not undermine his fundamental claim on philosophical speculation. Lester Frank Ward, first president of the American Sociological Association, defended Spencer in 1894 against a phalanx of theologians on precisely these grounds.7

If Spencer is now known as a champion of *laissez-faire* governmental forms (*Man Versus the State*; 1884), a believer in evolutionary progress, and a proponent of industrial versus militaristic social order, he was first of all a self-taught ontologist and epistemologist. His materialist view of the physical world, alternating between decomposition and reconstitution toward some desirable evolutionary end, all orchestrated around a unique lexicon (persistence of force, necessary rhythm, evolution versus dissolution, instability of the homogeneous, etc.), clearly revealed his hope of being accepted as a major philosopher – and as such triumphant over the German idealists he did not read carefully. His regimen of mental hygiene (not unlike Auguste Comte’s some years earlier) included careful avoidance of other philosophers’ ideas, so as to protect his creativity from the possible pollutants that might be loosed by conscientious reading of his competitors’ works. Yet the shadow of philosophy stayed with him throughout, as revealed in his *Autobiography*, where an essential chapter in the second volume is entitled “A System of Philosophy Projected.”

One wishes we had similarly detailed accounts for the other classical theorists of the kind that Spencer provided. His *Life and Letters*, assembled by an acolyte in 1908, is another 600-page “tome” (for once, the correct term), and again illustrates the astonishing dimensions of nineteenth-century thought at its highest levels. The classical theorists did not suffer imprisonment within the narrow, shallow disciplinary identities that trap most scholars today, and gloried in their ability to move freely among whatever fields of learning they found pertinent to their self-defined tasks. It is therefore unsurprising that Spencer in his prime

---

was often named “the nineteenth century’s Aristotle,” which seemed as plausible to his contemporaries as it appears preposterous now.\(^8\)

As a further indicator of the many puzzles that arise when trying to filiate social thought with philosophy, one might posit as nascent “social theorists” or even “sociologists,” the following: Mary Astell, Montesquieu, Turgot, Adam Smith, Adam Ferguson, John Millar, Kant (his *Anthropology* or *Ethics*), Condillac, Bentham, Wollstonecraft, Condorcet, Hegel (*Phenomenology of Spirit* or *Philosophy of Right*), Malthus, Sismondi, de Maistre, Saint-Simon, Carlyle, or Fourier – for a persuasive case could be made for each.\(^9\) But if one follows convention and categorizes them instead as philosophers, economists, or historians, no one could reasonably object given current constraints on disciplinary identities. Thus the difficulty of drawing a plausible line between, on the one hand, what since the Presocratics had been “philosophy” proper, and on the other, the neologistic “social sciences” – springing up like wildflowers in the nineteenth century – has been recognized for a long time.

The learned, forgotten American sociologist Charles Ellwood had this to say about this very topic in 1902 in the opening paragraph of “Aristotle as a Sociologist,” an article of continuing utility:

Sociology is ordinarily spoken of as a “new science.” In a certain sense this is true; yet social thought is as old as history, and social philosophy as an organized discipline has existed, at least, since Aristotle. Only in a very special sense, therefore, is it right to speak of sociology as a new science. If we understand by sociology merely the effort to apply to social phenomena the method of quantitative measurement, and to interpret these phenomena as merely the most complex manifestation of the forces of the physical universe, then we are justified in regarding it as a new science; for sociology in this sense is the product of modern positivism. But those who reject the mechanical theory of society, together with the idea that the scientific interpretation of society must be limited thereto, have no right to speak of sociology as a new science. When we regard modern sociology as “the more critical, more systematized study of the social reality,” we do not make it a “new” science, but rather a renovated and

---

reorganized science. The beginnings of sociology as a science in this sense certainly lie far back of the modern scientific era.10

Thus the question of when sociology’s classical theories began to evolve as such is impossible to answer definitively, even if we do know precisely when “sociology” got its name – a more modest discovery to be sure.

II. AUGUSTE COMTE

Standard accounts of sociology’s history always begin with Auguste Comte (1798–1857), not because he single-handedly invented the field, but because he named it. He was a mathematics prodigy, admitted to France’s premier engineering school aged sixteen, and tutored mathematics thereafter. But unlike most engineers being trained at the École Polytechnique, Comte was a fierce republican, rebellious at every turn, and even tried to arrange emigration to the United States in order to teach in a nation free of monarchy. His life was filled with professional and personal frustrations, especially after he began lecturing and publishing his Course of Positive Philosophy in 1826, which at first met with success, but later, owing partly to his repeated psychological crises, failed to win the kind of adoration that he thought was his due. Yet he could hardly be viewed as an intellectual failure. No less a figure than John Stuart Mill (1806–73) supported him financially, popularized his work in England by means of a small book (August Comte and Positivism; 1865), and patiently tolerated his egocentrism throughout their long friendship. And the noted British feminist, Harriet Martineau (1802–76), invested tremendous effort in freely translating his work into digestible English. There was a time when Comteanism (or “Comtism”) was a respectable label recognized worldwide among those interested in political and cultural change, and his works were widely discussed by a large anglophone audience as well as in Brazil,11 Mexico, Turkey, India, and elsewhere.

On the afternoon of Saturday, April 27, 1839, Comte in Paris “wrote and underlined the word” sociology in his manuscript, “embarrassed by coining

11. Several of the individuals involved in the coup that overthrew the Brazilian emperor and established the Brazilian republic in 1889 were followers of Comte’s ideas. To this day, the flag of Brazil bears the motto Ordem e Progresso (Order and progress), which was inspired by Comte’s positivist motto: “l’Amour pour principe; l’Ordre pour base; et le Progrès pour but” (Love as a principle; Order as the basis; and Progress as the goal), which appears on the title page of each of the four volumes of Comte’s Système de politique positive.
another neologism.”12 His own development as an intellectual historian and theorist, and by self-proclamation as “the first sociologist,” cannot be understood without examining a few of his many predecessors and peers, most of whom were deeply philosophical. Like most French intellectuals, ever since Pascal and Descartes, Comte learned to venerate the Gallic tradition as a schoolboy, but he managed to go far beyond it in his search for “universal” knowledge. Mary Pickering’s heroically detailed spadework13 has revealed, for example, that Hume was not only Comte’s favorite historian, but also, by his own admission, his “principal philosophical predecessor” – not the usual French standard-bearers, Montesquieu, Condorcet, or Turgot, as textbooks sometimes claim.14 Comte’s strident, encompassing version of religio-positivism made it impossible for him properly to “grasp the depth of Hume’s skepticism and relativism”15 – which was typical of his peculiar mode of incorporating others’ ideas into his own lumbering architectonic. More surprising yet, he claimed Condorcet, the German phrenologist and biologist Franz Joseph Gall (1758–1828), and the arch-conservative Joseph de Maistre (1753–1821), as his major influences overall.16 By working at fevered pitch for decades, he vigorously practiced a piratical version of what Robert K. Merton dubbed “OBI”: obliteration by incorporation.17 Yet he read so broadly, even manically, that virtually any thinker of the Enlightenment figured positively or negatively in his Cours de philosophie positive (six volumes; 1830–42) and his Système de politique positive (four volumes; 1851–54), even if often only in caricature. As Pickering put it, “It is evident that Comte had absorbed the ideas of Montesquieu and Condorcet and was influenced by Constant, Staël, Say, Cabanis, and Destutt de Tracy”18 – among many others. Comte represents that rare social theorist who combines top-level mathematical and scientific capacities with a passionate commitment to history, intellectual and political, fired by an unconstrained desire for liberating social change. He was not the economist that Marx or Vilfredo Pareto were to become, and less well schooled in philosophical argument than were Durkheim, Simmel, or Weber. Yet, by elaborating the teaching of his sometime employer, Henri

13. Ibid., 313, 306–8, 600.
16. Ibid., 263.
Saint-Simon, he did lay out in great detail a form of methodological positivism that inspired generations of social scientists during the ensuing century, even when they repudiated its more grandiose aspects.

Comte believed that humankind had historically progressed from theological entrapment in myth and fetish-worship to a metaphysical stage of skilled speculation, then finally achieving maturity in the positivist era – his own, of course, as he described it in the 1830s – which would put evidence and reasoned argument to use in establishing truth. Not only did he study and analyze religious and philosophical history, but also mathematics, astronomy, physics, chemistry, and biology in his far-flung attempt to prove that sociology would become the “queen of the sciences.” Comte’s vision for the social sciences generally, that they would put to use quantitative methods and data along with standard inductive practices, led him to argue that once sociologists had been installed as the secular priests of the social order, calamities such as the French Revolution would become unnecessary. Yet sociology’s roots for Comte always lay in philosophy, as he explained in “The Intellectual Character of Positivism”:

To effect this necessary intervention is the proper sphere of politics. But a right conception cannot be formed of it without the aid of the philosopher, whose business it is to define and amend the principles on which it is conducted. With this object in view, the philosopher endeavors to co-ordinate the various elements of man’s existence, so that it may be conceived of theoretically as an integral whole.19

The philosophical legacy of Comte continues to live invisibly in all modern social science, since the unspoken assumption underlying today’s research coincides perfectly with Comte’s fondest hope: once the unvarying “laws” of social behavior are uncovered through rigorous positivistic research, behavior can be tailored to fit society’s and individuals’ needs like a glove, and political miseries of the kind he knew during his own lifetime in France will no longer trouble the human condition. Comte’s simple notion of positivism, his theory of the three stages of human thought, and the so-called “religion of humanity” over which he and other “sociologist-priests” would preside via scientific method no longer appeal in the way they did among Mill’s peers. Yet this does not detract from Comte’s singular role in the early legitimation of sociology, and the necessary linkage he shaped between it and its philosophical heritage. And it is probably no accident that Comte was rediscovered, yet again, during the 1960s and 1970s, the “Age of Aquarius,” given that he introduced his “religion of humanity”

this way: “Love, then, is our principle; order our basis; and progress our end.” He learned late in life, through a beloved woman who died too soon after they had met, that love is the great motivating force in social life, and “reason” alone cannot inspire humans to develop a “religion of humanity” of the sort he envisioned in a trouble-free world.

The instance of Turgot is similarly interesting and illustrative in this regard, not only as it pertains to Comte’s development, but also as revealing the way early social theorists often routinely turned philosophical ideas to their own purposes. Turgot set out a three-stage theory of historical change in his famous 1750 address, “A Philosophical Review of the Successive Advances of the Human Mind,” which won high praise from Condorcet and others whom Comte also admired. One could therefore surmise (as did the noted chronicler Harry Elmer Barnes) that Turgot’s ideas directly influenced Comte when, seventy-two years later in 1822, he created his own tripartite theory of cultural “advance” (the theological–metaphysical–positivist eras). Yet, according to Pickering’s careful scrutiny of the evidence, this is not likely, because Comte apparently read Turgot only in 1852 or 1853, long after his own theory had been formulated. Moreover, his library contained none of Turgot’s own works, but instead, a well-used copy of Condorcet’s *Vie de Monsieur Turgot* (1787).

An intriguing intersection among the three thinkers occurs at the beginning of Condorcet’s “Essay on the Application of Mathematics to the Theory of Decision-Making” (1785), which opens with what from our vantage point can only seem poignant hopefulness:

> A great man, Monsieur Turgot, whose teaching and example, and above all whose friendship I shall always mourn, was convinced that the truths of the moral and political sciences are susceptible of the same certainty as those forming the system of the physical sciences, even those branches like astronomy which seem to approach mathematical certainty.

---

20. *Ibid.*, 381. As noted above (note 11), this motto served as inspiration for the creation of the Brazilian flag.
21. Anne-Robert-Jacques Turgot (1727–81) was a French economist and statesman, and an early proponent of economic liberalism. In his “A Philosophical Review of the Successive Advances of the Human Mind” is found what is considered the first complete statement of the Enlightenment “Idea of Progress.”
This opinion was dear to him, because it led him to the consoling hope that the human race will necessarily progress toward happiness and perfection, as it has done in the knowledge of truth.\textsuperscript{25}

Such sentiments are virtually identical with Comte’s, and continue even now to inspire a significant portion of modern sociological labors, even if usually in far more modest terms, chastened as they are by postmodern reflexivity and the failure of various large-scale social programs that were based on positivistic research (e.g. the James Coleman “busing report” of 1966).

**III. HENRI-CLAUDE DE SAINT-SIMON**

Even a cursory glance at Comte’s road to the creation of “sociology,” by name if not by practice, must pay special attention to Henri-Claude de Saint-Simon (1760–1825),\textsuperscript{26} for whom Comte served as a research associate from summer 1817 until March 1824. If the Marx/Engels relationship seems the least troubled, most productive, and “brotherly” of all such team efforts, it could be said that Saint-Simon’s and Comte’s – they were respectively forty-seven and nineteen when they met – represents the “dysfunctional family” model of collaboration at its worst. What began as worshipful attention of the younger for the elder ended as a paranoid tragedy in which Comte repudiated everything good about Saint-Simon’s ideas and person.

The parallels between the pair’s ideas have become increasingly obvious since their feuding bands of followers disappeared. Unlike Comte, who represented himself in logorrheic fashion, Saint-Simon’s ideas were best presented by his disciples (e.g. Amand Bazard’s *Exposition de la doctrine de St. Simon*; two volumes; 1828–30), and not in Saint-Simon’s own forty-seven volumes of collected writings (1865–78). He admitted in a letter to M. de Redern “to have thought a great deal and to have read very little to produce really new ideas,”\textsuperscript{27} which is wholly at odds with Comte’s synthesizing and inclusive mode of theorizing.

The notion so close to Comte’s heart, that science would guide “industrial society” toward universal prosperity and freedom, and that superstitious beliefs would be left behind, is indeed Saint-Simon’s. The latter thought that industrialists could be trusted to organize and run modern society (one is reminded of

\textsuperscript{25} In *Condorcet: Selected Writings*, Keith Baker (ed.) (Indianapolis, IN: Bobbs-Merrill, 1976), 33.

\textsuperscript{26} For a discussion of Saint-Simon, see the essay by Diane Morgan in *The History of Continental Philosophy: Volume 1*.

Thorstein Veblen's paean a century later to a guiding “soviet of engineers”\textsuperscript{28}, and that a Christianized socialism would evolve from their efforts. Here a utopian condition would obtain in which the worst features of human behavior would “naturally” evaporate. Ironically, it was Saint-Simon's late injection of religiosity into his program for social change that alienated Comte, who would himself late in life make almost precisely the same move when he fashioned his “Religion of Humanity.”

In \textit{The New Christianity} (1825), Saint-Simon argued that the ultimate goal of his utopian society would be to eliminate poverty and to elevate what Marx would call “the proletariat” to a healthy and respectable condition. He envisioned the elimination of war, anarchy, and the egotistical impulses that gave rise to both when his religiously based social order was in place, one built on the conventional Catholic virtues of obedience and devotion to a larger, collective good. It must be remembered that Saint-Simon had suffered imprisonment and near-execution during the revolution, so his feelings for organized aggressiveness were not warm. Similarly, Comte grew up with the shadowy memory of the Terror, so, like many of their countrymen, including rightists such as de Maistre, he posited as the supreme societal virtue the elimination of war and anarchic brutality among its citizens. Saint-Simon's utopia would also give women the vote and would abolish inheritance, themes picked up by many revolutionary groups that followed him. His high regard for women is another theme adopted by Comte as the latter entered his concluding years of creative work, around 1852.

\section*{IV. ÉMILE DURKHEIM}

A telling yet neglected work that bridges many of these ideas is Émile Durkheim's \textit{Socialism and Saint-Simon}, a dense set of lecture notes from 1895–96, which he delivered at Bordeaux, assembled posthumously in 1928 by his nephew, Marcel Mauss.\textsuperscript{29} Durkheim (1858–1917) planned to write a comprehensive history of socialism drawn from separate lecture courses on Saint-Simon, Proudhon, Lasalle, Marx–Engels, and others, but his manifold duties – including the single-handed founding of French sociology! – prevented him from going beyond the first course. Many of Durkheim's students and colleagues were committed leftists, and even though he sympathized with their goal of ameliorating the grim

\begin{footnotesize}
\footnote{28. Thorstein Veblen, \textit{The Engineers and the Price System} (New York: Viking, 1921).}
\end{footnotesize}
lives of the working classes, he stood back from the fray and evaluated this broad movement "scientifically," following his usual tack.

His opinion of Saint-Simon’s work was quite high, and he did not hesitate to point out the relative weakness of Comte’s theorizing, and its heavy reliance on the older man’s more fundamental innovations: “Comte owed him much more than he acknowledged.”30 In fact, as Alvin Gouldner points out in his introduction to the English translation, “Durkheim firmly denies to Comte, and bestows on Saint-Simon, the ‘honor’ of having founded both positivist philosophy and sociology.”31 The argument hinges on the 1813 Mémoire sur la science de l’homme by Saint-Simon, published in 1859, where the lineaments of a positivist social science are clearly spelled out. Gouldner speculates that perhaps Saint-Simon’s “socialism” besmirched the less politically loaded term “sociology” to which Comte laid claim, and early historians of the field so wished to distance themselves from public association with the Left that they elected to remember Comte rather than his mentor. Either way, sociology of the French variety was born within a context of serious philosophical discussion, fusing aspects of Enlightenment secularism, newly formed positivism, and latent idealism.

Durkheim shrewdly observed that Saint-Simon, as rebellious youth, received encouragement and refinement from his acquaintance with D’Alembert, fueling his desire to update the Encyclopedia with an eye to advances in the natural sciences.32 Yet for all his materialism, Saint-Simon’s positivism rests on an idealist base: “knowledge … according to him is the moving power of progress … For it is the positive source of all social life. A society is above all a community of ideas.”33 This notion, contrary to Marx’s desires, was absorbed into twentieth-century sociology through ideas such as “norms,” “value consensus,” and “societal belief-systems.” And this stream clearly began with Saint-Simon’s unique transformation of Enlightenment skepticism and materialism. In fact, Saint-Simon went so far as to claim that “philosophy appears as a branch of sociology,”34 another notion firmly taken up by Comte.

Durkheim thought that he was in genuine intellectual competition with Spencer, but prior to battling his British foil, he first needed to trounce Comte’s version of the discipline in order to advance his own. He believed that Comte misunderstood, perhaps by denying Saint-Simon’s insights, the true nature of industrializing Europe. For Durkheim, of course, modern life’s multiplying interdependencies were cause not for alarm, but for rejoicing, since they meant that philosophic and practical differences between individuals and their

30. Ibid., 86.
32. Ibid., 82.
33. Ibid., 91.
34. Ibid., 93.
affiliated groups would “naturally” diminish over time. There was no need, so thought Durkheim, for a Comtean priesthood of propagandizing sociologists intent on controlling the unruly masses. The magical “division of labor” would resolve whatever tensions were left over from the shocking degradation of village “mechanical solidarity” into the steely social structures of modern, urban life that constituted “organic solidarity.” This profound transformation of human life was most memorably analyzed by Durkheim’s German competitor, Ferdinand Tönnies (1855–1936), whose *Gemeinschaft und Gesellschaft* (1887) gave sociology two of its immortal and most contested terms. Tönnies understood that small-town life (*Gemeinschaft*) was made up of “community” relations, a naturally formed face-to-face intimacy that humans had perfected over millennia as an end in itself, whereas urban existence (*Gesellschaft*) bore within it an unavoidably alienating set of forces that has typified modern life, and led to a great number of “dysfunctions” (famously portrayed by Georg Simmel in “The Metropolis and Mental Life” of 1903).\(^{35}\) Problems with *anomie*, which Comte described without using the term itself, would vaporize, so Durkheim argued in opposition to Tönnies, as modern citizens assembled into professional groups that would legislate morality along “organic” rather than “mechanical” lines.

For Durkheim (whose early scholarship dealt with Kant) the major problem of industrialized social life was controlling the Byronic passions for superindividuality and egocentricity – perhaps of the very type that Comte perfected in his own sad life – that leads inevitably to social disorganization and crises. As he famously wrote in *Suicide* when defining “altruistic” self-destruction, “If, as we have seen, excessive individuation leads to suicide, insufficient individuation has the same results. When a man has become detached from society, he encounters less resistance to suicide in himself, and he does so likewise when social integration is too strong.”\(^{36}\) This broad-scale argument within theorizing, capsulized in the mid twentieth century as the “personality versus social structure” debate, was already “an issue” for the Scottish moralists (Adam Smith, Adam Ferguson, John Millar, Dugald Stewart) by 1750, and, with Durkheim’s embrace of Saint-Simon and Comte, assumed the role of foundational timber for all sociology that followed.

V. GERMAN SOCIAL THEORY

One could surely go on in pursuing the Gallic sociological tradition – from Condorcet to Saint-Simon to Sismondi to Comte, de Maistre, Fourier, Quetelet, Gobineau, LePlay, Coulanges, to Tarde and Le Bon. It is an astonishing progression of thought, with deep roots in the Enlightenment consciousness of Voltaire, Montesquieu, Rousseau, and others, yet equally at home in part with the arch conservatism of the counter-Enlightenment. But it is only a third of the major story one might tell about the origins of classical social theory and its links with philosophy per se. Much was also going on, of course, in Germany and Britain – not to mention Italy, Russia, and Central Europe, as outlined in Barnes’s uniquely informative volume, as well as in Pitirim Sorokin’s early masterpiece, where an international cast of hundreds flits across his stage. In some ways, though, the German and British components are better known than the French, at least in the United States. This is mainly because the founding fathers of American sociology were profoundly directed by Europeans – Marx, Weber, Durkheim, Simmel, and Tönnies – yet only one member of the early pantheon was French. And Durkheim’s viewpoint was so conceptually opposed to Tönnies’s in particular, and, by implication, to Weber’s and Marx’s, that most sociologists in the US have favored either the Gallic path or the Teutonic one, but seldom both.

The manifold connections between philosophical reflection and social theory as practiced in Germany has been explored many times in the US and Britain, as exemplified most forcefully by Talcott Parsons’s The Structure of Social Action in 1937. However, enthusiasm for Kant, Hegel, Dilthey, and Nietzsche, among others, has run high in these intellectual circles for two centuries. Even Goethe has been brought into discussions of social theory (e.g. regarding Marx, Weber, Simmel, and Georg Lukács), given the “elective affinity” these thinkers found in his Faust drama and other works. Friedrich Schiller’s role is similarly valued, not so much for his plays as for his Aesthetic Letters (1794), wherein a theory of freedom as play (Spieltrieb) and invention is proposed, the sociological influence of which has stretched from his time to Herbert Marcuse’s Eros and Civilization.

It was unsurprising, then, in 1975 when Marx’s dissertation on Democritus was first translated into English, to find that his membership in Berlin’s “Doctors’

37. See Sica (ed.), Social Thought.
38. Barnes, An Introduction to the History of Sociology.

Club” – a talented group of Young Hegelians who, alienated from the right-wing University of Berlin faculty and administration, met nightly for intellectual exchange – was more than mere sociality. He had been a serious philosopher long before he turned in earnest to economics and politics. In fact, it is a truism among Marxists that his early works cannot be understood without prior grounding in Hegel, Feuerbach, Fichte, Bruno Bauer, and others who made up his philosophical worldview. The relationship between Dilthey, a great philosophical talent of his era, and Weber, Tönnies, or Simmel is less easily specified, but is always assumed to have mattered deeply to the younger men. Dilthey was the great pedagogue of the age at Berlin, and his biography of Schleiermacher, his theory (following Mill) of how the Geisteswissenschaften must differ from the Naturwissenschaften, and his pre-Husserlian version of phenomenological apperception all fed directly into the origins of German classical social theory. It is impossible to conceive, for instance, of Simmel’s Philosophy of Money (1900) or Weber’s theory of Verstehen without giving Dilthey his due. Simmel’s monumental study of how “the cash nexus” (to use Marx’s term) affected interpersonal and intrapersonal life owes a great deal to philosophical currents swirling around him in Berlin. His Philosophy of Money exhaustively documents how monetary exchange “rationalizes” social life, even in its most intimate settings (art or sex), and strips away the formerly unique qualities that inhered within such social realms, converting “quality into quantity.” Unlike Marx, however, Simmel did not view this in always negative terms, since quantification and the transformation of values that goes with it can lead to individual freedom that is impossible to experience in a premonetized social environment.

Weber’s verstehende Soziologie (“interpretive” or “understanding” sociology) has been analyzed repeatedly since he proposed it around 1915, and shows its debt to a number of philosophical voices, beginning with Dilthey’s. Humans operate within a zone of meanings that they constitute “automatically” by the sheer operation of their consciousnesses. When trying, as they must, to understand the motivations of one another, they must leave aside positivist notions of evidence and proof that work well in the natural sciences, and instead “participate” through empathy in the meaningful orbits of others in order to comprehend

44. For a discussion of Dilthey, with particular reference to hermeneutic theory, see the essay by Eric Sean Nelson in this volume.
the significance of various actions as lived by the actors themselves. Arguments over how exactly to carry out social science, as then understood, is what inspired the battle beginning in 1883 fought between Carl Menger (1840–1921; representing the more theoretical Austrian School) and Gustav von Schmoller (1838–1917; representing the historical school) over proper methods for economics. Menger believed that economics should become mathematized and follow the scientific methods already put to sterling use in the natural sciences, whereas Schmoller, a capable historian, thought that searching for the invariant “laws of economic action” would ruin the field, sacrificing the unique details of the past for models that failed to describe any particular economic data accurately. Menger’s followers in the twentieth century “won” the battle, but it remains to be seen if “economics as natural science” will forever hold the field, or if a resurgence of Schmoller’s historicist viewpoint will occur. The lineaments of this protracted argument were codified by the philosophy teacher Wilhelm Windelband in 1894, drawing attentive social theorists into its orbit for their entire professional lives.46

As explained by Weber in numbing detail in Roscher and Knies, these were no small matters to his peer group of innovators, since these decades-long squabbles among epistemologists defined what the social sciences would or should become in the twentieth century.47 Weber’s virtuoso performance of critique, published between 1903 and 1906, deals not only in excruciating detail with the methodological practices of Wilhelm Roscher and Karl Knies,48 but also considers the views of Benedetto Croce, Simmel, Hugo Münsterberg, and Friedrich Gottl as they bore on various conundrums concerning “laws” of social behavior. In its rigor and analytic depth, it is unique in the history of classical social theory, nearly matched only by some of Simmel’s work on historiographical methods49 and by Durkheim’s lectures on pragmatism50 or the recently “discovered” lectures on philosophy proper.51 In these essays, Weber works very hard at distinguishing the criteria for “truth” within the social sciences versus philosophy proper, and begins to lay out the ideas he would later immortalize in “Science as a Vocation”

48. Wilhelm Roscher (1817–94) and Karl Knies (1821–98) were German economists and founding figures in the historical school of political economy.
and “Politics as a Vocation,” just prior to his death in 1920. In these two canonical lectures (delivered in 1917 and 1919) he explained, among many things, how scholarship differs definitively from political action, with the responsibility of scholars always to the truth as best they can define it, whereas politics calls for heartless attention to the maintenance of power and support for a stated cause. They are naturally antinomical, so he claimed, based in part on his witnessing of German and French professors prostituting themselves during the First World War as propagandists for their governments. Weber’s famous “fact–value distinction” has given rise to endless debate to this day. The question he confronted, as have many before and since, is whether a “social scientist” – as opposed to an ethicist, theologian, or moralist – has any intellectually legitimate role to play in defining the ultimate values by which people carry out their lives. Weber argued rigorously that those thinkers who desire a leadership role in the realm of ethics ought not to become sociologists, since, as Tolstoy said and as Weber quoted, the only really important question in life is how we are going to live it in a way that is meaningful. And to this question, social science has no answers. For instance, when Weber accompanied the official German peace delegation to Versailles in 1919 as their constitutional law expert, the “fact” that Germany had lost the First World War was paramount, yet the “values” or “meanings” that the world took from this event varied enormously, country by country – with disastrous consequences twenty years later.

Thus we see that social theory, classically imagined and then practiced, is most properly considered a heterodox, troubled branch of philosophy from the late eighteenth century to the early twentieth century. The prolonged struggle that most now view as needlessly prolix and indecisive, between the 1880s and the First World War, which sought to distance the social “sciences” from the humanities on epistemological grounds, and involving dozens of protagonists in Europe (and the US), did not succeed as completely as Durkheim, for instance, would have wished. The links between the theoretical apparatus of the *Geisteswissenschaften*, despite its reaching for a “scientific” identity, and the philosophical tradition that must include Rousseau, Kant, Hegel, Nietzsche, Husserl, and others have, if anything, become stronger over the past few decades. After Foucault, Derrida, Habermas, Giddens, Bourdieu, and their epigoni reintroduced Enlightenment philosophy into the social sciences during the 1960s and 1970s, it became obvious to all but the most hardened and unreflective positivists that the joint journey of philosophy and social theory would continue, as indeed it should.

---

I. AGE OF ROMANCE, AGE OF REVOLUTION

Nineteenth-century science and mathematics is an erratic continuation of the monumental innovations of the Enlightenment. The eighteenth century laid the groundwork for so much of what was to happen in the late modern period, and was in turn prepared for these advances by the remarkable progress in the new observational and pure and applied mathematical sciences of the seventeenth century.¹

Philosophy of science in this early period was not thematically or methodologically distinguished from scientific commentary on the practice of science itself, and did not emerge as a distinct field of study until relatively late in the nineteenth century. It is from the 1800s onward, particularly in the writings of Bernard Bolzano, Auguste Comte, and Arthur Schopenhauer, among others, that philosophy and philosophy of science gained recognition as a subdiscipline standing on its own apart from the pursuit of knowledge in the most general sense of scientia. Mathematics throughout this same epoch was understood as belonging to a higher intellectual order, available to all as a tool and model of exact reasoning. It served, as it did from antiquity, for the quantitative expression of ideas and calculation of formal consequences in pure theory and in innumerable practical applications.²

². See, inter alia, W. S. Anglin, Mathematics: A Concise History and Philosophy (New York: Springer, 1994); David M. Burton, The History of Mathematics: An Introduction (Boston, MA:
The expansion of knowledge in the nineteenth century nevertheless was not merely a steady conservative building upon the precedents of early modern philosophy and Enlightenment science in a single unified direction. Rather, the century witnessed a number of important revolutions in both science and mathematics that were to have profound implications for the emergence of the philosophy of science as a separate field with an identifiable subject matter and methodology. Whereas in the eighteenth century, Robert Boyle and Isaac Newton, among other leading figures, could still think of themselves as natural philosophers – and Newton, like so many others in these centuries, could without irony or pretension refer to his work as a contribution to philosophia naturalis, even in the title of his great treatise on kinematics – by the time of Charles Darwin, while still intelligible, as it is to us today, such identifications were an increasingly less recognized practice that had already started to become quaint-sounding. Natural philosophy thereafter becomes natural science, and in many contexts and for all practical purposes simply science, meaning that whatever can be explained is progressively considered as theoretically reducible to a purely mechanical physical phenomenon. The philosopher William Whewell is frequently credited with having coined the word “scientist” in his 1834 review of Mary Somerville’s On the Connexion of the Sciences, but the terminology did not find widespread acceptance until near the very end of the century.3

A snapshot of the transition from natural philosophy to (natural) science can be found in the history of the physics of electricity and magnetism in Scotland in the latter half of the nineteenth century. As late as the 1880s, the University of Glasgow and University of Edinburgh maintained a Chair in Natural Philosophy, occupied in 1846 in Glasgow by William Thomson (Lord Kelvin) and in 1860 in Edinburgh by Peter Guthrie Tait. Both of these researchers were practicing modern scientists making contributions to mathematics, physics, and chemistry, especially the theory of electrical phenomena, while publishing influential texts featuring the phrase “natural philosophy.”4 The same is true of Michael Faraday

at Marischal College in Aberdeen. Although James Clerk Maxwell, another great Scottish scientist and electromagnetic theorist, author of the well-known Maxwell equations unifying electricity and magnetism within a single applied mathematical framework, is also described as a “natural philosopher,” that exact term seldom appears in his writings, and his work falls squarely in the domain of experimental science as the concept has since come to be defined.\textsuperscript{5}

The gradual terminological shift from natural philosophy to natural science, or, simply, science, is itself of profound significance for understanding the history of developments in twentieth-century philosophy of science and mathematics.\textsuperscript{6} These subdivisions within philosophy arose precisely at this time, beginning in the nineteenth century with the first formulations of \textit{positivism} as a generalized theory of meaning and explicitly scientific philosophy. The writings of Comte inspired a later generation of scientifically trained philosophers who radicalized positivism as the conceptually most far-reaching \textit{logical positivism} in the philosophy of science, and, in the process, tried to reduce all of philosophy to a so-called logical positivist theory of the limited kinds of meanings available to thought in the sciences. Philosophy thereby became philosophy of science, and philosophy of science started to look increasingly like actual science, even as scientific explanation often appeared to be philosophical. Reflecting on the legacy of logical positivism – regardless of whether we celebrate its successes or bemoan the aftermath of its temporary stranglehold on metaphysics, philosophy of religion, and value theory – we should not lose sight of the fact that its origins derive in large part from Comte as a prominent nineteenth-century continental thinker, about whom we shall have more to say.\textsuperscript{7} The nineteenth

\begin{itemize}
\item For a discussion of developments in science and their relationship to continental philosophy in the early decades of the twentieth century, see the essay by Babette Babich in \textit{The History of Continental Philosophy: Volume 3}.
\end{itemize}
century is notable also for incubating Darwin’s and Alfred Russel Wallace’s evolutionary theory of the natural selection of species, and for the logic, metaphysics, scientific methodology, and the rigorous development of the formal ideas of such philosophers and mathematicians as Charles Sanders Peirce, George Boole, Gottlob Frege, and Bertrand Russell. As the century progressed, increasing attention was paid to the philosophical foundations of geometry, occasioned by the logically consistent axiomatization of non-Euclidean geometries by Georg Friedrich Bernhard Riemann and Nikolai Ivanovich Lobachevsky. In addition, David Hilbert’s formalistic philosophy of mathematics and program for the transparently formal metatheory of mathematical logic set a high standard for logically correct mathematical reasoning, while laying down specific goals for mathematical investigations within the principles prescribed by a well-articulated philosophy of mathematics.8

Revolutionary developments in nineteenth-century science, mathematics, and philosophy of science and philosophy of mathematics need also to be understood against the background of other strands of thought that characterize this era, curiously enough, as a time of Romantic thought. By Romance in this context is not meant anything specifically erotic, but rather the conflict of human freedom with social, political, and causal necessity and constraint. The latter category has profound implications for the Romantic quest for freedom as natural science comes increasingly to paint a picture of all natural phenomena as subject to deterministic forces and antecedent physical events.9 The problem of understanding human choices in a world in which freedom seems to be denied by natural or political factors was certainly not new to the nineteenth century. It dates back at least to Aristotle’s problem of the sea battle tomorrow in De Interpretatione.10 As with other cultural trends, and owing to the convergence of a complex variety of independently interesting circumstances, the nineteenth century was ripe for an especially lively and literary as well as penetrating philosophical consideration of the struggle of human will against the forces of social conformity and political oppression in the economic and intellectual circumstances of the times. The opposition of freedom and necessity, with implications

also for the rise of modern science on which its philosophical discussion was predicated, itself became a topic of close philosophical scrutiny. The Romantic struggle as a reflection of the human condition attained an extraordinary degree of self-awareness among philosophers at the time, examining the prospects of science and mathematics, not only for their explanatory successes and engineering possibilities, but as yet another threat to the Romantic sense of the freedom of will. This was a rather deep-felt philosophical concern that we may not share today, but that alongside more traditional scientific and philosophical preoccupations also characterizes the nineteenth century as an extraordinarily complex chapter of philosophy.11

II. HISTORICAL OVERVIEW OF NINETEENTH-CENTURY PHILOSOPHY OF SCIENCE AND MATHEMATICS

The plan of this section is to offer a historical overview of nineteenth-century philosophy of science and mathematics. The expansion of science and mathematics during this period is itself such an extensive subject that no single essay could possibly do justice to the discoveries made and the philosophical controversies that ensued. It is equally futile to try to fit into such a compact discussion all of the important movements in philosophy of science and mathematics during one hundred years of active philosophizing about the nature, meaning, and methodology of science and mathematics.

We cannot expect to offer more than a flavor of this rich and turbulent epoch, seen in retrospect and from a particular set of philosophical prejudices and predispositions. Interested readers are encouraged at every step to further explore the history of these subjects from other perspectives, and from the standpoint of an ever-expanding historical and philosophical commentary on the nineteenth-century development of the natural sciences. What is proposed instead is a sampling of characteristic moments spanning the period that helps shed light on particular chosen aspects of what makes the nineteenth century unique, and that also constitute forerunners of major topics that were later to figure prominently in philosophy of science and mathematics in the twentieth and twenty-first centuries. The organization of these separate discussions is topical rather than strictly chronological, highlighting aspects of nineteenth-century philosophy of science and mathematics that collectively sketch a portrait of philosophy of science and mathematics in the era. The episodes chosen for

review embody in their selection, arrangement, and emphasis a particular view of the most noteworthy events in this field over the course of one hundred extraordinary active years in philosophy of science as it emerged into philosophical awareness. Accordingly, we shall consider ideas concerning the theory and practice of natural science and mathematics in featured writings of leading nineteenth-century thinkers, among numerous others equally deserving of attention: J. S. Mill and certain of his immediate predecessors, Bolzano, Comte, and Frege.

As we concentrate on these representative thinkers of nineteenth-century philosophy, we should not lose sight of the fact that philosophy of science and mathematics at this time was nourished by the new findings of such important scientists, mathematicians, and philosophers as Boole, Darwin, Augustus De Morgan, Charles Lyell, John Venn, and Wallace in Great Britain; William Rowan Hamilton in Ireland; Franz Brentano, Georg Cantor, Franz Joseph Gall, Hermann von Helmholtz, Alexander von Humboldt, and Schopenhauer in Germany; Ludwig Eduard Boltzmann, Sigmund Freud, Ernst Mach, and Gregor Mendel in Austria; Georges Cuvier, Jean-Baptiste Lamarck, Louis Pasteur, and Henri Poincaré in France; William James and Peirce in the United States. It was marked by powerful advances in physics, chemistry, biology, medicine, and technology. It was the century of the Lewis and Clark Expedition, of Darwin’s voyage aboard the Beagle to the Galapagos Islands and elsewhere in South and Central America, of analytic geometry and non-Euclidean geometry, of Carl Friedrich Gauss and Karl Weierstrass, of Abelian group and complex function and invariant theory, of the discovery of predicate logic or functional calculus, of Hilbert, and of the ill-fated but highly instructive and influential hybrid mathematical–philosophical program of nineteenth-century logicism. All of these scientific, mathematical, and philosophical innovations had enormous repercussions and resonances that, despite rather spectacular failures in some instances, continue to reverberate into the present century.12

When this part of the intellectual, scientific, and philosophical milieu of the nineteenth century begins to come into focus, it needs, in turn, to be supplemented by an appreciation for the art and music of the time, of Ludwig van Beethoven, Hector Berlioz, Johannes Brahms, Frédéric Chopin, Franz Liszt, Felix Mendelssohn, and Piotr Illitch Tchaikovsky, of the French Academy and Impressionism, the fabulous world of the nineteenth-century novel and other forms of literature, and important political events, including the rise of nationalism and socialism, and accompanying decline of monarchism, Napoleon

Bonaparte, the American Civil War, and countless other socially-philosophically significant occurrences.

III. BRITISH EMPIRICIST METHODOLOGY OF INDUCTIVE REASONING

The success of modern science owes much of its momentum to the articulation in the nineteenth century of explicit methods of inductive reasoning. The principal exponents of induction include such figures as John F. W. Herschel (1792–1871), William Whewell (1794–1866), John Stuart Mill (1806–73), and George Boole (1815–64). The general topic of induction is not new to this period of thought, since we know from David Hume’s *A Treatise of Human Nature* in the previous century that philosophers were already concerned about the logical credentials of inductive inference. It is perhaps no accident that many of the most important contributions to philosophy of science in the nineteenth century occurred in Great Britain and, to a lesser extent, in the United States, in the work of such logicians and mathematical philosophers as Peirce, where the experimental sciences at the time were most rigorously pursued.

Prior to Mill’s publication in 1843 of *A System of Logic: Raciocinative and Inductive*, his most notable predecessor was John F. W. Herschel. Herschel was the son of the famous astronomer William Herschel, and an accomplished mathematician and contributor to astronomy, optics, and other physical sciences. Herschel in 1830 wrote an important volume titled *Preliminary Discourse on Natural Philosophy*. The book is noteworthy not only for its philosophical content, but because it was the first English-language text in the philosophy of science written by a respected practicing scientist. Herschel, in keeping with a well-established tradition in expositions of scientific methodology, distinguishes

---

*15. Peirce is the focus of the essay by Douglas R. Anderson in this volume.

between two phases of discovery and validation or justification. He discounts the means by which scientific hypotheses and other discoveries might be reached, focusing instead on their verification according to prescribed rules, regardless of how they are arrived at or presented to the scientific imagination. Herschel further distinguishes, also in the tradition of commentary on the interpretation of scientific findings originating with Galileo and John Locke, between primary and secondary qualities. He illustrates the distinction in one place by means of what he describes as a preliminary scientific analysis of the occurrence of sound, which he distinguishes as motion (primary quality) and sensation (secondary quality). He describes the purpose of science as the determination of causes of observed phenomena and is one of the first theorists to articulate the concept of a natural law.17

Herschel accordingly offers ten “general rules for guiding and facilitating our search, among a great mass of assembled facts, for their common cause.”18 Mill, in turn, in *A System of Logic*, condenses and summarizes the rules as:

1. Method of agreement: Constant conjunction of antecedent (cause) and consequent (effect).
3. Joint method of agreement and difference: Combination of (1) and (2).
4. Method of residues: Elimination of whatever part of a phenomenon is known by previous inductions to be the effect of particular antecedents, leaves whatever is left over as consequent of the remaining antecedents.
5. Method of concomitant variations: Whatever phenomenon varies when another phenomenon varies in a certain way, is either an antecedent or consequent of that phenomenon, or is connected with it through some fact of causation.19

What is significant in Mill’s inductive method is not so much the content of the principles themselves, but the fact that in presenting them he is offering both a descriptive characterization of scientific method and prescriptive advice about how scientific inquiry should be conducted. It is characteristic of nineteenth-century philosophy of science that it is conceived as an effort not only to explain

what science is and how it is done, but to legislate scientific practice by providing rules for correct empirical research. This is important in turn because it indicates a self-consciousness on the part of thinkers in addressing the methodology of science as a topic for philosophical reflection in which philosophy can contribute by standing back from the practice of science and considering the conditions for its success and failure. Mill, after Whewell, is one of the first philosophers to take this stance, and it is historically noteworthy that this happens in the nineteenth century when professional philosophy for the first time thematizes the methods of science. Mill builds on Whewell, but Whewell, unlike Mill, is a practicing scientist. It is always contentious to try to pinpoint the origin of a field of study to a particular time or particular author or publication. A case can nevertheless be made for Mill’s *A System of Logic* as the first work in philosophy of science, as a subject that emerges for philosophy for the first time in English-language philosophy.20

Mill’s study is remarkable for its combined philosophy of logic and mathematics. Having laid down the rules for determination of cause and effect relations and proper inductive reasoning, Mill presents an account of the nature of logic and mathematics as a formal theory of empirically encountered patterns of thought. His approach has frequently been criticized by such commentators later in the century as Frege, who accuses Mill of psychologism. Psychologism is the venial sin, from a Platonic realist standpoint, of confusing objective matters of abstract logical and mathematical relations, about which the mind is capable of forming opinions, with purely subjective aspects of the psychology of thinkers who reflect on and draw conclusions concerning the mind-independent truths of logic and mathematics.21

Mill would not have been disheartened by these criticisms. He deliberately chooses the empirical method in preference to any form of Platonism or rationalism, because he believes that experience is the only path to substantive truth. In another context, discussing the concept of nature and of laws of nature, in his essay “On Nature,” published as the first of three expositions in his collected volume of 1874, *Nature, the Utility of Religion and Theism*, Mill writes:

> Adopting this course [of clarifying the meaning of a term] with the word “nature,” the first question must be, what is meant by the “nature” of a particular object, as of fire, of water, or of some individual plant or animal? Evidently the ensemble or aggregate of its

---

powers or properties: the modes in which it acts on other things (counting among those things the senses of the observer), and the modes in which other things act upon it; to which, in the case of a sentient being, must be added its own capacities of feeling, or being conscious. The nature of the thing means all this; means its entire capacity of exhibiting phenomena. And since the phenomena which a thing exhibits, however much they vary in different circumstances, are always the same in the same circumstances, they admit of being described in general forms of words, which are called the laws of the thing’s nature. Thus it is a law of the nature of water that, under the mean pressure of the atmosphere at the level of the sea, it boils at 212 degrees Fahrenheit.22

As a sign of his reliance on empirical observation in the sciences, Mill posits unaided direct observation as the basis for discerning natural laws in every area of scientific inquiry. It is striking to see in this connection that Mill does not recognize the extent to which idealization beyond anything immediately perceptible to sensation is standardly required in the discovery and formulation of scientific laws. Considering the typical case of Newton’s first law of motion, according to which a moving projectile unimpeded by impressed forces continues indefinitely in a straight line, most laws of nature involve the postulation of entities that not only are nowhere observed in nature, but that are definitely known not to exist in nature. There are no moving bodies unimpeded by impressed forces, according to Newton’s own law of universal gravitation, since one and all are impeded by impressed forces, even if only negligibly across vast apparently empty distances of space. Mill seems oblivious to these aspects of idealization in the discovery of scientific laws of nature, which he claims in every instance are the direct result of empirical experience. It is with good reason, then, that some of Mill’s oversimplified claims about the nature of science and its methodology have come under criticism by later philosophers of science as naive and uninformed about actual scientific practice.23 Mill continues:

Since all phenomena which have been sufficiently examined are found to take place with regularity, each having certain fixed conditions, positive and negative, on the occurrence of which it invariably

happens, mankind have been able to ascertain, either by direct observation or by reasoning processes grounded on it, the conditions of the occurrence of many phenomena; and the progress of science mainly consists in ascertaining those conditions. When discovered they can be expressed in general propositions, which are called laws of the particular phenomenon, and also, more generally, Laws of Nature. Thus the truth, that all material objects tend towards one another with a force directly as their masses and inversely as the square of their distance, is a law of nature. The proposition, that air and food are necessary to animal life, if it be, as we have good reason to believe, true without exception, is also a law of nature, though the phenomenon of which it is the law is special, and not, like gravitation, universal.24

An impressive feature of Mill’s characterization of natural law is the large extent to which it agrees with what philosophers of science are still inclined even today to say about the object of scientific inquiry. Many of Mill’s detractors still admire his sense of what constitutes science, and confine their criticisms primarily to what they consider to be his misguided efforts to extend his notion of what constitutes good science to areas beyond its proper purview. In his own time, Mill was criticized most notably by Whewell, in his 1849 pamphlet On Induction, with Especial Reference to Mr. J. Stuart Mill’s System of Logic. Whewell takes issue with Mill’s uncompromising empiricism in the philosophy of logic and mathematics. Thus, Whewell writes:

But the elements and materials of Science are necessary truths contemplated by the intellect. It is by consisting of such elements and such materials, that Science is Science. Hence a use of the term Induction which requires us to obliterate this distinction, must make it impossible for us to arrive at any consistent and intelligible view of the nature of Science, and of the mental process by which Science comes into being.25

We see played out in Whewell’s nineteenth-century opposition to Mill a confrontation of rationalism with empiricism that goes back to Aristotle’s no doubt turbulent apprenticeship to Plato, and in later centuries between René Descartes, G. W. Leibniz, and Baruch de Spinoza, on the one hand, and, as

the Enlightenment gained traction, George Berkeley, Hume, and Thomas Reid. Later critics have objected to Mill’s interpretation of the ontic and epistemic status of logical and mathematical laws as all of a piece with the laws of nature, including the lawlike principles governing the psychology of logical and mathematical reasoning.

Mill’s philosophy of logic and mathematics as methods of empirical science, when compared with his moral and political philosophy, and the social policies philosophically grounded in Mill’s contributions to utilitarianism, had relatively scant influence on the European continent in his own day. His concept of logic and of mathematical principles was believed to have been discredited in some circles by virtue of its psychologism, as Frege and others were afterward to charge. Empiricist thinkers such as Brentano nevertheless saw in Mill’s empiricist foundations of logic and mathematics, and in his philosophy of science more generally, a powerful ally. A young Brentano in particular sought to meet with Mill, and was prevented from doing so after arriving in England only by the senior philosopher’s sudden unexpected death. The impact of Mill as well as Hume is tangible in Brentano’s work especially in philosophical psychology – *Deskriptive Psychologie, Phänomenologie*, and *Psychognosie* – developed by Brentano specifically as reflecting a Mill- and Hume-inspired empiricist anti-post-Kantian philosophy of science of “inner perception” (*innere Wahrnehmung*).26

### IV. BOLZANO’S NEORATIONALIST PHILOSOPHY OF SCIENCE AND MATHEMATICS

At roughly the same time, Bernard Bolzano, writing in Czechoslovakia in German, was laying the groundwork for a very different approach to the philosophy of science, logic, and mathematics, in his highly influential 1837 *Wissenschaftslehre, Versuch einer ausführlichen und grösstheils neuen Darstellung der Logik, mit steter Rücksicht auf deren bisherige Bearbeiter* (Theory of Science, Attempt at a Detailed and in the Main Novel Exposition of Logic with Constant Attention to Earlier Authors).

Bolzano’s approach to the philosophy of science is in obvious ways diametrically opposed to Mill’s. Where Mill offers purely empirical interpretations of the natural sciences extended to logic and mathematics in order to provide logical foundations for all the sciences, Bolzano instead offers conceptual abstractions, including part–whole or mereological relations, abstract objects and their

attributes, formal syntax, propositions as the abstract meanings of sentences (Sätze an sich), sums and sets, collections, substances, adherences, subjective ideas, judgments, and sentence-occurrences, as the metaphysical basis for all of science. Bolzano proposes an ontology for science, conceived as an elaboration of his earlier work in the philosophy of mathematics, in which he similarly develops a distinction between the objective relationships holding between logical consequences and subjective understanding of the relations that obtain. Bolzano does not consider it sufficient to produce verification of mathematical or natural scientific truths, but regards it as the purpose of the pure and applied sciences to search for and articulate justifications for its conclusions in terms of more fundamental truths that are not always intuitively self-evident.27

Bolzano’s commitment to a kind of Platonism in the philosophy of science, represented especially by his doctrine of propositions, is complemented by his reception of actual numerical and geometrical infinities, a concept challenged by empiricist thinkers such as Berkeley, Hume, and Mill. Bolzano’s 1851 Paradoxien des Unendlichen (Paradoxes of the Infinite) does not pose but rather offers to resolve many traditional paradoxes concerning the concept of infinity that other thinkers of a more empiricist bent had previously put forward in the philosophy of mathematics.28 As a mathematician, Bolzano made original contributions in his proof of theorems concerning the areas of similar rhombi, and what has since come to be called the Bolzano–Weierstrass theorem in real analysis (calculus). Later independently discovered by Weierstrass, but jointly redesignated when historians discovered that Bolzano had previously derived a proof, the result shows that a subset of real-numbered extension is sequentially compact if and only if it is both bounded and closed. Bolzano provided the first fully rigorous definition of a mathematical limit, in his 1817 Rein analytischer Beweis (“Purely Analytic Proof”), which also presents a version of the differential calculus unencumbered by the concept of infinitesimals.29 Bolzano’s practical knowledge is in constant dialectic with his philosophical explorations of the nature of mathematics. The interaction of Bolzano’s mathematical and philosophical interests is exemplified by his Theorie der reelen Zahlen (“Pure Theory

of Numbers”), unpublished during his lifetime but included in his handwritten Nachlaß, incorporating a theory of real functions, and by his efforts predating Riemann and Lobachevsky to define a geometry independently of Euclid’s fifth or parallel postulate.30

V. COMTE’S POSITIVISM

Comte31 was born before Mill and died before Mill, but his legacy in philosophy of science extends beyond many of his contemporaries and far beyond the boundaries of nineteenth-century France where he worked. Comte was primarily a sociologist; indeed, he invented the term “sociology,” which he first referred to as physique sociale, or “social physics,” and later renamed sociologie. His contributions to philosophy of science were far-reaching, affecting not only the social sciences, but exerting a profound influence also on the conception of the physical sciences and their methodology.32

As a sociologist, Comte argued that all sciences were subject to what he designates the “Law of Three Phases.” According to this thesis, societies progress through three distinct periods: Theological, Metaphysical, and Scientific. Human knowledge moves from phase to phase as it advances from belief in gods and God, and in the divine origin of the universe and intervention in the world of nature. Belief progresses from faith to a more philosophical attitude marked by the development of metaphysical systems that propose to explain the world and the place of human beings in natural events in terms of philosophical principles. Eventually, in the third phase, thought advances to a widespread acceptance of natural scientific explanations that take the quantitative physical sciences and the verification of hypotheses by inductive methods as their model. Comte refers to the third and final phase as “Positive,” exploiting the meaning of the word by which it represents something affirmative, improved, and superior. In large measure, Comte’s philosophy of science is oriented toward the natural sciences as a norm of human progress, in which knowledge naturally inclines toward and eventually attains the standards

*31. Comte is also discussed in the essay by Alan Sica in this volume.

of scientific explanation that, from the time of the seventeenth century and beyond, the Enlightenment had proved were so successful in understanding the world and controlling natural forces through observation, experiment, and engineering applications.

In psychology, for example, in keeping with Comte’s model for greater rigor in the social sciences, Brentano carried forward an effort to make the study of mind a scientific enterprise in his 1874 (and later editions) *Psychologie vom empirischen Standpunkt* (Psychology from an Empirical Standpoint), and posthumously published (1982) lectures on *Deskriptive Psychologie* (Descriptive Psychology). Brentano also conducted basic scientific experiments in empirical cognitive psychology, and some of his students founded the first European laboratories for experimental psychology. As a consequence of his lectures on descriptive psychology, which he also referred to as *Psychognosie*, Brentano established the foundations for phenomenology as it was later to take shape in the philosophy of Edmund Husserl.33

Comte, in keeping with his special interests, places considerable confidence especially in applications of scientific method to social problems. The practical aspects of science as a solution to society’s woes puts Comte very much in the vanguard of other nineteenth-century thinkers who in some general sense of the word “science” were also hoping that science would solve social predicaments and lead to a betterment of society. Here we find a common theme in nineteenth-century philosophy of science that runs through the writings of Karl Marx, Thomas Robert Malthus, Jeremy Bentham, James and John Stuart Mill, Sigmund Freud, and others in this period. Comte’s concept of a progressive scientific phase of social evolution was considered philosophically advanced and humanitarian, although eventually it came to be regarded as too closely and naively wedded to an ideal that was more appropriate to the exact physical sciences than anything realistically achievable in the social sphere. Comte’s “law of three phases” is nevertheless rightly heralded as a groundbreaking attempt to formulate a theory of social evolution. In this respect, Comte led the way for later theorists, including Darwin, Herbert Spencer, Thomas H. Huxley, Oswald Spengler, and, looking ahead to the beginning of the twentieth century, Otto Weininger.

Comte also proposes an encyclopedic system for organizing and hierarchically classifying the sciences. His categories include the inorganic and organic, incorporating physics, chemistry, astronomy, and the earth sciences under the heading of inorganic sciences; and biology, psychology, and sociology as

organic sciences. In a variety of recognizable guises, something like this division of sciences and their organization, first articulated in Comte’s philosophy, is preserved to the present time as a scheme for arranging and categorizing the sciences. More important than the classification itself is the fact that Comte understood precisely these disciplines as “scientific,” and was prepared to include them in the larger project of scientific knowledge in the third stage of human social evolution culminating in the Scientific phase. Comte’s concept of a social science that was not merely philosophical was not unprecedented, but the extent to which he elevated the social sciences to a position of importance not only among the sciences but within a larger agenda of social reform, and the resolute way he advanced his project, was at once distinctive of his thought and characteristic of nineteenth-century philosophical and scientific movements. Comte, also typically of the nineteenth century, understands his own preferred sociological science as the final moment in the development of all the sciences, to which they are reducible. He believes that sociology will eventually encompass all the other sciences and integrate their discoveries into a single unified all-embracing master science.34

Comte’s project is interesting in this respect as a harbinger of Vienna Circle logical positivism from the first decade of the twentieth century. Comte is often credited as having inspired the positivism of a later era, and, within limits and the proper qualifications, this is undoubtedly true. It is nevertheless important to remember that for Comte sociology was the apotheosis of science that would bring all the other sciences together. Nor is this a delusional concept, since, after all, physics, chemistry, biology, astronomy, and the other so-called “hard” quantitative physical sciences are the products of individual thinkers living and working in and supported educationally, culturally, financially, and in countless other ways by social communities. The fact that Comte places sociology at the top of his unity of sciences model should nevertheless give pause to the idea that the logical positivists of the Vienna Circle merely continued a project set in motion half a century earlier by Comte. Although Comte in many respects takes the physical sciences as his prime example of a science that he thought a mature sociological science should imitate, ultimately he regards sociology as standing above and subsuming the physical sciences. This form of the unity of sciences is upside down from the standpoint of the later project of logical positivism as it was to define itself in the early part of the twentieth century. The later positivists, while recognizing their debt to Comte, considered physics to

be the ultimate science, incorporating whatever aspects of sociology could be made scientifically respectable by relying on public and repeatable phenomena and some form of hypothetical-deductive method for confirming and explaining natural occurrences.

It is a characteristic but by no means idiosyncratic feature of Comte’s form of positivism that it should place a science other than physics at the pinnacle of the unity of sciences. Other philosophers in the twentieth century, reacting against the suffocating effect of logical positivism, were to propose similar inversions of the unity of sciences model, as R. G. Collingwood does when he suggests in his later writings that history is the ultimate science encapsulating all others. Collingwood offers his reduction on grounds similar to those of Comte, reasoning that all sciences are the artifact of human reasoning dealing with the problems presented to and solved by means of reason at particular moments in the past.

35. Collingwood puts the complex interrelation of history and philosophy into perspective when he writes: “History without philosophy is history seen from the outside, the play of mechanical and unchanging forces in a materialistically conceived world: philosophy without history is philosophy seen from the outside, the veering and backing, rising and falling, of motiveless winds of doctrine. ‘Both these are monsters.’ But history fertilized by philosophy is the history of the human spirit in its secular attempt to build itself a world of laws and institutions in which it can live as it wishes to live; and philosophy fertilized by history is the progressive raising and solving of the endless intellectual problems whose succession forms the inner side of this secular struggle. Thus the two studies which, apart, degenerate into strings of empty dates and lists of pedantic distinctions … become, together, a single science of all things human” (Essays in the Philosophy of History, William Debbins [ed.] [Austin, TX: University of Texas Press, 1965], 4).

36. Collingwood’s understanding of the relation between history and philosophy, which evolved during the course of his career, has naturally given rise to controversies about his final considered opinion, and about the exact status of his views at any point in their development. See, for example, William Debbins’s “Introduction” in Collingwood’s Essays in the Philosophy of History: “Comple’s Philosophy of History” is a critical review of Croce’s Teoria e Storia della Storiografia (1917). Collingwood criticizes Croce for reducing philosophy to history; he argues that they are distinct disciplines even though there is an interrelation and dependence of each on the other. If it is true, as I have argued above, that philosophy of history was for Collingwood a critical examination of some of the problems encountered by the historian in the course of his work, then it would seem to follow that Collingwood consistently rejected the identification of philosophy and history” (Debbins, “Introduction,” in Collingwood, Essays in the Philosophy of History, xxxii). Compare E. W. F. Tomlin: “In studying a historical process, our task is to think ourselves into the action to discern the thought of its agent … Thus ‘all history is the history of thought’ … If all history is the history of thought, so all knowledge is historical knowledge. And since historical knowledge is that which the historian absorbs into his own experience, the activity of historical thinking is simultaneously a means of self-knowledge … History is therefore ‘the self-knowledge of mind’ … The identification of philosophy and history was in effect an identification of theory and practice” (R. G. Collingwood [London: Longmans, Green, 1953], 30–33).
Ironically, but inevitably, perhaps, many of what Comte would have considered his most important contributions to the quantitative science of sociology have since come to be regarded as unscientific. Comte’s work in science has in this respect become the unexpected victim of the unanticipated success of his own philosophy of science.

VI. FREGE’S SCIENTIFIC SEMANTICS AND PHILOSOPHY OF MATHEMATICS

Frege is best known for his discovery of a prototype of the functional calculus or predicate-quantificational logic, and for his later treatment of philosophical semantics as represented by the distinction between the conventional and indirect sense (\textit{Sinn}) and reference (\textit{Bedeutung}) of proper names or individually referring terms and sentences. Frege postulates an ideal language or \textit{Begriffsschrift} (literally, concept-script or concept-writing) for the scientific expression of meaning.\footnote{Gottlob Frege, \textit{Conceptual Notation and Related Articles}, Terrell W. Bynum (trans.) (Oxford: Oxford University Press, 1972); originally published as \textit{Begriffsschrift: Eine der arithmetischen nachgebildete Formelsprache des reinen Denkens} (Halle: Louis Nebert, 1879).}

Frege hammers out a symbolic logic in order to formalize the foundations of arithmetic in his 1879 \textit{Begriffsschrift: Eine der arithmetischen nachgebildete Formelsprache des reinen Denkens} (Concept-writing: a formula-language for pure thought modeled on arithmetic).\footnote{See Michael Dummett, \textit{Frege: Philosophy of Mathematics} (Cambridge, MA: Harvard University Press, 1991); Danielle Macbeth, \textit{Frege’s Logic} (Cambridge, MA: Harvard University Press, 2005); Pavel Tichý, \textit{The Foundations of Frege’s Logic} (New York: de Gruyter, 1988).} A \textit{Begriffsschrift}, in Frege’s sense, in addition to satisfying other requirements of expressive adequacy, must prohibit the occurrence of multiple terms for the same entity (redundancy), the same term for distinct entities (ambiguity and equivocation), and disallow nondesignating singular terms such as those that purport to refer to fictional nonexistent objects, such as “Pegasus,” “Santa Claus,” or “the greatest even number” (putative reference to nonexistent objects). A \textit{Begriffsschrift} is meant to be a purely formal symbolic language, in effect, a mathematical notation, for the expression of any proposition in any area of discourse and, in particular, of any proposition dealing with the predications of properties to objects individually and in universal or existential quantifications.

Frege adopts a Platonic theory of \textit{Gedanken} or propositions, as the abstract meanings of inscribed sentences, like Bolzano’s \textit{Sätze an sich}. Translation from one language to another is then a matter of grasping the sense of the thought as expressed in one language and rendering the same abstract thought within
the grammar and vocabulary of another language. The analogy that suggests itself is that of the distinction in mathematics between numbers and numerals. Numbers are often thought to be abstract entities, say, the number 2 that exists on the number line in a particular position precisely between 1 and 3, while there are unlimitedly many different concrete numerals in unlimitedly many different concrete mathematical languages by means of which the same number can be expressed, including “2,” “II,” “two,” “|√4|,” “1 + 1,” “9 – 7,” “6/3,” and so on.39

Frege, in his later writings after 1890, offers a theory of meaning in which the reference or extension of terms and sentences is determined by their sense or intension. The conventional sense of a term is the set of properties the designated object possesses. The sense of the name “Aristotle,” for example, is the abstract set of all of Aristotle’s properties, including being Macedonian, born in Stagira, a student of Plato, teacher of Alexander the Great, author of the *Nicomachean Ethics*, and all the many other things that are true of him. The reference of the name “Aristotle” is that unique existent entity that has just the set of properties belonging to the sense of the name. This is the manner in which, according to Frege’s semantic theory, the sense of a term determines its reference, or intension determines extension. Where sentences are concerned, the sense of a sentence is a function of the senses of its significant terms or, broadly construed, proper names, including definite descriptions. The reference of a sentence is in turn a reified truth-value, which Frege designates as “the True,” in case the sentence is true, and “the False,” in case the sentence is false. Singular referring terms and sentences in colloquial language outside a *Begriffsschrift* on Frege’s distinction can have sense while lacking reference. An example of each is “Pegasus” and “Pegasus is a winged stallion.” The indirect reference of a name or sentence, according to Frege, is its conventional sense. If I quote a term in a context predicating a property of the term, as in “‘Aristotle’ contains nine letters,” then the name “Aristotle” does not refer directly to Aristotle, but to the conventional sense of the name. By this distinction, Frege proposes to avoid a number of difficulties in understanding the complex uses of language in talking about itself and referring to the contents of thoughts, quoting what another person says, and similar challenges to interpreting the expression of meaning and determination of truth value.40

40. Gottlob Frege, “On Sense and Meaning,” in *Collected Papers on Mathematics, Logic and Philosophy*, Max Black et al. (eds); originally published as “Über Sinn und Bedeutung,” *Zeitschrift für Philosophie und philosophische Kritik* 100 (1892). For useful commentary, see, as recommended in a vast secondary philosophical literature, Michael Beaney, *Frege: Making
Frege requires that the meaning of a term be understood holistically or contextually in light of its contribution to the meaning of an entire sentence. This condition is related in turn to what has come to be known as Frege’s compositionality thesis. Frege further rejects and polemicizes vehemently against psychologism in logic and semantics, and his objections have inspired generations of extensionally minded logicians and meaning-theorists also to avoid psychological, phenomenological, or generally intentional factors in understanding the nature of meaning. Indeed, one of the principal targets of his attack against psychologism, as we have already noted, is Mill’s *A System of Logic*. Frege wants semantic theory to be scientific, generally defined, and so he shuns any explanation that involves private psychological subjective factors that can be different in the thoughts of every different thinker and are, in that sense, at best accidental to the objective meaning of a word or sentence.\(^41\)

Frege’s researches in logic and theory of meaning provide the foundation for his groundbreaking efforts to advance the philosophical program of logicism. Logicism is the project to reduce all of mathematics, beginning with the basic concepts of arithmetic, to more basic principles of logic. It is this program that we find Frege trying to advance in his 1884 *Grundlagen der Arithmetik: Eine logisch-mathematische Untersuchung über den Begriff der Zahl* (*The Foundations of Arithmetic: A Logical-Mathematical Investigation into the Concept of Number*).

If we think of logic as the most fundamental discipline, one that sets the standards of good reasoning for all other fields, then the idea of reducing arithmetic and eventually all of mathematics to logic can exert a very strong appeal to the philosophical imagination. If the reduction of arithmetic to logic were to succeed, then it would guarantee the starting place of that part of mathematics concerning number the absolute certainty that we expect to hold of deductively valid inferences in logic, and we would have simplified our understanding of mathematics as nothing more than a complicated outgrowth of purely logical principles. Logicism in its original form, as Frege and others in the late nineteenth and early twentieth centuries tried to develop it, ultimately failed. It did so, nonetheless, in an instructive way that continues to inform philosophical discussion, and that in refined revisionary versions has been more recently exploited again in new quasilogist approaches to the philosophy of mathematics.\(^42\)

---

41. See note 21 above.

Early in his career, Frege believed that Kant’s proto-intuitionistic account of space and time as pure forms of intuition constituting the transcendental grounds respectively of geometry and arithmetic was correct with respect to geometry but not with respect to arithmetic. The failure of his efforts to provide an independent logicist foundation for arithmetic in concepts of logic eventually prompted Frege to rethink this position. Later in life, particularly after Russell in 1901 revealed a contradiction in Frege’s final formulation of a predicate logic reduction of arithmetic in Frege’s 1893 *Grundgesetze der Arithmetik*, Frege began to rethink his view that Kant was wrong about arithmetic having an intuitive foundation in innate preconditions for the human experience of time, and began to consider more seriously again a unified Kantian approach to the perceptual basis of both arithmetic and geometry.43

Frege’s extraordinary accomplishments in logic, philosophy of language, philosophical semantics, and philosophy of mathematics, along with his careful, self-conscious methodological reflections in theory and practice, in many ways laid the groundwork for mainstream analytic philosophy that has flourished from Frege’s time to the present day.44

**VII. PHILOSOPHY OF SCIENCE AND MATHEMATICS ON THE THRESHOLD OF A NEW CENTURY**

Whereas there is some truth and legitimacy to the oversimplifications by which the seventeenth century in philosophy is characterized as the period of rationalism, and the eighteenth century as the period of enlightenment and empiricism, the nineteenth century in dramatic contrast does not lend itself to such misleading labels as these for previous eras in the philosophy of science and mathematics, and philosophical methodology more generally. Especially on the European continent at this time, there is set loose a wide diversity of philosophical programs that defy easy summary or ideological sloganeering. In philosophy of science and mathematics, what generalization will serve to encapsulate a century over a stitched-together topography of philosophically very different European cultures that managed to produce such thinkers as Fichte and Cantor, Schelling and Darwin, Hegel and Frege, Schopenhauer and Hilbert, Marx and Dedekind, Nietzsche and Boole, to name but a few intellectual contrarieties?

The best we can do, after emphasizing all the appropriate caveats and qualifications, is to identify selected major trends that seem to be exemplified by the

most influential and highly regarded philosophers of science and mathematics from this dynamic century. We can suggest how the work of some important historical figures paved the way for later developments in what was soon to be a relatively unified transition to philosophy of the exact sciences in the twentieth century. From its fractured precursor, representing one hundred years of philosophical endeavor, twentieth-century philosophy of science and mathematics, using especially the machinery of formal symbolic logic, increasingly tracks the rigor demanded of formal mathematical and empirical scientific inquiry. As the sciences themselves continued to develop within an increasingly self-conscious methodology of what is properly meant by “science,” in practical terms as well as abstract theory, so the philosophy of science and mathematics has interpreted the requirements for maximizing the discovery of interesting truths to satisfy our need for information, while minimizing the risk of error in empirical judgment.

No account of nineteenth-century philosophy of science would be complete without taking notice of the idealistic movement that characterized much of the period and lent its influence to the Romantic strain of nineteenth-century thought. Unlike their intellectual forebear, the philosophers after Kant for the most part did not think of science as a continuation of the same observational and experimental hypothesis-testing tradition begun by Galileo, Descartes, Boyle, and Newton. They freely used the word “science” (Wissenschaft) to describe their own work in philosophy, but, with the exception of Schopenhauer, who began his university studies in medicine, most of the other German philosophers after Kant, including at least those mentioned above, were much more interested in art and literature than in the natural science of their time. Nor were any of this line of philosophers, beginning with Kant and this time including Schopenhauer, known for having made any contributions to, or demonstrated any serious command of, mathematics. Not being scientists or mathematicians does not necessarily preclude any of these thinkers in principle from doing respectable work in the philosophy of science or philosophy of mathematics, but when their actual lack of personal training and experience in the rigorous sciences is considered together with the content of their writings and what they have to say about what they call science and mathematics, it raises interesting questions as to what exactly they mean by the use of the words “science” and “scientific.” The follow-up inquiry is then to ask whether what they as philosophers have to say about what they call science should be considered a chapter in the history of the philosophy of science, or whether they are not rather doing metaphysics or epistemology, or something other than philosophy of science in the sense of the kind of science practiced by Galileo, Descartes, and Newton, and by such nineteenth-century contemporaries as Darwin, Ernst Haeckel, Hilbert, Cantor, and others in the mainstream of scientific and mathematical investigations.
Although nineteenth-century science and mathematics continued to refine its methods, nineteenth-century philosophy of science and philosophy of mathematics in some philosophical subcultures did not keep pace, but persisted in a priori generalizations and expectations of how independently accessible truth must be projected onto the world without the benefit of good observational or experimental evidence and what in the twentieth century came to be known as the scientific evaluation and interpretation of such empirical evidence. The archetypal example of this confusion of sound scientific methods with unscientific speculative philosophical conjecture is perhaps Hegel’s 1801 doctoral dissertation (De orbitus planetarum, University of Jena), in which he takes seriously an argument from Plato’s Timaeus about the occurrence of arithmetical sequences in nature to suggest that there could be only seven planets in our solar system, in a bid to challenge the truth of Bode’s law concerning the orbital distances of planets, which has since been vindicated by more contemporary astrophysics.

In this respect, and seen from the perspective of contemporary science and mathematics and philosophy of science and mathematics, the leading lights of nineteenth-century continental philosophy of science and philosophy of mathematics are not Hegel or Fichte or the other a priori transcendentalists in which the nineteenth century excelled, but figures such as Mill, Whewell, Frege, Hilbert, Cantor, Darwin (indulging in methodological asides), Boole, and others. It is this latter group, and not the nineteenth-century idealists, who self-consciously share a recognizably similar general modern scientific outlook, which might be partly described as a commitment to rigorously collected, carefully evaluated, interpreted, and reliably tested scientific truths about the properties of abstract formal structures and spatiotemporal empirical phenomena.

As science and mathematics and philosophy of science and mathematics came to define themselves in the nineteenth century, many lineages of philosophical thought were not carried into the twentieth century as fruitful approaches to explaining the nature, and understanding the methods, of mathematics and the natural sciences. As a result, what we see is the absence of a viable contemporary Hegelian, Fichtean, Schellingian, Marxist and so on philosophy of science and mathematics in the ensuing centuries. We see as well that the greatest thinkers of nineteenth-century continental philosophy – excluding Frege and Hilbert and the others we have already singled out as early exponents of a kind of rigorous scientific philosophy that emerged from the century’s free experimentation with ideas under the constraint of agreement with properly accepted and interpreted abstract formal relations and empirical facts – made their greatest contributions not to philosophy of science or mathematics, but to ethics and aesthetics, philosophy of culture and politics, social thought, and the struggles of the heart.

Whether this intellectually seething century, marked as much by a Romantic idealist struggle of freedom with necessity as by the steam engine and transfinite
cardinals, would have produced the breakthroughs in mathematics and natural science that in turn provided the basis for new developments in nineteenth-century continental philosophy of science and mathematics in the absence of Hegel, Fichte, and others since deemed to have been unscientific in their philosophical reflections, is difficult to affirm or to deny with any confidence. We know that philosophy is a dialectical activity, a conversation, between thinkers and themselves, and we know that philosophy only thrives within a culture and by interaction with that culture’s triumphs and tragedies. We see concretely during this productive time in human thought that Frege developed his ideas partly in response to his criticisms of Mill, that Brentano labored to make philosophical psychology scientific in a sense both modern and reaching back to Aristotle’s empiricism, specifically against the dominant trend in his day of post-Kantianism among the followers of Hegel, Fichte, and Schelling. If that is so, then perhaps the ideological preparation needed for the progression from nineteenth- to twentieth-century mathematical and scientific discoveries, and their traces in the transition from nineteenth- to twentieth-century philosophy of science and mathematics, would never have occurred or taken quite the historical form and content that they have in the twentieth century as a more distinctly scientific age.
I. PEIRCE AND PRAGMATISM

On the contemporary scene, pragmatism, under the influence of the work of Richard Rorty, is often misleadingly regarded as an antirealist, constructivist philosophy of language. I say “misleadingly” because however much contemporary pragmatism meets this description, the work of the early pragmatists Charles Sanders Peirce, William James, F. C. S. Schiller, and John Dewey is not captured by such an account. Early pragmatism was a philosophy of experience, not of language. Importantly, experience was not thought to be a veil between mind and world nor a barrier to our knowing the world. Rather, experience was considered to be the site of our direct engagement with that which environs us. As Dewey put it, “if anything seems adequately grounded empirically it is the

*1. For a discussion of Rorty, see the essay by David R. Hiley in The History of Continental Philosophy: Volume 6.

2. Charles Sanders Peirce (September 10, 1839–April 19, 1914; born in Boston, MA; died in Milford, PA) was educated at Harvard College (BA 1859, MA 1862), Lowell Scientific School (BS 1863). His influences included Aristotle, Augustus De Morgan (1806–71), Hegel, Kant, Leibniz, and Scotus, and he held an appointment at Johns Hopkins University (1879–84).

3. William James (1842–1910), psychologist and philosopher at Harvard University and close friend of Peirce, gave pragmatism its name in a talk entitled “Philosophical Conceptions and Practical Beliefs” in 1898. John Dewey (1859–1952) was the third original American pragmatist. He identified himself as an instrumentalist and experimentalist, and developed educational and political theories that were influential in the twentieth century. Schiller (1864–1937) was a German-born, British-trained philosopher who developed a version of pragmatism he named “humanism.” He corresponded at length with James regarding their mutual philosophical interests.
existence of a world which resists the characteristic functions of the subject of experience, which goes its way, in some respects, independently of those functions, and which frustrates our hopes and intentions.\footnote{4} In its own way early pragmatism was “realist” in the sense that our beliefs about things are directly constrained by what is sometimes called an “external world.” Even James, whose notion of truth is misconstrued as antirealist, argued: “All our truths are beliefs about ‘Reality’; and in any particular belief the reality acts as something independent, as a thing found, not manufactured.”\footnote{5} To get a fuller sense of pragmatism, of its importance for the history of philosophy, and, indeed, even of its contemporary guise, it is important to revisit the work of Peirce, who found a “pragmatic” tradition in the history of Western philosophy and brought it to the American scene in the late nineteenth century.

In 1868 Peirce published “On a New List of Categories” in Proceedings of the American Academy of Arts and Sciences. In it Peirce took himself to be rethinking the universal categories established by Aristotle and Kant. Peirce did not use the word “pragmatism” in the essay, but he sketched the structural outline for what he would later call his “pragmaticism.” Peirce’s three universal categories – what he later named Firstness, Secondness, and Thirdness – are derived from his reconception of perception. These categories appear across the board in Peirce’s work. In ontology they are the reality of qualitativenss, the reality of otherness, and the reality of generality or continuity. He immediately put them to work in several important ways. He offered his first published account of the triadic structure of a sign in which an interpretant understands a correlate’s reference to a ground or relate. Peirce exemplified this process of representation as follows: “a word represents a thing to the conception in the mind of the hearer, a portrait represents the person for whom it is intended to the conception or recognition, a weathercock represents the direction of the wind to the conception of him who understands it.”\footnote{6} Peirce proceeded to make his first triadic distinction among signs: likenesses (later called icons), indices, and symbols. Finally, he brought his categories to bear on arguments and made an initial attempt to show the differences among hypothesis (later abduction or retroduction), deduction, and

\footnotesize{5. William James, Pragmatism (New York: Longmans, Green, 1907), 243–4. Ralph Barton Perry, James’s student and biographer, wrote: “Some pragmatists, such as James, are avowedly, and on the whole consistently, realistic” (Present Philosophical Tendencies [New York: Longmans, Green, 1912], 214). The key is that while the pragmatists believed that reality constrained inquiry and belief, they did not believe that all ideas were imagistic “copies” of reality.} 
induction. This last triad came to play an important role in Peirce’s rethinking scientific and philosophical inquiry; this rethinking in turn influenced James’s reconsideration of the limits of science and Dewey’s development of what he called “experimental method.”

Peirce developed his interest in method more fully in a series of six papers published in Popular Science Monthly in 1877–78. He entitled the series “Illustrations in the Logic of Science,” and in them he laid the groundwork for pragmatism as theory of meaning but also for the larger experiential and experimental philosophy that would become identified with the word pragmaticism at the turn of the century. The first two papers of the series are among the best known of Peirce’s work: “The Fixation of Belief” and “How to Make Our Ideas Clear.” In “Fixation,” Peirce argued for an experimental method of inquiry that is self-correcting and can therefore trump what he took to be the *a priori* process of most modern philosophers. He also laid the ground for a pragmatic notion of true belief as that which satisfies our doubts. “The most that can be maintained,” he argued, “is, that we seek for a belief that we shall *think* to be true” (EP I: 115).

In the second paper we find the basis for a pragmatic theory of meaning that looks to the potential effects, fruits, consequences, or implied habits of a concept rather than its origin. Peirce provided here his first rough attempt at the pragmatic maxim: “Consider what effects, which might conceivably have practical bearings, we conceive the object of our conception to have. Then, our conception of these effects is the whole of our conception of the object” (EP I: 132).

With method and meaning addressed, the key concepts of pragmatism were in place. However, it is important not to overlook the other themes that appeared in these early essays; these themes help provide a much fuller picture of pragmatism and its projects.

In “How to Make Our Ideas Clear,” Peirce applied his new maxim to the philosophical conception of reality. His idea, which he modified significantly over the course of his career, was to show that reality’s independence of any particular perceiver or thinker could be cashed out by linking it to inquiry because the “sensible effect” of that which is real is to cause belief. Thus the real could finally be articulated by way of the beliefs of an indefinite run of inquiry; the real is that which would be agreed to by all good inquirers in the long run. It is easy to see the linkage here with James’s later focus on pragmatic truth as that which is “expedient in the way of our thinking”7 and Dewey’s focus in his own logic on what he called “warranted assertability.”8 These underpinnings of later

pragmatism come into sharper focus if we take into account as well the final four essays of Peirce’s *Popular Science Monthly* series.

In these essays Peirce developed the relations between inquiry and reality, and foreshadowed not only his own later thought but some key ideas in the work of James and Dewey. In general he argued that deduction is inadequate as a method of philosophy. We must instead make conjectures that are initially plausible, use the pragmatic meaning of the conjectures to make deductive predictions about what “would follow” if the conjecture were true, and then inductively establish ways to test for the prediction. Peirce outlined this method in the final essay, “Deduction, Induction, and Hypothesis.” This method is set against Peirce’s rethinking of the “order of nature.” He rejected the modern notion of a stable, solid-state universe that is shot through with order and necessity. He suggested instead that there is real chance and diversity in a universe that is constantly evolving. Moreover, this universe, Peirce argued, reveals continuity and indefiniteness in origin and future. Peirce suggested here what he later explicitly stated. Statistical inquiry is crucial to the development of science not only because of the finitude of inquirers but because it captures the “tychistic” – or chance-laden – nature of the world. In these essays, the tychism and focus on continuity that influenced James’s notion of a “pluralistic universe” are apparent in incipient form. On the inquiry side, we find explicit foreshadowings of Dewey’s emphasis on the communal nature of science. In “The Doctrine of Chances,” Peirce argued:

> logicality inexorably requires that our interests shall *not* be limited. They must not stop at our own fate, but must embrace the whole community. This community, again, must not be limited, but must extend to all races of beings with whom we can come into immediate or mediate intellectual relation. It must reach, however vaguely, beyond this geological epoch, beyond all bounds. He who would not sacrifice his own soul to save the whole world, is, as it seems to me, illogical in all his inferences, collectively. Logic is rooted in the social principle. (EP I: 149)

The linking of logic and reality in a very down-to-earth manner became the trademark of early American pragmatism, and it reveals the importance of empiricism as an avenue of knowing. This connection, one made repeatedly by James, is well established. However, this linking of logic and ontology also discloses a close affinity between pragmatism and German idealism, where the logic of the inquirer is revelatory of an objective logic. The pragmatists, we might say, kept the objective logic but loosened the hold necessity had on that logic such that the logic of inquirers is an experimental and statistical logic and the logic of Nature is tychistic and pluralistic.
As Loyd D. Easton and others have adequately shown, the philosophical thought of Hegel appeared on the American scene well before the Civil War. In New England, Theodore Parker and Frederick Henry Hedge introduced German idealism to the transcendentalist movement. In 1848, Judge J. B. Stallo of Ohio published his *General Principles of the Philosophy of Nature* developing Hegelian themes. Then, in the 1850s, the St. Louis Hegelians, led by Henry Brokmeyer, William Torrey Harris, and Denton Snider, brought Hegel to the heart of the US. Harris edited the *Journal of Speculative Philosophy* from 1867 to 1893, and published work by Peirce, James, and Dewey. Thus Hegel’s work – and much of German idealism – was not only a living option for the early pragmatists, but was infused into the very history of thought through which their own work came to life.

**William James and Hegelianism**

James was well known for his ongoing combat with the American and British Hegelians of his day, rejecting what he took to be their conception of the universe as a closed or “box” system. Hegel’s system, James remarked, “resembles a mouse-trap, in which if you once pass the door you may be lost forever.” James began reading Hegel as early as 1867 while studying in Germany. Over the course of his career he consistently exposed and argued against the “Hegelisms” in the work of his contemporaries. He was also adamantly opposed to what he took to be the mechanical progress of Hegel’s dialectical method: it offered too neat a picture of history and human experience. Nevertheless, he believed some features of Hegel’s outlook were redeemable, given proper reorientation. Thus, in *A Pluralistic Universe* he came to the conclusion that:

> Taken in the rough, Hegel is not only harmless but accurate. There is a dialectical movement in things, if such you please to call it, one

---

10. Henry Brokmeyer (1818–1906) was a German immigrant who, after engaging in a variety of enterprises, settled in St. Louis and helped establish a group to study the thought of Kant and Hegel. He was the spiritual leader of the St. Louis Hegelians and made his own translation of Hegel's *Logic*. William Torrey Harris (1835–1909), a New England transplant, became superintendent of St. Louis schools, introducing kindergarten to American culture. He also created and edited the *Journal of Speculative Philosophy* and later taught at the Concord Summer School in Massachusetts. He also served as US Commissioner of Education. Denton Snider (1841–1925) was another member of the St. Louis movement who wrote extensively on philosophy and education and worked for a time with Jane Addams at Hull House in Chicago.
that the whole constitution of concrete life establishes; but it is one that can be described and accounted for in terms of the pluralistic vision of things far more naturally than in the monistic terms to which Hegel finally reduced it.12

It would be a mistake, then, to maintain that James was merely an anti-Hegelian and that no Hegelian influence found its way into his version of pragmatism. As his student and biographer Ralph Barton Perry (1876–1957) pointed out:

Despite this early and lasting dislike of its form James continued his study of Hegelian philosophy intermittently throughout his life, with what was on the whole an increasing respect. In the 70s and 80s he was reading the translations and expositions of Hegel published in the *Journal of Speculative Philosophy* by W. T. Harris, “our most prominent American Hegelian.”13

Two features of Hegel’s work struck James as especially significant for his pragmatism. The first was what he considered to be Hegel’s evolutionary conception of truth: that is, that final truth arrives at the end of a long, historical process. The difference was that James insisted on a dialectical procession that was non-necessitarian. Understood in this light, “the pragmatist view of truth lends … a cordial hand to the evolutionary side of Hegelianism.”14 The second important feature was, for James, closely tied to the first, because the intellectualist truth toward which inquiry aimed began for Hegel in immediate perception. As James put it:

Hegel connects immediate perception with ideal truth by a ladder of intermediary concepts – at least, I suppose they are concepts. The best opinions among his interpreters seems to be that ideal truth does not abolish immediate perception but preserves it as an indispensable “moment.” … In other words, Hegel does not pull the ladder up after him when he gets to the top, and may therefore be counted as a non-intellectualist, in spite of his desperately intellectualist tone.15

---

For James’s pragmatism, being nonintellectualist was a central virtue. When James turned to Hegel’s *Phenomenology*, he found in Hegel a kindred spirit who immersed himself in immediate perception. In this much, Hegel’s work was among the influences on James’s development of his radical empiricism, an empiricism that did not rely on atomistic, external sense impressions but dwelled in what James called the “thickness” of experience. If one kicks away the structure of the “mouse-trap,” one can see the Hegel who “plants himself in the empirical flux of things and gets the impression of what happens. His mind is in very truth *impressionistic*.”

James thus found kinship in a loose sense of dialectical development that worked through history in the direction of truth and in Hegel’s impressionistic mode of inquiry. Dewey, on the other hand, whose instrumentalist pragmatism grew out of his reading of James and Peirce, was initially tempted by Hegel’s absolute. Ultimately, however, his own focus on social transformation led him away from the absolute toward a Hegelian manner of conceiving the means and structures of such transformation.

**John Dewey and Hegelianism**

From its inception, Dewey’s pragmatism was threaded with strands of Hegel’s philosophical outlook. While a graduate student at Johns Hopkins University, Dewey studied Hegel with his mentor G. S. Morris (1840–89). However, as did James, Dewey resisted necessitarianism and thus conceived Hegelian dialectic as retaining some contingency. Moreover, as James Good suggests, “the American Hegelian tradition encouraged Dewey to see Hegel as a politically liberal and eminently practical philosopher, to embrace his view of the individual’s relationship to society and his concept of positive freedom, and to develop a theory of learning and human growth similar to Hegel’s.”

Dewey was much less interested in the wholesale system of Hegel’s *Logic* than in its import for social development, which he believed took the form of reconstruction of historical circumstances in light of new ideas. Despite the “necessary interdependence of idea and machinery, of thought and institution,” Dewey argued, “there comes a time when one side conflicts with the other. At such a period reconstruction is necessary.” Throughout his early career, Dewey aligned social reconstruction with Hegel’s descriptions of historical development. Later, he learned to pursue reconstruction in his own ways, having kicked away the Hegelian ladder.

There was a period extending into my earlier years at Chicago when, in connection with a seminar in Hegel’s Logic I tried reinterpreting his categories in terms of “readjustment” and “reconstruction”. Gradually I came to realize that what the principles actually stood for could be better understood and stated when completely emancipated from Hegelian garb.¹⁹

As Dewey indicates, his movement away from Hegel and Hegelian influences was gradual and never fully completed. He claimed that he drifted away from Hegel’s absolutism toward his own pragmatic reconception of social development, and that his later work retained traces of Hegel’s influence. One of the most pervasive traces of this influence can be found in Dewey’s belief that selves, institutions, and cultures are achieved outcomes and not ready-made essences. Moreover, such achievements have to take full account of their cultural and historical settings. Understanding one’s situation is an initial condition of one’s development, growth, or reconstruction.

The responsibility Dewey laid on human communities required adequate means for considering how given situations might be moved forward or ameliorated. Thus, late in his career Dewey developed the experimental logic he had begun in earlier years. It is not surprising that this logic reveals more affinities with Hegel’s logic than it does with the narrowly deductivist practices that came to define logic in the twentieth century. For Dewey logic is, in its broadest sense, a theory of inquiry that provides tools for transforming the very nature of the situations in which we find ourselves.

Finally, Dewey noted early on that Hegel “elaborated the idea that the chief function of the state is educational.”²⁰ This focus on education follows from the general belief that the primary function of all social institutions was “to further the realization of the freedom of all.”²¹ Dewey openly embraced the centrality of education and the empowering of individuals through social institutions. In his hands education became the key condition for any culture that tried to live democratically. However, he noted that Hegel remained “haunted by his conception of an absolute goal,”²² and in the end failed to accomplish anything more than to “consecrate the Prussian State to enshrine bureaucratic absolutism.”²³

²². Dewey, Middle Works, vol. 9, 64.
We see, then, that James loosely borrowed the spirit of immediate perception from Hegelianism and Dewey appropriated Hegel’s dialectic in the service of social reconstruction. Peirce, the most systematic of the pragmatists, was not initially enamored of Hegel’s thought. But over the course of his career he came to respect Hegel’s insights and to use Hegel’s system as a standard by which to consider his own architectonic, and particularly his conception of Nature.

**Peirce and Hegelianism**

Peirce’s assessment of Hegel as a thinker varied considerably over the course of his career. Early on, Peirce read the *Encyclopedia* and the *Logic*. Nevertheless, by his own strict standards of scholarship he disavowed a sufficient understanding of Hegel. Indeed, as late as 1897 he noted, regarding some lectures he was preparing: “It is not my intention at all to attempt a criticism of Hegel. I have not studied him deeply enough to do so. But certain remarks about him strike me, from time to time; and those I insert.”

Peirce was not always this circumspect, and throughout his career worried about three aspects of Hegel’s thought: (i) what he took to be Hegel’s inadequate background in math and logic; (ii) what he took to be Hegel’s *a priori* and thus private method; and (iii) what he construed as Hegel’s ultimate abandonment of two of the three “categories” he initially introduced. Of the first, he remarked that “Hegel had the misfortune to be unusually deficient in mathematics” and that “Hegel’s dialectical method is only a feeble and rudimentary application of the principles of the calculus to metaphysics.”

Regarding his second concern, he argued that “The Absolute Knowledge of Hegel is nothing but G. W. F. Hegel’s idea of himself” (CP 8.118). Peirce’s final criticism was the one he most often leveled at Hegel: that he introduced the three categories only to take back two of them:

The third stage is very close indeed to Thirdness, which is substantially Hegel’s *Begriff*. Hegel, of course, blunders monstrously, as we shall all be seen to do; but to my mind the one fatal disease of his philosophy is that, seeing that the *Begriff* in a sense implies

26. Peirce often aligned his own categories of Firstness, Secondness, and Thirdness with Hegel’s three stages of thought as well as with other triadic structures in Hegel’s thought. I will describe the Peircean categories more fully below.
Secondness and Firstness, he failed to see that nevertheless they are elements of the phenomenon not to be *aufgehoben*, but as real and able to stand their ground as the *Begriff* itself. (CP 8.268)\(^{27}\)

Amid Peirce’s criticisms, we find his deep respect and admiration for Hegel. As we note in the claims just cited, he repeatedly aligned his own universal categories of Firstness (qualitative immediacy), Secondness (otherness), and Thirdness (mediation) with Hegel’s three stages of thought. “My three categories,” he claimed, “are nothing but Hegel’s three grades of thinking” (CP 8.213).\(^{28}\) He also appreciated the historical and evolutionary dimension of Hegel's objective logic and argued that “Hegel’s system of Nature represents tolerably the science of his day” (CP 1.524). We can see here the implicit suggestion that it will be up to Peirce, the pragmatists, and others to take the Hegelian method and bring it into alliance with the evolutionary science of the late nineteenth century. And, finally, Peirce, like James, appreciated the down-to-earthness of the *Phenomenology*. Whatever the instrumental importance of logic may be, philosophy is a science that employs “attentive scrutiny and comparison of the facts of everyday life, such as present themselves to every adult and sane person, and for the most part in every day and hour of his waking life.”\(^{29}\) To begin such a science, we ought to follow Hegel’s lead: “We must not begin by talking of pure ideas – vagabond thoughts that tramp the public roads without any human habitation – but must begin with men and their conversation” (CP 8.112). Thus, for Peirce, Hegel was “in some respects the greatest philosopher that ever lived” (CP 1.524). This remark is worth remembering because pragmatism is so often viewed simply as an antagonist of the neo-Hegelian idealisms in Britain and the US at the turn of the twentieth century. On the contrary, pragmatism was one of the avenues by which Hegel’s thought found its way into twentieth-century America. To overlook this, as many who currently fly the flag of pragmatism do, is to misunderstand pragmatism at its roots, as Peirce argued:

The truth is that pragmatism is closely allied to the Hegelian absolute idealism, from which it is sundered by its vigorous denial that the third category … suffices to make the world …. Had Hegel, instead of regarding the first two stages with his smile of contempt, held on

---

27. See also CP 5.79, 8.41, 8.272.
to them as independent or distinct elements of the triune Reality, pragmaticists might have looked up to him as the great vindicator of their truth. (CP 5.436)

Indeed, as early as 1893 Peirce described his relation to Hegel as follows: “The principles supported by Mr. Peirce bear a close affinity with those of Hegel; perhaps are what Hegel's might have been had he been educated in a physical laboratory instead of in a theological seminary” (CP 8, bibliography note).

My aim at this juncture is not to see to what extent Peirce got Hegel right.30 I want simply to explore one avenue by which German idealism makes an appearance in early pragmatism. I have noted Peirce's affinities and disaffinities with Hegel's thought. It is worth adding to this that Peirce often described himself as a Schellingian. Schelling, perhaps more than Hegel, at least in Peirce's eyes, kept freedom and Firstness more alive as a category. Moreover, he brought to life Fichte's relation of the “me” and the “not-me” in his conception of Nature. Through both Hegel and Schelling, Peirce arrived at a conception of Nature that is quite at odds with the conception held by the likes of Herbert Spencer, Karl Pearson, Thomas H. Huxley and others working out the tradition of British empiricism. In exploring Peirce's idealistic conception of Nature, we can begin to see the pragmatic differences it makes in a philosophy of science – differences in the aims of science, in the uses of statistics, and in the general methods of inquiry. These differences, as many contemporary readers of Peirce have suggested, clearly separate Peirce's thought from what has come to be called pragmatism in the early twenty-first century. Using Peirce's conception of Nature as a marker for pragmatism is not, however, arbitrary. As we noted earlier, pragmatism began as a description of meaning and for Peirce, as well as for Dewey and James, evolved into a notion of inquiry that tested proposed hypotheses by checking experimental results against deduced predictions. Thus, in 1903 Peirce offered a lecture entitled “Pragmatism as the Logic of Abduction” (EP II: 226). For Peirce, the logic of abduction hinged on an affinity between the mind of the human inquirer and the world. “I infer,” Peirce stated, “in the first place that man divines something of the secret principles of the universe because his mind has developed under the influence of these same secret principles” (CP 7.46, see also 1.81, 5.604). Thus an idealistic conception of Nature in which the logic of the natural inquirer was attuned to the logic of events made sense for Peirce as a way of understanding how our scientific practices are possible. In this regard, he saw Schelling and Hegel as his intellectual progenitors.

III. PEIRCEAN NATURE

Peirce is well known for his scientific practice and his writings on the philosophy of science. He invariably described himself as “a scientific man,” and he believed thinkers who had worked in laboratories made better philosophers (CP 1.618). Indeed, he argued that nineteenth-century philosophy suffered “because it had been pursued by men who have not been nurtured by dissecting rooms and other laboratories, and who consequently have not been animated by the true scientific Eros” (CP 1.620). His pragmaticistic method was, after all, an experimental method. Thus it seems ironic to some that he identified himself as an idealist, asserting that “the one intelligible theory of the universe is that of objective idealism that matter is effete mind” (CP 6.685). As a consequence, various commentators on Peirce’s work have tried to argue that this dimension of his thought is old-fashioned or outmoded. However, Peirce understood very well what he was doing in claiming idealism as his own. As he saw it, he was looking forward not backward. For this reason it makes sense to at least try to understand what he meant.

For Peirce, the old-fashioned and outmoded version of philosophy was the nominalism that was traceable back to William of Ockham. As Peirce saw it, “all modern philosophy of every sect has been nominalistic” (CP 1.19). It was especially true, he believed, of the British empirical tradition, which was also associated with what Peirce called the “daughters of nominalism”: “sensationalism, phenomenalism, individualism, and materialism” (CP 8.38). By the end of the nineteenth century, he complained, it was almost impossible to find a scientifically minded person who was not also a materialist. Peirce’s objective idealism was, on the contrary, built on a strong scholastic realism that argued for real generality and continuity in the universe, and that was capable of underwriting the reality of the laws of Nature.

For Peirce, idealism and scholastic realism together provided a better account of the practices of scientists than did materialistic nominalism. Moreover, they made it easier to grasp the import of the most significant scientific theory of the late nineteenth century: biological evolution. In short, Peirce believed that the common nominalistic conception of Nature was inadequate and that it needed to be replaced with an idealistic conception of Nature. In a 1908 letter to Cassius Keyser, he remarked that a “logical, Hegelian-like evolution must be recognized as logically preceding the temporal evolution.”

Peirce’s conception of Nature began, as did all of his metaphysical thought, with his logic. On this score, he saw himself in the tradition of Aristotle and Hegel. Logic, for Peirce, dealt not only with deduction but with the full range

of human reasoning. His pragmaticism and his semiotic were both featured parts of his logical theory. Logic, then, as a theory of inquiry seeks to describe and prescribe, in a general way, scientific practice. What impressed Peirce most was that many, although not all, scientists of his day believed they were coming to understand Nature, to find out truths about it. And the history of sciences, according to Peirce, confirmed this belief from a pragmatic point of view. That is, the ideas of the sciences reveal their truth in history through their effectiveness in dealing with the world. True ideas bear an experimental track record: “We call them in science established truths, that is, they are propositions into which the economy of endeavor prescribes that, for the time being, further inquiry shall cease” (CP 5.589).

If scientists are right about their mission, and Peirce believed they were, then human inquirers must be able to know Nature. Nature, that is, must be intelligible to human inquirers. As Peirce acknowledged to a group of Harvard students, he agreed with the “popular notion that modern science is so very great a thing as to be commensurate with Nature and indeed to constitute of itself some account of the universe” (CP 5.585). Or again, “The only end of science, as such, is to learn the lesson that the universe has to teach it” (CP 5.589). This requires a fittingness on both ends of the inquiry process. The human inquirer must be able to know Nature; and Nature must be able to be known. Of the first Peirce says, “I am quite sure that you must be brought to acknowledge that man’s mind has a natural adaptation to imagining correct theories of some kinds” (CP 5.591). On various occasions he stated that persons have an instinct for “guessing right” – not all of the time, but more often than not. Only such a belief could underwrite Peirce’s abductive/inductive theory of inquiry. Creating and selecting fitting or plausible hypotheses from an infinite realm of logically possible hypotheses requires this instinct for guessing or imagining. “It is somehow more than a mere figure of speech,” he argued, “to say that nature fecundates the mind of man with ideas which, when those ideas grow up, will resemble their father, Nature” (CP 5.591). On the side of Nature, he maintained, “Nature only appears intelligible so far as it appears rational, that is, so far as its processes are seen to be like processes of thought” (CP 3.422). Nature must have an element that is idea-like, that is akin to the working of the human mind. This should not be surprising if the human mind is itself a feature of Nature, as Spinoza, Schelling, and Hegel suggested. Thus the process of inquiry must be a working, living analogy between inquirers and Nature: “It is certain that the only hope of retroductive reasoning ever reaching the truth is that there may be some natural tendency towards an agreement between the ideas which suggest themselves to the human mind and those which are concerned in the laws of nature” (CP 1.81). This hypothesis that Nature is in some part idea-like is the beginning of Peirce’s idealistic conception of Nature. However, idealism
in its extreme forms argues that Nature is nothing but Idea, Spirit, or Mind. As we noted earlier, Peirce often charged Hegel with precisely this reductive sort of move. “The capital error of Hegel,” he wrote, “is that he almost altogether ignores the Outward Clash” of experience (CP 8.41). In the terms of Peirce’s own philosophical vocabulary: Hegel regards “Category the Third as the only true one. For in the Hegelian system the other two are only introduced in order to be aufgehoben” (CP 5.79). This concern led Peirce, in his conception of Nature, to return to his early essay “On a New List of Categories.” As we noted, in this piece he provided his own revision of the Aristotelian and Kantian categories of the Real. He argued that both logically and phenomenologically reality reveals itself as three-categorized, and he named these three, simply but awkwardly, Firstness, Secondness, and Thirdness. Unlike either the materialist or the extreme idealist, Peirce refused to excommunicate any of the categories or to reduce any one of them to the others. The reason to appropriate the term “idealism” was that it could include Thirdness without needing to get rid of Firstness and Secondness. Peirce’s idealism involved a reciprocal order of dependence among the categories akin to that operative among Kant’s relata of substance, cause, community. There, causality is first described as the interaction of two substantive individuals. However, for full causality, the entire situation or communitas in which the individuals interact is required. Thus, community cannot occur without substance and the dual relation of cause and effect, but the individuals and their interaction cannot be sustained without a community that provides the continuity of the relation. Materialism, on the contrary, had no way by which to include Thirdness. Thus Peirce revised idealism in light of his new list of categories, and this in turn led to his revised conception of the Nature into whose workings scientists inquire. Again, the argument is initiated by logic. Given an affinity between the reasoner and Nature, “It follows,” Peirce said, “that if we find three distinct and irreducible forms of rhemata, the ideas of these should be the three elementary conceptions of metaphysics” (CP 3.422). Nature must, therefore, be rethought in terms of the ideas attending “the three forms of rhemata … firstness, secondness, and thirdness; firstness, or spontaneity; secondness, or dependence; thirdness, or mediation” (CP 3.422). Elsewhere he described Firstness as variety and indeterminacy, Secondness as resistance, and Thirdness as generality and continuity.

Peirce believed that Nature revealed to inquirers traits of each of the three categories. Firstness was to be found in Nature’s growing variety, in the actuality of possibility and spontaneity, and in Nature’s statistical form. Secondness is disclosed most clearly in human experience where we find ourselves constrained in action and belief by Nature’s “facts.” Moreover, our residual belief in “things” or “individuals” is an indication of our acquaintance with Secondness in Nature. Finally, Nature’s Thirdness is found in its generality, continuity, and lawfulness.
It is not difficult to see Hegel’s stages of thought lurking in Peirce’s categoriology. What is missing is not the historical development of Nature and culture, but a lock-step process of necessity by which this development occurs. Let me provide a sketch of each of Peirce’s categories of Nature in turn.

**Nature’s Firstness**

From early on in his career Peirce was dissatisfied with what John Stuart Mill called the “uniformity of nature.” But his rejection of such uniformity was not grounded in an atomism or nominalism that outrightly rejected the reality of lawfulness or uniformity. Rather, it was his scientifically based belief in Nature’s growth that resisted the picture of uniformity in a steady-state universe. What science tended to find, Peirce argued, was not perfect regularity and determinateness, but a regularity accompanied by surprises, change, and growth. Uniformity or perfect regularity in Nature may be a “natural belief” but, as Peirce consistently maintained, “Natural beliefs … also require correction and purification from natural illusions” and so “the adaptations of nature, beautiful and marvelous as they verily are, are never found to be quite perfect; so that the argument is against the absolute exactitude of any natural belief, including that of the principle of causation” (CP 6.50). The uniformity of Nature is a reasonable ontological hypothesis but it fails to square with experience, as does the philosophical determinism that is its intellectual companion. Peirce argued:

> Nature is not regular. No disorder would be less orderly than the existing arrangement. It is true that the special laws and regularities are innumerable; but nobody thinks of the irregularities, which are infinitely more frequent. Every fact true of any one thing in the universe is related to every fact true of every other. But the immense majority of these relations are fortuitous or irregular. (CP 5.342)

Peirce’s evolutionary conception of Nature required a nonmechanistic outlook, one that admitted conditions for genuine growth.

Peirce, whose father helped create the first English translation of Laplace, rejected Laplace’s suggestion that chance or probability in Nature was simply a function of human ignorance. Nature rather seemed to disclose a wide range of “unlawful” or “irregular” events. In everyday experience, for example, whom we encounter and under what circumstances we encounter them are for the most

---

33. Pierre-Simon Laplace (1749–1827) was a French astronomer and seminal thinker in mathematical statistics.
part unlawful events. On the intellectual front, evolutionary theory and developments in statistics led Peirce to his “tychism,” the belief that there is always an element of chance or spontaneity in the universe. To his friend Chauncey Wright, a defender of both Mill and Darwin, Peirce stated, “Mill’s doctrine was nothing but a metaphysical point of view to which Darwin’s theory, which was nourished by positive observation, must be deadly” (CP 5.64). That is to say, Darwin’s observations suggested that there are real possibilities in Nature’s developments, real may bes as opposed to a seamless system of must bes and would bes: “The principle of sporting is the principle of irregularity, indeterminacy, chance” (EP II: 272). Tychism is supported by the simple observation of increased variety in Nature. From our limited perspective on earth, we see new species come and go and within species we find individuals that push the boundaries of the class. “The premises of Nature’s own processes,” Peirce argued, “are all independent uncaused elements of facts that go to make up the variety of nature which the necessitarian supposes to have been in existence from the foundation of the world, but which the Tychist supposes are continually receiving new accretions” (CP 5.119). Against Herbert Spencer’s influential blend of mechanism and evolutionary theory, he held that since Nature reveals both its growth and its diversification, we must abandon mechanism since “mechanical law can never produce diversification” (CP 1.174). Thus, for Peirce, just as in our logical theory we must shift from a deductivist and necessitarian outlook to an abductive/inductive logic, so in ontology we must move from an assumption of the uniformity of Nature to a tychistic ontology and cosmology that includes the spontaneity that can account for increased diversification. Nature is itself probabilistic – statistics describe its being directly: “if the laws of nature are still in process of evolution from a state of things in the infinitely distant past in which there were no laws, it must be that events are not even now absolutely regulated by law.” And:

just as when we attempt to verify any law of nature our observations show irregular departures from law owing to our errors, so there are in the very facts themselves absolutely fortuitous departures from law … which … must manifest themselves in some indirect way on account of their continual occurrence. (CP 7.514)

Peirce willingly acknowledged that his tychistic conception of Nature was hypothetical. But he believed it better accounted both for our ordinary experiences of indeterminacy and for the late-nineteenth-century developments in science than did the uncritical adoption of the uniformity of Nature and determinism. I believe his outlook on this score remains viable in the twenty-first century, although we are still occasionally tempted by the natural belief of uniformity.
Nature’s Secondness

The category of Secondness in Nature is the least problematic, I think, for contemporary science. Our human practice of scientific inquiry requires Nature’s Secondness. A Nature that is pure Secondness or atomistic actuality is the Nature of the late-nineteenth-century mechanist and nominalist. Peirce’s difficulty here is not so much to persuade scientists that Nature reveals Secondness, but to show that an idealistic conception of Nature can include Secondness. In other words, he must show that he is not Hegelian as he understood Hegelianism. Trading on evolutionary theory, Peirce recognized human beings as a natural result of evolution: humans are a feature of Nature. However, the human ability to inquire and to know seems to establish, as Fichte suggested, a duality in the midst of Nature. As inquirers, we become Nature knowing itself: “we are all of us natural products, naturally partaking of the characteristics that are found everywhere throughout nature” (CP 5.613). This accounts for the affinity between our ideas and Nature’s laws, as suggested at the outset, but it also insists on a fundamental otherness. There must be in reality both an ego and a non-ego; the inquirer must be able to objectify the rest of Nature, including herself. There is an inner and an outer, a subject and an object, and so forth – all within Nature. The key is to see these as functional features of Nature – they are not extra- or super-natural, as Dewey often put it; rightly or wrongly, Peirce seemed to believe that Schelling retained this view but that Hegel lost it by neglecting Secondness. For Peirce, our experience is itself the key indicator to us of the Secondness, the otherness: what he called the “outward clash” in Nature. “Experience,” he believed, “means nothing but just that of a cognitive nature which the history of our lives has forced upon us” (CP 5.539); it refers “to that which is forced upon man’s recognition, will-he, nill-he” (CP 5.613). Individually and communally, our beliefs are resisted by Nature’s otherness; this is the truth of any empiricism. And when as inquirers we experiment, we aim to make sense of this external constraint on our thought. Borrowing from the chemist Julius Adolph Stöckhardt (1809–86), Peirce described “experiment” as “a question put to nature” (CP 5.168).

Peirce thus resisted the idealistic temptation to claim that Nature is “nothing but mind”: an undifferentiated categorial whole. Material reality in the normal sense of things is a feature of our experience. According to Peirce, “An idealist need not deny the reality of the external world, any more than Berkeley did. For the reality of the external world means nothing except that real experience of duality” (CP 5.539). There are individual things and events to which we, as agents and inquirers, must respond. Indeed, one of our human purposes in

34. For an extended discussion of Hegel and Secondness, see Stern, “Peirce, Hegel, and the category of Secondness.”
35. See also CP 5.57.
discovering Nature’s truths is to be able to act more effectively within an oppositional environment. Knowing a law of Nature is not enough; we must also have the ability to act in a specific situation. As Peirce put it, “a law of nature left to itself would be quite analogous to a court without a sheriff” (CP 5.48).

Peirce shares with the nominalist a belief in the actuality of things and events; Nature has its Secondness. However, understanding Nature requires more than a bare acquaintance with individuals; we seek the intelligibility of the relations of things and the regularities of their behavior. Just as the court of law requires a sheriff for action, the sheriff reciprocally requires the court of law for guidance. It is not the individual facts and events themselves that require explanation – it seems foolish to ask in any full ontological sense why one’s shirt is blue. But we do require explanation for the regular behavior of things. “Law,” Peirce argued, “is par excellence the thing that wants a reason” (CP 6.12). All inquiry, scientific or otherwise, is an investigation into Nature’s Thirdness – its lawfulness, its meaning, its reasonableness.

**Nature’s Thirdness**

As we noted earlier, Peirce’s rejection of Nature’s uniformity was not a rejection of its regularity. And it is precisely this regularity about which the scientist hopes to learn. Even a statistical rather than a deterministic regularity shows that individuals in Nature have habits and ways of behaving that are general, or third-like. Peirce did not argue, therefore, for the *existence* of laws as objects or individuals – this would be to reduce them to seconds and would void their ability to cover a variety of instances. Instead, Peirce argued for the *reality* of laws, a reality that is evidenced by the past regularity of the actions of things as well as by the predictability of the future. It is here in Nature’s Thirdness that Peirce put his scholastic realism to work.

For the scientific world the question of Nature’s Thirdness is closely bound to our conceptions of laws of Nature. The traditional British empiricist/nominalist argued that what we call “laws” are simply arbitrary descriptions attributed by persons to things in Nature. Pearson, for example, argued that a law is “essentially a product of the human mind and has no meaning apart from man.”36 Or, as Peirce argued more generally, the conceptualists “say that the laws of nature and the properties of chemical species are the results of thinking” (CP 1.27). Given the work of Rorty and a wide variety of other thinkers, such an outlook still seems very much in vogue. Indeed, those who, like Rorty, follow the logic of nominalist reasoning to its conclusion, admit that science is a modern mythologizing and that Nature itself is a human fabrication.

---

Peirce resisted this line of reasoning not only because he believed science revealed something of Nature's intelligibility but also because we find ourselves practically constrained not only by Nature's actuality, its factual resistance, but by the force of Nature's laws. We cannot indeed truly think and act as we please. In describing gravity in a lecture, Peirce maintained that we come to believe by way of experience that any stone dropped on earth will behave in a reasonably similar way and that “there was a real reason, that is, a real general” that governed its falling (CP 6.99). We find a natural law that enables us to tell what would be the case in the future under certain circumstances.

The description, of course, is simple and commonplace. The difficulty seems to be in seeing the necessity of Peirce's realistic, idealistic ontology for making the description effective. The pragmatic meaning of natural laws, however, should bring the force of their reality home to us. These laws have what Peirce called “a sort of esse in futuro .... That is to say, they will have a present reality which consists in the fact that events will happen according to the formulation of those laws” (EP II: 153). A law's reality, its independence from what you or I think about it, is what enables us to make predictions according to it: “it is a prognostic generalization of observations” (EP II: 68). It is our very scientific and experimental use of Nature's laws that reveals and confirms their pragmatic meaning – gravity, for example, is found in its would-be consequences. “The scientific man,” Peirce said, “looks upon a law ... as a matter of fact as objective as fact can be” (EP II: 74). Only it cannot be an individual fact or a fact of Secondness; in order for prediction to be possible through its use, a law must be general and apply to an indefinite range of possible events.

Strictly speaking, Nature's laws reveal a kind of final causality in Nature. Such a claim is antithetical to nominalism and atomism, which begin and end with efficient and proximate causes, and it sounds strange to those who think of finality only in terms of conscious beings. But since a law has its “being in futuro,” it constrains events to take some forms and to resist others. Thus, for Peirce, “To say that the future does not influence the present is untenable doctrine .... All our knowledge of the laws of nature is analogous to knowledge of the future” (CP 2.86). To say, then, that the future is in some part governed by present laws is to argue for final causality in Nature.

Finally, Peirce's claim that Nature involves Thirdness, that generality is real, also means that Nature itself reveals generality and continuity to us as inquirers. It does this through lawfulness, as we have been arguing, but it also does so through some phenomenological features of our experience. For example, we on occasion experience sympathy with other living beings, and we quite routinely experience the efficacy of the communication of meaning. But for ideas or meanings to be communicable, Peirce claimed, we must be able to enter into them; ideas are real generals that do not reside in us but that any of us may
enter into. This was the feature of Hegel’s *Logic* that intrigued Peirce. Moreover, in order for me to sympathize with another person or animal, there must be continuity between their experiences and mine. Thus simple everyday experiences bring home to us the real generality of Nature; that we tend to overlook or dismiss this fact is a function of the depth of our habituation to a nominalistic version of the world. In scientific work we find such continuity similarly suggested. Evolutionary theories tend to argue for a process that moves forward by “insensible degrees.” Thus, in identifying species, Peirce argued, the naturalist notes that the qualities of his specimens “are not precisely alike.” Therefore “the differences are such as to lead him to believe that forms could be found intermediate between any two of those he possesses” (CP 2.646). The upshot is that natural kinds are real, but the borders between them are continuous such that new species may appear, and such that some individual specimens may partake in both—they may be border creatures.

For those who conceive of Nature as a steady-state, box universe, Peirce’s three-categorized Nature may seem to involve some extravagant claims. Many in the history of Western thought have been tempted by the simplicity of materialism and extreme conceptual idealism because of the clarity they can bring to explanation. However, Peirce found in the world of scientific practice enough evidence to call the simplicity of both materialism and conceptual idealism into question. To account for our natural experiences of possibility, of physical resistance, and of predictability, Nature must be diverse and spontaneous, factual and constraining, general and evolutionary. It must be, for Peirce, the same complex and living sort of Nature to be found in the thought of Hegel and Schelling.

**IV. CONCLUDING THOUGHTS**

In concluding, I would recall that for Peirce one’s metaphysical account of Nature is never without a practical and pragmatic meaning. It can affect whether we inquire, how we inquire, and even, as we now know, how we fund inquiry. It is for this reason, as well as for his concern for finding the truth, that Peirce worried about the nominalistic disease that had permeated not only nineteenth-century science but many features of everyday life. A nominalist lives in a Nature where truth, beauty, and goodness are not real regulative hopes but are arbitrary constructions of individual beings. Indeed, the nominalist, unlike the Peircean idealist, has no intrinsic reason to care about Nature since it bears no constitutive meaning. Peirce’s Nature, as did Hegel’s and Schelling’s, does bear meaning and may require aesthetic and moral consideration. Let me close, then, with a final sketch of Peirce’s resistance to Pearson’s nominalistic account of Nature. Pearson, as we noted, argued that natural laws are in a strict sense arbitrary
human conventions. And prior to Rorty, Pearson maintained that the world itself is a construction of the finite mind. Therefore, for Pearson, scientific practice could not legitimately be aimed at a real general called “truth.” Instead, it must be conducted for other reasons. Specifically, he argued, the sole reasons for science are to “promote the welfare of human society, to increase social happiness,” and “to strengthen social stability” (EP II: 57). At first blush these may seem worthy aims. But as Peirce was quick to point out, Pearson, an original leader of British eugenics, meant by these aims the preservation of British aristocracy. Peirce, who had by that time learned that even intelligent persons could become impoverished, retorted: “to demand that man should aim at the stability of British society, or society at large, or the perpetuation of the race as an ultimate end, is too much” (EP II: 60). Thus a nominalist Nature too has its consequences. As Peirce well knew, there is much more at stake in his idealistic conception of Nature than conversation among philosophers or scientists. And yet, to bring the issue full circle, this is the best reason why we, as philosophers and scientists, should continue to inquire into the efficacy and truth of such a conception. For if it is not the case that the truth is merely what works, it remains the case for Peirce that the truth will in the long run work:

The very being of law, general truth, reason, – call it what you will, – consists in its expressing itself in a cosmos and in intellects which reflect it, and in doing this progressively; and that which makes progressive creation worth doing, – so the researcher comes to feel, – is precisely the reason, the law, the general truth for the sake of which it takes place. (EP II: 58–9)

To see Peirce’s Nature in this way is to see that pragmatism’s roots in German idealism are deep and strong, even when they are not stated explicitly. We also see that these roots are heavily modified by the pragmatists’ experimental method, by their acceptance of a tychistic dimension of Nature, and by their evolutionary outlook. Missing this connection, however, is precisely what has unfortunately led to the many contemporary misreadings of the pragmatic tradition as antirealist, as subjective and relativistic, and as thoroughly constructivist. Especially for Peirce, pragmatism was not a radically novel philosophical outlook, but a reasonable development of the history of philosophy given the states of philosophy, science, mathematics, and logic at the close of the nineteenth century.
MAJOR WORKS

The question can be raised whether the category or discipline of philosophical aesthetics existed before the eighteenth century. Unlike “logic,” “ethics,” and “physics,” a traditional Stoic division of philosophy with great staying power, “aesthetics” is clearly a product of modernity. As Paul O. Kristeller demonstrated in “The Modern System of the Arts,” it was in the eighteenth century that the idea of the aesthetic as a distinctive human capacity and the parallel consolidation of the notion of the fine arts crystallized in the writings of (mostly) French, German, and English philosophers and critics.¹ The modern concepts of art and aesthetics emerged together. Any history or genealogy of aesthetics will have to confront the possible tensions between an orientation to the arts and one to aesthetic subjectivity; it should take account of the canon of the fine arts that the new field of aesthetics inherited from the eighteenth century as well as its conflicts, margins, and exclusions. We should be aware, for example, that the very notion of literature (in contrast to earlier traditions of poetics and rhetoric) arose around 1800, and almost immediately generated the idea of

world literature (which, as Marx observed in 1848, is a recent invention of the bourgeoisie).  

There is, then, only a modern aesthetics. The Greeks and Romans were concerned with the power of poetry and music and the beauty of the *kosmos*, but had no “aesthetics,” and nor did the medievals, despite their hermeneutic fascination with the meaning of biblical narrative. For the development of aesthetics in the specifically modern sense two things were required: (i) *the discovery of “man”* in the meaning that Michel Foucault gives to that term, that is the being who understands that his entire construction of the world is possible only through his own finite powers, and who sets himself the infinite and, as it turns out, impossible task of clarifying the nature of these powers, including aesthetic sensibility or taste; and (ii) the critical and practical formation of a *system of the fine arts*, in which poetry, painting, sculpture, architecture, music, and others (including some later marginalized, e.g. gardening and landscape architecture) were understood as having fundamentally similar aims and roots.  

The arts became a philosophically crucial form for the self-understanding of the finite human being at the time when it became possible to speak of art in something like the usual modern sense. This understanding was pursued in settings and institutions such as museums and concert halls where the arts had both a privileged and a newly isolated place. Aesthetics was the experience of beauty, sublimity, and art in which the human being manifests its universal capacities, coming to a knowledge of itself as reflective subject (Kant) or as participating in the work of *Geist* (Hegel).

Both Kantian and Hegelian aesthetics are centered in the concept of a universal humanity that comes to understand some of its deepest powers through aesthetic experience, including that of the arts.  

2. The earliest occurrence of “literature” documented by the *Oxford English Dictionary* is 1812; the word does not appear in Grimm’s *Wörterbuch*.  

*4. For discussions of Kant’s and Hegel’s aesthetics, see the essays by Thomas Nenon and Terry Pinkard, respectively, in The History of Continental Philosophy: Volume 1.
grand narrative of art, as developed in Hegel’s lectures, is a story of spirit coming
to itself historically, within the medium of sensuous material, a medium from
which it eventually twists free, transforming itself into religion and philosophy.
This universal historical hermeneutics concludes elegiacaclly by proclaiming the
notorious “death of art,” or to follow Hegel more precisely, the judgment that
art is no longer an original source of thought, having been surpassed by and
comprehended (aufgehoben) in religion and philosophy. Between roughly 1840
and 1900 philosophers assumed the task of elaborating and sometimes trans-
forming the conception of the universal aesthetic human and the meaning of
art that Kant and Hegel had pursued in their distinctive ways.

I. AESTHETICS AFTER HEGEL

Although a number of Hegel’s critics and commentators assume that he spoke
of the “death of art,” what he actually claimed was more complex and not at all
as naive as this phrase sounds. Hegel had said that art had completed itself in
its essential movements, that it had become a subject of science (Wissenschaft),
and could no longer play its former role as a primary source of thought, having
been superseded (aufgehoben) by religion and philosophy. What we could now
expect was not the disappearance or death of art, but its dissolution or unrav-
eling (Auflösung), which would involve stylistic experimentation, play, and
ironic self-consciousness. Hegel remarks that the knee no longer bends before
the painted Madonna seen as an artistic image, but art continues to be the great
educator of humanity and a fertile field of cultural life.5

The artistic world inherited by the post-Hegelian generation was one in
which relatively new institutions such as the museum and the concert hall had
firmly established themselves as the sites of art, corresponding both to Kant’s
divisions among the cognitive, practical, and aesthetic spheres and to Hegel’s
elaboration of a science of aesthetics. This new situation was contingent on
the rise of the bourgeoisie, greater literacy, and global markets that fostered
various forms of translation. The rising middle class sought credentials for its
new social standing in the exercise of universal taste (to put it in Kantian terms)
or in becoming knowledgeable heirs of art’s universal history (to reflect this in a
Hegelian way).6 This project fit well with the European restoration of order that
prevailed from Napoleon’s defeat in 1815 to the revolutionary period of 1848.

versity Press, 1975), vol. I, 11 (art on its highest side a thing of the past), 103 (the knee does
not bend); vol. II, 593–611 (dissolution of Romantic art).
6. For a Marxist account, see Terry Eagleton, The Ideology of the Aesthetic (Oxford: Blackwell,
1990), esp. 1–30.
While many artists and philosophers who took this new cultural context for granted found inspiration in Hegel’s aesthetics and his dialectical approach, the question arose whether Hegel had claimed premature closure in his triad of symbolic, classic, and Romantic art, and in his system of the individual arts, which traced a development from the most material and earth-bound art of architecture to the purely imaginative world of poetry. Post-Hegelians such as Karl Rosenkranz and F. T. Vischer were impressed by Hegel’s dialectical procedure, but argued that he had unduly restricted the scope of aesthetics by limiting its field to the beautiful. They set out instead to demonstrate that the beautiful was only one of a nest of related fundamental aesthetic forms that also included (at least) the sublime, the comic, and the ugly. In Vischer’s early work *On the Sublime and the Comic* (1837), and in his later massive and encyclopedic *Aesthetics* (1846–57), he implicitly claimed to out-Hegel the master, situating the beautiful as only the first or immediate moment of the aesthetic, a moment thrown into relief by its negation in the sublime, itself a negative and excessive movement, surpassing the self-contained harmony of the former. The final, reconciling moment is the comic, conceived as combining the immediate appeal of the beautiful with the disparity and conflict typical of the sublime. Vischer, after completing his monumental eight-volume *Aesthetics*, wrote an essay acknowledging that he had vastly underestimated the role of the perceiver, or the aesthetic subject, which contributed to Benedetto Croce’s later verdict that Vischer’s *Aesthetics* was “the tombstone of Hegelian aesthetics.” Rosenkranz’s *Aesthetics of the Ugly* (1853) employs a similar structure, but he pushes the dialectic further to explore the extremes of horror. While we can see how the tables of contents of Vischer’s and Rosenkranz’s treatises could appear to be (as F. H. Bradley said of Hegel) a “ballet of bloodless categories,” Rosenkranz’s stress on Hegel’s “power of the negative” in aesthetics was an important (if little

---

7. Johann Karl Friedrich Rosenkranz (April 23, 1805–July 14, 1879; born in Magdeburg, Germany; died in Königsberg) was educated at the Universities of Berlin, Halle, and Heidelberg. His influences included Hegel and Schleiermacher, and he held appointments at the University of Halle (1831–33) and University of Königsberg (1833–79). His major works include *Hegels Leben* (1844), *Aesthetik des Hässlichen* (1853), and *Hegel als deutscher Nationalphilosoph* (1870).

Friedrich Theodor Vischer (June 30, 1807–September 14, 1887; born in Ludwigsburg, Germany; died in Grunden) was educated at the University of Tübingen. His influences included Hegel, and he held appointments at the University of Tübingen (1837–55, 1866–87) and University of Zürich (1855–66). His major works include *Über das Erhabene und Komische* (1837), and *Aesthetik, oder Wissenschaft des Schönen* (1846–57).

acknowledged) step in a tradition represented by Theodor W. Adorno, who saw Rosenkranz’s aesthetics of the ugly (Hässliche) as anticipating a more recent concern with dissonance as a fundamental aesthetic category.10 As Rosenkranz proceeds from the formless to disfiguration, the destruction of the image, the demonic, evil, and terror, he effectively explores a dimension of subjectivity opened up in Kant’s analysis of the sublime. Reading beyond the obsessively systematic tables of contents of such works, we discover a number of philosophically rich discussions of music, literature, and other arts, some of which were read by American transcendentalists and pragmatists.11

Søren Kierkegaard took a different direction from Hegel. Many of his writings, especially those in the first volume of Either/Or, could (except for their ironic tone and pseudonymous authorship) be taken as contributions to Hegelian aesthetics like those proliferating in Germany; closer attention to context will take account of Kierkegaard’s agonistic relations with contemporary Danish Hegelians.12 In “The Tragic in Ancient Drama Reflected in the Tragic in Modern Drama,” a pseudonymous author argues that the modern world is comic, insofar as it presents subjectivity as pure form; whereas in Greece the social bond brought people together in common life, the modern state, in abandoning any real claim of authority, leaves the modern subject to lead an essentially isolated life.13 Since ethical substance is lacking in modernity, the suffering of the modern hero must be completely self-inflicted. If Hegel’s analysis of Antigone rightly discerned the tragic in the clash of two substantial powers – the universal claims of the state and those of family and ancestral piety – the modern Antigone would be one condemned to an absolutely private existence with a secret about her father, whose anxiety would be increased by her unresolvable uncertainty as to whether her father also knew and suffered from knowing it. Kierkegaard’s own pseudonymous authorship, playing as it does with various forms of the secret and the incommunicable, involves a complex strategy for awakening an intense awareness of the caesura of public and private. He deploys the forms of Romantic irony against the aestheticism of the movement, as he parodies the practices of Hegelian philosophy in order to validate the concept of individuality.

11. Much post-Hegelian and post-Schellingian aesthetics was published in translation in the Journal of Speculative Philosophy (1867–93), a basic source of philosophical education and discussion for such North American philosophers as Peirce, James, and Dewey (Dewey’s Art as Experience [1934] has been said to be his most Hegelian work).
12. For a discussion of Kierkegaard that situates his work in relation to Danish Hegelians, see the essay by Alastair Hannay in this volume.
Kierkegaard would no doubt have been amused by the growth of positivist aesthetics in France and Germany later in the century. He would have seen in the “experimental” aesthetics, pursued by Johann Friedrich Herbart, Gustav Fechner, Robert Zimmermann, and Carl Stumpf, a comic exhibition of how even the aesthetic could be emptied of subjectivity in the modern age. These aestheticians typically model their methods on a positivist interpretation of the natural sciences, one that imagines that theory must not only be confirmed by data but that our knowledge of laws arises from a process of accumulating observations. They wedded this to a reduced conception of the aesthetic judgment; characteristically, they have little or nothing to say about the notion of the aesthetic subject, simply taking as given the datum of the judgment of taste that Kant begins to analyze in the first four moments of his “analytic of the beautiful.” Fechner distinguishes an “aesthetics from above” (in the manner of Kant, Schelling, and Hegel) and an “aesthetics from below” that involves determining the laws of pleasure and displeasure; these can be determined only by observation. Zimmermann follows Kant in distinguishing mere feelings (which may vary widely from subject to subject, being pathological in Kant’s terms) from aesthetic judgments. Yet, unlike Kant, he claims that the experimental methods of the exact sciences can be used to “identify the specific relations of sound or color” that produce aesthetic judgments. This approach abandons any attempt to derive the whole of aesthetics from a single principle (such as “harmony is pleasing”). Zimmermann argues that “there are just as many objective principles of taste as there are aesthetic judgments.” Aesthetics should follow the model of the exact sciences, he proposes, reducing “the most complex expressions of taste, as produced by the works of nature and art, to those original factors which are incapable of further analysis.” This is a project that can be completed, Zimmermann asserts, yielding “a normative standard of eternal validity.” In practice this means that with respect to the visual arts, for example, experimental aesthetics attempts to understand the work in terms of responses to color, form,

15. Robert Zimmermann, “Toward the Reform of Aesthetics as an Exact Science” (1861), Nicholas Walker (trans.), in Art in Theory: 1815–1900, Harrison et al. (eds), 607–9.
and other measurable and observable properties. In an 1892 critical review of
the history of aesthetics, Wilhelm Dilthey argued that “experimental aesthetics
is unable to explain how the work of art is more than a heap of impressions.”

Recent efforts to construct psychological theories of art and the aesthetic are in
danger of analogous reductionism, which can be put in Dilthey’s terms by saying
that they lack a hermeneutic dimension.

Dilthey argued that the experimentalists were unable to recognize holistic
properties of artworks, notably style, that they had a reductive view of thought
and content in art, and so necessarily produced an arid formalism as the ground
of their researches. Both experimental and rational approaches (which he iden-
tifies with a tradition including Descartes, Leibniz, and Baumgarten) omit the
activity of creativity and genius that gives each work “an inner delineation,”
or style: “Style exudes an energy which enhances the vitality of the viewer
and his feeling of life … the psyche, by its delight in the inner form of its own
activity, assumes a superiority over the crude satisfaction of impulses.”

To this “Kantian” pronouncement, Dilthey adds the “Hegelian” insistence that the
artist’s spirit is necessarily formed by the spirit of his age. Dilthey concludes with
programs for both the arts and aesthetics: aesthetics must be enriched by the
historical sense, which will involve attention to the circumstances of the present,
in which naturalism is pointing to real conditions of life; and art awaits “men
of genius” who will discover styles for the new age in which we are becoming
aware of “the relation of the worker to the machine and the farmer to his soil,
the bond of persons working together for a common end, genealogical lines of
descent and heredity, the confrontation of the sexes, the relation of passion to its
social and pathological basis and of the hero to masses of unnamed people who
make him possible.” Like so many programmatic statements, Dilthey’s betrays
its own limits when he declares that these are tasks for the unique depth of the
“Germanic character,” as distinct from the Latin, Nordic, or Slavic.

Dilthey’s own distinctive contribution was his Weltanschauungslehre, or
theory of worldviews, and after distinguishing the Greek and Roman, medieval,
renaissance, and early modern views, he suggests here some of the themes of the
emerging worldview of the “new age.” The disclosure of worldviews, and the way
in which great artists or “geniuses” dealt with these, was part of his project for
a renewed hermeneutics, which was provoked by his study of Schleiermacher.

Neville (trans.), in Dilthey, Poetry and Experience, Rudolf A. Makkreel and Frithjof Rodi (eds)
*17. For a discussion of Dilthey’s approach to hermeneutics, see the essay by Eric Sean Nelson in
this volume.
19. Ibid., 221–2.
That project and his critical-philosophical essays on Goethe, Novalis, Hölderlin and other poets (later collected in *Das Erlebnis und die Dichtung*, 1906) had great importance for Martin Heidegger and his student Hans-Georg Gadamer, both of whom would criticize the very notion of aesthetics, replacing it with hermeneutics and ontology.

II. AESTHETICS AND REVOLUTION: MARX AND WAGNER

The 1840s were a time of political and social unrest, marked by revolutionary demands and activity aiming at greater democracy and asserting the rights of the working class. This ferment contributed to newly expanded conceptions of the universal aesthetic subject and to programs for new forms of art that could speak to the sense of future possibility aroused by radical social movements. The composer and theorist Richard Wagner absorbed his Left Hegelianism from Feuerbach;\(^\text{20}\) it chimed with the eclectic transmission of German idealism he received from miscellaneous sources, including Thomas Carlyle. Wagner greeted the revolutionary spirit by calling for a revolution in art. He followed the Hegelians in seeing the defining characteristic of Greek art as its public role in the *polis*. While this led to a scathing criticism of the compartmentalization of art and the aesthetic in bourgeois society, Wagner refused to accept the “death of art” entailed by this culture. He called for the new revolutionary art to draw its inspiration from the complexly organized industrial activities of the modern metropolis:

> Who, then, will be the artist of the future? The poet? The performer? The musician? The plastic artist? – Let us say it in one word: the folk [*das Volk*]. That very same folk to whom we owe the only genuine art-work, still living even in our modern memory, however much distorted by our restorations; to whom alone we owe all art itself.\(^\text{21}\)

Yet Wagner’s invocation of this apparently natural base of the people, echoing Feuerbach’s call for a *Philosophy of the Future* in its naturalism, concludes with a call for an ethico-aesthetic revolution under the symbolism of the divine that will join the universal humanity of Jesus with the beauty and strength of Apollo. This puzzling synthesis was left mysterious, although it may have played a role

\(^{20}\) Feuerbach and the Left Hegelians are discussed in the essay by Lawrence S. Stepelevich in *The History of Continental Philosophy: Volume 1*, as well as in the essay by William Clare Roberts in this volume.

Marx’s early philosophical writings disclose an analogous perspective. He saw modern industrial society as necessarily leading to the alienation of workers from their deepest human possibilities, notably involving free and spontaneous human activity and from the development of the senses. Marx’s analysis of alienated labor, in which humans make themselves other than they are, presupposes a conception of the human as an aesthetic subject, which, if it were in touch with its genuine nature, would be involved in creative and expressive work. Marx did not write a single systematic work in aesthetics, and this dimension of his thought was largely ignored until it proved to be a rich inspiration for later thinkers such as Georg Lukács, Walter Benjamin, Adorno, Herbert Marcuse, and others. In the 1830s Marx aspired to be a poet and a drama critic; while he soon abandoned these ambitions for philosophy, his writings draw extensively on world literature (whose reality and concept he saw as a contribution of the bourgeoisie). Marx’s early aesthetic utopianism owes much to Schiller and Hegel. He suggests that the whole range of human sensibility is not fixed in our nature, but the product of an ongoing historical development, one in which the arts could play a role in expanding our possibilities of perception and creation: “Only through the objectively unfolded wealth of human nature is the wealth of the subjective human sensibility either cultivated or created – a musical ear, an eye for the beauty of form, in short senses capable of human satisfaction, confirming themselves as essential human capacities.”

The critique of post-Hegelian philosophies of subjectivity in *The German Ideology* (co-written with Friedrich Engels) rejects any valorization of a pure consciousness that would be independent of the lived, material, and social world of human beings. The early writings identify productive labor as the human essence, or “species-being,” and this activity is genuinely free only when free of physical need; in this respect Marx’s very model of nonalienated labor comes close to the Kantian notion of the aesthetic as independent of practical interest. If nonhuman animals are bound by the instincts of their species in their production (e.g. of nests and dwelling places), “the human knows how to produce according to the standards of any species and at all times knows how

*23. Essays treating all of these figures can be found in *The History of Continental Philosophy: Volume 5.*

*24. For a discussion of Schiller’s aesthetics, see the essay by Daniel Dahlstrom in *The History of Continental Philosophy: Volume 1.*

to apply an intrinsic standard to the object. Thus humans create also according to the laws of beauty.”26 “The laws of beauty” are not further defined, and taken together with Marx’s later remarks on the eternal charm of Greek art, which he explains as the eternal attraction of the childhood of the species, this formulation betrays a taste solidly formed in the Kantian and Hegelian traditions.27 Yet Marx was not completely bound by the aesthetics of the beautiful. He made a close study of Vischer’s *Aesthetics* in 1857–58, and it seems that Vischer’s account of the sublime as intrinsically excessive, surpassing all limits, played a role in Marx’s later formulations (notably in *Capital*) of how capitalist production and social relations also embody the power of the negative, giving some theoretical grounds for the famous words of the *Communist Manifesto* that declare how in capitalism “All fixed, fast-frozen relations, with their train of ancient and venerable prejudices and opinions, are swept away, all new-formed ones become antiquated before they can ossify. All that is solid melts into air ….”28

This analysis is at the root of later interrogations of the culture industry and the feverish transformation of aesthetic style in late capitalism by Benjamin and Adorno. The poetics and rhetoric of Marx’s epic, prophetic, and parodic texts (e.g. *Capital*, *The Communist Manifesto*, and *Herr Vogt*) reflect his Hegelian and post-Hegelian formation; they also show his limited adoption of an artistic, conceptual persona developed in fuller form by Kierkegaard and Nietzsche.

On one level, Marx’s conception of the aesthetic subject can be seen as his translation of German idealism into the history of the laboring social body. As such it stands under the sign of the beautiful, the fundamental category of Hegel’s aesthetics. Yet Marx, like the post-Hegelians, also accorded special significance to the sublime and the comic. In the opening pages of *The Eighteenth Brumaire*, he implicitly criticizes the bourgeoisie’s displacement of the aesthetics of the beautiful into the political realm, remarking that:

> the tradition of all the dead generations weighs like a nightmare on the brain of the living … in such periods of revolutionary crisis they anxiously conjure up the spirits of the past to their service and borrow from them names, battle-cries, and costumes in order to present the new scene of world history in this time-honored disguise and this borrowed language.

---

Through this merger of aesthetics and politics they find “the ideals and the art-forms, the self-deceptions that they needed in order to conceal from themselves the bourgeois limitations of the content of their struggles and to maintain their passion on the high plane of great historical tragedy.” The alternative is not the abandonment of the poetic for a narrowly practical and mundane realism, nor an acceptance of the capitalist divorce of work and things of the spirit, itself simply a hypertrophied development of the initial division of intellectual and manual labor. Marx’s concept of human activity involves an irreducibly aesthetic dimension. A new revolutionary aesthetic will free itself from the elegiac attachment to the past: “The social revolution of the nineteenth century cannot draw its poetry from the past, but only from the future …. [In earlier revolutions,] the words went beyond the content; here the content goes beyond the words.” The aesthetic of the coming revolution, formulated here in traditional terms of form and content, is sublime rather than beautiful; it acknowledges the unanticipatable character of the future; rather than imagining itself in terms of a beautiful past, it accepts the absolute novelty of futurity that lies beyond all present limits.29

III. SCHOPENHAUER AND NIETZSCHE: FROM PURE CONTEMPLATION TO THE PHYSIOLOGY OF AESTHETICS

Following the failure of the revolutionary activity of 1848, the time was ripe for Arthur Schopenhauer’s aesthetics of pure contemplation, which offered a redeeming transcendence of the will, and so of all practical and political activity.30 If circumstances did not allow the development of the active aesthetic human, it still seemed possible to cultivate one’s own aesthetic sensibility. Schopenhauer radicalized the Kantian aesthetic subject, and his valorization of music (not poetry, as in systems of the arts like Hegel’s) as the art giving the deepest insight into our subjectivity, coincided with the ongoing modern formation of taste in which music effectively serves as the ultimate test in distinguishing elite from common taste.31 While his major work, The World as Will and Idea, was first published in 1818, it was the expanded edition of 1844 that marked the

30. For a detailed discussion of Schopenhauer, see the essay by Bart Vandenabeele in The History of Continental Philosophy: Volume 1.

31. Cf. Pierre Bourdieu: “Music represents the most radical and absolute form of the negation of the world, and especially the social world, which the bourgeois ethos tends to demand of
beginning of Schopenhauer’s influence.\textsuperscript{32} For Schopenhauer, aesthetic contemplation involves a complete suspension of the will; the latter is the obscure, dark side of the world and of human life, and as long as we are in its power we are tossed restlessly on the sea of desire, unable to be content for more than a moment with any of our satisfactions. Only pure religious resignation and philosophical contemplation offer any similar relief from the suffering that is necessarily bound up with the domination of the will that rules most lives most of the time. Like Kant, Schopenhauer distinguishes aesthetic subjectivity from cognition and desire, but raises the stakes by his claim that we are desperately in need of escape from representation and desire:

\begin{quote}
[when consciousness] considers things without interest, without [individual] subjectivity, purely objectively ….. Then all at once the peace, always sought but always escaping us on that first path of willing, comes to us of its own accord and all is well with us … that moment we are delivered from the miserable pressure of the will. We celebrate the Sabbath of the penal servitude of willing; the wheel of Ixion stands still. 
\end{quote}

(WWI 1: 196)

The artist, too, must have been in a “calm, tranquil, will-free frame of mind,” something that is evident in an art form such as Dutch still life and landscape painting, where it is necessary to focus an impartial attention on the most ordinary and humble objects (WWI 1: 197). Arts other than music allow the viewer or reader to see the will objectified in the world; an attentive aesthetic contemplation will reveal the various gradations of the will or its “adequate embodiments,” not as particulars but as Platonic Ideas. So Schopenhauer (like the Hegelians) constructs an extensive hierarchical system of the arts, leading from architecture, which embodies elemental resistance to the force of gravity, to tragedy, in which we observe the will in conflict with itself. Even animal painting and animal sculpture (or the aesthetic contemplation of actual animals) allows us to know the “restlessness and impetuosity of the depicted will, It is that willing, which also constitutes our own inner nature, that here appears before us in forms and figures.” All of Schopenhauer’s aesthetics, then, rests on this tension between the pure contemplative state and the seething, indeterminate will that we are. The simplest explanation of what we discover in the aesthetic state is to be found in the Hindu watchword “That art thou” (WWI 1: 219–20).

\begin{footnotes}
\end{footnotes}
Schopenhauer’s theory of art and the aesthetic is structured by this duality between a fully luminous consciousness and the obscure and aimless will at the heart of reality. At the point where our consciousness is clearest and least obstructed, we are confronted with the chaotic will that we really are. This ultimate dualism is the last word of Schopenhauer’s aesthetics; the aesthetic subject can never become a whole. The opposition finds its highest tension and deepest resolution in music, which is “by no means like the other arts, namely a copy of the Ideas, but a copy of the will itself” (WWI 1: 257). Music is such a copy because it embodies the entire gamut of human feelings, not this or that particular “affliction, pain, sorrow, horror, gaiety, merriment or peace of mind,” but all of these emotions, or movements of the will as they are in themselves, independent, as is music, from any specific representation such as we find in plastic art or poetry (accordingly Schopenhauer dismisses program music as an inferior form [WWI 1: 261]).

In The Birth of Tragedy, Nietzsche offers an analysis of the aesthetic human (ästhetische Mensch), a concept he takes immediately from Schopenhauer and Wagner. Nietzsche had befriended the older Wagner, who by this time had adopted Schopenhauer’s thought (apparently confirming Nietzsche’s later judgment in On the Genealogy of Morality that artists are always the “valets” of religious or philosophical ideas). Nietzsche defines human art in terms of two natural art impulses, named theologically after Apollo and Dionysus. Yet these are natural forces, so the Apollonian can be considered initially as the dream-like and visionary dimension of life, and the Dionysian as its intoxicated, orgiastic, and ecstatic side. Nietzsche betrays a divergence from the early Wagner in replacing the latter’s projected alliance of Jesus and Apollo with the productive agon of the two Greek figures; so in describing Raphael’s Transfiguration in The Birth of Tragedy he refers to the painter’s Jesus only as the radiant Apollo (BT §4). This binary of aesthetic forces is analogous to Schopenhauer’s indeterminate, surging will and the principle of individuation. Nietzsche accepts Schopenhauer’s teaching that life is suffering (finding it already in archaic Greek poetry) but transvalues his idea of art: great art, like Greek tragedy, is one that affirms life in all its suffering, and involves a play between beautiful Apollonian phantasy (Schein) and Dionysian excess and undifferentiated multiplicity. Tragedy consists in staging various versions of the ritual in which there is a clash and creative agon between individual figures (heroes, actors) and the music and dance of the chorus. An artistic manifesto, as well as a rewriting of Schopenhauer (as the post-Hegelians rewrote Hegel), The Birth of Tragedy

expands Schopenhauer’s idea of music with Richard Wagner’s program of the Gesamtkunstwerk (the total work of art), and deploys it in a call for a renewed cultural nationalism that requires its own tragic myth, a myth that must be independent of morality in order to safeguard its place in the “purely aesthetic sphere” and which admits the ugly, the disharmonious, and the dissonant (BT §24).

In 1886, Nietzsche severely criticized this early statement for its Hegelian attempt to produce a grand aesthetic synthesis through opposed concepts, and its failure to find an appropriate voice for his thought, which was a confused medley of poetry and prose. He continued to affirm the necessity of a tragic worldview and The Birth of Tragedy’s general project of situating the question of science within that of art, and that of art within the question of life. Nietzsche’s later philosophy of art involves a scathingly direct attack on the Kantian–Schopenhauerian theory of disinterested contemplation (GM III: §6) and sketches a philosophy of life as the will to power. In this later perspective, the Greeks are no longer the privileged origin of art, but simply its finest practitioners as well as its finest enemies, as in Socrates’ replacing the multiplicity of perspectives staged by tragedy with the “one great Cyclops eye” of reason and science (BT §14). In another late work, Nietzsche says that what he learned from the Greeks was the eternal recurrence of life; so the questions of origin, teleology, and return that are basic to Hegelian aesthetics are folded into an antidualitical vitalism of difference.34 Art no longer has a privileged origin or goal, but in its sheer excess and affirmation it is now seen as the will to power articulating itself for itself. Nietzsche announced the project of a “physiological aesthetics.”35 Indications are that this was to be centered on the artist, and the receptive experience was to be understood as an analogous quickening of powers. The indispensable “physiological condition” of artistic creativity is Rausch (intoxication, frenzy, or excess); while Rausch had been specifically associated with the Dionysian in The Birth of Tragedy, Nietzsche says in Twilight of the Idols that the Apollonian too is a form of Rausch, being a frenzy of the eye. Music as we know it is “only the remnant of a much fuller world of expression of the aff ects, a mere residue of the Dionysian histrionicism.”36 While Nietzsche’s discussions of music and literature (to use the names of these reduced genres) are much more extensive than his writings on architecture, painting, and landscape design, he

was already concerned in *The Birth of Tragedy* with the diagram of forces that enables the perspectivism of the Greek theater, and in *Twilight of the Idols* he exempts architecture from the Apollonian–Dionysian duality, seeing it as an eloquence of power capable of “the grand style,” which is powerful enough to eschew being pleasing. There is then in Nietzsche the sketch of an aesthetics oriented as much to spatial construction as to musical composition. It is telling that when he cites Heraclitus to explain the Dionysian phenomenon, he chooses an unusual variant of one of his sayings, comparing the “world-forming power” to a primitive architectural activity, to “a playing child who sets down stones here, there, and the next place and who builds up piles of sand only to knock them down again” (BT §24).37

**IV. THE AESTHETIC HUMAN: NEW VERSIONS, ALTERNATIVES, AND QUESTIONS**

Alain Badiou takes Nietzsche to be the typical philosopher of the “age of the poets,” an era whose beginning and end can be designated by the names of Hölderlin and Heidegger.38 In this era philosophy not only takes the poem or artwork as its organon (a position already announced by Schelling) but sees philosophy itself as a form of poetry. Nietzsche confirms the designation when he says that the fundamental opposition is that between Plato and Homer (GM III: §25), or in writing what he took to be his most important work, *Thus Spoke Zarathustra*, as a poetic narrative that parodically plays with multiple genres. Nietzsche develops the idea that all language is poetic, as in the celebrated claim, in his unpublished essay “On Truth and Lies in a Non-moral Sense,” that “truth is a mobile army of metaphors and metonymies” or figures of speech. On this view there is no absolutely literal level of language that can serve as contrast term to the poetic; the philosopher who is true to this insight will have to become something of a poet in order not to perpetuate the illusion of a purely cognitive language. Yet to the extent that it is language that speaks us (adopting a

37. Editors typically cite this as fragment 52 in the Diels-Kranz numbering; however, the phrase comes from Plutarch (“On the E at Delphi,” in *Moralia* V, 393F) and is not there specifically attributed to Heraclitus. In context, a speaker in Plutarch’s dialogue cites lines from Homer (*Iliad* 15.360–64) to demonstrate the folly of speaking of Apollo, who is absolutely one, as changing or entering into human affairs, after accusing Heraclitus of similar theological blasphemies. So Nietzsche has both transformed condemnation into praise and adapted a spatial and architectural metaphor to the description of music, ordinarily taken to be a temporal art.

Heideggerian locution that Nietzsche anticipates) we might speak of an age of poetry rather than poets, a gloss that accords with Nietzsche’s treatment of the “I” or ego as a misleading metaphysical interpretation of grammar and helps to explain his importance for poststructuralist thinkers such as Foucault and Derrida. By suggesting the primacy of language, Nietzsche points the way toward a nonhumanist aesthetics, one in which the primary concepts are rhetorical and textual, rather than psychological. Language or corresponding sets of conventions, styles, and diagrammatic procedures could be seen as replacing the individual creative genius; the reception of art was then described not as the quickening of the deep subject (Kant), the assumption of a purely contemplative consciousness (Schopenhauer), or the virtual model of the freely productive human (Marx), but in terms of activities such as reading and interpreting. At the same time that Nietzsche was opening up such possibilities with his philosophy of language, Charles Sanders Peirce was developing a general theory of signs (growing in part out of his own Hegelian and Schellingian criticisms of Cartesian intuitionism), which had analogous consequences in a variety of semiotic approaches to the arts in the next century.

Two important texts from around 1900, Benedetto Croce’s *Aesthetic* (1902) and Freud’s *The Interpretation of Dreams* (1899/1900), are marked by the contrast between the continuing quest to define the aesthetic human on the one hand, and the articulation of alternative, more linguistically oriented approaches to art and the aesthetic on the other. Croce’s full title explains that he considers aesthetics “as science of expression and general linguistics.” As expression, the artwork is to be seen as the unique completion of a process of intuition; it is an ideal fact, not to be confused with a physical artifact or text. In contrast to all attempts in the Aristotelian and rhetorical traditions to formulate the rules and principles by which artworks are formed, Croce argued for an absolute distinction between the expressive-intuitive work of art, whose result can never be anticipated, and the product of craft, which presupposes a prior intention.

*40. For Peirce’s semiotics see *Collected Papers of Charles Sanders Peirce*, Charles Hartshorne and Paul Weiss (eds) (Cambridge, MA: Harvard University Press, 1931–58), vol. II, paras 219–444; the editors thoughtfully entitle this selection “Speculative Grammar,” calling attention to Peirce’s medieval sources for thinking about language and categories; some of Heidegger’s early thinking on these topics emerges from his study of Duns Scotus, one of Peirce’s sources. [*] For a detailed discussion of Peirce, see Douglas Anderson’s essay in this volume.

*41. For a discussion of Croce’s place in Italian philosophy in the twentieth century, see the essay by Silvia Benso and Brian Schroeder in *The History of Continental Philosophy: Volume 7.*

and rules of technique. The artist is not a maker but a creator; poësis excludes technē. Linguistics is to be freed from grammar because “language is perpetual creation.” The upshot is a valorization of what “new critics” in the anglophone world came to call “the poem itself,” a self-sufficient totality or organic unity in which form and content are ultimately indistinguishable, and these very categories may be abandoned because they are embedded in the inappropriate model of craft or technē.

If Croce reduces linguistics to poetics, Freud’s work points in a very different direction. The Interpretation of Dreams seems to echo Schopenhauer, portraying human life as dominated by unconscious desires (which are disclosed by artists, as in Sophocles’ and Shakespeare’s depiction of the Oedipus complex); it also agrees with Nietzsche in seeing the dream as a prototype of artistic production. Freud articulates a poetics for interpreting the dream that recalls the rhetorical tradition that Croce seeks to demolish. Looking at the dream on the analogy of a hieroglyphic text, Freud identifies elementary procedures of its composition: condensation, displacement, scenic representation, and secondary revision. This is, of course, an unconscious rhetoric, but one that can be reconstructed by the analyst in interpreting and decoding the dream. In Freud’s later essays on literature and the visual arts, these principles are put to critical work, while he nevertheless retains more traditional concepts, confessing that psychoanalysis still cannot unravel the secret of genius, which distinguishes great art from mundane production.

V. THE QUESTION OF THE CANON: NATURAL BEAUTY AND LANDSCAPE GARDENING

In What is Art? Leo Tolstoy offers a version of expressionist aesthetics, but one that dispenses with the concept of genius, or reassigns it to the collective spirit of the people. Authentic expression must be sincere and communal, the expression of religious feelings of a universal humanity, the expression of common feeling that is universally intelligible. While this leads to Tolstoy’s repudiation of all high art (including Shakespeare and his own famous novels), his celebration of folk art coincides in some respects with the programs of Wagner, early Nietzsche, and others who see art in terms of the need to recapture an authentic origin that has been obscured by what they see as modernity’s compartmentalization of aesthetics. Like Dilthey and Croce, Tolstoy supports this position with

43. Croce, Aesthetic, 150.
44. Freud’s work and its influence on subsequent philosophy are discussed in detail in the essay by Adrian Johnston in The History of Continental Philosophy: Volume 3.
a critical history of aesthetics, which he sees as the rationalization of elite tastes that resolve themselves into markers of social distinction. Aesthetics turns out to be nothing but an ideological dodge for justifying class superiority. However crude Tolstoy’s judgments of high art and folk art may be, his manifesto highlights an otherwise unthought presupposition of the history of aesthetics from its mid-eighteenth-century beginnings to his own time, that is, the question of the canon. He argues that there is a circular and unexamined relationship between the art valued by cultured taste and the principles of aesthetics that aim to explain and justify the production and appreciation of such art:

[T]his science of aesthetics consists in first acknowledging a certain set of productions to be art (because they please us), and then framing such a theory of art that all those productions which please a certain circle of people should fit into it.45

… what is considered the definition of art is no definition at all but only a shuffle to justify existing art.46

Later writers such as Mikhail Bakhtin and Pierre Bourdieu47 argue in similar fashion for a more explicitly social conception of taste and the artistic canon; Bourdieu in effect reformulates Tolstoy by declaring that “taste is an acquired disposition to ‘differentiate’ and ‘appreciate’ … It functions as a sort of social orientation, a ‘sense of one’s place.’”48

The nineteenth century was marked by a number of disputes about the canon. Wagner, at first an outrageous rebel, became a touchstone for poets as well as musicians. The impressionists and postimpressionists, initially excluded from the salons, overshadowed the academicians who had ridiculed them. Nevertheless, as Tolstoy would point out, such disagreements still took place within certain implicit boundaries and were resolved within relatively cohesive social groups (indeed, it was the Emperor Louis-Napoleon who sponsored the Salon des refusés that allowed Manet to exhibit his scandalous Le Déjeuner sur l’herbe in 1863 when it was refused by the official Salon). More telling is the way in which some forms of art disappear from the canon or reappear unexpectedly. For example, the eighteenth-century formation of modern aesthetics coincided with a taste that accorded a high place among the arts to landscape

design, but European taste after Hegel meant, as a recent historian of the art has noted, that “garden encyclopedias replaced treatises in aesthetics.”49 While Kant, following a number of British critics, sees landscape gardening as a major art (a form of painting), Hegel represents a drastic change in taste that was typical of the culture by 1830 when he dismisses parks and gardens as trivial accompaniments to architecture. The disappearance of gardens from the canon also coincided with a decided turn away from a concern with natural beauty (and its affines, the sublime and the picturesque). Ten years after writing his massive, systematic Aesthetics, Vischer issued a self-criticism in which he declared that his entire long treatment of natural beauty was a fundamental mistake, and that his “agreeable excursion through the domain of natural beauty” was fundamentally flawed because he had not begun by making the crucial point that beauty is a subjective production, a thesis that he came to only in the third moment of his original system.50 Schopenhauer and Nietzsche are striking exceptions to the general neglect or exclusion of both the aesthetics of nature and various forms of landscape and land art. Schopenhauer compares the poet to the hydraulic engineer who creates displays of water in fountains and cascades; both present Platonic Ideas by exploring the extremes and not just the ordinary conditions of what they depict (WWI 1: 152). Nietzsche’s philosophical-poetic Thus Spoke Zarathustra is, among other things, a landscape poem that follows its protagonist through complex geographical and climatic variations. When he wakes from confronting his most abysmal thought, Zarathustra’s animals tell him what he must believe as the teacher of eternal recurrence, but the only part he accepts of what they say is that “the world awaits you like a garden.” In Beyond Good and Evil, Nietzsche devotes a chapter to “Peoples and Fatherlands,” which is in effect a geoaesthetics in which national cultures and their representative arts, specifically music, are situated with respect to human and natural geography; for example, Wagner’s music and Hegel’s philosophy are both said to be foggy and nebulous, echoing the German climate. North and south (and similar concepts) become aesthetic categories in this hint of a “physiological aesthetics” that could remind us of Marx’s concept of the earth as “the human’s inorganic body” and that looks forward to Heidegger’s investigations of place in Greek and German poetry and Deleuze and Guattari’s discussion of music as a way of occupying space.51

VI. CONCLUSION: TENDENCIES AND DIRECTIONS

In the wake of Hegel’s monumental and systematic aesthetics, later philosophers and critics were left with the task of either revising his system within the framework he established or striking out along new paths. In a revisionary mode the primacy of beauty was challenged within the Hegelian school by new analyses of the sublime, the ironic, and the comic that were still indebted to the dialectical approach and the idea of history as a meaningful development of spirit. More radical departures took the form of reversing Hegel’s notion of the transformation of art into the science of art by exploiting the supposed irreducible and ironic discrepancy of the internal and the external (Kierkegaard), or rethinking art as the engine of a new cultural revolution (Wagner, Marx, the younger Nietzsche). These radicalized forms of aesthetics could be seen as the intensification of what Hegel called “moments” of the Absolute: irony and the unhappy consciousness in the case of Kierkegaard, or (impossible) reversions to an art-oriented society of the sort Hegel saw in ancient Greece, as with the cultural revolutionaries. Both tendencies continued to be effective in the twentieth century. The arts saw a variety of minimalist projects that seemed to question the fullness and harmony of the beautiful (e.g. the painters Malevich, Mondrian, and Reinhardt), while surrealism encouraged a transformation of daily life and, not coincidentally, frequently acknowledged its debt to Hegel (this tendency is represented in continental philosophy by Georges Bataille and Jacques Lacan, who linked the Freudian unconscious to the Hegelian dialectic\(^\text{52}\)).

While even Baumgarten had already spoken of semiotics as one of the main dimensions of aesthetics, it was left to the structuralist and poststructuralist thinkers of the twentieth century to work out the implications of aesthetics’s “linguistic turn.” Roland Barthes, Jacques Derrida, and Julia Kristeva were inspired by Nietzsche’s and Freud’s meditations on language as well as by Saussure’s. The contest between hermeneutics and semiotics tended to refashion the contrast between philosophies of the self-knowing aesthetic subject (as in Hegel) and notions of language as an autonomous system. The questions that thinkers such as Tolstoy had begun to raise about the social and economic presuppositions of the idealist aesthetics that dominated the nineteenth century were sharpened and intensified with different emphases by, for example, the social theorist Bourdieu and philosophers such as Derrida (e.g. (Amherst, NY: Humanity Press, 2000). For Gilles Deleuze and Félix Guattari’s discussion of music as a form of territorialization, see “The Refrain,” in A Thousand Plateaus, Brian Massumi (trans.) (Minneapolis, MN: University of Minnesota Press, 1987).

\(^{52}\) For further discussion of Bataille and Lacan, see the essays by Peter Tracy Connor and Ed Pluth in The History of Continental Philosophy: Volume 5.
in “Economimesis”). Such inquiries led to increased questioning of the canon of high or great art that thinkers as different as Hegel and Nietzsche had taken for granted, so that by the second half of the twentieth century writers such as Barthes, Umberto Eco, and Jean Baudrillard were deploying their analytic energies in explicating such putative artistic sites and genres as television wrestling and Disneyland rather than Sophoclean tragedy or Italian Renaissance painting.

*Chronology* 381

*Bibliography* 401

*Index* 425
“Continental philosophy” is itself a contested concept. For some, it is understood to be any philosophy after 1780 originating on the European continent (Germany, France, Italy, etc.). Such an understanding would make Georg von Wright or Rudolf Carnap – respectively, a Finnish-born philosopher of language and a German-born logician who taught for many years in the US – a “continental philosopher,” an interpretation neither they nor their followers would easily accept. For others, “continental philosophy” refers to a style of philosophizing, one more attentive to the world of experience and less focused on a rigorous analysis of concepts or linguistic usage. In this and the accompanying seven volumes in this series, “continental philosophy” will be understood historically as a tradition that has its roots in several different ways of approaching and responding to Immanuel Kant’s critical philosophy, a tradition that takes its definitive form at the beginning of the twentieth century as the phenomenological tradition, with its modern roots in the work of Edmund Husserl. As such, continental philosophy emerges as a tradition distinct from the tradition that has identified itself as “analytic” or “Anglo-American,” and that locates its own origins in the logical analyses and philosophy of language of Gottlob Frege. Whether or not there is in fact a sharp divergence between the work of Husserl and Frege is itself a contested question, but what cannot be contested is that two distinct historical traditions emerged early in the twentieth century from these traditions’ respective interpretations of Husserl (and Heidegger) and Frege (and Russell). The aim of this history of continental philosophy is to trace the developments in one of these traditions from its roots in Kant and his contemporaries through to its most recent manifestations. Together, these volumes present a coherent and comprehensive account of the continental philosophical tradition.
that offers readers a unique resource for understanding this tradition's complex and interconnected history.

Because history does not unfold in a perfectly linear fashion, telling the history of continental philosophy cannot simply take the form of a chronologically organized series of “great thinker” essays. And because continental philosophy has not developed in a vacuum, telling its history must attend to the impact of figures and developments outside philosophy (in the sciences, social sciences, mathematics, art, politics, and culture more generally) as well as to the work of some philosophers not usually associated with continental philosophy. Such a series also must attend to significant philosophical movements and schools of thought and to the extended influence of certain philosophers within this history, either because their careers spanned a period during which they engaged with a range of different theorists and theoretical positions or because their work has been appropriated and reinterpreted by subsequent thinkers. For these reasons, the volumes have been organized with an eye toward chronological development but, in so far as the years covered in each volume overlap those covered in the subsequent volume, they have been organized as well with the aim of coordinating certain philosophical developments that intersect in a fashion that is not always strictly chronological.

Volume 1 begins with the origins of continental philosophy in Kant and the earliest responses to his critical philosophy, and presents an overview of German idealism, the major movement in philosophy from the late eighteenth to the middle of the nineteenth century. In addition to Kant, the period covered in the first volume was dominated by Fichte, Schelling, and Hegel, and together their work influenced not just philosophy, but also art, theology, and politics. This volume thus covers Kant’s younger contemporary Herder, and his readers Schiller and Schlegel – who shaped much of the subsequent reception of Kant in art, literature, and aesthetics; the “Young Hegelians” – including Bruno Bauer, Ludwig Feuerbach, and David Friedrich Strauss – whose writings would influence Engels and Marx; and the tradition of French utopian thinking in such figures as Saint-Simon, Fourier, and Proudhon. In addition to Kant’s early critics – Jacobi, Reinhold, and Maimon – significant attention is also paid to the later critic of German idealism Arthur Schopenhauer, whose appropriation and criticism of theories of cognition later had a decisive influence on Friedrich Nietzsche.

Volume 2 addresses the second half of the nineteenth century, in part as a response to the dominance of Hegelian philosophy. These years saw revolutionary developments in both European politics and philosophy, and five great critics dominated the European intellectual scene: Feuerbach, Marx, Søren Kierkegaard, Fyodor Dostoevsky, and Nietzsche. Responding in various ways to Hegelian philosophy and to the shifting political landscape of Europe and...
the United States, these thinkers brought to philosophy two guiding orientations – materialism and existentialism – that introduced themes that would continue to play out throughout the twentieth century. The second half of the nineteenth century also saw the emergence of new schools of thought and new disciplinary thinking, including the birth of sociology and the social sciences, the development of French spiritualism, the beginning of American pragmatism, radical developments in science and mathematics, and the development of hermeneutics beyond the domains of theology and philology into an approach to understanding all varieties of human endeavor.

Volume 3 covers the period between the 1890s and 1930s, a period that witnessed revolutions in the arts, science, and society that set the agenda for the twentieth century. In philosophy, these years saw the beginnings of what would grow into two distinct approaches to doing philosophy: analytic and continental. It also saw the emergence of phenomenology as a new rigorous science, the birth of Freudian psychoanalysis, and the maturing of the discipline of sociology. Volume 3 thus examines the most influential work of a remarkable series of thinkers who reviewed, evaluated, and transformed nineteenth-century thought, among them Henri Bergson, Émile Durkheim, Sigmund Freud, Martin Heidegger, Edmund Husserl, Karl Jaspers, Max Scheler, and Ludwig Wittgenstein. It also initiated an approach to philosophizing that saw philosophy move from the lecture hall or the private study into an active engagement with the world, an approach that would continue to mark continental philosophy's subsequent history.

The developments and responses to phenomenology after Husserl are the focus of the essays in Volume 4. An ambiguity inherent in phenomenology – between conscious experience and structural conditions – lent itself to a range of interpretations. While some existentialists focused on applying phenomenology to the concrete data of human experience, others developed phenomenology as conscious experience in order to analyze ethics and religion. Still other phenomenologists developed notions of structural conditions to explore questions of science, mathematics, and conceptualization. Volume 4 covers all the major innovators in phenomenology – notably Sartre, Merleau-Ponty, and the later Heidegger – as well as its extension into religion, ethics, aesthetics, hermeneutics, and science.

Volume 5 concentrates on philosophical developments in political theory and the social sciences between 1920 and 1968, as European thinkers responded to the difficult and world-transforming events of the time. While some of the significant figures and movements of this period drew on phenomenology, many went back further into the continental tradition, looking to Kant or Hegel, Marx or Nietzsche, for philosophical inspiration. Key figures and movements discussed in this volume include Adorno, Horkheimer, and the Frankfurt School,
Schmitt, Marcuse, Benjamin, Arendt, Bataille, black existentialism, French Marxism, Saussure, and structuralism. These individuals and schools of thought responded to the “crisis of modernity” in different ways, but largely focused on what they perceived to be liberal democracy’s betrayal of its own rationalist ideals of freedom, equality, and fraternity. One other point about the period covered in this volume is worthy of note: it is during these years that we see the initial spread of continental philosophy beyond the European continent. This happens largely because of the emigration of European Jewish intellectuals to the US and UK in the 1930s and 1940s, be it the temporary emigration of figures such as Adorno, Horkheimer, Lévi-Strauss, and Jakobson or the permanent emigration of Marcuse, Arendt, and Gurwitsch. As the succeeding volumes will attest, this becomes a central feature of continental philosophy’s subsequent history.

Volume 6 examines the major figures associated with poststructuralism and the second generation of critical theory, the two dominant movements that emerged in the 1960s, which together brought continental philosophy to the forefront of scholarship in a variety of humanities and social science disciplines and set the agenda for philosophical thought on the continent and elsewhere from the 1960s to the present. In addition to essays that discuss the work of such influential thinkers as Althusser, Foucault, Deleuze, Derrida, Lyotard, Irigaray, Habermas, Serres, Bourdieu, and Rorty, Volume 6 also includes thematic essays on issues including the Nietzschean legacy, the linguistic turn in continental thinking, the phenomenological inheritance of Gadamer and Ricoeur, the influence of psychoanalysis, the emergence of feminist thought and a philosophy of sexual difference, and the importation of continental philosophy into literary theory.

Before turning to Volume 7, a few words on the institutional history of continental philosophy in the United States are in order, in part because the developments addressed in Volumes 6–8 cannot be fully appreciated without recognizing some of the events that conditioned their North American and anglophone reception. As has been mentioned, phenomenologists such as Alfred Schutz and Aron Gurwitsch, and other European continental philosophers such as Herbert Marcuse and Hannah Arendt, began relocating to the United States in the 1930s and 1940s. Many of these philosophers began their work in the United States at the University in Exile, established in 1933 as a graduate division of the New School for Social Research for displaced European intellectuals. While some continental philosophy was taught elsewhere around the United States (at Harvard University, Yale University, the University at Buffalo, and elsewhere), and while the journal Philosophy and Phenomenological Research began publishing in 1939, continental philosophy first truly began to become an institutional presence in the United States in the 1960s. In 1961, John Wild (1902–72) left Harvard to become Chair of the Department of Philosophy at Northwestern University. With a commitment from the provost of the university
and the Northwestern University Press to enable him to launch the Northwestern Series in Phenomenology and Existential Philosophy, Wild joined William Earle and James Edie, thus making Northwestern a center for the study of continental philosophy. Wild set up an organizational committee including himself, Earle, Edie, George Schrader of Yale, and Calvin Schrag (a former student of Wild’s at Harvard, who was teaching at Northwestern and had recently accepted an appointment at Purdue University), to establish a professional society devoted to the examination of recent continental philosophy. That organization, the Society for Phenomenology and Existential Philosophy (SPEP), held its first meeting at Northwestern in 1962, with Wild and Gurwitsch as the dominant figures arguing for an existential phenomenology or a more strictly Husserlian phenomenology, respectively. Others attending the small meeting included Erwin Straus, as well as Northwestern graduate students Edward Casey and Robert Scharff, and today SPEP has grown into the second largest society of philosophers in the United States. Since those early days, many smaller societies (Heidegger Circle, Husserl Circle, Nietzsche Society, etc.) have formed and many journals and graduate programs devoted to continental philosophy have appeared. In addition, many of the important continental philosophers who first became known in the 1960s – including Gadamer, Ricoeur, Foucault, Derrida, Lyotard, and Habermas – came to hold continuing appointments at major American universities (although, it must be mentioned, not always housed in departments of philosophy) and, since the 1960s, much of the transmission of continental philosophy has come directly through teaching as well as through publications.

The transatlantic migration of continental philosophy plays a central role in Volume 7, which looks at developments in continental philosophy between 1980 and 1995, a time of great upheaval and profound social change that saw the fruits of the continental works of the 1960s beginning to shift the center of gravity of continental philosophizing from the European continent to the anglophone philosophical world and, in particular, to North America. During these years, the pace of translation into English of French and German philosophical works from the early twentieth century as well as the very recent past increased tremendously, and it was not uncommon to find essays or lectures from significant European philosophers appearing first in English and then subsequently being published in French or German. In addition, the period covered in this volume also saw the spread of continental philosophy beyond the confines of philosophy departments, as students and faculty in centers of humanities and departments of comparative literature, communication studies, rhetoric, and other interdisciplinary fields increasingly drew on the work of recent continental philosophers. Volume 7 ranges across several developments during these years – the birth of postmodernism, the differing philosophical traditions of France, Germany, and Italy, the third generation of critical theory, and the so-called
“ethical turn” – while also examining the extension of philosophy into questions of radical democracy, postcolonial theory, feminism, religion, and the rise of performativity and post-analytic philosophy. Fueled by an intense ethical and political desire to reflect changing social and political conditions, the philosophical work of this period reveals how continental thinkers responded to the changing world and to the key issues of the time, notably globalization, technology, and ethnicity.

The eighth and final volume in this series attempts to chart the most recent trends in continental philosophy, which has now developed into an approach to thinking that is present throughout the world and engaged with classical philosophical problems as well as current concerns. The essays in this volume focus more on thematic developments than individual figures as they explore how contemporary philosophers are drawing on the resources of the traditions surveyed in the preceding seven volumes to address issues relating to gender, race, politics, art, the environment, science, citizenship, and globalization. While by no means claiming to have the last word, this volume makes clear the dynamic and engaged quality of continental philosophy as it confronts some of the most pressing issues of the contemporary world.

As a designation, “continental philosophy” can be traced back at least as far as John Stuart Mill’s On Bentham and Coleridge (1840), where he uses it to distinguish the British empiricism of Bentham from a tradition on the continent in which he sees the influence of Kant. Since that time, and especially since the early twentieth century, the term has been used to designate philosophies from a particular geographical region, or with a particular style (poetic or dialectical, rather than logical or scientistic). For some, it has been appropriated as an honorific, while for others it has been used more pejoratively or dismissively. Rather than enter into these polemics, what the volumes in this series have sought to do is make clear that one way to understand “continental philosophy” is as an approach to philosophy that is deeply engaged in reflecting on its own history, and that, as a consequence, it is important to understand the history of continental philosophy.

While each of the volumes in this series was organized by its respective editor as a volume that could stand alone, the eight volumes have been coordinated in order to highlight various points of contact, influence, or debate across the historical period that they collectively survey. To facilitate these connections across the eight volumes, cross-referencing footnotes have been added to many of the essays by the General Editor. To distinguish these footnotes from those of the authors, they are indicated by an asterisk (*).

Alan D. Schrift, General Editor

Babette Babich is Professor of Philosophy at Fordham University. She is the author of Nietzsche’s Philosophy of Science: Reflecting Science on the Ground of Art and Life (1994), Words in Blood, Like Flowers: Philosophy and Poetry, Music and Eros in Hölderlin, Nietzsche, Heidegger (2006), and “Eines Gottes Glück, voller Macht und Liebe”: Beiträge zu Nietzsche, Hölderlin, Heidegger (2009), in addition to being contributing editor of several books, among them From Phenomenology to Thought, Errancy, and Desire (1996), Hermeneutic Philosophy of Science, Van Gogh’s Eyes, and God (2002), and Habermas, Nietzsche, and Critical Theory (2003). In addition to serving as founding and executive editor of New Nietzsche Studies (since 1996), she has published over a hundred essays in English and other languages and is a three-time Fulbright scholar.

Miguel de Beistegui is Professor of Philosophy at the University of Warwick. His areas of research include: the ontology of difference, the aesthetics of metaphor, and the ethics and politics of desire. His latest books include Truth and Genesis: Philosophy as Differential Ontology (2004), The New Heidegger (2005), Jouissance de Proust: Pour une esthétique de la métaphore (2007), and Immanence and Philosophy: Deleuze (2010).
Contributors

Fabien Capeillères teaches philosophy at the University of Caen, France. A specialist of the neo-Kantian tradition, he is Directeur du Centre d’Études Critiques and general editor for Ernst Cassirer’s complete works in French. He is currently writing a History of Philosophical Scientificty. The first volume, Kant Philosophé Newtonien, was published in 2004; The First Crisis of French Philosophy: Science, Religion and Metaphysics 1850–1920 is forthcoming.

John Fennell is Associate Professor of Philosophy at Grinnell College. His work, which focuses principally on naturalist and antinaturalist approaches to meaning and mind, has appeared in European Journal of Philosophy and International Journal of Philosophical Studies.

Mike Gane was a founder member of the Department of Social Sciences at Loughborough University in 1972, where he is now Emeritus Professor of Sociology. His main interest has been in the relation between science, philosophy, and the social sciences, particularly in the French tradition. He has published On Durkheim’s Rules of Sociological Method (1988), French Social Theory (2003), and Auguste Comte (2006). He has also published edited collections: Towards
a Critique of Foucault (1986), Foucault’s New Domains (with T. Johnson; 1993), and The Radical Sociology of Durkheim and Mauss (1992). He has also published widely on the work of Jean Baudrillard and is a member of the editorial board of Durkheimian Studies (Berghahn).

Adrian Johnston is an Assistant Professor in the Department of Philosophy at the University of New Mexico at Albuquerque and an assistant teaching analyst at the Emory Psychoanalytic Institute in Atlanta. He is the author of Time Driven: Metapsychology and the Splitting of the Drive (2005), Žižek’s Ontology: A Transcendental Materialist Theory of Subjectivity (2008), and Badiou, Žižek, and Political Transformations: The Cadence of Change (2009). With Catherine Malabou, he is presently coauthoring a book on affects reconsidered at the intersection of psychoanalysis, neuroscience, and philosophy (tentatively entitled Auto-affection and Emotional Life: Psychoanalysis and Neurobiology). And he is currently working on a project addressing forms of materialism ranging from historical and dialectical materialisms to such recent developments as speculative realism (tentatively entitled A Weak Nature Alone: Prolegomena to Any Future Materialism).

Sebastian Luft is Associate Professor of Philosophy at Marquette University. He has studied philosophy, classics, and German studies at the Universities of Freiburg, Heidelberg, SUNY Stony Brook, and Wuppertal, and was editorial assistant at the Husserl Archives in Louvain from 1998 to 2002. He is the author of “Phänomenologie der Phänomenologie”: Systematik und Methodologie der Phänomenologie in der Auseinandersetzung zwischen Husserl und Fink, and editor of Husserliana vol. 34, Zur phänomenologischen Reduktion: Texte aus dem Nachlass (1926–1935), coeditor of Neo-Kantianism in Contemporary Philosophy (with Rudolf A. Makkreel; 2010) and The Neo-Kantian Reader (with Dermot Moran; 2010), and is working with Thane M. Naberhaus on a translation of Edmund Husserl’s lecture course Erste Philosophie.

Paul-Antoine Miquel is Maître de Conférences in the Department of Philosophy at the University of Nice, and a member of the Centre d’Epistémologie et de Recherches Comparatives at the University of Provence. His publications include Comment penser le désordre? (2000), Bio-logiques du vieillissement (with Ladislas Robert, 2004), Qu’ est-ce que la vie? (2007), Bergson ou l’imagination métaphysique (2007), and Biologie du XXIème siècle, évolution des concepts fondateurs (2008).

Thomas Nenon is Professor of Philosophy at the University of Memphis. He is the author of *Objectivität und endlich Erkenntnis* (1986), coeditor of vol. 25 (*Aufsätze und Vorträge 1911–21*) and vol. 27 (*Aufsätze und Vorträge 1922–37*) of the *Husserliana*, and author of a number of articles on Husserl, Heidegger, Kant and German idealism, hermeneutics, and the philosophy of the social sciences. He has served as review editor for *Husserl Studies*, President of the Center for Advanced Research in Phenomenology, and as Director of the Center for the Humanities at the University of Memphis. His current research interests include Husserl's theories of personhood and subjectivity, Husserl's ethical theory, and Kant and Hegel's practical philosophy.

Diane Perpich is Associate Professor of Philosophy at Clemson University. She is the author of *The Ethics of Emmanuel Levinas* (2008) and is currently working on a project considering the contributions of the phenomenological tradition to social ontologies.

Bob Plant has been Lecturer in Philosophy at the University of Aberdeen since 2005. He has published articles on Wittgenstein, Levinas, Derrida, Foucault, and Thomas Reid, and is the author of *Wittgenstein and Levinas: Ethical and Religious Thought* (2005).

Alan D. Schrift is the F. Wendell Miller Professor of Philosophy at Grinnell College. In addition to his many published articles or book chapters on Nietzsche and French and German twentieth-century philosophy, he is the author of *Nietzsche and the Question of Interpretation: Between Hermeneutics and Deconstruction* (1990), *Nietzsche’s French Legacy: A Genealogy of Poststructuralism* (1995), and *Twentieth-Century French Philosophy: Key Themes and Thinkers* (2005). He has edited five collections on a variety of topics, including *The Logic of the Gift: Toward an Ethic of Generosity* (1997) and *Modernity and the Problem of Evil* (2005). In addition to serving as general editor of the eight-volume *The History of Continental Philosophy*, he serves as general editor of *The Complete Works of Friedrich Nietzsche*, the Stanford University Press translation of Nietzsche's *Kritische Studienausgabe*.

Michael Vaughan is currently at the University of Warwick, completing a PhD thesis entitled *Creative Revolution: Bergson’s Social Thought*. He is coeditor of the
centennial edition of Bergson’s *Creative Evolution* (with Keith Ansell-Pearson and Michael Kolkman) and of a special issue of *SubStance* entitled “*Creative Evolution* one hundred years later” (with Michael Kolkman).

**Dan Zahavi** is Professor of Philosophy and Director of the Danish National Research Foundation’s Center for Subjectivity Research at the University of Copenhagen. He has served as president of the Nordic Society for Phenomenology in the years 2001–7, and is currently coeditor in chief of the journal *Phenomenology and the Cognitive Sciences*. In his systematic work, Zahavi has mainly been investigating the nature of selfhood, self-consciousness, and intersubjectivity. His most important publications include *Husserl und die transzendentale Intersubjektivität* (1996), *Self-awareness and Alterity* (1999), *Husserl’s Phenomenology* (2003), *Subjectivity and Selfhood* (2005), and *The Phenomenological Mind* (with Shaun Gallagher; 2008).
Volume 3
“The twentieth century began by insisting on its secession from the past.” So writes Peter Conrad in his magisterial treatment of life and art in the twentieth century. Between the 1890s and 1930s, a period that witnessed an acceleration of time and the dispersal of places, revolutions in the arts and society set the agenda for the rest of the century. In philosophy, too, it is a period in which we witness the birth and development of new programs and new modes of inquiry, including the phenomenon of “Bergsonism,” the emergence of phenomenology as a new rigorous science, the birth of Freudian psychoanalysis, and the coming into maturity of sociology. As Michael Friedman and Thomas Ryckman note in their essay in this volume, all four of the major protagonists in both the analytic and continental traditions – Gottlob Frege and Rudolf Carnap, Edmund Husserl and Martin Heidegger – saw themselves as making revolutionary breaks with the philosophy of the past through the invention of new types of philosophical tools (Bertrand Russell is another relevant figure). In the period 1890–1930 we witness a remarkable series of thinkers, many of whom are covered in this volume, who review, evaluate, and transform into new directions the mixed results of nineteenth-century thought, and include Henri Bergson, Émile Durkheim, Sigmund Freud, Heidegger, Husserl, Karl Jaspers, Max Scheler, Georg Simmel, Max Weber, and Ludwig Wittgenstein. The results, according to one commentator, included wrestling with an ambivalent legacy, on the one hand, a dominant optimism based on the expansion of industrialization and democratisation, and on the other hand, a subordinate pessimism centered on the

corrosive effects of the rationalism that presided over the tremendous processes of social change: “the turn-of-the century generation puts the brakes on intellectual progressivism, but fought not to give up on life, though the myth of rationalism, in both its materialist and spiritualist forms, had been shattered.” In short, a generation of thinkers completed the disenchantment of the world and sought a new re-enchantment, so continuing in key respects the task Nietzsche, whose philosophical work had ceased in 1889 with his mental collapse, had set philosophy in the 1880s: “there are so many dawns that have not yet broken.”

The period that this volume covers can fairly be identified as the period that witnesses the second scientific revolution, with our own era, with the rise of electronics, digitalization, genetic engineering, nanotechnology, and so on, being the third. In this period, a number of important discoveries take place, including the X-ray, radioactivity, and the electron, and out of this experimental research emerge atomic physics, the laws of relativity, and quantum theory. Writing in the 1890s, the French poet and critic Paul Valéry described the period as one “completely formed by the sciences, in perpetual technological transformation, where nothing escapes the will to innovation.” In its initial phases it is a period of technological progress and even utopianism, with the emergence of the motor car, the extension of travel by trains, bicycles, and tramcars, with countries now linked up by an international mail system and new modes of communication such as the telephone, and, finally, the rise of cinematography and the presentation of moving images. Valéry wrote of the “dizzying transformations of modern life,” noting that the world had never before undergone such a rapid and profound transformation: “our ideas and our powers over matter, time, and space, conceived of and utilized completely differently than they were up to our time.” It has become impossible, he noted, to make a comparison between the way things were fifty years ago and how they are now in the time he is reflecting on. Values have been negated and ideas have been dissociated.

By the 1930s the tone of “energetic fascination” with which Valéry described the world has gone, being replaced by a mood of ambivalence and anxiety. Europe is undergoing a crisis both economically and intellectually. Between the 1890s and 1930s, several important political events have taken place and left an impact – the Dreyfus Affair in the mid-1890s, the Great War, and the rise of fascism among them – and the decade of the 1930s witnesses the coming into

5. Ibid., 115.
power of Hitler’s National Socialist Party. As Guerlac also notes, for the poet, the intellectual crisis centered on a crisis of the sciences with our idea of the universe decomposing, “losing all hope of a single image” and giving rise to a culture of disorder and chaos.

Valéry’s mood finds sustained philosophical expression in Husserl’s reflections on “the Crisis of the European Sciences” in the mid-1930s. For Husserl, the problem is centered on the positivistic concept of science that “decapitates philosophy.” He takes positivism to entail the reduction of the idea of science to mere factual science, giving rise to a crisis of science as the loss of its meaning for life: “Can we live in this world, where all historical occurrence is nothing but an unending concatenation of illusory progress and bitter disappointment?” In the midst of the unreason sweeping over Europe in the 1930s he sought – vainly, some would say – to restore belief in the ideal of a universal philosophy in which humanity radically renews itself through the new philosophy. He speaks of “the new man,” echoing Nietzsche’s exhortation that the Übermensch is to be the meaning of the future of the new earth that comes into being in the wake of the death of God. What guides this new human is the faith he has in securing a rational meaning for his individual and common existence; if this faith is being lost – which is Husserl’s chief concern in the book – then this will entail a loss of faith in man’s “own true being.” Husserl insists that this “true being” is not a possession the human has, like the self-evidence of the “I am,” but, and again echoing Nietzsche, a task: “True being is everywhere an ideal goal, a task of epistêmê or ‘reason.’” The task centers on the possibility of “universal knowledge.” For Husserl, the true struggles of the time are spiritual ones between philosophies (skeptical and vital ones) and between a humanity that has collapsed and one struggling to find new roots. Husserl’s perspective is Eurocentric – which is part of the reason why his analysis has been taken to task in our own time – in which it needs to be decided, he argues, whether or not European humanity bears within itself an absolute idea, as opposed to “being merely an empirical anthropological type like ‘China’ or ‘India,’” and, following from this, whether or not “the spectacle

9. Ibid., 7.
of the Europeanization of all other civilizations bears witness to the rule of an absolute meaning," that is, a meaning that is not simply historically arbitrary or contingent. In contrast to other sciences, such as psychology, what is at stake for philosophy, Husserl insists, are the ideas and ideals of "mankind," "humanity," and the future of our faith in the human as the being in search of truth and rational modes of being.

Historians in the early decades of the twentieth century were writing snapshots of philosophy as it was unfolding and what they privilege and focus attention on is quite different from how the history of this period is now conceived. Bergsonian thought was typically taken to be central to the era, but it is only in recent years, in our own time in fact, that Bergson's thought is being taken seriously once again. Until very recently Bergson has enjoyed a minimal presence in the rise and spread of academically practiced continental philosophy. Taking stock of the situation in philosophy at the beginning of the century, the Danish historian of philosophy Harald Höffding divided modern philosophers into three groupings corresponding to what he identified as three dominant tendencies: the "objective-systematic tendency" represented by the likes of Wilhelm Wundt in Germany, F. H. Bradley in the UK, and Alfred Fouillée in France; the "epistemological biological tendency" represented by various philosopher-scientists such as James Clerk Maxwell and Ernst Mach, and, finally, the "philosophy of value" represented by Nietzsche, Rudolf Eucken, and William James. For the 1913 edition, translated into English in 1915, Bergson was given a separate section on his own based on a series of lectures given by the author. Of course, this is one particular if revealing perspective on the changing philosophical scene. If one looks at Isaac Benrubi's *Contemporary Thought of France*, one finds a much wider range of authors and developments covered, but yet again prominence is given to Bergson with sections not only on him but also on "Bergsonians" (Edouard Le Roy, Georges Sorel) and "anti-Bergsonians" (Julien Benda, Jacques Maritain). Observing a great variety of currents and tendencies in the philosophical activity of his day, Benrubi identified three main tendencies of modern thought: empiric positivism, critico-epistemological idealism, and metaphysico-spiritual positivism. He also notes the closely interwoven character of contemporary French and German thought. We can also note certain developments in science that have an enormous impact on the philosophy being done in this period. Bergson, for example, was inspired by electromagnetism in his *Matter and Memory* of 1896, and he cites the likes of Michael Faraday and Maxwell in the text. For Bergson, it is the new science that is showing that "modifications, perturbations, changes of tension or of energy and nothing else”

pervade extensity. As one commentator has noted, electromagnetic physics confirms the intuition that a material point is a simple view of the mind by showing that solid bodies are not primary because “matter is first waves and light, indivisible energy and continuous flow.”

In the 1920s, a serious waning of Bergson’s influence on the philosophical scene was in evidence and various reasons have been offered to account for this: he did not create a school, after the end of the Second World War no Bergson archive was established, and the philosophy of life was eclipsed by existentialism and phenomenology. But a dissident philosophical voice was evolving in the 1950s in the work of Gilles Deleuze and in which Bergson’s texts and ideas play a vitally important role in the articulation of an innovative philosophy of difference.

The different trajectories and schools of thought that characterize this period are closely allied in that they offer a rich set of responses to a mid-nineteenth-century inheritance of positivism and scientism that sought to challenge and overturn philosophy’s independence. Some, such as Bergson, sought liberation from a mechanistic paradigm represented by, but not restricted to, the work of Herbert Spencer, who was a major player on the world stage of philosophy in the second half of the nineteenth century. According to one commentator, “A whole generation had grown up under the Spencerian dispensation but had been made restive by a liberal and scientific progressive faith that had gone sour.” At the turn of the century, however, the world changed and the sense of a new consciousness and new reality was in the air. The feeling was that reality was permanently new, forever making itself afresh: “The new reality meant that reality was by its very nature continually new, that one now lived in a world of immanence, a world of incessant and unforeseeable change and possibility, a world always about to be.”

William James, for example, was convinced that a kind of new dawn was breaking in philosophy in the early years of the new century. Reflecting on “The Present Dilemma in Philosophy” (1907), James describes philosophy as at once the most sublime and the most trivial of pursuits: “It works in the minutest crannies and it opens out the widest vistas.” Although it “bakes no bread,” it

---

17. Ibid.
emits “far-flashing beams of light … over the world’s perspectives.” Bergsonism enjoyed an intellectual and social significance in what has been called the “Progressive Era.” As Tom Quirk notes, “the Bergsonian universe is a universe of immanence, not transcendence.” At the Fourth International Congress in Philosophy held in Bologna in April 1911, Bergson gave one of the key lectures along with Hans Driesch, Paul Langevin, and Henri Poincaré. By the time of the Congress he had become the most celebrated thinker of the day and in his lecture he seeks to identify how philosophy relates to both science and art, something that also preoccupied the likes of Nietzsche and Wittgenstein, and that has been made central in our own time in Deleuze’s consideration of the question “What is philosophy?” For Bergson the future of philosophy resides in it finding its own sources of knowledge, not merely imitating developments in the method of science, and in this respect the activity of the philosopher is akin to that of the artist.

Bergson is also keen on occasion to tackle science head on in its claim to deal with facts and gain its superiority from this attachment to them. He pursues what we can call a “superior” positivism by conceiving metaphysics – the field of informed vision and speculation – as a mode of knowledge that can advance by the gradual accumulation of obtained results. In other words, metaphysics does not have to be “a take-it-or-leave-it system” that is forever in dispute and doomed to start afresh, thinking abstractly and vainly without the support of empirical science. Not only is it the case for Bergson that metaphysics can be a true empiricism, but it can also work with science in an intellectual effort to advance our knowledge of the various sources, tendencies, and directions of life. Bergson outlines his “superior positivism” in his Huxley lecture of 1911 on “Life and Consciousness”: “it seems to me that in different regions of experience there are different groups of facts … we possess now a certain number of lines of facts, which do not go as far as we want, but which we can prolong hypothetically.” This is taken up again in the Two Sources of Morality and Religion of 1932, where he states that the different lines of fact indicate for us the direction of truth but none go far enough; the attainment of truth can take place only when the lines are prolonged to the point where they intersect.

21. Deleuze and Guattari, What is Philosophy?
However, it is misleading, as is now customary, to simply label Bergson’s project as standing for the renewal of spiritualism. This only reinstates the antinomies of modern thought, notably freedom and determinism, he was so keen to reconfigure and in a way that would significantly alter our appreciation of the problem. As one commentator has noted, his work reflects a life-long interest in both the physical and mental realms and he was not an enemy of the inquiries of rational, physical science. Moreover, like most intellectuals in the post-Darwinian era he felt compelled to confront the radical discoveries of natural science. In *Creative Evolution*, he holds that “transformism,” as he calls the new science, “forces itself now upon all philosophy, as the dogmatic affirmation of transformism forces itself upon science.” Thus, to suggest that Bergson is the successor to French spiritualism who framed spiritualist ideas in terms that were appealing to a twentieth-century audience disillusioned with the rationalist and determinist society of the Third Republic is to present an oversimplified and distorting account of his work (it also ignores the fact that his academic training was in mathematics and physics; the same is also true of the founding figures of the analytic and continental traditions, Frege and Husserl). In insisting on a difference between the positive sciences and philosophy, Bergson is concerned with the purification of science from scientism, that is, a metaphysics that masquerades as positive scientific knowledge. Bergson’s stance is one, of course, that would be met with widespread favor among philosophers of different persuasions today.

The reputation Bergson enjoyed at the time of the Fourth International Congress, and more generally in the intellectual life of the time, derived from him being able to offer fresh solutions to philosophical problems that were perceived at the time to resonate with social and global changes. In essence, he offered a philosophy of life to replace the philosophy of the closed system and predictable certainty, and the phenomenon of Bergsonism served as the main catalyst for the transformation of sensibility and appropriation of the new reality. However, it was not alone in providing new methods and concepts to alter our understanding of, and participation in, the world.

Although today neo-Kantianism is unduly neglected, in this period it was one of the major philosophical forces in both France and Germany. As one commentator has noted, the view that it had reduced philosophy to the theory of

knowledge is unfair and was rejected by a number of neo-Kantians themselves.27 Their achievements included: developing philological research that helped establish Kant’s monumental role in the history of modern European philosophy, a role taken as a matter of course today; establishing important trajectories in epistemology and the philosophy of science; and developing Kantian thought in diverse areas such as the theory of value, ethics, and social and political philosophy. Taken together, these developments represent an attempt to restore the integrity of Kant’s transcendental project against the nineteenth-century reduction of philosophy to a handmaiden of science as a result of the immature claims of positivism and scientism.

As Suzanne Guerlac notes, in the mid-nineteenth-century context, positivism was a progressive force that held out the promise of a radical secularization of knowledge, countering the fog of metaphysical dogmatism on the one hand and religion on the other.28 The term “positivism” was first used by Auguste Comte (1798–1857) to denote a philosophy based on the positive facts of experience and that avoided metaphysical hypotheses. As Gary Gutting notes, it was applied to any view that privileged the empirical sciences over metaphysical thought.29 In its classical expression in the work of Comte, positivism seemed to offer a grand narrative of human development from a theological phase (the age of gods or of God) through a metaphysical phase (the age of metaphysical abstractions) to that of positive scientific knowledge in which human maturity is reached with the abandonment of ultimate explanatory causes. With the arrival of positivism, the human mind contents itself with focusing on observed facts that it subsumes under general descriptive laws such as the law of gravitation. Our knowledge is relative, not absolute, and we relinquish the concern with ultimate causes insofar as we do not know the whole universe but only the universe as it appears to us. Recent studies have encouraged us to appreciate Comte as a much more subtle and delicate – even “continental” – thinker than is widely supposed. In his Comte after Positivism, for example, Robert Scharff seeks to show that Comte, while holding scientific philosophy to be the final stage of intellectual development, did not simply reject theology and metaphysics; rather, he has a historico-critical appreciation of the situation in which philosophy’s past is relevant to its future practice, and this involves a critical appropriation of the theologico-metaphysical legacy.30 Comte emerges, then, as a historically minded reflective thinker about

scientific practice in which “positive philosophy” is to be practiced not in a “post-”metaphysical world but under transitional circumstances.

In the period this volume covers, one important development in French philosophy advances in the direction of what has been called a “spiritual positivism,” notably in the work of Bergson’s immediate precursor, Émile Boutroux (1845–1921), who exerted a major influence as a teacher of the history of philosophy at the École Normale Supérieure and at the Sorbonne. Indeed, Boutroux dominated the academic philosophy of the Third Republic through the First World War. Like other neo-Kantian philosophers of the period, Boutroux is wrestling with Kantian problems, especially freedom and determinism, and is dissatisfied with the Kantian solution, which places freedom and hence ethics in a sphere that is inaccessible to human consciousness. If we are to justify the claim that we are free, then it is necessary to establish that the phenomenal world as described by science is indeterministic. In two of his most important books, his 1874 doctoral dissertation, *De la contingence des lois de la nature* (*The Contingency of the Laws of Nature*), and *Idée de loi naturelle dans la science et la philosophie contemporaines* (*Natural Law in Science and Philosophy*; 1895), Boutroux seeks to show that freedom is the fundamental element of reality and that science does not necessitate rigid determinism. Whatever happens, according to Boutroux, does so neither necessarily nor accidentally but contingently, and is the expression of a world consciousness conceived as an eternally creative activity. For science the law of causation is a practical principle; it is unable to explain the general interaction and interpenetration of things. Thus, in respect to quality, cause and effect are disproportionate to one another: the effect is different in nature from the cause and if nothing new were contained in the effect, then cause and effect would not vary from each other. This means for Boutroux that the laws of nature have no absolute existence and iron necessity but are to be regarded as the artificial picture of a model that is essentially a living and moving reality.

Léon Brunschvicg (1869–1944) was the leading figure in the development of French idealism in this period who, as a professor at the Sorbonne from 1900 to 1939, exercised a tremendous influence, with all aspiring French philosophers of the time, including Jean-Paul Sartre and Maurice Merleau-Ponty, having to come to terms with his thought. He was the author of important studies of

31. For Scharff’s deft handling of Comte’s “three-stage law” – theology, metaphysics, science – see *ibid.*, 73–91.
Pascal and Spinoza, and one of his major texts was on the modality of judgment. He formulates a critical idealism in the spirit of Kant as an alternative to positivism on the one hand and Hegelian rationalism on the other. Genuine knowledge consists for Brunschvicg not in the judgment of crude experience but in an independent interpretation by the mind of the data provided by observation and through the means of the analytical and synthetical forms of knowledge that are peculiar to it: reality is part of the mind's own development and self-realization. This is a view he called “mathematical intellectualism.” He rejects completely Kant’s notion of the thing-in-itself since we can have no knowledge of something that exists independently of a relation to knowledge: a thing outside of knowledge would be equivalent to nothing. However, this does not lead him, qua his idealism, to reject external, material reality in favor of an inner spiritual reality since this would be to replace one thing-in-itself with another: “A consistent idealism must see all beings as the objects of a thought that is itself a function or act of thinking, not an independently existing thing.” The difference between science and philosophy is that whereas the former is concerned with objects of thought, the latter is concerned with thought itself in which thinking is identical with judging. As in the case of Boutroux, there is not an outright rejection of positivism. His project has been interpreted as a union of positivism and idealism: we know the truth through the experience of the historical progress of science and this history is the record of the mind's constitution of ever more successful frameworks for our interpretation of experience. Like Boutroux he accords privilege to freedom and creativity over determinism and inertia: “consciousness is the creator of moral values, as it is of scientific values and of aesthetic values.” Speaking like Nietzsche, who appeals to philosophical legislators, and echoing Bergson in the Two Sources of Morality and Religion, Brunschvicg champions those heroes of spiritual life who “cast ahead of themselves lines of intelligence and truth” that are destined to create a new universe.

Key figures in the history of sociology, such as Durkheim and Marcel Mauss, sought to assess the legacy of positivism (Comte and Émile Littré) and neo-Kantianism in France by reconfiguring the relation between philosophy and the social sciences, especially sociology and anthropology. Both preferred to be called rationalists rather than positivists. In political theory, they rejected Comte’s “positive polity” and Marxian communism, as well as the political forms of the Third Republic. Against these developments, they sought to outline a theory of socialism in which political liberty and individualism could flourish.

Their position was generally consistent with the development in the Third Republic of the laic state, the basis of which they argued would be civic secular ritual, institutional reforms underpinned by a new kind of moral and social scientific education. Their work influenced the theory of symbolic exchange developed by Georges Bataille and Jean Baudrillard, as well as the structural anthropology of Claude Lévi-Strauss. Mention should be made here of Mauss’s “Essay on the Gift,” which revolutionized the field of ethnology and, together with the aforementioned figures, has exerted a powerful influence on the reflections of Jacques Derrida on the economy of time and giving. Mauss’s text is not about religion but about economics and politics: “the theory of the gift is a theory of human solidarity.”

Before the First World War, the open enemy of French political philosophy was Anglo-Saxon utilitarianism and liberalism, which was typically subjected to three criticisms: (i) that it was based on an impoverished concept of the person construed as an independent atom instead of a social being implicated in communities of exchange; (ii) that it neglected how social relations change with changes in the mode of production; (iii) that its concept of liberty was a negative one in which little role was given to the ethical importance of political participation. In the conclusion to his essay, Mauss stresses two aspects of his analysis: first, that the kind of analysis into gift exchange he has embarked on, in which the gift is conceived as a public drama, can lead to a “science of customs” in which the facts studied and observed are held to be “total social facts” involving the totality of society and its institutions, and, second, that it leads to a set of “moral conclusions” or, as he says, to adopt an old world “civility” or “civics.” What is at stake in such a sociological inquiry is ultimately reflection on the nature and ends of “common life,” “the conscious direction of which is the supreme art, Politics, in the Socratic sense of the word.”

In Germany, neo-Kantianism developed out of an academic context but also, as Sebastian Luft and Fabien Capeillères point out in their essay in this volume, out of sociopolitical discourses that responded to industrialization and the workers’ question. The other relevant background, of course, as in France, is the progress of the natural sciences in an era of positivism. Hermann Cohen, one of the leading neo-Kantian figures in Germany, who promoted an ethical socialism, was dismissive of the rise of “Nietzschean” philosophy, seeing it as a withdrawal from scientific and scholastic rigor since it promoted a form of

cultural emancipation that could not be reconciled with the discipline of philosophy.\textsuperscript{44} This did not stop, however, more intellectually independent figures, on the margins of academic philosophy and the neo-Kantian movement, from attempting a synthesis of Kant and Nietzsche, with the work of Simmel being the best-known example. It is usual to focus on two main schools of German neo-Kantianism: the southwest school based in the universities of Heidelberg and Freiburg, which includes figures such as Wilhelm Windelband and Heinrich Rickert, and the Marburg School located further north at the university there, which includes leading academic figures such as Cohen and Paul Natorp. At the risk of overgeneralization, it can be said that the southwest school tended to focus on questions of culture and value, with members of the Marburg School focusing more on issues of logic and epistemology.\textsuperscript{45} Associated with the work of the southwest school, centered around its journal \textit{Logos}, were major intellectual figures such as Weber, Simmel, and, interestingly, Husserl. What united the schools, in spite of their differences and quarrels, was their subscription to the battle cry of “Back to Kant” which came from Otto Liebmann’s \textit{Kant und die Epigonen} of 1865. This involved determining what Kant actually taught and said, or Kant philology. Cohen produced commentaries on each of Kant’s three Critiques, while the edition of the Royal Prussian Academy, begun in 1900 under the general editorship of Wilhelm Dilthey, aimed to provide scholars with a definitive edition of Kant’s writings. On the other hand, it also involved setting out what Kant should have said. While aiming to adhere to the spirit and letter of Kant’s writings, “the neo-Kantians wished to return to Kant in order to use his principles and methodologies to answer both old and new philosophical problems.”\textsuperscript{46} A key concern and development was to extend the Kantian appreciation of what constituted universal and necessary knowledge. For Kant, such knowledge is exemplified by mathematics and the natural sciences; for the neo-Kantians, this could be extended to new sciences of man such as sociology and history. In refining and developing Kant in this way, Windelband argued that the aim was, in fact, to understand Kant by going beyond him.

In contrast to the case of Bergson, the legacies of Frege and Husserl were quite different, being both immediate and long-lasting. Frege, who taught mathematics at Jena University for the whole of his philosophical career, and who is today held to be, in the words of Michael Friedman and Thomas Ryckman, the “patriarch” of the analytic tradition, establishes modern mathematical logic

\textsuperscript{46} \textit{Ibid.}, 30.
as both a technical subject and a foundational subject for philosophy. Frege took stock of the developments that had taken place in mathematics since Kant, including the construction of non-Euclidean geometries by figures such as János Bolyai and Bernhard Riemann, and advances made by analysis and algebra in axiomatization. Under the influence of Rudolf Hermann Lotze, also read by Husserl, he arrived at the view that the propositions of arithmetic could not be synthetic a priori judgments but were instead analytic ones whose demonstration required no recourse to intuition. To show this, Frege aimed to free arithmetic from the bonds that tied it to natural languages and the way to do this was axiomatically, employing a system of conventional signs, namely, logic. In his now famous article of 1892 entitled “Sense and Reference,” Frege also formulated distinctions that were to prove invaluable not only for logical analysis but for linguistic analysis as well.

Husserl, the “patriarch” of the continental tradition, establishes the new method of transcendental phenomenology and seeks to constitute philosophy on new grounds as a rigorous “scientific” discipline. Although he did not invent the word “phenomenology” and was by no means the first to use it, the work he did under this title proved so influential that as a school of twentieth-century European philosophy, “phenomenology” became synonymous with his pioneering project. Husserl is one of the key philosophical figures of this period and his work undergoes a remarkable development, from Philosophy of Arithmetic of 1889 to The Crisis of the European Sciences and Transcendental Phenomenology of the mid-1930s. Against the imperial claims of a science that degenerates into scientism, Husserl is keen to show the necessity and validity of the human agent and person who belongs to a thematic world of intentional life. “Subjects cannot be dissolved into nature,” Husserl maintains, “for in that case what gives nature its sense would be missing.” On the basis of this kind of claim, he seeks to show the necessity of moving from the “naturalistic attitude” to the “personalistic world,” in which the researcher exists in a “surrounding world” of sense-bestowal. The other important aspect of Husserl’s project of phenomenology is its attack, which it shares with the work of Frege, on the psychologism that reigned in philosophy from the middle of the nineteenth century until well into the twentieth century. This is the view that the structure and principles of logic are derived from the organization of the human psyche. There is a variant to this, which is the claim that psychology is the basis of the human

48. Ibid.
sciences including philosophy, a version of which Nietzsche promotes in *Beyond Good and Evil*, and is a feature of the work of Wundt, Dilthey, and Simmel. The attempt to defeat psychologism and its influence, along with other philosophical reductions such as biologism, is what unites the work of Husserl, Scheler, and Heidegger. In short, phenomenology is an attempt to rehabilitate philosophy as a science with a special domain: as a rigorous science (*strenge Wissenschaft*), the attempt is made to describe phenomena as they are given and, through the famous *epochē*, refrain from “assumptions and affirmations of existence with regard to what it investigates in introspection … in this way, a vast field of enquiry, belonging only to ‘phenomenological research,’ is to be opened up.”

The phenomenological circles that flourished in the early part of the twentieth century – in Munich, Göttingen, Freiburg, and Vienna – served to extend the inquiries of phenomenology into the realms of aesthetics (Roman Ingarden), ethics (Max Scheler), social and political thought (Alfred Schutz and José Ortega y Gasset), and pushed it beyond its potentially narrow theoretical and geographical provincialism. The work of Scheler provides a good example of this. He was one of Husserl’s most important associates but, in contrast to Husserl, his focus was not on founding a new scientific philosophy but rather on what he perceived to be the moral crisis of his time, “in which the values of a calculating and egotistic bourgeois capitalism replaced those of Christianity.” He set himself the task of reconstructing Christian ethics after Nietzsche’s polemical attack on morality and showing that it was not the ethics of *resentiment* Nietzsche claimed. To this end, he employed the resources of phenomenology, publishing in 1913 a phenomenological study of sympathy (and love and hate) and a work on ethics in which he sought to counter the tendency in philosophy of producing a formal ethics.

Heidegger published his epoch-making text *Being and Time* in 1927 and today it stands as perhaps the single most influential work of twentieth-century European philosophy, seeking to show why time is the phenomenon that can unlock the question of the meaning of being. As Herbert Schnädelbach astutely observes, it is a work that brings together a number of discussions that were at the time scattered and endeavors to resolve them all at once by posing the question at a more radical level. This consists in offering a fundamental ontological theory of “understanding,” showing that the phenomenology of Dasein is hermeneutics in the original sense of the word, referring to the “business of exposition.” Heidegger’s contention is that this hermeneutics is the elaboration

---

of the conditions of the possibility of all ontological inquiry in which Dasein enjoys ontological priority over all beings: “Philosophy is universal phenomenological ontology, starting from the hermeneutics of Dasein, which, as an analytic of existence, has secured the end of the guiding thread of all philosophical questioning at the point from which it originates and to which it returns.”

In effect, this means that “understanding” belongs to the fundamental structure of the human being (Dasein) and is a problem in the theory of science only at a secondary level. Heidegger insists that Dasein is a Being that cannot be understood as like all other beings since it is distinguished by the fact that in its very Being that Being is an issue for it: “Understanding of Being is itself a definite characteristic of Dasein’s Being. Dasein is ontically distinctive in that it is ontological.” In this definition, Heidegger has carried out a major transformation of Husserl’s project: while agreeing with Husserl that ontology is possible only as phenomenology, he uses phenomenology as a methodological concept and no longer as a definition of a field of objects. As Heidegger says, the word “phenomenology” primarily informs us about “the ‘how’ with which what is to be treated in this science gets exhibited and handled.” Phenomenology has become the science of the Being of beings, that is, of the manner in which things show themselves. Dasein is not to be approached in an objectivist fashion but as a special kind of “subject” of knowledge: it is distinguished by its “existential” mode of being and conditions of existence, and of course the claim that the essence of Dasein lies in its existence is what gives rise to existentialism, even though Heidegger was keen to disassociate his own position from it in his well-known Letter on Humanism.

On the one hand, this development in European thought of a philosophy of existence with Heidegger and Jaspers represents another attack on positivism and scientism; on the other hand, it also supersedes the philosophy of life in an equally deeper and more radicalized manner. It did this by seeking an integration in the concept of “existence” of the antithesis of life and understanding, or the irrational and rationality, especially in the work of Jaspers. Like Heidegger, Jaspers proposes that we need to think about the question of Being in a radically new way by asking what it means for us in our temporal existence. Truth for the human being under temporal conditions is a matter of historicity and active realization, being a matter of responsiveness to challenges and limit situations that confront us with the radical confines of our temporal existence. On

55. Ibid., 32.
56. Schnädelbach, Philosophy in Germany 1831–1933, 206.
57. Heidegger, Being and Time, 59.
the one hand, Jaspers follows life philosophies, such as we find in Dilthey, in holding that the cognitivist concept of the subject is seriously deficient and that it is through existential lived experience – and not simply through discursive understanding or science – that truth discloses itself to us. On the other hand, however, such an illumination of existence through existential means should not lead to a devaluation of understanding, reason, and science. Rather, Jaspers advises, the philosophy of existence needs to make use of all material knowledge.

Freud is highly relevant to the European philosophical tradition because he too places temporality and embodiment at the center of an understanding of human subjectivity. Although Freud himself was averse to relying on philosophers in the course of his psychoanalytic labors (finding it excessively speculative), from the vantage point of Jacques Lacan’s return to Freud it is possible to discern important precursors of psychoanalysis in the modern era of the history of philosophy (Lacan takes great care to situate Freud in relation to the likes of Descartes, Kant, and Hegel), as well as appreciate the considerable impact Freud has had, and continues to have, on philosophy from his time through to the present. As Adrian Johnston notes in this volume, the topics Freud analyzes, such as temporality, subjectivity and intersubjectivity, embodiment, and affectivity are ones that are central to both the history of continental philosophy and its contemporary practice. A vulgar biological materialist would be of little interest to continental philosophers. But, as Johnston shows, for Freud the body with which psychical apparatus is in rapport is not construed along the lines of a piece of mechanistic matter moved by efficient causes. Thus, the picture of Freud as engaged in a reductive project shared by the likes of Heidegger and Sartre is fundamentally mistaken. As Johnston shows, Freud, like Husserl, has a debt to the work of Franz Brentano, which sought to show that the mental cannot be collapsed into the physical on account of the “intentional” quality and aspect of the mental. Where Freud’s psychoanalysis does part company with Husserl’s phenomenology, of course, is on the question of the unconscious. But with his all-important concept of the drive, Freud depicts the human subject as taking shape at the complex and tangled intersection of body and mind, nature, and nurture.

Wittgenstein’s influence on linguistic philosophy is well known and has been well documented. Less well known perhaps is the relation of his philosophical therapeutics, which sets out to dissolve philosophical problems by showing them to be false problems, to both previous figures in modern thought who have played a seminal role in the development of continental philosophy (e.g. Nietzsche), and to major twentieth-century developments in continental philosophy (e.g. the work of Bergson, Derrida, and Lyotard). Although he is not doing either natural science or natural history, Wittgenstein’s orientation is ultimately naturalistic: the conception of the “ordinary” is tightly woven with
the general “facts of nature” in which propositions function in the context of concrete forms of human life and language games. Like Bergson, but for different reasons, Wittgenstein can be seen as suggesting that philosophy is more like an art than a science: “It has turned back from the quest for some more general and inclusive system, and the sense of wonder now finds its object and its satisfaction in the nuances of the particular case.”

Like several other thinkers whose work is treated in this volume, Wittgenstein occupies an important place in the development of a “superior” or “subtle” positivism. As one commentator has noted, “It is clear that Wittgenstein was not a destructive positivist. He did not reject all discourse but factual discourse. On the contrary, one of his reasons for plotting the limit of factual discourse was that he wanted to prevent it from encroaching on the others.” The “truths” of religion and morality cannot be defended in the way Kant sought, and although they lack factual sense this does not mean they are unintelligible or insignificant. When Wittgenstein famously says in the preface to the Tractatus that there is nothing outside the limit of language, he meant that there is nothing factual outside the limit of factual language, and in stating this he allows that there are things that cannot be said in factual language but that can still be “shown.” Far from being an intolerant positivist, then, Wittgenstein shows in his approach to the phenomena of ethics, aesthetics, and religion that he is a “subtle” positivist. On this model of knowledge, although the natural sciences disclose what can be said about the world and have no use for philosophy, the empirical sciences are to be regarded as providing not an explanation but only a simple description of the world. Wittgenstein rejected the pseudo-scientific treatment of nonfactual modes of thought and defended their claim to independence. For example, a religious tenet is not a factual hypothesis but something that influences our thoughts and actions in a different way: “the meaning of a religious proposition is not a function of what would have to be the case if it were true but a function of the difference that it makes to the lives of those who maintain it.” Even when it appears that an “antiphilosophy” has been introduced into intellectual life, as in the cases of Nietzsche and Wittgenstein, it may be that such vexation is in fact, as one commentator has noted, a search for a new way of philosophizing.

Indeed, it could be said that what emerges in philosophy in this decidedly modernist period of invention is, above all, a remarkable set of resources,

59. Ibid., 169.
60. See ibid., 104, 172–4.
61. Delacampagne, A History of Philosophy in the Twentieth Century, 47.
63. Delacampagne, A History of Philosophy in the Twentieth Century, 60.
involving new methods, new concepts, and even new beings such as Dasein, that show the importance of philosophical subtlety, dexterity, and complexity, and these are vital instruments in combating the dogmatic self-assuredness of intellectual positivism and scientism. The thinkers of this period rediscover philosophy and invent it afresh, and they do so in many seminal ways that continue to exert a lively felt presence on its contemporary modes of practice.
For reasons too numerous to list here fully – many of them unrelated to what is normally called philosophy – Bergson’s place in the history of continental philosophy is one that has always had to be contested.¹ By “continental philosophy” I understand the anglophone reception of the past hundred years of mainly French and German philosophy, a field in which one is as likely to come across Bergson’s name as not at all. He appears as a central figure in one or two studies (in Eric Matthews’s history, for example, all twentieth-century French philosophy is dubbed a “series of footnotes to Bergson”²) but he is mostly neglected in others. This is not always a product of laziness or ignorance; despite much recent work done by Bergson scholars in the US, Britain, and France on the centrality of Bergson to the French reception of phenomenology – or to the philosophy of time (or the body, or life, or difference) – Bergson still remains a blind spot, a repressed element that needs to be defended, resurrected, or rehabilitated time and time again. Of all the moderns named in Gilles Deleuze’s famous counter-canon of philosophy – Spinoza, Leibniz, Hume, Nietzsche, and Bergson – it

¹. Henri-Louis Bergson (October 18, 1859–January 3, 1941; born and died in Paris, France) was educated at the École Normale Supérieure (1878–81) and took his doctorate at the University of Paris (1888). His influences included Boutroux, Kant, Lachelier, Ravaisson, and Spencer. He held appointments at the lycée in Angers (1881–82), Lycée Blaise-Pascal, Clermont-Ferrand (1882–88), and Lycée Henri-IV, Paris (1888–97), and was appointed maître de conférences at the École Normale Supérieure (1897–1900), Chair of Ancient Philosophy at the Collège de France (1900–1904), and Chair of Modern Philosophy at the Collège de France (1904–12, 1914–20). He was elected to the Académie des Sciences Morales et Politiques in 1901 and the Académie Française in 1914, and was awarded the Nobel Prize for Literature in 1928.

is really only the last mentioned who has not been canonized anywhere. The others have their long lists of disciples, societies, journals, schools, and recognized methods. Bergson has few or none, and remains an orphan within philosophical history, despite numerous efforts to reverse this; he appears as the perpetual outsider, uncategorizable, and anomalous in his place in the history of philosophy. It does not help, of course, that Bergson’s complex theoretical positions make him resistant to assimilation within other movements: he has phenomenological aspects to his thought, and yet was not a phenomenologist; he was a naturalistic philosopher, but his was a far from standard naturalism; his work valorizes difference, but not through the structures of language. One is tempted to define Bergson in terms of his own concept of the “indefinite”: as that which is always “on the move” and so incapable of being positioned.

It is not so surprising, therefore, that it has often fallen to the lot of the “Bergsonian” today to undo history’s “damnation of Bergson,” to make recompense for this unfair neglect, to show how he preempted Heidegger, influenced Merleau-Ponty, or shaped Deleuze’s thinking (the strategy of tethering his name to more lustrous figures is a well-worn one). Yet anyone who has tried in vain to reverse this neglect over the past decade, and who has seen others attempt the same with little success over many decades, could be forgiven for growing weary of the cause. The pressure of historical entropy seems to win out, its inertia irreversible: despite much evidence in favor of a Bergsonian dimension to their subject, most scholars (with a few of notable exceptions) of Merleau-Ponty or Deleuze (or Sartre, Henry, Levinas …) rarely read Bergson. Not that this is surprising any longer, however, for it was rare for any of the major postwar French philosophers themselves to acknowledge an influence from Bergson, and without that clear expression of lineage it must be difficult to pursue lines of inquiry outside the authorized version of intellectual history. Apart from Deleuze (who did write extensively on Bergson), only Levinas takes time to credit Bergson with any sustained significance for him, but even then does so only in interviews rather than primary works.

5. See the interview with Levinas in Richard Kearney (ed.), Dialogues with Contemporary Continental Thinkers (Manchester: Manchester University Press, 1984), 49. Levinas does give something like a sustained philosophical treatment of Bergson in Richard A. Cohen’s translated edition of Levinas’s Time and the Other (Pittsburgh, PA: Duquesne University Press, 1987), but this still amounts to only one small part of a lesser work.
And yet for nearly twenty years Bergson was at the center of Western philosophy; for half of that time, from 1907 to 1917, he was the philosopher of Europe, with an influence spreading beyond philosophy and into the arts, sociology, psychology, history, and politics. Although that influence had been severely diminished by the end of the First World War, all the same Bergson must have remained an important presence for the French philosophers born at the turn of the century. Whatever their reasons for not wishing to acknowledge that presence directly, there may be traces of it left in their work. One way to discover such traces is through the language used in their writing. And when one looks at Bergson’s own vocabulary – the one he invented – one does have a sense of déjà vu. One discovers that the language that has been in use over the past hundred years of continental philosophy has an obvious Bergonian provenance despite his own work’s reversal of fortune. This is not direct enough to be a specific philosophical influence nor, alternatively, coherent enough to warrant it being called the Weltanschauung in which French thought conducted itself. But there is a range of words and terminological strategies that stands out because it is only after Bergson that this kind of language became de rigueur in French continental thought.

Alternatively, one all too visible trace of Bergson’s presence that does not need any detection is what we should call “comic-book Bergsonism”: in its pages we find the comical picture of a dualism that opposed all forms of space to time, a vitalism that argued for a special form of living energy determining the direction of evolution, and a monism that denied the existence and appearance of substance in favor of everything being in motion. All of these stereotypes of Bergson were and are straw men: implausible positions set up mostly in order to cast a favorable light on whatever supposedly stark alternative to Bergson was being forwarded at the time – a new phenomenology, logical positivism, structuralism, and so on. Yet Bergson would have found these views no less incredible, for he never opposed all space to time, did not think of the élan vital as a special kind of energy, did not think that evolution was heading in any direction, and did not deny the existence and appearance of substance (but only showed what substance was – a complexity of movement).

It is the task of what follows, then, to replace this comical image with a serious one: the image of a thinker whose influence on philosophy’s language has been immense, yet rarely acknowledged by other philosophers. More often than not, of course, what philosophers say is at variance with what they do, and in the case at hand it will be the language of French philosophy that expresses a latent

---

Bergsonism “acting itself out,” so to speak. With this in mind, I shall set out a number of categories (not all of them explicitly used by Bergson – e.g. “holism”) that tie together Bergson’s terminology, while also linking them to his texts, to other philosophers, and to recent themes in continental philosophy. Although the terms will often overlap in usage, I shall try to separate them according to a number of linguistic practices:

- some of them methodological – the language of holism (vagueness, abstraction as immobilization, interpenetrating images, antibinarism, metaphoricity, thick descriptions that restore singular novelty, the concrete); the language of intuition (metaphysical perception, knowledge and sympathy, immanent thought as becoming the thing); the language of immanence (antitranscendence and the antitranscendental); the language of pluralism (multiplicity, levels, dissociation, qualitative difference and differentiation); and the language of nonphilosophy (philosophy in art, in mysticism);
- some of them metaphysical – the language of the Real (radical empiricism as metaphysics, the rejection of negativity, the critique of possibility); the language of time (novelty, becoming, change, process, movement, heterogeneity); and the language that goes beyond subject and object (refraction, endosmosis, mixture);
- some more naturalistic – the language of Consciousness (the unconscious, fractured ego, memory, the virtual); the language of the body (affectivity, motility, habit), and the language of nature (the animal, biology, evolution);
- and some more normative – the language of Life; the language of ethics (alterity, attention, sympathy, the Open and the Closed); the language of anti-reductionism (antimechanism, antiscientism); and the language of freedom (the given fact of liberty, the free act that dissolves aporia).

The philosophical origins of a term such as “multiplicity” are not exclusive to Bergson, of course (Husserl would also have to be brought into that account): no one can own a concept uniquely. But there is a critical mass attained by a large array of Bergson’s favored terms that, only after him, became widespread and publicly owned, evolving by mutation in the hands of others. Nor is this Bergsonian inheritance operating in isolation; it coexists with the language of Greek philosophy, Cartesianism, and Kantianism that can be found in every Western philosophy. But it is the layers of Bergsonisms that especially characterize French thought this past hundred years, layers that might also reduce the gap between Matthews’s comment on French philosophy as a “footnote” to Bergson, and the lack of actual footnotes to Bergson in its pages.
I. METHODOLOGIES

Holism

The mutation of Bergson’s language also occurs in his own hands, for concepts such as “duration” or “space” do not hold the same meaning across his works. They evolve or, rather, they co-evolve in the presence of other concepts in other contexts (the duration of consciousness in Time and Free Will is somewhat different from the duration of life in Creative Evolution). This co-evolution is indicative of a Bergsonian principle that is now a commonplace: the holism of the Real. Bergson is a holist such that the analysis of ideas and of things never reveals their genuine inner reality, but only a set of immobile parts. Analysis does not reveal truth, but only our material intervention upon reality; it breaks things up, killing the Real while vivisecting it. And this very notion of holism is itself holistic, having different meanings when taken in the context of logical abstraction, psychological intuition, or the decomposition of movement. With regard to abstraction, the emphasis lies on the spatiality subtending it. According to Creative Evolution, our abstract logic is physical in its origins: “our logic,” Bergson writes, “is, pre-eminently, the logic of solids.” The binaries of this or that, here or there, are all variations of an all-or-nothing bivalent logic modeled on a kind of space, to be precise the space of solid, impenetrable bodies, where no two objects can simultaneously occupy the same location.7 Other forms of logic – fuzzier, vaguer, more fluid – are no less possible; but, because we do not normally perceive how things do interpenetrate, how they do coexist in the same spaces, we separate everything into isolated, separable objects. Things are thrown apart – ob-jectified: “concepts, in fact, are outside each other, like objects in space; and they have the same stability as such objects.”8 It is for reasons of survival that our perception is keen enough only to see things in isolation. Were we to attempt to transcend our normal perception, we would see things much more fluidly, as movements that coexist, as indivisible continuities, shading into each other imperceptibly.9 But then we would not be able to grasp them, hold them, and kill them.

9. Bruno Paradis has written about the vague or fuzzy nature of Bergson’s concepts. He also points to an indetermination of conceptuality or “inexactitude” in Bergson’s work (“Indétermination et mouvements de bifurcation chez Bergson,” Philosophie 32 [1991], 19). A technical discussion here of the logic of vagueness would bring us far off the point, but the fact remains that Bergson clearly uses the notion of the indefinable and the indefinite, not in an attempt to perpetuate mystery, but to point to a genuine feature of the world.
These movements must be seen as individual, not as a movement in general or abstract, but in person. For Bergson, the individuality of movement is its metaphysical status. When seen normally, habitually, however, this movement has each of its various dynamic properties “extracted” as an abstract concept, leaving a putatively formless and static object behind. Abstraction is always extraction. Hence, the process of abstraction is a form of inattention to concrete specificity, whereby the individuating context (what makes a movement this movement) is extracted and immobilized to become a container for the content-object left behind by the very same process.¹⁰

Bergson’s own language of vagueness and vague language, his use of metaphors across all his works (which was used by many critics against him), is, according to him, absolutely essential to expressing duration. Infamously, Bergson is said to condemn language as inadequate to “thinking in duration.” But the truth is that he argues for new languages of thought, for the constant invention of metaphor, simile, and adjective, in order to provide the thick descriptions that will restore to the Real the novelty and concrete specificity extracted by the immobilizing general concept. In his seminal essay of 1903, An Introduction to Metaphysics, Bergson argues for a metaphysics that “frees itself from rigid and ready-made concepts in order to create a kind very different from those which we habitually use; I mean supple, mobile and almost fluid representations.”¹¹ That is why Bergson demands that we “use metaphors seriously,” because the transversal meanings of metaphor are the literal truth of a process reality.¹² This language of anti-abstraction, of the concrete, of antibinarism, the inseparability of dimensions and the ineliminability of context, is part of the atmosphere in which much poststructuralist thought breathes, and without it a good deal of what Jacques Derrida, or Luce Irigaray, or Deleuze write would make a good deal less sense. It gained its first prominence in French continental thought with Bergson, whether for good or (as Alan Sokal and Jean Bricmont argue¹³) for ill.

Intuition

Attached to the excessive interference of analysis is the excess of the intellect, which Bergson opposes to the noninterference of intuition. Clearly, intuition

---

¹⁰ For more on this, see my Bergson and Philosophy (Edinburgh: Edinburgh University Press, 1999), 175–7.
¹³ See Alan Sokal and Jean Bricmont, Impostures intellectuelles (Paris: Éditions Odile Jacob, 1997).
has a modern pedigree going back long before Bergson (be it to the rationalists on the one hand, or the Romantics on the other), so what is noteworthy about it in Bergsonism is a usage that is neither fully rationalist nor fully Romantic but accommodates aspects of both. With respect to the latter, intuition is taken as a sympathy with, or attention to, the object that approaches an immediate consciousness; with respect to the former, it is described as “supra-intellectual” or “ultra-intellectual,” the immediacy with the object not being an easy achievement but something requiring “painful” effort.\textsuperscript{14} Intuition is the painful exertion required to transcend our normal perception, to reverse the workings of the mind – for which analysis is not merely an intellectual habit but a vital necessity. By turning itself backwards in intuition, the mind attempts to reintegrate itself with the Real.

There is no “simple and geometrical definition of intuition,” however. To be in sympathy with something requires “views of it that are multiple, complementary and not at all equivalent.”\textsuperscript{15} Intuition is this faculty of multiple perspectives. It is the power by which one subject is able to adjust itself to the alterity of the object (a changing process) by re-creating its movement within itself. But this re-creation is not a representation. Intuition is in fact antirepresentational: it is a thinking that is a part of the Real rather than a point of view that represents the Real. This is possible because intuition and the Real are both processes, and as such can participate with each other without representation. That is why Bergson made the claim that metaphysics is a form of knowledge without symbols. By symbol he meant representation. Hence, intuition dispenses with symbols in favor of a kind of presence (over re-presence), a material, processual, partial coincidence with the object (although it is never a perfect, complete coincidence).

The “metaphysical investigation” of the singularity of the concrete object is another name for Bergsonian intuition. In the effort to experience the object in itself, to sympathize with or attend to its movement, we differentiate between a generic image of it and a multitude of forms. And in doing so we have also, at one and the same time, integrated our movement into its own: we have participated in its becoming. This integration, though, is always dynamic, being the attempt to enter into the flux of another\textit{ durée} rather than to discover an eternal supersensory essence. Indeed, Bergson is adamant that his notion of intuition is non-Platonic and anti-Kantian, for he states clearly that “in order to reach

\textsuperscript{15} Bergson, The Creative Mind, 34, in Œuvres, 1274.
intuition it is not necessary to transport ourselves outside the domain of the senses.” Intuition exists as the “perception of metaphysical reality.” It is a form of attentive perception. Most philosophers since Plato have wished to “rise above” perception, Bergson claims, and some have seen intuition as their means to do it (Descartes and Spinoza being the two most obvious examples). Conversely, traditional skeptics of metaphysical intuition (such as Kant) have been no less unworldly in their positing of intuition: if it exists, then it will be “radically” different “from consciousness as well as from the senses” (which, for Kant, would be an impossibility). Bergson, by contrast, sees no need to escape perception, but instead argues for its promotion and primacy in a manner presaging Merleau-Ponty. Intuition is not the faculty for producing ever newer genera, but a superior empiricism that illuminates every “detail of the real” by “deepening,” “widening,” and “expanding” our perception.16

**Immanence**

This is not a valorization of human, anthropocentric, perception, however: it is the primacy of *inhuman* perception and the sensing body. Perception must be worked over, made attentive, given new forms. Despite the Romantic overtones of ecstatic empiricism in Bergsonian intuition (which raised the same levels of doubt and enthusiasm then as it does today), what really carries across from Bergson is the emphasis on transcending the *norms* of human perception, especially by means of *nonrepresentational* knowledge. It would be this kind of knowledge as sympathy, knowledge that attempts to go beyond power, that Levinas would later characterize as an ethical relation. Conversely, by locating this transcendent power in nature, by rendering metaphysics immanent, in other words, Bergson received Deleuze’s approval. Indeed, reversing the effects of Platonism by annulling its unworldly view of metaphysics is perhaps Bergson’s greatest contribution to twentieth-century philosophy. The idea that the “true empiricism” is the “true metaphysics” is central here. Yet it goes even further than many think, for Bergson was also the “adversary of Kant,” as well as of Plato, inasmuch as he regarded the Critical Philosophy as simply another form of Platonism, only now applied to the human mind. There is no valid distinction between the “transcendent” and the “transcendental” (as Kantians claim), for the latter is simply the Platonization of deductive logic, making a certain kind of conceptual (and spatial) thought normative. But to make it normative, to make it the unconditioned condition of *all* experience is to render it transcendent to its immanent, mutable conditions. As we shall see, those conditions are multiple; *indeed they*

---

are multiplicity or novelty itself, inasmuch as, for a process philosophy, there can be no condition of the new save for itself: the new comes out of no-thing – not substance, nor form, nor logic – nothing except itself, de novo. Its condition is to be unconditioned.

**Pluralism**

When speaking of method and multiplicity in Bergson, one must mention what has been called his “method of multiplicity,” a method of proliferation in the face of philosophical paradox.\(^\text{17}\) Indeed, intuition is another name for the method of multiplicity. This is quite the opposite of William of Ockham’s principle – *entia non multiplicanda sunt praeter necessitatem* – which seeks the best explanation in parsimonious simplicity. The Bergsonian principle sees false problems and paradoxes arising *whenever we simplify too much*. Abstract intellect, of course, “loves simplicity,” but that is because abstraction *is* simplicity itself, an extraction from and diminution of the Real. By contrast, intuition is the acknowledgment of or attention to the messy nuances of reality, because the Real is always *de trop*, whatever is in excess of our intelligence: it is the “more than is necessary – too much of this, too much of that, too much of everything.”\(^\text{18}\) Consequently, Bergson’s axiom is one of disunity in the face of simplicity, be it a dis-uniting of space, of the ego, of memory, of order, of cause, of knowing, of religion, of morality. In each case, where we habitually see one kind of thing we can always be assured that a closer look will reveal many others, many kinds, or many levels. This is even true of multiplicity itself (it has two kinds, quantitative and qualitative) and Being as such (of which there are an indefinite number of levels). To break out of a false problematic or paradox, therefore, we must first multiply the number of variables at work within it: the problem of being (“why is there something rather than nothing?”), for example, emerges if one posits only one kind of ultimate being – “Being as such” – with an attendant non-being nipping at its heels. For Bergson, there is no one Being, but numerous, actual, levels or kinds of being, a proliferation of beings with no need for a ground in the One. As one commentator writes, Bergson’s is a true “metaphysics of degrees of reality, on condition, however, that one specifies that it is not a question of the ‘same’ reality, but of different realities.”\(^\text{19}\) The multiple – another name for novelty, for process, for duration – is its own ground. Similarly, Zeno’s paradoxes of movement only arise if one posits just one kind of space, homogeneous quantifiable

---

space, instead of the other, numerous qualitative spaces wherein we walk, run, and commonly move with consummate ease.

It would be a mistake, however, to see Bergson’s predilection for the multiple as gratuitous or unnecessary: it is immanent to or axiomatic of his method, given that intuition just is a sensitivity towards difference; it is not an intellectual decision, but an affective vision. There are many synonyms for multiplicity in Bergson’s work: “dissociation,” “dichotomy,” “disharmony,” “differentiation,” “divergence.” Picking just three from this list, the nineteenth-century psychopathological term of “dissociation,” for instance, is transformed into a metaphysical principle: the étan vital itself is one example of dissociation, proceeding “by dissociation and division.”20 A living being is not a static composition or association of cells but an ongoing process that “has made the cells by means of [a] dissociation” of itself.21 Because life proceeds by dissociation, the differences between species are more fundamental than the similarities. Likewise, knowledge and understanding are the “effect of a sudden dissociation,” understanding being described as “a certain faculty of dissociating.”22 In The Two Sources of Morality and Religion, dissociation appears in the form of the “Law of Dichotomy,” by which Bergson understands a natural tendency whereby every conceptual unity is actually only provisional, being destined to bifurcate indefinitely.23 This constant dichotomization is not be confused with the Hegelian dialectic (or at least a stereotype of it), however, because this constant ramification proceeds without any subsequent synthesis. Indeed, Bergson’s methodology is wholly different from Hegel’s, being genealogical rather than teleological, dissociative rather than associative (or synthetic), and differential rather than negative. In fact, by contrast with the dialectical logic of Hegel, we might say that Bergson’s pluralism posits itself in multiple logics: psycho-logic, bio-logic, epistemo-logic, socio-logic. Logic itself is multiple. Perhaps the nearest Bergson comes to an “orthodox” (abstract) logic of the multiple is in its mathematical implementation in the infinitesimal calculus, whose methods of differentiation and integration Bergson adopted as his own: “the object of metaphysics is to perform qualitative differentiations and integrations.”24

Although Bergson is commonly regarded as a dualist (of life and matter, space and time), or even sometimes a monist (of Life), rather than a pluralist,

---

the closest examinations of his work agree that his thought embraces a “dynamic monism” allowing for “qualitative diversity”; he is neither a monist nor a dualist in the substantialist sense of these terms: the “infrastructure” of his philosophy is at once “dualist and unitary.” Unity is that which always splits or dissociates, being itself only a pragmatic, temporary unity, an impression of unity that must eventually bifurcate along with its object. At the origins of life, knowledge, the problems of philosophy, and even Being itself, there are always false unities, the fragmentation of which being the driving force that leads to other actual entities (with putative unified identities) that will in their turn disintegrate and differentiate. There are always divergent tendencies in Bergson’s analyses, and a tendency is the movement between provisional, pragmatic states of the One or the Two or the Many. Movement is neither in a state of one, nor indeed in a state of many either, but is the transition between a kind of one and a new kind of many, the multiplicity of the multiple. His pluralism is a metapluralism, a plurality of pluralities. Although the provenance of the French philosophies of difference in the 1960s is clearly complex – Hegelian dialectic (or Alexandre Kojève’s version of it in the 1930s), Heideggerian difference, Saussurean differentialism, even Husserl’s own earlier use of “multiplicity” are all part of that story – the early and widespread use of pluralistic language throughout Bergson’s work must still be regarded as a vital part of the confluence of ideas that made “difference” such a central term in their vocabulary.

Nonphilosophy

A final element of Bergson’s methodological language concerns the sources of philosophy itself, for in taking metaphysics to be the indefinable intuition of the indefinite, the experience of a concrete multiplicity (which is immanent to or a part of the whole), philosophy itself can no longer be regarded as a predefined, autonomous inquiry. Philosophy becomes a self-fulfilling creative practice, and so that which one names “philosophy” only after the fact. It is a “bottom up,” extensional characterization, one that is empirically based on the actuality of experiences that nominate themselves “philosophical” only a posteriori. Metaphysics is a thinking in duration, and although Bergson vacillated on whether science could or could not itself think (about) movement (in 1903 he thought that it could – with mathematical calculus being exemplary

Volume 3
in this regard – but in 1907 he restricted its role to the study of spatialized matter alone), Bergson is clear that both art and religion do have access to the metaphysical. Bergson’s theory of art, best expressed in his study of humor in *Laughter* (1900), allows the artist the natural faculty to perceive difference, while *The Two Sources of Morality and Religion* sees the mystic as an individual endowed with “creation emotion” – a new name for intuition – that enables him or her to feel difference. In both cases, they have access to, or rather become a part of, the mobile Real, forming a triad, along with philosophy, of kinds of participation in the Absolute, which is change itself. Along with philosophy, they are forms of “attention to Life” or the Real. But what will count as Real – be it perceived, felt, or thought – always remains indefinite and indefinable. Bergson was adamant that even his own concepts of *durée* and qualitative multiplicity, for example, must not be seen as eternal names of the Real, but as conceptual placeholders that must eventually be surpassed: philosophy is not about discovering an eternal expression to represent reality perfectly; rather, it is the practice of continually creating new concepts that participate in the fluidity of the Real. The absolute is not comprehended “by giving it a name,” but by creating a new expression.26 And this creation can have its sources in nonphilosophy (art and religion) too. This tempering of the scope and sovereignty of philosophy, which nonetheless does not deny philosophy an ongoing role, makes Bergson appear particularly contemporary, for it avoids the postmodern clichés of philosophy being at its end (again), while also showing a maturity regarding philosophy’s empirical basis and the extent to which it can maintain its autonomy from other disciplines. Philosophy is indeed conditioned (it is not exhaustive in its access to the Absolute but only partial), yet this conditioning is a mark of its Reality, of it being a part of the enduring, moving, whole.

**II. METAPHYSICS**

*The Real*

Moving from the language of method to the overlapping language of metaphysics itself, we are first reminded of Bergson’s anti-Platonism as regards sensibility and anti-Kantianism as regards possibility. Bringing metaphysics down to earth from its Platonic heights renders it, in Bergson’s views, a remedial procedure for our perception. In “An Introduction to Metaphysics,” Bergson describes the percept as a “metaphysical object” and then continues: “a true empiricism is that which proposes to get as near to the original itself as possible, to search

Henri Bergson deeply into its life, and so, by a kind of intellectual auscultation, to feel the throbings of its soul; and this true empiricism is the true metaphysics.\textsuperscript{27}

This is a radical empiricism, one practiced by Bergson even before William James had coined the term. Like James after him (and even more like Deleuze later again), Bergson argues that a true, metaphysical empiricism is not a contradictory mixture of supersensory abstraction and everyday experience, but the painful effort to create new realms of experiences, to expand perception such that we attend to the singularity of the concrete individual, the individual that can only be sensed rather than intellectualized. By this means, “metaphysics will then become experience itself,” and concepts will be created to match each object rather than the other way around (in Procrustean fashion).\textsuperscript{28} Metaphysics is not the contemplation of an alternative reality, therefore, but the heightened perception of reality, a perception Bergson also calls “intuition.” There is also a link between Bergson and phenomenology in all of this: Time and Free Will’s resort to “immediate data,” its proposal that we come “face to face with the sensations themselves,” or Matter and Memory’s attempt to transcend “theory” in favor of “the presence of images,” both appear to approximate a Husserlian epoché of sorts.\textsuperscript{29} Nonetheless, although Bergson’s proto-phenomenology must have helped to prepare the French soil for the implantation of German ideas, Bergsonism itself was never centered on a human representation (reworked or otherwise) of the Ding an Sich but something much more metaphysical, something transcending human representation: it is still experience, but experience before its human “turning,” the Ding itself, the “very life of things” coming into thought.\textsuperscript{30}

As already mentioned, the painful effort of intuition requires a reversal of the normal way in which we think, which goes from the particular to the general, extracting abstractions. Two particular abstractions are most culpable in this, according to Bergson: nothingness and possibility. Deleuze rightly states that in Bergsonism “there are differences in being and yet nothing negative.”\textsuperscript{31} To embrace the multitude of actual beings is far too fatiguing for the mind; indeed, it is contrary to what the mind is, to wit, the very extraction and simplification of this multitude. The positing of Being or Nothingness as the source from which the multitude supposedly come simply is the immanent process of mentation: it is not done by the mind, but just is one symptom of having a mind – it

\textsuperscript{27} Ibid., 22, in Œuvres, 1408.
\textsuperscript{28} Ibid., 18, in Œuvres, 1259.
\textsuperscript{30} Ibid., 184–5, in Œuvres, 321; \textit{An Introduction to Metaphysics}, 43, in Œuvres, 1424.
is the mind as performance, as process rather than substance, the process of extraction–abstraction. The symptoms of Being and Nothingness extend back as far as Parmenides and travel down through Plato and the Neoplatonists to Hegel, Heidegger, Sartre, Lacan, and Badiou today. In contrast to this, Bergson stands, alongside Nietzsche, at the head of a modern tradition of metaphysical positivism, or antinihilism, that has worked its way through to Deleuze in the contemporary era. The Real does not lack anything; it is its own full plenitude in all positivity. There is finitude and negation in Bergsonism, of course (Gaston Bachelard, for one, was wrong to think otherwise), but they are not primary; they are not the ground of our actuality; the nought is a derivative produced by either memory or expectation (Creative Evolution), that is, from a creative desire that produces its own supposed lack. But we can only realize this, we can only see it, if we reverse the way the mind works and interprets its own creativity.

The idea of possibility as a containment of the Real is another indication of this normal working of the mind. What we call the possibility of the Real is, in fact, engendered retrospectively by the Real, wherein “there is perpetual creation of possibility and not only of reality.”32 According to Bergson, it is extremely hard for the intellect to acknowledge that each present is really something radically new, that is, to attend to the actuality of the new. French nineteenth-century Romanticism, for example, was supposedly made possible because of the foregoing circumstances created by French Classicism. But Bergson argues instead that it was the Romanticism of Chateaubriand, Vigny, and Hugo that retroactively created the impression of a nascent Romanticism in the earlier classical writers. Romanticism, by its very coming into existence, created its own prefiguration in the past and, by that, a putative explanation of its emergence. This retroactive logic – what Foucault would later call (with self-critical awareness) the “history of the present” – also leads to a number of philosophical illusions. Our normal logic of retrospection perpetually recreates the actual present with elements of the past: meaning is reconstituted from words that are already meaningful (Matter and Memory), for example, or life is reconstructed from matter (a prebiotic soup) that is already vital (Creative Evolution), or consciousness is composed from brain cells that are already sentient (“Brain and Thought,” in Mind-Energy), and so on. In each case, we reverse-engineer a generalized notion of the present phenomenon with a reductive mechanism as its supposed causal past. And we can do this only by extracting the novelty and singularity of the actual phenomenon in order to make it fit into (or reduce down to) our explanatory substratum. But duration is both the mark of reality and the agency behind our illusions concerning what makes any one reality possible. Because it is prior rather than subsequent to the possible, duration actually creates the

latter retrospectively. And this is also true of novelty itself, which is its own real condition and has no “transcendental” conditions of possibility. Bergson’s anti-Kantianism will not allow room for any form of abstract logic to act as the basis, the principle of sufficient reason, to understand time as duration. Duration does not need possibility, because it makes possibility.

Time

It must be admitted that what we described earlier as the comic-book Bergson, that of durée and the élan vital (time versus space and life versus matter), has nevertheless left to the French tradition an important set of terms for its vocabulary. Although there were important philosophers of time in France immediately preceding Bergson (Jean-Marie Guyau, Émile Boutroux), and he had a number of influential contemporaries outside France (Samuel Alexander and J. M. E. McTaggart especially), it was doubtless Bergson who made time and a whole family of associated terms – novelty, becoming, change, movement, process, and heterogeneity – an essential part of the intellectual milieu for the next century. Clearly, his was a dynamist theory of time, what McTaggart called an “A-Theory,” emphasizing the perspectival determinants of flux, change, and unpredictability in the past, present, and future. The language of movement, of process, of change (along with that of freedom and creativity, as we shall see) is fundamental to Bergson’s conception of time. Durée is “the uninterrupted up-surge of novelty,” “radical novelty,” “the radically new,” or “complete novelty.” In contrast, clock-time is spatialized time, time understood in terms of eternal relations (of being before, simultaneous with, or after): this is the false time of Kant, of science, and of most contemporary thought. Indeed, this is another source of Bergson’s anti-Kantianism. Far from being the first modern philosopher to liberate time from space (as some, like Deleuze, have argued), according to Bergson, Kant merely inverted the old binary opposition of time and space by making measured (spatially quantified) movement subordinate to the measure of (spatially quantified) time. Bergson’s own thesis is not about the binary of space (movement) and time at all, but one concerning measure and immeasure, or quantity and quality. Kant simply internalized space and called it time. Bergson instead wants time to be understood as qualitative movement, that is, to have its qualitative actuality restored.

Bergson actually encompasses two approaches to temporality in his work, however, the one emphasizing the subjective experience of durée (in Time and Free Will), the other looking to the objective data of the contemporary sciences, physics and biology in particular (Matter and Memory and Creative Evolution),

33. Ibid., 18, 99, 35, in Œuvres, 1259, 1339, 1276; Creative Evolution, 106, in Œuvres, 634.
and so extending the idea of continual, qualitative variation beyond human psychology and into the material universe. The idea that Bergson never goes beyond an implausible and old-fashioned dualism of psychological time (duration) versus static, homogeneous space, rests wholly on a (selective) reading of *Time and Free Will*.\(^{34}\) By the time of *Matter and Memory*, it is homogeneity in equally spatial and temporal forms that is at issue. Homogeneous space and time are both the effects that we introduce into the “moving continuity of the real” in order to fix it, to control it, and to kill it (so that we can survive). They are the “diagrammatic design of our eventual action upon matter,” not the other pole in an improbable Manichean system.\(^{35}\) The *homogenizing* of space and time stems from our vital need to ignore their indigenous alterity, to reduce difference to sameness.\(^{36}\) Real spatiality and real things, on the contrary, are not empty forms, but have depth and life all their own, in what Bergson calls “the extensive,” which is “intermediate between divided extension and pure inextension.”\(^{37}\) It is only when we attend to their heterogeneity (in art, in mysticism, in metaphysical empiricism) that we see and feel and think the very life of things, that we see duration everywhere: in short, that we notice the constant upsurge of novelty or becoming, without any need for static space, or being, or nothingness, or even logic to support it. When we look elsewhere, when we abstract and extract – as we must to live – then it is we who immobilize, spatialize, or homogenize the Real.

Although it was a caricature of his thought that allowed Bergson’s most obvious contribution – his theory of time – to be sidelined by the next generation of French philosophy, the fact remains that the philosophy of the new was a Bergsonian innovation, irrespective of its location (in the mind or in things), and it is one that remains a live issue today. For Badiou or Deleuze, for Lyotard or Derrida, for François Laruelle or Michel Henry, the problem of the new, of change, of the “Event,” be it in politics, in philosophy, in “theory,” in phenomenology, in art, or in literature, is obvious, and it is one that specifically marks out French continental thinking.\(^{38}\)

---

34. Even *Time and Free Will* can be ambivalent about space, going so far as to say that “we shall not lay too much stress on the question of the absolute reality of space: perhaps we might as well ask whether space is or is not in space” (Bergson, *Time and Free Will*, 91, in Œuvres, 62).
38. Indeed, even the term “Event” has a Bergsonian remit, *The Two Sources* arguing that the very notion of an event is already a spatialization of process, albeit in the special guise of what he calls “fabulation,” which functions to collect (extract) numerous processes together under the singular name of “event” (sometimes even to give it a proto-personality – as an “earthquake,” a “collision,” a “hurricane,” a bit of luck, my death, and so on). See *The Two Sources of Morality and Religion*, ch. 2 and my “Life, Movement, and the Fabulation of the Event,” *Theory, Culture, and Society* 24(6) (2007), 53–70.
Beyond subject and object

The importance of understanding Bergson’s purported dualism as actually processual, as a *dualization*, is critical. Alongside immanent intuition, Bergson also uses the language of mixture, “refraction,” and “interpenetration” to move his philosophical thought even further beyond the dualism of subject and object. After the admittedly Cartesian propensity of *Time and Free Will, Matter and Memory*, for example, begins by thinking of perception without reference to self and world (in what could be taken as an *epoché* of sorts). But this is just one instance. Bergson’s work is strewn with the language of contraction, “endosmosis,” “interval,” or “balance” understood as the condensation of opposed forces or movements, with seemingly subjective facets on one side and objective ones on the other. Impurity reigns everywhere, whereas purity is always only in theory, as a *hypothesis*, whether born from philosophy (like Nothingness) or the need to live (in homogeneous space). But what is real is the interval, the in between; what is unreal, or ideal, is the “extreme.”

Admittedly, there are various subjectivist extremes put to work in Bergson’s own thought – pure memory, *élan vital*, even pure duration – but they are ideal limits, entities with an “as if” (“*comme si*”) existence, a “virtual” reality. In actuality, neither duration nor the *élan* are ever pure, but contain contradictions within themselves (duration is always spatialized, life is always found in embodied, material beings). And these are not contingent facts: life would not *be* life, that is, dissociative, unless it existed in biological form. These are not the poles of a dualism but the interpenetrating tendencies in a movement of dualization: the enduring mind *really can* become spatialized, and matter *really can* become vitalized (that is precisely what a living body is) because space and life are actually processes (spatialization and vitalization). These interpenetrating tendencies are seen most intensely in the optical metaphor of refraction found throughout Bergson’s works, from the first to the last: space and time refract each other, free will and mechanism refract each other, open and closed morality refract each other, static and dynamic religion refract each other. Refraction as such is not tied to any privileged domain; it is seen in the psychological, social, and physical realms and so is relational rather than substantive. It is a form of movement. *The Two Sources of Morality and Religion* even ends with a prognosis for life on our “refractory planet” that must nonetheless be the means by which life evolves further.39 To a lesser extent, Bergson also uses the language of interpenetration, or osmosis and endosmosis, always with the purpose of exemplifying the mixed nature of the Real. Without these ideas of mixture, Merleau-Ponty’s chiasmic ontology of reversibility and subject–object

---

intermingling would not have been written with the same facility or received with the same enthusiasm.\textsuperscript{40}

And here is where metaphysics and methodology refract as well, for Bergsonism can also be seen as an attempt to move “beyond objectivism and relativism.” According to \textit{Matter and Memory}, when we try to transcend realism and idealism, all we are given are images, but these images are not representations; they are the universe set out in inhuman, nonrepresentational imagery. Objectivity can obviously be identified easily enough with a certain homogeneous physical reality. But Bergson sees this as merely the cancelling out of all perspectival differences, of all imagery whatsoever, “where everything balances and compensates and neutralizes everything else.”\textsuperscript{41} If everything is already a (nonrepresented) image, one could say that one purpose of Bergson’s project is to relativize relativity. In \textit{Duration and Simultaneity}, Bergson even forwards the idea of “full-relativity” as a relativism that actually reinstates a new kind of absolute, that of the Other’s perspective, the perspective of otherness that continually frames or relativizes my own (relative) conceptual and perceptual frames of others.

Indeed, there is a connection between relativism and absolutism for Bergson or, rather, between relativism and absolutism of a certain kind. He regards the motive behind Kant’s (relativizing) Copernican Revolution as itself a symptom of an absolutist intellect having failed in its attempt to totalize or subsume the world and that turns instead to a humble relativism that now dismisses the possibility of finding any absolutes whatsoever. If Kant banished metaphysics and with it the absolute, Bergson sees it as his task to reinstate them both, only now in a newly redeemed understanding rather than in the form to which Kant submitted them. Bergson’s new absolute is not lost or found through the rigid concepts of Being, Nothingness, Space, the Transcendental, Logic, or Objectivity, but is grounded on the recognition of our selectivist, extractionist, tendency to centralize our own point of view by making everything else move relative to it, to be private absolutists. To say that everything exists (realism) is the same as to say that nothing exists save as an image \textit{for me} (idealism). Relativism, or what Bergson says should more properly be called “half-relativism,” always disguises

\textsuperscript{40} The “fundamental likeness” between Merleau-Ponty’s project and Bergson’s philosophy has struck a number of commentators, for example Ben-Ami Scharfstein, “Bergson and Merleau-Ponty: A Preliminary Comparison,” \textit{Journal of Philosophy} 52 (1955), 385. Edward Casey has noted that “Bergson is often the most effective escort into Merleau-Pontian reflection on many subjects” (“Habitual Body and Memory in Merleau-Ponty,” \textit{Man and World} 17 [1984], 283), and Eugene Kaelin went so far as to describe \textit{La Phénoménologie de la perception} as a testament to the Bergsonian influence on Merleau-Ponty (\textit{An Existentialist Aesthetic: The Theories of Sartre and Merleau-Ponty} [Madison, WI: University of Wisconsin Press, 1962], 339).

\textsuperscript{41} Bergson, \textit{Matter and Memory}, 219, in \textit{Œuvres}, 353.
a dogmatic absolutism. In contradistinction to both, Bergson’s pluralism is also an absolute: an affirmation of the multiplicity of perspectives (images) that is nevertheless not an endorsement of the more customary representational form of relativism (because they are images for themselves). In place of relative knowledge Bergson puts partial knowledge, for while the relative implies a lost absolute, the part opens itself up immanently to the whole.\footnote{See Bergson, \textit{Mélanges}, 774.}

III. NATURALISM

Consciousness

As regards the conscious subject (of supposed representation), Bergson’s language also lent itself well to the project of decentering the self that became fundamental to French postmodernism. But it did so in a complex manner that involved Bergson’s work in nonreductive naturalization. On the one hand, Bergson does everything he can to dismantle the integrity of the ego. From the very start, \textit{Time and Free Will} split it into “superficial” and “profound” states: a state that is already a spatialized self – with sensations quantified on the model of social space – and another of continuous heterogeneous \textit{durée} lying beneath the sameness of the public self. This “\textit{moi profond}” was Bergson’s own theory of the unconscious, quite separate from Freud’s, although influenced by the psychologist Pierre Janet and as such closer to a theory of selective \textit{inattention} than one of the unconscious \textit{simpliciter}: Bergson does not divorce any one part of the personality from the other; the deeper self goes “not unperceived, but rather unnoticed.”\footnote{See Bergson, \textit{Time and Free Will}, 169, in \textit{Œuvres}, 112; See also \textit{Mélanges}, 810, for a rejection of an unconsciousness that is opaque to and inaccessibly cut off from consciousness.}

\textit{Matter and Memory} and the subsequent works proliferated this dyadic model into numerous levels of stratified duration, dropping the language of “surface” and “depth” in favor of different rhythms of time.\footnote{See A. D. Lindsay, \textit{The Philosophy of Bergson} (London: Dent, 1911), 5, 91–2, 156–7, 168–9, who makes a good deal of this development.} In both versions, however, the idea of a self-identical ego was always an illusion for Bergson, there being neither “a series of distinct psychological states, each one invariable, which would produce the variations of the ego by their very succession … [nor] an ego, no less invariable, which would serve as support for them.”\footnote{Bergson, \textit{The Creative Mind}, 148–9, in \textit{Œuvres}, 1383.} Bergson once went so far as to liken the self to the pathology of multiple personality and even to a series of spiritual possessions in preference over any
sovereign, autonomous agent. As Simon Clarke observes regarding Bergson on this matter: “The ‘death of the subject’ … has roots that go back deep into French philosophy.”

On the other hand, though, Bergson extends the notion of consciousness or psyche to cosmic levels as well as devolving it to micro-selves. Here we see Bergson’s nonreductive and even inflationary naturalism at work. In Creative Evolution, anything that is alive is regarded as conscious, although even matter at times is also treated as a kind of consciousness, albeit one that is turned in the opposite direction to life, physics being a “reversed psychology” or “psychics inverted.” Here is where Bergson approaches a Whiteheadian organicism. He never quite gets there, however, for the vital is not organic, but that which resists organization even as it must (provisionally) accommodate itself to it at any specific moment. Life, or consciousness, is not some subtle substance or vital energy, but a resistance movement. While Bergsonism is indeed a philosophy of consciousness, this consciousness or psyche is only a synonym for universal movement, cosmological rather than anthropological.

This other approach to decentering the (anthropomorphic) self, one that replaces it with the cosmos, has been adopted by Deleuze and his followers to huge acclaim. This is especially true with respect to Matter and Memory and its language of the “virtual” (or unrepresented memory). In Deleuze’s reading, the virtual becomes ontological rather than psychological (although Bergson would not have opposed these terms as Deleuze does) and takes on the role of gathering all forms of difference together on to the same plane of immanence. All the same, the virtual remains alive, sentient, and moving – all Bergsonian characteristics – while also trying to rid itself of any human psychologism.

The body

Two other sites of Bergsonian naturalism are the body and nature itself. Following in the tradition of Maine de Biran (1766–1824) and Félix Ravaisson (1813–1900) – while also modernizing them – the body is fundamental for philosophy in Bergson’s view. It is the affective center of each individual; even further, it is the means by which our own sense of individuality is engendered. Through movement and affect, one image stands out among all other images: that of the body. Or rather, the image of the body is the image of mineness, of

46. Bergson, Mélanges, 858.
49. This tradition is discussed in the essay by F. C. T. Moore in The History of Continental Philosophy: Volume 2.
my body. It is “a privileged image, perceived in its depths and no longer on the surface … it is this particular image which I adopt as the center of my universe and as the physical basis of my personality.”50 “Mineness” is the product of an individuating movement-image, an act of nature rather than of an autonomous subject. The body has even more than this passive function, however, for it is also a center of action, of indeterminacy and choice. The “I” is given a “horizon” of possible interests that is constituted through the spatial relationship that other images have with my body: “the objects which surround my body reflect its possible action upon them.”51 The body continues in importance in Bergson’s work, from Matter and Memory, as the basis of recollection (through habit memory, a crucial discovery for 1896), all the way to The Two Sources of Morality and Religion, and its idea of a “logic of the body” as “extension of desire.”52 Time and again this lived body, based on movement, affect, and action, is contrasted with an objective, geometrical body, the body seen from the outside. The first, Bergsonian body is a true body-subject with its own consciousness, Bergson writing explicitly of an “intelligence of the body” and a “logic of the body” as well as “bodily memory,” and both Merleau-Ponty and Irigaray are especially in his debt here.53 In some quarters, Bergson has been acknowledged as the first thinker to see “the genuine significance and peculiarity of the body,” as well as the earliest modern philosopher fully to realize “the body’s pivotal position … as a continual ‘center of action.’”54

Nature

Ironically, it was precisely for such naturalism, however, that the early Merleau-Ponty actually criticized Bergson, sharing the opinion of Sartre and most of the next generation of French philosophers.55 Naturalizing the human, emphasizing the continuity between culture and nature, attending to the animal and to biology as important sources of philosophy – these ideas were anathema to those like Sartre who thought that man was “the being whose appearance brings the world into existence,” and so who “wanted man to be the measure of

51. Ibid., 21, in Œuvres, 172.
53. Bergson, Matter and Memory, 111, 139, 152, in Œuvres, 256, 257, 293.
55. Merleau-Ponty would later return to Bergson at the same time that he discovered the attraction of creating his own philosophy of nature; see Maurice Merleau-Ponty, Elogie de la philosophie et autres essais (Paris: Gallimard, 1960).
everything.” Yet Bergson was also rebuked by philosophical naturalists at the time for what they saw as his residual subjectivism. What so dissatisfied both sides is the fact that Bergson’s is a nonreductive naturalism: although he does want to “give to the word biology the very wide meaning it should have, and will perhaps have one day,” this is not to reduce everything to one, worthless essence, because biology, as Bergson understands it, is what breaks all essences. Bergson’s is a process naturalism, and this is what gives it an irreducible value – the value of change. With regard to the sociobiology in The Two Sources of Morality and Religion, for example, there is no intent to deflate culture to the “merely” animal or biological; rather, in virtue of his antireductionist views in biology, his is an inflationary discourse – biology is a realm of value, not devaluation, and this value is the value of change. In process philosophy, norms and nature interpenetrate, refract each other and are only extracted as separate essences by the intellect (which is the faculty of separation, or spatialization).

IV. NORMATIVITY

Life

As already mentioned, the élan vital is a principle of change, and does not represent an alternative type of (living) substance (which would only beg the question of biological origins, anyway). It is a type of time, open and unpredictable. The values built into Bergson’s philosophy of time are ones of openness, of open-ended creativity, of attention to otherness, to Life. These values are immanent within life, for the mark of the living is simply to continue evolving rather than to stay fixed in one form of species. “Attention to life,” we recall, was always described in terms of an openness to the alterity, the singularity, of the other. Indeed, attention to life can appear in Creative Evolution as life’s sole (immanent) imperative, for the only hierarchy found in life is not one based on complexity or rationality (although these may be attendant phenomena), but one that is created immanently within life when each species falls into self-absorption and a disregard for “almost all the rest of life.” There is a fundamental antifinalism in Bergson’s thought that, for various reasons, has been obscured in the reception of his ideas. Against both Lamarck and the neo-Darwinians, Bergson argues

for a nonteleological, dissociative life, and the élan is simply a principle of this endlessness, this constant dichotomization without synthesis, this continual creativity. The élan has no end, or, if you prefer, its only end is to creatively end all ends, to break all molds of speciation, to keep moving. To think of it as “stuff” is ridiculously unBergsonian, given that his is a meticulously processesualist philosophy. Life is movement, a resistance movement, resisting whatever does not allow it to move, and that is its immanent value. No less than for Nietzsche before him or Deleuze (and Michel Henry) after him, creative Life is the supreme, self-positing or axiomatic value, once it is understood as that which remains open, moving, or, in Bergson’s most renowned term, “creative” (which made Bergson a favored philosopher among artists).

Ethics

This normative dimension was always implicit in Bergson’s work until The Two Sources of Morality and Religion, which at long last interprets the élan vital explicitly as an élan d’amour, a love or “open morality” forwarded as the end of life, that is, as the open-endedness of indefinite creativity (what Bergson calls “creative emotion”). This is embodied in the mystic or open soul, whose form of “dynamic” faith indicates a truly universal regard: it is not intentional – it has no particular end or object – for it is only disposed towards otherness as such:

The other attitude is that of the open soul. What, in that case, is allowed in? Suppose we say that it embraces all humanity: we should not be going too far, we should hardly be going far enough, since its love may extend to animals, to plants, to all nature. And yet no one of these things which would thus fill it would suffice to define the attitude taken by the soul, for it could, strictly speaking, do without all of them. Its form is not dependent on its content. We have just filled it; we could as easily empty it again. “Charity” would persist in him who possesses “charity,” though there be no other living creature on earth.59

The contrasting “closed morality” is not an affective regard toward alterity per se, but a set of rules, pressures, and obligations bearing down on the individual, homogenizing him or her as part of a group, a “closed society” of the same. Such a society tends to have an equally homogenizing form of faith, “static religion,” a highly institutionalized religiosity that expresses the interests of the

group through rules and obligations. What is fundamental to such bounded groups is that, no matter how large and inclusive they may come to be, they must remain closed to some form of outsider: “their essential characteristic is nonetheless to include at any moment a certain number of individuals, and exclude others.” Every in-group requires an out-group. Whatever feelings we have for the group, writes Bergson, “imply a choice, therefore an exclusion; they may act as incentives to strife, they do not exclude hatred.” Such closure, such hatred or disregard, indicates a differently oriented soul, centripetal rather than centrifugal. That is why closed morality cannot be transformed gradually (by steps of increasing enfranchisement) into open morality; there must be a leap from the one quality of closure to another of openness.

The oppositions in *The Two Sources of Morality and Religion* between open and closed (morality and society), dynamic and static (faith), are simply new implementations of the mobile–immobile dyad pervading Bergson’s work. The “creative emotion” linked to open morality is only another name for intuition, which was always both ethical and epistemological (as well as metaphysical), a sympathy with the object (that is also a partial coincidence with it). This language of the “open” and openness – overtly adopted for political ends by Karl Popper, covertly appropriated by Heidegger for ontological ends – is simultaneously ethical and naturalistic, ethical in its regard for alterity (an idea taken up later by Levinas), naturalistic in its attention to singularity (subsequently given an ethico-metaphysical treatment by Deleuze using Spinoza). Indeed, it is arguable that the separated thought of Levinas and Deleuze is simply the dissociation of tendencies that remain fused in Bergson.

**Antireductionism**

If one could summarize the philosophical effects of the Bergsonian value system, both implicit and explicit, it would have to be in terms of antireductionism. Be it the critique of psychophysics in *Time and Free Will*, mind–brain localization in *Matter and Memory*, or neo-Darwinian gradualism in *Creative Evolution*, Bergson’s intent was always to highlight the ineliminable remainder that refuses to be reduced (be it through a purported identity or a cause) to some nominated substratum, most often a mechanistic one. Such a reduction is a reduction, a diminution, because the substratum is always deemed to be less, to be merely mechanical, dumb, and inert. Bergsonism is a philosophy of levels of reality

that each have their own life and integrity. The “esprit de système” found in so much science (and philosophy), Bergson wrote, vainly tries to “embrace the totality of things in simple formulas.”64 A contrario, metaphysics for him must be the respect for, or sympathy with, the specificity of those levels of reality, for the complexity and excesses of nature. And with that respect comes a negative moment, namely the refusal to accommodate the intellect’s systematic desire to simplify, to extract, to reduce the many to the one. Crucially, however, Bergson pursues this cause not against science, but against scientism and mechanism. As an empiricist, he strongly believes that science and philosophy must cooperate, and Bergson was undoubtedly a philosopher of science in every sense of the term, some commentators even going so far as to describe him as a positivist.65

Ironically, however, this desire to cooperate with science, to attend to its data for its own singularities and nuances, has been taken by others as a sign of Bergson’s antirationalism. Significantly, where the English translation of Alan Sokal and Jean Bricmont’s Impostures Intellectuelles focuses exclusively on contemporary figures such as Lacan and Baudrillard in an attempt to expose the alleged scientific charlatanry of French postmodernism, the original French text has an additional chapter on Bergson, as he represents for them the historical source for the turn to irrationalism and anti-science in French twentieth-century thought.66 Contemporary French philosophy has indeed been a series of footnotes to Bergson, but according to Sokal and Bricmont they have been detrimental ones. But Sokal and Bricmont’s reading of Bergson is hugely weakened by falling for the usual, shallow stereotypes of his philosophy. Bergson’s extensive, long-term studies in psychology and biology are a testament to his respect for the methods and findings of the sciences. Of course, he never thought that philosophy itself could be reduced to science, but nor did he think that science could be reduced to philosophy (or language, or culture, or power). Philosophy is simply the space where we can, and have the duty to, interpret, or re-view, the underdetermined findings of science with new (metaphysical) ideas (rather than the lazy, mechanistic interpretations they usually acquire). The role of the philosopher is to engage with these scientific materials and provide them with the metaphysics – the vision of singularity – that they require.

64. Bergson, The Creative Mind, 207–8, in Œuvres, 1439. When Bergson proclaims “Je n’ai pas de système,” there is no tone of apology in his voice (Mélanges, 362, 940).
66. See Sokal and Bricmont, Impostures intellectuelles, ch. 11.
Philosophy has its freedoms, just as science has, but it is philosophy’s peculiar function to take the indeterminacy of the object as its object. Moreover, that indeterminacy is not the object of philosophy’s representation but, rather, philosophy simply is the indeterminacy immanent within the object. Freedom, indeterminacy, the underdetermined – these are only other names for the singularity and alterity that always attract Bergsonian thought, that are the indefinite end of its immanent regard (attention, sympathy, intuition). Freedom was the topic of Bergson’s first work, Time and Free Will, which argued against free will being spatialized as a decision between possible choices, for real freedom creates the illusion of preexisting choices retrospectively; freedom was also the core idea of Bergson’s most famous work, Creative Evolution, life being itself the freedom to create new forms of life; and freedom was also the final word of his most difficult work, Matter and Memory, which showed how freedom is always “intimately organized” with necessity and has its roots deep within it. Freedom is a given fact for Bergson: the core immediate datum that is named and renamed in his works, but that remains the abiding value throughout. It is equally the value at the heart of his method and of his metaphysics. It is the free act that is able to “break the circle” of intellectual aporia by multiplying (by seeing) the number of variables creating the paradox.}

Perhaps this freedom, then, also provides a solution to the paradox of Bergson himself, whose influence seems all the more pronounced just as it is refused (or it refuses) a clear place in history. It is possible that there was never a need to reverse history’s “damnation of Bergson,” for history’s neglect is perfectly adequate to the cause: Bergsonism = Freedom. Freedom does not exist in a vacuum: like its synonyms, Life, the Real, or duration, we must understand freedom to mean that which resists homogeneous space, that which resists static placement, that which resists historical identity. Durée itself is the freedom to resist. Consequently, Bergsonism is not the name of a philosophy, but the name of what resists (any one) naming. In this respect, Bergson’s place is a non-place, invisible as an influence, although all the more influential nevertheless on account of that invisibility. If this means that Bergson cannot be given a place in history, cannot be spatialized with clear lines of influence streaming from his work down to his theoretical progeny, then perhaps this is something that we ourselves should not try to resist either. Rather than a history of Bergson, we might look for a Bergsonian history instead.

68. See Bergson, Creative Evolution, 124, in Œuvres, 659–60.
HENRI BERGSON

MAJOR WORKS

I. NEO-KANTIANISM IN GERMANY

“Neo-Kantianism” is the name for a broad philosophical movement that sought to revive Kant’s philosophy in a radically changed philosophical and, more broadly, cultural landscape. It flourished especially in Germany, but also in France and, to a lesser extent, in Italy and a few other European countries (including Eastern Europe). It reached its apex between 1880 and 1920. In Germany, it grew out of a decidedly academic context – as opposed to “renegade” writers such as Kierkegaard, Schopenhauer, and Nietzsche, who disdained academic philosophy – although its origins lie, in part, in sociopolitical discourses stemming from the societal problems posed by the Industrial Revolution and the worker question (Arbeiterfrage). The other background is the challenge posed to philosophy by the impressively and quickly progressing natural sciences in the era of positivism. Both of these tendencies arose around the middle of the nineteenth century, in a time when, as was often noted, Hegel’s system had “collapsed.” In both cases, to be elucidated below, the call was issued, “Back to Kant!”

1. Sebastian Luft is primarily responsible for the sections dealing with neo-Kantianism in Germany, while Fabien Capeillères is the primary author of the sections dealing with neo-Kantianism in France.
The term “neo-Kantianism” was not used until the late 1880s, and then in a polemical fashion by its critics. The neo-Kantian movement, however, was (with the possible exception of the Marburg School), far from unitary and cohesive, as evidenced by the alternative names for this movement: (neo-)Criticism and neo-Fichteanism, among others. But around 1900, “neo-Kantianism” stuck. The demarcations concerning who belongs to this movement and who does not are to this day contested. Although it was a very broad movement, thinkers who might well be counted among its members – Nicolai Hartmann, Wilhelm Dilthey, or Edmund Husserl, for instance – are rarely included. In Germany, the neo-Kantian movement crystallized around the two “power centers”: the “Marburg School” in Marburg, a small university town in the state of Hessa north of Frankfurt, and the “Southwest School” at the universities of Freiburg and Heidelberg.

Given its academic location – all the neo-Kantians were university professors or professional academics – the neo-Kantian movement is also a history of successful university politics: neo-Kantianism in Germany soon exerted its power over nearly all German-speaking universities (including Switzerland and Austria), and its representatives were heavily involved in shaping hiring policies and academic curricula. Around the turn of nineteenth century, neo-Kantianism had attained what Jürgen Habermas once called an “imperial stance” that lasted until its near collapse after the First World War and its total disintegration in Nazi Germany as of 1933. But its dissolution was in itself part of the legacy of neo-Kantianism: many of the leading neo-Kantians were Jews and, not surprisingly, prosecuted by Hitler’s fascist regime. The removal of the main neo-Kantian philosophers from academia and from German culture – most of them were left-wing liberals anchoring the Weimar Republic in the values of the Enlightenment – was a consequence that reflected more than just official anti-Semitic policies. To many contemporaries, and Heidegger is here a good example of this attitude, the neo-Kantians represented not only a dated model of philosophy; in addition, their liberal politics, also diffusely associated with “Jewishness,” reflected a politics whose time had passed. When Heidegger, in a letter from 1929, railed against the “jewification of the German spirit” (Verjudung des deutschen Geistes),

(Detroit, MI: Wayne State University Press, 1978). Brief overviews of the neo-Kantian movement can be found in Hans-Ludwig Ollig, Der Neukantianismus (Stuttgart: Metzler, 1979), and Manfred Pascher, Einführung in den Neukantianismus (Munich: UTB, 1997). A full-scale account of the neo-Kantian movement does not exist to this day, although certain thinkers or schools have been covered in greater detail. For work on the Marburg School, for example, cf. the important works by Holzhey (see bibliography), and for an historical account, cf. Ulrich Sieg, Aufstieg und Niedergang des Marburger Neukantianismus: Die Geschichte einer philosophischen Schulgemeinschaft (Würzburg: Königshausen & Neumann, 1994). The account here is indebted to and draws from all of these sources.
we see that “to be Jewish” was more than a creed; it was a philosophical as well as a political “lifestyle.”

Due to their dominant position between 1890 and 1914, the neo-Kantians were harshly attacked by nearly all the other philosophical movements that emerged after the First World War, including phenomenology, Lebensphilosophie, existentialism (Jaspers, the early Heidegger), and logical positivism. This critique of what was perceived as the dominant philosophical school in Germany became so much a part of the self-definition of these new tendencies that many, if not most, new philosophical movements and ideas cannot be understood without at least a basic knowledge of the neo-Kantian paradigms and theories that they argued against. Defining one’s own project vis-à-vis the neo-Kantians became almost the modus operandi in many a philosopher’s work, and we see this in Husserl’s transcendental–eidetic phenomenology, Scheler’s value ethics, Heidegger’s hermeneutics of facticity, and Carnap’s and the Vienna School’s attempt at a “truly” scientific philosophy.

In short, the history of late-nineteenth- and early-twentieth-century philosophy cannot be adequately assessed without knowledge of neo-Kantianism. It is curious, then, to note that for over forty years (essentially after the Second World War), neo-Kantianism has been largely ignored by scholarship. As of the 1980s, however, increasing attention in Europe has been directed toward the work of the neo-Kantians and the importance of neo-Kantianism has also been brought to the fore by some scholars in North America. It is to be anticipated that neo-Kantianism will also become a widely discussed field of research in the next decade in North America for scholars working in the history of philosophy, history and philosophy of science, philosophy of culture, and “continental philosophy,” broadly construed. This revival is evidenced by a good number of international conferences held in the past decade not only in Germany, France, and Italy, but also in the United States.

Despite the important role of neo-Kantianism in the philosophical landscape of the time, it is, ironically, hard to point to any seminal works by any of the major figures. Of these major figures, Hermann Cohen, Paul Natorp, Wilhelm Windelband, and Heinrich Rickert were the most famous, along with Ernst Cassirer, whose writings were widely received and translated. This is not to say that the literary output was not most impressive: all of these philosophers wrote books at the rate at which most academics today write articles. Nevertheless, some of the systematic approaches of the neo-Kantians have to be pieced together through a synopsis of several works. This dearth of “seminal works” also has philosophical reasons; it has to do with the nature of the neo-Kantian movement itself.

and the type of work that it did and promoted – despite all differences of outlook and emphasis. Hence, to understand the distinct character of the neo-Kantian movement, let us return to its origins in the then-contemporary political thought and natural science.

Friedrich Albert Lange (1828–75) and Otto Liebmann (1840–1912) might both be considered “fathers” of neo-Kantianism. Lange published two works in 1865, which became defining works for the nascent movement, *Die Arbeiterfrage* (The worker question) and *Geschichte des Materialismus* (History of Materialism), while Liebmann’s *Kant und die Epigonen* (1865) was very popular at the time. Both of Lange’s books tackle the issue of the modern *conditio humana* and the problems arising from humankind’s situation in the industrial age, which posed many new and hitherto unknown challenges (mass society, the problem of the working class, etc.). Lange also participated in the Vereinstag Deutscher Arbeitervereine, the German Workers’ Association, an ancestor of the German Social Democratic Party (the SPD). However, as the title *Geschichte des Materialismus* indicates, Lange attempted to place these concrete problems into a larger philosophical context. The problem was, in his opinion, “materialism” and its disdain of human spirit and “idealistic” values in a broadly conceived sense of the term, along with materialism’s tendency to reduce humans to functioning wheels in the machinery of modern industrial society. Hence, a decidedly political sense of “idealism” runs through neo-Kantianism. This tendency led to interesting and – judging from political debate among social democrats worldwide – still valid social-democratic ideas, which took hold especially in the Marburg School. Both Hermann Cohen and Natorp, for example, promoted what they called “social idealism” as an explicit rejection of a socialism stemming from the Marxist tradition. Thus, in reconstructing the origins of neo-Kantianism, one needs to keep in mind this political background and the societal context that the neo-Kantians attempted to address in a Kantian vein, while Marxist ideas were developing in elsewhere in Germany, England, and Russia.

The other origin, which connects more directly to Kant and hence constitutes the general alliance with the Sage of Königsberg and “Kantianism” in a broader sense, came, interestingly enough, from within the natural sciences. Here scientists confronted the problems that arose once natural science became “scientific” in the modern sense of the term, and the speculative Naturphilosophie of the German Idealists and the Romantics, especially Schelling, became an object of ridicule. It was in fact a scientist – Hermann von Helmholtz (1821–94) – who, in his physical and optical experiments, discovered the influence of the observer on that which was being observed. In his famous speech *Über das

---

*4. For a discussion of Schelling, see the essay by Joseph P. Lawrence in *The History of Continental Philosophy: Volume 1*.
Sehen des Menschen (On man’s seeing, 1855), he attempted to formulate these ideas in Kantian terms, claiming that “all cognition of reality must be derived from experience.” In this manner, he thought that his study of the physiology of the senses had confirmed in a scientific manner Kant’s “organization of the mind,” namely “that the manner of our perceptions is equally determined by the nature of our senses as through external objects.” Hence, experimental natural science seemed to confirm Kant’s transcendental turn, without, however, the idealist baggage that burdened both Kant and his idealist aftermath. Early neo-Kantian philosophers such as Cohen soon took up this challenge and placed Helmholtz’s ideas on a firmer philosophical foundation. While they welcomed the fact that an experimental scientist had made the way “back to Kant,” they felt that this move took place in the (problematic) spirit of naturalism. As a result, the scientists’ return to Kant received an enthusiastic reception on the part of philosophers of the Kantian stripe, but the neo-Kantians also felt that this scientific return to Kant needed to be monitored carefully. The close connections to the sciences became one of the trademarks of neo-Kantianism. In an unfavorable reading, which, however, became popular (and which one still finds quoted today), neo-Kantianism was criticized in this vein for reducing philosophy to the “handmaiden of the sciences.” While this description is, as we shall see, unfair, it is true that the proximity to scientific endeavors and a reflection on the status and nature of the sciences – both the natural and the human sciences – became a dominant characteristic that defined and popularized neo-Kantian ideas.

Helmholtz’s work exemplifies the rehabilitation of Kantian philosophy that emerged from discussions within the sciences and the philosophy of science. The call to return to Kant was soon taken up by philosophers or those – such as Cohen, who started out as an experimental psychologist – who turned to philosophy under this influence. Yet, once Kant had become re-established as an eminent philosophical figure with whom to approach epistemological questions in the sciences, another field of activity emerged that also helped to strengthen the overall stance of the neo-Kantian movement within Germany, namely Kant philology and Kant scholarship. With the development of rigorous philology in the nineteenth century and new editorial techniques arose the inauguration of critical Kant editions that adhered to these new standards. “Complete Works” editions had up to then either not existed or were, for example, in the notorious case of Hegel, not philologically sound in the light of contemporary editorial practices. Under the influence of Wilhelm Dilthey, the Kant edition initiated by the Berlin Academy of the Sciences, begun in 1900 and staffed by philosophers in the neo-Kantian vicinity – Erich Adickes, Benno Erdmann, and others – stands (for the

most part) the test of modern editorial philology. The importance of this editorial work for the dissemination of Kant’s philosophy cannot be overemphasized.

In addition to the Berlin edition, the late nineteenth century saw an impressive proliferation of commentaries on Kant’s works. Some of the classical Kant scholarship produced then – commentaries by Cassirer, Cohen, Hans Vaihinger, and others – are to this day classics of Kant research. These basic readings defined the main avenues in which Kant would subsequently be read. In other words, what the neo-Kantians achieved, actively and conscientiously, was a canonization of Kant as he is perceived today: as the towering figure in modern philosophy. This is not to say that this status is not due to Kant’s philosophy itself; however, a writer needs a functioning “transmission belt” that conveys one’s thoughts to the readers. This is what the neo-Kantians achieved in an exemplary manner. While this might seem tangential to the actual philosophical importance of neo-Kantianism, it is indeed not to be dismissed, as it established both Kant in the position seen today and, in turn, the neo-Kantians as the “true” heirs of this seminal figure in the history of Western philosophy.

Since the neo-Kantian movement is anything but a unified school, we shall now turn to the Marburg School and the Southwestern School, respectively, to discuss their mutual contributions to modern philosophy. This short historical overview will have to confine itself to these two main groups.6

The Marburg School: Hermann Cohen, Paul Natorp, Ernst Cassirer

The Marburg School is the most “compact” group within neo-Kantianism, judging from its self-understanding and outward projection. This unity is due to the method that its founder, Hermann Cohen (1842–1918), developed out of his Kant interpretation. This method is called the Transcendental Method, in recognition of Kant’s method, although the term is itself not to be found in Kant’s oeuvre. This focus on method has led some to accuse the Marburg School of a “methodological fanaticism,” although we shall see that the method itself plays a crucial role in the Marburg School’s epistemological paradigm. Surrounded by a very

---

6. As mentioned, most philosophy departments in Germany and Austria were dominated by neo-Kantians and to do justice to this movement as a whole one would have to discuss figures whose names can merely be listed here: the largely independent Richard Hönsigwald (1875–1947) in Breslau (Gadamer’s first teacher there), later Munich; the critical realist Alois Riehl in Graz (1844–1924); the philosopher of law Leonard Nelson (1882–1927); Jonas Cohn (1869–1947) in Freiburg; Bruno Bauch (1877–1942), the editor of Kant Studien; and for the youngest generation of neo-Kantians after the Second World War, sometimes referred to as “neo-neo-Kantians” (a somewhat excessive title), Richard Zocher (1887–1976), Hans Wagner (1917–2000), and Wolfgang Cramer (1901–74), father of Konrad Cramer (1933–).

wide, national as well as international, circle of pupils and adherents, the main figures of this group are Hermann Cohen, Paul Natorp (1854–1924) and Ernst Cassirer (1874–1945). Cassirer is sometimes not counted as belonging to the Marburg School, although he is acknowledged to be one of the most significant philosophers who emerged from the neo-Kantian tradition as a whole. Unlike Cohen and Natorp, who were professorial colleagues at the University of Marburg and formed a unique coalition of great influence both within and outside the university, Cassirer was a generation younger and never actually taught in Marburg. The offspring of a rich Jewish family with relatives in Berlin, Munich, and Vienna, Cassirer rather disliked small-town life such as that of Marburg, a city with a population of some 30,000 at the time. Still, for reasons to be discussed, he deserves to be counted among the Marburg School and its method.

Cohen was by all accounts the dominant figure of this school; being also a charismatic and irritable character, he was the main attraction for students who, after his arrival in Marburg in 1873, soon flocked around him. His ally Natorp was initially one of them, but soon secured his own position at the university, first as a librarian, then later, with Cohen’s mentorship, as a professor. Cohen taught in Marburg until his retirement in 1912. He spent his last years living in Berlin teaching at the Lehranstalt für die Wissenschaft des Judentums (Academy for the Science of Judaism), where he taught mainly on Judaism and the philosophy of religion and was influential on a newer generation of thinkers such as Franz Rosenzweig and Martin Buber.

Cohen first made a name for himself through his influential commentaries on Kant’s three Critiques. The commentary on the First Critique, entitled Kants Theorie der Erfahrung (Kant’s theory of experience), became especially influential for Kant scholarship as well as for the popularization of the “Marburg Method.” Once these three voluminous commentaries were completed (1912), Cohen turned to composing his own “System of Philosophy” in three volumes analogous to Kant’s Critiques – Logik der Reinen Erkenntnis (Logic of pure

8. As will become evident below in the treatment of Cohen’s closest collaborator, Natorp, they seemed to have, as eyewitnesses report, polar opposite characters. Whereas Natorp was generally perceived as solid and reliable, Cohen seemed to have a choleric temper, which he did not even attempt to keep under wraps and which was directed at different people and peoples. To give just one example, Cohen, who discovered his Jewish roots after the Dreyfus affair, despised assimilated Jews and did not hold back judgment. One person whom he vilified in this way was, for instance, Husserl; see quotations from Cohen’s correspondence with Natorp in Sebastian Luft, “Reconstruction and Reduction: Natorp and Husserl on Method and the Question of Subjectivity,” in Neo-Kantianism in Contemporary Philosophy, Sebastian Luft and Rudolf Makkreel (eds) (Bloomington, IN: Indiana University Press, 2009), 84–5 n.3.

cognition), *Ethik des Reinen Willens* (Ethics of pure willing), and *Ästhetik des Reinen Gefühls* (Aesthetic of pure sentiment) – which appeared between 1902 and 1912. A transitional work, but from a developmental standpoint crucial, since it allowed Cohen to explicitly formulate his “transcendental method” (the centerpiece of the Marburg School), was the small study *Das Prinzip der Infinitesimal-Methode und seine Geschichte* (The principle of the infinitesimal method and its history). Cohen’s system was supposed to be rounded off by a fourth part, a psychology explicating the “unity of cultural consciousness,” but Cohen passed away before beginning it. Shortly before his death, Cohen completed his late manuscript on religion, *Religion der Vernunft aus den Quellen des Judentums* (Religion of reason out of the sources of Judaism), which was published posthumously and recently has attracted considerable attention in the philosophy of religion and Jewish studies.

To understand Cohen’s original approach culminating in the “transcendental method,” one must first assess his Kant interpretation. The thesis that Cohen boldly puts forth claims that with his Copernican turn Kant founded nothing less than a new concept of *experience*. Experience is not mere perception or intuition, but establishes *laws* about that which is experienced. In other words, according to Cohen, the experience Kant is talking about is that of the *scientist*. Cohen famously declares that Kant conceived his revolutionary Copernican turn as he meditated on Newton’s *Principia Mathematica*. “Not the stars in the heavens,” he writes, “are the phenomena, but the astronomical data that the scientist establishes, these are the contents of experience.”

10. The experience of the scientist, in establishing laws of nature, thereby *constructs* nature as a mathematical universe. For Kant, Newtonian physics exists and, because of its mathematical method, is able to give rise to synthetic judgments *a priori*. In Cohen’s interpretation, Kant’s question concerning the transcendental condition of the possibility of *a priori* cognition is really concerned with the question of how those *a priori* truths established in natural (physical) science become possible and how they can be justified. The accepted cornerstone – which Kant called the *factum* – that philosophy has to clarify is the “factum of the sciences” (*das Faktum der Wissenschaften*) in which reality is constructed. Taking cues from the analytic method Kant pursues in the *Prolegomena*, this entails that philosophy’s job is to *reconstruct* the conditions of possibility through which this *factum* comes about.

The manner in which Cohen recasts Kant’s transcendental turn is, essentially, by rejecting the two stems doctrine (concepts and intuitions). His solution is Hegelian, as he grounds all knowledge and experience of reality in *a priori* concepts. Reality as experienced is *constructed* through and through, and

---
this construction occurs through the use of concepts that are applied to what is experienced. Cohen grounds this premise on the discovery of the infinitesimal in mathematics, according to which all entities are constructed in thought on the basis of the category of the infinitesimally small. Since these concepts are a priori (Cohen prefers the word “pure”), reality as we encounter it is constructed in pure thought. The task of philosophy is to lay the foundations of objective knowledge in pure thought, but the laying of these foundations is modified by scientific progress. That is, scientific progress makes new concepts necessary, and since all scientific cognition is in principle falsifiable, the foundations themselves are subject to constant re-evaluation and scrutiny. Philosophy is no longer a science of ultimate foundations (Grundlagenwissenschaft) – the traditional task of metaphysics prior to Kant’s transcendental turn – but is a science of laying foundations (Grundlegungswissenschaft) in “pure thought.”

Cohen’s transcendental method grounds all knowledge of the world in pure thought. But Cohen’s restatement of Kant’s transcendental idealism operates on the basis of an unacknowledged Hegelian influence. This influence consists in the notion that the system of categories is not a “static” table of concepts, established once and for all, but something that evolves over time. This evolution, now departing from Hegelian idealism, is not that of absolute spirit but of scientific progress “on the ground.” Theoretical philosophy becomes a logic of categories that have their origin in pure thought, and epistemology is recast as a “logic of origin” (Ursprungslogik), in which self-generated categories in thought (as their origin) become constituted as functional (not substantial) categories, forming a web of relations as a matrix for orientation in thought. This is to say that what Cassirer later formulated in his reconstruction of the shift from ancient to modern science – the move from a substance to a functional ontology – in effect already takes place in Cohen’s logic. Cohen’s late philosophy in his logic of origin differs from Hegel’s, accordingly, in that thought categories lay the foundations for scientific thought. This logic is not, in other words, a “self-constructing path,” as Hegel calls his method, but an a priori foundation of scientific thinking in an a priori category system that is itself dynamic and ever-evolving. For Cohen, philosophy is the justification of the factum that is already established (the mathematical sciences) and reconstructs their constructive activity, thereby justifying the knowledge claims of the scientist.

This abbreviated discussion of Cohen’s philosophical system – his ethics, aesthetics, and political philosophy have been passed over – has focused on

the transcendental method that forms the nodal point around which the other two significant thinkers of the Marburg School constructed their systems. The principle of human beings’ construction of reality provides the crucial element for understanding this school. Reality, insofar as it is entirely constructed by the activities of the human spirit, of which scientific thought is merely one, albeit its most dignified, application, is the reality of humanity’s cultural activities. The Marburg School is in this sense unified as outlining an encompassing transcendental philosophy of culture.13 In the Marburg reading, to quote Cassirer, Kant’s critique of reason is recast as a “critique of culture.”

Natorp, after wavering between pursuing a career as a classical philologist, musician, or philosopher, finally came to focus on philosophy and moved to Marburg to study under Cohen. Cohen soon incorporated him into his growing group of collaborators. An avid student of the natural sciences and mathematics, Natorp was probably the most erudite member of this school. He wrote on ancient philosophy, ancient and modern science, social and political philosophy, and, last but not least – since his Chair was also dedicated to pedagogy – pedagogical philosophy, especially that of Heinrich Pestalozzi. A more agreeable character14 and also a lucid writer – Cohen’s writings were considered dense and difficult – Natorp helped the Marburg School gain a broader acceptance and popularity than Cohen himself would have been able to achieve. Given the openly anti-Semitic sentiment in large parts of German society and especially German academia, it is likely that, without Natorp on his side, Cohen, clearly the most innovative neo-Kantian, would have remained isolated and far less influential in the academic landscape of his time. The Marburg School must be seen as constituted by both individuals: Cohen, sometimes referred to as “minister of the exterior,” and Natorp, dubbed “minister of the interior.” Together they formed a powerful alliance and a functioning collaboration that lasted more than a quarter century.15

In addition to his writings on figures in the history of philosophy – most notably Plato – and on special problems in the philosophy of science, Natorp

---

14. Cf. footnote 8 above for an illustration of Cohen’s character. For an example of Natorp’s greater effect on the scientific community of his day, one can point out that nearly all statements of the Marburg School that were received in the philosophical and wider public stemmed from Natorp’s pen; for the logical method of the Marburg School, for example his Die logischen Grundlagen der exakten Wissenschaften (actually Cohen’s domain), and for a general, and popular, expression of the Marburg School as a whole, one should note that Natorp’s Philosophie: Ihr Problem und ihre Probleme (discussed in the main text above), was first published in 1911 and was re-edited four times during Natorp’s lifetime.
was also the only notable neo-Kantian who was able to write an unusually brief (150 pages) and bestselling treatise: Philosophie: Ihr Problem und Ihre Probleme (Philosophy: its problem and its problems). This text, which is a lucid “mission statement” of Marburg neo-Kantianism, has perhaps rightfully been considered the Programmschrift of the entire neo-Kantian movement. Yet Natorp’s initial fame was based on his influential 1903 work on Plato: Platos Ideenlehre: Eine Einführung in den Idealismus (Plato’s theory of ideas: an introduction to idealism). As the title indicates, Natorp’s peculiar interpretation concerning Plato’s theory of the Forms is that it is really an epistemological position – idealism – rather than a metaphysical one. More specifically, Natorp claims, Plato’s ideas are nothing but natural laws that govern physical entities. Laws are that which make things what they are, what is “valid” about them. Soon after its publication, this bold thesis was harshly criticized, since it seems to read Newtonian physics and Kant’s transcendental turn back into Plato’s premodern thought; but given the close alliance with modern science, this reading is perhaps less surprising stemming from a Marburger than it first appears. In this sense, Natorp’s Plato is less a work of Plato exegesis than a restatement of the type of idealism professed in the Marburg School.16

Natorp’s most substantial philosophical contribution to the Marburg School was his psychology and concomitant theory of subjectivity. Dismissed by Cohen – although not openly – Natorp’s idea of a philosophical psychology started out as a side project when he published in 1888 his short Einleitung in die Psychologie nach Kritischer Methode (Introduction to psychology according to critical method). This later turned into a full-fledged, yet ultimately abandoned, project when he published the “second edition” Allgemeine Psychologie nach Kritischer Methode (General psychology according to critical method), which had grown to 350 pages, more than three times its original size. In 1887, he published the influential article “Ueber Objective und Subjective Begründung der Erkenntniss” (On objective and subjective grounding of cognition), where he systematically laid out his idea of a philosophical – not experimental, as in the Brentano and Wundt Schools – psychology.

Natorp’s psychology grew directly out of problems that he saw with the transcendental method. If the latter is about constructing reality, all that this method accounts for philosophically are the finished “products” such as scientific theories; these are the “outcome” of humanity’s creative activity. In other words, all

that philosophy was to do was justify after the fact what the sciences were “always already” doing. What was missing was an account of the creative, subjective life that creates these cultural products. This should be, Natorp asserted, the task of a critical psychology. Its purpose was, more precisely, to recover this creative, subjective life by going in the opposite direction of the transcendental, constructive method. That is to say, it should proceed reconstructively from the finished products back to the creative life that was involved in their constructive processes. Metaphorically, Natorp described the psychological, reconstructive method as a “minus” vis-à-vis a “plus” direction on one and the same line. What was to be regained would be this active, dynamic life that had come to a standstill once cultural products had been formed. This method should remain faithful to the essentially dynamic life of consciousness. All other psychological approaches treated consciousness with objectifying methods; when reading accounts of consciousness, Natorp complains, he feels as though he is walking through a morgue instead of studying bodies filled with life. The reconstructive method was the method to finally overcome this problem. At the same time, given the metaphor of the plus and minus directions, it is clear that the reconstructive method is entirely dependent on the transcendental method; Natorp calls it its “inverse” application. That is, the reconstructive method of psychology serves a transcendental–philosophical function within the overall Marburg Method that was to account for subjectivity in all of its dimensions – in its cultural products and in its dynamic status nascendi – hence, psychology “according to critical method.” Natorp’s intention was not that this should replace or be in competition with experimental psychologies, but that it was intended to add a piece within the overall transcendental epistemology that the Marburg School had taken over from Kant, but which would remain incomplete unless this “subjective” part was supplied.

The subjective life, once it had been discovered through reconstruction, Natorp frames in terms of what he calls “conscious-ity” (Bewusstheit). Through this neologism he attempted to capture the very fact of “being conscious” of conscious life, with its conscious contents. Moreover, his reconstructive method would proceed genetically, that is, it would provide not static laws (of objectifying science), but genetic accounts of the dynamic life of consciousness, going down to the origins of consciousness where one cannot even speak of “consciousness” any longer. In his late work, Natorp simply calls it “life.” Other than these principal philosophical insights, however, the actual results of Natorp’s psychology were meager and Natorp himself abandoned the opposition between objective

17. Paul Natorp, Allgemeine Psychologie nach Kritischer Methode (Tübingen: Mohr/Siebeck, 1912), 16, 31. As Natorp explains there, an example of such “objectivist” treatment is the application of the mechanistic model of natural causality to the sphere of the psyche.
and subjective methods in favor of a more deeply grounded “all-method” that synthesized both subjectivist and objectivist methods. In his somewhat idiosyncratic late philosophical system, Natorp was seen to have departed from his Marburg roots (as some critics, clearly under the influence of Heidegger, have remarked), and given this verdict, Natorp’s late system has been vastly underappreciated. Challenging the fundamental assumptions of Kant’s philosophy as well as that of the Marburg School as a whole, the question as to how one should ultimately interpret this school turns on the issue of whether it represents the final fulfillment of Kant’s intentions if one spells out the implications of transcendental philosophy, or whether it is a radical departure from the Kantian paradigms. At any rate, his psychological method and his account of subjectivity have had significant impact on other theories, including Husserl’s phenomenology and Heidegger’s fundamental ontology of Dasein.

Cohen and Natorp formed such a close alliance that differences between them tended to remain subdued and unarticulated (either in public or even between them). When Cohen left Marburg for Berlin in 1912, Natorp, who remained in Marburg until his death in 1924, experienced something of a renaissance. In his lectures he developed his original philosophical system, which he worked on until his last days. In his late thought he wanted to form an all-encompassing method, incorporating mystical elements into a totalizing philosophical system. The manuscript, which was prepared for publication by Natorp himself, remained unpublished until 1954. There has been some speculation that the publication was discouraged at the time by Heidegger, who was professor in Marburg as of 1921 and who was familiar with Natorp’s latest developments. In fact, Natorp’s last intuitions, which focused on the simple and original fact of being simply being – the basic factum of the “es gibt” – bear some resemblance to Heidegger’s Seinsfrage.

The most important and also most influential individual for twentieth-century philosophy stemming from the Marburg School was undoubtedly Ernst Cassirer. He ingeniously picked up the main lines from his teachers Cohen and Natorp, weaving them into his own philosophical system, while incorporating

---

18. Cf., for example, Christoph Von Wolzogen, *Die Autonome Relation: Zum Problem der Beziehung im Spätwerk Paul Natorps; Ein Beitrag zur Geschichte der Theorien der Relation* (Würzburg and Amsterdam: Rodopi, 1984), who also lists examples of such readings (von Wolzogen himself reads Natorp in this Heideggerian manner as well).
20. Cf. von Wolzogen, *Die Autonome Relation*, who lists some quotations from Heidegger’s correspondence in support of this hypothesis. It would be, ironically, Gadamer, pupil of both Natorp and Heidegger, who later favored the publication of this text, as witnessed by his laudatory introduction “Paul Natorp,” in Natorp, *Philosophische Systematik*, xi–xviii.
influences from such diverse fields as linguistics, anthropology, and other (“hard”) sciences, such as contemporary physics. He was the most original and also most prolific offspring of the Marburg School. Coming from a wealthy family, he neither aspired to be a university professor, nor were his chances as a Jew ever very good in German academia at the time. Nevertheless, he was considered one of the strongest of his generation, earning his first recognition as a historian of philosophy through his studies on Leibniz and Renaissance and early modern thought. He was also involved in new editions of the works of Leibniz and Kant. His monograph, *Kant’s Leben und Lehre (Kant’s Life and Thought)*, originally intended as the introductory essay to the Kant edition but not published until after the First World War, has become a classic in Kant scholarship, while his four-volume *Das Erkenntnisproblem in der Philosophie und Wissenschaft der Neueren Zeit* (The problem of knowledge in modern philosophy and science) is an excellent example of neo-Kantian Problemgeschichte.\(^{21}\) One would, however, not do justice to his philosophical originality – which unfortunately has sometimes been the case – were he to be restricted to his early work on the history of philosophy.

After the First World War, Cassirer did receive a call as professor (*Ordinarius*) to the newly founded university of Hamburg, where he became Rektor (president) in 1929–30, the highest academic position that any Jew ever occupied in Germany. Quickly reading the signs of the times, he and his extended family left Nazi Germany in 1933. Cassirer emigrated first to England, then to Sweden, where he fled from the Nazis anew as they invaded that country in 1941. He was then invited to a visiting professorship at Yale, where he stayed for three years. In 1944, he assumed another visiting appointment at Columbia. Already in failing health and highly distressed by the war reports, he died of a heart attack on the streets of New York in 1945, shortly before the end of the Second World War. It has been speculated that his influence, especially in the US, would have been considerably stronger had he lived to see his original work, published in German and only slowly becoming translated, come to fruition in the New World.\(^{22}\)

Sometimes referred to as a watershed event in twentieth-century philosophy, the famous encounter between Cassirer and Heidegger in the Swiss town of Davos in 1929 must be mentioned.\(^{23}\) During the annually held *Hochschultage*

\(^{21}\) See the section on *Problemgeschichte* below.

\(^{23}\) There is a smattering of literature on this event, beginning – at least in recent scholarship – with Michael Friedman, *A Parting of the Ways: Carnap, Cassirer, and Heidegger* (Chicago, IL: Open Court, 2000) Cf. also the recent article by Gordon, “Neo-Kantianism and the Politics of Enlightenment.”
devoted to intellectual topics – in 1929, Kant’s philosophy and its interpretation – Heidegger and Cassirer conducted a well-attended dispute regarding their different interpretations of Kant’s philosophy. In truth, it amounted to a showdown between the two most prominent philosophers of the time: Heidegger, who had just published his groundbreaking *Being and Time* (1927); and Cassirer, who had just published the third volume of his philosophical system, the voluminous *Philosophy of Symbolic Forms*. While formally centering on the interpretation of Kant, the dispute was really about what, according to each, ought be considered the main purpose and intention of philosophy at large: for Cassirer, liberating the human being from his confinement in primitive and un-enlightened existence; for Heidegger, bringing human Dasein back into the “harshness and harshness of fate.” Given the events that would ensue in Germany in 1933, Heidegger’s role in them, and the fascist ideology the German people came to embrace – the country of the *Dichter und Denker* – it is not hard to see the wider and more profound implications of this encounter. This is not to say that these implications were clear at the time to those in the audience. However, in hindsight, this encounter bears an almost eerie premonition of what was to come. The reasons why contemporaries believed that Cassirer had been so thoroughly bested by Heidegger cannot be spelled out straightforwardly either, but can perhaps best be described as “atmospherical.” While the participants of the conference spent all day indoors debating, and dressed formally for the evening reception, Heidegger spent the days (presumably when he was not part of the program) skiing and showed up at the reception in his ski overalls, in total disregard of social etiquette. The “hardness of being” of the young and energetic Heidegger clashed against the bourgeois Cassirer, who seemed to be “in agreement with everything,” implying weak compromises reminiscent of the politics of the Weimar Republic, which compromised itself out of existence.

Regarding Cassirer’s character, it has been described as conciliatory and “Olympian,” which extends to his writings. These display a remarkable lucidity and, at the same time, philosophical modesty. At times the philosophical core of his argument can be lost in the wealth of historical erudition that accompanies

24. This dispute is published as “Davos Disputation Between Ernst Cassirer and Martin Heidegger,” in Martin Heidegger, *Kant and the Problem of Metaphysics*, Richard Taft (trans.) (Bloomington, IN: Indiana University Press, 1997). For important essays on this encounter, see Dominic Kaegi and Enno Rudolph (eds), *Cassirer–Heidegger: 70 Jahre Davoser Disputation* (Hamburg: Felix Meiner, 2000). Among those who travelled to Davos to witness this encounter were Rudolf Carnap, Eugen Fink, Herbert Marcuse, Joachim Ritter, Leo Strauss, Leon Brunschvicg, Emmanuel Levinas, Jean Cavaillé, and Maurice de Gandillac.  
25. In a telling anecdote, reported in Gordon, “Neo-Kantianism and the Politics of Enlightenment,” 223ff., students put on a mock debate between Heidegger and Cassirer one evening. Cassirer was played by the young Levinas, who supposedly let flour (= dust) trickle out of his sleeves, repeating the phrase “Ich bin mit allem einverstanden” (I agree with everything).
his accounts. Most of his writings focus on other thinkers and their theories, and he is content to raise philosophical issues in those contexts. Cassirer’s first original contribution to critical philosophy, which came fairly late in this young shooting star’s career, was his *Substanz- und Funktionsbegriff* (*Substance and Function*),\(^{26}\) which appears to discuss a seemingly remote problem in scientific concept formation, but in fact raises an issue that will be the cornerstone of his philosophical systematic: the distinction between a substantial and functional ontology and its epistemological implications. This basic insight, stemming from the groundwork laid by Cohen, was cashed out in his three-volume *Philosophy of Symbolic Forms*. In addition to these substantial tomes, Cassirer wrote the four-volume study *The Problem of Knowledge in Modern Philosophy* and a wide array of articles and smaller studies on mythology, linguistics, modern physics, and intellectual history. Once in the United States, he summarized his system in the popular book *An Essay on Man* (written in English). His last work, *The Myth of the State*, offers a penetrating critique of modern fascism based on his interpretation of the role of myth in the hierarchy of cultural achievements and its relation to modern totalitarianism.

Returning to his first systematic work, *Substance and Function*, Cassirer, taking his cue from Cohen’s paradigm of *construction*, traced the constructive activity of the human mind in the distinction between substantive and functional concepts in scientific nomenclature. Opposed to a substantial paradigm in which, following Aristotle’s substance ontology, concepts mirror things as substances, a new type of concept formation has taken hold in modernity: that of functional concepts. Functional concepts place the objects that they mirror into a *function*, as in mathematical functions (*f(x)*). What functional concepts mirror, then, are not substantial things, but functions, that is relations. Being a function means that the functional concept formation actually *constructs* the object of a particular scientific endeavor. Hence, Cassirer discovered Cohen’s constructive principle at the heart of scientific concept formation itself.

Relativitätstheorie (1920; published in English as “On Einstein’s Theory of Relativity: Considered from the Epistemological Standpoint” as a supplement to Substance and Function) identified the postulate of general covariance – that the laws of physics are the same in all reference frames, hence that the objects of fundamental physics must be represented as tensor expressions, valid in all coordinate systems – as a novel principle of objectifying unity, a significant further step away from anthropomorphic thing concepts toward an abstract and purely geometrical concept of object. Cassirer’s epistemological examination of quantum mechanics, Determinism and Indeterminism in Modern Physics, written while in exile in Sweden in 1936, points to Heisenberg’s uncertainty relations and quantum statistics as even more striking transformations of the concept of object, where the old classical notions of physical state and individual identity are transformed, acquiring functional form. The thrust of each of these two works is an insistence that the concept of object in physics is subordinate to that of physical law, and accordingly that “objectivity or objective reality, is attained only because and insofar as there is conformity to law – not vice versa.”

But this was only Cassirer’s first step. For, Cassirer asserted, such a constructive activity is not present just in scientific concept formation – an activity of the human spirit, to be sure – but in all cultural activities. Construction is, in other words, a form of interpretation of something that could be completely different depending on the manner in which it is constructed. The sine curve (Cassirer’s example) in the mathematical context is, in an artistic manner of seeing, an ornament, and may represent any number of other contexts. Prior to such an interpretation – any interpretation – the thing is simply nothing for us. What a thing is depends on its context, and the context is something constructed through the human mind. Cassirer calls the agent of this activity spirit. That which is constructed, or the medium of construction, he calls, nodding to Kant’s “Transcendental Aesthetic,” a form. There is no simple object given (as a substance or substratum) that then receives a supervening interpretation, but there are only objects-in-contexts. There is no “raw” datum. The term for such an object within a form Cassirer takes over from his favorite author, Goethe, in calling it a symbol. Cassirer therefore calls his system that of symbolic forms. They are the forms of manifestation into which human spirit’s activity becomes

27. Ernst Cassirer, Determinism and Indeterminism in Modern Physics: Historical and Systematic Studies of the Problem of Causality, O. Theodor Benfey (trans.) (New Haven, CT: Yale University Press, [1936] 1956), 132. By showing that there is continuous progress toward pure signification in the process of objectification in physics, this book also rebuked the Nazis’ characterization of relativity and quantum physics as “Jewish” and “degenerate” science. The authors would like to thank Thomas Ryckman for his suggestions on how to treat this issue. Interested readers should consult Ryckman’s The Reign of Relativity: Philosophy in Physics 1915–1925 (Oxford: Oxford University Press, 2005).
filled. Indeed, we live in a plurality of meaningful “contexts.” The three symbolic forms that Cassirer discusses in his *magnum opus* are language, myth, and scientific cognition. They are products of human spirit’s productive–constructive activity. His adaptation of the transcendental method traces the manner of construction in each form, respectively, while breaking with Cohen’s exclusively scientific–logistic paradigm. The modes of construction in each form are more freely described as different “logics” inhering in them. Cassirer’s system can also be described as a methodology of symbolic formation; thus, he is decidedly a methodological pluralist. But his methodological pluralism is incomprehensible without the fundamental constructive paradigm that is the signature of the “Marburg Method.”

Owing to his systematizing work in describing symbolic formation in different cultural contexts, his writings have become influential for several sciences, both human (anthropology, linguistics, aesthetics) and natural (such as physics). Before leaving Cassirer, a brief comment on his interpretation of fascism is in order. *The Myth of the State* rivals other classical texts dealing with fascism in the twentieth century. In his interpretation of the rise of fascism in the twentieth century, he argues that the phenomenon of fascism is the result of political propaganda that has allowed myth to re-enter the political arena, making porous the borders between responsible, rational action and mythical power. Myth, once overcome by Greek enlightenment, raises its ugly head once political discourse has become corrupted in a manner that allows mythical elements – Hitler, the “divine Führer,” the myth of the superior “Aryan Race,” and so on – to dominate political, democratic discourse.

**The Southwest School: Wilhelm Windelband, Heinrich Rickert, Emil Lask**

The Southwest School is much less cohesive than the Marburg School; even the name “Southwest” indicates that this “movement” (to speak of a school is perhaps exaggerated) was localized in different university towns – Heidelberg and Freiburg im Breisgau, respectively. The main representatives were Wilhelm Windelband (1848–1915) and his pupil Heinrich Rickert (1863–1936). An important member of this movement was Emil Lask (1875–1915), arguably the most interesting but also most difficult philosopher of this group and of significant influence for, among others, the young Heidegger. He died prematurely, however, in the trenches during the First World War. His “logic of philosophy” is a metaphilosophical category system for philosophy itself that, while highly

28. The Southwest School is sometimes also referred to as the “Baden School” after the state of Baden, part of the German Empire; the state was incorporated after the Second World War and is now called “Baden-Württemberg.”
original, is arguably a departure from neo-Kantianism in its Southwest mode and will not receive further discussion here.29

The Southwesterners were quite successful at their respective universities and shaped several generations of students. Windelband, for instance, was professor in Zurich, Freiburg, and Strasbourg (then German territory), before settling into Heidelberg, where he lived from 1903 until his death. Rickert became professor in Freiburg in 1896 before receiving a call to Heidelberg in 1916 to succeed Windelband, who had died the year before. Despite a mental illness that prohibited Rickert from making public appearances (he suffered from agoraphobia), he nevertheless exerted a substantial influence through his – often polemical and piercing – writings.30 While more loosely affiliated than the Marburg School, Rickert and Windelband nevertheless worked with certain core ideas that they shared, while not at all times agreeing in all details. Since their philosophical efforts displayed less of a systematic progression than the work of the members of the Marburg School, we shall be presenting the Southwest School in terms of their shared core ideas.31

(i) Writing the history of philosophy as a history of problems (Problemgeschichte)

Windelband, while best known as a historian of philosophy, is unfairly reduced to a historian insofar as he devised a new way of doing the history of philosophy, namely as the history of problems. While this might seem inconsequential today, to understand the history of philosophy as a development of philosophical problems was at the time quite innovative. Windelband’s historiological method took the emphasis away from individual philosophers and a quasi-biographical reconstruction of their work and placed that emphasis instead on the rich historical “horizon” that provided a historical–scientific–philosophical setting in which these philosophers worked. This setting is the process in which “European humanity” exposes its view of world and life (Welt- und Lebensauffassung). It is not a Hegelian scenario, in which history is the process of increasing knowledge of freedom, but rather a process in which thinkers and scientists communicate and interact. In this historical process, there are relevant factors that need to

30. Rickert’s reputation at the time indicates the significance of the acknowledgment given to the phenomenological movement when Husserl received the call to Freiburg in 1916 to succeed Rickert.

31. While the members of the Southwest School were no less respected in German academia than the Marburgers, their philosophical legacy has dwindled to nearly zero insofar as their achievements have become so much a part of the received idea of philosophical work that they can well be considered trivial.
be taken into account: pragmatic, cultural, and individual ones. A **pragmatic** consideration of the history of problems emphasizes that the same philosophical problems re-emerge throughout Western history in changed circumstances. The **cultural** aspect means that culture is the binding continuum that holds together seemingly incoherent scientific or philosophical discussions. And finally, the focus on **individuality** highlights the importance of individual characters in the history of philosophy. While this was the primary focus in earlier philosophical historiography, for the neo-Kantians this consideration now comes at the **end** of this historical reconstruction.\(^3\)\(^2\) This type of philosophical historiography – in conjunction with the meticulous work that neo-Kantian philosophers carried out in their editing of the original sources – has become the standard for any historical writings in philosophy. It has also been the target of attempts to provide alternative ways of doing the history of philosophy, and Heidegger’s “History of Being” and Gadamer’s “History of Effects”\(^3\)\(^3\) – both Heidegger and Gadamer knew this neo-Kantian method intimately – should be seen as direct critiques of the neo-Kantian method of doing history of philosophy.

**(ii) Distinctions in theory of science: idiographic and nomothetic sciences**
Perhaps the most famous legacy of the Southwest School is Windelband’s distinction between idiographic and nomothetic sciences, that is, between a science of the individual and singular and a science of the general and lawlike.\(^3\)\(^4\) Windelband lays out this influential distinction, at the height of his career, in his famous Presidential Address (*Rektoratsrede*) in Strasbourg in 1894.\(^3\)\(^5\) His starting-point is a critique of the traditional distinction between rational and empirical sciences. This distinction is no longer satisfactory; indeed, the development of certain sciences – most notoriously psychology and physics – has shown that the true results of these disciplines are neither purely rational nor purely empirical. An overview of the scientific activities of his day reveals a different distinction that seems to better fit the actual status quo, namely that between sciences of nature (*Naturwissenschaften*) and sciences of the human world (*Geisteswissenschaften*, sometimes also translated as “human” or “spiritual sciences,” or nowadays simply “humanities”). They are both sciences

---

\(^3\)\(^3\) This aspect of Gadamer’s work is discussed in the essay by Wayne J. Froman in *The History of Continental Philosophy: Volume 6*.

\(^3\)\(^4\) Rickert expanded on this distinction and added some further details, but he was in general agreement with Windelband’s line of thought. Although one reads time and again that this idiographic–nomothetic distinction was introduced by Rickert, it is Windelband, however, who conceived it.

– Wissenschaften – peculiar to the English ear, meaning, literally translated, “knowledge-dom.” Such a distinction undercuts that of rational and empirical sciences and is indeed an advance over it. But such a distinction, although widely acknowledged in Windelband’s day, rests on ontological assumptions concerning the ontic regions of nature and spirit that present a problem. The science that reveals the problem with this distinction is psychology: what kind of science is one to group it under? As it has the human psyche as its object, one would be inclined to call it a human science. Yet insofar as its goal is experimentally verifiable general results, it has the character of a natural science.

Here Windelband intervenes with an attempt to undercut this distinction. Arguing that all sciences, insofar as they treat objects of experience, are empirical, the only questions are how and as what to interpret these empirically ascertained results. This new distinction between how and as what is not an ontological one, but – in good Kantian fashion – a methodological one. The focal points of cognition are, generally, the individual or the general. Both are, however, not absolute but merely relative terms. Scientific cognition oscillates between these extreme focal points when interpreting its findings. The scientific cognition of something individual Windelband calls idiographic (i.e. describing the individual, singular), that of something general, nomothetic (i.e. positing the general, lawlike). “The latter are sciences of laws [Gesetzeswissenschaften], the former are sciences of events [Ereigniswissenschaften]; the latter teach what is always the case, the former what occurred only once.”

For instance, if one wants to, as a historian, work on the French Revolution, one has to describe the individual characters and individual events that took place, and so on. On the other hand, if one wants to understand, as a chemist, the manner in which certain chemicals react together, one has to find out the general laws by which they function and react – always and in a reliable, repeatable pattern. But neither rests on an ontological premise. Indeed, the nomothetic and idiographic standards can be applied to one and the same ontic field. The classic example for this, according to Windelband, is the science of organic nature:

As systematics, it is of nomothetic character, insofar as it describes the always fixed types of living creatures, which have been experienced within the millennia of human observation as their lawlike form. As developmental history, where it presents the order of earthly organisms as a process of descent and transformation of species [i.e. in evolutionary theory] … there it is an idiographic discipline.

---

36. Ibid., 145.
37. Ibid., 146.
This distinction stakes out a new type of science in the wake of the positivistic predicament that was rampant at the end of the nineteenth century, according to which naturalism was the method for all sciences. Contrary to the notion that human “disciplines” cannot be sciences precisely because they yield no general results, Windelband emphasized that the human sciences can indeed have the character of science with no less dignity than natural science if one has a different scientific ideal. The idiographic sciences have no less importance for the understanding of our world; indeed, if by “world” we mean not nature but culture, the idiographic sciences are more important. Windelband’s distinction was, in effect, an assertion of the importance of a genuine “science of culture” over the reduced notion of science as Wissenschaft in the sense of “natural science.”

As plausible as Windelband’s distinction might seem, it was the focus of criticisms from, among others, Dilthey and Husserl, both of whom, albeit for different reasons, rejected this distinction when it came to describing the proper object of the human sciences. For Dilthey, a description of human historical development need not be only idiographic, but instead could posit types of worldviews and typical character forms (i.e. types, not laws), and hence need not have to choose between individual and universal accounts. And Husserl’s attempt at an eidetic science of subjectivity goes even further, asserting the possibility of a “rigorous” (i.e. a priori) science of subjectivity after the transcendental–phenomenological reduction. Finally, Heidegger’s sketch of a hermeneutic of factual Dasein is predicated on a wholesale rejection of the (Platonic) distinction between the individual and the universal that underlies Windelband’s account. Here again we see that the influence of neo-Kantianism on twentieth-century philosophy is ex negativo, as the seminal philosophers mentioned here derive their methodological paradigms from a rejection of this Windelbandian distinction.

(iii) Philosophy as value theory

The idea of an idiographic science as the proper method of accessing the life of spirit or human culture was cashed out especially in Rickert’s work. Radicalizing Windelband, instead of seeing idiographic and nomothetic sciences as equally viable methods for cognition, Rickert privileges the idiographic over the nomothetic sciences. Informed by Rudolf Hermann Lotze’s philosophy of value – Lotze alleges that Plato’s ideas ought properly to be conceived as valid values – Rickert asserts in his influential work Der Gegenstand der Erkenntnis (The object

39. Rudolf Hermann Lotze (1817–81) was one of the leading German philosophers of the second half of the nineteenth century. A specialist in logic and philosophy of biology (he completed a medical degree along with his philosophy degree at Leipzig in 1838), he taught at Göttingen for almost forty years, beginning in 1844.
of cognition; first published in 1891 and re-edited six times, each time vastly reworked) that all cognition is in essence a form of valuing. Accepting Kant’s thesis of the primacy of practical reason, this primacy asserts itself, according to Rickert, already in the field of cognition insofar as cognizing is not a passive apprehending but a forming of the object of cognition as something to be integrated into culture, that is, the world of values. At stake, for Rickert, is nothing less than a redefinition of the traditional task of epistemology. The object that is represented in cognition is not something independent of its being cognized, but is something that is being formed by the subject. Transcendent reality, which to Kant was always mind-independent, is therefore dependent on the culturally creative subject. This, concomitantly, changes the traditional notion of the cognizing subject as “we must form a different notion of the cognizing subject as only representing consciousness and, consequently, also a different notion of the object and the measure of cognition as that of a transcendent reality.”

Given these two poles of cognition, one can approach the problem from both the subjective and objective sides. The subjective path leads to a transcendental psychology, the objective one to a transcendental logic; both are disciplines within transcendental philosophy. However, the empirical approach to the object of cognition remains valid in the empirical sciences; Rickert thus maps Kant’s idealism–realism distinction onto that of philosophy and the empirical sciences. This dual approach is Rickert’s restatement of Kant’s transcendental idealism.

In his second famous work, *Die Grenzen der Naturwissenschaftlichen Begriffsbildung* (The limits of concept formation in natural science; first published in 1896), Rickert expands on the epistemological foundations while also drawing from Windelband’s idiographic–nomothetic distinction. As the title indicates, concept formation in the natural sciences has limitations. It leads, if pursued to its extreme, into a purely naturalistic worldview. Contrary to Windelband, who considered both idiographic and nomothetic forms of scientific research to be on a relative scale (i.e. their difference was only a matter of degree), Rickert emphasizes the fundamental difference between them and goes on to favor the idiographic method. Nomothetic research winds up in a dangerous abstraction that threatens to cover up or make obsolete the historical life of culture (here anticipating Husserl’s famous critique of the mathematization of science in *The Crisis of the European Sciences and Transcendental Phenomenology*). This is the negative part of this work. The positive is Rickert’s description of the inner functioning of the human or cultural sciences. What makes them distinctly scientific in their own right is that they establish a relation to supra-individual values. Values, to Rickert, are neither physical nor mental, but are

“located” in an altogether different “third realm,” where entities do not exist but hold valid \((gelten)\). This realm is ontologically distinct from either the physical or the mental insofar as they both are forms of being, while the ontological status of values is their validity. Cultural scientific judgments, then, are characterized by making reference to this “world” of values. Hence the peculiarity of cultural scientific work is not primarily that it focuses on the individual – this is, as it were, taken for granted – but instead that in this individual attention it makes a connection to an independently existing realm of values. This realm, moreover, is in itself systematically organized. Correct cultural as well as moral judgments can be discerned in their adequacy to the systematic hierarchy and order of values. Cultural or spiritual sciences are expressions of the ideal order of values. Therefore, the task of philosophy is to draft and describe this ideal system of values. In his later years, Rickert drafted a “system of values” based on the distinction of six different fields of values: logic, aesthetics, mysticism, ethics, the erotic, and philosophy of religion. The true meaning of transcendental philosophy is thus redeemed in this draft of a system of values. Rickert began composing this sketch in his *System der Philosophie* (System of philosophy), of which only volume one appeared, and which has remained – despite Rickert’s reputation in Germany at the time – largely ignored.

II. NEO-KANTIANISM IN FRANCE

French neo-Kantianism emerged as the result of a conjunction of events including the demise of Victor Cousin’s eclecticism under the “authoritarian” first period of the Second Empire (1851–60) and the development of spiritualism under the “liberal” second period of the Empire. As a result of a very dense network of friendships, the extreme centralization of political power, and

---

41. Rickert also calls this realm – much earlier than 1933! – *das Dritte Reich*, the “Third Reich.” I just mention this in order to clear up any confusion on the part of a stumped reader. The term was not exclusively used by the neo-Kantians; for instance, it was also used – in the same sense – by Frege.

42. In connecting the individual human being to the universal realm of values, Rickert is close to Cassirer’s cultural anthropology, which defines the human being as a cultural being precisely in its capacity to lift itself out of the realm of nature and to become part of the world of spirit, which is intersubjective and universal.

---
influential universities such as the École Normale Supérieure (ENS) and the Sorbonne, neo-Kantianism became the predominant philosophical trend in French academia under Victor Duruy’s tenure as minister of education (1863–69). Charles Renouvier (1815–1903) and Jules Lachelier (1832–1918) initiated this trend, establishing two general and distinct forms that were never unified.\(^{46}\)

Renouvier’s works offer a system divided into the classical divisions of general and formal logic, rational psychology, and principles of nature.\(^{47}\) In his *Essais de critique générale* (Essays in general critique), he writes: “I frankly confess that I follow in Kant’s footsteps.”\(^{48}\) This Kantian program is described in general terms: “the analysis and the coordination of the principles of knowledge in general, and

---

46. The best studies of French philosophy between 1850 and 1930 are Isaac Benrubi, *Contemporary Thought of France*, Ernest B. Dicker (trans.) (London: Williams & Norgate, 1926), and Michel Espagne, *En deçà du Rhin: L’Allemagne des philosophes français au XIXe siècle* (Paris: Editions du Cerf, 2004). In English, John Alexander Gunn, *Modern French Philosophy: A Study of the Development since Comte* (London: T. F. Unwin, 1922), has some interesting insights but, as Bergson noted, lacks a clear and firm guiding thread. The translation of Benrubi, *Les Sources et les courants de la philosophie contemporaine en France* (Paris: Félix Alcan, 1933), seems to be based on a shorter and schematic German version. Gary Gutting, *French Philosophy in the Twentieth Century* (Cambridge: Cambridge University Press, 2001), although interesting, is very partial, uses arguable classifications, and contains many inaccuracies: although different forms of Kantianism are mentioned, there is no analysis of the exchanges with Germany, a conceptually, institutionally, and politically essential point. Renouvier is not a spiritualist, he did not study at the ENS with Ravaisson, but was a student at the École Polytechnique, an important element for his scientific background and his relation to positivism, since this is how he met Comte. Hegel was indeed translated before the middle of the twentieth century: Charles Bénard translated the *Lectures on Aesthetics* in 1855, Augusto Vera’s translation of the *Encyclopaedia* was published from 1859 to 1869, a fact that should be added to the file regarding Cousin’s essential relation to Hegel, as well as Hippolyte Taine’s. In *Twentieth-Century French Philosophy: Key Themes and Thinkers* (Malden, MA: Blackwell, 2006), Schrift’s description of how the French system of education functions is fundamental and unique in English. Vincent Descombes, *Modern French Philosophy*, L. Scott-Fox and J. M. Harding (trans.) (Cambridge: Cambridge University Press, 1980) offers a witty picture of the latter trends in French philosophy (structuralisms, essentially), although the subtlety of the analysis as well as its irony may make it a difficult read for the unadvised reader.

of those that the established sciences put at their foundations without making them explicit” (xx). The principles to which Renouvier refers are construed as fundamental *a priori* relations that constitute knowledge. Starting with the concept of representation in a very broad sense, Renouvier untangles its elements and the laws ruling knowledge. He is thereby led to rewrite the Kantian system of categories.

The Kantian inspiration is clear, and the influence of the forewords to the *Critique of Pure Reason*, in particular that of the second edition, is obvious. The question of the scientifcity of philosophy is the guiding thread: “It is impossible to reasonably reject the *Critique*. For it is inspired by the spirit of science; it is that very spirit” (xii). For Renouvier, as for Kant, the *Critique* is opposed to traditional metaphysics, which was informed by theology and cosmology. As will soon be the case for the German neo-Kantians, Renouvier sees the *Critique*’s scientific character in its methodological dimension: “If the result of the *Critique* is to formulate a method, to provide a lasting logic, this is indeed very much; it is almost enough for its scientifcicy” (xiii). But a notable difference between Renouvier and the German neo-Kantians, especially the Marburg School, is that for Renouvier it is not so much that the *Critique* as such is the method (as Kant wrote in the B Foreword); rather, the method is the *result* of the *Critique* (namely, the ensuing Kantian methodologies themselves).

Nevertheless, Renouvier is quite critical of Kant. His last book, *Critique de la doctrine de Kant* (Critique of the Kantian doctrine), offers a systematic deconstruction of the *Critique of Pure Reason*. In Renouvier’s idealism, as, arguably, in the Marburg School’s idealism, the return to Leibniz is nearly as important as the return to Kant. But the very essence of Renouvier’s concept of the transcendental remains deficient and psychological when compared to that found in more elaborate Kant interpretations, as well as in the main German neo-Kantian schools and Husserl’s phenomenology.

Renouvier never taught and was extremely prolific. His influence was felt, however, only after 1867, the year he founded, with his friend François Pillon, the journal *L’Année philosophique* (The philosophical yearbook). At that time

---

49. In 1899, Renouvier published his *La Nouvelle monadologie*. A Leibnizian reconstruction of Kant relies on a long history, going back to Salomon Maimon’s interpretation of Kant’s Anticipations of Perception as an unconscious sum of “petites perceptions.” Cohen’s rejection of sensitive intuition relies on a similar conception. It is here important because in French neo-Kantianism, and particularly in the philosophy of mathematics, it will give birth to a strong opposition between the Kantian philosophy of intuition (Boutroux, Poincaré) and the Leibnizian philosophy of the concept (Couturat, Cavaillès).

he started to have followers: François Evellin, the young Victor Brochard, Jean-Jacques Gourd, and his main disciple, Octave Hamelin. If Renouvier’s neo-Kantianism can be described as a neocriticism insofar as it submits Kant himself to critique, Lachelier’s can be described as a late evolution of spiritualism. His teacher, Félix Ravaission (1813–1900), established an intellectual and institutional strain that would develop into Bergson’s spiritualism as well as Émile Boutroux’s neo-Kantianism. Ravaission favored Schelling over Hegel, a preference that meant, in the French context, leaping over Cousin to return to Maine de Biran. True idealism is a spiritualism grounded in the will. Lachelier depicted, quite accurately, the intellectual situation framed by Ravaission’s Report (1868). As he writes in a letter to Paul Janet, on December 8, 1891:

It is Ravaission, I believe, who taught us all to conceive being not as objective forms of substances or phenomena, but as the subjective form of spiritual action, this action being – in its last resort – thought or will. I think you could find this idea in Bergson, in Ribot even, as well as in Boutroux and myself. It is perhaps the only trait that is common to all of us and that makes for the unity of the philosophical movement of the last twenty years.

With such a common ground, how can one account for the fragmentation of spiritualism into Christian philosophy, Bergsonism, and neo-Kantianism?

51. Victor Brochard’s (1848–1907) doctoral dissertation, De l’erreur (Paris, 1879), claims the influence of Kant and Renouvier. This is also the case for François Evellin’s (1835–1910) dissertation: Infini et quantité (Paris: Germer Baillière, 1880). Jean-Jacques Gourd (1850–1909) was one of Renouvier’s followers in Switzerland (see his Le Phénomène [Paris: Félix Alcan, 1888]). Octave Hamelin (1856–1907), the most prominent of Renouvier’s followers, first exerted his influence by teaching at the University of Bordeaux (1884–1903), at the ÉNS (1903–7), and at the Sorbonne (1905–7). His acclaimed book, Essai sur les éléments principaux de la représentation (Paris: Félix Alcan, 1907; doctoral thesis), as well as his translation and commentary of Aristotle Physics II (complementary dissertation) were published the year of his death. Léon Robin, his student and another of the Sorbonne’s major figures, published two thick volumes of Hamelin’s lectures: Le Système de Descartes (Paris: Félix Alcan, 1911; with a foreword by Hamelin’s friend Émile Durkheim), and Le Système d’Aristote (Paris: Félix Alcan, 1920; lectures given at the ÉNS in 1904–5). Indicative of his importance, other courses were later published, including Le Système de Renouvier (Sorbonne, 1906–7), Les Philosophes présocratiques (Strasbourg: Association des publications de l’université de Strasbourg, 1978; lectures 1905–6), and Fichte (Strasbourg: Presses Universitaires de Strasbourg, 1988; lectures 1887).

In 1861, Lachelier dissociated himself from Biran and hence from Ravaisson as well.\textsuperscript{53} His courses on logic and on psychology demonstrate that he had already taken a Kantian position when he began teaching at the ÉNS. He exerted his remarkable influence through his lectures rather than through his – relatively few – publications.

The lectures on logic present a general elucidation of the theoretical principles of knowledge. From the very first lesson, the method is imbued with Kantian elements. “Let me explain: in any science one can differentiate what man knows and the way he knows, in other words, matter and form.”\textsuperscript{54} Both in his Lectures on Logic and in the Critique of Pure Reason, Kant had already made use of this conceptual distinction between logic in general (which is purely formal) and transcendental logic, which is both formal and material. Lachelier’s lecture course then pursues a Kantian path. To circumscribe science, Lachelier takes a detour: “instead of saying in a few words what science is, it might be better to review the necessary conditions of science, the degrees spirit covers to reach science.”\textsuperscript{55} This path is very significant, for he borrows the conditions for science from the Critique of Pure Reason. The first condition for science is that an object is given. Lachelier takes an indirect path to introduce both forms of pure intuition, space and time: “the internal world of the successive states in time, the outside world of the simultaneous objects in space and also the successive states of these same objects in time.”\textsuperscript{56} Lachelier notes that space is integrated in time and, when dissociating the internal world from the external, he also intends to make room for that internal world that differs from the internalization of the external. A place is therefore reserved for feeling, desire, faith, and so on, opening the possibility for the fields of morality and religion, while avoiding a reductionist reading of Kant.

Sensation alone does not explain the possibility of science, since it is reduced to an indefinite number of atomistic elements: “impression, in itself, is reduced to an infinity of elementary impressions that is tied together by nothing and in which it vanishes.”\textsuperscript{57} Knowledge is constituted by a synthetic act of spirit, an intellectual synthesis that consists in the positing of pure relations. In addition to space and time, pure functions of synthesis are acknowledged as transcendental conditions of science. And when, in the middle of the chapter on induction, Lachelier intends to ground the determinism expressed by scientific law

\textsuperscript{55} Ibid.
\textsuperscript{56} Ibid.
\textsuperscript{57} Ibid., 16.
and experimental method such as Claude Bernard\textsuperscript{58} conceives it, he again refers to Kant, correcting the subjectivistic interpretation of the idealism:

And, although it is attributed to Kant to have reduced the principles of understanding to a purely subjective value, it is to him that we owe the justification of the principle of determinism. We cannot know a priori things in themselves, but we can assert a priori that the phenomena of nature, which compose the weft of our thoughts, are possible to be thought. And the consciousness of our personal identity is the condition of any thought.\textsuperscript{59}

Moving from the syntheses to individual unity, Lachelier again combines the original synthetic unity of apperception, the empirical unity of consciousness, and the paralogism of substantiality into one single thought.

The general method of his reflection, as well as the logical progression within these lectures, produce what one can call a transcendental idealism. They sketch an outline concerning induction that Lachelier’s 1871 dissertation, *Du fondement de l’induction* (On the foundation of induction), will further develop; regarding determinism, they draw a frame Boutroux will fill, with a few gaps, in his dissertation, *De la contingence des lois de la nature* (On the contingency of the laws of nature).

Neo-Kantianism reached a preeminent position in French philosophy through Lachelier’s teaching for the following reasons: he was a very charismatic professor; he taught at the ÉNS from 1864 to 1875; his lectures were copied and studied by at least twenty promotions of students,\textsuperscript{60} some of whom in turn became the most influential professors of their time – Boutroux, Liard, Paul and Jules Tannery, Janet, Séailles, Brunschvicg.\textsuperscript{61} And in addition to his teaching, Lachelier held important official positions such as the presidency of the Agrégation, a nationwide competitive examination one needed to take in order to teach in higher education, and the general inspector of public education.

In 1876, not even ten years after Ravaisson’s *Rapport*, Désiré Nolen (1838–1904), in his Inaugural Lecture at the University of Montpellier succeeding

\textsuperscript{58} Claude Bernard (1813–78) was a French physiologist. His *Introduction à l’étude de la médecine expérimentale* (1865) was universally considered as a classic discourse on the scientific method, comparable only to the works of Newton. A professor at the Collège de France from 1847 to 1878, when he died he was given a public funeral, the first man of science to be awarded that honor in France.

\textsuperscript{59} *Ibid.*, 51; see also 122.

\textsuperscript{60} Entering classes in the École Normale are referred to as “promotions.”

Boutroux (another important figure of French neo-Kantianism), remarked that “over the last ten years, it seems that Kant’s Critique has become the constant and common study of philosophical minds.”62 This, he continued, sets the stage for a truly European philosophy.63 Boutroux, in his lectures on Kant delivered from 1894 to 1897 and 1900 to 1901 at the Sorbonne, writes:

Moreover, we, the French, have today a closer relationship with Kant’s philosophy than we had fifty years ago. … These studies contributed to the awakening of the metaphysical sense in our country …. Hence, to go back to Kant is not only to act as a scholar, as a historian, as a dilettante; it is to draw useful knowledge and forces us to face the problems imposed on us [today].64

Meanwhile Louis Liard (1846–1917),65 a noteworthy neo-Kantian, student of Lachelier and friend of Boutroux, had become the director of the Enseignement Supérieur, France’s university educational system between 1884 and 1902. Finally, almost half a century after Lachelier started teaching, Brunschvicg, the last great neo-Kantian of that period, concluded: “From 1870 on, a philosophical University has been built in France that should bear the name of Lachelier, just like the Old University bears the name of Victor Cousin.”66 The main neo-Kantian figures of this new “philosophical university” are Émile Boutroux, Émile Meyerson,67 Léon Brunschvicg, and Octave Hamelin.

After Lachelier, Boutroux is the key figure in the development of French neo-Kantianism.68 He is at the center of the intellectual and the institutional network

63. He neglected to mention the important contributions from Italian neo-Kantianism.
64. Émile Boutroux, *La Philosophie de Kant: Cours de M. Émile Boutroux (Sorbonne 1896–1897)* (Paris: Vrin, 1926), 12.
67. Émile Meyerson (1859–1933), a Polish chemist who emigrated to Germany, then to France, exerted a strong influence on French philosophy, although, like Renouvier, he was never completely part of the system. His antipositivism, his Kantian and neocritical background as well as his discussion of contemporary science and his participation in discussions with Poincaré, Brunschvicg, and Langevin make him a noteworthy figure worthy of the renewed interest he is attracting.

constitutive of the French higher education system. His work can be understood as an attempt to carry on the spiritualism of his masters, Ravaisson and Lachelier, in a Kantian guise. The problem around which his thought revolves is the reconciliation of the universal validity of scientific laws (which seems to involve an ontological necessity and therefore determinism), human freedom (the condition for morality), and religion.

This problem is precisely what he calls “Kant's problem”: “How is science possible? How is morality possible? How is the reconciliation of science and morality possible?”⁶⁹ And later he states: “Kant's problem is ours. His writings talk about us: nostra res agitur.”⁷⁰ Despite several themes that can be considered Kantian, Boutroux's solution to the problem is not Kantian, and one cannot but assert that his understanding of the a priori and of the transcendental that he rejects is rather weak. One of the main interests is his treatment of science, which is both metaphysical and epistemological, and he is closely related to major scientists of the period such as his own son, Pierre Boutroux, and his brother-in-law, Henri Poincaré.⁷¹ Boutroux's Kantianism has also been considered an influence on Poincaré's contributions to the problem of hypotheses, as well as on his conventionalism.⁷² Within this constellation, the Tannery brothers were also of major importance.

Brunschvicg constitutes the apex of French neo-Kantianism, a status also claimed by Renouvier's heir, Hamelin.⁷³ Brunschvicg's achievement was a strictly methodological understanding of what he calls “the idea of critique.” His achievement is deployed via a “wider and richer” use of “the truth of the transcendental method.”⁷⁴ The general movement is similar to the “historization” and the “dynamization” of the transcendental operating in German neo-Kantianism, in particular, the Marburg School.

What will be left of the theory of transcendental consciousness, once one recognizes that algebra and geometry, mechanics and physics do not resign themselves to this docile immobility that Kant expected? And what will one

⁷³. This is a perspective held for instance by Dominique Parodi; see La Philosophie contemporaine en France (Paris: Félix Alcan, 1919). Brunschvicg answers in “L'Orientatio du rationalisme” (Écrits Philosophiques, vol. 2, 25): “we do not find any trace of critical thought in neo-criticism.”
make of the fact that, during the nineteenth century, they broke the limits that the “Transcendental Aesthetic,” the “Transcendental Analytic,” and the First Metaphysical Principles of the Science of Nature had commanded them to respect as the final layout?\textsuperscript{75}

The answer is somewhat brutal: “we should leave to some neo-Kantians and to Kant himself the postulate of this solidarity between the idea of critique and the table of the forms or the categories, since we know today that this solidarity expresses the most superficial and fragile aspect of the doctrine.”\textsuperscript{76} Brunschvicg then proceeds to point to a cleavage in the transcendental method: “The method put to work by the transcendental deduction is a reflexive analysis; it starts from science considered as a fact, and goes back to the a priori forms of intuitions and pure concepts of the understanding.”\textsuperscript{77} This first moment, reminiscent of Cohen, is legitimate in Brunschvicg’s eyes, especially since it reverts to the unity of transcendental apperception, an important element for someone who also wants to claim the spiritualist inheritance. However, when a philosopher considers the system of categories as fixed once and for all, and limits deduction to that of the principles of a determined moment of physics (Newton, for instance), then the progressive synthesis that leads to all the dimensions of spirit will be lacking.

Brunschvicg’s understanding of the “idea of critique” will be exercised as “reflexive analysis” on all fields of human knowledge: science, morality, religion, art, and history, in order to produce the system of critical idealism that presents the life of the spirit in all its directions as well as in its unity.

Brunschvicg’s enormous influence was at its peak in the 1920s. Setting aside his impressive intellectual stature, we see that he exerted his influence through all dimensions of the French system: he held a key teaching position at the Sorbonne (for thirty years, beginning in 1909), was president of the Agrégation (1936–38), for many years was part of the academic–political network that oversaw the philosophy curriculum and the awarding of positions and grants, and was founder of the journal Revue de Métaphysique et de Morale (with Xavier Léon in 1893) and of the Société Française de Philosophie (1901, with Léon and André Lalande).

At the end of the nineteenth century, neo-Kantianism was not only the preeminent philosophy in France, but had also become the philosophie officielle. But soon Boutroux left center stage in favor of his most famous student and the true heir of spiritualism, Henri Bergson; Bachelard overshadowed Meyerson; Brunschvicg became the embodiment of the mandarin, confronted by young

\textsuperscript{77} Ibid.
materialists such as Georges Politzer\textsuperscript{78} and Marxists such as Paul Nizan\textsuperscript{79} or by philosophers such as Sartre and Merleau-Ponty. These thinkers found their inspirations in new figures in German philosophy – the early Husserl, Heidegger – and subscribed to their criticisms of Kant.

To take a look at the influence of neo-Kantianism on post-Second World War French intellectual life, one of the most interesting developments of French neo-Kantianism is the role it played in the rise of structuralism. Martial Guéroult’s (1891–1976) reflections on the Kantian concept of architectonics, his familiarity with the neo-Kantian “quarrel of the system,”\textsuperscript{80} and his reading of Karl Mannheim’s Die Strukturanalyse der Erkenntnistheorie (The structural analysis of epistemology, 1922), resulted in his highly interesting structural methodology concerning the history of philosophy. Considering all genetic, chronological, and biographical studies merely preliminary steps, he argued that the analysis should proceed to an internal reconstruction of the philosophical work considered as a monument constructed by layers and successions of proofs. The more original rational conditions of the system consist in its transcendental conditions, just as, in Kant, the structure of the idea of pure reason forms a transcendental condition of a system. Victor Goldschmidt followed this path in his work in the history of philosophy.\textsuperscript{81} But more important is the affiliation with Jules Vuillemin (1920–2001),\textsuperscript{82} in which the meaning of the concept of structure shifted. It originally

\textsuperscript{80} The quarrel of the system was a fierce debate regarding two issues: (i) Could philosophy fulfill its claim to be a science only through the form of a system? And, given a positive answer to this first question: (ii) What kind of system should it be? Regarding the first claim, Hermann Cohen writes: “The philosophy reaches its concept only as system” (Logik der reinen Erkenntniss, 3rd ed. [Berlin: Bruno Cassirer, 1922], 601). Concerning the second claim, Natorp (like Cassirer) has a preference for the concept of a systematic: “Systematic, not system” (in Philosophische Systematik [Hamburg: Felix Meiner, 1958], 1). Rickert is also quite clear: “Unsystematic thought means unphilosophical thought” (in Allgemeine Grundlegung der Philosophie [Tübingen: J. C. B. Mohr, 1921], 11; see also Grundprobleme der Philosophie [Tübingen: J. C. B. Mohr, 1934], 1–25). He develops the concept of an “open system.” What is here at stake is to be systematic without being dogmatic (or Hegelian!). See Christian Krijnen, Philosophie als System: Prinzipiethetoretische Untersuchungen zum Systemgedanken bei Hegel, im Neukantianismus und in der Gegenwartsphilosophie (Würzburg: Königshausen & Neumann, 2008).
\textsuperscript{81} Victor Goldschmidt (1914–81) was well known for his application of a structuralist method of reading, inaugurated by Guéroult, to ancient philosophy (Plato, Aristotle, Epicurus, the Stoics, and so on) as well as to Rousseau. For some reservations, see Jacques Brunswig, “Goldschmidt and Guéroult: Some Facts, Some Enigmas,” Archiv für Geschichte der Philosophie 88 (2006).
referred to a scientificity gained through systematicity, but systematicity was now understood through logic and mathematical axiomatic. Gilles-Gaston Granger (1920– ) played an important role in this transformation. These intellectual affinities (and friendships) resulted in academic appointments: Guéroult, who held the Chair of History and Technology of Philosophical Systems at the Collège de France (1951–62), nominated Vuillemin for a Chair of Philosophy of Knowledge (1962–90). And Vuillemin appointed Foucault to succeed him at the University of Clermont-Ferrand, then at the Collège de France (where he held a Chair of History of Systems of Thought, 1970–84); Granger succeeded Foucault in 1986, renaming the Chair “Comparative Epistemology.”

This logico-mathematical transformation of the concept of structure also impacted the writing of the history of philosophy (as well as history itself), leading, for instance, on the one hand, to the work of Michel Serres and Daniel Parrochia and, on the other, to Althusser’s praxis in his reading of *Capital* and Foucault’s “archeology.” The end of this story is better known, although often in a very confused fashion owing to the omission of the first episodes: to the mathematical paradigm a linguistic one would be added (Saussure, Benveniste) that in turn would lead, by a complete reversal, to neostructuralism or poststructuralism, while a Heideggerian intellectual background (blended with various proportions of Nietzsche, Marx, and Freud) would come to replace the Kantian paradigm.

Today, neo-Kantianism is still active in France: in epistemology, philosophy of mathematics, and philosophy of physics one might mention the work of Jean Petitot; Michel Bitbol, Jean Seidengart, and Pierre Kerszberg; Alexis Philonenko in the history of philosophy; Alain Renaut in moral and political philosophy as well as education; and a neo-Kantian, Luc Ferry, became minister of education.

### III. CONCLUSION

To summarize, the label “neo-Kantianism” was applied to a variety of tendencies within the philosophical scene in Europe, mainly Germany and France, to a

---

83. It is also worth noting that Jacques Bouveresse, who presented his 1995 Collège de France Chair of Philosophy of Language and of Knowledge as “in a way succeeding” those of Vuillemin and Granger, devoted his 2007 and 2008 lectures to a question formulated after a title of Vuillemin’s book: “What are philosophical systems?” The lectures not only dealt explicitly with Vuillemin, but also with the tradition coming from Renouvier, Guéroult, and Hyppolite.

Volume 3
lesser extent Italy and the United Kingdom, at a certain period of time, roughly between 1870 and 1930.\footnote{Regarding Italian neo-Kantianism, see Massimo Ferrari, \textit{Introduzione a il neocriticismo} (Rome: Laterza, 1997) and, more specifically, \textit{I dati dell’esperienza: Il Neokantismo di Felice Tocco nella filosofia Italiana tra ottocento e novecento} (Florence: L. S. Olschki, 1990). UK neo-Kantianism is more difficult to characterize since it forms components of another complex philosophical movement: British idealism. Philosophers such as T. H. Green (1836–82), Edward Caird (1835–1908), and R. G. Collingwood (1889–1943) are often identified as neo-Kantians.} While the peak of this movement can be said to have come to an end after the First World War, the Second World War seemingly sent it into oblivion. In the late 1970s, neo-Kantianism’s importance and dominance in its own days began to be rediscovered in scholarship. This led to a philosophical revival, which is now palpable in nearly all fields of philosophical work. For instance, the question of \textit{a priori} knowledge is discussed in contemporary philosophy of mind, epistemology, and philosophy of science. It is also remarkable that this European trend of “continental” philosophy is currently gaining leverage in the US, with the works and the influence of John Rawls in ethics and political philosophy and, for example, Michael Friedman in both philosophy of science and the genesis of analytical philosophy. Today, neo-Kantianism is slowly regaining its status as a major interlocutor with phenomenology and analytical philosophy, a status first exemplified, for instance, by the relations between Husserl and Natorp and its influence on Carnap.

In one sense, then, the term “neo-Kantianism” refers mainly to this period of time. In another sense, the term “neo-Kantian” can be understood in the manner in which philosophers today call themselves “neo-Fregean” or “neo-Pragmatist,” by which they mean an alliance to these philosophers, not in the letter or in correct exegesis of the great thinker’s true intentions, but in the \textit{spirit} of the philosophers in question. It is in \textit{this} sense that the neo-Kantians discussed here perceived themselves as furthering Kant’s true intentions, be it in dismissing some elements in Kant's system for the sake of others or emphasizing those that they perceived to reveal a true kernel in the midst of other problematic intuitions in Kant’s thought. In this effort, they not only brought forth highly original avenues of Kant interpretation that are still essentially pursued today, but also produced a range of interesting new systematic approaches and theories that are far from obsolete and deserve to be studied anew.\footnote{Two recent anthologies will help make neo-Kantianism more accessible for scholarship in the English language: Luft and Makkreel, \textit{Neo-Kantianism in Contemporary Philosophy}, and Dominic Moran and Sebastian Luft (eds), \textit{The Neo-Kantianism Reader} (London: Routledge, 2010).}

If one were to summarize in the briefest terms its philosophical importance, one could call neo-Kantianism a philosophy of \textit{culture}, whereby culture is itself the problematic philosophical term, the \textit{terminus ad quem}. Philosophy, then,
is placed in the service of human culture in modern society, which values and upholds the fundamental beliefs of the Renaissance and the Enlightenment: reason, equality, freedom. Neo-Kantianism stands, to borrow a phrase from Ursula Renz, for a culture of rationality and the rationality of culture. Whether such an ideal and the consequences following from it will be allowed to survive in the so-called age of postmodernity is another question. Be that as it may, both as a starting-point for understanding the philosophical tendencies that would emerge and define the twentieth century, and as a vast quarry of inspiring ideas and timeless systematic approaches, one will need to reassess the neo-Kantian movement.88

88. Special thanks go to Celeste Harvey for her help with assembling the bibliographical data and for correcting the grammar and style of this piece.

89. A note on the editions of the major works: As was customary in the days of the neo-Kantians, new editions did not get published without extensive authors’ revisions, which not only eliminated typographical errors, but were also intended to capture the new developments the author had made since the first publication of the book in question. For this reason, in cases where there are different editions, we list the last – and presumably the latest and ultimately approved – version, or the critical edition, in the regular bibliography, preceded by the date of the first edition in brackets.

Charles Renouvier

Durkheim’s formation was in philosophy. After attaining his Agrégation de Philosophie in 1882, he taught philosophy in schools in Sens, Quentin, and Troyes. However, he became dissatisfied with philosophy in its apparent struggle against the sciences, particularly the social sciences, very early on in his career, and in 1887 he accepted a position at the University of Bordeaux to organize courses in social sciences and in pedagogy (he became Professor in 1896). It was from this base that he published the results of his initial researches into sociology and the methodology that he had constructed to carry them out. He established a team of researchers that he, with his nephew Marcel Mauss, organized around the journal *L’Année sociologique* from 1898. Mauss accepted a Chair at the École Pratique des Hautes Études in Paris in 1901 and, in 1902, Durkheim accepted a post in Paris at the Sorbonne, holding the Chair in the “Science of Education” (renamed as a Chair in Science of Education and Sociology in 1913). Durkheim did not promote himself as founder of sociology in France; this accolade came posthumously. He regarded his work as attempting a reorganization...
and correction of the sociology of Auguste Comte. He regarded positivism as the greatest contribution of French thought in the nineteenth century both to philosophy and the social sciences. His appropriation and modification of the positivist tradition took place within the framework of French Kantianism, and particularly the writings of Charles Renouvier, against the background of academic eclectic philosophy dominated by the legacy of Victor Cousin. It was Durkheim rather than Mauss who engaged in a dialogue with philosophy, but, ironically, it has been the work of Mauss that has seemed more to interest philosophers.

I. LOCATING DURKHEIM AND MAUSS

Recent interpretations that suggest Durkheim can be read as a late-modern or even postmodern thinker (Stjepan Meštrović) or as a thinker who imaginatively combined social science with a political and ethical vision derived from the Jewish tradition (Ivan Strenski) are not representative. On the other hand, the view that Durkheim was essentially a conservative who worked with a precritical functionalist method has given way over the past twenty-five years to a view that he was a sophisticated democratic socialist who developed with various degrees of success a sociology based on structural theory and an inventive experimental method. Susan Stedman Jones’s recent writings, for example, develop the view that key subtleties of Durkheim’s philosophy and epistemology are missed if the influence of Renouvier’s neo-Kantianism is not taken into account. Her reconsideration is organized as an attack and refutation of the view that Durkheim was working with a crudely positivistic methodology. Her central thesis is that Durkheim adopts Renouvier’s modification of Kant, which holds that reality is not a simple “thing” outside thought, but can exist only as a representation.

*3. For a discussion of Comte, see the essay by Alan Sica in The History of Continental Philosophy: Volume 2.
7. Any interpretation that wants Durkheim to depart from Kant risks reading him as positing knowledge as entirely relative to social structure. Thus, Stedman Jones’s Durkheim Reconsidered holds on to the possibility of a priori knowledge through Renouvier’s notion of the “skeleton” of representation. This a priori is “one which accommodates the historical and the relative” (ibid., 70). This interpretation suggests: “Each culture is aware of reality as temporal and spatial, and as changing; of events as brought about or caused to be; of action as a pursuit of some end” (ibid., 71). Relativism is not avoided by this sleight of hand, since
Durkheim’s study of suicide is a crucial test for any interpretation that stresses the methodological impact of Renouvier. For Stedman Jones, the key to interpreting this work involves setting optimism, pessimism, solidarity, and hope in a dialectic of action, for the theory of suicide concerns the representation of psychic life. She holds that Durkheim adopts a kind of vitalist philosophy from Renouvier involving notions of passion, desires, disturbance, and frustration.

Adopting Renouvier’s notion of representation, the individual and the social become aspects of a unified field of causation; since they are one system of forces – relational and representational – the micro and the macro come together. The impact of Renouvier in this account becomes clear: it provides a nonpositivist explanation for those comments in Durkheim that relate to a universal condition of human action.

Watts Miller, on the other hand, has argued that Durkheim should be read as making a key contribution to liberal socialist ethics, to a communitarian defense of individualism within a significant continuation of the Enlightenment project. Miller also separates Durkheim from Comte and the Comtean tradition. His central concern is to show how the problem of the relation between the individual as autonomous and as law governed – how individual freedom can be in harmony with a system of objective values – is not an insoluble problem for sociology. Miller tries to show that a purely rational construction of a scientific system cannot provide the structures for individual development and autonomy that are required by Durkheim’s own conception of the “organic self.” This requires not a mechanical enlightenment – based on the project of realizing a transparent society – but an organic enlightenment that works through the progressive dilemmas of modernity. Durkheim’s real problem is how to secularize the kingdom of ends, or how to insert the reality of individual liberty and autonomy into the democratic frame that is at the same time legitimated through any value, or any knowledge, can always be said to accommodate to the historical. What Durkheim set out to do – to analyze the ways in which representations are intimately bound up with the social – is occluded in this perspective.

8. Watts Willie Miller argues that Durkheim is concerned with the “rational deliberation of ends” and “not only to identify, clarify and rework ideals, but also to adjudicate on them” (Durkheim, Morals and Modernity [London: UCL Press, 1996], 1). The question that emerges concerns precisely the nature of the “ethical judge” (ibid., 172), if this is not the individual, society, or social science. Miller suggests that the judge is the individual as man (ibid., 177–8), but also “man,” for “man is the enlightened republic’s hidden god” (ibid., 249). This view is expressed as a “vision that, in seeing the moral ideal’s development through constant stirrings of new, obscure aspirations, builds in limits to a society with autonomous self-understanding. This in any case depends on the constitution, through collective processes, of a collective body of knowledge and experience … So the human ideal must remain, in various if not very mysterious ways, elusive” (ibid.).
an ethics based on reason. In other words, Durkheim worked via an encounter with Kant toward a viable version of Comte’s “religion of humanity.”

Since the discovery in 1995 of the lectures Durkheim presented at the Lycée at Sens in 1882–84, many of the issues surrounding his relation to Kant and Renouvier have been resolved. These lectures reveal that, far from marking a direct relation between Kant and Renouvier, Durkheim was working very systematically in the framework of Cousin’s eclectic spiritualism. Cousin’s influence dominated the curriculum of philosophy teaching from the 1830s and Durkheim had developed a position under this influence. The peculiarity of the French approach to philosophy, as opposed to the approach in Germany, was that it gave a founding role to psychology that, in Durkheim’s time, was being radically reworked by Pierre Janet (1859–1947) within the eclectic framework of Cousin. Durkheim, like Janet, held that philosophy was a science that had adopted experimental methods (guided by imaginative hypotheses controlled by empirical constraints). Thus in France, unlike in Germany, the philosophical tradition developed an analysis of the Kantian categories based on psychology rather than on logic. Emerging from this tradition, Durkheim sought to replace psychology with sociology as the foundation for philosophy, informed by a philosophical formation and terminology – particularly notions such as mental representation – that came from Cousin and Janet as well as Renouvier.

Durkheim’s sociology was therefore self-consciously embedded in the Kantian rationalism of the French philosophical tradition, a tradition that sidetracked the positivism of Comte almost entirely during the nineteenth century. In order for rationalism to produce its potentially positive effects, Durkheim now argued that the Kantianism – through Cousin’s spiritualist eclecticism – that had dominated the French rationalist tradition produced disastrous consequences – division, individualism, philosophy as art form, and in the end, an “anarchic dilettantism” – that had to be faced.

Durkheim claimed that the political and social problems confronted by France – the particular effects of the Revolution – seen against the advantages

---

10. It is worth noting that in French universities, professors of psychology were located in departments of philosophy.

of its intellectual and rationalist heritage, meant that France was in a position to lead the development of the social sciences. This sociology would be theoretical, holistic, fundamentally evolutionist (it did not accept a radical break between anthropology and sociology), and linked in a complex way with the development of socialist ideas (while it rejected communism). It would be based in the relative independence from politics provided by the universities, yet it would certainly not be divorced from the central issues facing modern societies. Sociology would be a sophisticated therapeutic discipline that could work out objective analyses of social pathology. This, of course, had already been attempted by Comte, and indeed it was central to the positivists that the social sciences be aligned with the life sciences and embrace categories of health and illness. Far from prohibiting the definition of values and norms, Durkheim, following Comte, specifically elaborated them. Durkheim’s particular version of Kantian rationalism was, from early on in his career, used critically to reconstruct and reinvigorate positive sociology through an encounter with the major sociologists influenced by Comte, in particular, John Stuart Mill (who was influenced early by Comte and then reacted strongly against him) and Herbert Spencer. Durkheim suggested it was precisely the moment of Saint-Simonian and early Comtean theory in the 1820s that reveals the decisive emergence of the modern notion of the “social” as such, and he provided one of the most notable accounts of this emergence in his lectures on *Socialism and Saint-Simon* (lectures given in 1895–96). His analysis of the French Revolution and the political instability in postrevolutionary France is not well known. Fundamentally it held that the dissolution of the guild-system in the prerevolutionary period initiated a deep-seated power imbalance within French society. He noted that for Henri de Saint-Simon, industry cannot advance without science and that therefore this too would have to be regulated in a new way.\footnote{Durkheim notes that “practice presupposes science but is not to be confused with it. Human conduct is intelligent and enlightened only to the degree it is directed by theory – though theory cannot be productive except on condition of its not being limited to the pursuit of practical ends. In this light, science ceased to be a simple private occupation, a simple matter of individual curiosity. It became a social function…” (*Socialism and Saint-Simon*, Charlotte Sattler [trans.] [New York: Collier, (1928) 1962], 185). From the beginning of the nineteenth century two different issues are very clearly identified: “on the one hand are the ‘political’ and on the other, ‘social’ problems … [and] the more one advances in time, the more public attention turns from the former to the latter … Social questions … are those to which the economic state of modern societies give rise … [and] as Saint-Simon demonstrated, economic relations have become either the unique, or in any case, the principal substance of social life” (ibid., 187–8).}

Recent research has shown that a considerable amount of what was published under Saint-Simon’s name when he was sketching out his vision for the new society was jointly written with Comte, who was his “secretary” for about five decisive years (Mary Pickering, *Auguste Comte: An Intellectual Biography* [Cambridge: Cambridge University Press, 1993]). The development
After having examined the Saint-Simonian socialist program and explained why it appeared when it did, Durkheim nonetheless thought its diagnoses were mistaken; indeed, “it seems to us that he was mistaken about what, in the present situation, is the cause of the uneasiness, and in having proposed, as a remedy, an aggravation of the evil.”14 This is also Durkheim’s view of Marxism and any socialism in which the proletariat or class struggle is given the central role in and for such a program. For Durkheim the question was how to define whether the social state of revolutionary and postrevolutionary France was normal or abnormal. He concluded that it indeed had abnormal features. This abnormality did not lie within the sphere of political structures (as in liberal theory), or as a structurally inherent antagonism of the economic structure (as in Marxist theory), but in the insufficiency and imbalance of institutions in society as a whole.

Although some observers have found the term useful for defining the orientation of the Durkheim School, Durkheim himself clearly rejected the conception of the “positive polity” in Comte’s sense. For Comte, popular sovereignty and democratic institutions were forms of the “metaphysical polity” linked structurally to egoistic individualism and, as such, were essentially unstable. Durkheim thought that Comte had not grasped the importance of the role of the democratic state in liberating the individual from bondage either to the family, or to secondary intermediary institutions. Nor had Comte grasped the way in which the social sciences could form the basis of a new curriculum in the schools and universities; for Comte education was to be controlled in detail by the sociocratic clergy. The key relationship was to be that between the state and secondary institutions remodeled as professions. Durkheim’s ideal seems to have been a kind of liberal corporate socialism, or a “socialism of institutions,” which would liberate a new individualism.

Thus Durkheim saw himself “following the path opened up” by Comte,15 but in the context of a particular philosophical conjuncture dominated by the opposed influences of Renouvier and Spencer (who offered a more complex notion of social structure). Comte’s fundamental three-state law of social evolution (theological, metaphysical, and positive) was rejected. This law did not

produce a valid conception of social types, or as he preferred to call them “social species.” He held that “Comte’s law correctly describes the way modern societies have developed from the tenth to the nineteenth century – but it does not apply to the entire course of human evolution.”\textsuperscript{16} He rejected Comte’s historical method: “the genealogical tree of organized beings, instead of having the form of a geometric line, resembles more nearly a very bushy tree whose branches, issuing haphazardly all along the trunk, shoot out capriciously in all directions.”\textsuperscript{17} He distinguished between a genealogical analysis within a single real continuous society, a comparative analysis within a single society and between societies of the same type, and a more abstract comparative cross-cultural analysis that could form the basis of theoretical evolutionary typologies.

While Durkheim worked toward a critical reconstruction of Comte’s sociology, he claimed that neither Hegel nor Marx had a direct influence on his thought. Certainly he debated with socialists, acknowledging that socialism and sociology were both profoundly indebted to Saint-Simon and Saint-Simonianism. In the mid-1890s, he began a lecture course on Saint-Simonianism that was conceived as the first in a series on socialist and communist ideas. After the initial lectures, however, Durkheim changed direction and began to work on religion; he was never to complete the series. It is clear that the very context of Durkheim’s youth and early political awareness makes it unlikely that events such as the fall of the Second Empire, the Paris Commune, and the defeat of France in the Franco-Prussian war of 1870–71 did not leave their mark. The Third French Republic began under conditions of harsh political censorship. Durkheim passed his \textit{baccalauréats} in 1875 and 1876, when the new political regime was beginning to settle into its republican and parliamentary routines. He came to maturity during the formation of the new regime, as a student at the École Normale Supérieure between 1879 and 1882. Durkheim’s recently discovered (2004) early lectures of 1882–84 can be read as a critique of the limits of pure philosophy as a means for assessing and resolving the problem of social integration in France.\textsuperscript{18} His early sociological publications suggest a change of perspective and that he worked to a position that would avoid the errors of the Commune on the one hand, and individualist liberalism (and anarchism – which took a turn to terrorism in the Third Republic in the years 1892–94) on the other, a position that formed the basis of his famous intervention in

the Dreyfus Affair (1894–1906). Many commentators have seen Durkheim's position here as a valuable move beyond the confines of liberal political theory (Talcott Parsons), while others have found that an absence of a theory of political parties constitutes the blind spot of Durkheimian sociology (Steven Lukes). Clearly it is both since although Durkheim does not focus on political parties directly, he introduces a new analysis of state power.

From the mid-1890s Durkheim was working in close association with his nephew, Marcel Mauss. In the division of labor between them, Mauss seems to have been more closely involved in political practice. The phase of Western European socialism that developed after the Commune, particularly from 1876 to 1890, revealed, as Mauss later remarked in his On Bolshevism, a variety of practical developments of a new kind that left the heroic and utopian age of theory (Marx and Proudhon) behind; only from an existing nation, said Mauss, can the transition to socialism be conceived as an internal progression of an organic type. Thus the task for socialists within a nation is not primarily a political and revolutionary one, but a social engagement in building new organizations within and against the existing frame. This frame was not in itself an insuperable obstacle to this engagement, as Marxists claimed; quite the contrary, it alone makes it possible. Mauss was sent by L'Humanité as special envoy to conferences of the cooperative movement in Hamburg, Budapest, Paisley, and on a research mission to Russia in 1906, thus revealing the difference between the political involvement of Mauss and Durkheim reflected in their theorizing.

The primary aim of Durkheim and Mauss's project was not to establish or guide a political movement or party; it was clearly to insure the implantation of sociology within the universities as a reputable discipline with a pivotal role to play in the identification of the normal forms of the emerging institutional

---

the emergence of french sociology

structures of modern societies. Durkheim stood at a distance from politics. Mauss said that even:

the social and moral crisis of the Dreyfus Affair in which he played a large part, did not change his attitude. Even during the war, he was among those who put no hope in the so-called internationally organized working class. He therefore remained uncommitted – he “sympathized” … with the socialists, with Jaurès, with socialism. But he never gave himself to it.

Durkheim’s theoretical sociology, however, did not in fact shy away from the issues of the nature of the modern state and political power. Durkheim’s argument suggests social theory is often mistaken in thinking the state is either a purely repressive machine, or that the purely political division of powers can deliver political and social liberty in the fullest sense. For Durkheim, the Spencerian thesis that freedom is freedom from the state ignores the fact that it is the state “that has rescued the child from family tyranny [and] the citizen from feudal groups and later from communal groups.” Indeed Durkheim argued the state must not limit itself to the administration of “prohibitive justice … [but] must deploy energies equal to those for which it has to provide a counter-balance.” Against the political illusion of power, for example as found in Montesquieu, Durkheim in effect tried to show that liberty is based on a particular form of the total social division of power: the state “must even permeate all those secondary groups of family, trade and professional association, Church, regional areas, and so on.”

Mary Ann Lamanna suggests that Durkheim’s analysis of the family reveals how “[t]he tension between spouse and kin as heirs reflects the historic struggle of the conjugal family to emancipate itself from kin dominance.” This historic struggle, central to Durkheim’s “grand narrative” of the movement from societies based on mechanical to those based on organic solidarity, is also the narrative of the modern state.

The legacy of Comte was not easily shaken off, however, for both Durkheim and Mauss, influenced by the Comtean view that war was incompatible with the advancement of industrial society, believed it impossible that there could really be deep-seated causes of war between advanced nations – by which they meant

France, Britain, and Germany. The diplomatic activities of these nations were
democratic, not divorced from popular control. In the run-up to the First World
War, Mauss in particular contrasted the political maturity of these nations with
the autocratic and feudal regimes of Eastern Europe, particularly Russia. His
view was that German ambitions were eastward and the Western nations would
not be drawn in. Close to Jean Jaurès, his position was pacifist.

When the war broke out, Mauss enlisted, immediately abandoning his pacifist
stance. Durkheim again turned to his theory of social abnormalities. The state can
become too strong and develop its own pathological dimensions and capacities:
in his pamphlet “Germany Above All: German Mentality and War” (1915), he
critiqued the ideas of the German political philosopher Heinrich von Treitschke
(1834–96), ideas that he took to be representative of the mentality that brought
war to Europe in 1914. He was careful in fact to say that he was not analyzing
the causes of war, but only examining one of the manifestations of a condition of
social pathology.26 Durkheim contrasted the democratic idea in which there is a
continuity between government and people with Treitschke’s thesis that there is
a radical antagonism between state and civil society. Treitschke called for a state
whose leaders are possessed of enormous ambition, unwavering determination,
with personalities characterized by “something harsh, caustic, and more or less
detestable” about them, a state with power capable of enforcing a mechanical
obedience from its citizens, whose first duty was to obey its dictates.27 These
states flouted international law and conventions, and their idea of war pushed
the development of military technology, which permitted the growth of states
that were almost “exempt from the laws of gravity … [t]hey seem to transport
us into an unreal world, where nothing can any longer resist the will of man.”28
Where there is a shift toward the concentration of power in the state, as occurs
in wartime, the structures protecting individual values are weakened. In wartime
there is to be expected not only an increase in altruistic suicide, most commonly
associated with military discipline,29 but also an increase in civil homicides since
the individual as such is less protected by moral forces.30

After the war, Mauss took up a detailed analysis of the Bolshevik strategy
in the Russian Revolution and its aftermath. The essay on Bolshevism, written
he says as an “assessment” in Comtean style, would “criticize” in the style of

26. Émile Durkheim, “Germany Above All: German Mentality and War (Paris: Armand Colin,
1915), 46.
27. Ibid., 30–34.
28. Ibid., 46.
29. Émile Durkheim, *Suicide: A Study in Sociology*, John A. Spaulding and George Simpson
Renouvier. He also suggested: “It would not be difficult here to pastiche Marx, to rewrite vis-à-vis this gigantic Commune his two famous pamphlets on the class struggles in France and on the Paris Commune. If I steer clear of such a parody, I hope I shall be allowed to follow fundamentally his example.” But he emphasized certain links with the Durkheimians. First, the idea of the soviet corresponds to Durkheim’s conception of professional corporations as the basis of property statute; and second, “the establishment of a moral and political law of the group formed out of the economic association of those united in the same production” that is the professional occupation becomes the basis for political representation and social status on the model of the guild or the university. Thus his interest in the Bolsheviks combined both scientific and personal concerns: “it was a socialism which among the options open to it had chosen my own, the professional organization”; indeed “Moscow seemed to many amongst us what it remains for many enlightened people … a kind of sanctuary incubating the very destiny of our ideas.”

All of these discussions are framed against a new evolutionary six-stage model – the elementary horde, simple clan-based tribe, tribal confederation, ancient city-state, medieval society, modern industrial nation – that is underpinned by a simple theory of two fundamental forms of social solidarity: mechanical and organic. Societies that are mechanical add together elements (kinship groups) as “compound” or “doubly compound” compositions in Spencer’s terms; societies that are organized on the basis of an “organic” division of labor and interdependent specialization of function (including medieval society, and the modern nation) have a form of social solidarity that is more and more complex. Whereas Durkheim outlined a theory of social structures, developing notably the distinction between segmental and organic forms of solidarity, Mauss retained the distinction as the basis of a theory of social evolution but introduced the concept of the nation as the key mediating term. Socialism is a modern idea and practice (after 1830), and is possible only as part of the development of the modern national form of organic solidarity; the project for a socialism where this form is absent, for example in Russia, can lead only to quite different results (for the

social elements are more like heterogeneous segments in an “Imperial sack”). But the way this framework was used by Durkheim and Mauss suggests there was a continuous and productive division of labor between them. Each developed a style of work. Mauss’s very large corpus of writings does not include a single book. Works like the famous essay on the gift were published as journal articles, as was the very long text Mauss wrote with Durkheim on social classification. In fact, a large proportion of Mauss’s output was coauthored, and appears as interventions in ongoing debates. He also favored work on social facts, and was against what he called “the pretentious search for originality.” Mauss, however, claimed that the most important characteristic of his approach was not simply that he was a positivist and thus not interested in “the lofty realms of … metaphysical ideas,” but that he was essentially a member of a school, a team, a workshop – in fact he had been Durkheim’s “recruiting agent.” Theory, not philosophy, remained important and open. For example, although Mauss’s studies were synthesized in Durkheim’s 1912 study The Elementary Forms of the Religious Life, Mauss admitted in 1930 that Durkheim’s argument about the nature of the sacred remained contested: “we were never sure that he was correct and I still continue to speak of the magico-religious.”

In 1893, Durkheim had referred to a specific group of acts as “gratuitous” and outside morals:

the refinements of worldly urbanity, the ingenuities of politeness … the gifts, affectionate words or caresses between friends or relatives, up to the heroic sacrifices that no duty demands … The father of a family risks his life for a stranger; who would dare to say that was useful?

---

39. A key concept in Mauss’s “Essai sur le don”, published in English as The Gift, by “total social fact” he named those social phenomena that involve “the totality of society and its institutions,” that “are at the same time juridical, economic, religious, and even aesthetic and morphological, etc.,” and that must be analyzed in terms of the totality of their connections (The Gift: The Form and Reason for Exchange in Archaic Societies, W. D. Halls [trans.] [London: Routledge, 1990], 78–9).
41. Ibid., 140.
42. Ibid., 149.
In a marked departure from this view, Mauss’s “Essai sur le don” clearly shifts from the notion that the gift is of no interest because it is merely a gratuitous act to the decisive discovery that it forms an obligatory form of exchange in all societies, whether or not it is the principle around which a particular society is organized. This is to say, although the gift might appear free and disinterested, it is in fact neither, as Mauss argues that the gift is given in a context in which both its reception and its reciprocal return are obligated, and obligated in terms of well-articulated social rules. Thus, much of The Gift involves analyzing gift-giving practices in an effort to disclose the underlying rules that govern the ongoing circulation of gifts. The essay on The Gift was the basis of a quite new problematic, one that was to be made famous in Mauss's lectures at the Collège de France (1931–40). Mauss wrote an “intellectual self portrait” at the time of his election to the Collège that provides a restatement of his inductivist position: from the facts, he says, he
drew out that at once religious, mythical and contractual idea of the
gift. I also brought out the idea of total prestation between clans, between
generations (usually staggered), between sexes and between
descent groups …: I established the collective nature of archaic forms …
and, above all, this notion of “total facts” which set the entire
economic, moral, religious, aesthetic and mythical … social whole
in motion. Superimposed on reciprocity and conflict, a system of
purely sumptuary, military, athletic, etc., rivalries developed within
these societies … the previous ways of posing questions have been
surpassed and displaced.

In his academic work, Mauss kept strictly to the sphere of those societies that
the Durkheimians called polysegmental. If academic sociology may, for Mauss,

44. “Essai sur le don” was published in the first issue of the second series of the Année sociologique in 1925, and all commentators have agreed that it marks a considerable move away from the problematic of the prewar Année (see Claude Lévi-Strauss, Introduction to the Work of Marcel Mauss, Felicity Baker [trans.] [London: Routledge, 1987]). Talcott Parsons likened the analysis to Mendel’s discoveries in genetics (in Wilton Dillon, Gifts and Nations [The Hague: Mouton, 1968], 6); others argued that it marks the beginning of the analysis of power (Jean Baudrillard, Symbolic Exchange and Death, Iain Hamilton Grant [trans.] [London: Sage, 1993]), the “foundation of ethnology” (Marcel Fournier, Marcel Mauss [Paris Fayard, 1994], 501ff.), or even the “invention of the symbolic” (Camille Tarot, De Durkheim à Mauss: L’invention du symbolique [Paris: La Découverte, 1999]). For a review see Alain Caillé, Don, intérêt et désintéressement: Bourdieu, Mauss, Platon et quelques autres (Paris: La Découverte, 1994).

even have been a “lost cause,” this was not because Mauss ignored the political and social problems of the advanced nations.

II. FUNDAMENTAL PROBLEMS OF METHODOLOGY

Following in Comte’s footsteps, Durkheim attempted to specify the unique domain of sociological phenomena within the division of labor of the sciences. He insisted that rules of method are strictly parallel with other ethical and moral rules: “methodological rules are for science what rules of law and custom are for conduct,” and whereas the natural sciences appear to have formed common ground, the “moral and social sciences” are in a state of anomie: “the jurist, the psychologist, the anthropologist, the economist, the statistician, the linguist, the historian, proceed with their investigations as if the different orders of fact they study constituted so many different worlds.” Rules of method organize and regulate the field, identify the ground for scientific strategies, and legitimate the way these strategies should be assessed. Methodology in the Durkheimian tradition was much more than a set of research techniques. It did not progress, however, without serious difficulties.

The methodological orientation was from the start one that strives for maximal objectivity of investigation: the primary definition of the terrain of sociology itself, the very object of social analysis, Durkheim formulated as “any way of acting, whether fixed or not, capable of exerting over the individual an external constraint.” On this The Rules of Sociological Method is insistent: all preconceptions must be discarded; never assume the voluntary character of a social institution; and always privilege the study of social phenomena that are detached from individual forms. The fundamental rule for observing social phenomena is “to consider social facts as things.” Durkheim considered the common ideological formation of the sociologist as modern citizen as in a sense, and paradoxically, both a support and a fundamental obstacle to positive research. His critical judgment is that in the absence of rules, “instead of observing, describing and comparing things, we … reflect on our ideas … Instead of a science which deals with realities, we carry out no more than an ideological analysis.”

49. Durkheim, The Division of Labor in Society, 368.
51. Ibid., 60.
52. Ibid.
ular text has been read as a revolutionary manifesto in sociology, for it essentially demands that each sociologist reverses habitual and everyday forms of thought.

When Mauss came to discuss the notion of the social fact, he gave it a different interpretation, more empirical and concrete in its emphasis. For example, when he presented socialism as a social fact, he departed from the classic definition of the social fact. Social facts are essentially psychological, and not to be found outside individuals in their social context, he says.\textsuperscript{53} Durkheim's famous methodological definition of social facts as external to individuals appears abstract and formal against Mauss's formulation, which appears more in line with Durkheim's post-1898 position. It is clear, however, that these definitions and rules are also closely bound up with changing and developing political and research priorities; what seems at first to be Durkheim's attempt to produce a definitive text on methodology, \textit{The Rules of Sociological Method}, is more complex than it appears. Durkheim and Mauss seemed able to produce definitive methodological rules that were only to be altered, or even abandoned, as soon as their researches progressed. The first definition of the field of study, for example, was not developed in terms of social facts at all, but rather of moral facts: "moral facts consist in a rule of sanctioned conduct."\textsuperscript{54} Durkheim adopts this definition since the study of moral evolution no longer depends on the study of norms, but norms and sanctions. The terrain thus changes: the development of the "positive science of morality is a branch of sociology, for every sanction is principally a social thing."\textsuperscript{55} When the focus is a moral social fact, Durkheim conceived the field in terms of the \textit{conscience collective}; when the focus changed, from 1898 on, to social knowledge, it is conceived in terms of collective representations.\textsuperscript{56} There is also a new conception toward 1912–14 that develops the conception of the articulation between the individual and society in terms of \textit{homo duplex}.\textsuperscript{57} With this concept Durkheim thought he had resolved the longstanding problem of the body (the basis of the sensation of individuality) and the soul (the reflection of the experience of social transcendence beyond the individual).

The (1893) discussion of method in \textit{The Division of Labor in Society} was clearly the basis for much of what appears in \textit{The Rules of Sociological Method} (published separately as articles in 1894 before appearing in modified book form in 1895). The characteristics of the moral fact are displaced and incorporated into the wider category of the social fact. In the 1894 formulations (that

\textsuperscript{53} Mauss, \textit{Écrits politiques}, 76.

\textsuperscript{54} Durkheim, \textit{The Division of Labor in Society}, 425.

\textsuperscript{55} \textit{Ibid.}, 428.

is to say, in the first journal appearance of *The Rules of Sociological Method*), it is made clear nonetheless that the sociologist must choose to give primacy to the study of facts from “a viewpoint where they present a sufficient degree of consolidation.” 58 By the time the book version of *The Rules of Sociological Method* was published in 1895, with a large number of revisions, this particular injunction was changed to the rule that the sociologist “must strive to consider [social facts] from a viewpoint where they present themselves in isolation from their individual manifestations.” 59 *The Rules of Sociological Method* specifies a whole new range of ways in which external constraint occurs, from informal sanctions of ridicule and social ostracism to technical and organizational necessities. Moral obligation and sanction form the first domain of objects, but constraint and circumstantial necessity broaden this into the essential characteristics of (externally acting) social facts in general.

Durkheim maintains a continuing interest in moral statistics from the early essay on variations in birth rates through a range of studies of family, divorce, and political statistics. 60 This aspect of his sociology has attracted attention for installing an experimental rationalism as a founding moment in the modern discipline. 61 It seems clear that in 1895 he altered his research and decided to undertake a full-scale study of suicide statistics. He wrote in *The Rules of Sociological Method*: “if suicide depends on more than one cause it is because in reality there are several kinds of suicide.” 62 The very existence of suicide statistics makes it possible for sociologists to study social currents as phenomena that are “independent of their individual manifestations.” Far from fixing a unique definition of the object of sociology, such as social statistics, Durkheim gave himself a number of options. He does not seem to be worried if he does not follow to the letter his own hastily conceived prescriptive rules, as long as he remains consistent with basic principles. 63

But there were important problems with this position in practice. Throughout the methodological writings to this point (1895), Durkheim insisted that the sociologist must start from things not ideas; indeed, the sociologist must start from “a group of phenomena defined beforehand by certain common external

characteristics.” 64 Work must begin from these external features and move toward an understanding of their internal causal relationships. When investigating suicide, the procedure required that he group together those suicides with the same external features (e.g. how suicides were committed), and “would admit as many suicide currents as there were distinct types, then seek to determine their causes.” 65 In the course of the analysis in Suicide, Durkheim says, however, that this procedure could not be used; instead, he proposed “to determine the social types of suicide by classifying them not directly by their preliminarily described characteristics, but by the causes which produce them.” 66 Instead of proceeding from the characteristics in the facts themselves, he says “once the nature of the causes is known we shall try to deduce that nature of the effects … Thus we shall descend from causes to effects and our aetiological classification will be completed by a morphological one.” 67 He admitted that this was a complete reversal of the order of analysis prescribed in The Rules of Sociological Method, which was designed to discover social causes. It comes as something of a surprise to learn that the social causes of suicides (anomic, egoistic, altruistic) are already known. 68

But there were other problems, particularly in defining abnormality in a society that was still in the process of formation. His primary rule here was: if the social fact is general in the average form of the social species under consideration, the fact is to be judged normal. Because there were problems with the very identification of the species French society belonged to, he introduced another much more theoretical consideration, requiring that it be demonstrated how a normal fact shows “that the general character of the phenomenon is related

64. Durkheim, The Rules of Sociological Method, 75.
65. Durkheim, Suicide, 146.
66. Ibid., 147.
67. Ibid.
68. See my “The Deconstruction of Social Action: The 'Reversal' of Durkheimian Methodology,” in Durkheim's Suicide: A Century of Research and Debate, W. S. F. Pickering and Geoffrey Walford (eds) (London: Routledge, 2000). If the results of Durkheim's analyses have often been challenged from outside the school, they were not immune from challenge from within either. Indeed, many observers have argued that Mauss sought to wrestle with the problems of Durkheim's initial conceptions and analyses to the end of his career (see Allen, Categories and Classifications). Others, such as Adam Kuper, have reviewed the criticisms of The Elementary Forms of Religious Life and concluded that Durkheim's “model of a segmentary structure based on unilineal descent groups is a sociological fantasy” (“Durkheim's Theory of Kinship,” British Journal of Sociology 36[2] [1985]). The paradox therefore is: Why does Durkheim's work remain significant? Kuper suggests the “apparently paradoxical fruitfulness of Durkheim's work, despite its substantive failure, is … due to the power of certain elements of his methodology; to the importance of some of the questions which he set on the agenda of the next generation; and, above all, to the sense which he communicated of the richness, complexity and sociological interest of ethnographic materials” (ibid., 235).
to the general conditions of collective life in the social type under consideration," and this "verification is necessary when this fact relates to a social species which has not yet gone through its complete evolution."69 The results of the analyses using these two rules tend to contradict each other in the case under discussion (one suggesting normality, the other abnormality). If the anomic forms of the division of labor are a continuation of segmental society, and "now increasingly dying out, we shall be forced to conclude that this now constitutes a morbid state, however universal it may be."70 In other words, the theoretical analysis of the forms and functions of regulation suggest that economic anomie is pathological even if it is general; yet the principal rule suggests generality indicates normality. Because there is a problematic relation between rules and facts, Durkheim, reluctantly, is forced into a theoretical detour;71 a detour that ultimately saved his sociology from a reductionist empiricism (unable to read social causation directly from facts, he had to take his detour through theory).

After Durkheim's death in 1917, the second series of L'Année sociologique also followed Durkheim's example by attempting to reflect on method. In Mauss's 1927 transitional text on method – "Sociology: Its Divisions and Their Relative Weightings" – it is clear that the old framework is bursting at the seams as Mauss attempted to reconstruct the sociological project in a new situation.72 Mauss seems to have moved very strongly in the direction of anthropology, whether it be called ethnology or ethnography, and away from what was recognized as

71. Of course one of the reasons Durkheim choose suicide was to demonstrate that suicide rates could form a distinct object of study. Gabriel Tarde disputed this but nonetheless helped Durkheim to get access to statistics in Paris. Tarde held the view that there are only individuals and that society and social cause does not exist: "there can only be individual actions and interactions. The rest is only a metaphysical entity, mysticism" (On Communication and Social Influence, Terry N. Clark [ed.] [Chicago, IL: University of Chicago Press, 1969], 140). The help that Tarde gave Durkheim ironically became "the empirical basis for the sharpest attack that he ever received" (M. Borlandi, "Informations sur la rédaction du Suicide et sur l'état du conflit entre Durkheim et Tarde de 1895 à 1897," *Durkheim Studies* 6 [Fall 1994], 6). Durkheim developed in *Suicide* the classic case for the existence of unique structural social causes over and above individual interactions and *inter alia* presents one of his tactical critiques of Tarde (*Suicide*, 123–42, 306–25; *my On Durkheim's Rules of Sociological Method* [London: Routledge, 1988], 76–83).
“sociology” in the years of the first *Année*. Incontestably the essays published in that journal were dominated by themes of religion, ritual, classification, and sanctions in “primitive” societies. If Mauss even said, at one point, “I have never been a militant of sociology,” what is striking is that, after Durkheim’s death, Mauss began to work out a detailed conception of “general sociology” that is almost completely lacking in Durkheim’s formulations. It has even been claimed, by Bruno Karsenti among others, that Mauss now began to restructure the anthropological field. Karsenti argues that:

Relations are formed, connections established, and passages introduced which lead to a redistribution of knowledge. The latter, insofar as it no longer suffers from a foundational split, can now be seen from a unitary viewpoint and can take back the name of anthropology – although the old term has now acquired a new meaning.

Indeed, for Karsenti, sociology in the Maussian scheme “has the imperative duty to fulfill itself on this basis and rediscover its place within anthropology.” Mauss also seemed to want to develop Durkheim’s notion of *homo duplex*, but he did this in a way that did not confront the philosophers head on. The long-running dispute about reason and pure rationality, on the one hand, and social determinants, on the other, produced on Mauss’s part some ingenious interventions. His early concern with bodily gestures, indicated in his 1909 thesis *On Prayer*, was continued throughout his career with essays on “techniques of the body” and technology. He held that from *homo duplex* it was possible to think

---

73. Between 1898 and 1913 twelve volumes were published, although the volumes that contained significant analyses ended with volume 9 in 1906. A conspectus of the contributions of Durkheim and Mauss indicates that their work was already dominated by questions of the nature of the “elementary forms” of social and cultural structure. The first volume of 1898 contained Durkheim’s essay on the origins of the incest taboo. The second published Durkheim’s essay on the definition of religious phenomena and Mauss and Hubert’s essay on sacrifice. The next major items by Durkheim appeared in volume 4 (1902), containing Durkheim’s essay on penal evolution, and in volume 5 with Durkheim’s essay on totemism. Volume 6 (1903) contained Durkheim and Mauss on “Primitive Classification.” Volume 7 (1904) contained Mauss and Hubert’s essay on magic. Volume 8 (1905) contained Durkheim’s essay on “The Matrimonial Organization of Australian Societies’), and volume 9 (1906) contained Mauss and Beuchat’s essay “Seasonal Variations of the Eskimo.”

76. *Ibid*.

of “homme total,” and of thinking not only with the brain but with the fingers. It is not far fetched to think that Mauss was developing here a materialist conception of practice that anticipated the critique of Durkheim developed later by sociologists such as Peter Worsley.

III. THEORETICAL REVISIONS

Durkheim developed his theory as his research grew more extensive. He began by suggesting that the earlier the society, the more likely it was to have repressive sanctions. He later revised this view completely. In his early lectures on Moral Education, for example, he argued that there was a plague of violent punishment in the schools of the Middle Ages, and the lash remained in constant use in schools up until the eighteenth century. After researching his lectures on educational thought in France, he describes the thesis of the violent medieval colleges as simply “a legend.” He had discovered that these educational communities remained essentially democratic and these forms “never have very harsh disciplinary regimes” because “he who is today judged may tomorrow become the judge.” The new analysis suggests that the turn towards a more oppressive disciplinary regime began at the end of the sixteenth century, just at the moment when the schools and colleges in France became centralized and isolated from the outside community.

But Durkheim faced up to the issue of punishment as a practical issue for teachers in his pedagogy classes. Between the offense and the punishment, he observed there is a hidden continuity, for they are not “two heterogeneous things coupled artificially.” This is the reason that erroneous theories of punishment arise. One such theory sees punishment as expiation or atonement; another sees punishment primarily as a way of intimidating or inhibiting further offenses. From a pedagogical point of view, the problem concerns the capacity to neutralize the demoralizing effects of an infringement of group norms. The effectiveness of punishment should be judged by how far it contributes to the solidarity of

81. Ibid., 155–7.
the group as a whole, since certain kinds of punishment can contribute to the creation of further immoral acts. Once applied, punishment seems to lose something of its power. A reign of terror is, in the end, a very weak system of sanctions often driven to extremes by its own ineffectiveness. Corporal punishment also involves an attack on the dignity of the individual, a dignity valued and fostered in modern societies.

The central theoretical issue here was addressed in his attempt to reconstruct the theses of *The Division of Labor in Society* in an article of 1900 called “Two Laws of Penal Evolution.” Durkheim criticized Spencer for thinking that the degree of absoluteness of governmental power is related to the number of functions it undertakes. But Durkheim worked toward the formulation: “the more or less absolute character of the government is not an inherent characteristic of any given social type” – an idea to be found in Spencer’s sociology. Durkheim presents an account of French society that is diametrically opposed to that of Marx, as he argues that “seventeenth-century France and nineteenth-century France belong to the same type.” To think there has been a change of type is to mistake a conjunctural event in the society (revolution) with its fundamental structure, since absolutism arises, not from the constituent features of a social form, but from “individual, transitory and contingent conditions” in social evolution. In principle, the form of state is never a fundamental constituting feature of any social type.

Durkheim’s work, then, involved considerable reworking of basic concepts, and his theorizing was constructed with a view that made this possible. One such important example was the conceptualization of the notion of primitive society itself between *The Division* (1893) and *The Elementary Forms of the Religious Life* (1912). In the first of these studies, the fundamental fact of the early societies is that they are held together by bonds of similitude and characterized by intense and violent reactions to infringements of a highly uniform “collective consciousness.” There is little social differentiation; even the gender division of labor is so slight there is no contractual regulation between the sexes, and relations between the sexes were characterized by sexual promiscuity. Durkheim’s more detailed investigations into Australian tribal society produced a more complex picture, as he began to see kinship organization as highly structured, and based on deeply embedded forms of sexual and age divisions. He came to view social structure as the outcome of symbolic practices, particularly

those crystallized in rituals. He established the thesis that ritual beliefs were structured on basic categories that were themselves socially produced and reproduced. Fundamental to such systems of religious categories were the concepts of the sacred and profane, good and evil, which were involved both in organizing such rituals and being at the same time reproduced by them. In this way, Durkheim thought he could arrive at a definitive sociological critique of Kantian apriorism on the one hand, and Spencerian individualism on the other. He also thought that this kind of investigation could shed light on the notion of the soul, developing further his notion of *homo duplex*, since evidence showed that representations of individual souls were intimately linked to the structure of social groups and their internal differentiation (in some Australian groups, for example, women did not have souls).

Because Durkheim’s attention had shifted to these symbolic processes and practices of intervention in and reproduction of such symbolic materials, it has been assumed in some interpretations that his whole sociology had itself become a subjective exercise in symbolic interactionism and a rapprochement with pragmatism. Although there was no acknowledgment of this in Durkheim’s writings on methodology, the focus of analysis was no longer on the external modes of sanctioned conduct (moral facts). It had moved to social epistemology, or what he called “the sociology of knowledge and religion,” which examined the way immanent infrastructures imposed their exigencies on action. This shift of emphasis had already been signaled in his discussion paper on “The Determination of Moral Facts” (1906), where he had suggested that external constraint and obligation was one side only of moral discipline. Another dimension, neglected by Kant (but emphasized by Renouvier), was that aspect of morality beyond obligation that was “desirable and desired.” This he thought required a sociological analysis from the inside, to complement the analyses of the externality of obligation: “[t]he desirability peculiar to moral life participates of the … characteristic of obligation, and is not the same as the desirability of the objects that attract our ordinary desires.” Durkheim develops parallel ideas in his lectures on pragmatism with respect to truth.

Mauss’s political writings also reflect two important developments of Durkheimian theory after Durkheim’s death in 1917. On the one hand, Mauss is much more influenced by the theory of capital and capitalism than Durkheim

89. See my “Woman as Outsider,” in Gane, *The Radical Sociology of Durkheim and Mauss.*
was, and this gives certain parts of his writing a critical and radical character. On
the other hand, Mauss attempted to think about politics directly. One aspect of
this reflection can be found in his attempt to define the relation between soci-
ology and politics; another tended to look more to the practical development
of socialism than to criticize socialist theory (although he also does this), and
this leads him to assess progress on grounds that he claims are different from,
and often in advance of, theory.

Mauss did not give any great weight to the notion of social pathology, and
so does not locate himself in Durkheim’s scheme where the principal objec-
tive of theorists is to repair a social abnormality of structure through appeals
to statesmen. In fact, the very category of “abnormal” and “pathological” social
facts disappears with Mauss. But if Mauss kept his academic anthropology and
his political writing separate, he drew practical political lessons for sociology
whenever the opportunity arose. His judgment against the Bolsheviks draws some
harsh ones: the Bolshevik Revolution was more a creature of the crisis in Russia
than the outcome of the will of a people; it was not “methodically pursued … it
was just a great adventure,” in fact, “an accident, it has been grafted, overlaid onto
the life of a people … it does not correspond to the movement of the mentality
of the Russian people, any more than it is the pure realization of the ideas of its
leaders.” Even the February Revolution of 1917, when Kerensky took power,
was not the work of “a living society creating for itself by force a constitution,” and
even the socialist revolutionaries destroyed what political and civic organization
there was. As for the Bolsheviks, “at least they had will power … savage will …
not encumbered by any love for this immense people.” The Bolsheviks “exploited”
the revolution; they “seized Russia,” but the opposition was even worse and even
less popular. It proves that all social revolution “must take a national character,”
“it must be the work of the ‘general will’ of the citizens.” Indeed the communist
and terrorist period of the Russian Revolution was not socialist. Socialism would
organize the market and not attempt to produce a communism of consumption.
Socialism would not “dispense with money” nor suppress the essential “indus-
trial and commercial freedom” of the modern economy. Essentially socialism
should maintain and “respect … intermediary collectivities.” Indeed, “Durkheim’s
hypotheses about the moral and economic value of the professional group emerge
further confirmed. The Soviets failed precisely because they undermined and
destroyed this primordial organizational element.” Essential political conclu-
sions follow: “violence is only legitimate via the law, via the legal order whose

reign it supports: it is not itself order, still less faith”; second, “naïve sociologists, the Communists believed that the order of sovereignty, the law, can create … from nothing … the law does not create, it sanctions.”

The Durkheimians clearly aimed to decamp from philosophy, the discipline in which they were formed, into a positive science. They did not think that this involved an epistemological break, since their notion of philosophy was that it was already a science from the point of view of its methodology and logic. What they wanted was to put this science to use. The philosophers who did not take this route were, in their view, taking a path into a profoundly reactionary mysticism or scholasticism. But in their own practice, it seems clear to conclude that Durkheimian philosophy evolved into a radicalized Kantianism formed out of the French tradition of Cousin and Renouvier that they then applied to Comte in order to regenerate sociology and anthropology. What they produced was an experimental rationalism that had learning from errors as its objective.

MAJOR WORKS

Mauss

99. Ibid., 198–9.
Gottlob Frege (1848–1925), Edmund Husserl (1859–1938), Rudolf Carnap (1891–1970), and Martin Heidegger (1889–1976) are universally acknowledged as key figures in the development of philosophy in the twentieth century and, in particular, as centrally important in the development of the well-known divide between what we now call the analytic and continental philosophical traditions. Frege, the patriarch of the analytic tradition, established modern mathematical logic as both a technical subject (now often pursued primarily in departments of mathematics and computer science) and a foundational discipline for philosophy. Carnap, one of Frege’s very few students at the University of Jena in the years 1910–14, actively participated in the great transformation of mathematical logic that led to Kurt Gödel’s fundamental contributions in the early 1930s; and he also took Frege’s and Bertrand Russell’s conception of (mathematical) logic as the essence of philosophy several steps further – eventually leading (in 1934) to the radical idea that Wissenschaftslogik (the logic of science) should replace traditional philosophy entirely. Husserl, the patriarch of the twentieth-century continental tradition, established the new philosophical method of transcendental phenomenology, aiming (in a way quite different from Carnap) to “bracket” the ontological problems of traditional metaphysics and reconstitute philosophy as a scientific discipline. Heidegger, Husserl’s most important assistant at the University of Freiburg in the late 1910s and early 1920s, then went on to disappoint his erstwhile mentor by establishing yet another radically new...
conception of philosophy – as phenomenological ontology or the existential hermeneutic of Dasein – in the late 1920s and early 1930s.

These two different traditions of philosophical thought appear, at first sight, to be completely at odds with one another. It is no wonder, then, that the increasing tension (and mutual incomprehension) between them crystallized in the early 1930s when Carnap published his well-known paper, “Überwindung der Metaphysik durch logische Analyse der Sprache” (Overcoming metaphysics through the logical analysis of language) (1932), featuring a blistering criticism of Heidegger’s notorious sentence “Das Nichts selbst nichtet” (nothingness itself nothings) as a typical example of a metaphysical pseudo-sentence. After this, not surprisingly, the relationship between the two traditions went quickly downhill – hastened, in no small part, by the Nazi seizure of power in 1933 and the following migration of much of the German-speaking philosophical world (including Carnap) from central Europe to the United Kingdom or its dominions and the United States. The deep intellectual impasse characterizing most of the second half of the twentieth century between the analytic tradition, dominant in the English-speaking world, and the continental tradition, dominant in European lands, was the natural and inevitable result.2

Nevertheless, before the epoch-making events of the early 1930s, there was no such intellectual gulf within German academic philosophy. On the contrary, throughout the late 1910s and 1920s, logical empiricism (represented by Carnap and others), Husserlian transcendental phenomenology, neo-Kantianism (represented by the Southwest and Marburg Schools),3 and Heidegger’s new existential–hermeneutic variant of phenomenology were rather engaged in a fascinating series of philosophical exchanges and struggles, all addressed to the revolutionary changes that were then sweeping both the Naturwissenschaften and the Geisteswissenschaften. The differing philosophical movements of course disagreed with and opposed one another about the interpretation and significance of these revolutionary changes, but they still spoke the same philosophical language and actively engaged one another in a common set of philosophical problems. Moreover, many of these central points of both agreement and disagreement have their origin, as we shall see, in the earlier reactions of both Frege and Husserl to the profound developments in the foundations of mathematics of the late nineteenth century. For both were initially trained as

2. For a detailed consideration of the collision between Carnap and Heidegger over “metaphysical pseudo-sentences” in the early 1930s, together with extended discussion of its social and political context, see Michael Friedman, A Parting of the Ways: Carnap, Cassirer, and Heidegger (Chicago, IL: Open Court, 2000), on which we are drawing here. We shall return to this topic in §III below.

3. For a detailed discussion of these schools, see the essay by Sebastian Luft and Fabien Capeillères in this volume.
mathematicians and were then led to philosophy by their deep (and somewhat different) interests in foundational problems.

Carnap’s evolving engagement with these problems was also fundamentally shaped, unlike Frege’s, by the influence of contemporary neo-Kantianism (especially as represented by the Marburg School), leading, in Carnap’s case, to an even more serious divorce between formal logic and intuitive experience than in Frege. Whereas Heidegger’s philosophy, after the fateful encounter with Carnap, was characterized by open hostility towards “logic and the scientific way of thinking,” his earlier writings (including *Being and Time*) express a serious interest in early-twentieth-century developments in logic, the foundations of mathematics, and the foundations of natural science. Moreover, although Heidegger’s evolving perspective on these issues was importantly shaped by both Husserl and the historically oriented *Lebensphilosophie* of Wilhelm Dilthey, he was also substantially influenced, like Carnap, by a thoroughgoing exposure to contemporary neo-Kantianism (here represented by the Southwest School). It turns out, therefore, that the original founders of the two traditions – even Carnap and Heidegger – had much more in common than may first appear. We shall argue, in particular, that one can go a long way toward understanding the divergent trajectories of the two traditions by concentrating on a single fundamental issue that divided them: the relative philosophical importance of the distinct but closely related disciplines Kant had called formal and transcendental logic.

I. FORMAL AND TRANSCENDENTAL LOGIC: THE KANTIAN LEGACY

Kant’s *Critique of Pure Reason* is divided into two principal parts: a very long first part called the “Transcendental Doctrine of Elements,” and a relatively brief second part called the “Transcendental Doctrine of Method.” The “Transcendental Doctrine of Elements” is then divided, in turn, into a relatively brief first part called the “Transcendental Aesthetic” (concerning our two pure forms of sensible intuition, space and time) and a very long second part called the “Transcendental Logic” (comprising both the “Transcendental Analytic” and the “Transcendental Dialectic”). Kant begins the introduction to the second part (of the doctrine of elements) by enunciating his fundamental distinction between two distinct faculties of the mind, intuitive and conceptual:

---

4. We describe Heidegger’s early writings on logic towards the end of §1 (see, in particular, note 27 below). For Heidegger’s interest in both the foundations of mathematics (formalism versus intuition) and the foundations of physics (relativity theory), see *Being and Time* §3.

5. For a discussion of Dilthey, see the essay by Eric Sean Nelson in *The History of Continental Philosophy: Volume 2*. 
Our cognition arises from two fundamental sources in the mind, of which the first is [the faculty] to receive representations (receptivity of impressions), the second the faculty to cognize an object through these representations (spontaneity of concepts); through the first an object is given to us, through the second it is thought in relation to this representation (as mere determination of the mind). Intuition and concepts therefore constitute the elements of all our cognition, so that neither concepts without intuition in some way corresponding to them, nor intuition without concepts, can yield a cognition. Both are either pure or empirical.⁶

On this basis, Kant continues, “we distinguish the science of the rules of sensibility in general, i.e., aesthetic, from the science of the rules of the understanding in general, i.e., logic” (A52/B76). And what Kant first has in mind by “logic,” in this context, is what he calls “general” or “formal” logic, characterized by the following two properties:

1) As general logic it abstracts from all contents of the cognition of the understanding and the diversity of its objects, and has to do with nothing but the mere form of thinking. 2) As pure logic it has no empirical principles, and thus it draws nothing from psychology (as one has sometimes allowed oneself to be persuaded), which therefore has no influence at all on the canon of the understanding. It is a demonstrated doctrine, and everything in it must be certain entirely a priori.

(A54/B78)

Kant’s own main concern, however, is a new type of logic, “transcendental” logic, which has the second property but not the first:

General logic abstracts, as we have indicated, from all content of cognition, i.e., from all relation of it to the object, and considers only logical form in the relation of cognitions to one another, i.e., the form of thinking in general. But now since there are pure as well as empirical intuitions (as the transcendental aesthetic has shown), there could also be a distinction between pure and empirical thinking of objects. In this case there would be a logic [i.e., transcendental logic], in which one did not abstract from all content of

cognitions; for that [logic] which contained merely the rules of the
pure thinking of an object would exclude all those cognitions that
were of empirical content.

(A55/B79–80)

It is the task of transcendental logic, therefore, to relate the pure logical
forms of thought comprising general logic to the pure forms of sensible intu-
tion described in the “Transcendental Aesthetic”; and it is precisely this task
that is then carried out in the “Transcendental Analytic.”

But the rapid rise of scientific psychology in Germany in the second half of
the nineteenth century prompted a renewed challenge to the sharp separation
between logic and psychology originally ordained by Kant. With characteristic
forthrightness, John Stuart Mill had already deemed logic to be a chapter of
psychology:

[Logic] is not a science distinct from, and coordinate with, Psychol-
ogy. So far as it is a science at all, it is a part, or branch, of Psychol-
ogy … Its theoretical grounds are wholly borrowed from
Psychology, and include as much of that science as is required to
justify the rules of the art.7

A centerpiece of late-nineteenth-century materialism and naturalism, the reduc-
tion of logic to psychology was the research program of numerous psycholo-
gists and psychologistic logicians, who sought to show that the principles and
laws of logic are rooted in empirical psychological (and ultimately, biological
and chemical) laws governing actual mental processes. Accordingly, even the
most basic principles of logic (including noncontradiction) were regarded as
being about, and drawing their evidence from, a range of facts regarding the
particular mental acts and processes of empirical cognizing subjects. The rejec-
tion of such views, first by Frege and then by Husserl, drew on the antipsycholo-
gism of German philosopher and logician Rudolph Hermann Lotze, and both
Frege and Husserl accordingly attacked the psychological logicians’ attempts to
ground the objective and a priori validity of logical and mathematical principles
or laws in the mental acts or psychic experiences (Erlebnisse) of the judging or
reasoning subject.8
